Appendix A Notice of Preparation and NOP Comments

Notice of Preparation

Notice of Preparation

To: State Clearinghouse
Responsible & Trustee Agencies
Interested Parties (Address)

From: Town of Loomis
P.O. Box1330
Loomis, CA 95650 (Address)

Subject: Notice of Preparation of a Draft Environmental Impact Report

The Town of Loomis will be the Lead Agency and will prepare an environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the project.

The project description, location, and the potential environmental effects are contained in the attached materials. A copy of the Initial Study (☐ is ☒ is not) attached.

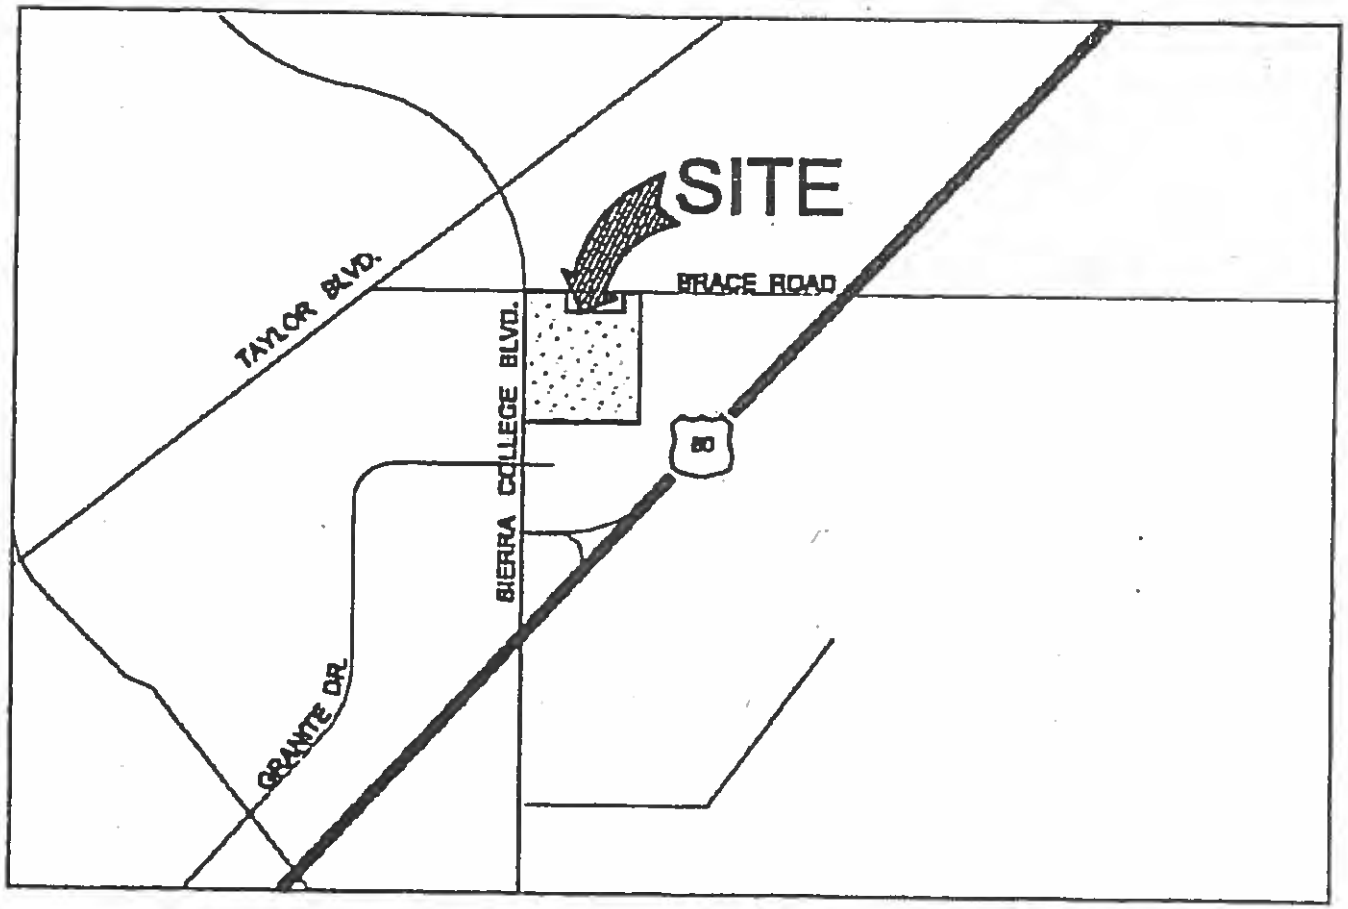
Due to the time limits mandated by State law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice.

Please send your response to Bob King, Town Planner at the address shown above. We will need the name for a contact person in your agency.

Project Title: Costco Warehouse and Fuel Facility

Project Applicant, if any: Costco Wholesale

Date May 15, 2017



Signature John L. Phillips

Title Interim Town Manager

Telephone 916-652-1840

Reference: California Code of Regulations, Title 14, (CEQA Guidelines) Sections 15082(a), 15103, 15375.

New Costco Warehouse and Fuel Facility

Site Information

Project Location:	Sierra College Blvd at Brace Road Loomis, CA
Assessor Parcel Numbers:	045-042-034, 045-042-035, 045-042-036, 045-042-037, 045-042-011, 045-042-012.
Site Area:	± 17.38
Current Zoning:	CG General Commercial RM-5 Medium Density Residential
Current General Plan:	CG General Commercial RM-5 Medium Density Residential
Proposed Zoning:	CG General Commercial RM-5 Medium Density Residential
Proposed Use:	Warehouse Retail (CG)

Site Description

Project Proposal

The proposed project consists of the following components:

1. The following applications will be processed for the project with the Town of Loomis;
    a. Design review approval for the site plan, building design, and preliminary landscape plan;
    b. A Conditional Use Permit to approve the tire center and fuel facility uses;
    c. A Lot Line Adjustment and Reversion to Acreage to combine the six existing parcels into a single parcel;
    d. A Zoning Text Amendment to allow for the Costco warehouse in the CG, General Commercial Zoning District for this specific site;
    e. A General Plan Text Amendment to allow for the Costco warehouse in the CG, General Commercial General Plan designation for this specific site;
    f. An Environmental Impact Report to study the impacts and potential mitigation measures required for the project. The construction of a new approximately 152,101 square foot Costco Wholesale warehouse building with ±777 parking stalls and associated landscaping on a ± 17.38-acre parcel. In addition, the Costco project will include a 24-dispenser fuel facility with potential future expansion to 30 dispensers that will be analyzed and approved with the entitlements for the project.
2. Proposed uses will include, without limitation, warehouse retail, tire sales and installation, motor vehicle fuel sales including diesel, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales and tasting, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December.
3. Vehicle display at the Costco warehouse entry for on-line or off-site (referred) automobile sales.
4. Signage to include the Costco warehouse typical signage to be approved as part of the entitlement process.
5. The Costco warehouse parcel would be entitled and constructed in one phase.

COSTCO PROJECT DESCRIPTION:

Costco Employment

It is anticipated that the Loomis Costco warehouse and gas station will employ approximately 165 to 170 employees.

Costco Site/Landscape Plan

The warehouse is sited to minimize impacts to the existing residential neighborhood to the east and apartments to the north. The main entry feature has been oriented towards the existing residential so that the loading dock and truck deliveries are accessed and oriented towards Sierra College Blvd to further reduce impact to the residences. The parking lot design has incorporated a generous perimeter landscape buffer adjacent to the existing residential to the east that varies from 34' to 38',

and a 20-foot landscape buffer adjacent to the existing apartments to the north and also to the west and south. Parking lot trees and landscaping per Town requirements will enhance the site and surrounding area and assist to minimize the visual impact to the development. Access to the warehouse and fuel facility will be from Interstate 80 at Sierra College Blvd. from a proposed signalized intersection at the southern portion of the site. Approximately 777 parking stalls are provided on site, which exceeds the required Town of Loomis parking requirement of 760 stalls. Landscape islands are typically provided at one island per 5 lineal parking spaces in the parking field. An ADA compliant pedestrian pathway will extend from the new warehouse to the western property boundary where it will connect to Sierra College Blvd. The project provides oversized parking stalls of 10' x 20' that are larger than the minimum requirements for the Town of Loomis to provide members with easier accessibility to vehicles.

The parking lot will be illuminated with standard downward pointing lights, each containing two LED fixtures affixed to a 37' foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are designed in order to provide even light distribution for vehicle and pedestrian safety. The parking lot lights will be timer controlled to limit lighting after the warehouse has closed and most employees are gone from the warehouse. Parking lot lighting will only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures will also be located on the building approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting will incorporate the use of cutoff lenses to keep light from overflowing beyond the project boundaries.

The landscape plan includes a mix of drought tolerant shrubs and grasses, and a variety of shade trees will be used throughout the parking field and along the project perimeter that are appropriate for the climate in Loomis.

Costco Warehouse Architecture

The warehouse design is contemporary and has set the standard for large format retail facades with variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco is able to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, the incorporation of varying parapet cap heights, Costco can successfully break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The technique of breaking a long elevation into smaller elements with varied materials and colors is used to create a more pedestrian-friendly scale. The proposed colors are warm natural earth tones, which will relate to the proposed surrounding development by utilizing similar building materials and architectural detailing. The building entrance, located on the "skew" of the floor plan, creates a visual queue to the warehouse entry.

Building signage consists of the signature Costco red and blue corporate colors. The signage is scaled appropriately to the mass of the building elevations so as to not overwhelm but to reinforce the brand that Costco has established. The warehouse wall signage will consist of externally illuminated reverse pan channel letters, and the gas station signage will also be externally illuminated.

The warehouse has one customer entrance to the main Costco store located at the southeast corner. The Loomis Costco will include a bakery, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse also includes a Tire Center, a 5,478 square-foot facility with member access via the inside of the main Costco building, that includes tire sales and a tire installation facility. The installation facility has four bays that face east to allow Costco employees to drive the cars into the installation facility. A promotional vehicle may be on display near the entry

to the building. This vehicle is only to promote online or offsite vehicle sales; no vehicles are sold on site.

The truck loading dock is located at the southwest side of the building adjacent to Sierra College Blvd. to buffer noise to the adjacent apartments to the north and existing residences to the east. The bay doors will be equipped with sealed gaskets to limit noise impacts. A smaller on grade door is located on the west side of the building. This door is to receive bread delivery and Federal Express type trucks. A transformer and two trash compactors will also be located along the west edge of the building. Dense landscape material provides the necessary screening to this area (see Landscape Plan).

Costco Fuel Facility

The fuel facility includes a 7,560 square-foot canopy and a 106 square-foot controller enclosure that will be located on the southern portion of the planting island of the fuel station to house the control equipment. The controller enclosure will be built with steel walls and finished with paint to match the warehouse building colors. There will be four covered fueling bays, each with three two-sided fuel dispensers which will provide for the fueling of six cars at each island. The fueling station will also have 8 stacking lanes which will allow approximately 32 cars to wait for pumps at any given time in addition to the 24 at the dispensers. The gas station will have fueling capacity for 24 dispensers initially with expansion to 30 dispensers and an expansion to the canopy of 1,410 square-feet with vehicle stacking as needed which is to be approved with this application. The dispensers are fully automated and self-service for Costco members only, with a Costco attendant present to oversee operations and assist members with problems. Five underground fuel tanks will also be installed at the southern edge of the gas station. Lights will be recessed into the canopy and provide both lighting during operating hours and a lower level of security lighting after hours.

Costco Operations

Costco Wholesale is a membership-only retail/wholesale business, selling high quality national brands and private label merchandise for commercial and personal use. The warehouse hours are anticipated to be: Monday through Friday from 10:00 am to 8:30 pm, Saturday from 9:30 am to 6:00 pm, and Sunday from 10:00 am to 6:00 pm. The fuel facility hours are anticipated to be daily from 5:00 am to 10:00 pm

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 80, and accessing the site from Sierra College Drive.

It is estimated that fuel will be delivered to the gasoline facility in two to three trucks per day. The largest fuel trucks are approximately 70 feet long. While delivering the fuel, the truck will be parked over the underground tanks located on the east side of the gas facility. The truck will not block access to any of the fueling positions or occupy any queuing space. The fuel facility is located and specifically designed to avoid traffic and queuing conflicts with the warehouse and adjacent retail commercial uses.

In order to open and operate the gas facility, Costco will have to meet requirements of local, state and federal regulators and agencies, including the Town Fire Department, the County Department of Environmental Health, the Air Quality Management District, the State Water Resources Control

Board, the California Environmental Protection Agency, and the United States Environmental Protection Agency.

The tire center typically will receive shipments of tires one to two times per week in single- or double-trailer trucks of up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center will be scheduled for pre-opening hours, typically about 6:00 a.m.

Ancillary Uses: Alcohol Tasting License

Costco has recently developed an alcohol tasting protocol to be performed by authorized vendors within the warehouse to allow members to sample no more than three types of beer, wine or spirits in the warehouse prior to purchase. Costco is in the process of obtaining Type 86 Tasting licenses from California State Alcoholic Beverage Control in 16 locations in Southern and Northern California.

The tastings will be performed in a small area within the warehouse that has been sectioned off by a rope/cord that allows only members over the age of 21 to enter. Unlike the more formal tasting area with seating or bar area that you may see in stores such as Whole Foods, these areas are smaller and less formal, more similar to a typical Costco sampling area (except with a few more rules and precautions). Costco has taken significant steps to assure that this particular product is sampled responsibly and safely.

The following protocol will be followed:

- The tasting area (approximately 8' x 8') is physically separated from the rest of the sales area
- No one under 21 years of age may enter the tasting area
- Tastings are operated by authorized vendor personnel; one ID Checker and two Pourers
- Only one event per warehouse per day
- Tastings are limited to a single type alcoholic beverage. Either beer, wine or spirit by one particular vendor
- Amounts served cannot exceed 3 tastings PER person PER day; a serving is:
  - Wine: not to exceed one (1) oz.
  - Beer: not to exceed one (1) oz.
  - Spirits: not to exceed ¼ of one (1) oz.
- Open containers (glasses, etc.) may NOT leave the tasting area
- Tastings will take place during regular warehouse hours
- Like existing samplings there is no charge for tasting

Costco Energy-Efficient Project Components

In an effort to reduce energy consumption and promote sustainability, Costco will incorporate many energy saving measures when constructing a new facility. Below are some of the significant practices that Costco currently incorporates into new buildings that help conserve energy and other natural resources:

Energy Conservation:

- Parking lot light standards are designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps provide a higher level of perceived brightness with less energy than other lamps such as high pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project minimizing the transportation and impact to local road networks.
- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.
- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.
- Costco uses a reflective cool roof material to produce lower heat absorption and thereby lowering energy requirements during the hot summer months. This roofing material meets the requirements for the EPA's Energy Star energy efficiency program.
- The warehouse includes over 200 skylights placed strategically throughout the metal roof. Photo sensors are placed at various locations on the roof as well as inside a number of skylights to accurately measure the amount of natural light entering the building. Interior warehouse lighting is reduced from 100% to 66% to 33% to 0%, based on daylight contribution through the skylights. Daylight is measured by exterior and interior photo sensors. This program allows lights to automatically shut off when they are not needed.
- A substantial amount of the proposed plant material for the new site is native drought tolerant and will use less water than other common species.
- The irrigation system includes the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.
- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the Town's requirements.
- Use of native species vegetation and drip irrigation systems greatly reduces potable water consumption.
- High-efficiency restroom fixtures achieve Achievement of a 40% decrease and water savings over U.S. standards by using high efficient restroom fixtures.
- The building is insulated to meet or exceed current energy code requirements.
- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed.
- HVAC comfort systems are controlled by a computerized building management system to maximize efficiency.
- HVAC units are high efficiency direct ducted units.
- HVAC units have phased out the use of HCFC's completely, long before the Montreal Protocol timeline.
- Parking lot and exterior lights are controlled by a photo sensor and time clock.
- Lighting is controlled by the overall project energy management system.

- Energy efficient Transformers (i.e., Square D Type EE transformers) are used.
- Variable speed motors will be used on make-up air units and booster pumps.
- Gas water heaters are direct vent and 94% efficient or greater.
- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
- Main Building structure is a pre-engineered system that uses 100% recycled steel materials and is designed to minimize the amount of material utilized.
- Roof material is 100% recycled standing seam metal panel, designed to maximum efficiency for spanning the structure.
- Construction waste is recycled whenever possible.
- Floor sealant is No-VOC and represents over 80% of the floor area.
- Lighting systems are designed with employee controllability in mind. Lighting is controlled by timers but over-ride switches are provided for employee use.
- CO_2 is monitored throughout the warehouse.
- Extensive recycling/reuse program is implemented for warehouse and office space including tires, cardboard, grease, plastics and electronic waste.
- Use of plastic shopping bags is avoided.
- Suppliers are required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities are strategically located to minimize miles traveled for delivery.
- Deliveries are made in full trucks.
- All Costco trucks are equipped with an engine idle shut off timers.

PROJECT OBJECTIVES

Objectives of the Proposed Project:
The proposed project has been designed to meet a series of objectives:

- Construct and operate a new Costco warehouse that serves the local community with goods and serves from both nationally known businesses but also more regional and local businesses.
- Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and Federal code requirements.
- Provide a Costco warehouse in a location that is convenient for its members, the community, and employees to travel to shopping and work.
- Increase the number of employees and contribute to the local job/housing balance
- Provide a state of the art Costco warehouse to better serve the membership in the greater Loomis area.
- Enhance the area with a warehouse which is architecturally designed to be unique to the Town and sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.
- Continue and increase contribution to the Town's tax base by Costco.
- Expand the space available for integrated retail sales of goods and services in the Town of Loomis.
- Design a site plan that minimizes circulation conflicts between automobiles and pedestrians.
- Plan and design for public transit access.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure including roadways and utilities.
- Develop a Costco warehouse that is large enough to accommodate all the uses and services Costco provides to its members elsewhere.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

TOWN OF LOOMIS
PLANNING DEPARTMENT

ENVIRONMENTAL REVIEW ASSESSMENT

I. LAND USE AND PLANNING

1. Project Name (same as on Planning Application) Costco Warehouse

2. What is the general land use category for the project? Commercial
(residential, commercial, industrial, etc.)

3. What are the number of units or gross floor area proposed? 152,101 warehouse, and 30 dispenser fuel facility

4. Are there existing facilities on the site? (buildings, wells, septic systems, parking, etc.) Yes [ ] No [X]
If yes, show on the site plan and describe. _____

5. Is adjacent property in common ownership? Yes [ ] No [X] If yes, Assessor's Parcel Number (s) and acreage(s). _____

6. Describe previous land use(s) of the site over the last 10 years. Vacant parcel

7. Will the project require or provide storage for vehicles, equipment, materials, etc.? Yes [ ] No [X]
If yes, describe the location, size and type of storage (secured, covered, etc.) proposed. _____

II. POPULATION AND HOUSING

1. How many new residents will the project generate? N/A

2. Will the project displace or require the relocation of any residential units? Yes [ ] No [X] If yes, the number. _____

3. What changes in character of the neighborhood would result from project development? (surrounding land uses such as residential, agricultural, commercial, etc.) Development of a vacant parcel with a 152,101 square foot Costco warehouse with associated parking and landscaping on an existing commercially zoned property

4. Will the project create or destroy job opportunities? Create [X] Destroy [ ] Describe _____

5. Will the proposed project displace any currently productive use? Yes [ ] No [X] If yes, describe.

III. GEOLOGY AND SOILS

1. Are there any potential geologic hazards (soil settlement, steep slopes, slides, faults, etc.) associated with the project property or on surrounding properties? Yes [ ] No [X] If yes, describe. _____

2. Will grading on the site be required? Yes [X] No [ ] If yes, describe the grading anticipated for the project (locations, maximum depths/slopes of excavations and fills). _____

Estimate the grading area/quantities. +/- 17 acres acres _____ cubic yards

3. Will site excavation and fill quantities balance? Yes [X] No [ ] If no, describe the source(s) or disposal site(s), transport methods and haul routes required for grading materials. _____

4. Are retaining walls proposed? Yes [X] No [ ] If yes, describe location(s), type(s), height(s), etc. Gravity stack retaining

5. Describe the erosion potential of the project site and the measures that will be utilized to reduce erosion. The erosion potential is low and there will be strom drainage facilities on site to capture and treat runoff.

6. Will blasting be required during project construction? Yes [ ] No [X] If yes, describe. _____

7. Are there any known natural economic mineral resources on the project site? (sand, gravel, mineral deposits, etc.) Yes [ ] No [X] If yes, describe. _____

IV. HYDROLOGY AND DRAINAGE

1. Is there any body of water within or on the boundaries of the project site? (lake, pond, stream, canal, etc.) Yes [ ] No [X] If yes, name/describe the body of water and show on the site plan. _____

2. If there is a body of water within or on the boundaries of the project site, will water be diverted from this water body? Yes [ ] No [ ] If yes, describe. N/A

3. If water will be diverted, does the project applicant have an appropriative or riparian water right? Yes [ ] No [ ] If yes, describe. N/A

4. Where is the nearest off-site body of water such as a waterway, river stream, pond, canal, irrigation ditch or drainageway? Include the name of this water body, if applicable. Secret Ravine is the nearest receiving waterway located approximately 600' west of the project site

5. What area/percentage of the project site is presently covered by impervious surface? 0%
What will be the area/percentage of impervious surface coverage after development? 624,583 sf/ 83%

6. Will any runoff from the project site enter any off-site body of water? Yes [ ] No [X] If yes, identify the destination of the runoff. _____

7. Will there be a discharge to surface waters of wastewater other than stormwater runoff? Yes [ ] No [X] If yes, identify/describe the materials/contaminants present in this runoff. _____

8. Will the project result in the physical alteration of a body of water? Yes [ ] No [X] If yes, describe. _____

9. Will the drainage or runoff from this project cause or exacerbate downstream flooding? Yes [ ] No [X] If yes, describe. _____

10. Are there any areas of the project site that are subject to flooding or inundation? Yes [X] No [ ] If yes, describe. The FEMA Flood Insurance Rate Map number 06061C0418F, effective date June 8, 1998 indicates that the entire project site is Zone X. However, the highest water surface elevation in the "Loomis Tributary" (a.k.a. "Secret Ravine" near the site is 322 while the lowest existing site elevation is approximately 318 at the swale flowline before crossing under Sierra College Blvd. Based on those elevations, the site could be expected to experience some inundation along the northerly street frontage of Sierra College Blvd and along the westerly frontage of Brace Rd.

11. Will the project alter existing drainage channels and/or drainage patterns? Yes [X] No [ ] If yes, describe. The site receives run-on from the neighboring subdivision to the east at two locations. Currently, the northerly location appears to drain into a ground-level swale, then to an inlet which appears to flow across Brace Rd to the north, into a swale between bulidings to Secret Ravine. This outfall will be intercepted at or near the property line and conveyed through the site storm drain system to the exsting 24" culvert under Sierra College Blvd. locatated approximately mid-way along the site frontage. The second, southerly, outfall will also be intercepted at or near the property line and conveyed through the site storm drain system in the same way.

V. AIR QUALITY

Note: Specific air quality studies may be required to be conducted as part of the project review/approval process. Such specific studies may be included with the submittal of this questionnaire.

1. Are there currently any known sources of air pollution such as an industrial use or major roadway in the vicinity of the project? Yes [X] No [ ] If yes, describe. Sierra College Boulevard is located at the eastern boundary of the parcel.

2. Describe the following emissions sources related to project development:

   Construction emissions - Extent and duration of site grading activities: Approximately 2 months

   Stationary source emissions - Are woodstoves proposed in residential projects? Yes [ ] No [X]

   Mobile source emissions - Vehicle activities related to residential, commercial and/or industrial uses: N/A

3. Based on proposed use, will the project significantly contribute to the violation of ambient air quality standards? Yes [ ] No [X] If yes, describe (may require the results from specific air quality studies).

4. Are there any sensitive receptors to air pollution (such as schools or hospitals) located in the vicinity of the project? Yes [ ] No [X] If yes, describe. _____

5. Describe measures that are proposed by the project to reduce stationary and mobile source emissions?

6. Will vegetation be cleared from the project? Yes [X] No [ ] If yes, describe the method of disposal.
Removal of trees and clearing and grubbing of the site will occur. Disposal of the debris will be recycled as green waste at the land fill site.

VI. TRANSPORTATION/CIRCULATION

Note: Detailed traffic studies prepared by a qualified traffic consultant may be required, following review of the information presented below. Such studies may be included with the submittal of this questionnaire.

1. Does the project front on a local roadway? Yes [X] No [ ] If yes, what is the name of the roadway?
Sierra College Boulevard

If no, what is the name and distance of the nearest roadway? _____

2. Will new entrances onto local roadways be constructed. Yes [X] No [ ]
If yes, describe. One new drive way entrance off Sierra College Boulevard is proposed with the project.

3. Would any non-automobile traffic result from the development of the project? Yes [X] No [ ] If yes, describe. Costco delivery trucks will deliver both merchandise and perishable items as well as fuel on a daily basis. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 80, and accessing the site from Sierra College Drive. It is estimated that fuel will be delivered to the gasoline facility in two to three trucks per day. The largest fuel trucks are approximately 70 feet long.

4. If applicable, what road standards are proposed within the project? See attached Civil Engineering Plans.
(Show typical street sections(s) on the site plan.)

5. Will a new entrance(s) onto local roadways be constructed? Yes [X] No [ ]
If yes, show location(s) on site plan.

6. Describe any frontage improvements to the local roadway(s). Frontage improvements will occur to both Sierra Collebge Boulevard and Brace Road and will consist of new curb, gutter, and sidewalk frontage improvements. Sierra College Boulevard will also be improved to provide decel and acceleration improvements at the driveway entry. Final improvements for the streets are still under consideration by the Town of Loomis.

7. Describe the traffic that will be generated by the project (average daily traffic [ADT], peak hour volumes and peak hour times/days). A traffic study is under preparation and the results of the analysis are pending.

8. Will this traffic affect the service levels at an existing major street intersection or freeway interchange?
Yes [ ] No [ ] If yes, describe. A traffic study is under preparation and the results of the analysis are pending.

9. Are pedestrian, bicycle, equestrian and/or transit facilities proposed with the project? Yes [x] No [ ] If yes, describe. Frontage improvements along the project property boundary will include sidewalks, bicycle racks will be included per the requirements of the California Building Code, and transit facilities are not proposed as part of the project.

10. Will the project require provisions for parking? Yes [X] No [ ] If yes, describe the number, size, location and access of the parking facilities proposed. 777 parking spaces are required for the project which is greater than the 760 required. The parking spaces are oversized 10' x 20' which meets the requirements of the Town of Loomis.

11. Will there be company vehicles associated with the project? Yes [ ] No [X] If yes, describe the number and type of vehicles and the parking that will be provided for these vehicles (see 10, above).

VII. BIOLOGICAL RESOURCES

Note: Detailed studies or exhibits (e.g., tree survey, wetlands delineation) may be required, following a review of the information presented below. Such studies or exhibits may be included with the submittal of this questionnaire.

1. Briefly describe site vegetation. The project site is made up of Valley Oak Woodland, Annual Grassland, and Freshwater Marsh.

2. Will any trees of 6-inches diameter breast height (dbh) or greater be removed as a result of project development? Yes [ ] No [ ] If yes, describe the number of trees to be removed, tree species, tree inches and the percentage of the trees on the site that the removals represent. Approximately 372 trees exist on the site, 352 to be removed, for a removal percentage of approximately 95%. The size, species, and description of condition can be seen in further detail on the topographic survey sheets (C1 – C3) in tabular form by Hort-Science, and the arborist report by Mann Made Resources.

3. Briefly describe wildlife typically found in the area. Much of the wildlife observed included resident and wintering species of birds that are adapted to the mix of wetland and upland habitats found at the site. Resident bird species observed include red-shouldered hawk, Anna's hummingbird, mourning dove, Northern flicker, acorn woodpecker, Nuttall's woodpecker, black phoebe, western bluebird, California scrub-jay, European starling, Northern mockingbird, oak titmouse, bushtit, white-breasted nuthatch, Bewick's wren, California towhee, white-crowned sparrow, song sparrow, purple finch and house finch. Species observed that are expected only during the winter include red-breasted sapsucker, American robin, hermit thrush, rubycrowned kinglet, yellow-rumped warbler, and golden crowned sparrow. Although no mammals were documented at the site, it is expected that mammals adapted to urban environments would be found on the property including striped skunk, raccoon, Virginia opossum, deer mouse and mule deer. Despite looking under logs and boards, no reptiles were observed and the only amphibian recorded was Pacific treefrog. Additional amphibians likely include western toad, and common reptiles likely include western fence lizard, southern alligator lizard, western skink, ringneck snake, gopher snake and common garter snake.

4. Describe changes to site habitat(s) resulting from development of the project. Loss of vegetation associated with the habitats on site will disrupt and displace existing wildlife. Some bird roosting, nesting, and foraging areas will be eliminated. Reptiles, amphibians, and small mammals that utilize these areas will be displaced to remaining undisturbed areas. Open space areas near the project area should be capable of accommodating these species.

5. Are any rare or endangered species (as defined in Section 15380, CEQA Guidelines) found in the project area? Yes [ ] No [X] If yes, describe. A search of the CNDDB records of occurrence for special status animals and plants and natural communities within these quadrangles indicated that none have been documented as occurring on the Project Site itself, but that a number of special status animal species have been known to occur in the project vicinity.

6. Are any federally-listed threatened species, or candidates for listing, found in the project area? Yes [ ] No [ ] If yes, describe. See 5 above

7. Is there a rare natural community (monitored by the DFG Natural Diversity Data Base) present on the project site? Yes [ ] No [ ] If yes, describe. See 5 above

8. Are there wetlands (i.e., seasonal wetlands, wetland swales, riparian corridor, etc.) on the project site? Yes [X] No [ ] If yes, describe (type, acreage, etc.). Direct (fill) impacts to 0.15 acres of waters of the U.S. would result from implementation of the proposed Costco warehouse facility.

9. If yes, will project development affect these wetland areas? Yes [X] No [ ] If yes, describe. The development plan for the site would permanently impact 0.15 acres of palustrine emergent wetlands located on the site that are potentially under the jurisdiction of the Corps under Clean Water Act Section 404.

10. If yes, will a Corps of Engineers permit be required for disturbing site wetlands? Yes [X] No [ ]

VIII. HAZARDOUS MATERIALS

Hazardous material are defined as any material that, because of its quantity, concentration or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. "Hazardous materials" include, but are not limited to, hazardous substances, hazardous waste and any material (including oils, lubricants and fuels) which a handler or administering agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or environment.

1. Will the proposed project involve the handling, storage or transportation of hazardous materials? Yes [X] No [ ]

   If yes, attach a list of all hazardous materials to be handled/stored at the project site. The list needs to include (but is not limited to) fuels, chemicals, cleaners, lubricants, coolants, biocides, etc. A description needs to be included explaining how these materials will be managed, used, stored, disposed/recycled.

   Describe any hazardous wastes that will be generated and detail how/where they will be stored and disposal of. Include an outline of the proposed chemical emergency spill response plan.

   If yes, will the project involve the handling, storage or transportation of more than 55 gallons, 500 pounds or 200 cubic feet (STP) at any one time of a product or formulation containing hazardous materials or will any of these materials be stored in underground storage tanks? Yes [X] No [ ]
   If yes, please contact the Placer County Environmental Health Division at 889-7335 for an explanation of additional requirements.

IX. NOISE

Note: Projects located near a major noise source and/or projects that will result in increased noise generation or exposure may require a detailed noise study (with any proposed mitigations) prior to environmental determination.

1. Is the project located near a major noise source? Yes [X] No [ ] If yes, describe. Sierra College Boulevard

2. Describe the noise that will be generated by this project, both during construction and following project development. A noise study is under preparation and will present the sources and projected noise levels gerated during construction as well as post project development.

X. PUBLIC SERVICES

FIRE AND EMERGENCY MEDICAL SERVICES

1. Describe the nearest fire protection facilities (location, distance, agency). Loomis Fire District Fire Station, 5840 Horseshoe Bar Road

2. Describe the nearest emergency water source for fire protection purposes (type, location, distance, agency). A looped fire service at the warehouse is proposed that will provide the necessary fire flows is proposed as part of the project.

3. Describe the fire hazard and fire protection needs created as a result of project development. The project will require a 10" – 12" fire service at 1,600 GPM for fire sprinklers at a residual pressure of 55 PSI and fire fighting flow of 4,000 GPM at a residual pressure of 20 PSI

4. Describe the on-site fire protection facilities proposed with this project. The warehouse will include fire protection systems as required and there will be fire hydrants located around the perimeter of building.

5. If this is a single access project, what is the distance from the project to the nearest through roadway/name of roadway? There are two points of access shown for the project

6. Describe parking area access, number of spaces and entry/exit for emergency vehicles. Two points of access are shown for the project, the main entry off Sierra College Boulevard, and a secont off Brace Road. 777 parking spaces are shown on the site plan. There is a 30' drive aisle that loops around the entire warehouse providing access by emergency vehicles.

7. Are there any site limitations that will limit accessibility by emergency service vehicles? Yes [ ] No [X] If yes, describe.

8. Estimate the number of persons on-site (residents or employees/visitors) 160 to 170 employees are anticipated for the project.

LAW ENFORCEMENT

1. Describe the access to the site and entrance features (gates, etc.). There are no gates that would limit access to the site

2. Describe the security protection that will be provided on the site, if any. There will be security lighting at the warehouse that will remain on after typical warehouse hours.

3. Describe the location, visibility and lighting of vehicle and equipment storage areas. Lighting of the parking lot and around the warehouse will be provided to provide safe circulation of vehicles and pedestrians.

WATER

1. Is the project within a public domestic water system district or service area? Yes [X] No [ ] If yes, describe the district/area. There is an existing 8" water main in Sierra College Boulevard, and a 12" water main in Brace Road. Water service will be provided by Placer County Water Agency.

2. Can the district serve the project? Yes [X] No [ ]

3. What will be the water source(s) for the project? Domestic water supplied by Placer County Water Agency

4. What is the estimated usage and peak usage of the project? 10,000 gpd/ gpd

5. Are there any existing or abandoned wells on the site? Yes [ ] No [X] If yes, describe (location, depth, yield, contaminants, etc.)

WASTEWATER

1. Is wastewater presently disposed on the site? Yes [ ] No [X] If yes, describe the method(s) and quantities (gpd).

2. Is the project located within a sewer district? Yes [X] No [ ] If yes, describe. South Placer Municipal Utility District

   If yes, can the district serve the project? Yes [X] No [ ]

   Is there sewer service in the area? Yes [ ] No [ ] If yes, what is the distance to the nearest collector line? 8" Sanitry Sewer main in Sierra College Boulevard and Brace Road.

3. What are the projected wastewater quantities (gpd) generated by the project and the proposed method of disposal? 5-8,000 gpd Gravity flow sewer system to existing sewer mains

4. Will there be any unusual characteristics associated with project wastewater? Yes [ ] No [X] If yes, describe any special treatment processes that may be necessary for these wastes.

5. During the wettest time of year, is the groundwater level on the project site less than 8 feet below the surface of the ground? Yes [ ] No [X]

SOLID WASTE

1. Describe the type(s) of solid waste and estimate the quantities of waste per day/month that will be produced by the project. Specify if there are any special wastes (chemicals, infectious waste, oils, solvents, recyclables, etc.) Solid waste including recycling will be provided by Recology Auburn/Placer

2. Describe the disposal method of this waste material. Costco has two weather tight compactor that will be serviced by Recology.

3. Describe the access that will be provided to refuse removal vehicles and the location and design of recycling and refuse storage equipment. Costco will coordinate with Recology on pick up services for the two large compactors located on the south side of the warehouse. A 30' drive aisle will provide access to the compactors and backup and truck turning to the compactors.

PARKS AND RECREATION

1. What is the distance from the project to the nearest public park or recreation area? Loomis Basin Community Park, approximately 2-miles from the site
   What is the name of this facility? Loomis Basin Community Park

2. Are any park or recreation facilities proposed as part of the project? Yes [ ] No [X] If yes, describe.

SCHOOLS

1. What are the nearest elementary and high schools to the project? Loomis Grammer School, Del Oro High School

   What are the distances to these schools from the project? , 1.5 miles (grammer school) 2-miles (high school)

XI. AESTHETICS

1. Is the proposed project consistent/compatible with adjacent land uses and densities? Yes [X] No [ ]
   Describe the consistencies/compatibilities or inconsistencies/incompatibilities. See attached Project Description discussing project architecture

2. Is the proposed project consistent/compatible with adjacent architectural styles? Yes [X] No [ ]
   Describe the consistencies/compatibilities or inconsistencies/incompatibilities. See attached Project Description discussing project architecture and compatibility with architectural styles and detailing consistent with the Town of Loomis.

3. Describe the signage and/or lighting proposed by the project. See attached Project Description discussing signage.

4. Is landscaping proposed? Yes [X] No [ ] If yes, describe. See attached Project Description discussing the landscape portion of the project.

XII. CULTURAL RESOURCES

Note: If the project site is located on or near an archaeological, historical or paleontological site, specific studies may be required.

1. Does the project site support any archaeological, historical or paleontological features (e.g., Native American habitation sites, old foundations or structures, etc.)? Yes [ ] No [ ] If yes, describe.
   A Cultural Resources investigation has not been completed for the site and will be included with the EIR.

2. What is the nearest archaeological, historical or paleontological site? Unknown at this time

   What is the name of this site? Unknown at this time

NOP Comments

ROCKLIN
CALIFORNIA

June 14, 2017

Bob King, Town Planner
Town of Loomis
P.O. Box 1330
Loomis, CA 95650

SUBJECT: Notice of Preparation (NOP) for the Costco Warehouse and Fuel Facility Project

Dear Bob:

Thank you for the opportunity to review the Costco Warehouse and Fuel Facility NOP. Based on the project description provided in the NOP, the 17.4 +/- acre project is located on the east side of Sierra College Boulevard and south of Brace Road and consists of a 152,101 square foot Costco Wholesale warehouse building, with 777+/- parking stalls, a 24-dispenser fuel facility with potential expansion to 30 dispensers, and associated landscaping and street frontage improvements. Other aspects of the project include temporary outdoor sales within the parking field for seasonal sales, a tire center, vehicle display near the building entry for on-line and off-site automobile sales, and signage. The warehouse hours are anticipated to be Monday-Friday, 10:00 a.m. to 8:30 p.m., Saturday from 9:30 a.m. to 6:00 p.m. and Sunday from 10:00 a.m. to 6:00 p.m., and the fuel facility hours are anticipated to be daily from 5:00 a.m. to 10:00 p.m.

Primary vehicular access to the project site for the general public, fuel trucks and other merchandise delivery trucks exiting the site would be provided from a proposed new signalized intersection on Sierra College Boulevard. A secondary limited right-in and right-out driveway entrance is proposed on Brace Road and primarily intended for incoming merchandise truck deliveries and emergency exiting. . Costco delivery trucks ranging in size from 26 feet to 70 feet will average about 10 per typical weekday, with receiving times from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Fuel trucks approximately 70 feet long will average two to three trucks per day.

The concept of a new Costco facility on the I-80 corridor in close proximity to Rocklin is considered desirable. However, due to the project's location on the border of the City of Rocklin with primary regional access to the site being provided through use of the Sierra College Boulevard interchange and via Granite Drive (both within Rocklin) there is a heightened level of interest as to how the proposed project may affect the City and improvements that have been funded and are maintained by Rocklin. We have completed our review of the NOP and would like to offer the following comments:

1. The EIR should also assess any potential impacts on the Sierra College/I-80 interchange and on City of Rocklin roadways and intersections in the vicinity of the project. Funding contributions/financial participation or the construction of improvements may be required if impacts are identified. Specifically, because Costco will be a regional destination it is suggested that the scope of the traffic analysis be similar to the traffic analyses that were conducted for the Rocklin Crossings and Rocklin Commons shopping centers. The traffic analysis for the proposed project should include at a minimum, the following list of City of Rocklin intersections:

- Pacific Street/Rocklin Road (planned roundabout)
- Granite Drive/Rocklin Road
- Interstate 80/Rocklin Road EB and WB ramp intersections
- Dominguez Road (Del Mar Avenue)/Pacific Street
- Granite Drive/Dominguez Road
- Granite Drive/Sierra College Boulevard
- Interstate 80/Sierra College Boulevard EB and WB ramp intersections
- Sierra College Boulevard/Dominguez Road/Bass Pro Drive
- Newly proposed signal at Schriber Way/Sierra College Boulevard
- Sierra College Boulevard/Sierra College Stadium Entrance Roadway
- Sierra College Boulevard/Rocklin Road
- Rocklin Road/El Don Drive
- Rocklin Road/Aguilar Road

The EIR should utilize traffic count information taken while local schools are in session and should assess traffic impacts associated with the proposed project under existing, existing plus approved projects, and buildout (cumulative) conditions, including:

- increases in traffic on local and regional roadways with mitigation to be addressed at the project-specific level and not through a reliance on a future project or future funding mechanism;
- level of service impacts;
- access and parking impacts, particularly as it relates to future adjacent retail commercial development in Rocklin;
- impacts to/conflicts with alternative transportation policies, plans, or programs, and
- affects that a project of this scope and scale may have on current regional transportation infrastructure funding mechanisms and formulas. To date Loomis has not participated in the SPRTA Program or funding of regional improvements to the Sierra College Boulevard corridor. Appropriate participation in a regional funding mechanism such as SPRTA should be evaluated and identified as a component of the project's mitigation.

2. The proposal for one primary general access point into and out of the site is of particular concern due to the historic nature of traffic patterns associated with this type of regional destination use and from a life safety perspective. The existing Costco facility in Roseville is known to experience congestion in and around the site and that facility has at least three general use access points with an additional two nearby driveways available on adjacent

properties. The Costco in Citrus Heights has eight access points onto a long commercial driveway that customers can use to enter and exit the site. The Costco in Folsom has two main points of general ingress and egress and these entrances are fed by long commercial drives leading to nearby arterials rather than driveways that front directly onto adjacent arterials or collector streets. In addition to the limited number of access points, the location of the large fuel dispensing facility very close to the singular primary ingress and egress point is also of concern. It is difficult to imagine that the proposed circulation system for the project will not result in vehicles queuing back onto City streets and intersections. The traffic and site access analysis in the EIR will need to analyze these issues in detail. It is our recommendation that additional general access points be created for the project.

3. Due to the site access concerns listed in Item 2. above, the City strongly recommends that the location of the fuel dispensing facility be relocated to as far away from the main entrance as possible.

4. Due to the close proximity of the site to multiple existing and/or planned signalized intersections on the Sierra College Boulevard corridor, it is likely that synchronization of traffic signals will need to be considered. The project's contribution and implementation of this effort will need to be coordinated with the City of Rocklin.

5. The proposed project will generate considerable additional heavy truck traffic utilizing both the Sierra College interchange and Granite Drive (over 7,200 trip ends (10 in/10 out for roughly 360 days per year). The additional truck traffic should be factored into the analysis for effects on queuing and for ongoing damage to pavement facilities in Rocklin). Mitigation or separate agreements should be created to offset and address these effects on an ongoing basis.

6. The Town of Loomis did not participate in the funding of the Sierra College interchange improvements, however, this project would require and clearly benefits from the existence of the recently expanded interchange. Contributions similar to those charged to other similarly situated properties in the vicinity of the interchange should be addressed through mitigation or separate agreements with the City.

7. A portion of Sierra College Boulevard in the vicinity of the project is located within the Rocklin City limits and a portion is within the Town's incorporated limits. The final location of the new signal at the entrance into the facility will need to be determined in coordination with planned development needs for property across the street in Rocklin. Arrangements regarding all aspects of maintenance for the street section, median and signal will need to be addressed in detail between the two agencies.

8. It is our understanding that the Loomis General Plan identifies the Horseshoe Bar/Interstate 80 (I-80) overcrossing as a future four-lane facility and it currently exists as a two-lane facility. The EIR should assess any potential impacts on the current overcrossing and interchange configuration to determine if it is adequately sized to accommodate additional traffic from the Costco project and other planned growth within Loomis and the region.

9. Due to Rocklin's downstream location relative to the project and the anticipated stormwater drainage from the project site, the EIR should assess any potential impact associated with potential downstream flooding and storm drainage water quality that could be created by the project.

10. The EIR should assess any potential effects that the project could have on public services, particularly fire and police services and the potential need for mutual aid from the City of Rocklin Police and Fire Departments. It is suggested that typical calls for service at northern California Costcos and the Roseville Costco be used to establish and quantify potential calls for service at the new location.

11. The City has not yet received a Referral/Request for Comment for the project; therefore, we reserve the right to address any other items regarding the project, including those relative to building design and architectural treatment, etc. when that opportunity is formally provided. In general we would expect that the architectural detail and materials used should be at the level of quality and design that has been implemented at the Rocklin Commons and Crossings projects.

If there are any questions regarding these comments, please contact me at (916) 625-5162.

Sincerely,

David Mohlenbrok

Mr. Jeff Berberich
City of Loomis
3581 Mt. Diablo Blvd., Suite 235
Lafayette, CA 94549

Costco Warehouse and Fuel Facility

Dear Mr. Jeff Berberich:

Thank you for including the California Department of Transportation (Caltrans) in the environmental/application review process for the project referenced above. The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. The Local Development-Intergovernmental Review (LD-IGR) Program reviews land use projects and plans through the lenses of our mission and state planning priorities of infill, conservation, and travel-efficient development. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation network.

The proposed project will construct a new 152,101 sqft Costco Wholesale warehouse building with 777 parking stalls and associated landscaping on a 17.38 acre parcel. The project also includes a 24 dispenser fuel facility with potential future expansion to 30 dispensers. The project is located at the southeast corner of the intersection of Brace Road and Sierra College Blvd in Loomis. The following comments are based on the Notice of Preparation (NOP) of an Environmental Impact Report (EIR).

Vehicle Miles Travelled (VMT) and Traffic Operations

In response to the provisions of Senate Bill 743, we encourage the integration of transportation and land use in a way that reduces VMT and Greenhouse Gas (GHG) emissions by facilitating the provision of more proximate goods and services to shorten trip lengths, as well as achieve a high level of non-motorized travel and transit use. As such, we encourage the evaluation of the potential of Transportation Demand Management (TDM) strategies and Intelligent Transportation System (ITS) applications in order to better manage the transportation network, as well as transit

service and bicycle or pedestrian connectivity improvements. The Department also seeks to reduce serious injuries and fatalities, as well as provide equitable mobility options for people who are economically, socially, or physically disadvantaged. Therefore, we encourage the evaluation of the project site for access problems, VMT, and service needs that may need to be addressed.

The proposed development could have significant traffic impacts at the existing location. please include, in the scope, Sierra College Blvd./ I-80 interchange, the Horseshoe Bar/I-80 interchange, Sierra College Blvd., and mainline I-80 between Horseshoe Bar Road and Sierra College Blvd.

The environmental document should include an analysis of the multimodal travel demand expected from the proposed project. This analysis should also identify potentially significant adverse impacts from such demands and avoidance, minimization, and mitigation measures needed to address them.

Early collaboration, such as sharing the analysis for review and comment prior to the environmental document, leads to better outcomes for all stakeholders.

Given that Caltrans current guidelines are in the process of being updated, a transportation impact study scoping meeting with District staff could be used to discuss the most appropriate methodology for this analysis. At a minimum, the analysis should provide the following:

1. Vicinity maps, regional location map, and a site plan clearly showing project access in relation to nearby roadways and key destinations. Ingress and egress for all project components should be clearly identified. Clearly identify the State right-of-way (ROW). Project driveways, the State Highway System and local roads, intersections and interchanges, pedestrian and bicycle routes, car/bike parking, and transit routes and facilities should be mapped.

2. Project-related VMT should be calculated factoring in per capita use of transit, rideshare or active transportation modes and VMT reduction factors. The assumptions and methodologies used to develop this information should be detailed in the study, should utilize the latest place based research, and should be supported with appropriate documentation. Mitigation for any roadway section or intersection with increasing VMT should be identified and mitigated in a manner that does not further raise VMT.

3. Schematic illustrations of walking, biking and auto traffic conditions at the project site and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane configurations, for AM and PM peak periods. Operational concerns for all road users that may increase the potential for

future collisions should be identified and fully mitigated in a manner that does not further raise VMT.

For any traffic mitigation proposed, please provide construction cost estimates and a timeline for completion. If the project will be paying into an impact fee, please provide what amount will be set aside for highway improvements.

Please provide our office with copies of any further actions regarding this project. We would appreciate the opportunity to review and comment on any changes related to this development.

If you have any question regarding these comments or require additional information, please contact David J. Smith, Intergovernmental Review Coordinator for Placer County, by phone (530) 634-7799 or via email to david.j.smith@dot.ca.gov.

Sincerely,

KEVIN YOUNT, Branch Chief
Office of Transportation Planning

Loomis, CA 95650

Subject: **Costco Loomis – Sierra College Boulevard and Brace Road**

Dear Mr. King,

Thank you for contacting the District regarding the development of Costco at the corner of Sierra College Boulevard and Brace Road in Loomis.

The design and construction of all on-site and off-site facilities which may be required as a result of this project, including the acquisition and granting of sewer easements, will be the responsibility of the developer/owner. All work shall conform to the Standard Specifications of SPMUD. Improvement plans shall be submitted to SPMUD for review and approval. A copy of the District's facility map has been provided for your use. Please refer to Ordinance 09-02 for information regarding participation fees.

The District has reviewed the request for sewer service availability and the following comments apply:

a. Downstream portions of the sewer collection system that serve this property have capacity deficiencies. Construction of the Loomis Diversion Line, which will address the capacity deficiencies, is anticipated to begin this summer. Once the owner and/or owner's representative meets with District staff in order to discuss the project and determine project specific requirements, a will-serve letter will be issued.
b. The property may be able to sewer out to Granite Drive. Further analysis would be required in order to pursue this alternative.
c. A sewer study may be required as design progresses.

Additional requirements may be included as design information is provided.

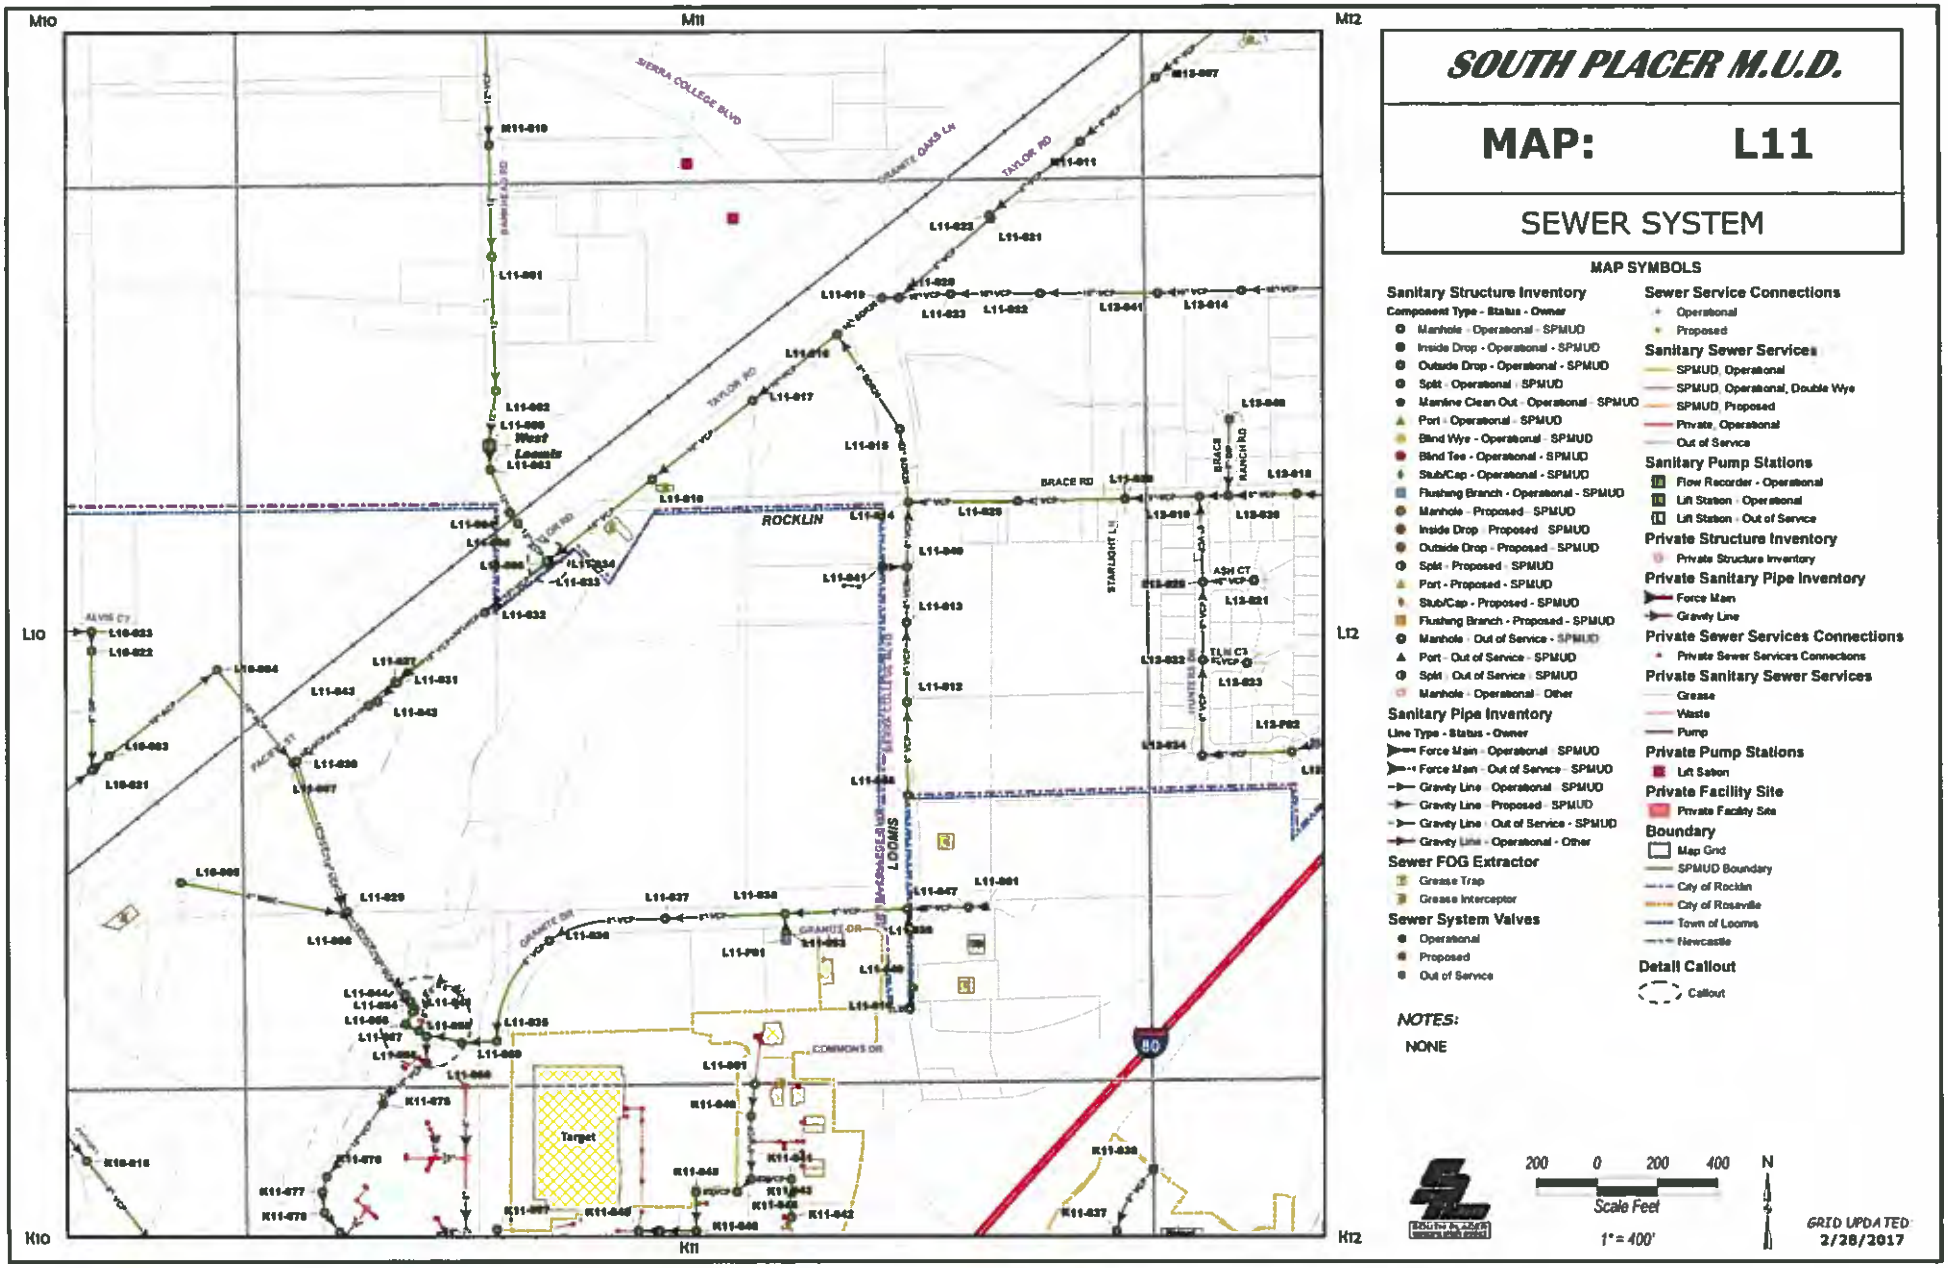
Prior to issuing a will-serve letter for sewer service, the owner and/or owner's representative will need to schedule a meeting with District staff in order to discuss the project and to determine specific requirements.

South Placer Municipal Utility District
5807 Springview Drive
Rocklin, CA 95677
(916) 786-8555

Please note that the District's Standard Specifications and Improvement Standards for Sanitary Sewers can be viewed at SPMUD's website:

http://spmud.ca.gov/developer-resources/standards-specifications/

The District's Fee Schedule can be found at the following location:



http://spmud.ca.gov/wp-content/uploads/2014/08/FY16-17-Fee-Schedule.pdf

Please do not hesitate to contact me at (916) 786-8555 extension 311 or chuff@spmud.ca.gov if you have any questions or need additional information.

Sincerely,

Carie Huff, P.E.

MEMORANDUM

DEPARTMENT OF HEALTH & HUMAN SERVICES
ENVIRONMENTAL HEALTH SERVICES

To: Robert King, Town of Loomis

From: Joey Scarbrough, Technical Specialist
Land Use and Water Resources Section

Date: May 25, 2017

Subject: **Costco Warehouse and Fuel Facility, Notice of Preparation**

Environmental Health Services has reviewed the above mentioned application and has the following comments.

1. Prior to this project moving forward to a public hearing or project approval, provide a Phase 1 Environmental Site Assessment performed to ASTM Standard E 1527-05. This will need to be reviewed by this department to determine if potential environmental concerns occur on site. If so, Phase 2 limited soil investigation should be completed in accordance with the California EPA, Department of Toxic Substances Control (DTSC).

2. Submit to the Environmental Health Services a "will-serve" letter from the franchised refuse collector for weekly or more frequent refuse collection service. The refuse collection provider shall also approve the location of the trash receptacle(s) on-site.

3. Submit to Environmental Health Services a "will-serve" letter from the South Placer Municipal Utility District indicating that the district can and will provide sewerage service to the project. The project shall connect the project to this public sewer.

4. Submit to Environmental Health Services, for review and approval, a "will-serve" letter or a "letter of availability" from the Placer County Water Agency for domestic water service. The applicant shall connect the project to this treated domestic water supply.

5. "Hazardous materials" as defined in Health and Safety Code Division 20, Chapter 6.95 shall not be allowed on any premises in regulated quantities (55 gallons, 200 cubic feet, 500 pounds) without notification to Environmental Health Services. A property owner/occupant who handles or stores regulated quantities of hazardous materials shall comply with the following within 30 days of commencing operations:

   Operator must complete an electronic submittal to California Environmental Reporting System (CERS) and pay required permit fees.

Perspective, Hope, and Opportunity

If the business will generate hazardous waste from routine operations, obtain an EPA ID number from the Department of Toxic Substances Control (DTSC).

Note: If the business owner/operator is unsure of what constitutes a hazardous material or waste, please contact Environmental Health Services for assistance at 530-745-2300.

6. Prior to Building Permit approval, installation, excavation, or breaking ground, contact the Environmental Health Services, Hazardous Materials Section, pay required fees, and secure appropriate permits and approvals to complete work on the underground storage tank system.

7. If at any time during the course of executing the proposed project, evidence of soil and/or groundwater contamination with hazardous material is encountered, the applicant shall immediately stop the project and contact Environmental Health Services Hazardous Materials Section. The project shall remain stopped until there is resolution of the contamination problem to the satisfaction of Environmental Health Services and to Central Valley Regional Water Quality Control Board. A note to this effect shall be added to the Improvement Plans where applicable.

8. The discharge of fuels, oils, or other petroleum products, chemicals, detergents, cleaners, or similar chemicals to the surface of the ground or to drainageways on, or adjacent to, the site is prohibited.

SUBJECT: Notice of Preparation / Agency Notification for Costco Membership Warehouse

Mr. King,

Thank you for submitting the **Notice of Preparation / Agency Notification for Costco Membership Warehouse** (Project) to the Placer County Air Pollution Control District (District) for review and comment. This project documentation was received in the mail on June 8, 2017. The District provides the following comments for consideration.

1. The District's Board of Directors adopted CEQA Thresholds of Significance for criteria pollutants and Greenhouse Gas (GHG) on October 13, 2016. The following tables summarize the adopted thresholds:

Criteria Pollutant Thresholds								
Construction Phase			Operational Phase Project-Level			Operational Phase Cumulative-Level		
ROG (lbs/day)	NOx (lbs/day)	PM_{10} (lbs/day)	ROG (lbs/day)	NOx (lbs/day)	PM_{10} (lbs/day)	ROG (lbs/day)	NOx (lbs/day)	PM_{10} (lbs/day)
82	82	82	55	55	82	55	55	82

Greenhouse Gas Thresholds			
Bright-line Threshold 10,000 MT CO2e/yr			
Efficiency Matrix			
Residential		Non-residential	
Urban	Rural	Urban	Rural
(MT CO2e/capita)		(MT CO2e/1,000sf)	
4.5	5.5	26.5	27.3
De Minimis Level 1,100 MT CO2e/yr			

The District recommends applying the District's adopted thresholds to determine the level of significance for the Project's related criteria pollutants and GHG impacts.

2. The District's California Environmental Quality Act (CEQA) Air Quality Handbook (Handbook) provides recommended analytical approaches and feasible mitigation measures when preparing air quality analyses for land use projects. The Handbook is available on the District's website at http://www.placer.ca.gov/departments/air/landusceqa. Except where noted below additional detail relating to the following recommended items can be found within the Handbook.

   - The Project is located within the Sacramento Valley Air Basin (SVAB) and is under the jurisdiction of the District. The SVAB is designated as nonattainment for federal and state ozone (O_3) standards, nonattainment for the federal particulate matter standard ($PM_{2.5}$) and state particulate

matter standard (PM_{10}). Within the Air Quality section of the Initial Study, the District recommends the discussion include the area designations for the federal and state standards for the SVAB.

- The California Emissions Estimator Model (CalEEMod) is recommended when estimating the Project related air pollutants emissions from construction and operational phases. CalEEMod quantifies criteria pollutant emissions, including greenhouse gases (GHGs) from construction and operation (including vehicle use), as well as GHG emissions from energy production, solid waste handling, vegetation planting and/or removal, and water conveyance. In addition, CalEEMod calculates the benefits from implementing mitigation measures, including GHG mitigation measures, developed and approved by CAPCOA. During 2016, the CalEEMod Version 2016.3.1 was released which incorporates the California Air Resources Board's OFFROAD and EMFAC 2014 updates. No prior versions of CalEEMod should be used. Please contact the District for information on appropriate default settings applicable to the project area.

  The District requests copies of all modeling analysis files during the review of the DEIR for public review and comment.

- In the event the air quality analysis demonstrates the potential for the Project to cause or generate significant adverse air quality related impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse air quality impacts. Additional mitigation measures can be found in the District's CEQA Handbook within the following related appendices.

  Appendix A. Recommended Mitigation Measures (Construction)

  Appendix B. District Rules and Regulations (Construction)

  Appendix C. Recommended Mitigation Measures (Operational)

  Appendix D. District Rules and Regulations (Operational)

  Appendix G. Mitigation Measures (Greenhouse Gases)

3. The District recommends a CALINE 4 modeling analysis for carbon monoxide (CO) concentration be performed and discussed within the environmental document if any intersection or roundabout is determined by the traffic study to degrade to a level of service "E" or "F" as a result of this project, alone or cumulatively; or where the total project-level CO emissions exceed 550 lbs/day.

4. Any project that includes the use of equipment capable of releasing emissions to the atmosphere may require permits(s) from the District. The applicant, developer, or operator of a project that includes an generator, gasoline storage tanks should contact the District early to determine if a permit is required, and to begin the permit application process. Portable construction equipment (e.g. generators, compressors, pile drivers, lighting equipment, etc) with an internal combustion engine over 50 horsepower are required to have a PCAPCD permit or a California Air Resources Board portable equipment registration. The District recommends the following condition of approval for this Project.

   Processes that discharge 2 pounds per day or more of air contaminants, as defined by Health and Safety Code Section 39013, to the atmosphere may require a permit. Permits are required for both construction and operation. Developers/contractors should contact the District prior to construction and obtain any necessary permits prior to the issuance of a Building Permit. (Based on the California Health & Safety Code section 39013: http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=39001-40000&file=39010-39060

5. The Project requests approval of a gasoline facility which is a source of gasoline vapors that include Toxic Air Contaminants (TACs), primarily benzene[1]. Refueling at gasoline dispensing facilities releases benzene into the air. Benzene is a potent carcinogen and is one of the highest risk air pollutants regulated by the California Air Resources Board (ARB)[2]. The District recommends the environmental document describe the level of analysis, such as a Health Risk Assessment (HRA) or other modeling analysis, necessary to determine if the Project will have the potential to cause adverse health impacts.

[1] http://www.epa.gov/air/toxicair/newtoxics.html#effects
[2] http://www.arb.ca.gov/ch/handbook.pdf page 30

Prior to construction and operation of a gasoline facility, the applicant is required to obtain an Authority to Construct (ATC) permit from the District. A Health Risk Analysis is required as part of the ATC permit in order to determine the potential cancer risk that will be generated as a result of the project. The District reviews the proposed facility's preliminary health risk assessment of TACs emitted to determine the potential increased cancer risk. The District applies a Significance Risk Threshold for probability of cancer of 10 in a million, as well as a health index number of one (1) for non-carcinogens (based on a screening level analysis or computer modeling). All gasoline dispensing facilities with storage tanks over 250 gallons in size are required to install certified vapor recovery equipment. Additionally, the annual amount of gasoline dispensed from the facility will be limited to below the significance threshold for cancer risk of 10 in one million as demonstrated by the health risk assessment.

A Permit to Operate is then granted by the District, after the operator has demonstrated compliance with all District Rules and Regulations within the ATC permit. The Permit to Operate contains the parameters within which the facility may operate and is renewed annually to ensure compliance with all local, state, and federal air pollution control requirements.

Thank you for allowing the District this opportunity to review the project proposal. Please do not hesitate to contact me at 530.745.2327 or ahobbs@placer.ca.gov if you have any questions.

Sincerely,

Ann Hobbs
Air Quality Specialist

Subject: Notice of Preparation of a Draft Environmental Impact Report for the Costco Warehouse and Fuel Facility Project

Dear Bob King,

Thank you for requesting information regarding the above referenced project. The United Auburn Indian Community (UAIC) of the Auburn Rancheria is comprised of Miwok and Southern Maidu (Nisenan) people whose tribal lands are within Placer County and whose service area includes El Dorado, Nevada, Placer, Sacramento, Sutter, and Yuba counties. The UAIC is concerned about development within its aboriginal territory that has potential to impact the lifeways, cultural sites, and landscapes that may be of sacred or ceremonial significance. We appreciate the opportunity to comment on this and other projects. The UAIC would like to consult on this project.

In order to ascertain whether the project could affect cultural resources that may be of importance to the UAIC, we would like to receive copies of any archaeological reports that are completed for the project. We also request copies of environmental documents for the proposed project so that we have the opportunity to comment on appropriate identification, assessment and mitigation related to cultural resources. We recommend UAIC tribal representatives observe and participate in all cultural resource surveys. If you are interested, the UAIC's preservation department offers a mapping, records and literature search services program that has been shown to assist project proponents in complying with the necessary resource laws and choosing the appropriate mitigation measures or form of environmental documentation during the planning process.

The UAIC's preservation committee would like to set up a meeting or site visit, and begin consulting on the proposed project. Based on the preservation committee's identification of cultural resources in and around your project area, UAIC recommends that a tribal monitor be present during any ground disturbing activities. Thank you again for taking these matters into consideration, and for involving the UAIC early in the planning process. We look forward to reviewing the documents requested above and consulting on your project. Please contact Marcos Guerrero, Cultural Resources Manager, at (530) 883-2364 or by email at mguerrero@auburnrancheria.com if you have any questions.

Sincerely,

Gene Whitehouse,
Chairman

RE: Costco Membership Warehouse/Notice of Preparation of a Draft EIR

Robert:

We have reviewed the Notice of Preparation of a Draft EIR for the subject project and have the following comments.

The proposed Costco Membership Warehouse has the potential to create the following impacts:

a.) Increases in peak flow runoff downstream of the project site.

b.) Overloading of the actual or designed capacity of existing stormwater and flood-carrying facilities.

Future EIRs must specifically quantify the incremental effects of each of the above impacts due to the subject project and propose mitigation measures if necessary.

Please call me at (530) 745-7541 if you have any questions regarding these comments.

Brad Brewer, M.S., P.E., QSD/P
Development Coordinator

Subject: EIR - COSTCO

Robert: The Loomis Fire District has no special concerns regarding the EIR for the proposed COSTCO warehouse. The facility will be constructed to comply with the requirements contained in Title 24, California Administrative Code and Loomis Fire District amendments to the California Fire Code. Adequate water supply should be available from PCWA.

Please contact me if you have any questions as the project proceeds.

Operational Emissions Summary

Summary of CalEEMod Modeled Maximum Daily Long-Term Operational Emissions of Criteria Air Pollutants and Precursors[1]

Emissions Source	Daily Emissions (lbs/day)		
	ROG	NO_X	PM_{10}
Area	4.00	9.20E-04	3.60E-04
Energy	0.06	0.51	0.04
Mobile	5.03	36.76	12.15
Fueling Center	28.05	-	-
Total Daily Operational Emissions[2]	**37**	**37**	**12**
PCAPCD Thresholds of Significance	**55**	**55**	**82**
Exceeds Thresholds?	**No**	**No**	**No**

Notes: lbs/day = pounds per day; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; PCAPCD = Placer County Air Pollution Control District.

[a] Operational emissions were modeled for year 2018.
[b] Includes emissions from delivery truck (warehouse and fueling center) idling and TRU emissions during deliveries.
[c] Assumes reactive organic gases associated with gasoline dispensing = total organic gases. Based on CARB's Revised Emission Factors report, December 23, 2013 : https://www.arb.ca.gov/vapor/gdf-emisfactor/gdf%20umbrella%20document%20-%2020%20nov%202013.pdf
[d] Total emissions may not add correctly due to rounding.

Source: AECOM 2019; See Appendix X for detailed modeling assumptions, outputs, and results.

HRA Summary:

a. PM2.5 exhaust and ROG for gasoline deliveries and warehouse deliveries. We'd need this broken out for each. I'm assuming it would be similar to your idling calculation with different emission factors.
b. ROG for customer and worker traffic. A total number is fine. We will be dividing this out based on the traffic turn movements in the TIS.

	Emissions (lb/day)		Emissions (tpy)		Distance (one-way per trip)*
	ROG	PM2.5 (Exhaust)	ROG	PM2.5 (Exhaust)	
Mobile Operations:					
Warehouse Deliveries - Truck Operations	0.143547158	0.018718625	0.026197356	0.003416149	10
Warehouse Deliviers - TRU Operations	0.053687614	0.020456216	0.00979799	0.003733259	10
Fuel Deliveries	0.082081192	0.03072618	0.014979818	0.005607528	10
Customer/Worker Commutes	4.20	0.17	0.77	0.0296	see "Operational Trip Rate Calcs" tab
On-Site Idling:					
Warehouse Deliveries	5.16	0.03	4.15E+00	2.32E-02	-
Fuel Deliveries	2.67	0.05	2.15E+00	3.92E-02	-
TRUs	4.06	1.55	3.27E+00	1.24E+00	-

** Note that trip distanc and duration are based on travel within Placer County for trucks travelling to Loomis from Tracy and West Sacramento. Additional miles travelled outside of the county and air district will be incurred and are separately ccounted for and discussed.*

GHG Emissions Summary

Emissions Source	GHG Emissions ($MTCO_2e$ / year)
Construction GHG Emissions	
Maximum Annual Construction Emissions	385
Operational GHG Emissions	
Area	0.018
Energy	678
Mobile[1]	5095
Waste	343
Water	42
Total Annual Operational Emissions	**6159**
Total[3] Annual Operational + Amortized Construction Emissions	**6,178**
Total[3] Annual Project Emissions per 1,000 Square Feet[3]	**39.73**
PCAPCD GHG Efficiency Threshold	***27.3***

Notes:

[1] Mobile emissions calculations include those calculated in CalEEMod based upon VMT projected in the Transportation Impact Analysis for customer and worker trips, plus those calculated using EMFAC 2017 and OFFROAD 2017 Emissions Inventory for fuel and warehouse delivery truck trips and on-site idling.

[2] Annual Operational EMissions per 1,000 square feet calculated based upon approximate warehouse size of 155,000 sq. ft.

Losses	Emission Factor (lbs/kgal)[a]
Phase I Bulk Transfer Losses	0.15
Pressure Driven Losses	0.024
Phase II Fueling	0.0888
Phase II Fueling - Spillage	0.24
Hose Permeation	0.009
Total	0.51183

[a] Based on CARB's Revised Emission Factors report, December 23, 2013 : https://www.arb.ca.gov/vapor/gdf-emisfactor/gdf%20umbrella%20document%20-%2020%20nov%202013.pdf

Assumes reactive organic gases associated with gasoline dispensing = total organic gases.
Notes: lbs/kgal = pounds per 1,000 gallongs fuel

Derivation of Phase II Fueling Emission Factor

	Percent of CA Vehicle Fleet in 2018[a]	Emission Factor (lbs/kgal)[b]
ORVR Vehicles	83%	0.021
Non-ORVR Vehicles	17%	0.42
Composite	100%	0.0888

[a] Figure 1 from Staff Report ISOR for Public Hearing to Consider the Proposed Amendments to California Specifications for Fill Pipes and Openings of Motor Vehicle Fuel Tanks (Sep 4 2018): https://www.arb.ca.gov/regact/2018/fillpipe2018/fpisor.pdf

[b] Table I-I from CARB's Revised Emission Factors report, December 23, 2013 : https://www.arb.ca.gov/vapor/gdf-emisfactor/gdf%20umbrella%20document%20-%2020%20nov%202013.pdf

Notes: lbs/kgal = pounds per 1,000 gallongs fuel; ORVR = On-board Refueling Vapor Recovery

EMFAC2017 (v1.0.2) Emission Rates
Region Type: County
Region: PLACER
Calendar Year: 2020
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	2.29	Acre	2.29	99,752.40	0
Parking Lot	778.00	Space	7.00	311,200.00	0
Discount Club	155.00	1000sqft	10.21	155,000.00	0
Gasoline/Service Station	30.00	Pump	0.10	4,235.25	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	74
Climate Zone	2			**Operational Year**	2020
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land use based on project description and overal site disturbance. Other Asphalt Surfaces for Condition of Approval roadway project and Transportation mitigation roadway improvements applicable to Alternative Option A.

Construction Phase - Construction phases and duration based on project-specific construction schedule.

Off-road Equipment - Construction equipment based on project-specific equipment list.

Trips and VMT - Worker trips based on CalEEMod defaults.
Vendor trips based on project-specific projections.
Balanced site.

Grading -

Vehicle Trips - Operational trip rates adjusted to reflect daily new VMT to roadways per Traffic Impact Analysis.

Area Coating -

Construction Off-road Equipment Mitigation - Watering of disturbed areas on site for dust suppression mitigation.

Architectural Coating -

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	74
Climate Zone	2			**Operational Year**	2020
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land use based on project description and overal site disturbance. Other Asphalt Surfaces for Condition of Approval roadway project and Transportation mitigation roadway improvements applicable to Alternative Option A.

Construction Phase - Construction phases and duration based on project-specific construction schedule.

Off-road Equipment - Construction equipment based on project-specific equipment list.

Trips and VMT - Worker trips based on CalEEMod defaults.
Vendor trips based on project-specific projections.
Balanced site.

Grading -

Vehicle Trips - Operational trip rates adjusted to reflect daily new VMT to roadways per Traffic Impact Analysis.

Area Coating -

Construction Off-road Equipment Mitigation - Watering of disturbed areas on site for dust suppression mitigation.

Architectural Coating -

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land use based on project description and overal site disturbance. Other Asphalt Surfaces for Condition of Approval roadway project and Transportation mitigation roadway improvements applicable to Alternative Option A.

Construction Phase - Construction phases and duration based on project-specific construction schedule.

Off-road Equipment - Construction equipment based on project-specific equipment list.

Trips and VMT - Worker trips based on CalEEMod defaults.
Vendor trips based on project-specific projections.
Balanced site.

Grading -

Vehicle Trips - Operational trip rates adjusted to reflect daily new VMT to roadways per Traffic Impact Analysis.

Area Coating -

Construction Off-road Equipment Mitigation - Watering of disturbed areas on site for dust suppression mitigation.

Architectural Coating -

Memorandum

Loomis Costco Project
AECOM – Draft Health Risk Assessment

AECOM has prepared this summary to describe the results of the Health Risk Assessment (HRA) for the proposed Costco warehouse retail store and fueling station project, referred to as the project. The HRA has been requested by the Placer County Air Pollution Control District (PCAPCD), for compliance with the California Environmental Quality Act (CEQA), and is consistent with the 1997 Toxics Committee of the California Air Pollution Control Officers Association (CAPCOA). This memorandum describes the proposed project, the approach to the health risk assessment (HRA), and the modeling methodologies used to perform the analysis.

This memorandum addresses the following topics, as listed below by section:

1.0 – Introduction describes the project understanding and the objectives and methodology for the HRA.

2.0 – Emissions Estimates describes the methods used to estimate the emissions of toxic air contaminants (TACs) generated from project construction and operations.

3.0 – Air Dispersion Modeling describes the methods for modeling pollutant dispersion and estimating pollutant concentration contributions from project sources.

4.0 – Health Risk Analysis Methodology provides an overview of the methodology for estimating potential health risks to defined sensitive receptors.

5.0 – Health Risk Analysis Results provides the results of the project cancer risk at the defined sensitive receptors.

6.0 – Cumulative Health Risk provides a discussion of the cumulative risk due to the project and nearby sources.

7.0 – Uncertainties provides a discussion of uncertainties and limitations associated with the Health Risk Analysis.

8.0 – References provides the sources cited in this memorandum.

1.0 Introduction

Project Understanding

The project applicant, Costco Wholesale, proposes to develop the 17.4 acre property located at in the town of Loomis, in Placer County, approximately 25 miles northeast of the city of Sacramento. More specifically, the proposed project site is located at the southeast corner of the Sierra College Boulevard/Brace Road intersection. The proposed project is a warehouse retail store with a fueling station.

The warehouse retail site would sell national brands and private-label merchandise for commercial and personal use. Other goods and services provided would include tire sales and installation, sales of motor vehicle fuel including diesel, optical exams and sales, a photo center and processing, hearing aid testing and sales, food service preparation and sales (including meat and baked goods), alcohol sales and tasting, and propane tank exchanges. During seasonal sales promotions, temporary outdoor sales may occur within the parking field adjacent to the warehouse.

Costco is a membership-only retail/wholesale business. Warehouse and tire center hours are anticipated to be Monday through Friday from 10 a.m. to 8:30 p.m., Saturday from 9:30 a.m. to 6 p.m., and Sunday from 10 a.m. to 6 p.m. The fueling facility is anticipated to operate daily from 5 a.m. to 10 p.m.

The proposed warehouse retail space would be constructed using a steel frame, masonry blocks, and metal paneling supported by a concrete slab on-grade foundation. The warehouse structure would be approximately 33 feet tall and would provide 155,000 square feet of floor space dedicated to retail goods and services. The warehouse would be located near the northern boundary of the project site, while the fueling station would be located on the southwest corner of the site, as shown in **Figure 1**.

The loading dock for the Costco warehouse would be located on the southwest side of the warehouse, away from residential uses located north and east of the project site. A smaller on-grade door would be located on the west side of the building to receive smaller deliveries such as baked goods and other shipments.

The fueling station would be located in the southwest corner of the project site, adjacent to Sierra College Boulevard. The station would include a 7,560-square-foot canopy and a 106-square-foot controller enclosure that would be located on the southern portion of the station's landscape planter. The enclosure's walls would be constructed of steel and painted in earth tones to match the warehouse.

There are three slightly different configuration scenarios being considered for the project, which only affect secondary vehicle entrance points. The three scenarios include the following variations;

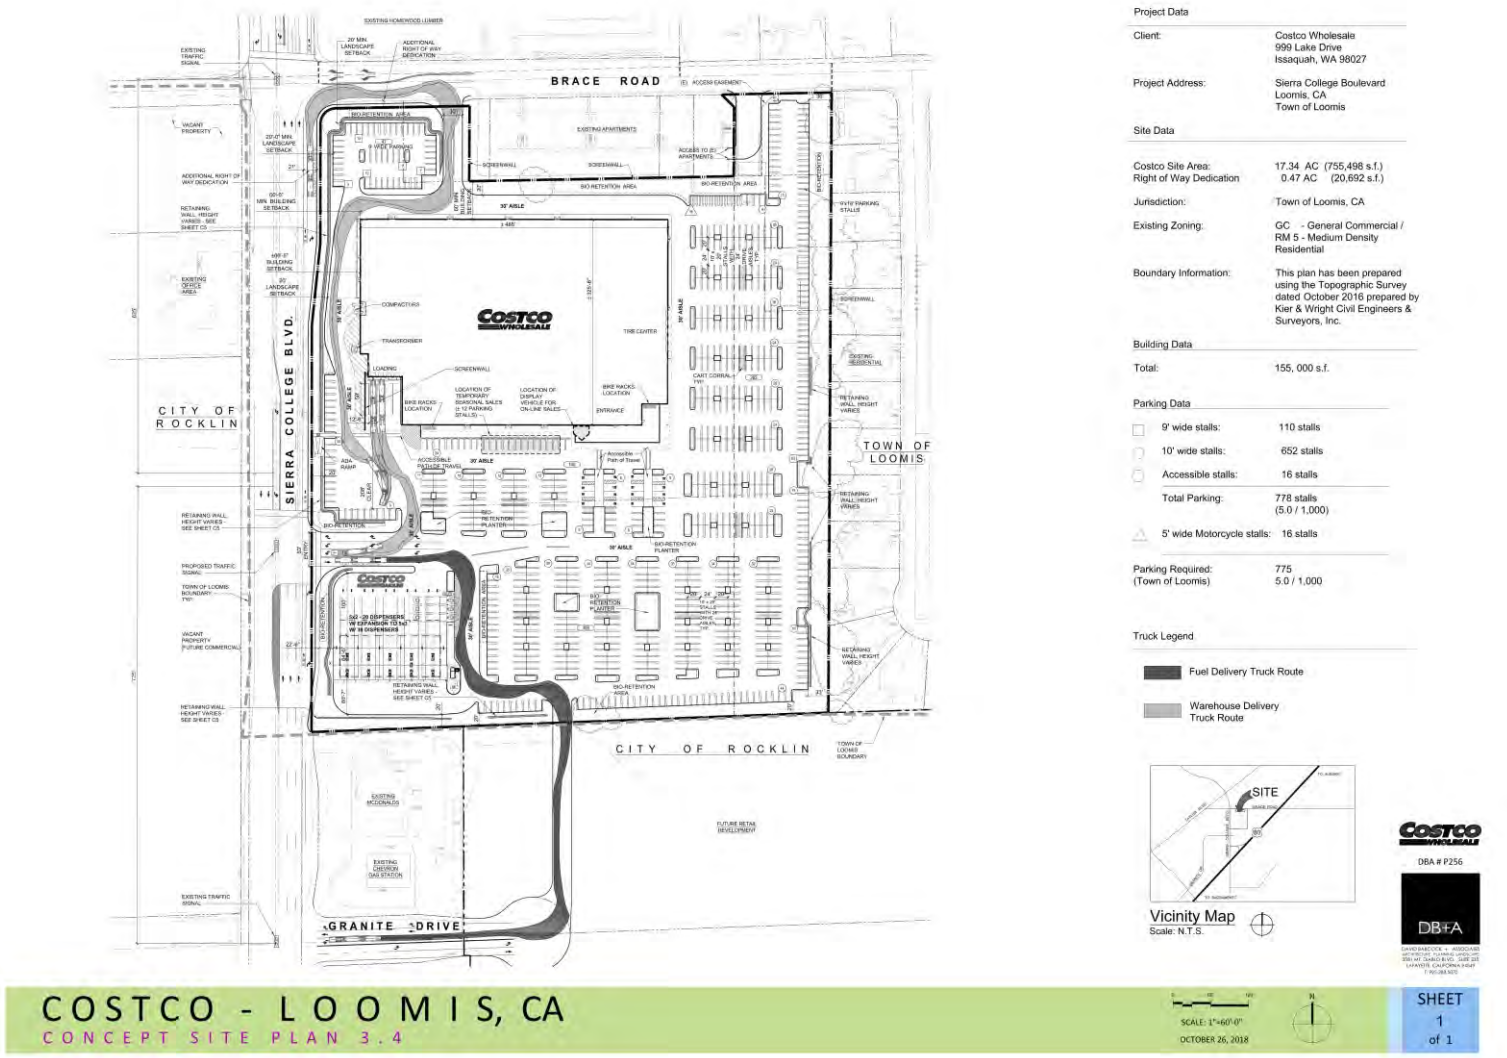
- Option A – has a second entrance/exit driveway along Brace Road near the northeast corner of the project site;
- Option B – does not have a second entrance/exit driveway along Brace Road but does have an entrance/exit connection from the southern portion of project site to Granite Drive; anOption C – same as Option A and includes the entrance/exit connection to Granite Drive.

All 3 options will be assessed as part of this HRA.

Project Construction

Construction for the proposed project is anticipated to occur over a six month period. Grading and site preparation would take 2 months to complete. Utility installation, paving, and erection of the structure would follow over a 2-month time frame. Construction would conclude with the application of architectural coatings and installation of landscaping during a 1-month period.

Preparation for construction would begin with the demolition of existing building foundations and grubbing to remove vegetation. Abandoned utilities in the proposed development areas, including a domestic well and other existing features (if encountered), would be removed and the excavation(s) would be backfilled with engineered fill. Debris produced during demolition (e.g., wood, steel, piping, and plastics) would be separated and disposed of off-site. Existing utility pipelines or conduits would be abandoned in place and plugged with nonshrinking cement grout to prevent migration of soil and/or water.



Once this work has been completed, soil on portions of the property would be overexcavated and recompacted to reduce the potential for differential settlement and provide uniform support for the proposed warehouse and associated facilities. According to the preliminary grading plan (Figure 2-9), the finished floor elevation for the warehouse would be approximately 331.50 feet above mean sea level. The warehouse building pad area would be raised as much as approximately 10 feet by fill and would transition to an area of cut as deep as 5 feet. The fueling facility area would be raised approximately 1–5 feet above the existing ground surface. Excavations for deep utilities and the loading dock may exceed 4 feet, and installing the underground storage tanks for the fueling facility would require excavation up to about 20 feet deep.Earthwork would be balanced on-site, with the earth material cut during overexcavation used as fill to establish building pads. No import or export of soil would be necessary to construct the project. Staging and materials storage would occur on the project site.

Project Operation

The proposed project anticipates up to 13 diesel engine trucks delivering goods on a daily basis to the warehouse retail store. The loading bays are planned to be located in the southwest portion of the warehouse, which would be the farthest point of the warehouse from residences. It is anticipated that on average, four of the 13 trucks per day would be equipped with diesel engines powering transport refrigeration units (TRUs). Additional on-site off-road equipment used during project operations, such as forklifts will be battery operated and therefore do not pose an air quality health risk are not included as part of this HRA. No diesel generators are planned to be used as part of this project.

The fueling station would contain four covered fueling bays, each with three two-sided fuel dispensers that would allow up to six vehicles to occupy each island. The station would also have eight stacking lanes, which would allow approximately 32 vehicles to queue for the pumps at any given time. The station would initially have fueling capacity for 24 fuel positions (i.e. dispensers), with the potential to expand to 30 fuel positions as demand warrants. This HRA assumes the maximum anticipated number of fuel dispensers to be 30, which would allow for approximately 30 vehicles to queue for the pumps at any given time. Fuel would be stored in three underground tanks installed along the perimeter of the station. The fueling station is planned for the southwest corner of the project site along Sierra College Boulevard. The proposed project anticipates an average of seven gasoline fuel delivery trucks on a daily basis to the refueling station.

Figure 1: Site Plan

Health Risk Background

The U.S. Environmental Protection Agency (USEPA) regulates hazardous air pollutants (HAPs), also known as toxic air contaminants or TACs. TACs may be emitted by stationary, area, or mobile sources. Common stationary sources of TAC emissions include gasoline stations, dry cleaners, and diesel backup generators, which are subject to the requirements of local air districts' permits. The other, often more substantial, sources of TAC emissions are motor vehicles on freeways, on high-volume roadways, or in other areas with high numbers of diesel vehicles, such as distribution centers. Off-road mobile sources are also major contributors of TAC emissions and include construction equipment, ships, and trains.

TACs collectively refer to a diverse group of air pollutants that are capable of causing chronic (i.e., long-duration) and acute (i.e., severe but short-term) adverse effects on human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and mortality. There are hundreds of different types of TACs with varying degrees of toxicity. The health risks of individual TACs vary greatly; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

TACs can be separated into carcinogens and noncarcinogens based on the nature of the effects associated with exposure to the pollutant. For regulatory purposes, carcinogens are assumed to have no safe threshold below which health impacts would not occur. Any exposure to a carcinogen poses some risk of contracting cancer. Noncarcinogens differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

Air pollution does not affect every individual in the population in the same way, and some groups are more sensitive than others to adverse health effects. Land uses such as residences, schools, daycare centers, hospitals, and nursing and convalescent homes are considered most sensitive to poor air quality because the population groups associated with these uses are more susceptible to respiratory distress or, for residential receptors, their exposure time is greater than that for other land uses. Therefore, these groups are referred to as sensitive receptors.

The project site is located in approximately 35 kilometers northeast Sacramento in the Placer County Air Pollution Control District (PCAPCD). The project site is adjacent to residential and commercial buildings. Multi-family dwelling units are located north of the project site with single-family homes located to the east of the project site. The nearest sensitive receptors are within the multi-family units to the north (situated south of Brace Road, between Starlight Lane and Sierra College Boulevard) and single-family homes to the east (along Hunters Drive), both located approximately 50 feet from of the project site boundary.

Objective and Methodology

The purpose of this HRA is to assess potential TAC emission impacts associated with daily operation of the proposed project. PCAPCD has requested that the HRA be prepared as part of the response to comments on the Draft Environmental Impact Report (DEIR) to determine the potential risk on the exposure of sensitive receptors to toxic air contaminants (TACs) emission from the fueling station and other operational sources with TAC emissions. Analyses were conducted consistent with guidance and methodologies from local, regional, state, and federal agencies, including CAPCOA (2009), the California Air Resources Board (ARB) (2017), the Office of Environmental Health Hazard Assessment (OEHHA) (2015), and the U.S. Environmental Protection Agency (EPA) (2017).

Consistent with CEQA requirements and guidance provided by CAPCOA, the analysis evaluated the following:

1. *Health risk and hazard impacts of operational emissions* from the project-related construction and operational emissions on existing and future off-site sensitive receptors (residents and schools) located within 2 kilometers of the project site. **Figures 2 and 3** show the locations of receptors included in the modeling for the proposed project for the far and near fields, respectively.

The results are summarized in Section 5.

Project Sources

This HRA evaluates the following sources of air quality emissions and exposures:

1. **Construction Emissions:** The proposed project's construction-related emissions affecting local sensitive receptors. Emissions sources include construction equipment and vehicle trips.

2. **Operational Emissions from Truck Deliveries**: The proposed project operational emissions associated with trucks traveling to and from the site (within ¼ mile) and idling during loading/unloading activities affecting local sensitive receptors. Emission sources include diesel engine exhaust from trucks while idling and exhaust from diesel engines powering trailer refrigeration units (TRUs).

3. **Operational Emissions from Gasoline Deliveries**: The proposed project operational emissions associated with gasoline fuel trucks traveling within ¼ mile of the site and idling at the loading dock. The ¼ mile extent is comparable or slightly more conservative with other California air district guidance, such as the Bay Area Air Quality Management District (BAAQMD) (2017) that recommends 1,000 feet from project boundary or within.

4. **Operational Emissions from New Customer Vehicle Trips**: The proposed project operational emissions associated with new vehicle traffic from customer vehicles traveling within ¼ mile of the site. Emissions associated with customer vehicles in queue (up to 30 simultaneously during the peak hour) are included.

5. **Operations Emissions from Refueling Station**: The proposed project operational emissions associated with loading, storage, and spillage of gasoline and refueling of vehicles affecting local sensitive receptors. There will be no diesel or propane dispensers at the fueling station. Emission sources from a refueling station according to CAPCOA guidance include:

    a. **Bulk Transfer Losses (Loading)** – emissions that occur when a cargo tank truck unloads gasoline to the storage tanks at the gasoline station. Storage tank vapors are emitted from the vent pipe during the initial transfer period.

    b. **Pressure Driven Losses (Breathing)** – gasoline vapors emitted from the storage tank vent pipe due to temperature and pressure changes within the storage tank vapor space.

    c. **Fueling and Hose Permeation**– gasoline vapors that are emitted during the refueling process at the vehicle/nozzle interface.

    d. **Spillage** – emissions that occur from spills during vehicle fueling.

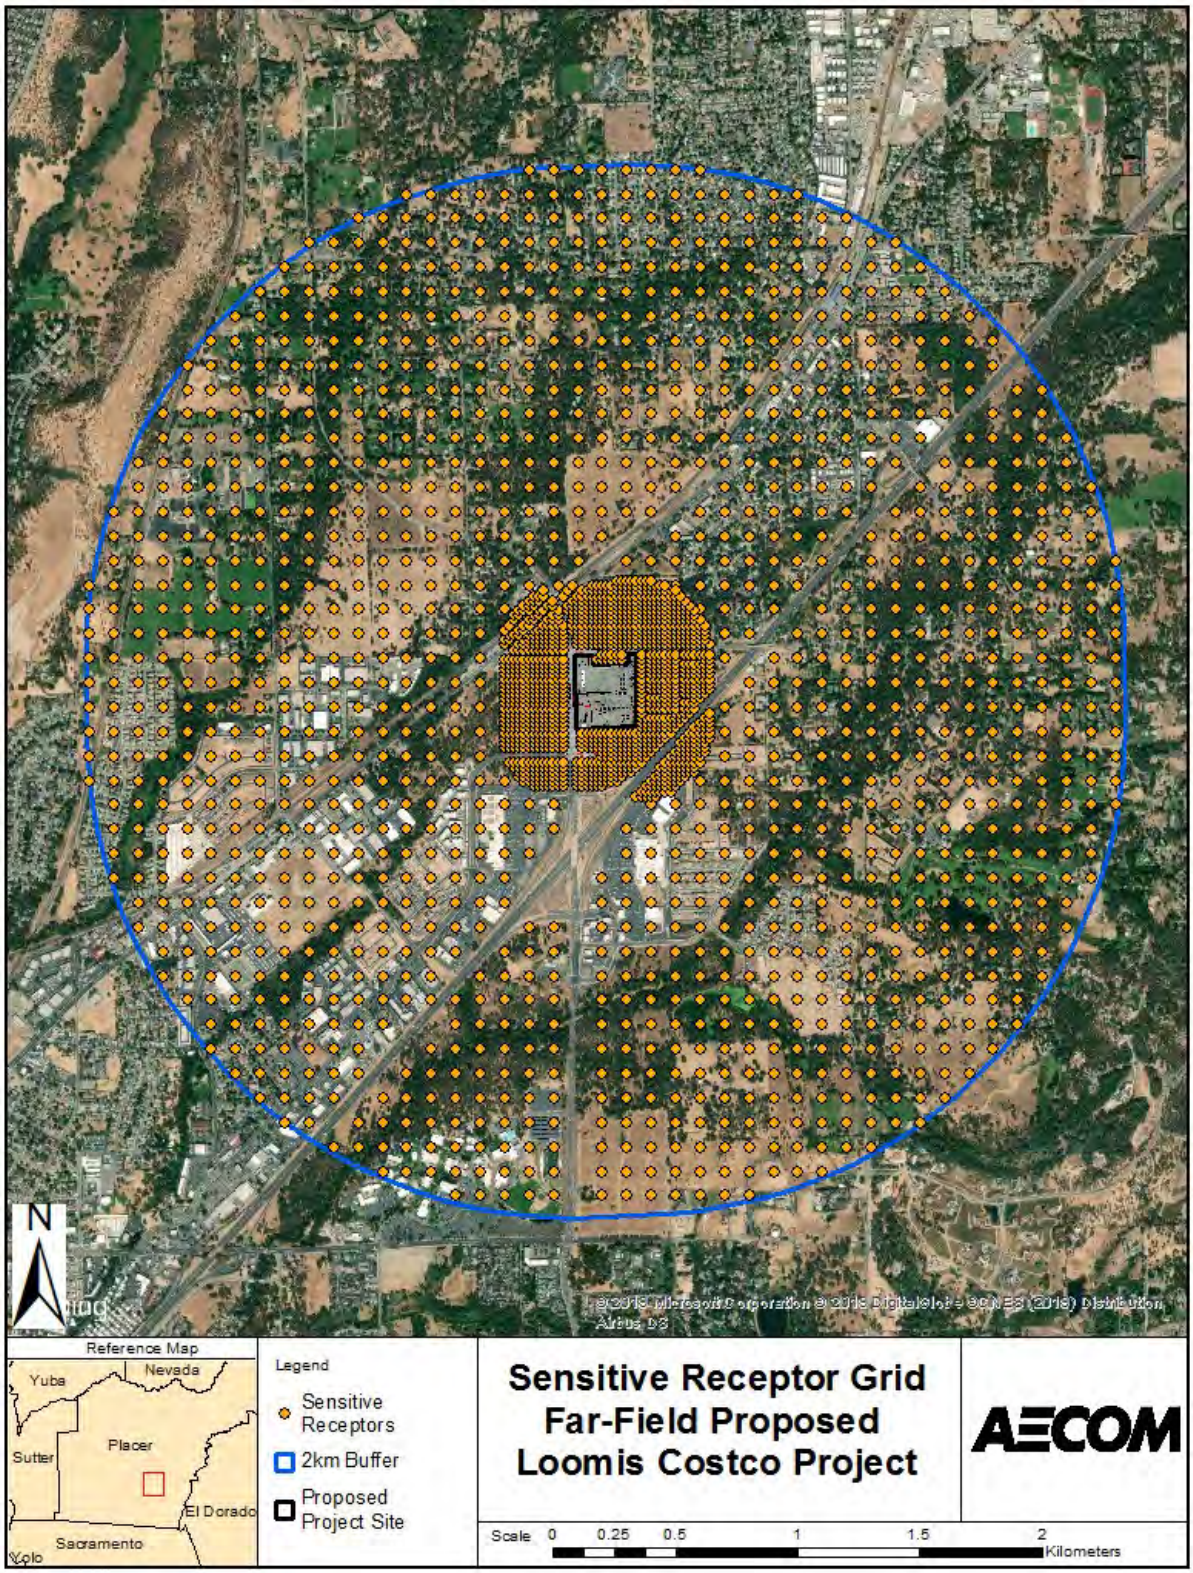

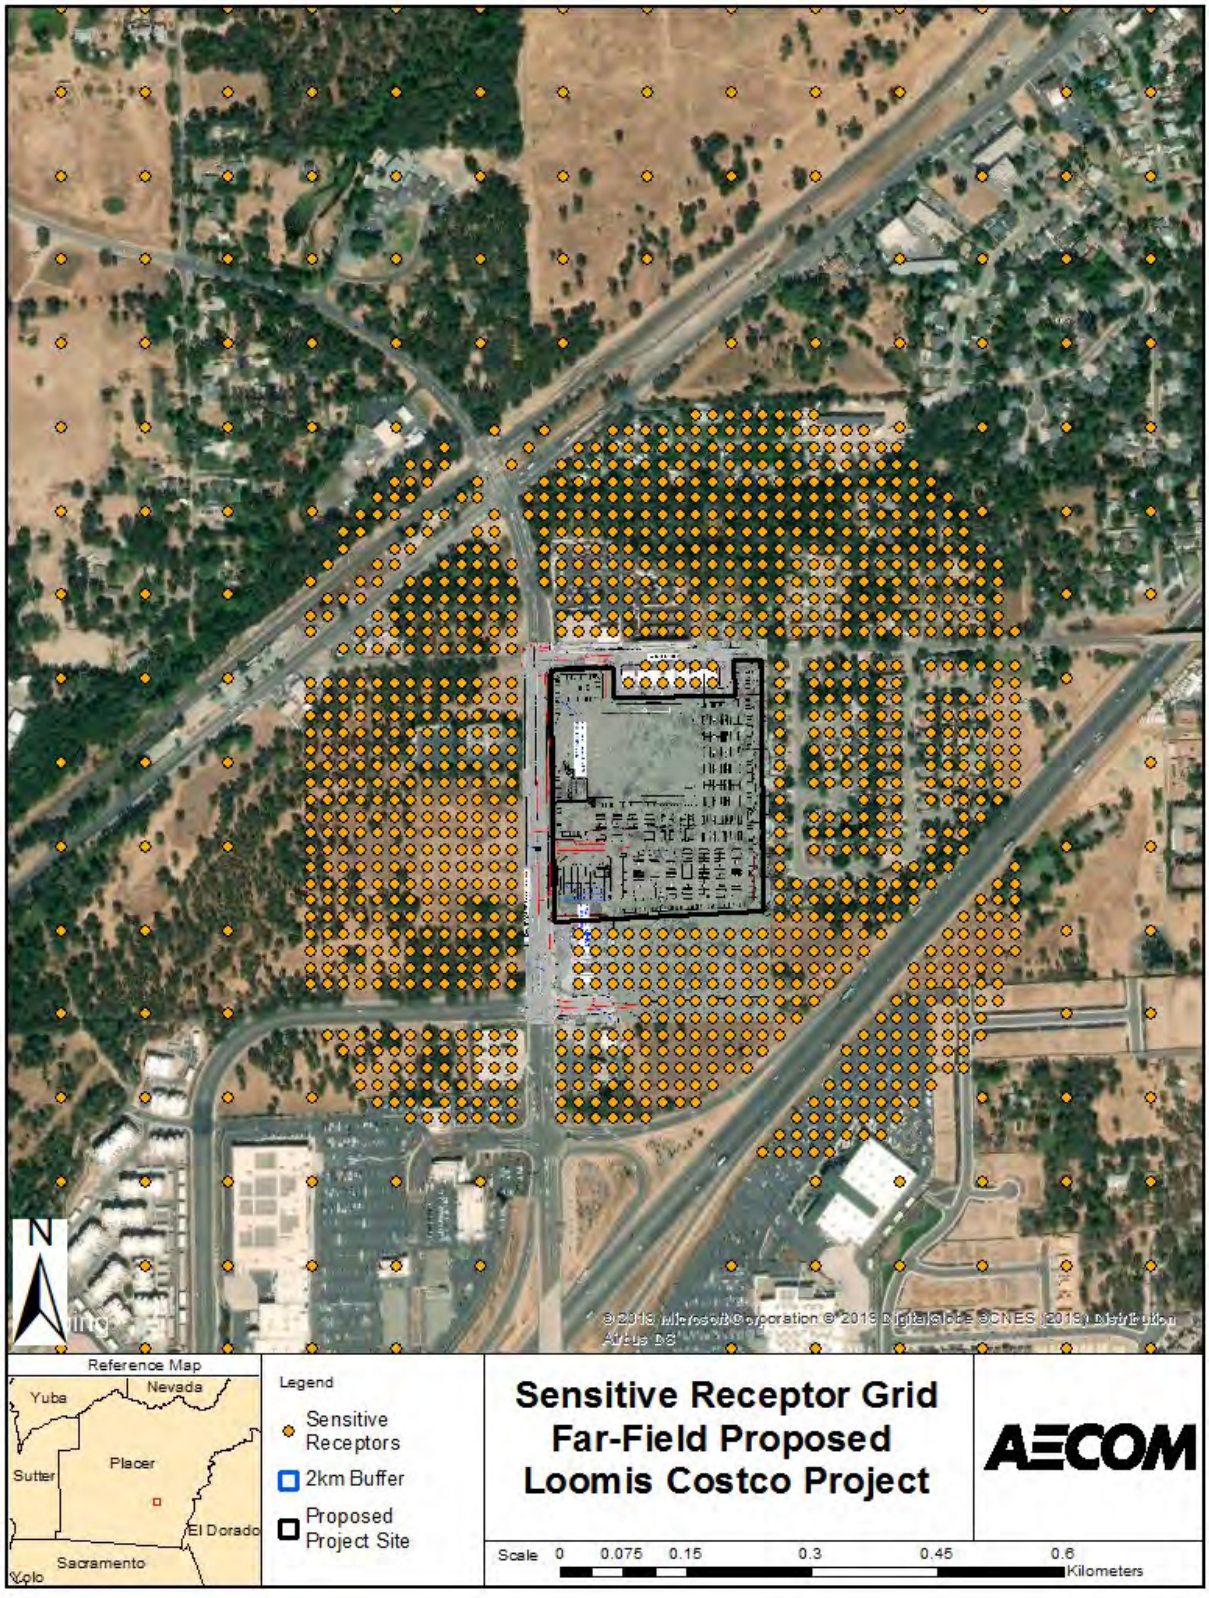

Figure 3: Near-Field View of Receptors around the Proposed Project

2.0 Emissions Estimates

This HRA evaluates diesel particulate matter (DPM) (assumed to be equivalent to $PM_{2.5}$ exhaust) from delivery trucks and components of gasoline (benzene, toluene, xylenes and methyl tertiary-butyl either (MTBE)) associated with operation of the gas station. These emissions estimates are then used to determine concentrations of each pollutant at sensitive receptor locations in order to evaluate the excess cancer risk a receptor is exposed to as a result of the proposed project. This section identifies the methodologies used to estimate pollutant emissions.

The proposed project construction and operational air quality emissions were quantified according to guidance and methods from CAPCOA, ARB, and EPA as previously referenced above. The process for determining the parameters and assumptions used to model these emissions, along with the modeling methods, are described below. Attachment A of the Criteria Air Pollutant Analysis (CAPA) contains the detailed emissions output and a summary of the emissions used in this analysis is provided in **Attachment A** of this document.

Calculation Methodologies for Construction Emission Sources

Construction of the proposed project would generate emissions of TACs (i.e., diesel particulate matter) from a variety of sources, including off-road construction equipment, on-road vehicles, earthmoving activities, architectural coating activities, and paving activities. Construction emissions are dependent on the following project information:

- Schedule and duration of construction phases
- Types and sizes (site acreages and building square footages) of land uses to be developed

The following list of construction activities used CalEEMod defaults to estimate the emissions since project-specific information was not provided. The default parameters used are detailed in **Attachment A**, but include the following:

- Off-road construction equipment and activity schedules
- Construction-related haul-truck traffic volumes
- Construction worker traffic volumes
- Earthmoving activities (e.g., cut/fill, grading)

Construction of the project is estimated to take approximately six months to complete, with various activities occurring as described in Section 1. There are two proposed construction scenarios;

1. One that involves providing an access road that connects Granite Road with the southern portion of the project site (Options B and C), and
2. The other does not include this access road (Option A).

The equipment used in the construction of the project is described in the Criteria Air Pollutant Analysis (CAPA) contained in Attachment A. Construction emissions were calculated for each year and were converted from total tons/year to grams per second (g/s) for the $PM_{2.5}$ analysis and pounds per year (lb/year) for the excess cancer risk analysis for each construction phase. As discussed in Section 3 below, the g/s emissions assumed 1,846 hours during the six months of construction and as such the tons/year conversion was based on this number of hours/year. The tons/year to lb/year conversion is not time related.

Figures 4 and **5** show the location of the off- and on-road construction sources for each of the construction scenario options.

Off-Road Construction Equipment

Off-road construction equipment would generate exhaust-related emissions of TACs. To calculate emissions, the number and types of construction equipment required for each construction phase were identified, along with the hours of operation per day, horsepower, and the load factor for each respective piece of project-specific equipment. For those pieces of equipment that project-specific information was unavailable, CalEEMod default parameters were selected. Pursuant to BAAQMD's guidance, the California Emissions Estimator Model (CalEEMod) was used to estimate emissions resulting from off-road construction equipment.

CalEEMod contains emission factors from ARB's off-road equipment emissions estimator model, OFFROAD 2011. Both EPA and the State of California have set emissions standards for new off-road equipment engines, ranging from Tier 1 to Tier 4. Tier 1 emission standards were phased in between 1996 and 2000, and Tier 4 interim and final emission standards for all new engines were phased in between 2008 and 2015. The emission factors for the engines were based on the fleet average, which includes all tier engines for the calendar year of the analysis. Default assumptions for the equipment type, hours, horsepower and load factors are noted above contained in CalEEMod were used to quantify emissions. The CalEEMod default assumptions typically are conservative, providing a reasonable upper boundary for potential construction emissions. The analysis performed used CalEEMod Version 2016.3.2, which is the most current version of the CalEEMod. The CalEEMod outputs provide estimates of $PM_{2.5}$ emissions from diesel exhaust, brake wear, tire wear, and running losses. These emissions were conservatively assumed to equal DPM as well.

On-Road Construction Vehicles

On-road construction sources include construction-worker vehicles, material delivery trucks, and on-site work trucks. CalEEMod was used to estimate emissions resulting from these on-road vehicles. $PM_{2.5}$ exhaust emissions from DPM as well as reactive organic gas (ROG) emissions from gasoline exhaust are also estimated by CalEEMod. As noted above, $PM_{2.5}$ exhaust was assumed to be DPM. Default assumptions for parameters such as construction-worker vehicles and on-site work trucks, material delivery trips, construction worker trips, trip distance, and vehicle type were estimated using CalEEMod. The CalEEMod emissions were scaled by trip length within the modeling domain divided by CalEEMod trip distance to determine the amount of emissions within the modeling domain the project. In addition to estimating air pollution emissions using CalEEMod, emission factors from EMFAC2017 and OFFROAD2017 were used. As noted above, annual tons/year output from CalEEMod was converted to lb/year.

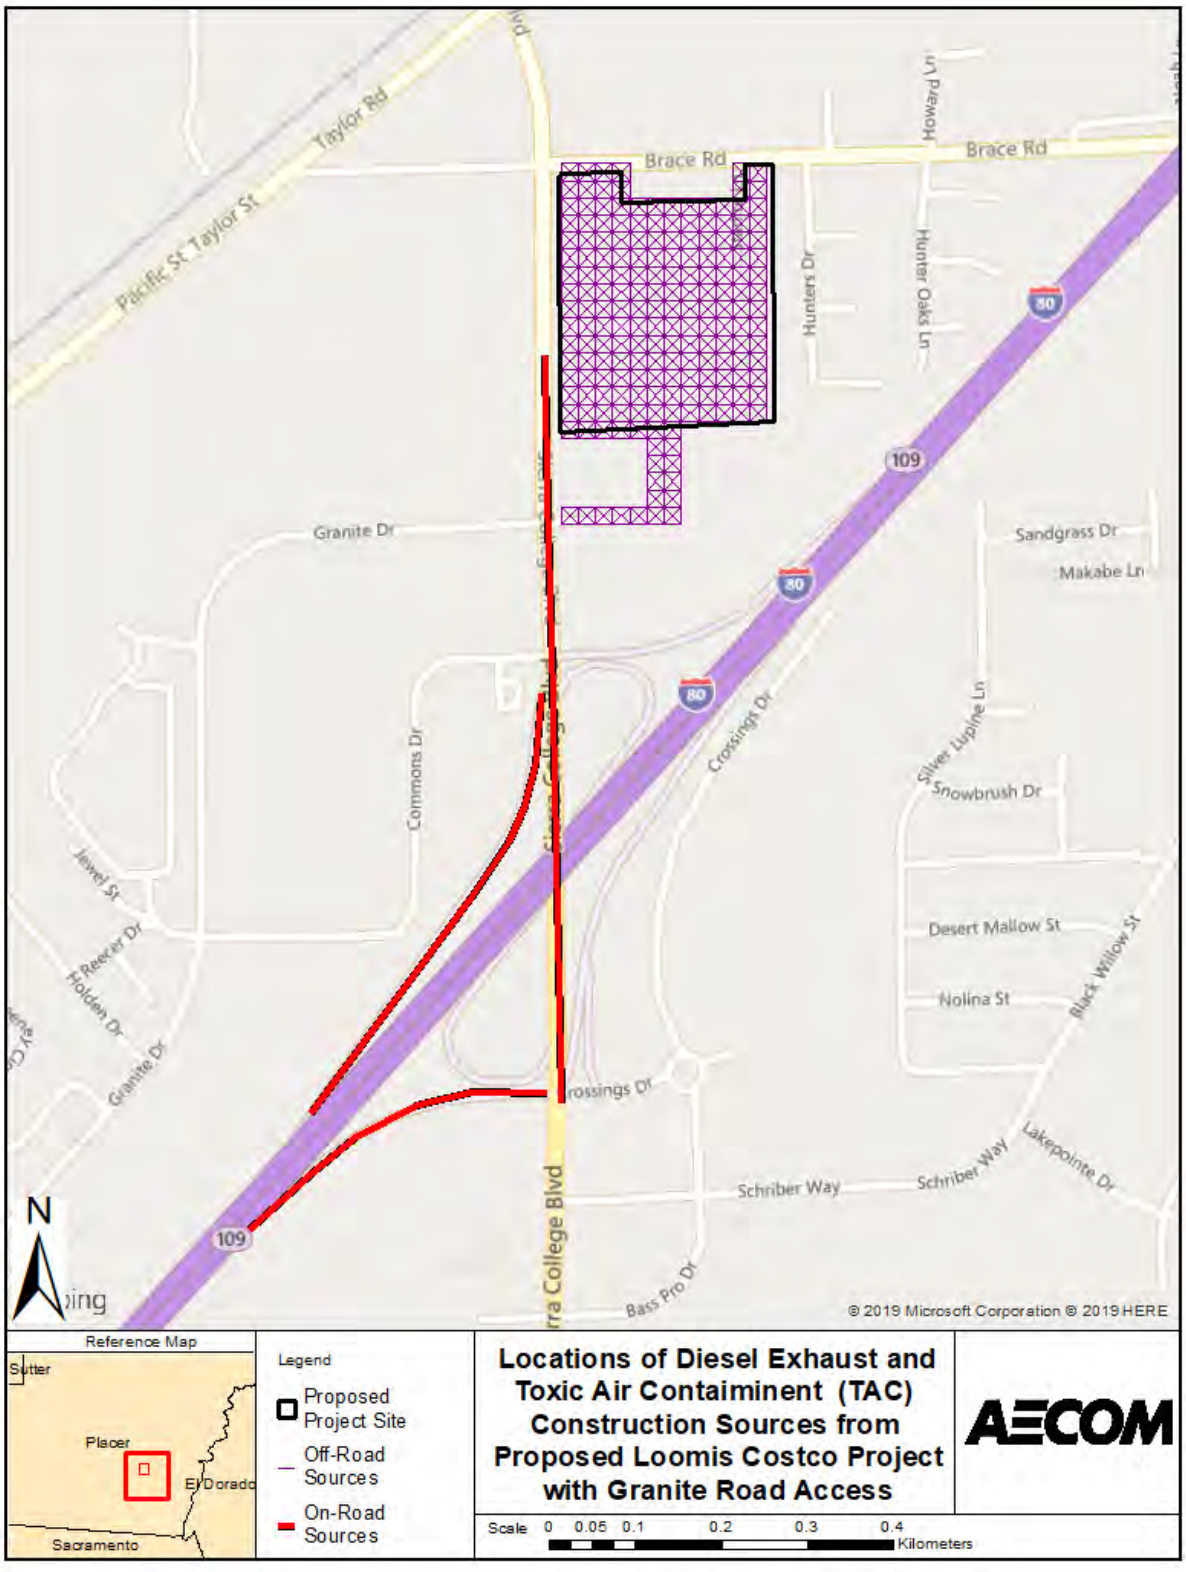
Table 1 summarizes the construction emissions used in the HRA.

TABLE 1
UNCONTROLLED CONSTRUCTION RELATED EMISSIONS (LB/YEAR)

Source	ROG	Exhaust $PM_{2.5}$
Off-Site (Mobile Vehicles)	52.34	4.10
On-Site (Off-Road Equip/Vehicles)	2,055.20	180.64

Notes: lb/year = pounds per year; $PM_{2.5}$ = particulate matter with aerodynamic diameter less than 2.5 microns; ROG = reactive organic gases
Emissions shown are for Options B and C, which are identical and present the worst-case construction emissions scenario inclusive of additional improvements providing an access road that connects Granite Road with the southern portion of the project site.

Figure 4: TAC and Diesel Emission Source Locations Associated with Construction of Proposed Project Including Connection to Granite Road (Option B/C)



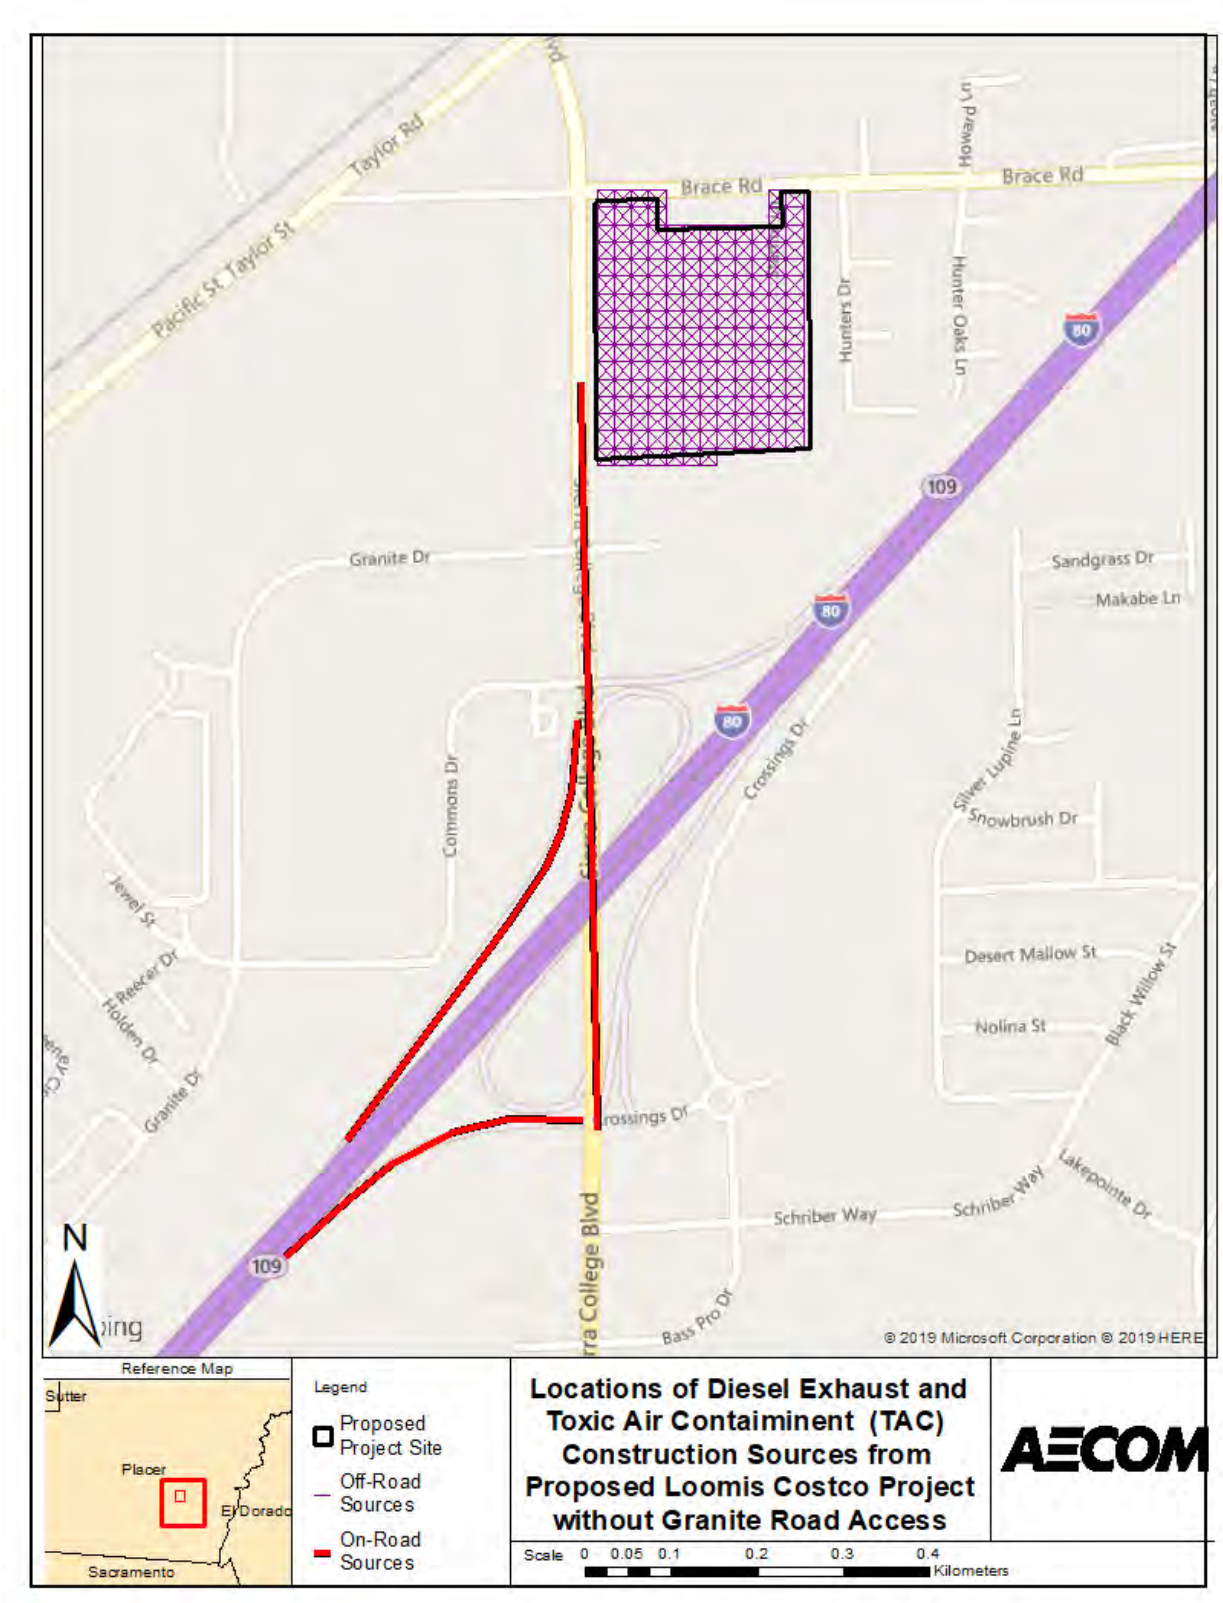


Figure 5: TAC and Diesel Emission Source Locations Associated with Construction of Proposed Project without a Connection to Granite Road (Option A)

Calculation Methodologies for Operational Emission Sources

After construction of the proposed project, long-term operations would generate emissions of TACs from a variety of sources, including stationary sources, volume sources, and mobile sources.

Operational emissions have been calculated for each of the proposed project scenarios. TACs will not be emitted from the warehouse as the equipment used inside the warehouse such as forklifts will be electric. The assumptions and methods used to conduct the calculations are summarized below.

Stationary Sources

CAPCOA guidance for Gasoline Service Stations (CAPCOA 1997) recommends that gas venting from loading and breathing processes be characterized in the model as point sources. It was assumed that for each gas pump (15 gas pumps that equates to 30 fuel positions) would be included as a single point source for each pump. **Figure 6** depicts the proposed location of the vent stack emissions due to loading and breathing. To account for emissions associated with fueling (refueling) and spillage processes, these sources were characterized as volume sources in the model, consistent with the CAPCOA guidance. **Figure 6** shows the proposed location of the volume sources that consider the length and width of typical vehicles. Emission factors and methods prescribed by CARB's Revised Emission Factors for Gasoline Marketing Operations at California Gasoline Dispensing Facilities (ARB, 2013) were used to estimate emissions for the bulk transfer (loading) and pressure driven losses (breathing processes) for underground tanks. It was assumed that the annual gasoline throughput for the proposed project would be 20 million gallons per year. **Table 2** summarizes the ROG emission factors used in the modeling for these processes.

Idling truck emissions were calculated using diesel heavy duty truck idling emission factors taken from ARB's motor vehicle emission factor model, EMFAC 2017. Idling emission rates are provided in grams per vehicle per day and were converted to grams per vehicle per idle-hour using idle hours for selected categories provided in Table 4.4-9 of ARBs EMFAC 2017 Technical Documentation Volume III (ARB, 2018a). It is assumed that there will be nine trucks per day without TRUs, and four trucks per day that would include TRUs, for a total of 13 warehouse delivery trucks per day. Based on the annual gasoline throughput of 20,000,000 gallons per year and tanker truck capacity, approximately seven trucks per day will deliver gasoline to the gas station. This HRA assumes seven gasoline delivery trucks per day. Idling emission rates are in grams per hour, and emissions were estimated assuming each cargo delivery truck with or without TRUs would idle for up to 10 minutes (5 minutes upon arrival and 5 minutes prior to departure) and each gasoline delivery truck would idle up to 10 minutes (5 minutes upon arrival and 5 minutes prior to departure). In addition, emissions associated with the diesel-powered TRUs were estimated using emission rates from the ARB OFFROAD 2017 emissions inventory for a 25 horsepower Truck TRU. The TRU emission rates are provided in tons per day and were converted to grams per horsepower-hour to calculate daily emissions, which assumed each of the four TRUs on-site daily would operate for up to one hour.

TABLE 2
ROG EMISSION FACTORS FOR GASOLINE STATIONS

Current Emission Factors (lbs/1000 gal)[1]	Process
0.15	Bulk Transfer (Loading)
0.024	Pressure Driven Losses (Breathing)
0.09783[2,3]	Fueling and Hose Permeation (Refueling)
0.24	Spillage

[1] Emission factors obtained from table I-I in CARB's Revised Emission Factors for Gasoline Marketing Operations at California Gasoline Dispensing Facilities (2013).
[2] Fueling is based upon 80% On-board Refueling Vapor Recovery (ORVR) and 20% non-ORVR vehicles obtained from Figure 1 from CARB's Staff Report: Initial Statement of Reasons (2018b)
[3]Hose permeation emissions added to fueling sources.

To account for emissions associated customer vehicles, these sources were characterized as volume sources in the model. **Figure 6** shows the proposed location of the volume sources (green lines) that consider the area where these vehicles would be waiting in queue to refuel. Emissions from the idling of passenger vehicles in queue at the fueling station were calculated using emission factors from EMFAC2017. Because EMFAC only provides extended idle emissions rates for heavy duty trucks, idle emissions for passenger vehicles were computed using the methods recommended by ARB for light-duty vehicles. Running emissions rates for the lowest speed bin (in this case, 10 miles per hour) for light- and medium-duty vehicles and converting these rates to hourly emissions. This analysis assumed that the peak hour would have up to 30 vehicles in queue constantly for a peak hour. Similar to traffic studies which often assume that peak hour is approximately 10 percent of daily volume, this relationship was assumed for the queue line, thus assuming that the peak hour emissions from idling vehicles in queue at the fueling station represented 10 percent of the daily emissions from queuing.

Mobile Sources

Mobile-source emissions for worker and customer trips were calculated using vehicle miles traveled (VMT) from the TIS (Kittelson & Associates, 2019) and used CalEEMod. As described for construction on-road vehicles, CalEEMod Version 2016.3.2 incorporates EMFAC2014 mobile-source emission factors. On-road emissions from the cargo and fuel delivery trucks and the TRUs while in transit were calculated using EMFAC 2017 and OFFROAD 2017, respectively. **Figures 7** through **12** show the anticipated road routes of customer and worker traffic (for three configurations), warehouse, and gas deliveries (for two configurations), respectively. The CalEEMod emissions were scaled by trip length within the modeling domain divided by CalEEMod trip distance to determine the amount of emissions within modeling domain the project. **Table 3** summarizes the annual operational emissions used in the HRA. It is assumed that all new customer and worker mobile emissions are from gasoline vehicles, while diesel vehicles include delivery trucks to the warehouse and gasoline delivery trucks.

TABLE 3
UNCONTROLLED OPERATION RELATED EMISSIONS (LB/YEAR)

Source	ROG	Exhaust Diesel PM
Diesel Vehicles	--	24.36
Gasoline Vehicles	753.55	--
Notes: lb/year = pounds per year; $PM_{2.5}$ = particulate matter with aerodynamic diameter less than 2.5 microns; ROG = reactive organic gases		

Table 4 summarizes the gasoline station emission rates used in the HRA.

TABLE 4
GASOLINE STATION RELATED ROG EMISSIONS

Process	Benzene	Toluene	Xylenes	MTBE
Loading	9.00E+00	3.00E+01	3.00E+01	3.30E+02
Breathing	1.44E+00	4.80E+00	4.80E+00	5.28E+01
Refueling	5.97E+00	1.96E+01	1.96E+01	2.15E+02
Spillage	4.80E+01	3.84E+02	1.15E+02	5.28E+02
Totals	6.43E+01	4.38E+02	1.70E+02	1.13E+03
Notes: lb/year = pounds per year; Annual throughput assumes 20,000,000 gallons of gasoline per year.

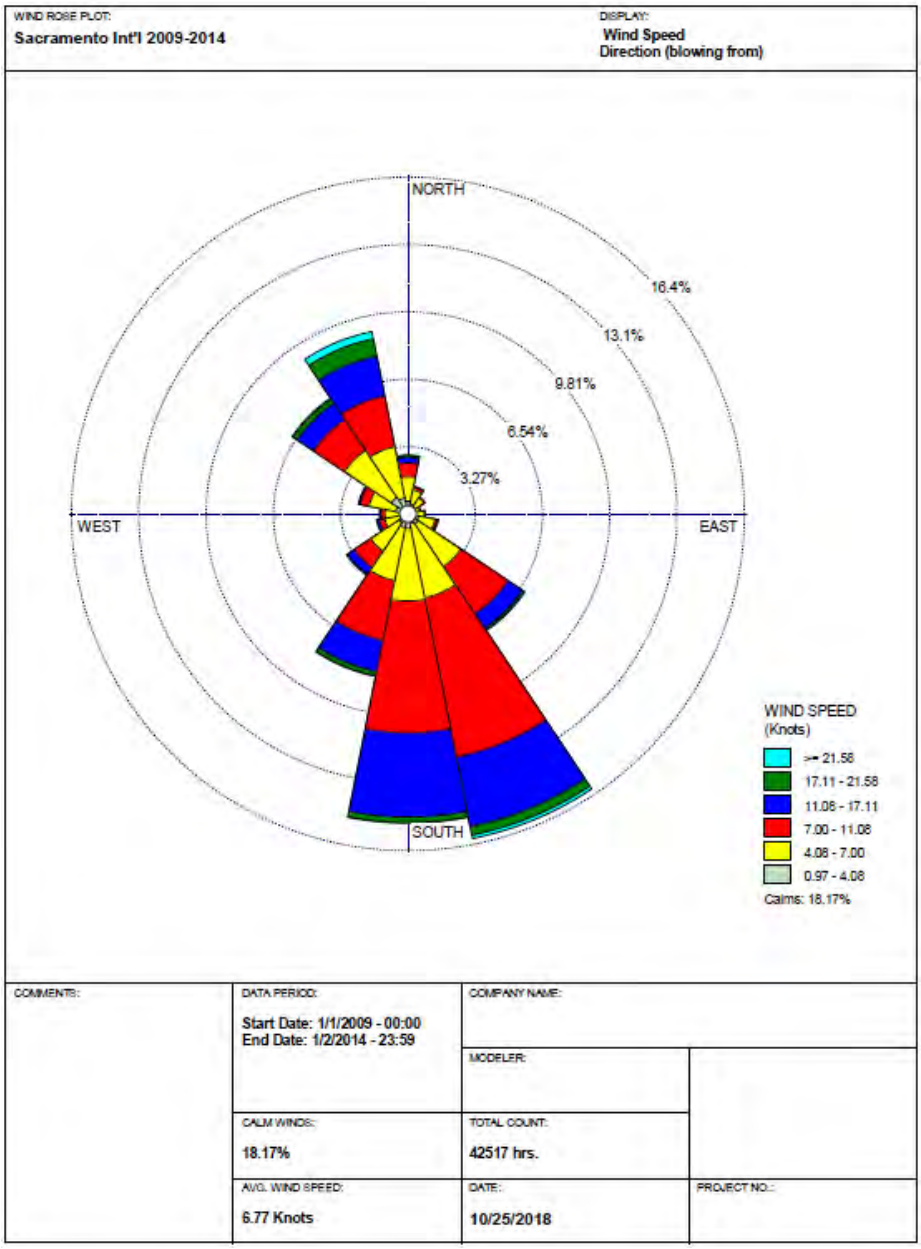
3.0 Air Dispersion Modeling

The American Meteorological Society/USEPA Regulatory Model (AERMOD) dispersion model (Version 19191) was used to estimate pollutant concentrations at specific distances from project emission sources using hourly meteorological data. At the direction of PCAPCD, the Sacramento International Airport meteorological station (2009-2014) of hourly meteorological data was used.

Meteorological Data

The topography around Loomis, CA is generally flat with some rolling hills to the south and a relatively large lake (Folsom Lake) to the southeast. More elevated terrain features are situated to the west, north and northeast of the area with several mountain passes to the northeast. A wind rose using near-surface (10-meter) wind measures from the Sacramento International Airport from 2009-2014 is shown in **Figure 13**. **Figure 14** shows the location of the Sacramento International Airport relative to the proposed project site.

Figure 13
Sacramento International Airport Wind Rose (2009-2014)



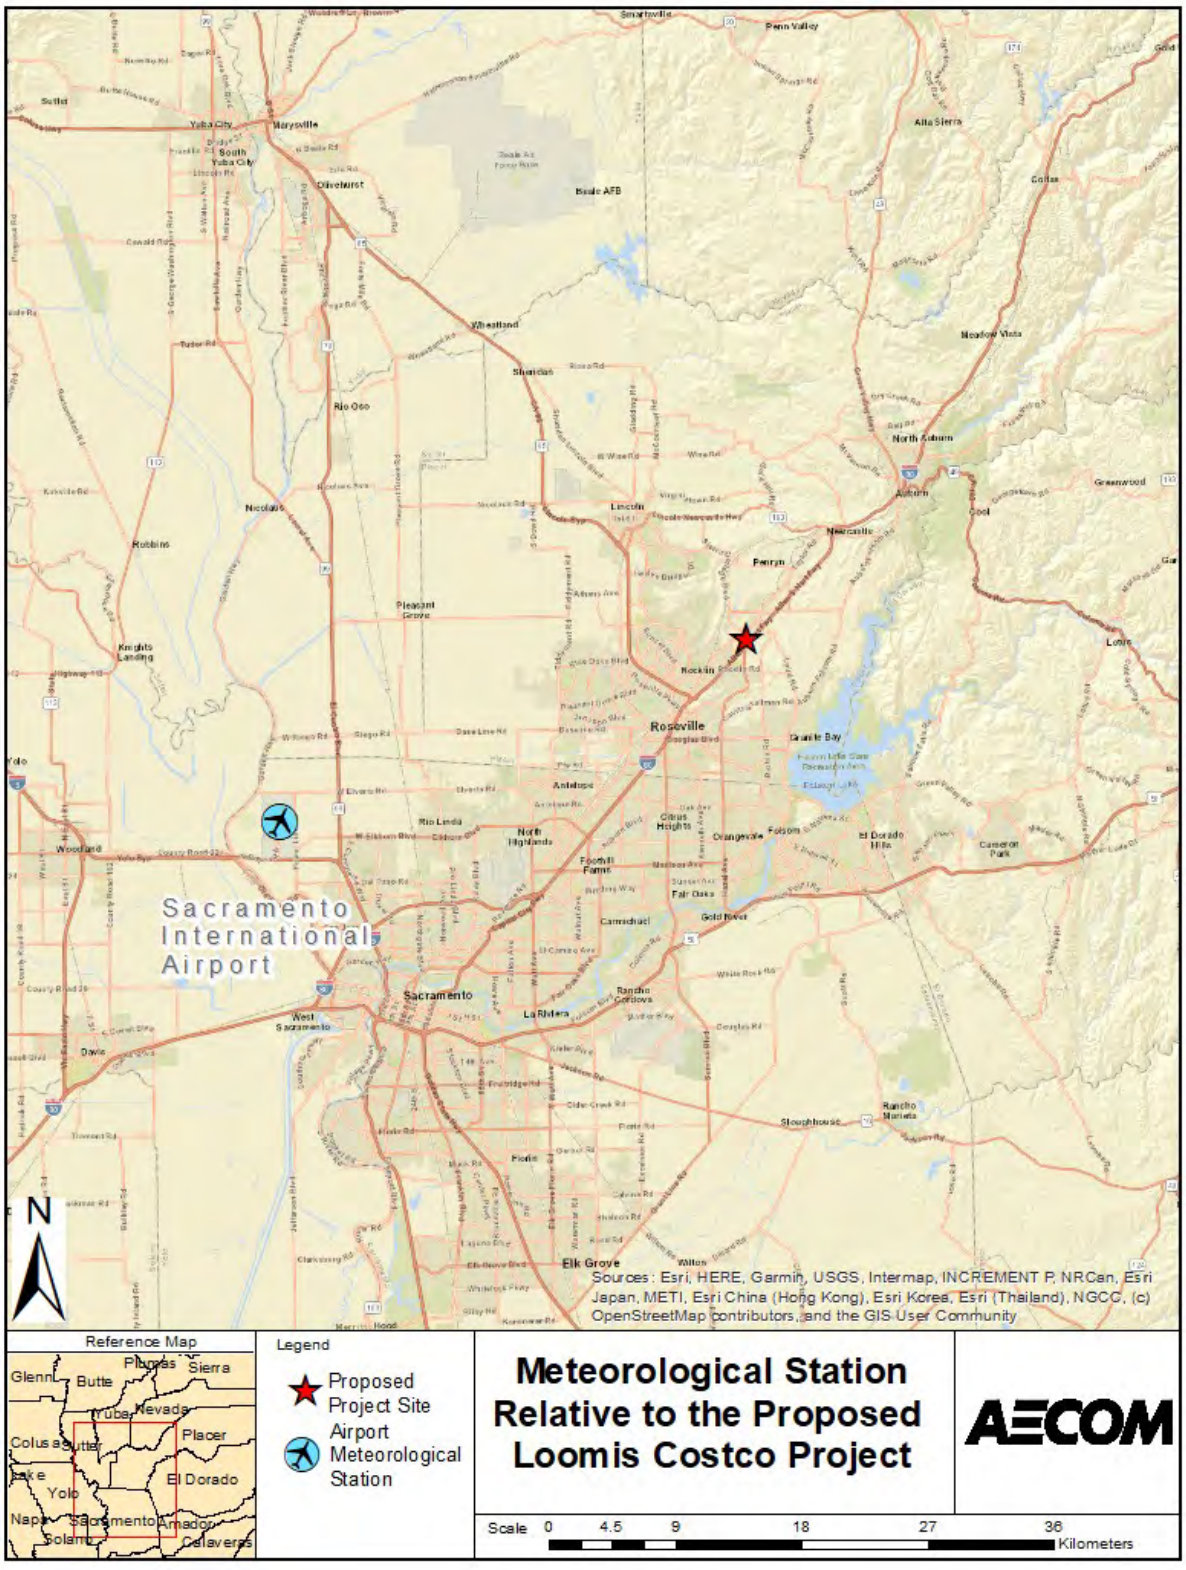


Figure 14

Locations of Meteorological Stations

Receptor Locations

Sensitive receptor locations for the proposed project are shown in **Figures 2 and 3**. The receptors were assigned a flagpole height of 1.8 meters for the ground level residences. CAPCOA recommends a receptor spacing of 25 meters for cases with emissions from short stacks or vents and that have a close property line. Given the proximity to residential dwellings along the east and northern properly line, 20-meter receptor intervals were used to adequately assess health risks in the near field. This 20-meter receptor spacing was used from the proposed project boundary line outward to 1,000 feet. This is consistent with other California air district guidance, such as the Bay Area Air Quality Management District (BAAQMD) (2017) since PCAPCD does not have receptor placement guidance. Beyond 1,000 feet and out to 2 kilometers, a receptor spacing of 100 meters was used as the area of maximum exposure typically occurs close to the source(s). This approach, of using a nested receptor grid with fine receptor spacing near the source to a coarser resolution farther away is consistent with CAPCOA and other California air district guidance.

Terrain elevations were obtained from commercially available digital terrain elevations developed by the U.S. Geological Survey by using its National Elevation Dataset (NED). The NED data provide terrain elevations with 1-meter vertical resolution and 10-meter (1/3 arc-second) horizontal resolution based on a Universal Transverse Mercator (UTM) coordinate system. The U.S. Geological Survey specifies coordinates in North American Datum 83, UTM Zone 10. Lakes Environmental software was used to process the NED data and assign elevations to the receptor locations and sources.

Construction Sources

Off-road construction equipment was represented by adjacent volume sources covering the footprint of the project site. The release height of these sources was set to 5 meters and the initial vertical dimension was set to 2.3 meters. The lateral dimensions of each volume source were set to 20 meters, which is consistent with South Coast Air Quality Management District guidance (SQAQMD, 2008) for adjacent volume sources over an area greater than 5 acres. PCAPCD does not have guidance pertaining to model set up options.

On-road emissions from construction-worker vehicles, haul trucks, and material delivery trucks, and on-site work trucks traveling to and from the project site were also modeled as adjacent volume sources. The release height of these sources was set to 4.25 meters and the initial vertical dimension was set to 2.3 meters. The initial lateral dimension varies depending on roadway width. In coordination with the project sponsor and the transportation consultant, Kittelson and Associates, it was assumed that construction-worker vehicles, and material delivery trucks would approach the project site from a single direction. All traffic would come from I-80 would exit onto Sierra College Boulevard and turn north until arriving at the proposed project site. All traffic exiting the project site would enter Sierra College Boulevard and travel south on Sierra College Boulevard to the southbound on-ramp toward I-80. On-road traffic within 1,000 feet of the Project site was modeled. **Figures 4** and **5** illustrate the proposed construction on-road vehicle routes modeled for the two construction options described earlier.

Construction is anticipated to occur Monday through Friday from 8 a.m. to 5 p.m. (1,170 hours over the 6-month construction phase period). As such, these hours were modeled in AERMOD using the EMISFACT HRDOW keywords. This would include construction diesel particulate matter emissions.

Operational Sources

Operational emission sources evaluated in the dispersion modeling include bulk transfer (loading), pressure driven losses (breathing), fueling/hose permeation and spillage processes associated with the fueling station, along with delivery trucks idling and exhaust from diesel engines powering TRUs and on-road vehicles. Modeling assumed loading and breathing processes as point sources, while refueling and spillage were included as adjacent volume sources. The stack height used for the point source modeling of loading and breathing processes was 12 feet. The exhaust gas temperature used was 65°F for loading and 60°F for breathing, which are defined by CAPCOA for underground tanks. A mass emission rate and subsequent gas exit velocity were derived based on formulas provided by ARB that incorporate the emission factors (described in Section 2.0), annual gasoline throughput and

diameter of the release point (which is recommended by CAPCOA to be 2 inches). The modeled stack parameters are summarized in **Table 2**. Velocity calculations are provided in **Attachment B**.

Modeling assumed the emissions from refueling and spillage associated with the project site's fueling station as adjacent volume sources. To be consistent with the CAPCOA guidance, the release height of the refueling sources was set to 1 meter and the initial vertical dimension was set to 1.86 meters. The initial lateral dimension was determined by taking width of the proposed fueling station canopy (160 feet) and dividing that evenly across 5 volume sources. Spillage was represented in the model using the same locations and dimensions of the refueling volume sources, but with a release height of 0.0 meters, effectively at ground level. For the vehicles in queue waiting to refuel, adjacent volume sources were used to characterize these emissions in the model. The release height was set to 1.7 meters and the initial vertical dimension was set to 0.79 meters. The initial lateral dimension was determined by taking the width of the all the proposed queue lanes together and dividing that evenly across 7 volume sources.

Modeling parameters used to characterize emissions associated with diesel truck idling were based on guidance provided in CAPCOA Workshop's Health Risk Assessments and Land Use presentation (2010). The guidance provides a high vertical or horizontal exhaust release from a point stack. This HRA conservatively assumes that all exhaust parameters from delivery trucks associated with the proposed project would have high horizontal releases. The exhaust parameters used in this HRA for delivery trucks are listed in **Table 5**. The location of the truck emissions was determined based on a typical semitrailer length as defined by the California Department of Transportation (2018). A semitrailer has a maximum length of 48 feet. The location of the delivery truck stacks included in this modeling were located 48 feet away from the delivery bay as the trucks would be positioned with the truck cab farthest from the bay and the trailer closest. A sensitivity analysis was conducted to determine the worst-case location of the truck with a TRU in the model. A 1 g/s emission rate was used along with the stack parameters listed in **Table 5**. Of the four idling truck locations, the worst-case position was located closest to the warehouse building and farther from Sierra College Boulevard. Therefore, the truck with a TRU and the TRU stack were both positioned at the truck bay closest to the warehouse building.

In addition, CAPCOA provides point stack parameters to use in the modeling of TRU emissions sources. The exhaust parameters for the TRU sources are provided in **Table 5**. The location of the TRU emission uses the same methodology described above for the location of the truck emissions, which is approximately 48 feet from the delivery bays given that the location of the exhaust vent/stack would be at the front of the trailer.

Modeling assumed the on-road emissions from operational vehicles associated with the project site as adjacent volume sources. The release height of customer and worker traffic sources was set to 1.7 meters and the initial vertical dimension was set to 0.79 meters. The initial lateral dimensions vary depending on roadway width. For truck deliveries, both to the warehouse and gasoline, the release for these sources was set to 4.25 meters and the initial vertical dimension was set to 2.3 meters. The initial lateral dimensions vary depending on roadway width. On-road traffic within 1/4 mile of the project site was modeled based on inbound and outbound traffic routes outlined in the TIA. **Figures 7** through **12** illustrate the proposed operational on-road vehicle routes modeled for each option. The EMFAC TOG Speciation profile was used to model TACs from vehicles as shown in **Table 6**.

TABLE 5
MODELING PARAMETERS FOR TAC SOURCES

Point Sources						
Source	Model IDs	Stack Orientation	Release Height (m)	Temperature (K)	Exit Velocity (m/s)	Diameter (m)
Gasoline Loading	GAS_L1-L15	Capped[1]	3.66	291.48	0.0071	0.051

4.0 Health Risk Analysis Methodology

Pollutant Concentrations

Emissions from the above sources were run in AERMOD to determine air pollutant concentrations at sensitive receptor locations. AERMOD was run using unit emissions. Each source group was modeled assuming emissions of 1 gram per second (g/s) divided by the number of sources for point sources or 1 g/s divided by the number of volume

sources. The unitized AERMOD results for each source group are output in µg/m^3 per g/s [(µg/m^3)(g/s)$^{-1}$]. Maximum hourly and period-average plot files generated by AERMOD as described above were input to HARP2 with corresponding TAC emission rates for the project operational emissions to calculate project pollutant concentration contributions. These concentrations were then used to estimate the acute and long-term effects of TACs on nearby sensitive receptor locations.

Receptor Exposure and Health Risk Calculations

Exposure factors were used to calculate the dose associated with exposure to the estimated unit concentration results obtained using AERMOD. ARB created the HARP2 software to assist in the development of emissions inventories, dispersion modeling, and risk assessment. For this project, HARP2 was used solely to estimate cancer risk via HARP2's Air Dispersion Modeling and Risk Tool (ADMRT), Version 19121; ADMRT was developed to encapsulate the exposure factors and guidance of the 2015 OEHHA Health Risk Assessment (OEHHA, 2015). AECOM evaluated the 30-year cancer risk for resident receptors through the inhalation, soil ingestion, mother's milk, and homegrown produce pathways, using the OEHHA-Derived Method. Factors that affect the dose that a receptor would receive include but are not limited to age-specific daily breathing rates as well as exposure time, frequencies, and duration. The general formula for calculating residential inhalation risk is as follows:

$$\mathbf{RISK_{inh\text{-}res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH}$$

Where:

$RISK_{inh\text{-}res}$	= Residential inhalation cancer risk
$DOSE_{air}$	= Daily inhalation dose (milligrams/kilogram [mg/kg]-day)
CPF	= Inhalation cancer potency factor (mg/kg-day^{-1})
ASF	= Age sensitivity factor for a specified age group (unitless)
ED	= Exposure duration (in years) for a specified age group
AT	= Averaging time for lifetime cancer risk (years)
FAH	= Fraction of time spent at home (unitless)

The inhalation risk was calculated in HARP2 using the OEHHA 2015 recommended default values for these parameters:

CPF	= Substance-specific
ASF	= 10 for 3rd trimester of pregnancy to age 2, 3 for age 2 to 16, 1 for age 16 to 30
ED	= 0.25 years for 3rd trimester, 2 years for age 0 to 2, 7 years for age 2 to 9, 14 years for age 2 to 16, 14 years for age 16 to 30
AT	= 70 years
FAH	= 1.0 (no adjustment)

The daily inhalation dose is defined as:

$$\mathbf{DOSE_{air} = C_{air} \times \{BR/BW\} \times A \times EF \times 10^{-6}}$$

Where:

$DOSE_{air}$	= Dose through inhalation (mg/kg-day)
C_{air}	= Concentration in air (µg/m^3)
{BR/BW}	= Daily Breathing rate normalized to body weight (Liters/kilogram body weight - day)
A	= Inhalation absorption factor (unitless)
EF	= Exposure frequency (unitless), days/365 days
10^{-6}	= Micrograms to milligrams conversion, liters to cubic meters conversion

The daily inhalation dose will be calculated in HARP2 using OEHHA 2015 recommended default values for these parameters:

C_{air}	= Concentration as calculated from AERMOD

{BR/BW} = OEHHA derived method (i.e. 95th percentile) estimates (361 for 3rd trimester of pregnancy, 1090 for age 0 to 2, 745 for age 2 to 16, 335 for age 16 to 30)
A = 1
EF = 0.96 (350 days/365 days in a year for a resident)

Non-cancer health risks for chronic exposure (a one-year average exposure and an 8-hour average chronic non-cancer health impact from repeated 8-hour exposure) and acute exposure (one-hour average) were calculated by HARP2 using the hazard index (HI) approach for the receptors and toxic substances emitted from the project.

For each TAC, the hazard quotient (HQ) was calculated by dividing the predicted exposure from the model by the reference exposure level (REL) for the substance. The HQs were then summed to calculate the HQ. Because substances may affect different target organ systems, such as the pulmonary or gastrointestinal systems, the HIs were calculated separately for each target organ system, and the highest HI was used to characterize the potential health risks.

The cancer potency factors and RELs used are consistent with the current values published by CARB (2018c). The RELs are intended to represent exposure levels below which adverse health effects do not occur. Therefore, an HI below one indicates that the project will not cause adverse health risks.

HARP2 Output Options

Maximum impact locations include the maximum exposed individual resident (MEIR) and the maximum exposed individual worker (MEIW). The off-site location with the highest estimated impact level for acute exposure is the Point of Maximum Impact (PMI). The PMI typically occurs on or near the property line, where air toxic concentrations are highest. The MEIR is the off-site location of a residence that has the highest estimated impact for each health effect. The MEIW is conservatively assumed to occur at the PMI.

The following HARP2 options were used for the risk analysis to estimate impacts at the PMI, the MEIR, and the MEIW:

- 30-year Resident Cancer Risk – RMP Using the Derived Method
- 9-year (child resident) Cancer Risk – RMP Using the Derived Method
- Worker Cancer Risk – OEHHA Derived Method
- Chronic Hazard Index – OEHHA Derived Method
- 8-hour Average Chronic Noncancer Health Impact – OEHHA Derived Method
- Acute Hazard Index

HRA Results

Health risks are provided in terms of cancer and non-cancer risks, where the non-cancer risks are further divided into chronic (long-term and 8-hour) and acute (short-term) risks. Health risks were evaluated for each of the three configuration options of the proposed project.

Cancer Risk

The HRA included estimates of health risks associated with long-term (multi-year) exposures resulting from emissions of carcinogens. The maximum individual excess cancer risk is an estimate of the highest increased cancer risk an off-site individual can expect from a 30-year exposure to emissions of toxic substances from the facility. None of the TACs listed in Section 2.0 are multi-pathway TACs for cancer risk, therefore the HARP2 model calculates the individual excess cancer risk by summing the contributions due to the inhalation pathway only. The only multi-pathway toxic air contaminants emitted by the facility are benzene (blood), MTBE (kidney, liver, eye) and toluene (central nervous system, reproductive) for non-cancer chronic health effects; these toxics are not multi-pathway carcinogens.

Option A

Table 7 presents the locations and cancer risks for the off-site MEIR and the MEIW for the proposed project Option A scenario. At the MEIR, cancer risk is calculated on a 30-year basis for an adult, and on a 9-year basis for a child, to account for variable residence times. Cancer risk for the MEIW is calculated on a 25-year exposure basis assuming most workers will be present during the same hours as gas station operation. Cancer risks are below the significance level of 10 in a million at the residential and worker receptors. For construction the 8-hour worker period was assumed to be 8 a.m. to 4 p.m. to overlap with construction emissions and for operations the 8-hour worker period was assumed to be 5 a.m. to 1 p.m. to overlap with gasoline dispensing and delivery truck traffic.

Table 7
Summary of Cancer Risks (Option A)

Phase	Cancer Risk (in a Million)		
	30-Yr Resident (MEIR)	9-Yr (Child)	25-Yr (Offsite Worker) (MEIW)
Construction	4.22	4.22	0.12
Operations	2.76	2.05	4.05

Significance Threshold	10.0	10.0	10.0
Exceed Threshold?	No	No	No

Notes: units are in micrograms per cubic meter.
1 MEIR Receptor Location: 655924.60 E, 4297230.73 N
2 MEIW Receptor Location: 655884.60 E, 4296930.73 N

The locations of the MEIR and MEIW for cancer risk are shown in **Figure 15** for the proposed project Option A scenario. The MEIW is located south of the southwestern property boundary. The MEIR is located north of the property. The 30-year cancer risk at the MEIR and 25-year cancer risk at the MEIW by chemical is presented in **Table 8**. **Figures 15** and **16** illustrate the cancer risk above 1 in a million for residential receptors and for workers using contour plots, respectively. These figures are only presented for Option A as this is the controlling scenario with the highest cancer risk out of the three options. The aerial extent of the cancer risk exceeding 1 in a million for Options B and C would be smaller than Option A.

Table 8

6.0 Cumulative Health Risk

This section assesses cumulative cancer risk at off-site sensitive receptors that could result from existing sources, project sources, and other nearby projects.

Cumulative Projects

There are no known other projects located within 1,000 feet of the project site and this project is not adding any new sensitive receptors. Therefore, the cumulative modeling analysis only includes the proposed project.

Cumulative Analysis for Off-site Sensitive Receptors

There are three other gasoline dispensing stations (Arco, Chevron, and 7-Eleven) located within 1,000 feet of the Project as well as the highly traveled I-80 corridor. The Arco station has 16 dispensers, the Chevron station has 12 dispensers, and the 7-Eleven has 12 dispensers, for a total of 40 dispensers. These three gasolines dispensing stations are approximately the same distance from the MEIR as the proposed gasoline dispensing station.

Based on the cancer risk at the MEIR presented in Tables 7, 9 and 11 for the 3 proposed options, over 95% of the cancer risk is due to DPM from construction equipment. The cancer risk due to operations of the project is less than

3.0 in a million for any of the 3 proposed options. At the residences closer to the gasoline dispensing stations, the cancer risk due to operations is 0.89, 0.56 and 0.62 in a million for proposed options A, B and C, respectively. For the 40 dispensers at the other three gasoline dispensing stations, the project cancer risk could be scaled by the number of dispensers such that the cancer risk due to these three existing gasolines dispensing stations would be approximately 0.5 in a million.

The residences located east of the Project, closest to the I-80 corridor, likely receive the highest cancer risk due to DPM from trucks traveling on the highway. Several of these residences are within 500 feet of I-80 but these are further from the Project and the gasoline dispensing stations. The wind direction to expose these residences to DPM emissions from I-80 is different than that of the Project. Therefore, impacts on these residences would be either from the Project or from the on-road sources along I-80 and not the sum of the two. Given that the exposures from the Project are below 2 in a million for these residences, the cumulative risks would be less than significant.

7.0 Uncertainties

In accordance with risk assessment guidance, the following discussion summarizes the main uncertainties associated with the emissions estimation, air dispersion modeling, and risk estimation components of the HRA methodology.

Emissions Estimates

Uncertainties exist in estimating emissions from operational TAC emissions from potential stationary sources associated with the fueling station as new CAPCOA guidance regarding estimating risk from fueling stations will be released in the coming months.

Air Dispersion Modeling

In addition to the uncertainty associated with emission estimates, uncertainty exists regarding the pollutant concentrations estimated by the air dispersion model. The limitations of the air dispersion model provide a source of uncertainty in the estimation of exposure concentrations. According to EPA, errors attributable to the limitation of the algorithms implemented in the air dispersion model in the highest estimated concentrations of +/- 10 percent to 40 percent are typical (EPA, 2017). AECOM's methodologies use conservative assumptions and techniques to produce conservative results; thus, predicted exposure concentrations are likely to be at or above actual exposure concentrations.

The source parameters used to model emission sources add uncertainty. For all emission sources, AECOM uses source parameters that are either recommended as defaults or expected to produce more conservative (worst-case) results. Discrepancies might exist between the actual emissions characteristics of a source and its representation in the model; exposure concentrations used in this assessment represent approximate exposure concentrations.

Health Risk Analysis

Numerous assumptions must be made to estimate human exposure to pollutants. These assumptions include parameters such as breathing rates, exposure time and frequency, exposure duration, and human activity patterns. While a mean value derived from scientifically defensible studies is the best estimate of central tendency, most exposure variables used in this HRA are high-end estimates. For example, it is assumed that residential receptors would be exposed to project emissions for 8,760 hours per year. This assumption is highly conservative because most residents do not remain in their homes for this period, and the gas station is anticipated to only operate daily from 5 a.m. to 10 p.m. The combination of several high-end estimates used as exposure parameters may substantially overestimate chemical intake. The excess lifetime cancer risks calculated in this assessment are therefore likely to be higher than may be required to be protective of public health.

The OEHHA Cancer Potency Factor (CPF) for diesel PM is used to estimate cancer risks associated with exposure to diesel PM from the project and off-site emissions. However, the CPF derived by OEHHA for diesel PM is highly uncertain in the estimation of both response and dose. In the past, because of inadequate animal test data and epidemiology data on diesel exhaust, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization, had classified diesel PM as Probably Carcinogenic to Humans (Group 2); EPA had also

concluded that the existing data did not provide an adequate basis for quantitative risk assessment (EPA, 2002). However, based on two recent scientific studies (Benbrahim-Tallaa et al., 2012; Attfield et al, 2012), IARC recently reclassified diesel PM as Carcinogenic to Humans (Group 1) (IARC, 2012), which means that the agency has determined that there is "sufficient evidence of carcinogenicity" of a substance in humans and represents the strongest weight-of-evidence rating in IARC's carcinogen classification scheme. This determination by IARC may provide additional impetus for EPA to identify a quantitative dose/response relationship between exposure to diesel PM and cancer.

OEHHA notes that the conservative assumptions used in a risk assessment are intended to avoid underestimation of actual risks posed by a site and are designed to err on the side of health protection (OEHHA, 2015). The estimated risks in this HRA are based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. Although it is difficult to quantify the uncertainties associated with all the assumptions made in this risk assessment, the use of conservative assumptions is likely to result in substantial overestimates of exposure, and hence, risk.

1.0 INTRODUCTION

On behalf of Costco Wholesale, Huffman-Broadway Group, Inc. (HBG) has prepared a Biological Resources Report for the Costco Wholesale Project in The Town of Loomis, Placer County, California. It is expected that this Biological Resources Report will be incorporated into an environmental document prepared by Placer County to satisfy requirements of the California Environmental Quality Act (CEQA). This report describes biological resources and ecological constraints present on the 17.88-acre Project Site, including the presence of sensitive habitats and an evaluation of the potential for rare, threatened, or endangered species of flora and/or fauna to occur at the site or in the project vicinity. The report also includes a preliminary review of biological impacts associated with implementation of the project and recommended mitigation measures, as needed.

Our analysis included a review of pertinent literature on habitat characteristics of the site, species of plants and animals expected to utilize the site, a review of planning documents referencing ecological aspects of the site, and field site surveys. The Biological Resources Report also incorporates the results of a wetland jurisdictional determination prepared for the site by Salix Consulting Inc., in May of 2016. This report was a detailed delineation of wetlands and waters of the United States at the property, conducted per criteria of the U.S. Army Corps of Engineers, and the results of the wetland delineation are summarized herein. Also considered is an Arborist's Report prepared by Mann Made Resources. Both the wetland delineation and arborist's report are included as attachments. The California Natural Diversity Data Base (CNDDB) was consulted to determine if any populations of endangered, threatened, or rare species have occurred historically or currently are known to exist near the project. The study site was surveyed by HBG biologists during February of 2017.

2.0 PROJECT DESCRIPTION

2.1 Location of Project Site

The Project Site is in the Town of Loomis in Placer County, California. The site is north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. The location corresponds to Section 28 of Township 11 North and Range 7 East on the 7.5 minute Rocklin, CA United States Geological Survey (USGS) quadrangle (Figure 1). The latitude and longitude of the approximate center of the site are 38°48'34" North and121°12'16" West. The Assessor Parcel Numbers (APNs) are 045-042-011, 045-042-012,045-042-023, 045-042-034, 045-042-035, 045-042-036, and 045-042-037.The property is located on the Loomis 7.5-minute U.S. Geographic (USGS) topographic quadrangle map.

Refer to Exhibit 1, Figure 1 for the project site location map, Figure 2 for the location of the project on the Loomis USGS 7.5-minute quadrangle map, and Figure 3 for an aerial photograph of the project site.

2.2 Project Description

Costco Wholesale is proposing to construct a Costco facility at the site as shown in Figure 4. The facility includes the Costco warehouse and associated parking and other planned infrastructure. The proposed project would cover the entire site.

3.0 EXISTING SETTING

3.1 Site Description

The Project Site is in the Town of Loomis in Placer County, California. The site is north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. Adjacent land uses include a multi-family residential building along the northern boundary the Homewood Lumber complex to the north, single family residential to the east, commercial and undeveloped land to the south, and an office building and undeveloped land to the west (Figure 3). The study area is bounded by Brace Road to the north and Sierra College Boulevard to the west.

General features of the project site are as follows:

- **Soils and Topography**. One soil unit is mapped in the study area (Figure 5): Andregg coarse sandy loam, 2 to 9 percent slopes. Andregg soils are well drained and have moderately rapid permeability. This soil is neither ponded nor flooded. This soil does not meet hydric criteria. The study area is located at an elevation between approximately 320 and 340 feet. The topography of the study area gently slopes to the west.

- **Hydrology**. The Project Site is in the Dry Creek watershed (Hydrologic Unit Code 1802011101), as shown in the watershed map of Figure 6. A wetland swale and drainage ditch located in the southwest corner of the site drain water westerly and convey water offsite through culverts underneath Sierra College Boulevard. Water continues to drain westerly on the adjacent property and drains into Sucker Ravine which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River. The constructed drainage in the northeastern corner conveys storm water and urban runoff from the residential development to the east through a storm drain system.

- **Vegetation**. Based on field reconnaissance by HBG conducted in February 2017 and review of the wetland jurisdictional report (Salix 2016), the Project Site is made up of Valley Oak Woodland, Annual Grassland and Valley Freshwater Marsh. Details of vegetation are provided below in Section 3.2.

- **Climate**. Loomis has a temperate Mediterranean climate with dry hot summers and mild winters. Average high temperature typically varies from 54 degrees F in the winter to approximately 92 degrees in the summer. Average rainfall for the area is approximately 25 inches per year, most occurring between November and April.

3.2 Biological Setting

3.2.1 Plant Communities

An HBG biologist conducted field reconnaissance of the project site on February 11, 2017. All habitats on the project sites were surveyed on foot and assessed for similarity to sites known to support special status species within the area. Qualitative information on the composition and distribution of plant species on the sites was obtained during the site visits. Plant communities were identified on aerial photographs of the site.

Vegetation communities are assemblages of plant species growing in an area of similar biological and environmental factors. Vegetation communities and habitats at the project site were identified based on the currently accepted List of Vegetation Alliances and Associations (or Natural Communities List) (CDFW 2010). The list is based on A Manual of California Vegetation, Second Edition (Sawyer and Keeler-Wolf 2009), which is the National Vegetation Classification applied to California. The project site contains three habitat types per this classification: Valley Oak Woodland (7.96 acres), Annual Grassland (10.16 acres), and Valley Freshwater Marsh (0.15 acres). Figure 7 shows the extent and distribution of vegetation types on the property. A list of plant species identified on the property during surveys is included in Attachment 2, Table 1. The main source for the plant list in Table 1 was the wetland delineation report prepared by Salix (2016), which was augmented with additional species noted during surveys by HBG.

Wetland habitats on-site were further classified using the U.S. Fish and Wildlife's Service's "Classification System for Wetland and Deepwater Habitats" (Cowardin et al. 1979); the wetlands at the property are defined as palustrine emergent seasonal wetlands, palustrine emergent vernal pools, and palustrine scrub-shrub wetlands per the Cowardin et al criteria.

Annual Grassland

Annual grassland is the predominant habitat type on site, comprising 10.16 acres, or approximately 56% of the land area. The Annual Grassland found on the property is comprised largely of non-native grasses and forage species. Grasses included Italian ryegrass *(Festuca perennis)*, ripgut grass (*Bromus diandrus)*, soft chess (*Bromus hordeaceus)*, wild oat (*Avena fatua)*, hedgehog dogtail (*Cynosurus echinatus*,) foxtail barley (*Hordeum jubatum)*, and medusahead (*Elymus caput-medusae)*. Forbs present include Italian thistle (*Carduus pycnocephalus*), California mugwort (*Artemisia douglasiana)*, field hedge parsley (*Torilis arvensis)*, klamathweed (*Hypericum perforatum)*, broad-leaf filaree (*Erodium botrys*,) common vetch (*Vicia sativa)*, and cut-leaf geranium (*Geranium dissectum)*, yellow starthistle (*Centaurea solstitialis)*, rose clover (*Trifolium hirtum)*, smooth's cat-ear (*Hypochaeris glabra)*, common fiddleneck (*Amsinckia menziesii)*, short-podded mustard (*Hirschfeldia incana)*, and bindweed (*Convolvulus arvensis*). The annual grassland onsite appears to be disked annually.

Valley Oak Woodland

Valley Oak Woodland comprises 7.96 acres or approximately 44% of the site. The foothill woodland varies in density throughout the site, being mostly open, and it is dominated by

valley oak (*Quercus lobata)* and interior live oak (*Quercus wislizeni)*, with a small number of blue oak (*Quercus douglasii)*, and a few scattered foothill pines (*Pinus sabiniana)*. Shrubs in the understory include thickets of coyote brush (*Baccharis pilularis)* and Himalayan berry (*Rubus armeniacus)*. Groundcover is mostly the non-native herbaceous plants and grasses that are noted as occurring in the Annual Grassland above.

A tree survey conducted on the site by Mann Made Resources (see Attachment 3) found 372 trees that were determined to be of protected size. These 372 trees consisted of 284 valley oaks, 86 Interior live oaks, and two blue oaks. Of these, 162 trees were found to be in good or fair condition and 210 trees were found to be in poor, very poor, or dead condition. The 210 trees included 68 trees in poor condition, 38 trees in very poor condition, and four trees that were dead. The Tree Preservation Ordinance of the Town of Loomis provided the requirements for data collection; blue oaks 4 inches in diameter and greater and valley and interior live oaks 6 inches in diameter and greater are considered Protected Trees. Detailed information regarding all trees on the property is included in the Tree Report (Mann Made Resources, see Attachment 3), including information on species, size, condition, suitability for preservation.

The California Oak Woodlands Conservation Program recognizes oak woodlands as a vital statewide resource providing benefits including wildlife habitat, monetary and ecological value, and an ability to reduce soil erosion, enhance water quality and moderate temperatures.

Valley Freshwater Marsh

Valley Freshwater Marsh habitat occurs within three separate swales occurring on the property. The marsh habitats total 0.15 acres. The three separate wetland swales are shown in Figure 7 and are described in detail in Section 3.2.3 (Wetland and Other Waters of the U.S. Delineation).

One of three swales flows westerly through the oak woodland into a culvert under Sierra College Boulevard. The eastern end of the swale is a small open area dominated by iris leaf rush (*Juncus xiphioides)*. The swale flows through a patch of coyote brush, and the lower portion of the swale includes wetland plant species such as hyssop loosestrife (*Lythrum hyssopifolia)*, curly dock (*Rumex crispus)*, prickly lettuce (*Lactuca serriola*,) Italian ryegrass, and Mexican rush *(Juncus mexicanus)*. A short swale in the northeast corner of the site is vegetated with Himalayan blackberry and flows under Starlight Lane. The third swale in the southwestern corner of the study area is an area where stormwater runoff drains onto the Project Site from nearby commercial development and travels about 175 feet before exiting the site through a culvert under Sierra College Boulevard. Wetland species such as water plantain (*Alisma triviale)*, speedwell (*Veronica* sp.), moth mullein (*Verbascum blattaria)*, water cress (*Nasturtium officinale)*, and curly dock are present.

3.2.2 Animal Populations

The species discussed in this study are based on review of available literature, visits to the area by HBG wildlife biologist for many years, and habitat observations made during qualitative surveys conducted by an HBG wildlife biologist on February 11, 2017. A complete listing of the references from which information was compiled on the flora and fauna inhabiting the region is

contained in the References section. Table 1 (Attachment 2) provides species lists based on these reconnaissance level observations for reptiles, amphibians, birds and mammals. The table lists all wildlife species observed or expected on the project sites and in the site vicinity and includes the scientific names of all species mentioned in the text.

The wetland habitats and the disturbed annual grassland and oak woodland habitats onsite support a variety of wildlife species. The complex of habitats includes the presence of small streams that can accommodate wildlife adapted to aquatic areas, and upland vegetation that provides potential foraging areas for species of mammals, reptiles, amphibians and birds. Native trees and shrubs are present along with native and non-native herbaceous plants and grasses that provide a mix of habitats suitable to support nesting by a variety of both passerine and non-passerine avian species.

Much of the wildlife observed at the site during the February 11 field reconnaissance included resident and wintering species of birds that are adapted to the mix of wetland and upland habitats found at the site. Resident bird species observed during the field review, many of which may also nest at or in the vicinity of the site, include red-shouldered hawk, Anna's hummingbird, mourning dove, Northern flicker, acorn woodpecker, Nuttall's woodpecker, black phoebe, western bluebird, California scrub-jay, European starling, Northern mockingbird, oak titmouse, bushtit, white-breasted nuthatch, Bewick's wren, California towhee, white-crowned sparrow, song sparrow, purple finch and house finch. Species observed that are expected only during the winter include red-breasted sapsucker, American robin, hermit thrush, ruby-crowned kinglet, yellow-rumped warbler, and golden crowned sparrow. Additional neotropical migrants that could be expected to nest at the site during the spring and summer months include Pacific-slope flycatcher, western wood-pewee, western kingbird, ash-throated flycatcher, black-headed grosbeak and Bullock's oriole. Additional wildlife surveys will be conducted by an HBG wildlife biologist in late-April or May of 2017.

Although no mammals were documented at the site, it is expected that mammals adapted to urban environments would be found on the property including striped skunk, raccoon, Virginia opossum, deer mouse and mule deer. Despite looking under logs and boards, no reptiles were observed and the only amphibian recorded was Pacific treefrog. Additional amphibians likely include western toad, and common reptiles likely include western fence lizard, southern alligator lizard, western skink, ringneck snake, gopher snake and common garter snake.

3.2.3 Wetland and Other Waters of the U.S. Delineation

Definitions of Wetlands and Other Waters of the U.S.

The Department of the Army, acting through the U.S. Army Corps of Engineers (Corps), has the authority to permit the discharge of dredge or fill material in waters of the U.S. under Section 404 of the Clean Water Act (CWA), and permit work and placement of structures in navigable waters of the U.S. under Section 10 of the Rivers and Harbors Act of 1899 (RHA).

EPA and the Corps define wetlands as: "areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal

circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (EPA regulations at 40 CFR § 230.3(t); Corps regulations at 33 CFR § 328.3(b)). The term "*under normal circumstances*" refers to situations in which the vegetation has not been substantially altered by man's activities as defined in Appendix A of the Corps' 1987 *Wetlands Delineation Manual*. Clarification of the term, as it pertains to farmed wetlands, was furthered defined in Regulatory Guidance Letter 90-7 dated September 26, 1990, as "the soil and hydrologic conditions that are normally present, without regard to whether the vegetation has been removed."

Under Section 10 of the Rivers and Harbors Act of 1899, the Corps also regulates the construction of structures in, over, or under; excavation of material from; or deposition of material into navigable waters. As described by Corps' regulation 33 CFR § 329.4, the general definition of "navigable waters" includes those waters subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or might be susceptible for use to transport interstate or foreign commerce. Several factors must be examined when making a determination whether a waterbody is a navigable water. These factors include (a) past, present, or potential presence of interstate or foreign commerce; (b) physical capabilities for use by commerce and (c) defined geographic limits of the waterbody. A determination of navigability, once made by the Corps, applies laterally over the entire surface of the water body, and is not extinguished by later actions or events which impeded or destroy navigable capacity. Based on this provision, the Corps also has the discretion to regulate activities in historically navigable waters. Historically navigable waters are areas that were navigable in the past, but are no longer navigable because of artificial modifications, such as levees, dikes, and dams.

Furthermore, waters of the U.S. can be defined by exhibiting a defined bed and bank and ordinary high water mark (OHWM). The OHWM is defined by the Corps as "that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 C.F.R. §328.3(e)).

Detailed Wetland and Other Waters of the U.S. Delineation-Methodology

Salix Consulting, Inc. conducted a preliminary wetland delineation of the property in May of 2016 (Salix Consulting 2016) in accordance with Code of Federal Regulations (CFR) definitions of jurisdictional waters, the Corps' 1987 *Wetlands Delineation Manual* (1987 Manual), the Corps' 2008 *Regional Supplement to Corps of Engineers Wetland Delineation Manual: Arid Wes, Version 2.0* (Arid West Regional Supplement) and supporting guidance documents. The 1987 Manual provides technical guidance and procedures, from a national perspective, for identifying and delineation of wetlands that may be subject to Section 404 of the CWA. Pursuant to the 1987 Manual, key criteria for determining the presence of wetlands are: (a) the presence of inundated or saturated soil conditions resulting from permanent or periodic inundation by groundwater or surface water; and (b) a prevalence of vegetation typically adapted for life in saturated soil conditions (i.e., hydrophytic vegetation). Explicit in the definition is the consideration of three environmental parameters: hydrology, soil, and

vegetation. The Arid West Regional Supplement presents wetland indicators, delineation guidance, and other information that is specific to the Arid West Region. The combined use of the 1987 Manual and Arid West Regional Supplement enhances the technical accuracy, consistency, and credibility of wetland determinations.

Detailed Wetland Delineation-Results

A total of 0.15 acres of vegetated palustrine emergent wetlands were found within the project site as shown in Figure 8. This finding is based on the collective presence of hydric soil, wetland hydrology, and wetland vegetation indicators. The identified palustrine emergent wetlands contained low chroma soils, evidence of wetland hydrology and vegetation adapted for life in saturated soil conditions. The 0.15 acres of vegetated wetlands on the project site are palustrine emergent seasonal wetlands and palustrine scrub-shrub wetlands per Cowardin et al. (1979) criteria. The wetlands mapped on site consist of areas located within the three drainages found on the property. The 0.15 acres of jurisdictional waters of the US serve the functions of flood flow alteration, groundwater recharge, sediment reconstruction, sediment/toxicant retention, nutrient removal/ transformation, production export, and wildlife habitat.

Aquatic resources within the Study Area and adjacent to the Study Area were examined with respect to the *Solid Waste Agency of Northern Cook County* (*SWANCC) v. U.S. Army Corps of Engineers*, 531 U.S. 159 (2001) exclusion from Clean Water Act regulation. No areas were found that could either potentially be exempted or excluded from regulation in accordance with SWANNC. HBG has also reviewed the wetlands with respect to the *Rapanos v. United States* and *Carabell v. United States* 547 U.S. 715 (2006) and found the areas in question to be jurisdictional pursuant to the Corps criteria.

The wetland map was verified by the Sacramento District of the Corps of Engineers on June 14, 2016. Three areas of jurisdictional wetland have been verified on the property. These are noted in Figure 8 as Wetland Swale (WS)-1, WS-2 and WS-3 and are described below with information contained the wetland delineation report (Salix Consulting 2016).

- WS-1 (0.12 acres) occurs within the foothill woodland habitat. The swale begins in the middle of the study area, where it collects surface water (in the form of sheet flow) and then drains westerly, where it then exits the study area through a culvert underneath Sierra College Boulevard. The swale then continues west to culvert adjacent to Sierra College Boulevard.

- WS-2 (0.01 acres) enters the study area through a culvert along the eastern boundary in the northeast corner of the study area. The swale appears to convey stormwater runoff and urban water westerly for approximately 80 feet within the study area, and then exits the study area through a culvert underneath Starlight Lane.

- WS-3 (0.02 acres) occurs in the southwestern corner of the study area, where stormwater runoff drains onto the study area through an 18-inch PVC culvert located on the commercial development (McDonald's/Chevron) to the south. The swale continues

for approximately 175 feet west until it merges with a narrower excavated ditch that drains water from a 12-inch concrete culvert located under the commercial development to the south. Water exits the study area along the western boundary through a 30-inch corrugated metal pipe culvert under Sierra College Boulevard.

3.2.4 Special Status Species

Sensitive species include those species listed by the federal and state governments as endangered, threatened, or rare or candidate species for these lists. Endangered or threatened species are protected by the federal Endangered Species Act of 1973 as amended, the California Native Plant Protection Act of 1977, and the California Endangered Species Act of 1970. The California Environmental Quality Act (CEQA) provides additional protection for unlisted species that meet the "rare" or "endangered" criteria defined in Title 14, California Code of Regulations, Section 15380.

The CDFW maintains records for the distribution and known occurrences of sensitive species and habitats in the California Natural Diversity Database (CNDDB). The CNDDB is organized into map areas based on 7.5 minute topographic maps produced by the U.S. Geological Survey (USGS). All known occurrences of sensitive species and important natural communities are mapped onto the quadrangle map. The database gives further detailed information on each occurrence, including specific location of the individual, population, or habitat (if possible) and the presumed current state of the population or habitat. The Project Site is in the Rocklin 7.5-minute USGS topographic quadrangle map. The relevant adjacent quads within the search area are the Roseville, Lincoln, Gold Hill, Auburn, Pilot Hill, Folsom, and Citrus Heights quadrangles. HBG collected all information contained within the CNDDB regarding special status species within a 10-mile radius of the Project Site.

A search of the CNDDB records of occurrence for special status animals and plants and natural communities within these quadrangles indicated that none have been documented as occurring on the Project Site itself, but that a number of special status animal species have been known to occur in the project vicinity. The absence of a special animal, plant, or natural community from the report does not necessarily mean they are absent from the area in question, but only that no occurrence data have been entered for that species or natural community in the CNDDB inventory. The occurrence of special status plant and animal species near the project area may be an indication that they also could occur at the Project Site, depending on habitat conditions at the site. Therefore, occurrences of special status species throughout the quadrangles mentioned above were noted in considering the potential presence of these species on the Project Site.

An evaluation of all special status plant species reported near the Project Site is presented in Table 3 (Attachment 2). Table 4 presents an evaluation of special status animal species that have been reported near the project.

Special Status Plant Species
Special status plant species include: (i) species that are listed or proposed for listing as threatened or endangered under the federal Endangered Species Act; (ii) species that are listed, or proposed for listing by the state of California as threatened or endangered under the California Endangered Species Act; (iii) plants considered by the California Native Plant Society (CNPS) to be rare, threatened, or endangered in California and elsewhere; and (iv) plant species that meet the definition of rare or endangered under CEQA.

A target list of special status plants found within 10 miles of the site is shown in Table 3 that includes all species mentioned in the CNDDB occurring within 10 miles of the project site. Many of the species mentioned in the CNDDB as occurring within 10 miles of the project require habitats that are not found on the Project (e.g., vernal pools, chaparral, coniferous forest) or microhabitat conditions such as soils that do not occur on the property (gabbro or serpentine). Based on field review of the habitats and conditions occurring on the site, HBG has determined that several species are possible at the Project Site. These species are listed below along with their flowering periods (Munz and Keck 1973).

- Big-scale balsamroot (*Balsamorhiza macrolepis var. macrolepis*) a CNPS List 1B.2 plant, that is sometimes, but not always found in serpentine. Flowering period from March to June.
- Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*), a CNPS List 4.2 plant. Flowering period from May to July.
- Stinkbells (*Fritillaria agrestis*), a CNPS List 4.2 plant, that is sometimes, but not always found in serpentine. Flowering period from March to June.

A systematic survey of the site for special status plant species is planned for the spring and summer of 2017. Dr. Terry Huffman, Ph.D. botanist, will conduct systematic surveys both early and late in the flowering period of target species. Surveys will be conducted between late-March and late-June.

Special Status Animal Species
The special status animal species evaluated in Table 4 (Attachment 2) include those noted in the CNDDB as occurring within 10 miles of the site and those that are known to occur in the general vicinity based on the knowledge of HBG biologists. Key species are either known to occur in the vicinity of the property or with a potential to occur at the site, or that require specific study to determine presence/absence, are discussed below.

HBG has consulted the CDFW California Natural Diversity Data Base (CNDDB) to ascertain the potential for special status animal species occurring within the 7.5-minute quadrangle map areas in the project site vicinity. The CNDDB indicates that seven special status species deserve note as having occurred within the 10-mile radius of the site: vernal pool fairy shrimp (*Branchinecta lynchi*), California linderiella (*Linderiella occidentalis*), Steelhead-Central Valley DPS *(Oncorhynchus mykiss irideus),* Western spadefoot toad (*Spea hammondii*), burrowing owl (*Athene cunicularia*), Swainson's hawk (*Buteo swainsoni*) and tricolored blackbird *(Agelaius*

tricolor). These species are discussed below. Other species found to occur within the general CNDDB search area, or determined to be potentially present based on the knowledge of the investigators, are evaluated in Table 4.

HBG wildlife biologist Gary Deghi conducted a variety of special status species surveys and habitat assessments on the project site during a field visit conducted on February 11, 2017. The field work included an evaluation of wetlands swales areas for suitability to support the vernal pool fairy shrimp, vernal pool tadpole shrimp and western spadefoot toad. Gary Deghi of HBG also conducted habitat evaluations related to other special status species including possible use of the site by special status raptors (including Swainson's hawk, burrowing owl, white-tailed kite and others) and other special status species such as Western pond turtle, tricolored blackbird and loggerhead shrike.

Listed Vernal Pool Large Branchiopods

The two most common of the large branchiopods occurring in the Central Valley, that are listed under the federal Endangered Species Act, are the threatened vernal pool fairy shrimp (VPFS, *Branchinecta lynchi*) and endangered vernal pool tadpole shrimp (VPTS, *Lepidurus packardi*). These large branchiopods are ephemeral creatures. When the temporary water bodies that they inhabit dry up, the population remains in the dry basin as cysts (embryonic eggs). These cysts can withstand harsh conditions (i.e., freezing and desiccation) while they await the return of rain to fill their pools. After the appropriate environmental conditions (i.e., water temperature, pH, oxygen concentration, etc.) prevail, the young hatch, quickly mature, and then mate to ensure the next generation.

Potential habitat for listed large branchiopods is considered any seasonally-inundated depression that on average ponds water at a sufficient depth and duration for a listed branchiopod to complete its lifecycle. Potential habitat for the VPFS and VPTS are defined as any seasonal inundated depression that on average ponds water 2.0 inches or greater in depth for 14 or more consecutive days and 30 or more consecutive days, respectively.
Generally, these habitats occur within the California Floristic Province at elevations below 5,600 feet in Coast Range and below 3,000 feet elevations for the rest of the State and Oregon. Habitats that swiftly flow water (e.g., creeks, streams, and ephemeral drainages) or semi-to-permanently inundated areas that support perennial population of predators (e.g. bullfrogs, fish, and crayfish) are generally not considered suitable habitat for federally listed large branchiopods.

The records search of the CNDDB (CDFW 2017) revealed occurrences of the VPFS or VPTS within vernal pool landscapes as close at about 3 miles to the south and west of the Project Site. It was determined that the seasonal swales at the Project Site were flowing-water systems of insufficient depth that do not exhibit the characteristics that would accommodate use of the site by either of these listed species of vernal pool crustacean.

California Linderiella

The California linderiella (*Linderiella occidentalis*), also known as the California fairy shrimp, is

not listed by the federal ESA or CESA, but was at one time a federal species of concern and is listed by the International Union for the Conservation of Nature (IUCN) as a species threatened with extinction. It is generally found in the same types of aquatic habitats as vernal pool fairy shrimp and frequently co-occurs with this species. This species tends to live in large, fairly clear vernal pools and lakes. However, they can survive in clear to turbid water with a pH from 6.1 to 8.5, and they have also been found in very small pools. They are tolerant of water temperatures from 41 degrees to 85 degrees F, making them the most heat tolerant fairy shrimp in California. The California fairy shrimp is the most common fairy shrimp in the Central Valley. It has been documented in most land forms, geologic formations and soil types supporting vernal pools in California, at altitudes as high as 3800 feet above sea level. The range extends from Shasta County south to Fresno County and across the valley to the coast and Transverse Ranges from Willits in Mendocino County south to near Sulfur Mountain in Ventura County.

The CNDDB documents that California linderiella have occurred in vernal pool landscapes as near as two miles south of the Project Site. None of the seasonal wetlands found on the Project Site have inundation characteristics making them suitable to support California linderiella.

Steelhead- Central Valley DPS

Central Valley steelhead was originally listed in 1998 as a threatened species and the listing was reconfirmed in January of 2005. The Central Valley Distinct Population Segment (DPS) includes all naturally spawned populations of steelhead (and their progeny) in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco Bay and San Pablo Bays and their tributaries. Central Valley steelhead spawn and rear, or have the potential to spawn and rear, in western Placer County streams, including Coon Creek, Doty Ravine, Auburn Ravine, Secret Ravine, and Miners Ravine. In the project area, Central Valley steelhead are found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine, located about four miles southwest of the Project Site.

Steelhead are anadromous, but some individuals may complete their life cycle within a given river reach. Historical records indicate that adult steelhead enter the mainstem of the Sacramento River in July, peak in abundance in September and October, and continue migrating through February or March. Most steelhead spawn from December through April, with the most spawning occurring from January through March. Unlike Pacific salmon, some steelhead may survive to spawn more than once, returning to the ocean between spawning migrations. Juvenile migration to the ocean generally occurs from December through August. Most Sacramento River steelhead migrate in spring and early summer. After 2 to 3 years of ocean residence, adult steelhead return to their natal stream to spawn as 3- or 4-year-olds.

Local populations of Central Valley steelhead are found in Dry Creek and its tributaries, most notably in Secret Ravine and Miners Ravine. The CNDDB (CDFW 2017) reports that the mainstem of Dry Creek is used by the fish as a migratory corridor as the water quality and substrate are too degraded so support spawning. Spawning and rearing habitat is found in tributaries upstream from Dry Creek, including both Secret Ravine and Miners Ravine, which are located about four miles southwest of the Project Site. Electrofishing surveys conducted in

2004 caught 136 steelhead in Secret Ravine and evidence of spawning was also reported in 2007. Cottonwood Dam was a barrier to fish passage in Miners Ravine until the dam's collapse in 2009.

Western Spadefoot Toad

The western spadefoot toad (*Scaphiopus hammondi*i) is a state-designated species of special concern that is known from the Central Valley and adjacent foothills, and from the coast ranges south of San Francisco Bay to Baja California. Western spadefoot toads require presence of an aquatic habitat for breeding and a terrestrial habitat for feeding and aestivation. Western spadefoot toads are mostly terrestrial, using upland habitats to feed and burrow in for their long dry-season dormancy. The species primarily occurs in grasslands habitat, typically near extensive areas of friable soils (but usually not sandy), but can occur in valley-foothill woodlands, coastal scrub and chaparral communities below 3,000 ft. elevation.

The western spadefoot toad requires seasonally-inundated wetlands for reproduction and metamorphosis, but have been known to utilize slow-mowing waters and pools within washes, river floodplains, alluvial fans, alkali lakes and playas. They mate during the rainy season (generally from January to March), usually after heavy rains. Potential western spadefoot toad breeding habitat includes any seasonally to semi-permanently inundated depression that on average ponds water at a sufficient depth and duration for a toad to complete its lifecycle (eggs to metamorphous) which occurs in the known range of the species. Habitats that swiftly flow water (e.g., creeks, streams, and ephemeral drainages) or support populations of predators (e.g. bullfrogs, fish, crayfish) are generally not considered suitable habitat for western spadefoot toad larvae.

The CNDDB reports occurrences of western spadefoot toad in suitable habitat approximately 3.5 miles southwest of the Project Site. A review of habitat conditions found on the site during field studies conducted on February 11, 2017 revealed that the seasonal swales are flowing streams of insufficient depth and duration to support the western spadefoot toad.

Swainson's Hawk

The Swainson's hawk (*Buteo swainsoni*) is a medium-sized hawk that is state-listed in California as threatened species and designated by the USFWS as a Bird Species of Conservation Concern. Most Swainson's hawk territories in the Central Valley are in riparian systems adjacent to suitable foraging habitats. Valley oak, Fremont cottonwood, walnut and large willows with an average height of about 58 feet, and ranging from 41 to 82 feet, are the most commonly used nest trees in the Central Valley (CDFG 2007), but eucalyptus is also commonly used. Swainson's hawks often nest peripherally to riparian systems of the valley as well as utilizing lone trees or groves of trees in agricultural fields. Suitable foraging areas include grasslands, pastures, alfalfa and other hay crops, and certain grain and row croplands. In the Central Valley, Swainson's hawks find suitable foraging habitat in such agricultural areas near suitable nest sites, however, nesting habitat is in decline due primarily to flood control projects, agricultural practices, and urban development. The current population of Swainson's hawk in California's Central Valley is estimated at 1,948 breeding pairs (CDFW 2007), with most of this population occurring in the

area from Stanislaus County north to Butte County.

The nearest documentation of nesting Swainson's hawk is about 7 miles west of the Project Site, according to the CNDDB. Swainson's hawk is much more likely to nest in trees near riparian habitats or agricultural fields on the Valley floor rather than in oak woodland in the foothills, such as found at the Project Site. Use of the Project Site by this species is probably limited to occasional visits while foraging. Nevertheless, spring surveys of the site planned by an HBG wildlife biologist between late-April and May of 2017 will include searches for this species.

Burrowing Owl

Burrowing owl (*Athene cunicularia*) is a state species of special concern and designated by the USFWS as a Bird Species of Conservation Concern. Burrowing owls are small terrestrial owls commonly found in open grassland topography ranging from western Canada to portions of South America. Burrowing owl habitat can be found in annual and perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. In California, burrowing owls most commonly use ground squirrel burrows, but they also may use man-made structures, such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement. Burrowing owls may use a site for breeding, wintering, foraging, and/or migration stopovers during migration. Occupancy of suitable burrowing owl habitat can be verified at a site by an observation of at least one burrowing owl, or, alternatively, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance.

The nearest report of burrowing owl in the CNDDB is more than eight miles west of the site. A survey of the project area was conducted by HBG wildlife biologist Gary Deghi during the February 11, 2017 site visit, and no burrowing owls were observed. The site is also lacking in colonies of California ground squirrels that are the most common burrow occupied by burrowing owl. In addition, habitat at the Project Site was found to be unsuitable to support burrowing owl, as heights of herbaceous plants and grasses throughout the onsite uplands were too high to support foraging by this species. Based on these findings, it is very unlikely that burrowing owl occurs on the Project Site. In addition, no California ground squirrels or their burrows were observed anywhere on the site during field review, indicating that presence of burrowing owl on the property is extremely unlikely. Nevertheless, spring surveys of the site planned by an HBG wildlife biologist between late-April and May of 2017 will include searches for this species.

Tricolored Blackbird

Tricolored blackbird (*Agelaius tricolor*) is a Candidate for listing as Endangered under CESA and is also designated by the USFWS as a Bird Species of Conservation Concern. Commencing on December 29, 2014, tricolored blackbird nesting colonies were given a six-month emergency listing as an endangered species under the California Endangered Species Act. Tricolored blackbird is a highly colonial nesting species that breeds near freshwater, preferably in emergent wetlands with tall, dense growth of cattails or tules. Even when the preferred nesting substrates are available, other vegetation may be used for nesting including sedges, nettles,

willows, thistles, mustard, blackberry, wild rose, foxtail grass or barley. Since the 1970s with declines in populations, nesting in cereal crops and dairy silage has been documented. Tricolored blackbird foraging areas include rangeland, fields of alfalfa or cut hay, or irrigated pastures with an abundance of insects. No areas of the Project Site provide suitable habitat for a nesting colony of tricolored blackbird, nor do onsite habitats provide foraging habitat for the species.

Special Status Raptor Species- Six raptor species designated with special status by the State of California have a small potential to nest at the site. These species include ground-nesting species: burrowing owl (State Species of Special Concern and Federal Bird Species of Conservation Concern), and Northern harrier (State Species of Special Concern and Federal Bird Species of Conservation Concern); and tree nesting species: white-tailed kite (California Fully Protected), Cooper's hawk (California Watch List Species), Sharp-shinned hawk (California Watch List Species) and Swainson's hawk (state-listed threatened).

Three raptor species that could occur are designated as state species of special concern based on presence of wintering habitat (ferruginous hawk, golden eagle, and merlin). These species are wide-ranging species often wintering over a broad area, and incidental use of the site by any these species in winter is certainly possible. The site, however, contains no unique habitat features that would highlight the importance of the site as a wintering location for any of these species.

3.2.5 Essential Fish Habitat

The Magnuson-Stevens Fishery Conservation and Management Act conserves and manages the fishery resources found off the coasts of the United States, the anadromous species, and the Continental Shelf fishery resources of the United States, including the conservation and management of highly migratory species through the implementation and enforcement of international fishery agreements. The National Marine Fisheries Service (NMFS) enforces the Magnuson-Stevens Fishery Conservation and Management Act and regulates commercial and recreational fishing and the management of fisheries resources. Consultation with NOAA Fisheries is required for all projects with the potential to affect EFH for any MSA species. Central Valley fall/late fall–run Chinook salmon is a Magnuson-Stevens Fishery Conservation and Management Act managed species.

In the Central Valley, fall/late fall–run Chinook historically spawned in all major streams draining the Sierra Nevada, but fish passage has since been blocked by dams. Currently, fall/late fall–run Chinook salmon compose about 80% of the total Chinook salmon produced in the Sacramento and San Joaquin drainages. Fall/late fall–run Chinook salmon spawn in the Sacramento and San Joaquin Rivers and most of their tributaries. Central Valley fall/late fall–run Chinook salmon spawn and rear, or have the potential to spawn and rear, in western Placer County streams including Bear River, Coon Creek, Doty Ravine, Auburn Ravine, Dry Creek, Antelope Creek, Secret Ravine, and Miners Ravine (Jones and Stokes 2005). Antelope Creek, Secret Ravine and Miners Ravine may be considered as Essential Fish Habitat

(EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon.

4.0 REGULATORY AGENCIES AND POLICIES

The following is a description of federal, state, and local environmental laws and policies that are relevant to the California Environmental Quality Act (CEQA) review process.

FEDERAL

Clean Water Act-Section 404

The U.S. Army Corps of Engineers regulates discharges of dredged or fill material into Waters of the United States under Section 404 of the Clean Water Act (CWA). "Discharge of fill material" is defined as the addition of fill material into Waters of the U.S., including but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; and fill for intake and outfall pipes and sub-aqueous utility lines (33 C.F.R. §328.2(f)). In addition, Section 401 of the CWA (33 U.S.C. 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into Waters of the United States to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

The U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency are responsible for implementing the Section 404 program. Section 404(a) authorizes the Corps to issue permits, after notice and opportunity for comment, for discharges of dredged or fill material into waters of United States. Section 404(b) requires that the Corps issue permits in compliance with EPA guidelines, which are known as the Section 404(b)(1) Guidelines. Specifically, the Section 404(b) (1) guidelines require that the Corps only authorize the "least environmentally damaging practicable alternative" (LEDPA) and include all practicable measures to avoid and minimize impacts to the aquatic ecosystem. The guidelines also prohibit discharges that would cause significant degradation of the aquatic environment or violate state water quality standards.

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Wetlands are defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 C.F.R. §328.3(b)).

Furthermore, Jurisdictional Waters of the U.S. can be defined by exhibiting a defined bed and bank and ordinary high water mark (OHWM). The OHWM is defined by the Corps as "that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 C.F.R. §328.3(e)).

Tidal waters are also under the jurisdiction of the Corps. The landward limits of jurisdiction in tidal waters extend to the high tide line…"or, when adjacent non-tidal waters of the United States are present, to the limits of jurisdiction for such non-tidal waters" (33 C.F.R.§328.4(b)) High tide is further defined to include the line reached by spring high tides and other high tides that occur with periodic frequency (33 C.F.R.§328.3(d)).

All wetlands at the Project Site were reviewed to determine if they could be disclaimed from Corps jurisdiction as isolated wetlands following two recent US Supreme Court decisions. In *Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers (SWANCC), No. 99-1178 (2001),* some isolated wetlands may be excluded from the Corps' Section 404 jurisdiction because they are (1) non-tidal, (2) non-navigable, (3) not hydrologically connected to navigable waters or adjacent to such waters, and (4) not subject to foreign or interstate commerce.

Subsequent to SWANCC, the U.S. Supreme Court decided on *Rapanos v. United States* and *Carabell v. United States*, 126 U.S. 2208 (2006) (herein referred to as Rapanos). In 2007, guidance was given to EPA regions and Corps districts to implement the Supreme Court's decision which addresses the jurisdiction over waters of the U.S. under the Clean Water Act. The Rapanos guidance requires the Corps to conduct detailed analysis of the functions and values of wetlands and other waters of the U.S. potentially onsite and in some cases offsite, determine if there is a nexus to traditional navigable waters and the significance of the nexus to the traditional navigable water. Neither the Court nor the recently-issued guidance draw a clear line regarding the geographic reach of jurisdiction, particularly in drainages where flows are ephemeral and where wetlands are adjacent to but not directly abutting relatively permanent water, such as the wetlands delineated on the study site.

The guidance includes requirements for additional documentation, particularly regarding whether there is a "significant nexus" to a traditionally-navigable water (TNW). For water bodies that are traditionally navigable (and their adjacent wetlands), and for tributaries that are "relatively permanent waters" (RPW's: streams that are not perennial but that flow for 3 months or more annually, and their adjacent wetlands that directly abut the RPW's), the Corps and EPA will assert jurisdiction under the Clean Water Act, without the need for any exhaustive documentation of "significant nexus." There is no dispute that Clean Water Act jurisdiction encompasses traditionally-navigable waters and their perennial and relatively-permanent tributaries. Activities that result in discharges of pollutants into these waters can adversely affect the physical, chemical, and biological integrity of navigable waters.

For wetlands adjacent to but not directly abutting a RPW, jurisdiction may be asserted under the Clean Water Act if there is a "significant nexus" and for tributaries that typically do not flow more 3 months or more annually, and if there are adjacent wetlands associated with these non-relatively permanent waters (non-RPW's), jurisdiction may be asserted under the Clean Water Act if there is a "significant nexus." A significant nexus analysis, using the Corps' approved jurisdictional determination form, "will assess the flow characteristics and functions of the

tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW." These factors include (a) the capacity to carry pollutants or flood water into a TNW; (b) the capacity to provide habitat for species that are present in the downstream TNW; (c) the capacity of transferring nutrients and organic carbon to a TNW; or (d) other "relationships to the physical, chemical, or biological integrity of the TNW.

Clean Water Act-NPDES Requirements

In 1972, the Clean Water Act was amended to provide that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollution Discharge Elimination System (NPDES) permit. The 1987 amendments established a framework for regulating municipal, industrial, and construction-related storm water discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (USEPA) published final regulations that establish storm water permit application requirements for specified categories of industries. The regulations provide that discharges of storm water from construction projects that encompass one or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit. The California State Water Resource Control Board has developed a general construction storm water permit to implement this requirement.

Federal Endangered Species Act

The United States Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. The FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend. The FESA establishes an official listing process for plants and animals considered to be in danger of extinction; requires development of specific plans of action for the recovery of listed species; and restricts activities perceived to harm or kill listed species or affect critical habitat (16 USC 1532, 1536).

The FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined as harassing, harming (including significantly modifying or degrading habitat), pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species, or any attempt to engage in such conduct (16 USC 1532, 50 CFR 17.3) Taking can result in civil or criminal penalties. Federal regulation 50 CFR 17.3 further defines the term harm in the take definition to mean any act that kills or injures a federally listed species, including significant habitat modification or degradation. Additionally, FESA prohibits the destruction or adverse modification of designated critical habitat. In the Service's regulations at 50 CFR 402.2, destruction or adverse modification is defined as a "direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species.

The ESA also requires federal agencies to ensure that their actions do not jeopardize the continued existence of listed species or adversely modify critical habitat (16 USC 1536). Therefore, the ESA is invoked when the property contains a federally listed threatened or

endangered species that may be affected by a permit decision. In the event that listed species are involved and a Corps permit is required for impacts to jurisdictional waters, the Corps must initiate consultation with USFWS (or the National Marine Fisheries Service, NMFS) pursuant to Section 7 of the ESA (16 USC 1536; 40 CFR § 402). If formal consultation is required, USFWS or NMFS will issue a biological opinion stating whether the permit action is likely to jeopardize the continued existence of the listed species, recommending reasonable and prudent measures to ensure the continued existence of the species, establishing terms and conditions under which the project may proceed, and authorizing incidental take of the species.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSFA) conserves and manages the fishery resources found off the coasts of the United States, the anadromous species, and the Continental Shelf fishery resources of the United States, including the conservation and management of highly migratory species through the implementation and enforcement of international fishery agreements. The NMFS enforces the MSFA and regulates commercial and recreational fishing and the management of fisheries resources. The Sustainable Fisheries Act of 1996 amended the MSFA to include new fisheries conservation provisions by emphasizing the importance of fish habitat in regards to the overall productivity and sustainability of U.S. marine fisheries (Public Law 104-267). The revised MSFA mandates the identification and protection of Essential Fish Habitat (EFH) for managed species during the review of projects conducted under federal permits that have the potential to affect such habitat. Federal agencies are required to consult with NMFS on all actions or proposed actions authorized, funded, or undertaken by the agency, which may adversely affect EFH (MSFA 305.b.2).

Under the MSFA, NMFS identifies, conserves, and enhances EFH for those species regulated under a federal fisheries management plan (FMP). EFH is defined as those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity and includes all associated physical, chemical and biological properties of aquatic habitat that are used by fish. Projects that have the potential to adversely affect EFH must initiate consultation with NMFS. Adverse effects are any impacts that reduce the quality and/or quantity of EFH and can include direct (e.g., contamination or physical disruption), indirect (e.g., loss of prey or reduction in species fecundity), site-specific or habitat-wide impacts, including individual, cumulative, or synergistic consequences of actions (50 CFR 600.810). There are four FMPs in California, Oregon, and Washington that identify EFH for groundfish, coastal pelagic species, Pacific salmon, and Pacific highly migratory fisheries.

Central Valley fall/late fall–run Chinook salmon is a Magnuson-Stevens Fishery Conservation and Management Act managed species. This species either spawns of has the potential to spawn in western Placer County streams, that near the project include Antelope Creek, Secret Ravine, and Miners Ravine, which would be considered as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon.

Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act is administered by the USFWS. The Act provides that it is unlawful to: pursue, hunt, take, capture or kill; attempt to take, capture or kill; possess, offer to sell, barter, purchase, deliver or cause to be shipped, exported, imported, transported, carried or received any migratory bird, part, nest, egg or product unless permitted by regulations. Most bird species within California fall under the provisions of the Act. Excluded species include nonnative species such as house sparrow, starling, and ring-necked pheasant and native game species such as quail.

Fish and Wildlife Coordination Act

The USFWS also has responsibility for project review under the Fish and Wildlife Coordination Act. This statute requires that all federal agencies consult with USFWS, NMFS, and the state's wildlife agency (California Department of Fish and Wildlife, CDFW) for activities that affect, control, or modify streams and other water bodies. Under the authority of the Fish and Wildlife Coordination Act, USFWS, NMFS, and CDFW review applications for permits issued under Section 404 and provide comments to the Corps about potential environmental impacts.

STATE

California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. The CESA is similar to the FESA but pertains to state-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW) when preparing California Environmental Quality Act (CEQA) documents to ensure that the state lead agency actions do not jeopardize the existence of listed species. CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur, and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. Agencies can approve a project that affects a listed species if they determine that 'overriding considerations" exist; however, the agencies are prohibited from approving projects that would result in the extinction of a listed species.

The CESA prohibits the taking of state-listed endangered or threatened plant and wildlife species. CDFW exercises authority over mitigation projects involving state-listed species, including those resulting from CEQA mitigation requirements. CDFW may authorize taking if an approved habitat management plan or management agreement that avoids or compensates for possible jeopardy is implemented. CDFW requires preparation of mitigation plans in accordance with published guidelines.

Section 401 of the Federal Clean Water Act/Porter Cologne Water Quality Act

Pursuant to section 401 of the Federal Clean Water Act, projects that require a Corps permit for the discharge of dredge or fill material must obtain water quality certification that confirms a project complies with state water quality standards before the Corps permit is valid. State

water quality is regulated/administered by the State Water Resources Control Board and its nine Regional Water Quality Control Boards (RWQCB). The state also maintains independent regulatory authority over the placement of waste, including fill, into waters of the State under the Porter-Cologne Act.

The California State Water Resource Control Board has developed a general construction storm water permit to implement the requirements for the federal National Pollution Discharge Elimination System (NPDES) permit. The permit requires submittal of a Notice of Intent to comply, fees, and the implementation of a Storm Water Pollution Prevention Plan.

CDFW Species of Special Concern

CDFW tracks species in California whose numbers, reproductive success, or habitat may be threatened. Even though not formally listed under FESA or CESA, such plant and wildlife species receive additional consideration during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern" developed by the CDFW. CDFW has also designated special-status natural communities which are considered rare in the region, support special status species or otherwise receive some form of regulatory protection. Documentation pertaining to these communities, as well as special status species (including species of special concern), is kept by CDFW as part of the CNDDB.

Natural Community Conservation Planning Act

The Natural Communities Conservation Planning Act (NCCP) program, which began in 1991 under the California Natural Community Conservation Planning Act, is broader in its orientation and objectives than CESA and ESA; these laws are designed to identify and protect individual species that are already listed as threatened or endangered and their habitats. The primary objective of the NCCP program is to conserve natural communities at the ecosystem scale while accommodating compatible land use.

Placer County is currently involved in efforts to prepare the Placer County Conservation Plan, a Habitat Conservation Plan (HCP) and Natural Communities Conservation Plan (NCCP) that may eventually be applicable to projects in the Loomis area. A draft of the HCP/NCCP has not been developed as of the date of this report.

California Department of Fish and Wildlife-Streambed Alteration Agreement

Section 1602 of the California Fish and Game Code requires any person, governmental agency, or public utility proposing any activity that will divert or obstruct the natural flow or change the bed, channel or bank of any river, stream, or lake, or proposing to use any material from a streambed, to first notify CDFW of such proposed activity. CDFW may propose reasonable modifications, based on the information contained in the notification form and a possible field inspection, CDFW may propose reasonable modifications in the proposed construction as would allow for the protection of fish and wildlife resources. Upon request, the parties may meet to discuss the modifications. If the parties cannot agree and execute a Lake and Streambed Alteration Agreement, then the matter may be referred to arbitration.

California Department of Fish and Wildlife Fish and Game Code 3503 and 3503.5
Section 3503 of the Fish and Game Code makes it unlawful to take, possess, or needlessly destroy the nests or eggs of any bird. Section 3503.5 makes it unlawful to take or possess birds of prey (hawks, eagles, vultures, owls) or destroy their nests or eggs.

California Department of Fish and Wildlife Fully Protected Animal Species
The classification of Fully Protected was an effort by the State of California in the 1960's to identify and provide additional protection to those animals that were rare or faced possible extinction. Most Fully-Protected species have also been listed as threatened or endangered species under state endangered species laws and regulations. Species classified as Fully Protected Species by the CDFW may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock (as per California Fish and Game Code Section 3511(a)(1)).

Public Resources Code Section 21084.4 for Oak Woodlands Conservation
As of January 2005, Public Resources Code Section 21083.4 requires California Counties acting as Lead Agencies under CEQA to determine whether a project "may result in a conversion of oak woodlands that will have a significant effect on the environment." If individual or cumulative impacts to oak woodlands are identified, the law requires that the impacts be mitigated. Acceptable mitigation measures include, but are not limited to, conservation of other oak woodlands through the use of conservation easements, planting replacement trees which must be maintained for seven years, contribution to the Oak Woodland Conservation Fund established under Section 1363(a) of the Fish and Game Code, or other measures.

LOCAL

Placer County General Plan
In addition to federal and state regulations, the development of the property must be accomplished consistent with the land use designations and natural resource and other policies of the Placer County General Plan.

OTHER STATUTES, CODES, AND POLICIES AFFORDING LIMITIED PROTECTION

California Native Plant Society
The California Native Plant Society (CNPS) maintains a list of plant species native to California that have low numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Plants of California (CNPS 2014: https://www.cnps.org/cnps/rareplants/inventory/). Potential impacts to populations of CNPS-listed plants receive consideration under CEQA review. The following identifies the definitions of the CNPS listings: https://www.cnps.org/cnps/rareplants/ranking.php

California Rare Plant Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.

California Rare Plant Rank1B: Plants rare, threatened, or endangered in California and elsewhere.
California Rare Plant Rank 2A: Plants presumed extirpated in California, but more common elsewhere.
California Rare Plant Rank 2B: Plants rare, threatened, or endangered in California, but more numerous elsewhere.
California Rare Plant Rank 3: Plants about which more information is needed – a review list.
California Rare Plant Rank 4: Plants of limited distribution – a watch list.

5.0 IMPACTS AND MITIGATION MEASURES

5.1 Standards of Significance

According to the Environmental Checklist in Appendix G of the CEQA Guidelines (Title 14, California Code of Regulations, 15000 et seq.), the project would be considered to have a significant impact on biological resources if it would:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Wildlife and Game or U.S. Fish and Wildlife Service.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service.

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

5.2 Relevant Project Characteristics

Costco Wholesale is proposing to construct Costco warehouse facility on the property. A plan view of conceptual design for the configuration of proposed project can be seen in Figure 4. The facility includes the Costco warehouse and associated parking and other infrastructure. The proposed project would cover the entire site.

5.3 Impacts and Mitigation Measures

5.3.1 Plant Communities and Vegetation

Impacts to biological resources will result from vegetation removal due to the conversion of upland areas composed of Annual Grassland, Valley Oak Woodland and Valley Freshwater Marsh to accommodate the proposed Costco facility. The acreage of each of the vegetation

communities found on the property, and impacts resulting from site development as planned are shown in Table A. Figure 9 shows the development footprint as an overlay of the vegetation communities found on the project site. The footprint for the proposed project would cover 100% of the site.

TABLE A. IMPACTS TO VEGETATION COMMUNITIES

Habitat Type	Existing Acreage in Overall Study Area (acres)	Impacted Acreage (acres)
Annual Grassland	10.16	10.16
Valley Freshwater Marsh	0.15	0.15
Valley Oak Woodland	7.96	7.96
TOTAL	**18.27**	**18.27**

Wetlands and Waters of the U.S.

Wetlands and waters of the U.S. are regulated by state and federal agencies and would be considered sensitive natural communities as defined by CEQA. Impacts to waters of the U.S. would be potentially significant if appropriate mitigation was not implemented for all regulated wetlands as required by state and federal regulations.

The ecological constraints to development at the site include approximately 0.15 acres of wetlands and waters of the U.S. potentially subject to Corps jurisdiction pursuant to Section 404 of the Federal Clean Water Act as shown in Figure 8. As the palustrine emergent wetlands are located in various portions of the site, complete avoidance of jurisdictional wetlands would not be possible. Impacts to wetlands and waters of the U.S. potentially subject to Corps jurisdiction are shown in Figure 10. The development plan for the site would permanently impact 0.15 acres of palustrine emergent wetlands located on the site that are potentially under the jurisdiction of the Corps under Clean Water Act Section 404. Without mitigation, project impacts to wetlands or waters of the U.S. would be significant.

Impact 1: Direct (fill) impacts to 0.15 acres of waters of the U.S. would result from implementation of the proposed Costco warehouse facility.

> **Mitigation Measure 1:** The developer will submit applications for a Nationwide permit from the Corps of Engineers (see Section 4.5, Permit Requirements), and Section 401 water quality certification from the Central Valley Regional Water Quality Control Board (RWQCB), required for the Corps permit to be valid. Appropriate wetland mitigation would be required by the Corps and RWQCB for impacts to the 0.15 acres of seasonal wetlands located at the site, and a wetland mitigation plan to mitigate impacts to jurisdictional areas would need to be developed as part of the Corps and RWQCB permit

process. Corps jurisdictional areas must be replaced at a minimum 1:1 ratio through wetland creation (preferably on-site) to ensure that no net loss of acreage or functions and values to these areas occurs. Options for providing mitigation include creation of wetlands on site or contributions to an agency-approved wetland mitigation bank. As the footprint of the proposed project requires use of most, if not all, of the site, the preferred method of mitigation is through contributions to an agency-approved mitigation bank.

Oak Woodlands

Project construction would result in the loss of approximately 7.96 acres of Valley Oak Woodland habitat on the site (see Figure 9). Tree removal and impact to oak woodland habitat was assumed within the graded footprint of the project, and included all trees on the property.

Mann Made Resources (see Attachment 3) determined that the project would result in the removal of 372 trees determined to be of protected size. Of these 372 trees, 162 were found to be in good and fair condition for a total mitigation planting requirement of potentially 290 #15 container trees. It should be possible to plant these trees on the property as part of the project landscape design and parking lot shade.

Oaks woodlands provide significant wildlife habitat value. Oak woodlands are protected by the California Department of Fish and Game, State of California regulations including Public Resources Code Section 21083.4, and policies of the Town of Loomis. Public Resources Code Section 21083.4 directs Counties to mitigate significant effects of oak woodland conversion, and would not apply to a project reviewed by the Town of Loomis as a CEQA Lead Agency.

Impact 2: The project would require construction within 7.96 acres of Valley Oak Woodland habitat and the direct removal of 372 mature trees determined to be of protected size.

> **Mitigation Measure 2:** The applicant should prepare an Oak Woodland Tree Replacement and Protection Plan including: (i) planting of 290 #15 container trees as recommended by the arborist to attain tree replacement ratios prescribed by the Town of Loomis; (ii) the specific location of the tree planting, (including a map and planting plan); (iii) schedules and methodologies for maintaining and monitoring the success of the Plan; and (iv) performance standards.

Landscaping/Invasive Species

Invasive, exotic weeds compete with native vegetation and can degrade the quality of wildlife habitats. Project landscaping and construction activity has the potential to introduce invasive, exotic, non-native vegetation, some of which may not now exist in the area. Also, highways and various construction projects provide a pathway for dispersal of invasive plants. Invasive plant species include those designated as noxious weeds by the U.S. Department of Agriculture, problem species listed by the California Department of Food and Agriculture, and other invasive plants designated by the California Invasive Plant Council. Where appropriate, vegetation removed because of project activities should be replaced with native species which are of value

to local wildlife. Native plants generally are more valuable as wildlife food sources and require less irrigation, fertilizers, and pesticides than exotic species.

Impact 3: Project landscaping is expected to introduce exotic, non-native vegetation, some of which may not exist in the area.

> **Mitigation Measure 3:** Landscaping should be designed to enhance the wildlife value and aesthetic quality of undeveloped portions of the project site. Where appropriate, vegetation removed because of project activities should be replaced with native species which are of value to local wildlife, and native vegetation should be retained. Weed management practices may be warranted, including identification and removal of infestations of noxious weeds prior to construction, use of construction equipment and materials such as fill and erosion control devices that are known to be weed-free, power-washing of construction vehicles to remove mud, dirt and vegetative material before working in relatively weed-free areas, and removal of invasive species from undeveloped areas within the project boundary.

5.3.2 Animal Species

Loss of vegetation associated with the habitats on site will disrupt and displace existing wildlife. Some bird roosting, nesting, and foraging areas will be eliminated. Reptiles, amphibians, and small mammals that utilize these areas will be displaced to remaining undisturbed areas. Open space areas near the project area should be capable of accommodating these species. Animal species that have adapted to living in close association with human disturbance can be expected to increase after the proposed project. These species include mammals such as raccoon, California ground squirrel, deer mouse, and house mouse, and birds such as rock pigeon, Eurasian-collared dove, American robin, European starling, house sparrow, Brewer's blackbird and brown-headed cowbird.

Nesting Birds

Nesting bird species protected by the federal Migratory Bird Treaty Act could be impacted during project construction. The removal of trees and shrubs during the February 1 to August 31 breeding season could result in mortality of nesting avian species if they are present. Therefore, preconstruction surveys should be conducted of the development area to determine if nesting is occurring. If nests are found, a construction plan would need to be developed that would allow successful nesting (fledging of young birds).

Many species of raptors (birds of prey) are sensitive to human incursion and construction activities. Therefore, to ensure that nesting raptor species are not present near the construction site, preconstruction surveys should include a thorough search for nesting raptor species, including raptor species of special status such as Swainson's hawk and burrowing owl, among others (see Mitigation Measure #7 below). Even though the Project Site does not contain suitable habitats for nesting by special status bird species such as tricolored blackbird and loggerhead shrike, preconstruction surveys should include searches for these species to

ensure nests of these species, if they were to found at the site, are not harmed.

Impact 4: The removal of vegetation during the February 1 to August 31 breeding season could result in mortality of nesting avian species if they are present.

> **Mitigation Measure 4:** If feasible, construction work should take place outside of the February 1 to August 31 breeding window for nesting birds. If construction is to be conducted during the breeding season, a qualified biologist should conduct a pre-construction breeding bird survey in areas of suitable habitat within 15 days prior to the onset of construction activity. If bird nests are found, appropriate buffer zones should be established around all active nests to protect nesting adults and their young from construction disturbance. Size of buffer zones should be determined in consultation with wildlife agency staff based on site conditions and species involved. Buffer zones should be maintained until it can be documented that either the nest has failed or the young have fledged. Preconstruction surveys should include appropriate survey for nesting species of raptor, including special status raptor species (see Mitigation Measure #7) and other avian species with special status and with a small chance of occurring on the Project Site, such as tricolored blackbird and loggerhead shrike.

Water Quality

Construction activities on the project site would involve disturbance and exposure of soils through grading and removal of vegetative cover, excavation to install supports for the solar array, and other activities. These activities would result in exposure of soil to runoff, potentially causing erosion and entrainment of sediment in the runoff. If not managed properly, the runoff could cause increased sedimentation and turbidity in surface waters outside of the Project Site, resulting in degradation of water quality. Water from the Project Site drains west toward the adjacent property and then into Sucker Ravine, which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River.

Ground-disturbing activities could promote erosion and allow elevated levels of sediment to wash into downstream creeks, where potential impacts to fish and wildlife species would be possible. In the absence of water quality controls, indirect impacts to animal populations in wetlands and other aquatic habitats could result from the proposed project due to elevated contaminants in stormwater runoff. However, the requirement for the implementation of a Stormwater Pollution Prevention Plan (SWPPP), with identification of proper construction techniques and Best Management Practices (BMPs) will minimize adverse effects associated with these activities. Furthermore, standard techniques to control contaminants in stormwater such as oil and grease traps will be employed to mitigate water quality concerns.

Impact 5: Placement of fill and other ground disturbing activities could promote erosion and allow elevated levels of sediment to wash into downstream aquatic areas, potentially affecting fish and wildlife resources.

Mitigation Measure 5: Best Management Practices and all requirements as detailed in the Stormwater Pollution Prevention Plan shall be implemented to control erosion and migration of sediments off-site. Implementation of water quality controls shall be consistent with the BMP requirements in the most recent version of the California Stormwater Quality Association Stormwater Best Management Handbook-Construction. In addition, vegetation should only be cleared from the permitted construction footprint. Areas cleared of vegetation, pavement, or other substrates should be stabilized as quickly as possible to prevent erosion and runoff.

Essential Fish Habitat

Antelope Creek, Secret Ravine and Miners Ravine would be considered as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon. Secret Ravine and Miners Ravine are located about four miles southwest of the Project Site; runoff from the site drains over the adjacent property to the west and then into Sucker Ravine which drains into Secret Ravine. Portions of Antelope Creek run approximately 0.7 miles to the northwest of the Project Site, but drainage flow is not in the direction of the creek. An unnamed drainage located just north of the property is a tributary to Antelope Creek.

In the absence of water quality controls, indirect impacts to EFH for Central Valley fall/late fall-run Chinook salmon could result from the proposed project due to elevated contaminants in stormwater runoff that eventually flow into Secret Ravine. However, the requirement for the implementation of a Stormwater Pollution Prevention Plan (SWPPP), with identification of proper construction techniques and Best Management Practices (BMPs) will minimize adverse effects associated with these activities (see Mitigation Measure 5). Furthermore, standard techniques to control contaminants in stormwater such as oil and grease traps will be employed to mitigate water quality concerns.

5.3.3 Special Status Species

A review of habitat requirements of sensitive animal species documented by the CNDDB as occurring in the project vicinity, and sensitive animal species known to occur in the general vicinity, was conducted by HBG. Animal species of special concern are present or possible as described below.

Special Status Plants

Habitat conditions at the project site are potentially suitable to support several species of special status plant. If present, development of the site as proposed could result in impacts to special status botanical species. The only way to ensure that populations of special status plants are not present in development sites would be to conduct a systematic protocol survey during the flowering period of the species.

Impact 6: If special status plant species are present at the site, project development could result in the elimination of populations of these species.

Mitigation 6: Systematic protocol rare plant surveys should be conducted during the flowering period of target species to definitively determine their presence or absence at the site. These plants, along with their flowering periods include, but are not necessarily limited to: big-scale balsamroot (March to June), Brandegee's clarkia (May to July), and stinkbells (March to June).

Special Status Animals

Vernal Pool Crustaceans -The seasonal wetland swales within the several drainages on the property do not provide suitable habitat for listed species of vernal pool crustaceans. The swales are flowing systems and not seasonal inundated depressions with more than two inches of ponding for at least two weeks (for VPFS) or four weeks (for VPTS). The drainages are also not suitable habitat for the California linderiella. No impacts to vernal pool fairy shrimp, vernal pool tadpole shrimp, or California linderiella would result from project development.

Steelhead Central Valley DPS- In the project area, Central Valley steelhead are found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine, located as close as about 4 miles from the Project Site. No direct impacts would occur to steelhead habitat as no spawning or rearing habitat or occupied tributary streams are found on the Project Site. However, uncontrolled erosion from the developed site could result in consequent downstream sedimentation that could adversely affect spawning areas in Secret Ravine or Miners Ravine, and untreated stormwater runoff from onsite impervious surfaces could introduce contaminants that could adversely affect water quality that currently supports the life cycle of steelhead in these tributaries. Implementation of Mitigation Measure 5, with requirements to implement Best Management Practices as part of a Stormwater Pollution Prevention Plan to control erosion and migration of sediments off-site and other water quality control practices, will ensure that impacts to local steelhead populations do not occur.

Western Spadefoot Toad- A review of habitat conditions found on the site revealed that the seasonal swales at the site are flowing water systems that do not pond water for sufficient depth and duration to support the western spadefoot toad. No impacts to western spadefoot toad would result from project development.

Swainson's Hawk- Swainson's hawk is much more likely to nest in trees near riparian habitats or agricultural fields on the Valley floor rather than in oak woodland in the foothills, such as found at the Project Site. Nesting by Swainson's hawk at the Project Site is unlikely. Use of the Project Site by this species is probably limited to occasional visits while foraging. No impacts to Swainson's hawk breeding or foraging habitat is anticipated due to project development. Mitigation measures for preconstruction surveys of nesting birds include inclusion of this species in the surveys.

Burrowing Owl- No burrowing owls, California ground squirrel colonies or California ground squirrels were observed during field reviews. In addition, heights of grasses within the onsite grassland are too tall to provide habitat for burrowing owl, which prefers grasslands with low

profile vegetation. No impacts to burrowing owl breeding or wintering habitat is anticipated due to project development. Nevertheless, spring surveys of the site planned by an HBG wildlife biologist between late April and May of 2017 will include searches for this species, and mitigation measures for preconstruction surveys of nesting birds include inclusion of this species in the surveys.

Tricolored Blackbird- Vegetation within the onsite wetland swales is not of a type that would be preferred to support a nesting colony of tricolored blackbird. No impacts to tricolored blackbird would result from project development. Nevertheless, spring surveys of the site planned by an HBG wildlife biologist between late-April and May of 2017 will include searches for this species, and mitigation measures for preconstruction surveys of nesting birds include inclusion of this species in the surveys.

Special Status Raptor Species- Six raptor species designated with special status by the State of California have a potential to nest at the site. These species include burrowing owl (State Species of Special Concern and Federal Bird Species of Conservation Concern), Northern harrier (State Species of Special Concern and Federal Bird Species of Conservation Concern), white-tailed kite (California Fully Protected), Cooper's hawk (California Watch List Species), Sharp-shinned hawk (California Watch List Species) and Swainson's hawk (state-listed threatened). Preconstruction surveys for tree-nesting special status raptor species (e.g., white-tailed kite, Cooper's hawk, sharp-shinned hawk, Swainson's hawk) will be necessary if tree removal occurs during the February 1 to August 31 nesting season. Preconstruction surveys for ground-nesting special status raptor species (Northern harrier and burrowing owl) would be necessary prior to any ground disturbance in grasslands.

Impact 7: Construction during the nesting season could impact any of six raptor species designated with special status by the State of California: burrowing owl, Northern harrier, white-tailed kite, Cooper's hawk, sharp-shinned hawk, and Swainson's hawk.

> **Mitigation Measure 7:** Preconstruction surveys conducted for nesting birds pursuant to the MBTA should include specific preconstruction surveys for special status species of raptors. Preconstruction surveys for special status tree-nesting raptor species (white-tailed kite, Cooper's hawk, sharp-shinned hawk, Swainson's hawk) will be necessary if tree removal occurs during the February 1 to August 31 nesting season. A preconstruction survey for ground-nesting special status raptor species (Northern harrier and burrowing owl) should be conducted to ensure impacts to ground-nesting species do not occur. Preconstruction surveys should be conducted within 15 days of initiation of construction activity. If an active raptor nest is identified, appropriate mitigation measures shall be developed and implemented in consultation with CDFW. Mitigation would include development of a construction plan that establishes buffer zones around active nests during construction activity and/or until young have fledged.

6.0 AGENCY PERMIT REQUIREMENTS

Any potential impacts to jurisdictional wetlands or waters of the U.S. at the site will require authorization from the Army Corps of Engineers pursuant to Section 404 of the Clean Water Act. NWP 39 authorizes "discharges of dredged or fill material into non-tidal waters of the U.S., excluding non-tidal wetlands adjacent to tidal waters, for the construction or expansion of residential, commercial, and institutional building foundations and building pads and attendant features that are necessary for the use and maintenance of the structures" provided the activities meet the following criteria:

- The discharge does not cause the loss of greater than 0.5-acre of non-tidal waters of the U.S.;
- The discharge does not cause the loss of greater than 300 linear feet of a stream bed (unless the criterion is waived by the District Engineer);
- The discharge is part of a single and complete project;
- The permittee avoids and minimizes discharges into waters of the U.S. to the maximum extent practicable;
- The discharge does not cause more than minimal degradation of water quality or more than minimal changes to stream flow characteristics; and
- The permittee establishes and maintains vegetated buffers next to open water to the maximum extent practicable.

As the 0.15 acres of seasonal wetlands are scattered throughout the site and avoidance of these wetlands would be problematic with any layout of land uses, a permit from the Corps is a certainty for development at this site. Wetland impacts would not exceed the 0.5-acre limit of Nationwide Permit 39; therefore, the Corps would determine that the proposed project would qualify for a Nationwide Permit 39 and an Individual Permit would not be required. A wetland mitigation plan describing procedures to mitigate impacts to jurisdictional areas would need to be developed as part of the Corps permit process. The applicant would need to demonstrate that wetlands have been avoided to the extent possible and provide documentation of how the project has been minimized to reduce onsite impacts.

The requirement for a Clean Water Act Section 404 Nationwide permit means that any development project at this site will also require Section 401 water quality certification from the Central Valley Regional Water Quality Control Board (RWQCB) for the Corps permit to be valid. Prior to issuance of the water quality certification, RWQCB will require the applicant to demonstrate that requirements of the County of Placer pursuant to the California Environmental Quality Act (CEQA) have been satisfied. Mitigation of wetlands will be required to obtain Corps and RWQCB approval. It does not appear as though A Section 7 consultation with USFWS or NOAA Fisheries/NMFS would be warranted as neither federally-listed species nor their habitats would not be adversely affected by project development. An Essential Fish Habitat evaluation conducted in conjunction with NMFS is also not likely warranted.

Table 1. Plant List for Property

Table 2. Animal Species Observed on the Project Site or Expected to Utilize the Project Site

Table 3. Special Status Plants Known to Occur in the Vicinity of the Project Area, Placer County, California

Table 4. Special Status Animal Species that have been Reported in the Vicinity of the Project Area, Placer County, California

TABLE 1. PLANT LIST FOR THE PROPERTY

Scientific Name	Common Name	Wetland Status
Acacia baileyana	Cootamundra wattle	UPL
Acmispon americanus var. americanus	Spanish-clover	UPL
Alisma triviale	California water plantain	OBL
Amsinckia menziesii	common fiddleneck	UPL
Artemisia douglasiana	California mugwort	FAC
Arundo donax	Giant reed	FACW
Avena fatua	Wild oat	UPL
Baccharis pilularis	Coyote brush	UPL
Briza minor	Small quaking grass	FAC
Bromus diandrus	Ripgut grass	UPL
Bromus hordeaceus	Soft chess	FACU
Carduus pycnocephalus	Italian thistle	UPL
Centaurea solstitialis	Yellow starthistle	UPL
Cichorium intybus	Chicory	FACU
Cirsium arvense	Canada thistle	FACU
Clarkia sp.	Clarkia	UPL
Claytonia perfoliata	Common miner's lettuce	FAC
Convolvulus arvensis	Bindweed	UPL
Cynodon dactylon	Bermudagrass	FACU
Cynosurus echinatus	Hedgehog dogtail	UPL
Cyperus eragrostis	Tall flatsedge	FACW
Cytisus scoparius	Scotch broom	UPL
Elymus caput-medusae	Medusahead	UPL
Epilobium brachycarpum	Summer cottonweed	UPL
Erigeron canadensis	Canadian horseweed	FACU
Erodium botrys	Broad-leaf filaree	FACU
Erodium cicutarium	Red-stem filaree	UPL
Eschscholzia californica	California poppy	UPL
Festuca perennis	Italian ryegrass	FAC
Galium aparine	Goose grass	FACU
Geranium dissectum	Cut-leaf geranium	UPL
Geranium molle	Dove's-foot geranium	UPL
Hirschfeldia incana	Short-podded mustard	UPL
Hordeum jubatum	Foxtail barley	UPL
Hordeum marinum subsp. gussoneanum	Mediterranean barley	FAC
Hordeum murinum	Wall barley	FACU
Hypericum perforatum subsp. perforatum	Klamathweed	FACU
Hypochaeris glabra	Smooth cat's-ear	UPL
Juncus mexicanus	Mexican rush	FACW
Juncus xiphioides	Iris-leaved rush	OBL
Lactuca serriola	Prickly lettuce	FACU

Lamium amplexicaule	Deadnettle	UPL
Lupinus bicolor	Miniature lupine	UPL
Lythrum hyssopifolia	Hyssop loosestrife	OBL
Melilotus sp.	Melilotus	UPL
Nasturtium officinale	Watercress	OBL
Olea europaea	Olive	UPL
Paspalum dilatatum	Dallis grass	FAC
Pinus sabiniana	Gray pine	UPL
Plantago lanceolata	English plantain	FAC
Polypogon monspeliensis	Annual beard grass	FACW
Populus fremontii subsp. fremontii	Fremont cottonwood	FAC
Prunus dulcis	Almond tree	UPL
Pyracantha sp.	Pyracantha	UPL
Pyrus sp.	Pear	UPL
Quercus douglasii	Blue oak	UPL
Quercus lobata	Valley oak	FACU
Quercus wislizeni	Interior live oak	UPL
Rubus armeniacus	Himalayan blackberry	FACU
Rumex crispus	Curly dock	FAC
Salix exigua var. exigua	Narrowleaf willow	FACW
Salix lasiolepis	Arroyo willow	FACW
Silybum marianum	Milk thistle	UPL
Sonchus asper subsp. asper	Prickly sow-thistle	FAC
Spartium junceum	Spanish broom	UPL
Torilis arvensis	Field hedgeparsley	UPL
Toxicodendron diversilobum	Western poison-oak	FACU
Trifolium hirtum	Rose clover	UPL
Verbascum blattaria	Moth mullein	UPL
Verbascum thapsus	Woolly mullein	FACU
Veronica sp.	Speedwell	VARIES
Vicia sativa	Common vetch	FACU
Vicia villosa	Winter vetch	UPL
Vinca major	Periwinkle	UPL

TABLE 2. ANIMAL SPECIES OBSERVED ON THE PROJECT SITE OR EXPECTED TO UTILIZE THE PROJECT SITE

MAMMALS

Virginia Opossum	*Didelphis virginiana*
Broad-footed Mole	*Scapanus latimanus*
California Myotis	*Myotis californicus*
Yuma Myotis	*Myotis yumanensis*
Western Pipistrelle	*Pipistrellus hesperus*
Big Brown Bat	*Eptesicus fuscus*
Hoary Bat	*Lasiurus cinereus*
Red Bat	*Lasiurus borealis*
Pallid Bat	*Antrozous pallidus*
Brazilian Free-tailed Bat	*Tadarida brasiliensis*
Black-tailed Hare	*Lepus californicus*
Desert Cottontail	*Sylvilagus audubonii*
California Ground Squirrel	*Spermophilus beecheyi*
Botta's Pocket Gopher	*Thomomys bottae*
Western Harvest Mouse	*Reithrodontomys megalotis*
Deer Mouse	*Peromyscus maniculatus*
Dusky-footed Woodrat	*Neotoma fuscipes*
California Vole	*Microtus californicus*
Black Rat	*Rattus rattus*
Norway Rat	*Rattus norvegicus*
House Mouse	*Mus musculus*
Coyote	*Canis latrans*
Gray Fox	*Urocyon cinereoargenteus*
Raccoon	*Procyon lotor*
Long-tailed Weasel	*Mustela frenata*
Striped Skunk	*Mephitis mephitis*
Mule Deer	*Odocoileus hemionus*

REPTILES AND AMPHIBIANS

Pacific Treefrog	*Pseudacris regilla*
Western Toad	*Bufo boreas*
Western Fence Lizard	*Sceloporus occidentalis*
Coast Horned Lizard	*Phrynosoma coronatum*
Western Skink	*Eumeces skiltonianus*
Gilbert’s Skink	*Eumeces gilberti*
Western Whiptail	*Cnemidophorus tigris*
Southern Alligator Lizard	*Gerrhonotus multicarinatus*

Ringneck Snake	*Diadophis punctatus*
Sharp-tailed Snake	*Contia tenuis*
Racer	*Coluber constrictor*
California Whipsnake	*Masticophis lateralis*
Coachwhip	*Masticophis flagellum*
Gopher Snake	*Pituophis melanoleucus*
Common Kingsnake	*Lampropeltis getulus*
Common Garter Snake	*Thamnophis sirtalis*
Western Terrestrial Garter Snake	*Thamnophis elegans*
Night Snake	*Hupsiglena torquata*
Western Rattlesnake	*Crotalis viridis*

BIRDS

Turkey Vulture	*Cathartes aura*
White-tailed Kite	*Elanus caeruleus*
Northern Harrier	*Circus cyaneus*
Sharp-shinned Hawk	*Accipiter striatus*
Cooper's Hawk	*Accipiter cooperi*
Red-tailed Hawk	*Buteo jamaicensis*
Red-shouldered Hawk	*Buteo lineatus*
Golden Eagle	*Aquila chrysaetos*
Bald Eagle	*Haliaeetus leucocephalus*
American Kestrel	*Falco sparverius*
Prairie Falcon	*Falco mexicanus*
Peregrine Falcon	*Falco peregrinus*
Merlin	*Falco columbarius*
California Quail	*Callipepla californica*
Killdeer	*Charadrius vociferous*
Wilson’s Snipe	*Gallinago delicata*
Ring-billed Gull	*Larus delawarensis*
California Gull	*Larus californicus*
Herring Gull	*Larus argentatus*
Rock Dove	*Columba livia*
Mourning Dove	*Zenaida macroura*
Barn Owl	*Tyto alba*
Great Horned Owl	*Bubo virginianus*
Western Screech-Owl	*Otus kennicottii*
Vaux’s Swift	*Chaetura vauxi*
Anna's Hummingbird	*Calypte annas*
Northern Flicker	*Colaptes auratus*
Acorn Woodpecker	*Melanerpes formicivorus*
Lewis’s Woodpecker	*Melanerpes lewis*
Red-breasted Sapsucker	*Sphyrapicus ruber*

Nuttall’s Woodpecker	*Picoides nuttallii*
Downy Woodpecker	*Dendrocopos pubescens*
Black Phoebe	*Sayornis nigricans*
Say's Phoebe	*Sayornis saya*
Pacific-slope Flycatcher	*Empidonax difficilus*
Ash-throated Flycatcher	*Myiarchus cinerascens*
Western Kingbird	*Tyrannus verticalis*
Barn Swallow	*Hirundo rustica*
Cliff Swallow	*Petrochelidon pyrrhonota*
Tree Swallow	*Tachicineta bicolor*
Violet-green swallow	*Tachycineta thalassina*
Northern Rough-winged Swallow	*Stelgidopteryx serripennis*
California Scrub-jay	*Aphelocoma californica*
American Crow	*Corvus brachyrhynchos*
Common Bushtit	*Psaltriparus minimus*
Oak Titmouse	*Parus inornatus*
White-breasted Nuthatch	*Sitta carolinensis*
Bewick's Wren	*Thryomanes bewickii*
House Wren	*Troglodytes aedon*
American Robin	*Turdus migratorius*
Hermit Thrush	*Hylocichla guttata*
Western Bluebird	*Sialia mexicana*
Ruby-crowned Kinglet	*Regulus calendula*
Northern Mockingbird	*Mimus polyglottos*
Cedar Waxwing	*Bombycilla cedrorum*
Loggerhead Shrike	*Lanius ludovicianus*
Hutton’s Vireo	*Vireo huttonni*
Orange-crowned Warbler	*Orethlypis celata*
Yellow Warbler	*Setophaga petechia*
Yellow-rumped Warbler	*Setophaha coronata*
Townsend's Warbler	*Setophaga townsendi*
Common Yellowthroat	*Geothlypis trichas*
Western Tanager	*Piranga ludoviciana*
Black-headed Grosbeak	*Pheucticus melanocephalus*
Lazuli Bunting	*Passerina amoena*
Spotted Towhee	*Pipilo maculatus*
California Towhee	*Pipilo crissalis*
Savannah Sparrow	*Passerculus sandwichensis*
Lark Sparrow	*Chondestes grammacus*
White-crowned Sparrow	*Zonotrichia leucophrys*
Golden-crowned Sparrow	*Zonotrichia atricapilla*
Fox Sparrow	*Passerella iliaca*
Song Sparrow	*Melospiza melodia maxillaris*
Lincoln's Sparrow	*Melospiza lincolnii*

Dark-eyed Junco	*Junco hyemalis*
Western Meadowlark	*Sturnella neglecta*
Red-winged Blackbird	*Agelaius phoeniceus*
Brewer's Blackbird	*Euphagus cyanocephalus*
Brown-headed Cowbird	*Molothrus ater*
Bullock's Oriole	*Icterus bullockii*
Purple Finch	*Haemorhous purpureus*
House Finch	*Carpodacus mexicanus*
Pine Siskin	*Spinus pinus*
American Goldfinch	*Spinus tristis*
Lesser Goldfinch	*Spinus psaltria*
House Sparrow	*Passer domesticus*

TABLE 3. SPECIAL STATUS PLANTS KNOWN TO OCCUR IN THE VICINITY OF THE PROJECT AREA, PLACER COUNTY, CALIFORNIA [1]

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Big-scale (California) balsamroot (*Balsamorhiza macrolepis var. macrolepis*)	--/--/1B.2	Chaparral, cismontane woodland, valley and foothill grassland/sometimes serpentinite; 90-1400m.	Possible. Suitable habitat may be present on the site. Surveys to be conducted spring/summer 2017.
Stebbins morning-glory *(Calystegia stebbinsii)*	FE/CE/1B1	Found in chaparral, cismontane woodland. Occurs on red clay soils of the pine-hill formation, on gabbro or serpentine. Prefers open areas. 300-725 M.	Not present. Suitable habitat not present at the site.
Pine Hill ceanothus (*Ceanothus roderickii*)	FE/Rare/1B.2	Found in chaparral and cismontane woodland. In gabbroic soils, often in disturbed area with other rare plants. 260-630 m.	Not present. Suitable habitat not present at the site.
Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*)	--/--/4.2	Found in chaparral, cismontane woodland, and lower montane coniferous forest. Often in roadcuts. 75-915 m.	Possible. Suitable habitat may be present on the site. Surveys to be conducted spring/summer 2017.
Red Hill soaproot (*Chlorogalum grandiflorum*)	--/--/1B.2	Found in cismontane woodland, chaparral, and lower montane coniferous forest. Occurs frequently on serpentine or gabbro, but also on non-ultramafic substrates and often on disturbed sites. 240-760 m.	Not present. Suitable habitat not present at the site.
Hispid salty bird's beak *(Chloropyron molle ssp. hispidum)*	--/--1B/1	Found in damp alkaline soils in meadows, seeps, playas, valley and foothill grassland. Especially in alkaline meadows and alkali sins with *Distichlis*. 1-155 M.	Not present. Suitable habitat not present at the site.
Dwarf downingia (*Downingia pusilla*)	--/--/2B.2	Found vernal pools and mesic sites within valley and foothill grassland. Found along margins of several types of vernal pools. 1-445 m.	Not present. Suitable habitat not present at the site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Stinkbells (*Fritillaria agrestis*)	--/--/4.2	Found in cismontane woodland, chaparral, and valley and foothill grassland. Sometimes found on serpentine, mostly found in non-native grassland or in grassy openings in clay soil. 10-1555 m.	Possible. Suitable habitat may be present on the site. Surveys to be conducted spring/summer 2017.
El Dorado bedstraw (*Galium californicum ssp. sierra)*	FE/Rare/1B.2	Found in cismontane woodland, chaparral, and lower montane coniferous forest. Occurs in pine-oak woodland or chaparral. Restricted to gabbroic or serpentine soils. 130-585 M.	Not present. Suitable habitat not present at the site.
Bogg's Lake hedge hyssop (*Gratiola heterosepala*)	--/CE/1B.2	Inhabits vernal pools and freshwater swamps and marshes. In clay soils and usually in vernal pools, sometime on lake margins. 10-2375 m.	Not present. Suitable habitat not present at the site.
Bisbee Peak rush-rose (*Helianthemum suffrutescens*)	--/--/3.2	Found in openings in chaparral, often on serpentine, gabbroic, or Ione formation soils. 45-840 m.	Not present. Suitable habitat not present at the site.
Ahart's dwarf rush (Juncus leiospermus var. ahartii)	--/--/ 1B.2	Restricted to the edge of vernal pools. Vernal pools and grasslands. 30-229 m.	Not present. Suitable habitat not present at the site.
Red Bluff dwarf rush *(Juncus leiospermus var. leiospermus)*	--/--/1B.1	Found in vernally mesic sites, sometimes on edges of vernal pools within chaparral, valley and foothill grassland, cismontane woodland, vernal pools, meadows and seeps. 30-1025 M.	Not present. Suitable habitat not present at the site.
Legenere (*Legenere limosa*)	--/--/1B.1	Found in the beds of vernal pools. Many historical occurrences are extirpated. 1-880 m.	Not present. Suitable habitat not present at the site.
Pincushion navarretia (*Navarretia myersii* ssp. *myersii*)	--/--/1B.1	Found in vernal pools, in clay soils within non-native grassland. 20-330 m.	Not present. Suitable habitat not present at the site.
Sacramento Orcutt grass (*Orcuttia viscida*)	FE/CE/1B.1	Found in vernal pools. 30-100 m.	Not present. Suitable habitat not present at the site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Layne's ragwort (*Packera layneae*)	FT/Rare/1B.2	Found in ultramafic soil, occasionally along streams in chaparral and cismontane woodland. 200-1000 m.	Not present. Suitable habitat not present at the site.
Sanford's arrowhead (*Sagittaria sanfordii*)	--/--/1B.2	Found in marshes and swamps. In standing or slow-moving freshwater ponds, marshes and ditches. 0-650 m.	Not present. Suitable habitat not present at the site.
El Dorado County mule ears (*Wyethia reticulata*)	--/--/1B.2	Found in chaparral, cismontane woodland, and lower montane coniferous forest. Found in stony red clay and gabbroic soils, often in openings in gabbro chaparral. 185-630 m.	Not present. Suitable habitat not present at the site.

1. Source: California Natural Diversity Data Base, Natural Heritage Division, California Department of Fish and Wildlife for the Rocklin 7.5-Minute Quadrangle Map and surrounding areas, information dated February 2017.

2. Status Codes:

FE	Federal-listed Endangered
FT	Federal-listed Threatened
FPE	Federal Proposed Endangered
FPT	Federal Proposed Threatened
CE	California State-listed Endangered
CT	California State-listed Threatened
CR	California Rare
FP	California Fully Protected
CSC	California Species of Special Concern

California Rare Plant Rank 1A:	Plants presumed extirpated in California and either rare or extinct elsewhere.
California Rare Plant Rank 1B:	Plants rare, threatened, or endangered in California and elsewhere.
California Rare Plant Rank 2A:	Plants presumed extirpated in California, but more common elsewhere.
California Rare Plant Rank 2B:	Plants rare, threatened, or endangered in California, but more numerous elsewhere.
California Rare Plant Rank 3:	Plants about which more information is needed – a review list.
California Rare Plant Rank 4:	Plants of limited distribution – a watch list.

CNPS Threat Ranks

0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

TABLE 4. SPECIAL STATUS ANIMAL SPECIES THAT HAVE BEEN REPORTED IN THE VICINITY OF THE PROJECT AREA, PLACER COUNTY, CALIFORNIA

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Invertebrates			
Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)	FT/--	Inhabits vernal pools; occurs throughout the Delta and Central Valley.	Not present. Suitable habitat is not present on site.
Vernal Pool Tadpole Shrimp (*Lepidurus packardi*)	FE/--	Inhabits vernal pools; known from scattered locations in the Delta and Central Valley.	Not present. Suitable habitat is not present on site.
California Linderiella (*Linderiella occidentalis*)	--/--	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions.	Not present. Suitable habitat is not present on site.
Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)	FT/--	Inhabits blue elderberry bushes (host plant); restricted to the Central Valley and adjacent foothills.	Not present. No elderberries were observed at the site during site surveys, therefor no potential habitat exists at the site for this species
Ricksecker's Water Scavenger Beetle (*Hydrochara rickseckeri*)	--/--	Aquatic beetle that lives in weedy shallow, open water associated freshwater seeps, springs, farm ponds, vernal pools (playa type pools) and slow-moving stream habitats.	Not present. Suitable habitat is not present on site.
Alabaster Cave harvestman *Banksula californica*	--/--	Known only from the type locality, Alabaster Cave in El Dorado County. The type locality has been partly destroyed by mining and the species may be extinct.	Not present. Suitable habitat is not present on site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Fish			
Conumnes stripetail *(Cosumnoperla hypocrena)*	--/--	Found in intermittent streams on the western slope of the Central Sierra Foothill in the American and Cosumnes River Basins.	Not present. Suitable habitat is not present on site.
Steelhead- Central Valley DPS *(Oncorhynchus mykiss irideus)*	FT/--	Population occur in the Sacramento and San Joaquin Rivers and their tributaries. In the project area found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine.	Not present. Suitable habitat is not present onsite; no large river systems or suitable spawning streams. Suitable spawning habitat located about 4 miles southwest of the site in Secret Ravine and Miners Ravine. Best Management Practices are necessary to control contaminants in stormwater runoff.
Amphibians			
Western Spadefoot Toad (*Spea hammondii*)	--/CSC	Breeds in vernal pools/seasonal stock ponds in the Central Valley and southern coast.	Not present. Although there are records in the CNDDB in vicinity of the property, onsite wetlands do not have characteristics sufficient to support this species.
California Red-legged Frog *(Rana draytonii)*	FT/CSC	Inhabits freshwater creeks and ponds in the scattered areas along the Coast Rangers from northern California down to northern Baja.	Not present. No CNDDB records in immediate vicinity of the property. The study site is considered to be outside of the current range of this species. Additionally, non-tidal wetlands onsite are seasonal and do not provide the perennial waters typically required for California Red-legged Frog.

Reptiles			
Western Pond Turtle *(Emys marmorata)*	--/CSC	Inhabits freshwater ponds and sluggish streams; occurs from WA to Baja, mostly west of the Sierra crest.	Not present. Suitable habitat is not present on site.
Birds			
Great Blue Heron (rookery site) *(Ardea herodias)*	--/--	Forms rookeries in large tree stands; occurs throughout California and elsewhere.	Rookery not present. Rookeries unlikely on the study site due to a lack of suitable trees.
Prairie Falcon *(Falco mexicanus)(*Nesting)	BCC/WL	Associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields and desert scrub. Permanent resident and migrant along inner coast and ranges.	Nesting unlikely. Appropriate nest sites not present. This species may forage on the site in winter, though none were observed in February 2017.
Peregrine Falcon *(Falco peregrinus anatum)(*Nesting)	Delisted,BCC /Delisted,FP	Inhabits open wetlands near cliffs, also occurs in some cities where nests on buildings and bridges.	Nesting unlikely. Appropriate nest sites not present.
Merlin *(Falco columbarius)* [wintering]	-/WL	Breeds in Canada, winters in a variety of California habitats, including grasslands, savannahs, wetlands, etc.	Wintering possible. The species may sporadically utilize the site as a winter foraging habitat.

Sharp-shinned Hawk *(Accipiter striatus)* [nesting]	-/WL	Breeds in ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine habitats. Prefers, but not restricted to, riparian habitats. North facing slopes, with plucking perches are critical requirements. All habitats except alpine, open prairie, and bare desert used in winter.	Nesting unlikely. Appropriate nesting habitat not present on site. Species likely forages on or near the site, especially in winter.
Cooper's Hawk *(Accipiter cooperii)* [nesting]	-/WL	Nests primarily in deciduous riparian forests; forages in open woodlands.	Nesting unlikely. Appropriate nesting habitat not present on site. Species likely forages on or near the site, especially in winter.
Osprey (*Pandion haliaetus*) [Nesting]	--/WL	Breeds in northern California from the Cascade Ranges south to Lake Tahoe, and along the coast south to Marin County. Associated strictly with large, fish-bearing waters, primarily in Ponderosa pine through mixed conifer habitats.	Nesting unlikely. Suitable nesting habitat not present on site.
Ferruginous Hawk *(Buteo regalis)* (wintering)	BCC/CSC	Inhabits open country. Winters in small numbers along California coast and inland valleys.	Wintering possible. The site is considered suitable wintering foraging habitat, though none were observed in February 2017 field studies.
Swainson's Hawk (nesting) *(Buteo swainsoni)*	BCC/CT	Nests in trees and riparian stands; summer migrant to Central Valley. Suitable foraging areas include grasslands, pastures, alfalfa and other hay crops, and certain grain and row croplands.	Nesting unlikely. CNDDB records indicate this species nests within two miles of the site. Nests unlikely on the property. The site may provide marginally suitable foraging habitat for this species. To be included in preconstruction surveys.

Northern Harrier *(Circus cyaneus)* (nesting)	--/CSC	Forages and nests in grasslands, marshes, and agricultural fields; occurs throughout California, concentrated in the Central Valley and coastal valleys.	Nesting unlikely. Suitable nesting habitat not present on site.
White-tailed Kite *(Elanus leucurus)* (nesting)	--/FP	Nests in dense oaks, willows, other trees; occurs in the Central Valley and adjacent low foothills.	Nesting unlikely. No CNDDB nesting records in vicinity. Nests unlikely on the study site due to a lack of suitable trees.
Bald Eagle *(Haliaeetus leucocephalus)* (nesting and wintering)	Delisted,BCC /CE,FP	In winter, maybe be found throughout most of California at lakes, reservoirs, rivers and some rangelands and coastal wetlands. California's breeding habitats are mainly located in mountains and foothill forests near permanent water sources.	Nesting unlikely. Suitable nesting habitat not present on site.
Golden Eagle *(Aquila chrysaetos)* [nesting and wintering]	BCC/WL,FP	Typically frequents rolling foothills, mountain areas, sage-juniper flats and desert.	Wintering possible. The site likely receives sporadic use by the species in winter.
California black rail *(Laterallus jamaicensis coturniculus)*	--/CT,FP	Mainly inhabits salt-marshes bordering larger bays. Occurs in tidal salt marsh with dense growths of pickleweed; also occurs in freshwater and brackish marshes.	Not present. Suitable habitat is not present at the site.
Short-eared Owl (nest site) *(Asio flammeus)*	--/CSC	Forages and nests in perennial marsh and grassland habitat; occurs in the Central Valley, coast, and east Sierra regions.	Nesting unlikely. Suitable nesting habitat not present on site.

Western Burrowing Owl *(Athene cunicularia hypugea)* (burrow sites)	BCC/CSC	Nests in mammal burrows, rock cavities in grassland and scrub; occurs throughout much of mid and lower California.	Not present. Although CNDDB documents nesting records in the project, suitable habitat is not present at the site due to tall heights of upland grasses and general lack of California ground squirrels and ground squirrel burrows. No individuals were observed during surveys in February 2017. To be included in preconstruction surveys.
Purple Martin *(Progne subis)*	--/CSC	Uses a variety of wooded, low-elevation habitats throughout California. Uses hardwood and hardwood-conifer habitats as well as riparian habitats. Now a rare and local breeder on the coast and in interior mountain ranges.	Nesting unlikely. Suitable nesting habitat not present on site.
Loggerhead Shrike *(Lanius ludovicianus)* (nesting)	BCC/CSC	Habitat includes open areas such as desert, grasslands, and savannah. Nests in thickly foliaged trees or tall shrubs. Forages in open habitat which contains trees, fence posts, utility poles and other perches.	Unlikely. Although not recorded for the project area in the CNDDB, trees and shrubs provide suitable nesting habitat. Not observed during surveys conducted in February 2017. To be included in preconstruction surveys.
Grasshopper Sparrow *(Ammodramus savannarum)*	--/CSC	Found in dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches.	Nesting unlikely. Suitable nesting habitat not present on site.
Yellow Warbler *(Setophaha petechia)* [nesting]	BCC/CSC	Breeds in deciduous riparian woodlands, widespread during fall migration.	Nesting not present. May occur on site during fall migration, but suitable nesting habitat is not present at the site.
Tricolored Blackbird *(Agelaius tricolor)* (nesting colony)	BCC/CE, CSC	Nests in cattails, riparian scrub, and other dense marsh vegetation; occurs in SF Bay, Delta, and Central Valley basin.	Nesting not present. Appropriate nest sites not present. To be included in preconstruction surveys.

Mammals			
Silver-haired bat *(Lasionycteris noctivagans)*	--/--	Coastal and montane forests. Feeds over streams, ponds and open bushy areas, roosts in hollow trees.	Not present. Suitable habitat is not present at the site.
Pallid bat *(Antrozous pallidus)*	-/CSC	Roosts primarily in oak woodland and ponderosa pine habitats; forages in open areas.	Not present. Suitable habitat is not present at the site.
Townsend's Big-eared Bat *(Corynorhinus townsendii)*	--/CCT,CSC	Found in desert scrub and coniferous forests. Roost in caves or abandoned mines and occasionally are found to roost in buildings.	Not present. Suitable habitat is not present at the site.
American badger *(Taxidea taxus)*	-/CSC	Drier open stages of most shrub, forest, and herbaceous habitats; needs sufficient food, friable soils and open, uncultivated ground.	Not present. Suitable habitat is not present at the site.

Arborists Report for Costco Site, Loomis, CA,
Prepared by Mann Made Resources, December 9, 2016.

Mann Made Resources
Arborist Consulting and Tree Conservation Products

December 9, 2016

Mr. Steve Calcagno
Kier & Wright Civil Engineers & Surveyors
2850 Collier Canyon Road
Livermore, CA 94551

SUBJECT: ARBORISTS REPORT FOR COSTCO SITE, LOOMIS, CA

Dear Mr. Calcagno,

Thank you for the opportunity to provide Arborist Consulting Services. The trees on the subject property were inspected on Friday, Saturday, and Sunday, November 18, 19, and 20, and December 9, 2016, and this report provides the findings from the inspections.

Assignment and Background: You contacted my office on October 30th to request an arborist inspection of the trees located within the construction site in Loomis on Sierra College Boulevard and Brace Road for a proposed Costco. I provided a proposal, and you provided the site image to work from. The assignment was to list all Blue Oak trees 4 inches diameter and greater, and all Live Oak and Valley Oak trees 6 inches diameter and greater. You also asked for an estimate of the mitigation required for the removal of the trees on the property.

Observations: The site was inspected on Friday, Saturday, and Sunday, November 18, 19, and 20, with a re-visit on Friday, December 9, 2016 to capture 9 trees that were not completed during the previous site visits. The site is an open area surrounded by fencing, bordered by Sierra College Boulevard top the west, Brace Road to the north, and the Rocklin Border to the south. An apartment complex is adjacent to the property on Brace Road, and the entry gate to the property was behind the driveway into the apartment complex. There is a piece of excess property to the east of the apartment complex that was included in the survey. Twenty eight trees were found to be in the excess property.

Prior to beginning the survey, I reviewed the Loomis Tree Preservation Ordinance to assure the data collected meets their requirements. A Trimble Geo7X unit was used to capture the data and tree locations. A tree ID number was listed on the map image, and the tree tag number was listed for each tree, and the data spreadsheet lists both numbers for easier field identification. The Tree ID number is shown on the KMZ file except for the last 9 trees along Brace Road that were captured using Google Earth, and the Tree ID number and the tag number are the same for those trees.

Each Oak tree was visited and measured. Undersized trees were not listed. Most of the trees had 1 or two previous tag numbers, and a new number was given to each tree for this inspection. Three trees were double numbered with 301, 302, and 303, before I caught that the same numbers were already used. The double number trees are differentiated by the Tree ID numbers. The tag I installed has the nail head tilted downward so the tag falls away from the tree. Tree tags are typically good for at least three years. After three years, tags may need to be replaced as the tree can grow over the tag which makes the tag number unable to be read. Each tree ID number is the number shown on the KMZ file aerial image.

The required data to be collected was:

i. Tree number
ii. Tree species/common name
iii. Diameter at 4.5' above grade, or the best measurement for diameter if 4.5 was not a good representation of the trunk diameter.
iv. Condition determined by combining vigor, structure, and ability to grow on the site, rated from Excellent, Good, Fair, Major Problems, Extreme Problems, or Dead. Condition ratings are used to calculate mitigation requirements.
v. Comments supporting the condition rating.

All of the trees were viewed while standing on the ground. The diameter was measured using a diameter tape. A probe was used to learn the depth of cavities. A mallet was used to sound the wood and listen for hollow spots.

Three Hundred Seventy Two (372) trees were listed as being of protected size. One hundred sixty two (162) trees were found to be in good or fair condition. Two hundred ten (210) trees were found to be in poor, very poor, or dead condition. The inspection data is shown on the attached 20 page spreadsheet.

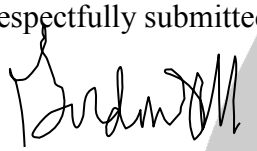
Other testing or examination: No other testing or examination was agreed to as part of the inspection assignment.

Discussion: The Town's Tree Preservation Ordinance provided the requirements for data collection. Blue Oaks 4 inches diameter and greater, and Valley and Live Oaks 6 inches diameter and greater are considered Protected Trees.

A total of 372 trees were listed found to be of protected size. Of the 372 total trees, 210 trees were found to be in condition rating 2, 1, and 0, and do not require mitigation. Of the 210 trees, 168 trees were found to be in poor condition, a numerical 2 rating, considered major problems. Thirty eight (38) trees were found to be in very poor condition a 1 rating, considered extreme problems. Four (4) trees were found to be dead, a zero rating.

One hundred sixty two (162) trees were found to be in good and fair condition. Eight (8) trees were found to be in good condition, a 4 rating. Fifteen (15) #15 container size trees are required for mitigation. One hundred fifty four (154) trees were found to be in fair condition, a 3 rating. Two Hundred Seventy Five (275) #15 container size trees are required for mitigation. Per the Town's ordinance, a total of 290 #15 container size trees may be required to be planted on the site for mitigation.

Two (2) of the existing trees in good and fair condition were found to be blue oaks, and require higher mitgation planting. Eighty six (86) of the existing trees were found to be Live Oaks. Two hundred eighty four trees were found to be Valle Oaks.



The spreadsheet includes the tree map ID number, the tree tag number, common name, species, diameter at 4.5 measurement or other appropriate location, tree condition using the Town of Loomis 0-5 rating system, and comments with notes supporting the condition rating. The spreadsheet is sorted 3 ways, by tree tag number, tree condition to calculate mitigation planting, and by species.

Conclusion: Three hundred seventy two (372) trees were found to be of protected size. Of those trees, 162 were found to be in good and fair condition for a total mitigation planting requirement of potentially 290 #15 container trees. It should be possible to plant these trees on the property as part of the project landscape design and parking lot shade.

Certification: I certify that all the statements in this report are true, complete and correct to the best of my knowledge, and that all statements were made in good faith.

Please contact me at 650-740-3461 or at gordon@mannandtrees.com if you have any questions about this report or if additional services are desired.

Assumptions and Limitations: This report provides information about the subject trees at the time of the inspection. Trees and conditions may change over time. This report is only valid for the conditions present at the time of the inspection. All observations were made while standing on the ground. The inspection consisted of visual observations. No further examinations were requested or performed.

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the options and recommendations of the arborist, or seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that can fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatments, pruning, and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, landlord-tenant matters, etc. Arborists cannot take such issues into account unless complete and accurate information is given to the arborist. The person hiring the arborist accepts full responsibility for authorizing the treatment options or remedial measures.

Trees can be managed, but they cannot be controlled. To live near a tree is to accept some degree of risk. The only way to eliminate all risks associated with trees is to eliminate all trees.

WETLAND DELINEATION
FOR THE
±17.88-ACRE SIERRA-BRACE STUDY AREA

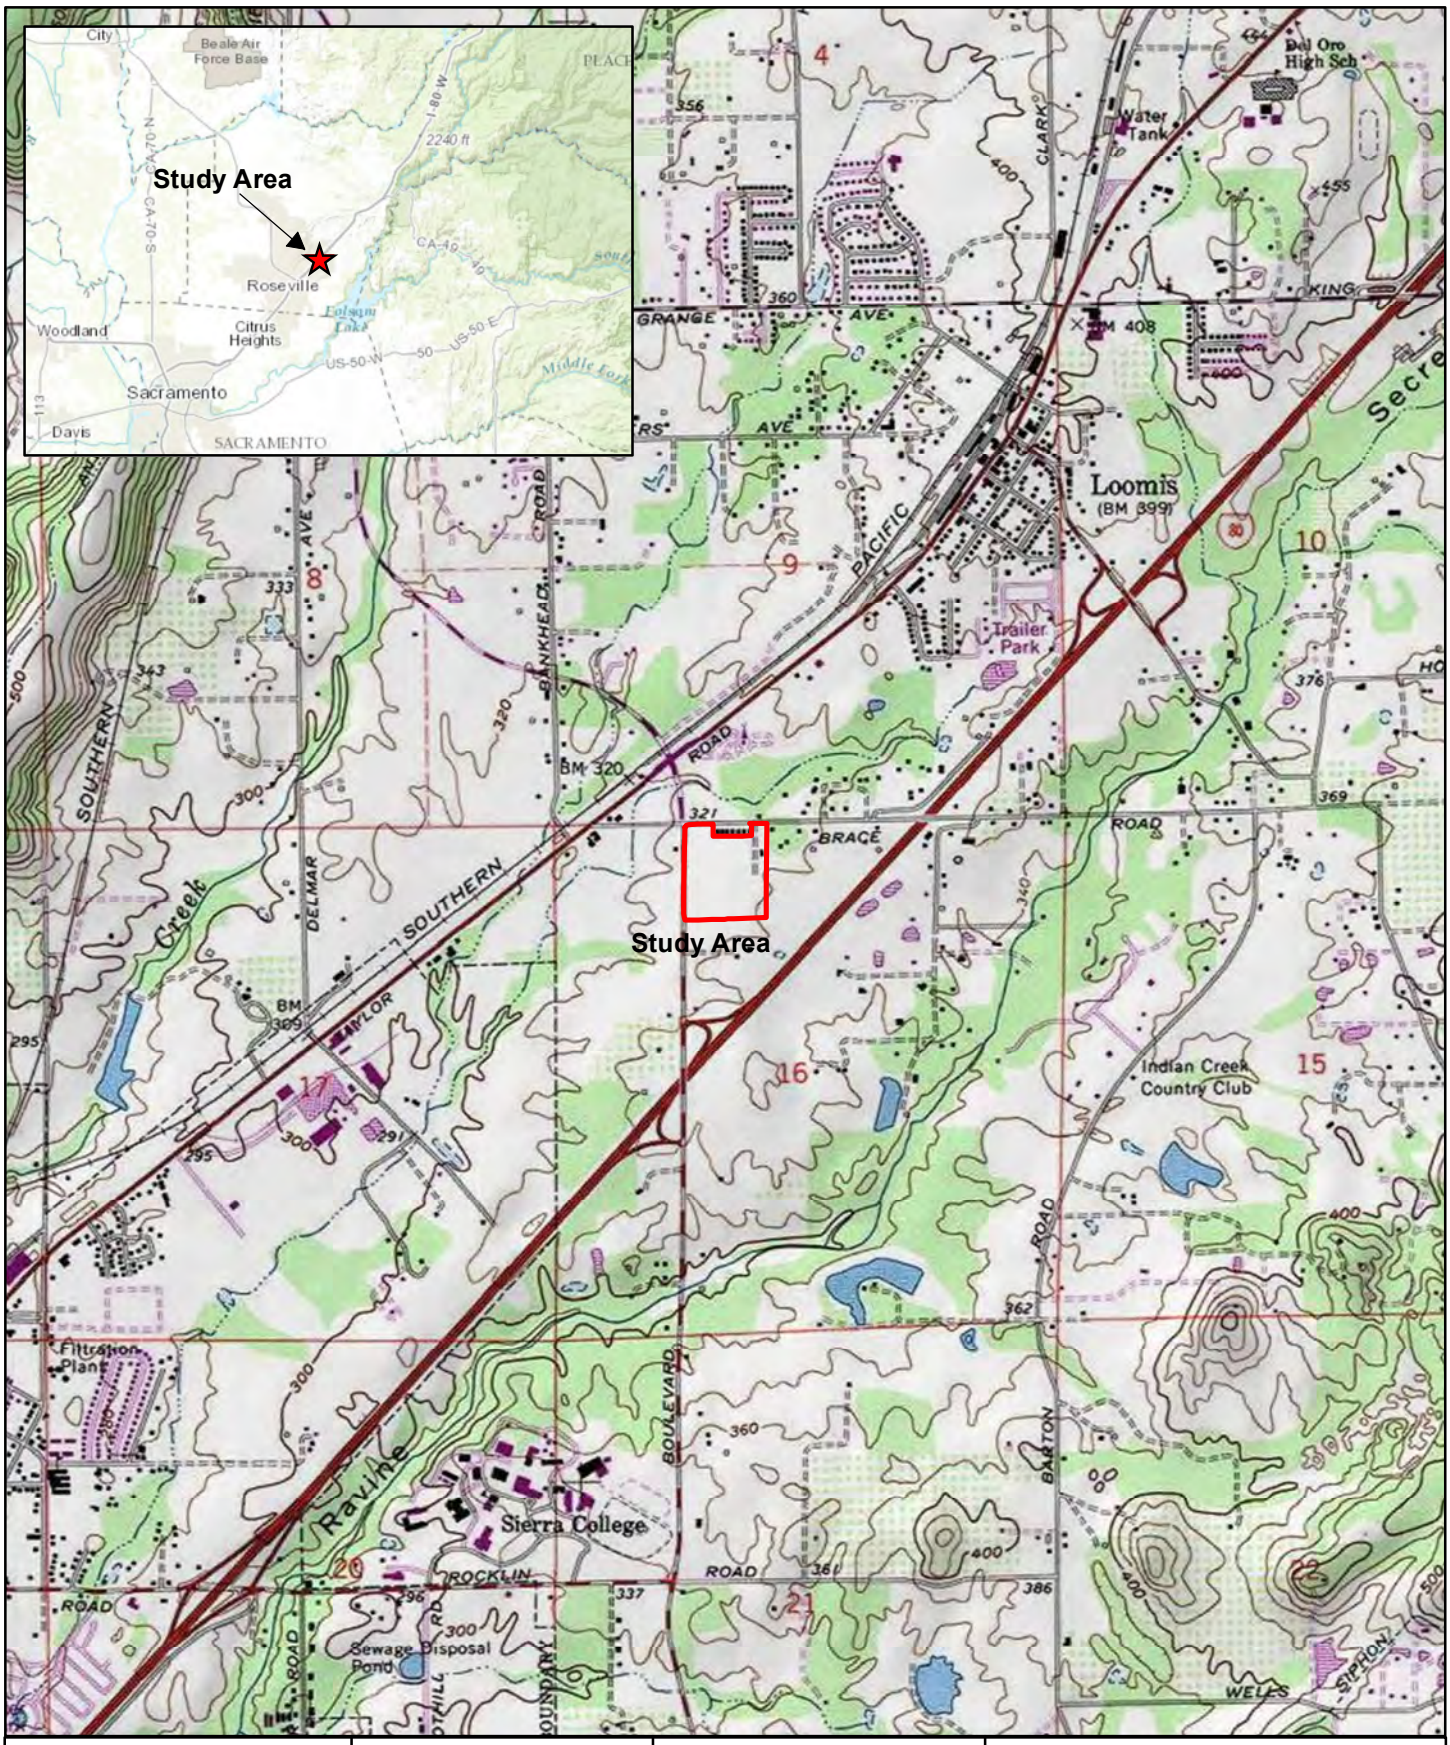
INTRODUCTION

On behalf of Manikas Properties, Salix Consulting, Inc., is submitting this updated delineation of waters of the United States for the ±17.88-acre Sierra-Brace study area in the Town of Loomis, Placer County, California. The property was originally delineated by North Fork Associates in February 2008 and verified by the Corps March 20, 2009 (SPK-2008-00630). This document largely includes the original delineation documentation and mapping, with minor adjustments, as needed.

The study area is located north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. The location corresponds to Section 28 of Township 11 North and Range 7 East on the 7.5 minute Rocklin, CA United States Geological Survey (USGS) quadrangle (Figure 1). The latitude and longitude of the approximate center of the site are 38°48'34"North and 121°12'16" West. The Assessor Parcel Numbers (APNs) are 045-042-011, 045-042-012, 045-042-023, 045-042-034, 045-042-035, 045-042-036, and 045-042-037.



The study area is located at an elevation between approximately 320 and 340 feet. Habitats in the study area include annual grassland and foothill woodland. Adjacent land uses include a multi-family residential building along the northern boundary the Homewood Lumber complex to the north, single family residential to the east, commercial and undeveloped land to the south, and an office building and undeveloped land to the west (Figure 2). The study area is bounded by Brace Road to the north and Sierra College Boulevard to the west.

Background

As noted above, waters of the U.S. were delineated by North Fork Associates in February 2008 and verified by the U.S. Army Corps of Engineers March 20, 2009. The verification was valid for five years from the date of the letter. The 2009 verification letter is included as Attachment 1, following the Appendices. Property ownership has changed since that time, and this report is intended to update that delineation.

Directions to the Site

From Sacramento, proceed east on Interstate 80. Take the Sierra College Boulevard exit and turn left after exiting the freeway. The Brace Road and Sierra College Boulevard intersection is just north of Interstate 80. The study area is located in the southeastern corner of the intersection.

Phone: (530) 888-0130
Contact: Jeff Glazner

METHODS

Waters of the United States were assessed on March 25, 2016, by Jeff Glazner and Hunter Gallant. The North Fork delineation was uploaded to the submeter GPS and field checked. Very minor adjustments were made and are reflected in the map provided in this document. The original topographic basemap was used for the revised map as new topo was not available. The original data forms are included in Appendix A. The plant list for the site is included as Appendix B.

RESULTS

Climate

The region has a Mediterranean climate with dry hot summers and mild winters. Over the course of a year, average high temperatures typically vary from 54°F in the winter to around 92°F in the summer. The warm season lasts from May through September, with an average daily high temperature above 88°F. On average, the hottest months are July and August with an average high of 92°F and low of 61°F. The coolest months are December and January, with an average daily high temperature around 54°F and average low temperature around 40°F. Precipitation occurs mostly from November through April in the form of rain, averaging around 25 inches per year. Little or no precipitation falls during June, July, and August.

Precipitation occurred 3 days prior to the March 25, 2016, field visit, amounting to one-half an inch of rainfall.

Soils

One soil unit is mapped in the study area (Figure 3): Andregg coarse sandy loam, 2 to 9 percent slopes.

Andregg soils on-site are coarse-loamy Ultic Haploxerolls, which are Mollisols formed in a Mediterranean climate and characterized by little subsoil development. This component is on foothills, hills with slopes of 2 to 9 percent. They are derived from weathered granodiorite, and bedrock is 29 to 33 inches below the surface. The A horizon extends to about 15 inches and the BA horizon to about 24 inches. Hues range from 10YR to 2.5YR; values between 5 and 2; and chromas between 3 and 2, moist. Organic matter at the surface horizon is around 2 percent. Andregg soils are well-

drained and have moderately rapid permeability. This soil is neither ponded nor flooded. This soil does not meet hydric criteria.

Hydrology

The Sierra-Brace study area is located in the Lower American watershed (Hydrologic Unit Code 18020111). The topography of the study area gently slopes to the west. The wetland swale and drainage ditch located in the southwest corner of the site drain water westerly and convey water offsite through culverts underneath Sierra College Boulevard. Water continues to drain westerly on the adjacent property and drains into Sucker Ravine which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River. The constructed drainage in the northeastern corner conveys storm water and urban runoff from the residential development to the east through a storm drain system.

Vegetation

Two biological communities were identified within the study area: foothill woodland and annual grassland. The site wetlands are embedded in these habitats. Figures 4a and 4b. provides photos of the site taken during the March 25, 2016, site visit.

Foothill Woodland

The foothill woodland varies in density throughout the site, being mostly open, and it is dominated by valley oak and interior live oak with a few scattered foothill pines. Shrubs in the understory vary from dense stands of coyote brush and Himalayan blackberry to a completely absent shrub layer. The herbaceous layer consists of a mixture of non-native grasses and forbs. Grasses include Italian ryegrass, ripgut grass, and soft chess. Forbs present include Italian thistle, California mugwort, field hedge-parsley, klamathweed, broad leaf filaree, common vetch, and crane's-bill geranium.

The wetland swale in the study area occurs within the foothill woodland habitat. A few Fremont cottonwood, narrow-leaved willow, and arroyo willow occur within the shrub understory. The herbaceous understory includes curly dock, Mexican rush, Iris-leaf rush, tall flatsedge, and prickly lettuce.

Annual Grassland

The non-native grasses and forbs that occur in the foothill woodland also occur in the annual grassland in the study area. Other grasses and forbs present in the annual grassland include wild oat, hedgehog dogtail, foxtail barley, medusahead, yellow star-thistle, rose clover, smooth's cat-ear, common fiddleneck, short-podded mustard, and bindweed. The annual grassland onsite appears to be disked annually.

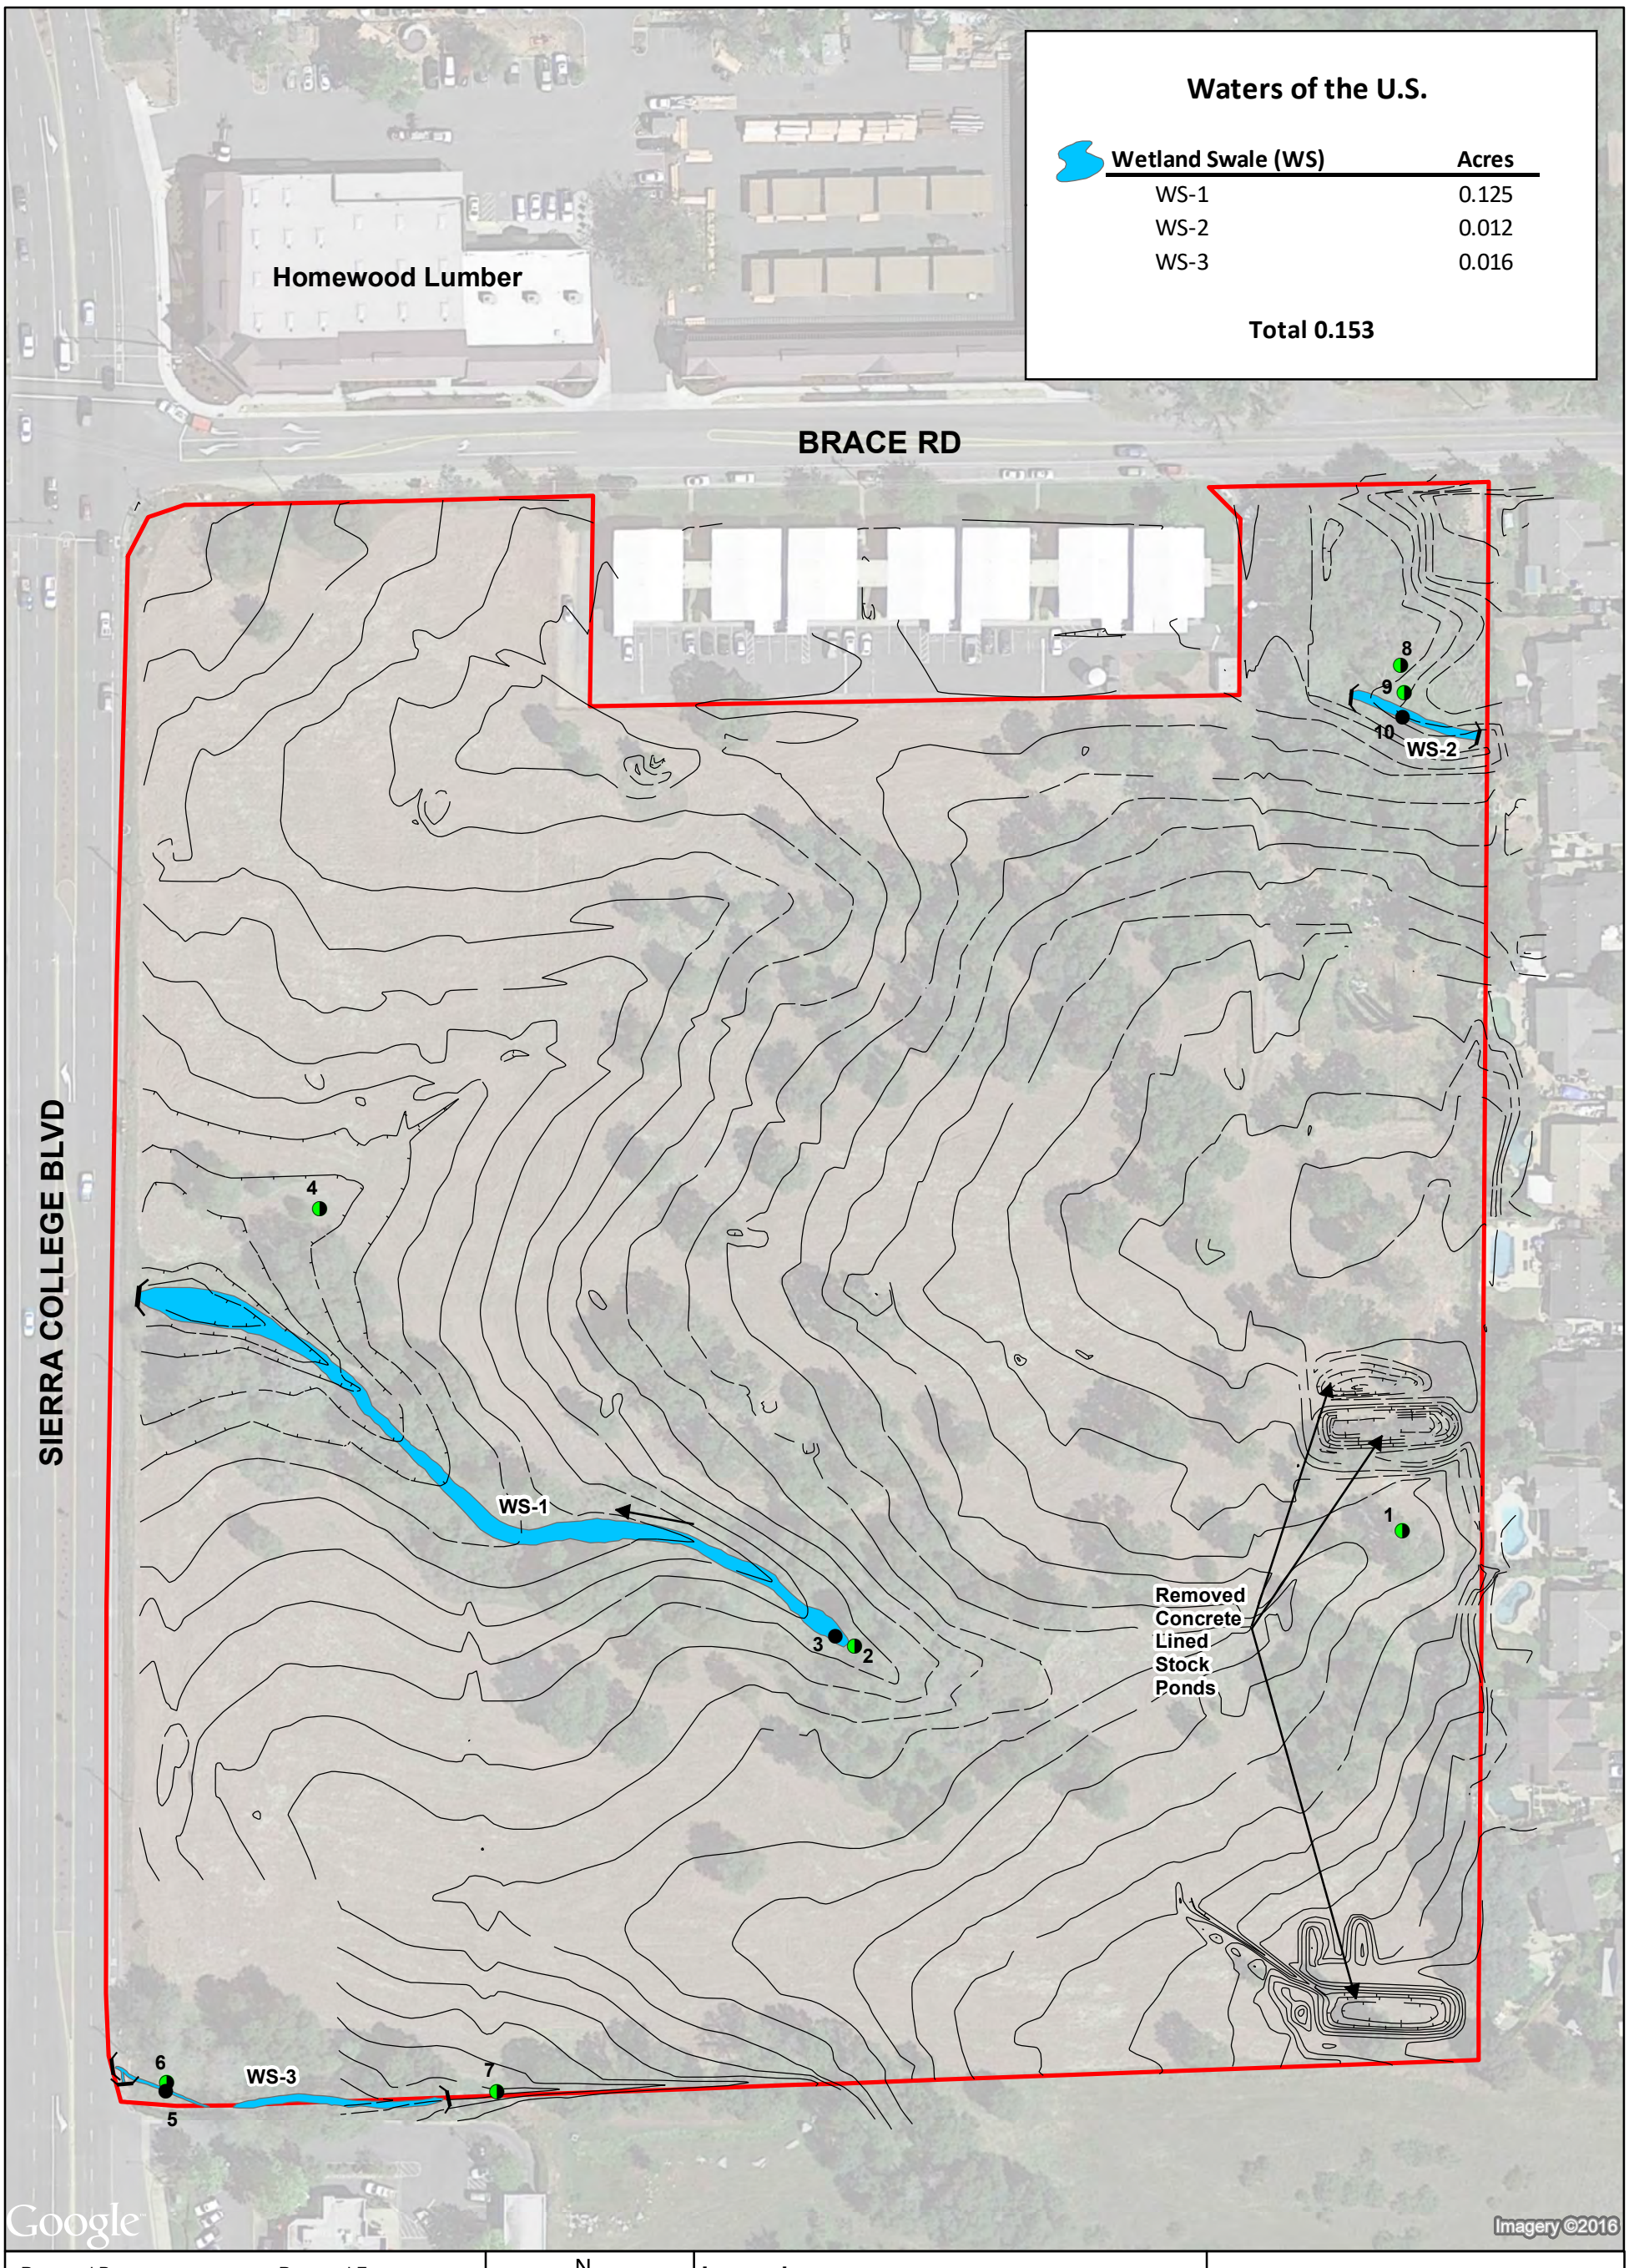
Waters of the United States

One category of waters of the United States was mapped on the site: wetland swale. Table 1 provides an acreage summary of the wetland swales. The wetland delineation map is included in Figure 5. GIS data is provided on the accompanying DVD, and the Corps of Engineers Aquatic Resources spreadsheet is included as Appendix C.

Table 1.
Waters of the United States within the Sierra-Brace Study Area



Type	Acreage
Wetlands:	
Wetland swale	
WS-1	0.125
WS-2	0.012
WS-3	0.016
Total Waters of the United States	**0.153**

Wetland Swale

One wetland swale occurs within the foothill woodland habitat (Figure 4a). This swale (WS-1) begins in the middle of the study area, where it collects surface water (in the form of sheet flow) and then drains westerly, where it then exits the study area through a culvert underneath Sierra College Boulevard. The beginning of the swale is a small open area dominated by iris leaf rush. The swale then continues west through a dense patch of coyote brush and opens up again near the culvert adjacent to Sierra College Boulevard. Wetland plant species such as hyssop loosestrife, curly dock, prickly lettuce, Italian ryegrass, and Mexican rush are present within the lower portion of the swale.

A second wetland swale (WS-2) enters the study area through a culvert along the eastern boundary in the northeast corner of the study area. The swale appears to convey stormwater runoff and urban water westerly for approximately 80 feet within the study area, and then exits the study area through a culvert underneath Starlight Lane. The swale is densely vegetated with Himalayan blackberry (Figure 4b).

A third swale (WS-3) occurs in the southwestern corner of the study area, where stormwater runoff drains onto the study area through an 18-inch PVC culvert located on the commercial development (McDonald's/Chevron) to the south. Wetland species such as water plantain, veronica, moth mullein, water cress, and curly dock are present. The swale (WS-3) continues for approximately 175 feet west until it merges with a narrower excavated ditch that drains water from a 12-inch concrete culvert located under the commercial development to the south (Figure 4b). Water exits the study area along the western boundary through a 30-inch corrugated metal pipe culvert under Sierra College Boulevard.

NOTES: Revised wetland delineation conducted March 2016. Original delineation conducted by Pat Britton and Barry Anderson of North Fork Associates in 2007.

Figure 5

WETLAND DELINEATION

Sierra-Brace

Town of Loomis, Placer County, CA

April 18, 2016

Former Cattle Watering Holes

According to historic information, three concrete-lined livestock ponds once existed onsite and these ponds had been directly connected to a well and pump that had been abandoned, and that they had been filled for safety reasons, utilizing a grading permit issued by the Town of Loomis (#5475). Because we are using the old topographic mapping, the concrete depressions appear on the map. These areas are now leveled ground.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Sierra-Brace | City/County: Town of Loomis, Placer County | Sampling Date: 12/13/2007
Applicant/Owner: Patterson Properties | State: CA | Sampling Point: 1
Investigator(s): Pat Britton and Melissa Perretti | Section, Township, Range: Section 16, Township 11N, Range 7E
Landform (hillslope, terrace, etc.): Plain | Local relief (concave, convex, none): none | Slope (%): 0
Subregion (LRR): C | Lat: 38°48'34"North | Long: 121°12'16" West | Datum: NAD 83
Soil Map Unit Name: Andregg coarse sandy loam, 2 to 9 percent slopes | NWI classification:
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation N, Soil N, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ☒	No ☐	**Is the Sampled Area**	
Hydric Soil Present?	Yes ☒	No ☐	**within a Wetland?**	**Yes** ☐ **No** ☒
Wetland Hydrology Present?	Yes ☐	No ☒

5-9	10 YR 3/1	90	7.5 YR 3/3	10	C	M	Coarse sandy loam	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [2]Location: PL=Pore Lining, RC=Root Channel, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5) (**LRR C**)
- ☐ 1 cm Muck (A9) (**LRR D**)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☒ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1 cm Muck (A9) (**LRR C**)
- ☐ 2 cm Muck (A10) (**LRR B**)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type:

Depth (inches):

Hydric Soil Present? Yes ☒ **No** ☐

Remarks:

At 6 inches deep within the soil profile, there appears to be a red band.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1) (**Nonriverine**)
- ☐ Sediment Deposits (B2) (**Nonriverine**)
- ☐ Drift Deposits (B3) (**Nonriverine**)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Plowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1) (**Riverine**)
- ☐ Sediment Deposits (B2) (**Riverine**)
- ☐ Drift Deposits (B3) (**Riverine**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches):

Water Table Present? Yes ☐ No ☒ Depth (inches):

Saturation Present? Yes ☐ No ☒ Depth (inches):

(includes capillary fringe)

Wetland Hydrology Present Yes ☐ **No** ☒

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Lacks evidence of wetland hydrology indicators.

- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches):

Water Table Present? Yes ☐ No ☒ Depth (inches):

Saturation Present? Yes ☐ No ☒ Depth (inches):

(includes capillary fringe)

Wetland Hydrology Present Yes ☐ **No** ☒

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Lacks evidence of prolonged seasonal saturation.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Sierra-Brace | City/County: Town of Loomis, Placer County | Sampling Date: 12/13/2007
Applicant/Owner: Patterson Properties | State: CA | Sampling Point: 5
Investigator(s): Pat Britton and Melissa Perretti | Section, Township, Range: Section 16, Township 11N, Range 7E
Landform (hillslope, terrace, etc.): hillslope | Local relief (concave, convex, none): Concave | Slope (%): 2
Subregion (LRR): C | Lat: 38°48'34"North | Long: 121°12'16" West | Datum: NAD 83
Soil Map Unit Name: Andregg coarse sandy loam, 2 to 9 percent slopes | NWI classification:
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)

Are Vegetation N, Soil N, or Hydrology N significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
Are Vegetation N, Soil N, or Hydrology N naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes ☒ No ☐
Hydric Soil Present? Yes ☒ No ☐
Wetland Hydrology Present? Yes ☒ No ☐
Is the Sampled Area within a Wetland? Yes ☐ No ☒

Remarks:
Ditch that drains storm water runoff. Drains for a short distance on the site and leaves via a 30 inch culvert under Sierra College Boulevard.

Regulatory Division (SPK-2008-00630)

Stephen Patterson
Patterson Properties
2270 Douglas Boulevard, Suite 111
Roseville, California 95661

Dear Mr. Patterson:

We are responding to your consultant's request for an approved jurisdictional determination for the Sierra-Brace Property. This approximately 17.88-acre site is located in Section 28, Township 11 North, Range 7 East, MDB&M, Latitude 38.808793° North, Longitude 121.203869° West, near the City of Rocklin and Town of Loomis, Placer County, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on the February 28, 2008, *Appendix C, Wetland Delineation Map, Sierra-Brace Study Area, Town of Loomis, Placer County, CA,* drawing prepared by North Fork Associates. Approximately 0.14 acre of waters of the United States, including wetlands, is present within the survey area. These waters are regulated under Section 404 of the Clean Water Act, since they are tributary to an unnamed intermittent stream, which is tributary to Secret Ravine, which is tributary to Miner's Ravine, which is tributary to Dry Creek, which is tributary to the Natomas East Main Drainage Canal, which is tributary to the Sacramento River, a navigable water of the United States.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331.

A Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form is enclosed. If you request to appeal this determination you must submit a completed RFA form to the South Pacific Division Office at the following address: Administrative Appeal Review Officer, Army Corps of Engineers, South Pacific Division, CESPD-PDS-O, 1455 Market Street, San Francisco, California 94103-1399, Telephone: 415-503-6574, FAX: 415-503-6646.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by 60 days from the date of this letter. It is

not necessary to submit an RFA form to the Division Office if you do not object to the determination in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please complete our customer survey at *http://www.spk.usace.army.mil/customer_survey.html*. Your passcode is "conigliaro".

Please refer to identification number SPK-2008-00630 in any correspondence concerning this project. If you have any questions, please contact (b) (6) at our California North Branch, 1325 J Street, Room 1480, Sacramento, California, 95814-2922, email (b) (6) *@usace.army.mil*, or telephone (916) 557-6740. You may also use our website: *www.spk.usace.army.mil/regulatory.html*.

Sincerely,

ORIGINAL SIGNED

SACRAMENTO CA 95814-2922

June 14, 2016

Regulatory Division (SPK-2008-00630)

Manikas Properties
Attn: Mr. John Manikas
1817 Maryal Drive, Suite 100
Sacramento, California 95864

Dear Mr. Manikas:

We are responding to your May 11, 2016, request for a preliminary jurisdictional determination (JD), in accordance with our Regulatory Guidance Letter (RGL) 08-02, for the Sierra-Brace Property site. The approximately 17.88-acre project site is located in Section 16, Township 11 North, Range 7 East, Mount Diablo Meridian, Latitude 38.80879°, Longitude -121.20387°, Loomis, Placer County, California.

Based on available information, **we concur with the amount and location of wetlands and/or other water bodies on the site as depicted on the enclosed April 18, 2016, *Figure 5 Wetland Delineation Sierra Brace* drawing prepared by Salix Consulting, Inc. (enclosure 1)**. The approximately 0.153 acres of wetland swales present within the survey area are potential waters of the United States regulated under Section 404 of the Clean Water Act.

We have enclosed a copy of the *Preliminary Jurisdictional Determination Form* for this site (enclosure 2). Please sign and return a copy of the completed form to this office. Once we receive a copy of the form with your signature we can accept and process a Pre-Construction Notification or permit application for your proposed project.

You should not start any work in potentially jurisdictional waters of the United States unless you have Department of the Army permit authorization for the activity. You may request an approved JD for this site at any time prior to starting work within waters. In certain circumstances, as described in RGL 08-02, an approved JD may later be necessary.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This preliminary determination has been conducted to identify the potential limits of wetlands and other water bodies which may be subject to Corps of Engineers' jurisdiction for the particular site identified in this request. A Notification of Appeal Process and Request for Appeal form is enclosed to notify you of your options with this determination (enclosure 3). This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are U.S. Department of Agriculture (USDA) program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please tell us how we are doing by completing the customer survey on our website under *Customer Service Survey*.

Please refer to identification number SPK-2008-00630 in any correspondence concerning this project. If you have any questions, please contact (b) (6) at our California North Branch Office, Regulatory Division, Sacramento District, U.S. Army Corps of Engineers, 1325 J Street Room 1350, Sacramento, California 95814-2922, by email at (b) (6) *@usace.army.mil*, or telephone at 916-557-7759. For more information regarding our program, please visit our website at *www.spk.usace.army.mil/Missions/Regulatory.aspx*.

Sincerely,

This report should be cited as: *Draft Biological Resources Report, Costco Wholesale Project, Town of Loomis, Placer County, California.* June 2017. San Rafael, California 37 pp. plus attachments. Prepared for Costco Wholesale.

1.0 INTRODUCTION

On behalf of Costco Wholesale, Huffman-Broadway Group, Inc. (HBG) has prepared a Biological Resources Report for the Costco Wholesale Project in The Town of Loomis, Placer County, California. It is expected that this Biological Resources Report will be incorporated into an environmental document prepared by Placer County to satisfy requirements of the California Environmental Quality Act (CEQA). This report describes biological resources and ecological constraints present on the 17.88-acre Project Site, including the presence of sensitive habitats and an evaluation of the potential for rare, threatened, or endangered species of flora and/or fauna to occur at the site or in the project vicinity. The report also includes a preliminary review of biological impacts associated with implementation of the project and recommended mitigation measures, as needed.

Our analysis included a review of pertinent literature on habitat characteristics of the site, species of plants and animals expected to utilize the site, a review of planning documents referencing ecological aspects of the site, and field site surveys. The Biological Resources Report also incorporates the results of a wetland jurisdictional determination prepared for the site by Salix Consulting Inc., in May of 2016. This report was a detailed delineation of wetlands and waters of the United States at the property, conducted per criteria of the U.S. Army Corps of Engineers, and the results of the wetland delineation are summarized herein. Also considered is an Arborist's Report prepared by Mann Made Resources. The wetland delineation is included as an attachment herein, and the Arborist's Report is available at the City of Loomis under separate cover. The California Natural Diversity Data Base (CNDDB) was consulted to determine if any populations of endangered, threatened, or rare species have occurred historically or currently are known to exist near the project. The study site was surveyed by HBG biologists between February and June of 2017.

2.0 PROJECT DESCRIPTION

2.1 Location of Project Site

The Project Site is in the Town of Loomis in Placer County, California. The site is north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. The location corresponds to Section 28 of Township 11 North and Range 7 East on the 7.5 minute Rocklin, CA United States Geological Survey (USGS) quadrangle (Figure 1). The latitude and longitude of the approximate center of the site are 38°48'34" North and121°12'16" West. The Assessor Parcel Numbers (APNs) are 045-042-011, 045-042-012,045-042-023, 045-042-034, 045-042-035, 045-042-036, and 045-042-037.The property is located on the Loomis 7.5-minute U.S. Geographic (USGS) topographic quadrangle map.

Refer to Exhibit 1, Figure 1 for the project site location map, Figure 2 for the location of the project on the Loomis USGS 7.5-minute quadrangle map, and Figure 3 for an aerial photograph of the project site.

2.2 Project Description

Costco Wholesale is proposing to construct a Costco facility at the site as shown in the conceptual plan in Figure 4. The Preliminary Grading and Drainage Plan is shown in Figure 5. The facility includes the Costco warehouse and associated parking and other planned infrastructure. The proposed project would cover the entire site.

3.0 EXISTING SETTING

3.1 Site Description

The Project Site is in the Town of Loomis in Placer County, California. The site is north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. Adjacent land uses include a multi-family residential building along the northern boundary the Homewood Lumber complex to the north, single family residential to the east, commercial and undeveloped land to the south, and an office building and undeveloped land to the west (Figure 3). The study area is bounded by Brace Road to the north and Sierra College Boulevard to the west.

General features of the project site are as follows:

- **Soils and Topography**. One soil unit is mapped in the study area (Figure 6): Andregg coarse sandy loam, 2 to 9 percent slopes. Andregg soils are well drained and have moderately rapid permeability. This soil is neither ponded nor flooded. This soil does not meet hydric criteria. The study area is located at an elevation between approximately 320 and 340 feet. The topography of the study area gently slopes to the west.

- **Hydrology**. The Project Site is in the Dry Creek watershed (Hydrologic Unit Code 1802011101), as shown in the watershed map of Figure 7. A wetland swale and drainage ditch located in the southwest corner of the site drain water westerly and convey water offsite through culverts underneath Sierra College Boulevard. Water continues to drain westerly on the adjacent property and drains into Sucker Ravine which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River. The constructed drainage in the northeastern corner conveys storm water and urban runoff from the residential development to the east through a storm drain system.

- **Vegetation**. Based on field reconnaissance by HBG conducted in February 2017 and review of the wetland jurisdictional report (Salix 2016), the Project Site is made up of Valley Oak Woodland, Annual Grassland and Valley Freshwater Marsh. Details of vegetation are provided below in Section 3.2.

- **Climate**. Loomis has a temperate Mediterranean climate with dry hot summers and mild winters. Average high temperature typically varies from 54 degrees F in the winter to approximately 92 degrees in the summer. Average rainfall for the area is approximately 25 inches per year, most occurring between November and April.

3.2 Biological Setting

3.2.1 Plant Communities

An HBG biologist conducted field reconnaissance of the Project Site on February 11 and April 22, 2017, and the HBG botanist surveyed the site for special status plants on March 27 and June 23, 2017. All habitats on the Project Site were surveyed on foot and assessed for similarity to sites known to support special status species within the area. Qualitative information on the composition and distribution of plant species on the sites was obtained during the site visits. Plant communities were identified on aerial photographs of the site.

Vegetation communities are assemblages of plant species growing in an area of similar biological and environmental factors. Vegetation communities and habitats at the project site were identified based on the currently accepted List of Vegetation Alliances and Associations (or Natural Communities List) (CDFW 2010). The list is based on A Manual of California Vegetation, Second Edition (Sawyer and Keeler-Wolf 2009), which is the National Vegetation Classification applied to California. The project site contains three habitat types per this classification: Valley Oak Woodland (7.96 acres), Annual Grassland (10.16 acres), and Valley Freshwater Marsh (0.15 acres). Figure 8 shows the extent and distribution of vegetation types on the property. A list of plant species identified on the property during surveys is included in Attachment 2, Table 1. The main source for the plant list in Table 1 was the wetland delineation report prepared by Salix (2016), which was augmented with additional species noted during surveys by HBG.

Wetland habitats on-site were further classified using the U.S. Fish and Wildlife's Service's "Classification System for Wetland and Deepwater Habitats" (Cowardin et al. 1979); the wetlands at the property are defined as palustrine emergent seasonal wetlands, palustrine emergent vernal pools, and palustrine scrub-shrub wetlands per the Cowardin et al criteria.

Annual Grassland

Annual grassland is the predominant habitat type on site, comprising 10.16 acres, or approximately 56% of the land area. The Annual Grassland found on the property is comprised largely of non-native grasses and forage species. Grasses included Italian ryegrass *(Festuca perennis)*, ripgut grass (*Bromus diandrus)*, soft chess (*Bromus hordeaceus)*, wild oat (*Avena fatua)*, hedgehog dogtail (*Cynosurus echinatus*,) foxtail barley (*Hordeum jubatum)*, and medusahead (*Elymus caput-medusae)*. Forbs present include Italian thistle (*Carduus pycnocephalus*), California mugwort (*Artemisia douglasiana)*, field hedge parsley (*Torilis arvensis)*, klamathweed (*Hypericum perforatum)*, broad-leaf filaree (*Erodium botrys*,) common vetch (*Vicia sativa)*, and cut-leaf geranium (*Geranium dissectum)*, yellow starthistle (*Centaurea solstitialis)*, rose clover (*Trifolium hirtum)*, smooth's cat-ear (*Hypochaeris glabra)*, common fiddleneck (*Amsinckia menziesii)*, short-podded mustard (*Hirschfeldia incana)*, and bindweed (*Convolvulus arvensis*). The annual grassland onsite appears to be disked annually.

Valley Oak Woodland

Valley Oak Woodland comprises 7.96 acres or approximately 44% of the site. The foothill

woodland varies in density throughout the site, being mostly open, and it is dominated by valley oak (*Quercus lobata)* and interior live oak (*Quercus wislizeni)*, with a small number of blue oak (*Quercus douglasii)*, and a few scattered foothill pines (*Pinus sabiniana)*. Shrubs in the understory include thickets of coyote brush (*Baccharis pilularis)* and Himalayan berry (*Rubus armeniacus)*. Groundcover is mostly the non-native herbaceous plants and grasses that are noted as occurring in the Annual Grassland above.

A tree survey conducted on the site by Mann Made Resources (Mann Made Resources 2016) found 372 trees that were determined to be of protected size. The Tree Preservation Ordinance of the Town of Loomis provided the requirements for data collection; blue oaks 4 inches in diameter and greater and valley and interior live oaks 6 inches in diameter and greater are considered Protected Trees. The 372 trees of protected size consisted of 284 valley oaks, 86 Interior live oaks, and two blue oaks. Of these, 162 trees were found to be in good or fair condition and 210 trees were found to be in poor, very poor, or dead condition. The 210 trees included 170 trees in poor condition, 36 trees in very poor condition, and four trees that were dead. Detailed information regarding all trees on the property is included in the Tree Report (Mann Made Resources 2016), including information on species, size, condition, suitability for preservation.

The California Oak Woodlands Conservation Program recognizes oak woodlands as a vital statewide resource providing benefits including wildlife habitat, monetary and ecological value, and an ability to reduce soil erosion, enhance water quality and moderate temperatures.

Valley Freshwater Marsh

Valley Freshwater Marsh habitat occurs within three separate swales occurring on the property. The marsh habitats total 0.15 acres. The three separate wetland swales are shown in Figure 8 and are described in detail in Section 3.2.3 (Wetland and Other Waters of the U.S. Delineation).

One of three swales flows westerly through the oak woodland into a culvert under Sierra College Boulevard. The eastern end of the swale is a small open area dominated by iris leaf rush (*Juncus xiphioides)*. The swale flows through a patch of coyote brush, and the lower portion of the swale includes wetland plant species such as hyssop loosestrife (*Lythrum hyssopifolia)*, curly dock (*Rumex crispus)*, prickly lettuce (*Lactuca serriola*,) Italian ryegrass, and Mexican rush *(Juncus mexicanus)*. A short swale in the northeast corner of the site is vegetated with Himalayan blackberry and flows under Starlight Lane. The third swale in the southwestern corner of the study area is an area where stormwater runoff drains onto the Project Site from nearby commercial development and travels about 175 feet before exiting the site through a culvert under Sierra College Boulevard. Wetland species such as water plantain (*Alisma triviale)*, speedwell (*Veronica* sp.), moth mullein (*Verbascum blattaria)*, water cress (*Nasturtium officinale)*, and curly dock are present.

3.2.2 Animal Populations

The species discussed in this study are based on review of available literature, visits to the area by HBG wildlife biologist for many years, and habitat observations made during qualitative

surveys conducted by HBG wildlife biologist Gary Deghi on February 11 and April 22, 2017. A complete listing of the references from which information was compiled on the flora and fauna inhabiting the region is contained in the References section. Table 1 (Attachment 2) provides species lists based on these reconnaissance level observations for reptiles, amphibians, birds and mammals. The table lists all wildlife species observed or expected on the project sites and in the site vicinity and includes the scientific names of all species mentioned in the text.

The wetland habitats and the disturbed annual grassland and oak woodland habitats onsite support a variety of wildlife species. The complex of habitats includes the presence of small streams that can accommodate wildlife adapted to aquatic areas, and upland vegetation that provides potential foraging areas for species of mammals, reptiles, amphibians and birds. Native trees and shrubs are present along with native and non-native herbaceous plants and grasses that provide a mix of habitats suitable to support nesting by a variety of both passerine and non-passerine avian species.

Much of the wildlife observed at the site during the February 11 field reconnaissance included resident and wintering species of birds that are adapted to the mix of wetland and upland habitats found at the site. Resident bird species observed during the field review included red-shouldered hawk, Anna's hummingbird, mourning dove, Northern flicker, acorn woodpecker, Nuttall's woodpecker, black phoebe, western bluebird, California scrub-jay, European starling, Northern mockingbird, oak titmouse, bushtit, white-breasted nuthatch, Bewick's wren, California towhee, white-crowned sparrow, song sparrow, purple finch and house finch. Species observed that are expected only during the winter include red-breasted sapsucker, American robin, hermit thrush, ruby-crowned kinglet, yellow-rumped warbler, and golden crowned sparrow. Despite looking under logs and boards, no reptiles were observed and the only amphibian recorded was Pacific treefrog. No mammals were documented at the site.

The April 22 site visit was timed to provide information about patterns of wildlife use during the spring nesting season of many avian species. Many of the resident species noted during the February 17 reconnaissance were observed including red-shouldered hawk, Anna's hummingbird, mourning dove, acorn woodpecker, Nuttall's woodpecker, black phoebe, California scrub-jay, European starling, Northern mockingbird, oak titmouse, bushtit, white-breasted nuthatch, Bewick's wren, California towhee, white-crowned sparrow, and house finch. Other resident species noted during the April survey included band-tailed pigeon, common raven, orange-crowned warbler, lark sparrow, savannah sparrow, American goldfinch, lesser goldfinch and Brewer's blackbird. Cedar waxwing and golden-crowned sparrow were observed, and these species would be considered migrants passing through as the project site is not within the nesting range of these species. Neotropical migrants that breed in the area were also observed including Western kingbird and Bullock's oriole. Any of the resident species or breeding neotropical migrants could nest on the Project Site, and evidence of nesting (observation of birds either on a nest or carrying nesting material) was observed during the field review for Northern mockingbird, bushtit, oak titmouse, Western kingbird and Bullock's oriole. A pair of red-shouldered hawks were on territory on the western portion of the site and likely have a nest either on the project site or the immediate vicinity. Other raptors observed

flying over the site included red-tailed hawk, Swainson's hawk and turkey vulture.

Amphibians noted at the site during the spring survey included Pacific treefrog (tadpoles in the wetlands) and reptiles included Western fence lizard and Southern alligator lizard. Additional amphibians likely include western toad, and common reptiles likely include western skink, ringneck snake, gopher snake and common garter snake. Although no mammals were documented at the site, it is expected that mammals adapted to urban environments would be found on the property including Botta's pocket gopher, striped skunk, raccoon, Virginia opossum, deer mouse and mule deer.

3.2.3 Wetland and Other Waters of the U.S. Delineation

Definitions of Wetlands and Other Waters of the U.S.

The Department of the Army, acting through the U.S. Army Corps of Engineers (Corps), has the authority to permit the discharge of dredge or fill material in waters of the U.S. under Section 404 of the Clean Water Act (CWA), and permit work and placement of structures in navigable waters of the U.S. under Section 10 of the Rivers and Harbors Act of 1899 (RHA).

EPA and the Corps define wetlands as: "areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (EPA regulations at 40 CFR § 230.3(t); Corps regulations at 33 CFR § 328.3(b)). The term "*under normal circumstances*" refers to situations in which the vegetation has not been substantially altered by man's activities as defined in Appendix A of the Corps' 1987 *Wetlands Delineation Manual*. Clarification of the term, as it pertains to farmed wetlands, was furthered defined in Regulatory Guidance Letter 90-7 dated September 26, 1990, as "the soil and hydrologic conditions that are normally present, without regard to whether the vegetation has been removed."

Under Section 10 of the Rivers and Harbors Act of 1899, the Corps also regulates the construction of structures in, over, or under; excavation of material from; or deposition of material into navigable waters. As described by Corps' regulation 33 CFR § 329.4, the general definition of "navigable waters" includes those waters subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or might be susceptible for use to transport interstate or foreign commerce. Several factors must be examined when making a determination whether a waterbody is a navigable water. These factors include (a) past, present, or potential presence of interstate or foreign commerce; (b) physical capabilities for use by commerce and (c) defined geographic limits of the waterbody. A determination of navigability, once made by the Corps, applies laterally over the entire surface of the water body, and is not extinguished by later actions or events which impeded or destroy navigable capacity. Based on this provision, the Corps also has the discretion to regulate activities in historically navigable waters. Historically navigable waters are areas that were navigable in the past, but are no longer navigable because of artificial modifications, such as levees, dikes, and dams.

Furthermore, waters of the U.S. can be defined by exhibiting a defined bed and bank and ordinary high water mark (OHWM). The OHWM is defined by the Corps as "that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 C.F.R. §328.3(e)).

Detailed Wetland and Other Waters of the U.S. Delineation-Methodology

Salix Consulting, Inc. conducted a preliminary wetland delineation of the property in May of 2016 (Salix Consulting 2016, see Attachment 3) in accordance with Code of Federal Regulations (CFR) definitions of jurisdictional waters, the Corps' 1987 *Wetlands Delineation Manual* (1987 Manual), the Corps' 2008 *Regional Supplement to Corps of Engineers Wetland Delineation Manual: Arid Wes, Version 2.0* (Arid West Regional Supplement) and supporting guidance documents. The 1987 Manual provides technical guidance and procedures, from a national perspective, for identifying and delineation of wetlands that may be subject to Section 404 of the CWA. Pursuant to the 1987 Manual, key criteria for determining the presence of wetlands are: (a) the presence of inundated or saturated soil conditions resulting from permanent or periodic inundation by groundwater or surface water; and (b) a prevalence of vegetation typically adapted for life in saturated soil conditions (i.e., hydrophytic vegetation). Explicit in the definition is the consideration of three environmental parameters: hydrology, soil, and vegetation. The Arid West Regional Supplement presents wetland indicators, delineation guidance, and other information that is specific to the Arid West Region. The combined use of the 1987 Manual and Arid West Regional Supplement enhances the technical accuracy, consistency, and credibility of wetland determinations.

Detailed Wetland Delineation-Results

A total of 0.15 acres of vegetated palustrine emergent wetlands were found within the project site as shown in Figure 9. This finding is based on the collective presence of hydric soil, wetland hydrology, and wetland vegetation indicators. The identified palustrine emergent wetlands contained low chroma soils, evidence of wetland hydrology and vegetation adapted for life in saturated soil conditions. The 0.15 acres of vegetated wetlands on the project site are palustrine emergent seasonal wetlands and palustrine scrub-shrub wetlands per Cowardin et al. (1979) criteria. The wetlands mapped on site consist of areas located within the three drainages found on the property. The 0.15 acres of jurisdictional waters of the US serve the functions of flood flow alteration, groundwater recharge, sediment reconstruction, sediment/toxicant retention, nutrient removal/ transformation, production export, and wildlife habitat.

Aquatic resources within the Study Area and adjacent to the Study Area were examined with respect to the *Solid Waste Agency of Northern Cook County* (*SWANCC) v. U.S. Army Corps of Engineers*, 531 U.S. 159 (2001) exclusion from Clean Water Act regulation. No areas were found that could either potentially be exempted or excluded from regulation in accordance with SWANNC. HBG has also reviewed the wetlands with respect to the *Rapanos v. United States* and *Carabell v. United States* 547 U.S. 715 (2006) and found the areas in question to be jurisdictional pursuant to the Corps criteria.

The wetland map was verified by the Sacramento District of the Corps of Engineers on June 14, 2016 (see wetland determination letter from the Corps in Attachment 3). Three areas of jurisdictional wetland have been verified on the property. These are noted in Figure 8 as Wetland Swale (WS)-1, WS-2 and WS-3 and are described below with information contained the wetland delineation report (Salix Consulting 2016).

- WS-1 (0.12 acres) occurs within the foothill woodland habitat. The swale begins in the middle of the study area, where it collects surface water (in the form of sheet flow) and then drains westerly, where it then exits the study area through a culvert underneath Sierra College Boulevard. The swale then continues west to culvert adjacent to Sierra College Boulevard.

- WS-2 (0.01 acres) enters the study area through a culvert along the eastern boundary in the northeast corner of the study area. The swale appears to convey stormwater runoff and urban water westerly for approximately 80 feet within the study area, and then exits the study area through a culvert underneath Starlight Lane.

- WS-3 (0.02 acres) occurs in the southwestern corner of the study area, where stormwater runoff drains onto the study area through an 18-inch PVC culvert located on the commercial development (McDonald's/Chevron) to the south. The swale continues for approximately 175 feet west until it merges with a narrower excavated ditch that drains water from a 12-inch concrete culvert located under the commercial development to the south. Water exits the study area along the western boundary through a 30-inch corrugated metal pipe culvert under Sierra College Boulevard.

3.2.4 Special Status Species

Sensitive species include those species listed by the federal and state governments as endangered, threatened, or rare or candidate species for these lists. Endangered or threatened species are protected by the federal Endangered Species Act of 1973 as amended, the California Native Plant Protection Act of 1977, and the California Endangered Species Act of 1970. The California Environmental Quality Act (CEQA) provides additional protection for unlisted species that meet the "rare" or "endangered" criteria defined in Title 14, California Code of Regulations, Section 15380.

The CDFW maintains records for the distribution and known occurrences of sensitive species and habitats in the California Natural Diversity Database (CNDDB). The CNDDB is organized into map areas based on 7.5 minute topographic maps produced by the U.S. Geological Survey (USGS). All known occurrences of sensitive species and important natural communities are mapped onto the quadrangle map. The database gives further detailed information on each occurrence, including specific location of the individual, population, or habitat (if possible) and the presumed current state of the population or habitat. The Project Site is in the Rocklin 7.5-minute USGS topographic quadrangle map. The relevant adjacent quads within the search area are the Roseville, Lincoln, Gold Hill, Auburn, Pilot Hill, Folsom, and Citrus Heights quadrangles.

HBG collected all information contained within the CNDDB regarding special status species within a 10-mile radius of the Project Site.

A search of the CNDDB records of occurrence for special status animals and plants and natural communities within these quadrangles indicated that none have been documented as occurring on the Project Site itself, but that a number of special status animal species have been known to occur in the project vicinity. The absence of a special animal, plant, or natural community from the report does not necessarily mean they are absent from the area in question, but only that no occurrence data have been entered for that species or natural community in the CNDDB inventory. The occurrence of special status plant and animal species near the project area may be an indication that they also could occur at the Project Site, depending on habitat conditions at the site. Therefore, occurrences of special status species throughout the quadrangles mentioned above were noted in considering the potential presence of these species on the Project Site.

An evaluation of all special status plant species reported near the Project Site is presented in Table 3 (Attachment 2). Table 4 presents an evaluation of special status animal species that have been reported near the project.

Special Status Plant Species

Special status plant species include: (i) species that are listed or proposed for listing as threatened or endangered under the federal Endangered Species Act; (ii) species that are listed, or proposed for listing by the state of California as threatened or endangered under the California Endangered Species Act; (iii) plants considered by the California Native Plant Society (CNPS) to be rare, threatened, or endangered in California and elsewhere; and (iv) plant species that meet the definition of rare or endangered under CEQA.

A target list of special status plants found within 10 miles of the site is shown in Table 3 that includes all species mentioned in the CNDDB occurring within 10 miles of the project site. Many of the species mentioned in the CNDDB as occurring within 10 miles of the project require habitats that are not found on the Project (e.g., vernal pools, chaparral, coniferous forest) or microhabitat conditions such as soils that do not occur on the property (gabbro or serpentine). Based on field review of the habitats and conditions occurring on the site, HBG determined that Project Site habitats are potentially suitable to support several species of special status plant. These species are listed below along with their flowering periods (Munz and Keck 1973).

- Big-scale balsamroot (*Balsamorhiza macrolepis var. macrolepis*) a CNPS List 1B.2 plant, that is sometimes, but not always found in serpentine. Flowering period from March to June.
- Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*), a CNPS List 4.2 plant. Flowering period from May to July.
- Stinkbells (*Fritillaria agrestis*), a CNPS List 4.2 plant, that is sometimes, but not always found in serpentine. Flowering period from March to June.

Protocol surveys of the site for special status plant species were conducted by HBG botanist, Dr. Terry Huffman during the spring and summer of 2017. The systematic surveys were conducted both early and late in the flowering period of target species (field surveys were conducted on March 27 and June 23, 2017). Special status plant surveys were conducted pursuant to *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2009) that require systematic search techniques in all habitats of the site to ensure thorough coverage of potential impact areas. All vascular plant species were identified using keys and descriptions in the Jepson Manual (Baldwin et al 2012). Specimens of target species were reviewed in the Jepson Herbarium prior to trips to the field.

None of the target species or any other special status plant species were found on the site during the spring/summer 2017 protocol surveys of the property.

Special Status Animal Species

The special status animal species evaluated in Table 4 (Attachment 2) include those noted in the CNDDB as occurring within 10 miles of the site and those that are known to occur in the general vicinity based on the knowledge of HBG biologists. Key species are either known to occur in the vicinity of the property or with a potential to occur at the site, or that require specific study to determine presence/absence, are discussed below.

HBG has consulted the CDFW California Natural Diversity Data Base (CNDDB) to ascertain the potential for special status animal species occurring within the 7.5-minute quadrangle map areas in the project site vicinity. The CNDDB indicates that seven special status species deserve note as having occurred within the 10-mile radius of the site: vernal pool fairy shrimp (*Branchinecta lynchi*), California linderiella (*Linderiella occidentalis*), Steelhead-Central Valley DPS *(Oncorhynchus mykiss irideus),* Western spadefoot toad (*Spea hammondii*), burrowing owl (*Athene cunicularia*), Swainson's hawk (*Buteo swainsoni*) and tricolored blackbird *(Agelaius tricolor).* These species are discussed below. Other species found to occur within the general CNDDB search area, or determined to be potentially present based on the knowledge of the investigators, are evaluated in Table 4.

HBG wildlife biologist Gary Deghi conducted a variety of special status species surveys and habitat assessments on the project site during a field visit conducted on February 11 and April 22, 2017. The field work included an evaluation of wetlands swales areas for suitability to support the vernal pool fairy shrimp, vernal pool tadpole shrimp and western spadefoot toad. Gary Deghi of HBG also conducted habitat evaluations related to other special status species including possible use of the site by special status raptors (including Swainson's hawk, burrowing owl, white-tailed kite and others) and other special status species such as Western pond turtle, tricolored blackbird and loggerhead shrike.

Listed Vernal Pool Large Branchiopods

The two most common of the large branchiopods occurring in the Central Valley, that are listed under the federal Endangered Species Act, are the threatened vernal pool fairy shrimp (VPFS, *Branchinecta lynchi*) and endangered vernal pool tadpole shrimp (VPTS, *Lepidurus packardi*).

These large branchiopods are ephemeral creatures. When the temporary water bodies that they inhabit dry up, the population remains in the dry basin as cysts (embryonic eggs). These cysts can withstand harsh conditions (i.e., freezing and desiccation) while they await the return of rain to fill their pools. After the appropriate environmental conditions (i.e., water temperature, pH, oxygen concentration, etc.) prevail, the young hatch, quickly mature, and then mate to ensure the next generation.

Potential habitat for listed large branchiopods is considered any seasonally-inundated depression that on average ponds water at a sufficient depth and duration for a listed branchiopod to complete its lifecycle. Potential habitat for the VPFS and VPTS are defined as any seasonal inundated depression that on average ponds water 2.0 inches or greater in depth for 14 or more consecutive days and 30 or more consecutive days, respectively. Generally, these habitats occur within the California Floristic Province at elevations below 5,600 feet in Coast Range and below 3,000 feet elevations for the rest of the State and Oregon. Habitats that swiftly flow water (e.g., creeks, streams, and ephemeral drainages) or semi-to-permanently inundated areas that support perennial population of predators (e.g. bullfrogs, fish, and crayfish) are generally not considered suitable habitat for federally listed large branchiopods.

The records search of the CNDDB (CDFW 2017) revealed occurrences of the VPFS or VPTS within vernal pool landscapes as close at about 3 miles to the south and west of the Project Site. The seasonal swales at the Project Site do not have inundation characteristics that would support listed large branchiopods as these areas are flowing water systems that were inundated at depths of up to 6 to 8 inches even in late-April. It was determined that the seasonal swales at the Project Site do not exhibit the characteristics that would accommodate use of the site by either of these listed species of vernal pool crustacean.

California Linderiella

The California linderiella (*Linderiella occidentalis*), also known as the California fairy shrimp, is not listed by the federal ESA or CESA, but was at one time a federal species of concern and is listed by the International Union for the Conservation of Nature (IUCN) as a species threatened with extinction. It is generally found in the same types of aquatic habitats as vernal pool fairy shrimp and frequently co-occurs with this species. This species tends to live in large, fairly clear vernal pools and lakes. However, they can survive in clear to turbid water with a pH from 6.1 to 8.5, and they have also been found in very small pools. They are tolerant of water temperatures from 41 degrees to 85 degrees F, making them the most heat tolerant fairy shrimp in California. The California fairy shrimp is the most common fairy shrimp in the Central Valley. It has been documented in most land forms, geologic formations and soil types supporting vernal pools in California, at altitudes as high as 3800 feet above sea level. The range extends from Shasta County south to Fresno County and across the valley to the coast and Transverse Ranges from Willits in Mendocino County south to near Sulfur Mountain in Ventura County.

The CNDDB documents that California linderiella have occurred in vernal pool landscapes as near as two miles south of the Project Site. None of the seasonal wetlands found on the Project

Site have inundation characteristics making them suitable to support California linderiella.

Steelhead- Central Valley DPS

Central Valley steelhead was originally listed in 1998 as a threatened species and the listing was reconfirmed in January of 2005. The Central Valley Distinct Population Segment (DPS) includes all naturally spawned populations of steelhead (and their progeny) in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco Bay and San Pablo Bays and their tributaries. Central Valley steelhead spawn and rear, or have the potential to spawn and rear, in western Placer County streams, including Coon Creek, Doty Ravine, Auburn Ravine, Secret Ravine, and Miners Ravine. In the project area, Central Valley steelhead are found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine, located about four miles southwest of the Project Site.

Steelhead are anadromous, but some individuals may complete their life cycle within a given river reach. Historical records indicate that adult steelhead enter the mainstem of the Sacramento River in July, peak in abundance in September and October, and continue migrating through February or March. Most steelhead spawn from December through April, with the most spawning occurring from January through March. Unlike Pacific salmon, some steelhead may survive to spawn more than once, returning to the ocean between spawning migrations. Juvenile migration to the ocean generally occurs from December through August. Most Sacramento River steelhead migrate in spring and early summer. After 2 to 3 years of ocean residence, adult steelhead return to their natal stream to spawn as 3- or 4-year-olds.

Local populations of Central Valley steelhead are found in Dry Creek and its tributaries, most notably in Secret Ravine and Miners Ravine. The CNDDB (CDFW 2017) reports that the mainstem of Dry Creek is used by the fish as a migratory corridor as the water quality and substrate are too degraded so support spawning. Spawning and rearing habitat is found in tributaries upstream from Dry Creek, including both Secret Ravine and Miners Ravine, which are located about four miles southwest of the Project Site. Electrofishing surveys conducted in 2004 caught 136 steelhead in Secret Ravine and evidence of spawning was also reported in 2007. Cottonwood Dam was a barrier to fish passage in Miners Ravine until the dam's collapse in 2009.

Western Spadefoot Toad

The western spadefoot toad (*Scaphiopus hammondi*i) is a state-designated species of special concern that is known from the Central Valley and adjacent foothills, and from the interior coast ranges south of San Francisco Bay to Baja California. Western spadefoot toads require presence of an aquatic habitat for breeding and a terrestrial habitat for feeding and aestivation. Western spadefoot toads are mostly terrestrial, using upland habitats to feed and burrow in for their long dry-season dormancy. The species primarily occurs in grasslands habitat, typically near extensive areas of friable soils (but usually not sandy), but can occur in valley-foothill woodlands, coastal scrub and chaparral communities below 3,000 ft. elevation.

The western spadefoot toad requires seasonally-inundated wetlands for reproduction and

metamorphosis, but have been known to utilize slow-mowing waters and pools within washes, river floodplains, alluvial fans, alkali lakes and playas. They mate during the rainy season (generally from January to March), usually after heavy rains. Potential western spadefoot toad breeding habitat includes any seasonally to semi-permanently inundated depression that on average ponds water at a sufficient depth and duration for a toad to complete its lifecycle (eggs to metamorphosis) which occurs in the known range of the species. Habitats that swiftly flow water (e.g., creeks, streams, and ephemeral drainages) or support populations of predators (e.g. bullfrogs, fish, crayfish) are generally not considered suitable habitat for western spadefoot toad larvae.

The CNDDB reports occurrences of western spadefoot toad in suitable habitat approximately 3.5 miles southwest of the Project Site. The Project Site is within the range of western spadefoot toad, and a review of habitat conditions during field studies conducted on February 11 and April 22, 2017 found seasonal swales within woodland situations (riparian situations or oak woodland) that are potentially suitable but not optimal habitat conditions for the species. Water depths of up to 6 to 8 inches were present in wetland WS-1 within the foothill woodland during field inspection conducted in late-April, and Pacific treefrog tadpoles were observed in this wetland during the field survey. No tadpoles for western spadefoot toad were observed. Even though wetland WS-1 is not an optimal situation in which to find western spadefoot toad and no larvae were observed during the April 22, 2017 survey, there is a remote chance that western spadefoot toad could occur at the site.

Swainson's Hawk

The Swainson's hawk (*Buteo swainsoni*) is a medium-sized hawk that is state-listed in California as threatened species and designated by the USFWS as a Bird Species of Conservation Concern. Most Swainson's hawk territories in the Central Valley are in riparian systems adjacent to suitable foraging habitats. Valley oak, Fremont cottonwood, walnut and large willows with an average height of about 58 feet, and ranging from 41 to 82 feet, are the most commonly used nest trees in the Central Valley (CDFG 2007), but eucalyptus is also commonly used. Swainson's hawks often nest peripherally to riparian systems of the valley as well as utilizing lone trees or groves of trees in agricultural fields. Suitable foraging areas include grasslands, pastures, alfalfa and other hay crops, and certain grain and row croplands. In the Central Valley, Swainson's hawks find suitable foraging habitat in such agricultural areas near suitable nest sites, however, nesting habitat is in decline due primarily to flood control projects, agricultural practices, and urban development. The current population of Swainson's hawk in California's Central Valley is estimated at 1,948 breeding pairs (CDFW 2007), with most of this population occurring in the area from Stanislaus County north to Butte County.

The nearest documentation of nesting Swainson's hawk is about 7 miles west of the Project Site, according to the CNDDB. Swainson's hawk is much more likely to nest in trees near riparian habitats or agricultural fields on the Valley floor rather than in oak woodland in the foothills, such as found at the Project Site. Use of the Project Site by this species is probably limited to occasional visits while foraging, as evidenced by the observation of a single Swainson's hawk flying over the site during the April 22, 2017 site survey. No evidence of

nesting by Swainson's was observed at the Project Site or anywhere in the immediate vicinity during the nesting season survey in late April.

Burrowing Owl

Burrowing owl (*Athene cunicularia*) is a state species of special concern and designated by the USFWS as a Bird Species of Conservation Concern. Burrowing owls are small terrestrial owls commonly found in open grassland topography ranging from western Canada to portions of South America. Burrowing owl habitat can be found in annual and perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. In California, burrowing owls most commonly use ground squirrel burrows, but they also may use man-made structures, such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement. Burrowing owls may use a site for breeding, wintering, foraging, and/or migration stopovers during migration. Occupancy of suitable burrowing owl habitat can be verified at a site by an observation of at least one burrowing owl, or, alternatively, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance.

The nearest report of burrowing owl in the CNDDB is more than eight miles west of the site. A survey of the project area was conducted by HBG wildlife biologist Gary Deghi during the February 11, 2017 site visit and again during a survey of the site on April 22, 2017, and no burrowing owls were observed. The site is also lacking in colonies of California ground squirrels that are the most common burrow occupied by burrowing owl. In addition, habitat at the Project Site was found to be unsuitable to support burrowing owl, as heights of herbaceous plants and grasses throughout the on-site uplands were too high to support foraging by this species. Based on these findings, it is very unlikely that burrowing owl occurs on the Project Site. In addition, no California ground squirrels or their burrows were observed anywhere on the site during field review, indicating that presence of burrowing owl on the property is extremely unlikely.

Tricolored Blackbird

Tricolored blackbird (*Agelaius tricolor*) is a Candidate for listing as Endangered under CESA and is also designated by the USFWS as a Bird Species of Conservation Concern. Commencing on December 29, 2014, tricolored blackbird nesting colonies were given a six-month emergency listing as an endangered species under the California Endangered Species Act. Tricolored blackbird is a highly colonial nesting species that breeds near freshwater, preferably in emergent wetlands with tall, dense growth of cattails or tules. Even when the preferred nesting substrates are available, other vegetation may be used for nesting including sedges, nettles, willows, thistles, mustard, blackberry, wild rose, foxtail grass or barley. Since the 1970s with declines in populations, nesting in cereal crops and dairy silage has been documented. Tricolored blackbird foraging areas include rangeland, fields of alfalfa or cut hay, or irrigated pastures with an abundance of insects. No areas of the Project Site provide suitable habitat for a nesting colony of tricolored blackbird, nor do onsite habitats provide foraging habitat for the species.

Special Status Raptor Species- Six raptor species designated with special status by the State of California have a small potential to nest at the site. These species include ground-nesting species: burrowing owl (State Species of Special Concern and Federal Bird Species of Conservation Concern), and Northern harrier (State Species of Special Concern and Federal Bird Species of Conservation Concern); and tree nesting species: white-tailed kite (California Fully Protected), Cooper's hawk (California Watch List Species), Sharp-shinned hawk (California Watch List Species) and Swainson's hawk (state-listed threatened).

Three raptor species that could occur are designated as state species of special concern based on presence of wintering habitat (ferruginous hawk, golden eagle, and merlin). These species are wide-ranging species often wintering over a broad area, and incidental use of the site by any these species in winter is certainly possible. The site, however, contains no unique habitat features that would highlight the importance of the site as a wintering location for any of these species.

3.2.5 Essential Fish Habitat

The Magnuson-Stevens Fishery Conservation and Management Act conserves and manages the fishery resources found off the coasts of the United States, the anadromous species, and the Continental Shelf fishery resources of the United States, including the conservation and management of highly migratory species through the implementation and enforcement of international fishery agreements. The National Marine Fisheries Service (NMFS) enforces the Magnuson-Stevens Fishery Conservation and Management Act and regulates commercial and recreational fishing and the management of fisheries resources. Consultation with NOAA Fisheries is required for all projects with the potential to affect EFH for any MSA species. Central Valley fall/late fall–run Chinook salmon is a Magnuson-Stevens Fishery Conservation and Management Act managed species.

In the Central Valley, fall/late fall–run Chinook historically spawned in all major streams draining the Sierra Nevada, but fish passage has since been blocked by dams. Currently, fall/late fall–run Chinook salmon compose about 80% of the total Chinook salmon produced in the Sacramento and San Joaquin drainages. Fall/late fall–run Chinook salmon spawn in the Sacramento and San Joaquin Rivers and most of their tributaries. Central Valley fall/late fall–run Chinook salmon spawn and rear, or have the potential to spawn and rear, in western Placer County streams including Bear River, Coon Creek, Doty Ravine, Auburn Ravine, Dry Creek, Antelope Creek, Secret Ravine, and Miners Ravine (Jones and Stokes 2005). Antelope Creek, Secret Ravine and Miners Ravine may be considered as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon.

4.0 REGULATORY AGENCIES AND POLICIES

The following is a description of federal, state, and local environmental laws and policies that are relevant to the California Environmental Quality Act (CEQA) review process.

FEDERAL

Clean Water Act-Section 404

The U.S. Army Corps of Engineers regulates discharges of dredged or fill material into Waters of the United States under Section 404 of the Clean Water Act (CWA). "Discharge of fill material" is defined as the addition of fill material into Waters of the U.S., including but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; and fill for intake and outfall pipes and sub-aqueous utility lines (33 C.F.R. §328.2(f)). In addition, Section 401 of the CWA (33 U.S.C. 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into Waters of the United States to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

The U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency are responsible for implementing the Section 404 program. Section 404(a) authorizes the Corps to issue permits, after notice and opportunity for comment, for discharges of dredged or fill material into waters of United States. Section 404(b) requires that the Corps issue permits in compliance with EPA guidelines, which are known as the Section 404(b)(1) Guidelines. Specifically, the Section 404(b) (1) guidelines require that the Corps only authorize the "least environmentally damaging practicable alternative" (LEDPA) and include all practicable measures to avoid and minimize impacts to the aquatic ecosystem. The guidelines also prohibit discharges that would cause significant degradation of the aquatic environment or violate state water quality standards.

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Wetlands are defined as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 C.F.R. §328.3(b)).

Furthermore, Jurisdictional Waters of the U.S. can be defined by exhibiting a defined bed and bank and ordinary high water mark (OHWM). The OHWM is defined by the Corps as "that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 C.F.R. §328.3(e)).

Tidal waters are also under the jurisdiction of the Corps. The landward limits of jurisdiction in tidal waters extend to the high tide line…"or, when adjacent non-tidal waters of the United States are present, to the limits of jurisdiction for such non-tidal waters" (33 C.F.R.§328.4(b)) High tide is further defined to include the line reached by spring high tides and other high tides that occur with periodic frequency (33 C.F.R.§328.3(d)).

All wetlands at the Project Site were reviewed to determine if they could be disclaimed from Corps jurisdiction as isolated wetlands following two recent US Supreme Court decisions. In *Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers (SWANCC), No. 99-1178 (2001),* some isolated wetlands may be excluded from the Corps' Section 404 jurisdiction because they are (1) non-tidal, (2) non-navigable, (3) not hydrologically connected to navigable waters or adjacent to such waters, and (4) not subject to foreign or interstate commerce.

Subsequent to SWANCC, the U.S. Supreme Court decided on *Rapanos v. United States* and *Carabell v. United States*, 126 U.S. 2208 (2006) (herein referred to as Rapanos). In 2007, guidance was given to EPA regions and Corps districts to implement the Supreme Court's decision which addresses the jurisdiction over waters of the U.S. under the Clean Water Act. The Rapanos guidance requires the Corps to conduct detailed analysis of the functions and values of wetlands and other waters of the U.S. potentially onsite and in some cases offsite, determine if there is a nexus to traditional navigable waters and the significance of the nexus to the traditional navigable water. Neither the Court nor the recently-issued guidance draw a clear line regarding the geographic reach of jurisdiction, particularly in drainages where flows are ephemeral and where wetlands are adjacent to but not directly abutting relatively permanent water, such as the wetlands delineated on the study site.

The guidance includes requirements for additional documentation, particularly regarding whether there is a "significant nexus" to a traditionally-navigable water (TNW). For water bodies that are traditionally navigable (and their adjacent wetlands), and for tributaries that are "relatively permanent waters" (RPW's: streams that are not perennial but that flow for 3 months or more annually, and their adjacent wetlands that directly abut the RPW's), the Corps and EPA will assert jurisdiction under the Clean Water Act, without the need for any exhaustive documentation of "significant nexus." There is no dispute that Clean Water Act jurisdiction encompasses traditionally-navigable waters and their perennial and relatively-permanent tributaries. Activities that result in discharges of pollutants into these waters can adversely affect the physical, chemical, and biological integrity of navigable waters.

For wetlands adjacent to but not directly abutting a RPW, jurisdiction may be asserted under the Clean Water Act if there is a "significant nexus" and for tributaries that typically do not flow more 3 months or more annually, and if there are adjacent wetlands associated with these non-relatively permanent waters (non-RPW's), jurisdiction may be asserted under the Clean Water Act if there is a "significant nexus." A significant nexus analysis, using the Corps' approved jurisdictional determination form, "will assess the flow characteristics and functions of the

tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW." These factors include (a) the capacity to carry pollutants or flood water into a TNW; (b) the capacity to provide habitat for species that are present in the downstream TNW; (c) the capacity of transferring nutrients and organic carbon to a TNW; or (d) other "relationships to the physical, chemical, or biological integrity of the TNW.

Clean Water Act-NPDES Requirements

In 1972, the Clean Water Act was amended to provide that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollution Discharge Elimination System (NPDES) permit. The 1987 amendments established a framework for regulating municipal, industrial, and construction-related storm water discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (USEPA) published final regulations that establish storm water permit application requirements for specified categories of industries. The regulations provide that discharges of storm water from construction projects that encompass one or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit. The California State Water Resource Control Board has developed a general construction storm water permit to implement this requirement.

Federal Endangered Species Act

The United States Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. The FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend. The FESA establishes an official listing process for plants and animals considered to be in danger of extinction; requires development of specific plans of action for the recovery of listed species; and restricts activities perceived to harm or kill listed species or affect critical habitat (16 USC 1532, 1536).

The FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined as harassing, harming (including significantly modifying or degrading habitat), pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species, or any attempt to engage in such conduct (16 USC 1532, 50 CFR 17.3) Taking can result in civil or criminal penalties. Federal regulation 50 CFR 17.3 further defines the term harm in the take definition to mean any act that kills or injures a federally listed species, including significant habitat modification or degradation. Additionally, FESA prohibits the destruction or adverse modification of designated critical habitat. In the Service's regulations at 50 CFR 402.2, destruction or adverse modification is defined as a "direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species.

The ESA also requires federal agencies to ensure that their actions do not jeopardize the continued existence of listed species or adversely modify critical habitat (16 USC 1536). Therefore, the ESA is invoked when the property contains a federally listed threatened or

endangered species that may be affected by a permit decision. In the event that listed species are involved and a Corps permit is required for impacts to jurisdictional waters, the Corps must initiate consultation with USFWS (or the National Marine Fisheries Service, NMFS) pursuant to Section 7 of the ESA (16 USC 1536; 40 CFR § 402). If formal consultation is required, USFWS or NMFS will issue a biological opinion stating whether the permit action is likely to jeopardize the continued existence of the listed species, recommending reasonable and prudent measures to ensure the continued existence of the species, establishing terms and conditions under which the project may proceed, and authorizing incidental take of the species.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSFA) conserves and manages the fishery resources found off the coasts of the United States, the anadromous species, and the Continental Shelf fishery resources of the United States, including the conservation and management of highly migratory species through the implementation and enforcement of international fishery agreements. The NMFS enforces the MSFA and regulates commercial and recreational fishing and the management of fisheries resources. The Sustainable Fisheries Act of 1996 amended the MSFA to include new fisheries conservation provisions by emphasizing the importance of fish habitat in regards to the overall productivity and sustainability of U.S. marine fisheries (Public Law 104-267). The revised MSFA mandates the identification and protection of Essential Fish Habitat (EFH) for managed species during the review of projects conducted under federal permits that have the potential to affect such habitat. Federal agencies are required to consult with NMFS on all actions or proposed actions authorized, funded, or undertaken by the agency, which may adversely affect EFH (MSFA 305.b.2).

Under the MSFA, NMFS identifies, conserves, and enhances EFH for those species regulated under a federal fisheries management plan (FMP). EFH is defined as those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity and includes all associated physical, chemical and biological properties of aquatic habitat that are used by fish. Projects that have the potential to adversely affect EFH must initiate consultation with NMFS. Adverse effects are any impacts that reduce the quality and/or quantity of EFH and can include direct (e.g., contamination or physical disruption), indirect (e.g., loss of prey or reduction in species fecundity), site-specific or habitat-wide impacts, including individual, cumulative, or synergistic consequences of actions (50 CFR 600.810). There are four FMPs in California, Oregon, and Washington that identify EFH for groundfish, coastal pelagic species, Pacific salmon, and Pacific highly migratory fisheries.

Central Valley fall/late fall–run Chinook salmon is a Magnuson-Stevens Fishery Conservation and Management Act managed species. This species either spawns of has the potential to spawn in western Placer County streams, that near the project include Antelope Creek, Secret Ravine, and Miners Ravine, which would be considered as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon.

Migratory Bird Treaty Act

The federal Migratory Bird Treaty Act is administered by the USFWS. The Act provides that it is unlawful to: pursue, hunt, take, capture or kill; attempt to take, capture or kill; possess, offer to sell, barter, purchase, deliver or cause to be shipped, exported, imported, transported, carried or received any migratory bird, part, nest, egg or product unless permitted by regulations. Most bird species within California fall under the provisions of the Act. Excluded species include nonnative species such as house sparrow, starling, and ring-necked pheasant and native game species such as quail.

Fish and Wildlife Coordination Act

The USFWS also has responsibility for project review under the Fish and Wildlife Coordination Act. This statute requires that all federal agencies consult with USFWS, NMFS, and the state's wildlife agency (California Department of Fish and Wildlife, CDFW) for activities that affect, control, or modify streams and other water bodies. Under the authority of the Fish and Wildlife Coordination Act, USFWS, NMFS, and CDFW review applications for permits issued under Section 404 and provide comments to the Corps about potential environmental impacts.

STATE

California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. The CESA is similar to the FESA but pertains to state-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW) when preparing California Environmental Quality Act (CEQA) documents to ensure that the state lead agency actions do not jeopardize the existence of listed species. CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur, and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. Agencies can approve a project that affects a listed species if they determine that 'overriding considerations" exist; however, the agencies are prohibited from approving projects that would result in the extinction of a listed species.

The CESA prohibits the taking of state-listed endangered or threatened plant and wildlife species. CDFW exercises authority over mitigation projects involving state-listed species, including those resulting from CEQA mitigation requirements. CDFW may authorize taking if an approved habitat management plan or management agreement that avoids or compensates for possible jeopardy is implemented. CDFW requires preparation of mitigation plans in accordance with published guidelines.

Section 401 of the Federal Clean Water Act/Porter Cologne Water Quality Act

Pursuant to section 401 of the Federal Clean Water Act, projects that require a Corps permit for the discharge of dredge or fill material must obtain water quality certification that confirms a project complies with state water quality standards before the Corps permit is valid. State

water quality is regulated/administered by the State Water Resources Control Board and its nine Regional Water Quality Control Boards (RWQCB). The state also maintains independent regulatory authority over the placement of waste, including fill, into waters of the State under the Porter-Cologne Act.

The California State Water Resource Control Board has developed a general construction storm water permit to implement the requirements for the federal National Pollution Discharge Elimination System (NPDES) permit. The permit requires submittal of a Notice of Intent to comply, fees, and the implementation of a Storm Water Pollution Prevention Plan.

CDFW Species of Special Concern

CDFW tracks species in California whose numbers, reproductive success, or habitat may be threatened. Even though not formally listed under FESA or CESA, such plant and wildlife species receive additional consideration during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern" developed by the CDFW. CDFW has also designated special-status natural communities which are considered rare in the region, support special status species or otherwise receive some form of regulatory protection. Documentation pertaining to these communities, as well as special status species (including species of special concern), is kept by CDFW as part of the CNDDB.

Natural Community Conservation Planning Act

The Natural Communities Conservation Planning Act (NCCP) program, which began in 1991 under the California Natural Community Conservation Planning Act, is broader in its orientation and objectives than CESA and ESA; these laws are designed to identify and protect individual species that are already listed as threatened or endangered and their habitats. The primary objective of the NCCP program is to conserve natural communities at the ecosystem scale while accommodating compatible land use.

Placer County is currently involved in efforts to prepare the Placer County Conservation Plan, a Habitat Conservation Plan (HCP) and Natural Communities Conservation Plan (NCCP) that may eventually be applicable to projects in the Loomis area. A draft of the HCP/NCCP has not been developed as of the date of this report.

California Department of Fish and Wildlife-Streambed Alteration Agreement

Section 1602 of the California Fish and Game Code requires any person, governmental agency, or public utility proposing any activity that will divert or obstruct the natural flow or change the bed, channel or bank of any river, stream, or lake, or proposing to use any material from a streambed, to first notify CDFW of such proposed activity. CDFW may propose reasonable modifications, based on the information contained in the notification form and a possible field inspection, CDFW may propose reasonable modifications in the proposed construction as would allow for the protection of fish and wildlife resources. Upon request, the parties may meet to discuss the modifications. If the parties cannot agree and execute a Lake and Streambed Alteration Agreement, then the matter may be referred to arbitration.

California Department of Fish and Wildlife Fish and Game Code 3503 and 3503.5
Section 3503 of the Fish and Game Code makes it unlawful to take, possess, or needlessly destroy the nests or eggs of any bird. Section 3503.5 makes it unlawful to take or possess birds of prey (hawks, eagles, vultures, owls) or destroy their nests or eggs.

California Department of Fish and Wildlife Fully Protected Animal Species
The classification of Fully Protected was an effort by the State of California in the 1960's to identify and provide additional protection to those animals that were rare or faced possible extinction. Most Fully-Protected species have also been listed as threatened or endangered species under state endangered species laws and regulations. Species classified as Fully Protected Species by the CDFW may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock (as per California Fish and Game Code Section 3511(a)(1)).

Public Resources Code Section 21084.4 for Oak Woodlands Conservation
As of January 2005, Public Resources Code Section 21083.4 requires California Counties acting as Lead Agencies under CEQA to determine whether a project "may result in a conversion of oak woodlands that will have a significant effect on the environment." If individual or cumulative impacts to oak woodlands are identified, the law requires that the impacts be mitigated. Acceptable mitigation measures include, but are not limited to, conservation of other oak woodlands through the use of conservation easements, planting replacement trees which must be maintained for seven years, contribution to the Oak Woodland Conservation Fund established under Section 1363(a) of the Fish and Game Code, or other measures.

LOCAL

Placer County General Plan
In addition to federal and state regulations, the development of the property must be accomplished consistent with the land use designations and natural resource and other policies of the Placer County General Plan.

OTHER STATUTES, CODES, AND POLICIES AFFORDING LIMITIED PROTECTION

California Native Plant Society
The California Native Plant Society (CNPS) maintains a list of plant species native to California that have low numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Plants of California (CNPS 2014: https://www.cnps.org/cnps/rareplants/inventory/). Potential impacts to populations of CNPS-listed plants receive consideration under CEQA review. The following identifies the definitions of the CNPS listings: https://www.cnps.org/cnps/rareplants/ranking.php

California Rare Plant Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.

California Rare Plant Rank1B: Plants rare, threatened, or endangered in California and elsewhere.
California Rare Plant Rank 2A: Plants presumed extirpated in California, but more common elsewhere.
California Rare Plant Rank 2B: Plants rare, threatened, or endangered in California, but more numerous elsewhere.
California Rare Plant Rank 3: Plants about which more information is needed – a review list.
California Rare Plant Rank 4: Plants of limited distribution – a watch list.

5.0 IMPACTS AND MITIGATION MEASURES

5.1 Standards of Significance

According to the Environmental Checklist in Appendix G of the CEQA Guidelines (Title 14, California Code of Regulations, 15000 et seq.), the project would be considered to have a significant impact on biological resources if it would:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Wildlife and Game or U.S. Fish and Wildlife Service.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service.

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

5.2 Relevant Project Characteristics

Costco Wholesale is proposing to construct Costco warehouse facility on the property. A plan view of conceptual design for the configuration of proposed project can be seen in Figure 4. The Preliminary Grading and Drainage Plan is shown in Figure 5. The facility includes the Costco warehouse and associated parking and other infrastructure. The proposed project would cover the entire site.

5.3 Impacts and Mitigation Measures

5.3.1 Plant Communities and Vegetation

Impacts to biological resources will result from vegetation removal due to the conversion of upland areas composed of Annual Grassland, Valley Oak Woodland and Valley Freshwater

Marsh to accommodate the proposed Costco facility. The acreage of each of the vegetation communities found on the property, and impacts resulting from site development as planned are shown in Table A. Figure 10 shows the development footprint as an overlay of the vegetation communities found on the project site. The footprint for the proposed project would cover 100% of the site.

TABLE A. IMPACTS TO VEGETATION COMMUNITIES

Habitat Type	Existing Acreage in Overall Study Area (acres)	Impacted Acreage (acres)
Annual Grassland	10.16	10.16
Valley Freshwater Marsh	0.15	0.15
Valley Oak Woodland	7.96	7.96
TOTAL	**18.27**	**18.27**

Wetlands and Waters of the U.S.

Wetlands and waters of the U.S. are regulated by state and federal agencies and would be considered sensitive natural communities as defined by CEQA. Impacts to waters of the U.S. would be potentially significant if appropriate mitigation was not implemented for all regulated wetlands as required by state and federal regulations.

The ecological constraints to development at the site include approximately 0.15 acres of wetlands and waters of the U.S. potentially subject to Corps jurisdiction pursuant to Section 404 of the Federal Clean Water Act as shown in Figure 9. As the palustrine emergent wetlands are located in various portions of the site, complete avoidance of jurisdictional wetlands would not be possible. Impacts to wetlands and waters of the U.S. potentially subject to Corps jurisdiction are shown in Figure 11. The development plan for the site would permanently impact 0.15 acres of palustrine emergent wetlands located on the site that are potentially under the jurisdiction of the Corps under Clean Water Act Section 404. Without mitigation, project impacts to wetlands or waters of the U.S. would be significant.

Impact 1: Direct (fill) impacts to 0.15 acres of waters of the U.S. would result from implementation of the proposed Costco warehouse facility.

> **Mitigation Measure 1:** The developer will submit applications for a Nationwide permit from the Corps of Engineers (see Section 4.5, Permit Requirements), and Section 401 water quality certification from the Central Valley Regional Water Quality Control Board (RWQCB), required for the Corps permit to be valid. Appropriate wetland mitigation would be required by the Corps and RWQCB for impacts to the 0.15 acres of seasonal wetlands located at the site, and a wetland mitigation plan to mitigate impacts to

jurisdictional areas would need to be developed as part of the Corps and RWQCB permit process. Corps jurisdictional areas must be replaced at a minimum 1:1 ratio through wetland creation (preferably on-site) to ensure that no net loss of acreage or functions and values to these areas occurs. Options for providing mitigation include creation of wetlands on site or contributions to an agency-approved wetland mitigation bank. As the footprint of the proposed project requires use of most, if not all, of the site, the preferred method of mitigation is through contributions to an agency-approved mitigation bank.

Oak Woodlands

Project construction would result in the loss of approximately 7.96 acres of Valley Oak Woodland habitat on the site (see Figure 10). Tree removal and impact to oak woodland habitat was assumed within the graded footprint of the project, and included all trees on the property.

Mann Made Resources (see Attachment 3) determined that the project would result in the removal of 372 trees determined to be of protected size. Of these 372 trees, 162 were found to be in good and fair condition and would require mitigation pursuant to the Town of Loomis Tree Ordinance. The arborist considered the condition of each of these 162 and species of tree in calculating a total mitigation planting requirement of potentially 290 #15 container trees. It should be possible to plant these trees on the property as part of the project landscape design and parking lot shade.

Oaks woodlands provide significant wildlife habitat value. Oak woodlands are protected by the California Department of Fish and Game, State of California regulations including Public Resources Code Section 21083.4, and policies of the Town of Loomis. Public Resources Code Section 21083.4 directs Counties to mitigate significant effects of oak woodland conversion, and would not apply to a project reviewed by the Town of Loomis as a CEQA Lead Agency.

Impact 2: The project would require construction within 7.96 acres of Valley Oak Woodland habitat and the direct removal of 372 mature trees determined to be of protected size.

> **Mitigation Measure 2:** The applicant shall prepare an Oak Woodland Tree Replacement and Protection Plan including: (i) planting of 290 #15 container trees as recommended by the arborist to attain tree replacement ratios prescribed by the Town of Loomis; (ii) the specific location of the tree planting, (including a map and planting plan); (iii) schedules and methodologies for maintaining and monitoring the success of the Plan; and (iv) performance standards.

Landscaping/Invasive Species

Invasive, exotic weeds compete with native vegetation and can degrade the quality of wildlife habitats. Project landscaping and construction activity has the potential to introduce invasive, exotic, non-native vegetation, some of which may not now exist in the area. Also, highways and various construction projects provide a pathway for dispersal of invasive plants. Invasive

plant species include those designated as noxious weeds by the U.S. Department of Agriculture, problem species listed by the California Department of Food and Agriculture, and other invasive plants designated by the California Invasive Plant Council. Where appropriate, vegetation removed because of project activities should be replaced with native species which are of value to local wildlife. Native plants generally are more valuable as wildlife food sources and require less irrigation, fertilizers, and pesticides than exotic species.

Impact 3: Project landscaping is expected to introduce exotic, non-native vegetation, some of which may not exist in the area.

> **Mitigation Measure 3:** Landscaping shall be designed to enhance the wildlife value and aesthetic quality of undeveloped portions of the project site. Where appropriate, vegetation removed because of project activities shall be replaced with native species which are of value to local wildlife, and native vegetation shall be retained. Weed management practices may be warranted, including identification and removal of infestations of noxious weeds prior to construction, use of construction equipment and materials such as fill and erosion control devices that are known to be weed-free, power-washing of construction vehicles to remove mud, dirt and vegetative material before working in relatively weed-free areas, and removal of invasive species from undeveloped areas within the project boundary.

5.3.2 Animal Species

Loss of vegetation associated with the habitats on site will disrupt and displace existing wildlife. Some bird roosting, nesting, and foraging areas will be eliminated. Reptiles, amphibians, and small mammals that utilize these areas will be displaced to remaining undisturbed areas. Open space areas near the project area should be capable of accommodating these species. Animal species that have adapted to living in close association with human disturbance can be expected to increase after the proposed project. These species include mammals such as raccoon, California ground squirrel, deer mouse, and house mouse, and birds such as rock pigeon, Eurasian-collared dove, American robin, European starling, house sparrow, Brewer's blackbird and brown-headed cowbird.

Nesting Birds

Nesting bird species protected by the federal Migratory Bird Treaty Act could be impacted during project construction. Evidence of nesting by bird species protected by the MBTA was observed at the Project Site during the April 22, 2017 field survey. The removal of trees and shrubs during the February 1 to August 31 breeding season could result in mortality of nesting avian species if they are present. Therefore, preconstruction surveys should be conducted of the development area to determine if nesting is occurring. If nests are found, a construction plan would need to be developed that would allow successful nesting (fledging of young birds).

Many species of raptors (birds of prey) are sensitive to human incursion and construction activities. Field surveys conducted by HBG in April of 2017 revealed that red-shouldered hawk

may nest at the site or in the immediate project vicinity. Therefore, to ensure that nesting raptor species are not present near the construction site, preconstruction surveys should include a thorough search for nesting raptor species, including raptor species of special status such as Swainson's hawk and burrowing owl, among others (see Mitigation Measure #7 below). Even though the Project Site does not contain suitable habitats for nesting by special status bird species such as tricolored blackbird and loggerhead shrike, preconstruction surveys should include searches for these species to ensure nests of these species, if they were to found at the site, are not harmed.

Impact 4: The removal of vegetation during the February 1 to August 31 breeding season could result in mortality of nesting avian species if they are present.

> **Mitigation Measure 4:** If feasible, construction work should take place outside of the February 1 to August 31 breeding window for nesting birds. If construction is to be conducted during the breeding season, a qualified biologist shall conduct a pre-construction breeding bird survey in areas of suitable habitat within 15 days prior to the onset of construction activity. If bird nests are found, appropriate buffer zones shall be established around all active nests to protect nesting adults and their young from construction disturbance. Size of buffer zones shall be determined in consultation with wildlife agency staff based on site conditions and species involved. Buffer zones shall be maintained until it can be documented that either the nest has failed or the young have fledged. Preconstruction surveys shall include appropriate survey for nesting species of raptor, including special status raptor species (see Mitigation Measure #7) and other avian species with special status and with a small chance of occurring on the Project Site, such as tricolored blackbird and loggerhead shrike.

Water Quality

Construction activities on the project site would involve disturbance and exposure of soils through grading and removal of vegetative cover, installation of infrastructure, and other activities. These activities would result in exposure of soil to runoff, potentially causing erosion and entrainment of sediment in the runoff. If not managed properly, the runoff could cause increased sedimentation and turbidity in surface waters outside of the Project Site, resulting in degradation of water quality. Water from the Project Site drains west toward the adjacent property and then into Sucker Ravine, which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River.

Ground-disturbing activities could promote erosion and allow elevated levels of sediment to wash into downstream creeks, where potential impacts to fish and wildlife species would be possible. In the absence of water quality controls, indirect impacts to animal populations in wetlands and other aquatic habitats could result from the proposed project due to elevated contaminants in stormwater runoff. However, the requirement for the implementation of a Stormwater Pollution Prevention Plan (SWPPP), with identification of proper construction techniques and Best Management Practices (BMPs) will minimize adverse effects associated with these activities. Furthermore, standard techniques to control contaminants in stormwater

such as oil and grease traps will be employed to mitigate water quality concerns.

Impact 5: Placement of fill and other ground disturbing activities could promote erosion and allow elevated levels of sediment to wash into downstream aquatic areas, potentially affecting fish and wildlife resources.

> **Mitigation Measure 5:** Best Management Practices and all requirements as detailed in the Stormwater Pollution Prevention Plan shall be implemented to control erosion and migration of sediments off-site. Implementation of water quality controls shall be consistent with the BMP requirements in the most recent version of the California Stormwater Quality Association Stormwater Best Management Handbook-Construction. In addition, vegetation shall only be cleared from the permitted construction footprint. Areas cleared of vegetation, pavement, or other substrates shall be stabilized as quickly as possible to prevent erosion and runoff.

Essential Fish Habitat

Antelope Creek, Secret Ravine and Miners Ravine would be considered as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act for various life stages of Central Valley fall/late fall–run Chinook salmon. Secret Ravine and Miners Ravine are located about four miles southwest of the Project Site; runoff from the site drains over the adjacent property to the west and then into Sucker Ravine which drains into Secret Ravine. Portions of Antelope Creek run approximately 0.7 miles to the northwest of the Project Site, but drainage flow is not in the direction of the creek. An unnamed drainage located just north of the property is a tributary to Antelope Creek.

In the absence of water quality controls, indirect impacts to EFH for Central Valley fall/late fall-run Chinook salmon could result from the proposed project due to elevated contaminants in stormwater runoff that eventually flow into Secret Ravine. However, the requirement for the implementation of a Stormwater Pollution Prevention Plan (SWPPP), with identification of proper construction techniques and Best Management Practices (BMPs) will minimize adverse effects associated with these activities (see Mitigation Measure 5). Furthermore, standard techniques to control contaminants in stormwater such as oil and grease traps will be employed to mitigate water quality concerns.

5.3.3 Special Status Species

A review of habitat requirements of sensitive animal species documented by the CNDDB as occurring in the project vicinity, and sensitive animal species known to occur in the general vicinity, was conducted by HBG. Animal species of special concern are present or possible as described below.

Special Status Plants

Habitat conditions at the Project Site are potentially suitable to support several species of special status plant, but no special status plants were found during protocol rare plant surveys

of the property conducted by a qualified botanist during the spring/summer 2017 flowering period of target species. No impacts to special status plant species would result from construction of the proposed project.

Special Status Animals

Vernal Pool Crustaceans -The seasonal wetland swales within the several drainages on the property do not provide suitable habitat for listed species of vernal pool crustaceans. The swales are flowing systems lacking the inundation characteristics that would support VPFS or VPTS. The drainages are also not suitable habitat for the California linderiella. No impacts to vernal pool fairy shrimp, vernal pool tadpole shrimp, or California linderiella would result from project development.

Steelhead Central Valley DPS- In the project area, Central Valley steelhead are found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine, located as close as about 4 miles from the Project Site. No direct impacts would occur to steelhead habitat as no spawning or rearing habitat or occupied tributary streams are found on the Project Site. However, uncontrolled erosion from the developed site could result in consequent downstream sedimentation that could adversely affect spawning areas in Secret Ravine or Miners Ravine, and untreated stormwater runoff from onsite impervious surfaces could introduce contaminants that could adversely affect water quality that currently supports the life cycle of steelhead in these tributaries. Implementation of Mitigation Measure 5, with requirements to implement Best Management Practices as part of a Stormwater Pollution Prevention Plan to control erosion and migration of sediments off-site and other water quality control practices, will ensure that impacts to local steelhead populations do not occur.

Western Spadefoot Toad- The project site is within the range of western spadefoot toad and wetland WS-1 is marginally suitable to support the species. No western spadefoot toad adults or larvae were observed during April 2017 field studies. As there is a remote possibility that western spadefoot toad could be present on the site, a preconstruction survey for this species is warranted.

Impact 6: Construction could impact western spadefoot toad if individuals of the species were present on the property.

> **Mitigation Measure 6:** Preconstruction surveys of all ponded habitats shall be conducted for western spadefoot toad, and any western spadefoot toad encountered within the construction footprint shall be allowed to move out of harm's way of its own volition or a qualified biologist will relocate it to a burrow outside of the construction impact area. For work conducted during the western spadefoot toad migration and breeding season (November 1 to May 31), a qualified biologist will survey active work areas in mornings following measurable precipitation events, with construction commencing only once the biologist has confirmed that no spadefoot toads are in the work area.

Swainson's Hawk- Swainson's hawk is much more likely to nest in trees near riparian habitats or agricultural fields on the Valley floor rather than in oak woodland in the foothills, such as found at the Project Site. Although a single Swainson's hawk was observed flying over the Project Site during the April 22, 2017 field review, nesting by Swainson's hawk at the Project Site is unlikely. Use of the Project Site by this species is probably limited to occasional visits while foraging or during migration. No impacts to Swainson's hawk breeding or foraging habitat is anticipated due to project development. Mitigation measures for preconstruction surveys of nesting birds include inclusion of this species in the surveys.

Burrowing Owl- No burrowing owls, California ground squirrel colonies or California ground squirrels were observed during field reviews conducted in either February or April or 2017. In addition, heights of grasses within the onsite grassland are too tall to provide habitat for burrowing owl, which prefers grasslands with low profile vegetation. No impacts to burrowing owl breeding or wintering habitat is anticipated due to project development. Nevertheless, mitigation measures for preconstruction surveys of nesting birds are recommended to include of this species in the surveys.

Tricolored Blackbird- Vegetation within the onsite wetland swales is not of a type that would be preferred to support a nesting colony of tricolored blackbird. Surveys of the site by an HBG wildlife biologist in April 2017 found no evidence of use of the site by tricolored blackbird. No impacts to tricolored blackbird would result from project development. Mitigation measures for preconstruction surveys of nesting birds are recommended to include this species in the surveys.

Special Status Raptor Species- Six raptor species designated with special status by the State of California have a potential to nest at the site. These species include burrowing owl (State Species of Special Concern and Federal Bird Species of Conservation Concern), Northern harrier (State Species of Special Concern and Federal Bird Species of Conservation Concern), white-tailed kite (California Fully Protected), Cooper's hawk (California Watch List Species), Sharp-shinned hawk (California Watch List Species) and Swainson's hawk (state-listed threatened). Preconstruction surveys for tree-nesting special status raptor species (e.g., white-tailed kite, Cooper's hawk, sharp-shinned hawk, Swainson's hawk) will be necessary if tree removal occurs during the February 1 to August 31 nesting season. Preconstruction surveys for ground-nesting special status raptor species (Northern harrier and burrowing owl) would be necessary prior to any ground disturbance in grasslands.

Impact 7: Construction during the nesting season could impact any of six raptor species designated with special status by the State of California: burrowing owl, Northern harrier, white-tailed kite, Cooper's hawk, sharp-shinned hawk, and Swainson's hawk.

> **Mitigation Measure 7:** Preconstruction surveys conducted for nesting birds pursuant to the MBTA shall include specific preconstruction surveys for special status species of raptors. Preconstruction surveys for special status tree-nesting raptor species (white-tailed kite, Cooper's hawk, sharp-shinned hawk, Swainson's hawk) will be necessary if

tree removal occurs during the February 1 to August 31 nesting season. A preconstruction survey for ground-nesting special status raptor species (Northern harrier and burrowing owl) shall be conducted to ensure impacts to ground-nesting species do not occur. Preconstruction surveys shall be conducted within 15 days of initiation of construction activity. If an active raptor nest is identified, appropriate mitigation measures shall be developed and implemented in consultation with CDFW. Mitigation will include development of a construction plan that establishes buffer zones around active nests during construction activity and/or until young have fledged.

6.0 AGENCY PERMIT REQUIREMENTS

Any potential impacts to jurisdictional wetlands or waters of the U.S. at the site will require authorization from the Army Corps of Engineers pursuant to Section 404 of the Clean Water Act. NWP 39 authorizes "discharges of dredged or fill material into non-tidal waters of the U.S., excluding non-tidal wetlands adjacent to tidal waters, for the construction or expansion of residential, commercial, and institutional building foundations and building pads and attendant features that are necessary for the use and maintenance of the structures" provided the activities meet the following criteria:

- The discharge does not cause the loss of greater than 0.5-acre of non-tidal waters of the U.S.;
- The discharge does not cause the loss of greater than 300 linear feet of a stream bed (unless the criterion is waived by the District Engineer);
- The discharge is part of a single and complete project;
- The permittee avoids and minimizes discharges into waters of the U.S. to the maximum extent practicable;
- The discharge does not cause more than minimal degradation of water quality or more than minimal changes to stream flow characteristics; and
- The permittee establishes and maintains vegetated buffers next to open water to the maximum extent practicable.

As the 0.15 acres of seasonal wetlands are scattered throughout the site and avoidance of these wetlands would be problematic with any layout of land uses, a permit from the Corps is a certainty for development at this site. Wetland impacts would not exceed the 0.5-acre limit of Nationwide Permit 39; therefore, the Corps would determine that the proposed project would qualify for a Nationwide Permit 39 and an Individual Permit would not be required. A wetland mitigation plan describing procedures to mitigate impacts to jurisdictional areas would need to be developed as part of the Corps permit process. The applicant would need to demonstrate that wetlands have been avoided to the extent possible and provide documentation of how the project has been minimized to reduce onsite impacts.

The requirement for a Clean Water Act Section 404 Nationwide permit means that any development project at this site will also require Section 401 water quality certification from the Central Valley Regional Water Quality Control Board (RWQCB) for the Corps permit to be valid. Prior to issuance of the water quality certification, RWQCB will require the applicant to demonstrate that requirements of the County of Placer pursuant to the California Environmental Quality Act (CEQA) have been satisfied. Mitigation of wetlands will be required to obtain Corps and RWQCB approval. It does not appear as though A Section 7 consultation with USFWS or NOAA Fisheries/NMFS would be warranted as neither federally-listed species nor their habitats would not be adversely affected by project development. An Essential Fish Habitat evaluation conducted in conjunction with NMFS is also not likely warranted.

Table 1. Plant List for Property

Table 2. Animal Species Observed on the Project Site or Expected to Utilize the Project Site

Table 3. Special Status Plants Known to Occur in the Vicinity of the Project Area, Placer County, California

Table 4. Special Status Animal Species that have been Reported in the Vicinity of the Project Area, Placer County, California

TABLE 1. PLANT LIST FOR THE PROPERTY

Scientific Name	Common Name	Wetland Status
Acacia baileyana	Cootamundra wattle	UPL
Acmispon americanus var. americanus	Spanish-clover	UPL
Alisma triviale	California water plantain	OBL
Amsinckia menziesii	common fiddleneck	UPL
Artemisia douglasiana	California mugwort	FAC
Arundo donax	Giant reed	FACW
Avena fatua	Wild oat	UPL
Baccharis pilularis	Coyote brush	UPL
Briza minor	Small quaking grass	FAC
Bromus diandrus	Ripgut grass	UPL
Bromus hordeaceus	Soft chess	FACU
Carduus pycnocephalus	Italian thistle	UPL
Castilleja attenuata	Valley tassles	UPL
Centaurea solstitialis	Yellow starthistle	UPL
Cichorium intybus	Chicory	FACU
Cirsium arvense	Canada thistle	FACU
Clarkia sp.	Clarkia	UPL
Claytonia perfoliata	Common miner's lettuce	FAC
Convolvulus arvensis	Bindweed	UPL
Cynodon dactylon	Bermudagrass	FACU
Cynosurus echinatus	Hedgehog dogtail	UPL
Cyperus eragrostis	Tall flatsedge	FACW
Cytisus scoparius	Scotch broom	UPL
Elymus caput-medusae	Medusahead	UPL
Epilobium brachycarpum	Summer cottonweed	UPL
Erigeron canadensis	Canadian horseweed	FACU
Erodium botrys	Broad-leaf filaree	FACU
Erodium cicutarium	Red-stem filaree	UPL
Eschscholzia californica	California poppy	UPL
Festuca perennis	Italian ryegrass	FAC
Galium aparine	Goose grass	FACU
Geranium dissectum	Cut-leaf geranium	UPL
Geranium molle	Dove's-foot geranium	UPL
Hirschfeldia incana	Short-podded mustard	UPL
Hordeum jubatum	Foxtail barley	UPL
Hordeum marinum subsp. gussoneanum	Mediterranean barley	FAC
Hordeum murinum	Wall barley	FACU
Hypericum perforatum subsp. perforatum	Klamathweed	FACU
Hypochaeris glabra	Smooth cat's-ear	UPL
Juncus mexicanus	Mexican rush	FACW
Juncus xiphioides	Iris-leaved rush	OBL

Lactuca serriola	Prickly lettuce	FACU
Lamium amplexicaule	Deadnettle	UPL
Lupinus bicolor	Miniature lupine	UPL
Lythrum hyssopifolia	Hyssop loosestrife	OBL
Melilotus sp.	Melilotus	UPL
Nasturtium officinale	Watercress	OBL
Olea europaea	Olive	UPL
Paspalum dilatatum	Dallis grass	FAC
Pinus sabiniana	Gray pine	UPL
Plantago lanceolata	English plantain	FAC
Polypogon monspeliensis	Annual beard grass	FACW
Populus fremontii subsp. fremontii	Fremont cottonwood	FAC
Prunus dulcis	Almond tree	UPL
Pyracantha sp.	Pyracantha	UPL
Pyrus sp.	Pear	UPL
Quercus douglasii	Blue oak	UPL
Quercus lobata	Valley oak	FACU
Quercus wislizeni	Interior live oak	UPL
Rubus armeniacus	Himalayan blackberry	FACU
Rumex crispus	Curly dock	FAC
Salix exigua var. exigua	Narrowleaf willow	FACW
Salix lasiolepis	Arroyo willow	FACW
Silybum marianum	Milk thistle	UPL
Sonchus asper subsp. asper	Prickly sow-thistle	FAC
Spartium junceum	Spanish broom	UPL
Torilis arvensis	Field hedgeparsley	UPL
Toxicodendron diversilobum	Western poison-oak	FACU
Trifolium hirtum	Rose clover	UPL
Verbascum blattaria	Moth mullein	UPL
Verbascum thapsus	Woolly mullein	FACU
Veronica sp.	Speedwell	VARIES
Vicia sativa	Common vetch	FACU
Vicia villosa	Winter vetch	UPL
Vinca major	Periwinkle	UPL

TABLE 2. ANIMAL SPECIES OBSERVED ON THE PROJECT SITE OR EXPECTED TO UTILIZE THE PROJECT SITE

MAMMALS

Virginia Opossum	*Didelphis virginiana*
Broad-footed Mole	*Scapanus latimanus*
California Myotis	*Myotis californicus*
Yuma Myotis	*Myotis yumanensis*
Western Pipistrelle	*Pipistrellus hesperus*
Big Brown Bat	*Eptesicus fuscus*
Hoary Bat	*Lasiurus cinereus*
Red Bat	*Lasiurus borealis*
Pallid Bat	*Antrozous pallidus*
Brazilian Free-tailed Bat	*Tadarida brasiliensis*
Black-tailed Hare	*Lepus californicus*
Desert Cottontail	*Sylvilagus audubonii*
California Ground Squirrel	*Spermophilus beecheyi*
Botta's Pocket Gopher	*Thomomys bottae*
Western Harvest Mouse	*Reithrodontomys megalotis*
Deer Mouse	*Peromyscus maniculatus*
Dusky-footed Woodrat	*Neotoma fuscipes*
California Vole	*Microtus californicus*
Black Rat	*Rattus rattus*
Norway Rat	*Rattus norvegicus*
House Mouse	*Mus musculus*
Coyote	*Canis latrans*
Gray Fox	*Urocyon cinereoargenteus*
Raccoon	*Procyon lotor*
Long-tailed Weasel	*Mustela frenata*
Striped Skunk	*Mephitis mephitis*
Mule Deer	*Odocoileus hemionus*

REPTILES AND AMPHIBIANS

Pacific Treefrog	*Pseudacris regilla*
Western Toad	*Bufo boreas*
Western Fence Lizard	*Sceloporus occidentalis*
Coast Horned Lizard	*Phrynosoma coronatum*
Western Skink	*Eumeces skiltonianus*
Gilbert’s Skink	*Eumeces gilberti*
Western Whiptail	*Cnemidophorus tigris*
Southern Alligator Lizard	*Gerrhonotus multicarinatus*

Ringneck Snake	*Diadophis punctatus*
Sharp-tailed Snake	*Contia tenuis*
Racer	*Coluber constrictor*
California Whipsnake	*Masticophis lateralis*
Coachwhip	*Masticophis flagellum*
Gopher Snake	*Pituophis melanoleucus*
Common Kingsnake	*Lampropeltis getulus*
Common Garter Snake	*Thamnophis sirtalis*
Western Terrestrial Garter Snake	*Thamnophis elegans*
Night Snake	*Hupsiglena torquata*
Western Rattlesnake	*Crotalis viridis*

BIRDS

Turkey Vulture	*Cathartes aura*
White-tailed Kite	*Elanus caeruleus*
Northern Harrier	*Circus cyaneus*
Sharp-shinned Hawk	*Accipiter striatus*
Cooper's Hawk	*Accipiter cooperi*
Red-tailed Hawk	*Buteo jamaicensis*
Red-shouldered Hawk	*Buteo lineatus*
Golden Eagle	*Aquila chrysaetos*
Bald Eagle	*Haliaeetus leucocephalus*
American Kestrel	*Falco sparverius*
Prairie Falcon	*Falco mexicanus*
Peregrine Falcon	*Falco peregrinus*
Merlin	*Falco columbarius*
California Quail	*Callipepla californica*
Killdeer	*Charadrius vociferous*
Wilson’s Snipe	*Gallinago delicata*
Ring-billed Gull	*Larus delawarensis*
California Gull	*Larus californicus*
Herring Gull	*Larus argentatus*
Rock Dove	*Columba livia*
Mourning Dove	*Zenaida macroura*
Barn Owl	*Tyto alba*
Great Horned Owl	*Bubo virginianus*
Western Screech-Owl	*Otus kennicottii*
Vaux’s Swift	*Chaetura vauxi*
Anna's Hummingbird	*Calypte annas*
Northern Flicker	*Colaptes auratus*
Acorn Woodpecker	*Melanerpes formicivorus*
Lewis’s Woodpecker	*Melanerpes lewis*
Red-breasted Sapsucker	*Sphyrapicus ruber*

Nuttall’s Woodpecker	*Picoides nuttallii*
Downy Woodpecker	*Dendrocopos pubescens*
Black Phoebe	*Sayornis nigricans*
Say's Phoebe	*Sayornis saya*
Pacific-slope Flycatcher	*Empidonax difficilus*
Ash-throated Flycatcher	*Myiarchus cinerascens*
Western Kingbird	*Tyrannus verticalis*
Barn Swallow	*Hirundo rustica*
Cliff Swallow	*Petrochelidon pyrrhonota*
Tree Swallow	*Tachicineta bicolor*
Violet-green swallow	*Tachycineta thalassina*
Northern Rough-winged Swallow	*Stelgidopteryx serripennis*
California Scrub-jay	*Aphelocoma californica*
American Crow	*Corvus brachyrhynchos*
Common Bushtit	*Psaltriparus minimus*
Oak Titmouse	*Parus inornatus*
White-breasted Nuthatch	*Sitta carolinensis*
Bewick's Wren	*Thryomanes bewickii*
House Wren	*Troglodytes aedon*
American Robin	*Turdus migratorius*
Hermit Thrush	*Hylocichla guttata*
Western Bluebird	*Sialia mexicana*
Ruby-crowned Kinglet	*Regulus calendula*
Northern Mockingbird	*Mimus polyglottos*
Cedar Waxwing	*Bombycilla cedrorum*
Loggerhead Shrike	*Lanius ludovicianus*
Hutton’s Vireo	*Vireo huttonni*
Orange-crowned Warbler	*Orethlypis celata*
Yellow Warbler	*Setophaga petechia*
Yellow-rumped Warbler	*Setophaha coronata*
Townsend's Warbler	*Setophaga townsendi*
Common Yellowthroat	*Geothlypis trichas*
Western Tanager	*Piranga ludoviciana*
Black-headed Grosbeak	*Pheucticus melanocephalus*
Lazuli Bunting	*Passerina amoena*
Spotted Towhee	*Pipilo maculatus*
California Towhee	*Pipilo crissalis*
Savannah Sparrow	*Passerculus sandwichensis*
Lark Sparrow	*Chondestes grammacus*
White-crowned Sparrow	*Zonotrichia leucophrys*
Golden-crowned Sparrow	*Zonotrichia atricapilla*
Fox Sparrow	*Passerella iliaca*
Song Sparrow	*Melospiza melodia maxillaris*
Lincoln's Sparrow	*Melospiza lincolnii*

Dark-eyed Junco	*Junco hyemalis*
Western Meadowlark	*Sturnella neglecta*
Red-winged Blackbird	*Agelaius phoeniceus*
Brewer's Blackbird	*Euphagus cyanocephalus*
Brown-headed Cowbird	*Molothrus ater*
Bullock's Oriole	*Icterus bullockii*
Purple Finch	*Haemorhous purpureus*
House Finch	*Carpodacus mexicanus*
Pine Siskin	*Spinus pinus*
American Goldfinch	*Spinus tristis*
Lesser Goldfinch	*Spinus psaltria*
House Sparrow	*Passer domesticus*

TABLE 3. SPECIAL STATUS PLANTS KNOWN TO OCCUR IN THE VICINITY OF THE PROJECT AREA, PLACER COUNTY, CALIFORNIA [1]

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Big-scale (California) balsamroot (*Balsamorhiza macrolepis var. macrolepis*)	--/--/1B.2	Chaparral, cismontane woodland, valley and foothill grassland/sometimes serpentinite; 90-1400m.	Not present. No individuals of this species were found during protocol surveys conducted in spring/summer 2017.
Stebbins morning-glory *(Calystegia stebbinsii)*	FE/CE/1B1	Found in chaparral, cismontane woodland. Occurs on red clay soils of the pine-hill formation, on gabbro or serpentine. Prefers open areas. 300-725 M.	Not present. Suitable habitat not present at the site.
Pine Hill ceanothus (*Ceanothus roderickii*)	FE/Rare/1B.2	Found in chaparral and cismontane woodland. In gabbroic soils, often in disturbed area with other rare plants. 260-630 m.	Not present. Suitable habitat not present at the site.
Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*)	--/--/4.2	Found in chaparral, cismontane woodland, and lower montane coniferous forest. Often in roadcuts. 75-915 m.	Not present. No individuals of this species were found during protocol surveys conducted in spring/summer 2017.
Red Hill soaproot (*Chlorogalum grandiflorum*)	--/--/1B.2	Found in cismontane woodland, chaparral, and lower montane coniferous forest. Occurs frequently on serpentine or gabbro, but also on non-ultramafic substrates and often on disturbed sites. 240-760 m.	Not present. Suitable habitat not present at the site.
Hispid salty bird's beak *(Chloropyron molle ssp. hispidum)*	--/--1B/1	Found in damp alkaline soils in meadows, seeps, playas, valley and foothill grassland. Especially in alkaline meadows and alkali sins with *Distichlis*. 1-155 M.	Not present. Suitable habitat not present at the site.
Dwarf downingia (*Downingia pusilla*)	--/--/2B.2	Found vernal pools and mesic sites within valley and foothill grassland. Found along margins of several types of vernal pools. 1-445 m.	Not present. Suitable habitat not present at the site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Stinkbells (*Fritillaria agrestis*)	--/--/4.2	Found in cismontane woodland, chaparral, and valley and foothill grassland. Sometimes found on serpentine, mostly found in non-native grassland or in grassy openings in clay soil. 10-1555 m.	Not present. No individuals of this species were found during protocol surveys conducted in spring/summer 2017.
El Dorado bedstraw (*Galium californicum ssp. sierra)*	FE/Rare/1B.2	Found in cismontane woodland, chaparral, and lower montane coniferous forest. Occurs in pine-oak woodland or chaparral. Restricted to gabbroic or serpentine soils. 130-585 M.	Not present. Suitable habitat not present at the site.
Bogg's Lake hedge hyssop (*Gratiola heterosepala*)	--/CE/1B.2	Inhabits vernal pools and freshwater swamps and marshes. In clay soils and usually in vernal pools, sometime on lake margins. 10-2375 m.	Not present. Suitable habitat not present at the site.
Bisbee Peak rush-rose (*Helianthemum suffrutescens*)	--/--/3.2	Found in openings in chaparral, often on serpentine, gabbroic, or Ione formation soils. 45-840 m.	Not present. Suitable habitat not present at the site.
Ahart's dwarf rush (Juncus leiospermus var. ahartii)	--/--/ 1B.2	Restricted to the edge of vernal pools. Vernal pools and grasslands. 30-229 m.	Not present. Suitable habitat not present at the site.
Red Bluff dwarf rush *(Juncus leiospermus var. leiospermus)*	--/--/1B.1	Found in vernally mesic sites, sometimes on edges of vernal pools within chaparral, valley and foothill grassland, cismontane woodland, vernal pools, meadows and seeps. 30-1025 M.	Not present. Suitable habitat not present at the site.
Legenere (*Legenere limosa*)	--/--/1B.1	Found in the beds of vernal pools. Many historical occurrences are extirpated. 1-880 m.	Not present. Suitable habitat not present at the site.
Pincushion navarretia (*Navarretia myersii* ssp. *myersii*)	--/--/1B.1	Found in vernal pools, in clay soils within non-native grassland. 20-330 m.	Not present. Suitable habitat not present at the site.
Sacramento Orcutt grass (*Orcuttia viscida*)	FE/CE/1B.1	Found in vernal pools. 30-100 m.	Not present. Suitable habitat not present at the site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Layne's ragwort (*Packera layneae*)	FT/Rare/1B.2	Found in ultramafic soil, occasionally along streams in chaparral and cismontane woodland. 200-1000 m.	Not present. Suitable habitat not present at the site.
Sanford's arrowhead (*Sagittaria sanfordii*)	--/--/1B.2	Found in marshes and swamps. In standing or slow-moving freshwater ponds, marshes and ditches. 0-650 m.	Not present. Suitable habitat not present at the site.
El Dorado County mule ears (*Wyethia reticulata*)	--/--/1B.2	Found in chaparral, cismontane woodland, and lower montane coniferous forest. Found in stony red clay and gabbroic soils, often in openings in gabbro chaparral. 185-630 m.	Not present. Suitable habitat not present at the site.

1. Source: California Natural Diversity Data Base, Natural Heritage Division, California Department of Fish and Wildlife for the Rocklin 7.5-Minute Quadrangle Map and surrounding areas, information dated February 2017.

2. Status Codes:

FE	Federal-listed Endangered
FT	Federal-listed Threatened
FPE	Federal Proposed Endangered
FPT	Federal Proposed Threatened
CE	California State-listed Endangered
CT	California State-listed Threatened
CR	California Rare
FP	California Fully Protected
CSC	California Species of Special Concern

California Rare Plant Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.
California Rare Plant Rank 1B: Plants rare, threatened, or endangered in California and elsewhere.
California Rare Plant Rank 2A: Plants presumed extirpated in California, but more common elsewhere.
California Rare Plant Rank 2B: Plants rare, threatened, or endangered in California, but more numerous elsewhere.
California Rare Plant Rank 3: Plants about which more information is needed – a review list.
California Rare Plant Rank 4: Plants of limited distribution – a watch list.
CNPS Threat Ranks
0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

TABLE 4. SPECIAL STATUS ANIMAL SPECIES THAT HAVE BEEN REPORTED IN THE VICINITY OF THE PROJECT AREA, PLACER COUNTY, CALIFORNIA

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Invertebrates			
Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)	FT/--	Inhabits vernal pools; occurs throughout the Delta and Central Valley.	Not present. Suitable habitat is not present on site.
Vernal Pool Tadpole Shrimp (*Lepidurus packardi*)	FE/--	Inhabits vernal pools; known from scattered locations in the Delta and Central Valley.	Not present. Suitable habitat is not present on site.
California Linderiella (*Linderiella occidentalis*)	--/--	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions.	Not present. Suitable habitat is not present on site.
Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)	FT/--	Inhabits blue elderberry bushes (host plant); restricted to the Central Valley and adjacent foothills.	Not present. No elderberries were observed at the site during site surveys, therefor no potential habitat exists at the site for this species
Ricksecker's Water Scavenger Beetle (*Hydrochara rickseckeri*)	--/--	Aquatic beetle that lives in weedy shallow, open water associated freshwater seeps, springs, farm ponds, vernal pools (playa type pools) and slow-moving stream habitats.	Not present. Suitable habitat is not present on site.
Alabaster Cave harvestman *Banksula californica*	--/--	Known only from the type locality, Alabaster Cave in El Dorado County. The type locality has been partly destroyed by mining and the species may be extinct.	Not present. Suitable habitat is not present on site.

SCIENTIFIC NAME	STATUS[2]	HABITAT/RANGE	OCCURRENCE
Fish			
Conumnes stripetail *(Cosumnoperla hypocrena)*	--/--	Found in intermittent streams on the western slope of the Central Sierra Foothill in the American and Cosumnes River Basins.	Not present. Suitable habitat is not present on site.
Steelhead- Central Valley DPS *(Oncorhynchus mykiss irideus)*	FT/--	Population occur in the Sacramento and San Joaquin Rivers and their tributaries. In the project area found in Dry Creek and its tributaries in Secret Ravine and Miners Ravine.	Not present. Suitable habitat is not present onsite; no large river systems or suitable spawning streams. Suitable spawning habitat located about 4 miles southwest of the site in Secret Ravine and Miners Ravine. Best Management Practices are necessary to control contaminants in stormwater runoff.
Amphibians			
Western Spadefoot Toad (*Spea hammondii*)	--/CSC	Breeds in vernal pools/seasonal stock ponds in the Central Valley and southern coast.	Not likely. The site is in the range of the species. Habitat is less than optimal but marginally suitable. Preconstruction surveys are recommended.
California Red-legged Frog *(Rana draytonii)*	FT/CSC	Inhabits freshwater creeks and ponds in the scattered areas along the Coast Rangers from northern California down to northern Baja.	Not present. No CNDDB records in immediate vicinity of the property. The study site is considered to be outside of the current range of this species. Additionally, non-tidal wetlands onsite are seasonal and do not provide the perennial waters typically required for California Red-legged Frog.

Reptiles			
Western Pond Turtle *(Emys marmorata)*	--/CSC	Inhabits freshwater ponds and sluggish streams; occurs from WA to Baja, mostly west of the Sierra crest.	Not present. Suitable habitat is not present on site.
Birds			
Great Blue Heron (rookery site) *(Ardea herodias)*	--/--	Forms rookeries in large tree stands; occurs throughout California and elsewhere.	Rookery not present. Rookeries unlikely on the study site due to a lack of suitable trees.
Prairie Falcon *(Falco mexicanus)(*Nesting)	BCC/WL	Associated primarily with perennial grasslands, savannahs, rangeland, some agricultural fields and desert scrub. Permanent resident and migrant along inner coast and ranges.	Nesting unlikely. Appropriate nest sites not present. This species may forage on the site in winter, though none were observed in February 2017.
Peregrine Falcon *(Falco peregrinus anatum)(*Nesting)	Delisted,BCC /Delisted,FP	Inhabits open wetlands near cliffs, also occurs in some cities where nests on buildings and bridges.	Nesting unlikely. Appropriate nest sites not present.
Merlin *(Falco columbarius)* [wintering]	-/WL	Breeds in Canada, winters in a variety of California habitats, including grasslands, savannahs, wetlands, etc.	Wintering possible. The species may sporadically utilize the site as a winter foraging habitat.

Sharp-shinned Hawk *(Accipiter striatus)* [nesting]	-/WL	Breeds in ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine habitats. Prefers, but not restricted to, riparian habitats. North facing slopes, with plucking perches are critical requirements. All habitats except alpine, open prairie, and bare desert used in winter.	Nesting unlikely. Appropriate nesting habitat not present on site. Species likely forages on or near the site, especially in winter. Preconstruction bird nesting surveys will include this species.
Cooper's Hawk *(Accipiter cooperii)* [nesting]	-/WL	Nests primarily in deciduous riparian forests; forages in open woodlands.	Nesting unlikely. Appropriate nesting habitat not present on site. Species likely forages on or near the site, especially in winter. Preconstruction bird nesting surveys will include this species.
Osprey (*Pandion haliaetus*) [Nesting]	--/WL	Breeds in northern California from the Cascade Ranges south to Lake Tahoe, and along the coast south to Marin County. Associated strictly with large, fish-bearing waters, primarily in Ponderosa pine through mixed conifer habitats.	Nesting unlikely. Suitable nesting habitat not present on site.
Ferruginous Hawk *(Buteo regalis)* (wintering)	BCC/CSC	Inhabits open country. Winters in small numbers along California coast and inland valleys.	Wintering possible. The site is considered suitable wintering foraging habitat, though none were observed in February 2017 field studies.
Swainson's Hawk (nesting) *(Buteo swainsoni)*	BCC/CT	Nests in trees and riparian stands; summer migrant to Central Valley. Suitable foraging areas include grasslands, pastures, alfalfa and other hay crops, and certain grain and row croplands.	Nesting unlikely. CNDDB records indicate this species nests within seven miles of the site. Nests unlikely on the property. The site may provide marginally suitable foraging habitat for this species, and one was observed flying over the site on April 22, 2017. Preconstruction bird nesting surveys will include this species.

Northern Harrier *(Circus cyaneus)* (nesting)	--/CSC	Forages and nests in grasslands, marshes, and agricultural fields; occurs throughout California, concentrated in the Central Valley and coastal valleys.	Nesting unlikely. Suitable nesting habitat not present on site. Preconstruction bird nesting surveys will include this species.
White-tailed Kite *(Elanus leucurus)* (nesting)	--/FP	Nests in dense oaks, willows, other trees; occurs in the Central Valley and adjacent low foothills.	Nesting unlikely. No CNDDB nesting records in vicinity. Nests unlikely on the study site due to a lack of suitable trees. Preconstruction bird nesting surveys will include this species.
Bald Eagle *(Haliaeetus leucocephalus)* (nesting and wintering)	Delisted,BCC /CE,FP	In winter, maybe be found throughout most of California at lakes, reservoirs, rivers and some rangelands and coastal wetlands. California's breeding habitats are mainly located in mountains and foothill forests near permanent water sources.	Nesting unlikely. Suitable nesting habitat not present on site.
Golden Eagle *(Aquila chrysaetos)* [nesting and wintering]	BCC/WL,FP	Typically frequents rolling foothills, mountain areas, sage-juniper flats and desert.	Wintering possible. The site likely receives sporadic use by the species in winter.
California black rail *(Laterallus jamaicensis coturniculus)*	--/CT,FP	Mainly inhabits salt-marshes bordering larger bays. Occurs in tidal salt marsh with dense growths of pickleweed; also occurs in freshwater and brackish marshes.	Not present. Suitable habitat is not present at the site.
Short-eared Owl (nest site) *(Asio flammeus)*	--/CSC	Forages and nests in perennial marsh and grassland habitat; occurs in the Central Valley, coast, and east Sierra regions.	Nesting unlikely. Suitable nesting habitat not present on site.

Western Burrowing Owl *(Athene cunicularia hypugea)* (burrow sites)	BCC/CSC	Nests in mammal burrows, rock cavities in grassland and scrub; occurs throughout much of mid and lower California.	Not present. Although CNDDB documents nesting records in the project, suitable habitat is not present at the site due to tall heights of upland grasses and general lack of California ground squirrels and ground squirrel burrows. No individuals were observed during surveys in February or late April of 2017. Preconstruction bird nesting surveys will include this species.
Purple Martin *(Progne subis)*	--/CSC	Uses a variety of wooded, low-elevation habitats throughout California. Uses hardwood and hardwood-conifer habitats as well as riparian habitats. Now a rare and local breeder on the coast and in interior mountain ranges.	Nesting unlikely. Suitable nesting habitat not present on site.
Loggerhead Shrike *(Lanius ludovicianus)* (nesting)	BCC/CSC	Habitat includes open areas such as desert, grasslands, and savannah. Nests in thickly foliaged trees or tall shrubs. Forages in open habitat which contains trees, fence posts, utility poles and other perches.	Unlikely. Although not recorded for the project area in the CNDDB, trees and shrubs provide suitable nesting habitat. Not observed during surveys conducted in February or April of 2017. Preconstruction bird nesting surveys will include this species.
Grasshopper Sparrow *(Ammodramus savannarum)*	--/CSC	Found in dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches.	Nesting unlikely. Suitable nesting habitat not present on site.
Yellow Warbler *(Setophaha petechia)* [nesting]	BCC/CSC	Breeds in deciduous riparian woodlands, widespread during fall migration.	Nesting not present. May occur on site during fall migration, but suitable nesting habitat is not present at the site.
Tricolored Blackbird *(Agelaius tricolor)* (nesting colony)	BCC/CE, CSC	Nests in cattails, riparian scrub, and other dense marsh vegetation; occurs in SF Bay, Delta, and Central Valley basin.	Nesting not present. Appropriate nest sites not present. Preconstruction bird nesting surveys will include this species.

Mammals			
Silver-haired bat *(Lasionycteris noctivagans)*	--/--	Coastal and montane forests. Feeds over streams, ponds and open bushy areas, roosts in hollow trees.	Not present. Suitable habitat is not present at the site.
Pallid bat *(Antrozous pallidus)*	-/CSC	Roosts primarily in oak woodland and ponderosa pine habitats; forages in open areas.	Not present. Suitable habitat is not present at the site.
Townsend's Big-eared Bat *(Corynorhinus townsendii)*	--/CCT,CSC	Found in desert scrub and coniferous forests. Roost in caves or abandoned mines and occasionally are found to roost in buildings.	Not present. Suitable habitat is not present at the site.
American badger *(Taxidea taxus)*	-/CSC	Drier open stages of most shrub, forest, and herbaceous habitats; needs sufficient food, friable soils and open, uncultivated ground.	Not present. Suitable habitat is not present at the site.

WETLAND DELINEATION
FOR THE
±17.88-ACRE SIERRA-BRACE STUDY AREA

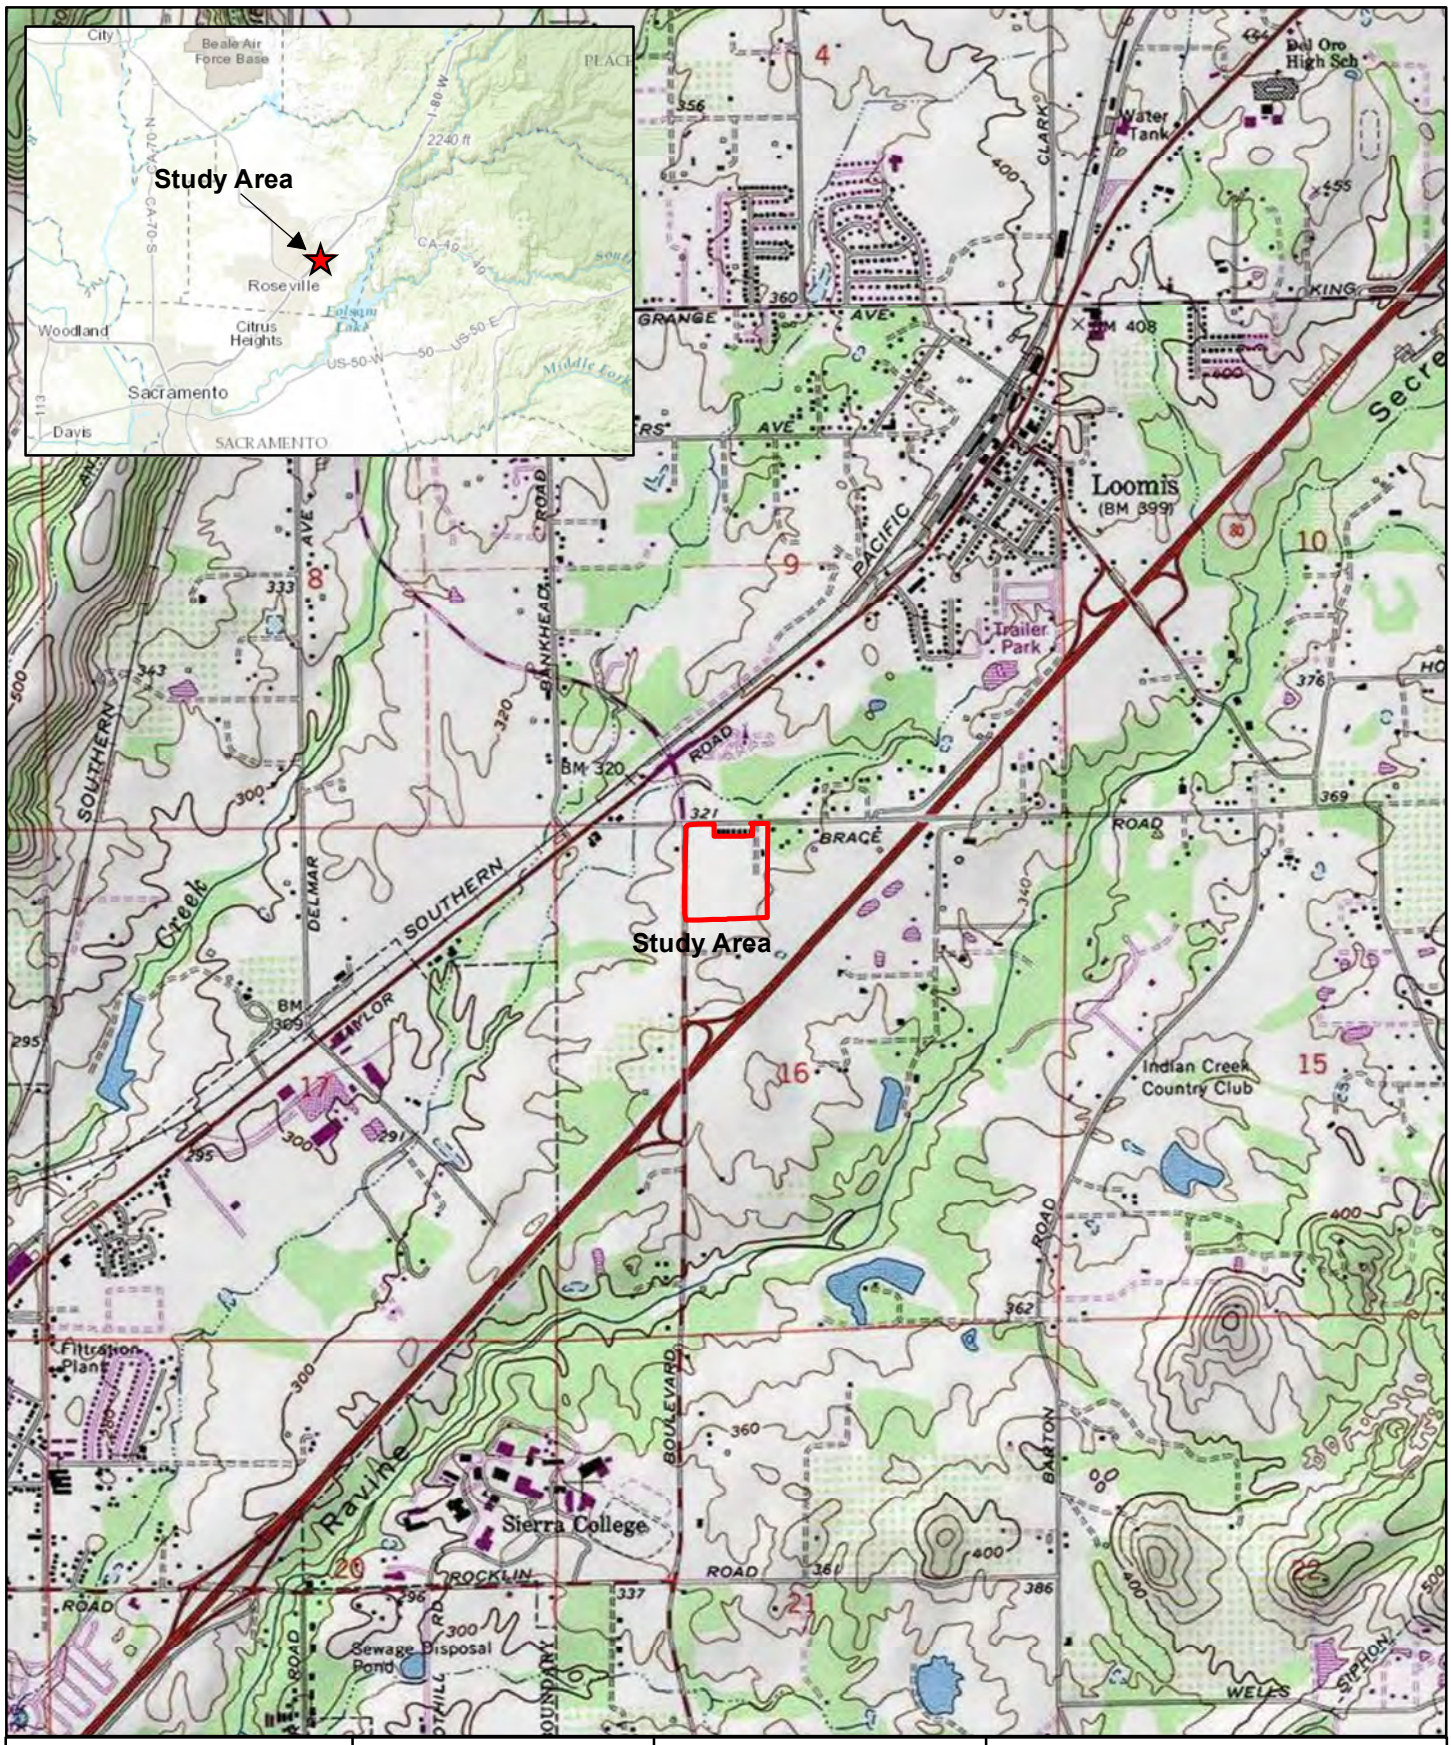
INTRODUCTION

On behalf of Manikas Properties, Salix Consulting, Inc., is submitting this updated delineation of waters of the United States for the ±17.88-acre Sierra-Brace study area in the Town of Loomis, Placer County, California. The property was originally delineated by North Fork Associates in February 2008 and verified by the Corps March 20, 2009 (SPK-2008-00630). This document largely includes the original delineation documentation and mapping, with minor adjustments, as needed.

The study area is located north of Interstate 80, in the southeastern corner of the intersection between Sierra College Boulevard and Brace Road. The location corresponds to Section 28 of Township 11 North and Range 7 East on the 7.5 minute Rocklin, CA United States Geological Survey (USGS) quadrangle (Figure 1). The latitude and longitude of the approximate center of the site are 38°48'34"North and 121°12'16" West. The Assessor Parcel Numbers (APNs) are 045-042-011, 045-042-012, 045-042-023, 045-042-034, 045-042-035, 045-042-036, and 045-042-037.



The study area is located at an elevation between approximately 320 and 340 feet. Habitats in the study area include annual grassland and foothill woodland. Adjacent land uses include a multi-family residential building along the northern boundary the Homewood Lumber complex to the north, single family residential to the east, commercial and undeveloped land to the south, and an office building and undeveloped land to the west (Figure 2). The study area is bounded by Brace Road to the north and Sierra College Boulevard to the west.

Background

As noted above, waters of the U.S. were delineated by North Fork Associates in February 2008 and verified by the U.S. Army Corps of Engineers March 20, 2009. The verification was valid for five years from the date of the letter. The 2009 verification letter is included as Attachment 1, following the Appendices. Property ownership has changed since that time, and this report is intended to update that delineation.

Directions to the Site

From Sacramento, proceed east on Interstate 80. Take the Sierra College Boulevard exit and turn left after exiting the freeway. The Brace Road and Sierra College Boulevard intersection is just north of Interstate 80. The study area is located in the southeastern corner of the intersection.

12240 Herdal Drive, Ste. 14
Auburn, California 95603
Phone: (530) 888-0130
Contact: Jeff Glazner

METHODS

Waters of the United States were assessed on March 25, 2016, by Jeff Glazner and Hunter Gallant. The North Fork delineation was uploaded to the submeter GPS and field checked. Very minor adjustments were made and are reflected in the map provided in this document. The original topographic basemap was used for the revised map as new topo was not available. The original data forms are included in Appendix A. The plant list for the site is included as Appendix B.

RESULTS

Climate

The region has a Mediterranean climate with dry hot summers and mild winters. Over the course of a year, average high temperatures typically vary from 54°F in the winter to around 92°F in the summer. The warm season lasts from May through September, with an average daily high temperature above 88°F. On average, the hottest months are July and August with an average high of 92°F and low of 61°F. The coolest months are December and January, with an average daily high temperature around 54°F and average low temperature around 40°F. Precipitation occurs mostly from November through April in the form of rain, averaging around 25 inches per year. Little or no precipitation falls during June, July, and August.

Precipitation occurred 3 days prior to the March 25, 2016, field visit, amounting to one-half an inch of rainfall.

Soils

One soil unit is mapped in the study area (Figure 3): Andregg coarse sandy loam, 2 to 9 percent slopes.

Andregg soils on-site are coarse-loamy Ultic Haploxerolls, which are Mollisols formed in a Mediterranean climate and characterized by little subsoil development. This component is on foothills, hills with slopes of 2 to 9 percent. They are derived from weathered granodiorite, and bedrock is 29 to 33 inches below the surface. The A horizon extends to about 15 inches and the BA horizon to about 24 inches. Hues range from 10YR to 2.5YR; values between 5 and 2; and chromas between 3 and 2, moist. Organic matter at the surface horizon is around 2 percent. Andregg soils are well-

drained and have moderately rapid permeability. This soil is neither ponded nor flooded. This soil does not meet hydric criteria.

Hydrology

The Sierra-Brace study area is located in the Lower American watershed (Hydrologic Unit Code 18020111). The topography of the study area gently slopes to the west. The wetland swale and drainage ditch located in the southwest corner of the site drain water westerly and convey water offsite through culverts underneath Sierra College Boulevard. Water continues to drain westerly on the adjacent property and drains into Sucker Ravine which drains into Secret Ravine. Secret Ravine is a tributary of Miners Ravine, which ultimately reaches Dry Creek and then the American River. The constructed drainage in the northeastern corner conveys storm water and urban runoff from the residential development to the east through a storm drain system.

Vegetation

Two biological communities were identified within the study area: foothill woodland and annual grassland. The site wetlands are embedded in these habitats. Figures 4a and 4b. provides photos of the site taken during the March 25, 2016, site visit.

Foothill Woodland

The foothill woodland varies in density throughout the site, being mostly open, and it is dominated by valley oak and interior live oak with a few scattered foothill pines. Shrubs in the understory vary from dense stands of coyote brush and Himalayan blackberry to a completely absent shrub layer. The herbaceous layer consists of a mixture of non-native grasses and forbs. Grasses include Italian ryegrass, ripgut grass, and soft chess. Forbs present include Italian thistle, California mugwort, field hedge-parsley, klamathweed, broad leaf filaree, common vetch, and crane's-bill geranium.

The wetland swale in the study area occurs within the foothill woodland habitat. A few Fremont cottonwood, narrow-leaved willow, and arroyo willow occur within the shrub understory. The herbaceous understory includes curly dock, Mexican rush, Iris-leaf rush, tall flatsedge, and prickly lettuce.

Annual Grassland

The non-native grasses and forbs that occur in the foothill woodland also occur in the annual grassland in the study area. Other grasses and forbs present in the annual grassland include wild oat, hedgehog dogtail, foxtail barley, medusahead, yellow star-thistle, rose clover, smooth's cat-ear, common fiddleneck, short-podded mustard, and bindweed. The annual grassland onsite appears to be disked annually.

Waters of the United States

One category of waters of the United States was mapped on the site: wetland swale. Table 1 provides an acreage summary of the wetland swales. The wetland delineation map is included in Figure 5. GIS data is provided on the accompanying DVD, and the Corps of Engineers Aquatic Resources spreadsheet is included as Appendix C.

Table 1.
Waters of the United States within the Sierra-Brace Study Area

Type	Acreage
Wetlands:	
Wetland swale	
WS-1	0.125
WS-2	0.012
WS-3	0.016
Total Waters of the United States	**0.153**

Wetland Swale

One wetland swale occurs within the foothill woodland habitat (Figure 4a). This swale (WS-1) begins in the middle of the study area, where it collects surface water (in the form of sheet flow) and then drains westerly, where it then exits the study area through a culvert underneath Sierra College Boulevard. The beginning of the swale is a small open area dominated by iris leaf rush. The swale then continues west through a dense patch of coyote brush and opens up again near the culvert adjacent to Sierra College Boulevard. Wetland plant species such as hyssop loosestrife, curly dock, prickly lettuce, Italian ryegrass, and Mexican rush are present within the lower portion of the swale.

A second wetland swale (WS-2) enters the study area through a culvert along the eastern boundary in the northeast corner of the study area. The swale appears to convey stormwater runoff and urban water westerly for approximately 80 feet within the study area, and then exits the study area through a culvert underneath Starlight Lane. The swale is densely vegetated with Himalayan blackberry (Figure 4b).

A third swale (WS-3) occurs in the southwestern corner of the study area, where stormwater runoff drains onto the study area through an 18-inch PVC culvert located on the commercial development (McDonald's/Chevron) to the south. Wetland species such as water plantain, veronica, moth mullein, water cress, and curly dock are present. The swale (WS-3) continues for approximately 175 feet west until it merges with a narrower excavated ditch that drains water from a 12-inch concrete culvert located under the commercial development to the south (Figure 4b). Water exits the study area along the western boundary through a 30-inch corrugated metal pipe culvert under Sierra College Boulevard.

WETLAND DELINEATION

Sierra-Brace

Town of Loomis, Placer County, CA

April 18, 2016

Former Cattle Watering Holes

According to historic information, three concrete-lined livestock ponds once existed onsite and these ponds had been directly connected to a well and pump that had been abandoned, and that they had been filled for safety reasons, utilizing a grading permit issued by the Town of Loomis (#5475). Because we are using the old topographic mapping, the concrete depressions appear on the map. These areas are now leveled ground.

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☐ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1) (**Nonriverine**)
- ☐ Sediment Deposits (B2) (**Nonriverine**)
- ☐ Drift Deposits (B3) (**Nonriverine**)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☒ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Plowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1) (**Riverine**)
- ☐ Sediment Deposits (B2) (**Riverine**)
- ☐ Drift Deposits (B3) (**Riverine**)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☒ No ☐ Depth (inches): **1"**

Water Table Present? Yes ☐ No ☐ Depth (inches):

Saturation Present? Yes ☒ No ☐ Depth (inches): **0**

(includes capillary fringe)

Wetland Hydrology Present Yes ☒ **No** ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Regulatory Division (SPK-2008-00630)

Stephen Patterson
Patterson Properties
2270 Douglas Boulevard, Suite 111
Roseville, California 95661

Dear Mr. Patterson:

We are responding to your consultant's request for an approved jurisdictional determination for the Sierra-Brace Property. This approximately 17.88-acre site is located in Section 28, Township 11 North, Range 7 East, MDB&M, Latitude 38.808793° North, Longitude 121.203869° West, near the City of Rocklin and Town of Loomis, Placer County, California.

Based on available information, we concur with the estimate of waters of the United States, as depicted on the February 28, 2008, *Appendix C, Wetland Delineation Map, Sierra-Brace Study Area, Town of Loomis, Placer County, CA,* drawing prepared by North Fork Associates. Approximately 0.14 acre of waters of the United States, including wetlands, is present within the survey area. These waters are regulated under Section 404 of the Clean Water Act, since they are tributary to an unnamed intermittent stream, which is tributary to Secret Ravine, which is tributary to Miner's Ravine, which is tributary to Dry Creek, which is tributary to the Natomas East Main Drainage Canal, which is tributary to the Sacramento River, a navigable water of the United States.

This verification is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331.

A Notification of Appeal Process (NAP) fact sheet and Request for Appeal (RFA) form is enclosed. If you request to appeal this determination you must submit a completed RFA form to the South Pacific Division Office at the following address: Administrative Appeal Review Officer, Army Corps of Engineers, South Pacific Division, CESPD-PDS-O, 1455 Market Street, San Francisco, California 94103-1399, Telephone: 415-503-6574, FAX: 415-503-6646.

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5, and that it has been received by the Division Office within 60 days of the NAP. Should you decide to submit an RFA form, it must be received at the above address by 60 days from the date of this letter. It is

not necessary to submit an RFA form to the Division Office if you do not object to the determination in this letter.

You should provide a copy of this letter and notice to all other affected parties, including any individual who has an identifiable and substantial legal interest in the property.

This determination has been conducted to identify the limits of Corps of Engineers' Clean Water Act jurisdiction for the particular site identified in this request. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

We appreciate your feedback. At your earliest convenience, please complete our customer survey at *http://www.spk.usace.army.mil/customer_survey.html*. Your passcode is "conigliaro".

Please refer to identification number SPK-2008-00630 in any correspondence concerning this project. If you have any questions, please contact (b) (6) at our California North Branch, 1325 J Street, Room 1480, Sacramento, California, 95814-2922, email (b) (6) *@usace.army.mil*, or telephone (916) 557-6740. You may also use our website: *www.spk.usace.army.mil/regulatory.html*.

Sincerely,

ORIGINAL SIGNED

Arborist Report

Mann Made Resources
Arborist Consulting and Tree Conservation Products

December 9, 2016

Mr. Steve Calcagno
Kier & Wright Civil Engineers & Surveyors
2850 Collier Canyon Road
Livermore, CA 94551

SUBJECT: ARBORISTS REPORT FOR COSTCO SITE, LOOMIS, CA

Dear Mr. Calcagno,

Thank you for the opportunity to provide Arborist Consulting Services. The trees on the subject property were inspected on Friday, Saturday, and Sunday, November 18, 19, and 20, and December 9, 2016, and this report provides the findings from the inspections.

Assignment and Background: You contacted my office on October 30th to request an arborist inspection of the trees located within the construction site in Loomis on Sierra College Boulevard and Brace Road for a proposed Costco. I provided a proposal, and you provided the site image to work from. The assignment was to list all Blue Oak trees 4 inches diameter and greater, and all Live Oak and Valley Oak trees 6 inches diameter and greater. You also asked for an estimate of the mitigation required for the removal of the trees on the property.

Observations: The site was inspected on Friday, Saturday, and Sunday, November 18, 19, and 20, with a re-visit on Friday, December 9, 2016 to capture 9 trees that were not completed during the previous site visits. The site is an open area surrounded by fencing, bordered by Sierra College Boulevard top the west, Brace Road to the north, and the Rocklin Border to the south. An apartment complex is adjacent to the property on Brace Road, and the entry gate to the property was behind the driveway into the apartment complex. There is a piece of excess property to the east of the apartment complex that was included in the survey. Twenty eight trees were found to be in the excess property.

Prior to beginning the survey, I reviewed the Loomis Tree Preservation Ordinance to assure the data collected meets their requirements. A Trimble Geo7X unit was used to capture the data and tree locations. A tree ID number was listed on the map image, and the tree tag number was listed for each tree, and the data spreadsheet lists both numbers for easier field identification. The Tree ID number is shown on the KMZ file except for the last 9 trees along Brace Road that were captured using Google Earth, and the Tree ID number and the tag number are the same for those trees.

12661 Torrey Pines Drive, Auburn, CA 95602
(650) 740-3461 ♦ FAX (530) 268-0926
www.mannandtrees.com

Each Oak tree was visited and measured. Undersized trees were not listed. Most of the trees had 1 or two previous tag numbers, and a new number was given to each tree for this inspection. Three trees were double numbered with 301, 302, and 303, before I caught that the same numbers were already used. The double number trees are differentiated by the Tree ID numbers. The tag I installed has the nail head tilted downward so the tag falls away from the tree. Tree tags are typically good for at least three years. After three years, tags may need to be replaced as the tree can grow over the tag which makes the tag number unable to be read. Each tree ID number is the number shown on the KMZ file aerial image.

The required data to be collected was:

i. Tree number
ii. Tree species/common name
iii. Diameter at 4.5' above grade, or the best measurement for diameter if 4.5 was not a good representation of the trunk diameter.
iv. Condition determined by combining vigor, structure, and ability to grow on the site, rated from Excellent, Good, Fair, Major Problems, Extreme Problems, or Dead. Condition ratings are used to calculate mitigation requirements.
v. Comments supporting the condition rating.

All of the trees were viewed while standing on the ground. The diameter was measured using a diameter tape. A probe was used to learn the depth of cavities. A mallet was used to sound the wood and listen for hollow spots.

Three Hundred Seventy Two (372) trees were listed as being of protected size. One hundred sixty two (162) trees were found to be in good or fair condition. Two hundred ten (210) trees were found to be in poor, very poor, or dead condition. The inspection data is shown on the attached 20 page spreadsheet.

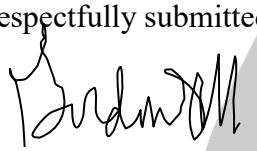
Other testing or examination: No other testing or examination was agreed to as part of the inspection assignment.

Discussion: The Town's Tree Preservation Ordinance provided the requirements for data collection. Blue Oaks 4 inches diameter and greater, and Valley and Live Oaks 6 inches diameter and greater are considered Protected Trees.

A total of 372 trees were listed found to be of protected size. Of the 372 total trees, 210 trees were found to be in condition rating 2, 1, and 0, and do not require mitigation. Of the 210 trees, 168 trees were found to be in poor condition, a numerical 2 rating, considered major problems. Thirty eight (38) trees were found to be in very poor condition a 1 rating, considered extreme problems. Four (4) trees were found to be dead, a zero rating.

One hundred sixty two (162) trees were found to be in good and fair condition. Eight (8) trees were found to be in good condition, a 4 rating. Fifteen (15) #15 container size trees are required for mitigation. One hundred fifty four (154) trees were found to be in fair condition, a 3 rating. Two Hundred Seventy Five (275) #15 container size trees are required for mitigation. Per the Town's ordinance, a total of 290 #15 container size trees may be required to be planted on the site for mitigation.

Two (2) of the existing trees in good and fair condition were found to be blue oaks, and require higher mitgation planting. Eighty six (86) of the existing trees were found to be Live Oaks. Two hundred eighty four trees were found to be Valle Oaks.



The spreadsheet includes the tree map ID number, the tree tag number, common name, species, diameter at 4.5 measurement or other appropriate location, tree condition using the Town of Loomis 0-5 rating system, and comments with notes supporting the condition rating. The spreadsheet is sorted 3 ways, by tree tag number, tree condition to calculate mitigation planting, and by species.

Conclusion: Three hundred seventy two (372) trees were found to be of protected size. Of those trees, 162 were found to be in good and fair condition for a total mitigation planting requirement of potentially 290 #15 container trees. It should be possible to plant these trees on the property as part of the project landscape design and parking lot shade.

Certification: I certify that all the statements in this report are true, complete and correct to the best of my knowledge, and that all statements were made in good faith.

Please contact me at 650-740-3461 or at gordon@mannandtrees.com if you have any questions about this report or if additional services are desired.

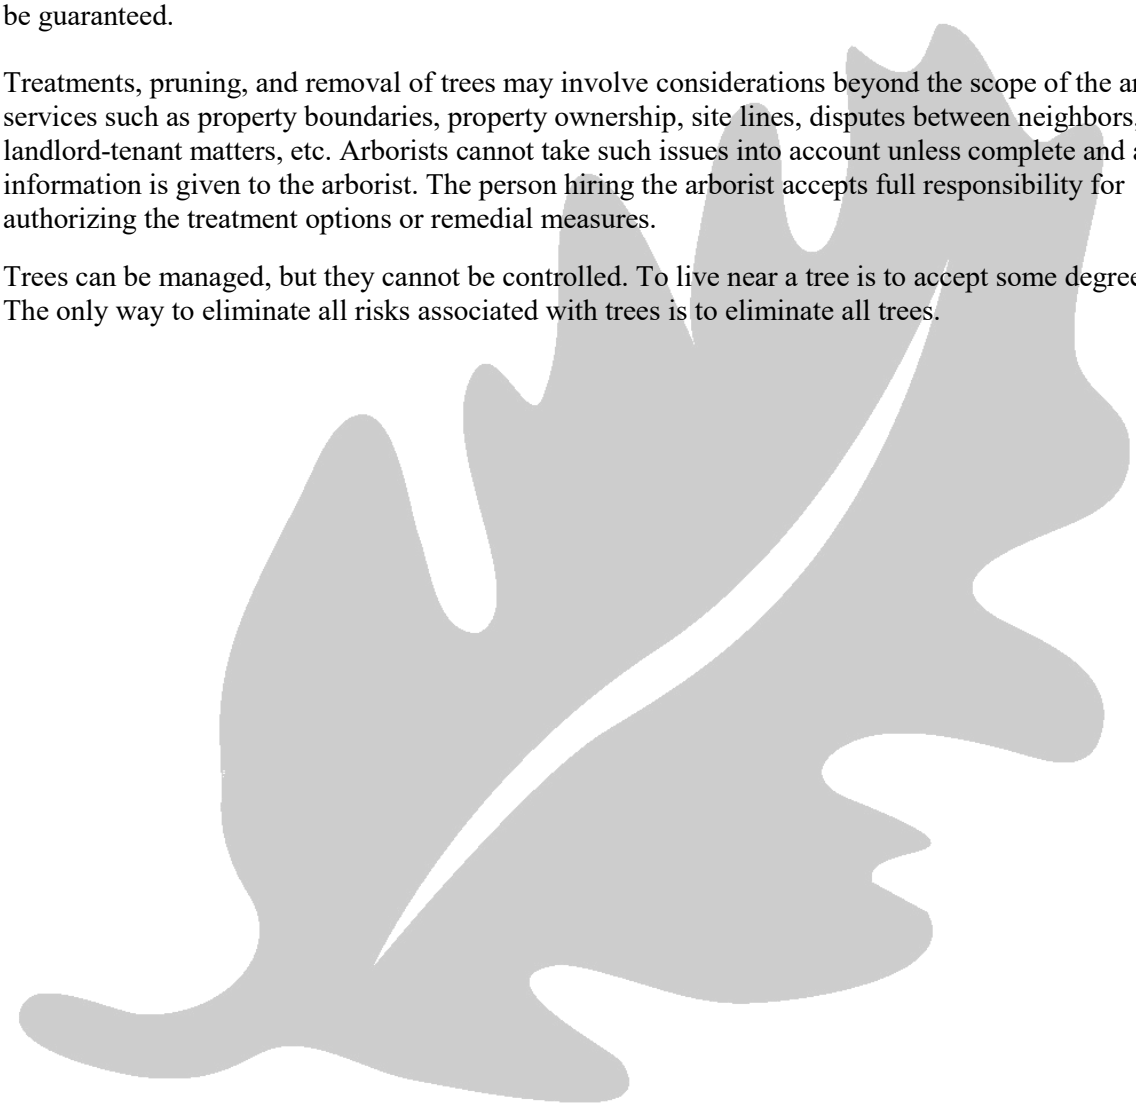
Attachments: Site image with tree ID numbers
Spreadsheet of trees sorted by tree number, species, and condition
KMZ file for aerial image with GPS coordinates



Assumptions and Limitations: This report provides information about the subject trees at the time of the inspection. Trees and conditions may change over time. This report is only valid for the conditions present at the time of the inspection. All observations were made while standing on the ground. The inspection consisted of visual observations. No further examinations were requested or performed.

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the options and recommendations of the arborist, or seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that can fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatments, pruning, and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, landlord-tenant matters, etc. Arborists cannot take such issues into account unless complete and accurate information is given to the arborist. The person hiring the arborist accepts full responsibility for authorizing the treatment options or remedial measures.

Trees can be managed, but they cannot be controlled. To live near a tree is to accept some degree of risk. The only way to eliminate all risks associated with trees is to eliminate all trees.

[1] Obtained from the FHWA Roadway Construction Noise Model, J

[2] Based on the following from the Federal Transit Noise and Vibrat

$L_{eq}(equip) = E.L.+10*\log(U.F.) - 20*\log(D/50) - 10*G*\log(D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects; and

D = Distance from source to receiver.

TABLE OF CONTENTS

Executive Summary 1
1.0 Introduction 10
1.1 Project Description 10
1.2 Scope Of The Report 11
2.0 Regulatory Setting 13
2.1 Town of Loomis Significance Criteria 13
2.2 City of Rocklin Significance Criteria 13
2.3 Placer County Significance CrIteria 14
2.4 Caltrans Significance Criteria 16
2.5 CEQA Significance Criteria 16
2.6 Significant Impact 17
3.0 Methods of Evaluation 21
3.1 Level of Service Methodology 21
3.2 Queuing Methodology 22
3.3 Freeway Mainline 23
3.4 Supplemental Evaluations 23
4.0 Existing Conditions 26
4.1 Site Conditions and Adjacent Land Uses 26
4.2 Transportation Facilities 26
4.3 Intersection Operations 32
4.4 Placer County Roadway Operations 47
4.5 Freeway Facilities Operations 48
5.0 Project Characteristics 50
5.1 Project Description 50
5.2 Project Trip Generation 58
5.3 Project Trip Distribution 61
5.4 Project Trip Assignment 75
5.5 Truck Delivery Considerations 88
5.6 Project VMT Calculation 92
6.0 Existing Plus Project Conditions 98
6.1 Intersection Evaluation 98
6.2 Placer County Roadway Operations 124
6.3 Freeway Facilities Evaluation 125

6.4 Pedestrian and Bicycle Evaluation 126
6.5 Transit Evaluation 128
7.0 Cumulative Conditions – Short Term Baseline 130
7.1 Intersection Evaluation 132
7.2 Placer County Roadway Operations 146
7.3 Freeway Facilities Evaluation 147
7.4 Pedestrian and Bicycle Evaluation 148
7.5 Transit Evaluation 148
8.0 Cumulative Conditions – Short Term Plus Project 150
8.1 Intersection Evaluation 150
8.2 Placer County Roadway Operations 175
8.3 Freeway Facilities Evaluation 175

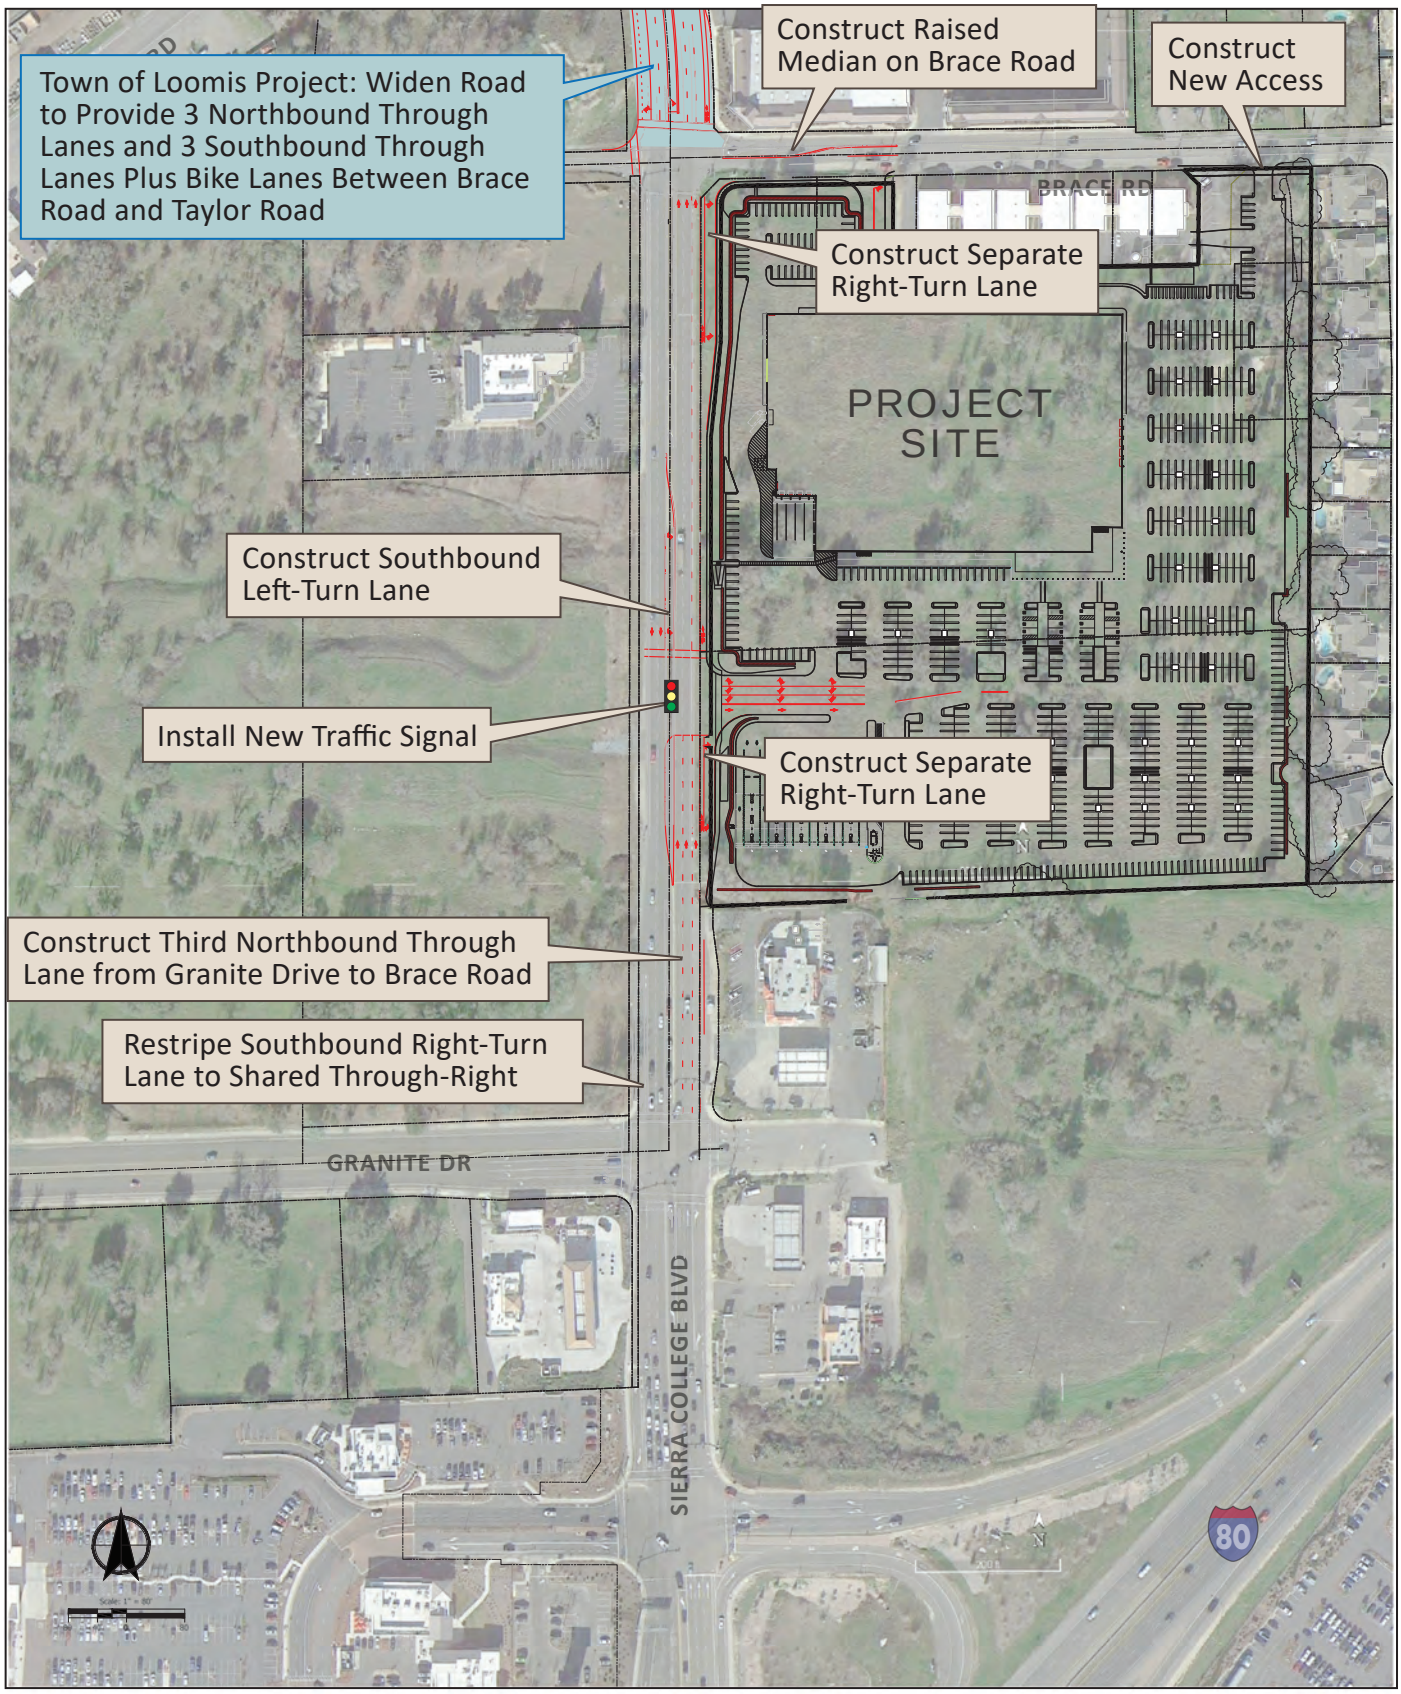
Section 1 Executive Summary

EXECUTIVE SUMMARY

Costco Wholesale Corporation (Costco) proposes to develop a new warehouse with a tire center and fuel station (collectively referred to as the "Project") in The Town of Loomis (Town) along the east side of Sierra College Boulevard south of Brace Road. The Project includes a Costco Warehouse building measuring approximately 155,000 square feet, a Costco Gasoline fuel station with up to 30 fueling positions and supporting parking.

The proposed site plan provides access to the site at three locations including a new signalized intersection on Sierra College Boulevard, a right-in/right-out only driveway located on Brace Road, and a full movement driveway located further east on Brace Road. In addition to analyzing the traffic impacts associated with the proposed site access (Project Driveway Option 1A), study intersection traffic operations are documented in this report for two alternative site access options for comparison purposes. For ease of identification, the access options will be referenced in this report as follows:



- Project Driveway Option 1A (proposed Project site plan)
- Project Driveway Option 1B, which includes:
  - A new signalized intersection along Sierra College Boulevard (same as Option 1A);
  - A right-in/right-out only driveway on Brace Road (same as Option 1A); and
  - A shared drive aisle connection to Granite Drive.
- Project Driveway Option 1C: this option includes the same access as Option 1A plus a shared drive aisle connection to Granite Drive.

In conjunction with site development, Costco would provide right-of-way dedications and widen Sierra College Boulevard along the Project site frontage, activating a third northbound travel lane between Granite Drive and Brace Road. Separate northbound right-turn lanes would be constructed on Sierra College Boulevard at the new signalized Costco access and at Brace Road. The new signalized entry on Sierra College Boulevard would be designed to accommodate a potential fourth approach to serve future Rocklin development on the vacant lot across Sierra College Boulevard to the west.

For the Project access scenarios involving a connection to Granite Drive, Costco would reconfigure Granite Drive east of Sierra College Boulevard to provide side-by-side eastbound and westbound left-turn lanes on Granite Drive (separated by a raised median) between Sierra College Boulevard and the new north-south drive aisle connecting to the Project site.

Figure EX-1 illustrates the proposed site driveway locations and summarizes key planned transportation infrastructure serving the site. In addition to the recommended improvements to be constructed by Costco described above and shown in Figure EX-1, the Town of Loomis will be separately completing widening of Sierra College Boulevard to three lanes northbound and three lanes southbound between Brace Road and Taylor Road as part of a funded Capital Improvement Plan project. The Sierra College Boulevard widening by the Town north of Brace Road is expected to be completed prior to opening of the Costco.

Based on the analysis methodology and significance criteria approved by the Town, Table A lists the study intersections performing at unacceptable level-of-service (LOS) as well as locations impacted by the Project. Table B lists the study intersections where queues extend beyond the available storage lengths as well as locations impacted by the Project. Table C lists the specific project mitigation measures.

Proposed Costco Transportation Improvements
Loomis, CA

Notes:
NB: northbound, SB: southbound, EB: eastbound, WD: westbound, L: left turn lane, T: through lane, R: right turn lane
*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures may be deemed infeasible or outside of the lead agency jurisdiction to implement.
[1]Temporary impact given this impact can be mitigated with the westbound right-turn mitigation measure under Short Term and Long Term conditions. Traffic volumes projected at intersection do not meet signal traffic warrants.

[2]The proposed mitigation does not reduce queues to No Project Conditions and additional geometric improvements are not feasible due to site constraints.

[3] The impact could not be mitigated to less than significant levels. A fourth southbound through lane may be needed to accommodate traffic volumes. The mitigation measures may be deemed infeasible or outside of the lead agency jurisdiction to implement.

Section 1
Introduction

1.0 INTRODUCTION

1.1 PROJECT DESCRIPTION

The Project proposes an approximately 155,000 square foot warehouse with a tire center and a Costco Gasoline fuel station with up to 30 fueling positions. The approximately 17.4-acre site would provide 778 parking stalls, including 16 accessible stalls. The proposed site plan exceeds the Town's minimum parking requirement of five stalls per thousand square feet (765 spaces). Bike parking would also be provided consistent with City requirements.

Proposed Site Access

The proposed Project site plan provides access to the site at three locations:

- A proposed new Project signalized intersection along Sierra College Boulevard;
- A right-in/right-out only Project driveway on Brace Road located approximately 215 feet east of Sierra College Boulevard (measured curb-to-curb); and
- A full access Project driveway on Brace Road located approximately 675 feet east of Sierra College Boulevard (measured curb-to-curb). This new access would be shared with an existing apartment building located to the west. Starlight Lane would be closed and vacated.

All Project access points would be available to Costco members. The right-in/right-out only Brace Road driveway would also serve entering warehouse delivery trucks. Warehouse deliver trucks would exit the site at the new Project signalized intersection on Sierra College Boulevard. Costco Gasoline fuel station delivery vehicles would enter and exit the Project site at the proposed new Project signalized intersection on Sierra College Boulevard.

Alternative Site Access

In addition to analyzing the traffic impacts associated with the proposed site access, study intersection traffic operations are documented in this report for two alternative site access options for comparison purposes. For ease of identification, the access options will be referenced in this report as follows:

- Project Driveway Option 1A (proposed Project site plan)
- Project Driveway Option 1B which includes:
  - A new signalized intersection along Sierra College Boulevard (same as Option 1A);
  - A right-in/right-out only driveway on Brace Road (same as Option 1A); and
  - A shared drive aisle connection to Granite Drive.
- Project Driveway Option 1C: this option includes the same access as Option 1A plus a shared drive aisle connection to Granite Drive.

Supporting Transportation Infrastructure Provided by Project

Transportation infrastructure to be constructed by Costco in conjunction with site development includes:

- Widening Sierra College Boulevard along the Project site frontage to provide three northbound travel lanes and a Class II northbound bicycle facility
- Separate northbound right-turn lanes on Sierra College Boulevard at the new signalized Costco access and at Brace Road, including overlap traffic signals at both locations
- A new Project site signalized entry on Sierra College Boulevard that is designed to accommodate a potential fourth approach to serve future development by others on the vacant lot across Sierra College Boulevard to the west as well a dedicated southbound left turn lane
- Provide traffic signal interconnect between the proposed new Costco site access signalized intersection and the adjacent intersections along Sierra College Boulevard at Brace Road and Granite Drive Dedicate right-of-way and construct standard half-street improvements along the Brace Road site frontage
- Install a raised median on Brace Road between Sierra College Boulevard and the existing Homewood Lumber driveway to the east to limit Costco access to right-turns only
- Provide a left turn pocket or stripe a two-way left turn median along Brace Road

As previously noted, Project Driveway Options 1B and 1C additionally will assume construction of a driveway access through Granite Drive. The access would provide a drive aisle connection to the anticipated future shopping center to be located on the eastern terminus of Granite Drive. With the Project driveway on Granite Drive in Options 1B and 1C, the Project would also restripe the existing northbound right-turn travel lane on Sierra College Boulevard at Granite Drive to a shared through/right lane.

1.2 SCOPE OF THE REPORT

This analysis determines the transportation-related impacts associated with the proposed Costco Warehouse and was prepared in accordance with the Town of Loomis (Town) and California Transportation Department's (Caltrans) requirements for traffic impact studies. The study intersections and scope of this Project were selected based on scoping direction from the Town of Loomis (Town) in consultation with City of Rocklin (City), Placer County (County) and Caltrans staff.

Per the Town's requirements, the study includes analysis for the following scenarios:

- Existing Conditions
- Existing plus Project Conditions
- Cumulative Baseline Conditions (Short Term and Long Term)
- Cumulative plus Project Conditions (Short Term and Long Term)

Section 2
Regulatory Setting

2.0 REGULATORY SETTING

The following section outlines State and local regulations related to transportation and traffic. Intersection performance measures reported in this study include level of service (LOS) and delay. Transportation system operations were compared to applicable significance criteria for the Town, City, County and Caltrans. The sections below summarize each of the respective agency standards as well California Environmental Quality Act standards (CEQA). LOS operating goals for each jurisdiction are applied to study locations owned by that jurisdiction.

2.1 TOWN OF LOOMIS SIGNIFICANCE CRITERIA

The Town of Loomis General Plan Circulation Element (2016) specifies minimum LOS standards for all streets and intersections within Loomis, as follows:

> Level of Service policy: In order to minimize congestion, maintain LOS C on all roads and intersections within the Town of Loomis. LOS D may be allowed in conjunction with development approved within the Town as an exception to this standard, at the intersections of King and Taylor, Horseshoe Bar Road and Taylor, Horseshoe Bar Road and I-80, and Sierra College and Brace Road, when:
>
> 1. The deficiency is substantially caused by "through" traffic, which neither begins nor ends in Loomis, and is primarily generated by non-residents; or
>
> 2. The deficiency will be temporary (less than three years), and a fully-funded plan is in place to provide the improvements needed to remedy the substandard condition.

2.2 CITY OF ROCKLIN SIGNIFICANCE CRITERIA

The City of Rocklin General Plan Circulation Element (2012) states the following:

A. Maintain a minimum traffic LOS C for all signalized intersections during the PM peak hour on an average weekday, except in the circumstances described below.

B. Recognizing that some signalized intersections within the City serve and are impacted by development located in adjacent jurisdictions, and that these impacts are outside the control of the City, a development project which is determined to result in a LOS worse than "C" may be approved, if the approving body finds (1) the diminished LOS is an interim situation which will be alleviated by the implementation of planned improvements or (2) based on the specific circumstances described in Section C. below, there are no feasible street improvements that will improve the LOS to "C" or better as set forward in the Action Plan for the Circulation Element.

C. All development in another jurisdiction outside of Rocklin's control which creates traffic impacts in Rocklin should be required to construct all mitigation necessary in order to maintain a LOS C in Rocklin unless the mitigation is determined to be infeasible by the Rocklin City Council. The standard for determining the feasibility of the mitigation would be whether or not the improvements create unusual economic, legal, social, technological, physical or other similar burdens and considerations".

2.3 PLACER COUNTY SIGNIFICANCE CRITERIA

The Placer County General Plan identifies Policies presenting significance criteria, including the following:

- Policy 3.A.7: The County shall develop and manage its roadway system to maintain the following minimum LOS.
  - LOS C on rural roadways, except within one-half mile of state highways where the standard shall be LOS D.
  - LOS C on urban/suburban roadways except within one-half mile of state highways where the standard shall be LOS D.

The County may allow exceptions to these level of service standards where it finds that the improvements or other measures required to achieve the LOS standards are unacceptable based on established criteria. In allowing any exception to the standards, the County shall consider the following factors:

- The number of hours per day that the intersection or roadway segment would operate at conditions worse than the standard.
- The ability of the required improvement to significantly reduce peak hour delay and improve traffic operations.
- The right-of-way needs and the physical impacts on surrounding properties.
- The visual aesthetics of the required improvement and its impact on community identity and character.
- Environmental impacts including air quality and noise impacts.
- Construction and right-of-way acquisition costs.
- The impacts on general safety.
- The impacts of the required construction phasing and traffic maintenance.
- The impacts on quality of life as perceived by residents.
- Consideration of other environmental, social, or economic factors on which the County may base findings to allow an exceedance of the standards.

Exceptions to the standards will only be allowed after all feasible measures and options are explored, including alternative forms of transportation.

Specific methodology is provided in the Impact Analysis Methodology of Assessment Memorandum prepared September 30th, 2015 as outlined below:

> *Signalized Intersection Assessment Methodology:*
>
> A project may be considered to exceed minimum LOS policies if;
>
> - An intersection operating at or above the established Placer County policies without the project traffic trips will decrease to an unacceptable LOS with the project; or
> - An intersection currently operating below the established acceptable LOS policy will experience an increase in overall average intersection delay of 4 seconds or greater.
>
> *Unsignalized Intersection Assessment Methodology:*
>
> A project may be considered to exceed minimum LOS policies if;
>
> - An all way stop or side street controlled intersection, which currently operates at or above the established Placer County policies without the project, will deteriorate to an unacceptable LOS with the project and cause the intersection to meet MUTCD traffic sign warrant(s); or
> - An all way stop or side street controlled intersection which currently operates below the established acceptable LOS policy and meets MUTCD signal warrant(s) will experience an increase of 2.5 seconds or more with the project.
>
> Further consideration will be given in situations where the existing level of service is just above or at the approved minimum level of service and any increase in vehicle trips, or even daily fluctuations in traffic, will deteriorate the level of service to an unacceptable level.

Based on review of Placer County roadway segment analysis in the approved Bickford Ranch EIR[1], roadway segment impacts would be considered in conjunction with intersection performance along the corridor. Specific methodology outlined in the Impact Analysis Methodology of Assessment Memorandum prepared September 30th, 2015 states:

> A project may be considered to exceed minimum LOS policies (as defined by Policy 3.A.7 as outlined above) if;
>
> - A roadway segment operating at or above the established Placer County policies without the project traffic trips will decrease to an unacceptable LOS with the project; or
> - A roadway segment currently operating below the established acceptable LOS policy will experience an increase in volume to capacity (V/C) ratio of 0.05 or greater with the project; or
> - A roadway segment currently operating below the established acceptable LOS policy will experience an increase in Average Daily Traffic (ADT) of 100 or more project generated trips, per lane.

[1] Addendum to the Bickford Ranch Specific Plan Environmental Impact Report. October 13, 2015.

2.4 CALTRANS SIGNIFICANCE CRITERIA

Per the Caltrans Guide for the Preparation of Traffic Impact Studies (December 2002), Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D (see Appendix "C-3") on State highway facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. Based on conversations with the Town of Loomis staff, it was determined that the target LOS for State highway facilities for the purposes of this project is LOS D. If an existing State highway facility is operating at less than the appropriate target LOS (LOS D), the existing measures of effectives (MOE) should be maintained.

Caltrans staff were contacted to confirm operating requirements for study intersection assessment purposes as noted above. Caltrans District 3 Forecasting and Operations staff identified a LOS E target standard for the Sierra College Boulevard ramp terminals with I-80[2].

2.5 CEQA SIGNIFICANCE CRITERIA

Based on Appendix G of the CEQA Guidelines, the project would have a significant transportation impact if it would do the following:

- Conflict with an applicable plan, ordinance, or policy establishing measures of performance of the circulation system, taking into account all modes of transportation relevant components of the circulation system
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities or otherwise materially decrease the performance or safety of such facilities
- Result in inadequate emergency access
- Substantially increase hazards due to a design feature (such as sharp curves or dangerous intersections) or incompatible uses (such as farm equipment)

[2] Source: November 14, 2018 correspondence from David Smith, Associate Transportation Planner, Transportation Planning – North, Caltrans District 3

2.6 SIGNIFICANT IMPACT

2.6.1 Intersection Delay and Level of Service

Based on direction provided by the lead jurisdiction, Town of Loomis, an intersection is considered significantly impacted as follows:

- At signalized intersections, if project trips cause intersection LOS to change from acceptable to unacceptable levels or if the intersection is already operating at unacceptable LOS, and the project trips cause the average intersection delay to increase by 5.0 seconds or more, then the impact is significant.
- At unsignalized intersections, if project trips cause intersection LOS to change from acceptable to unacceptable levels or if the intersection is already failing, and the project adds trips to the intersection exceeding 5% of the total traffic already at the intersection, then the impact is significant.

This criteria is applied to study locations within the Town of Loomis as well as for jurisdictions where an incremental delay-based impact is not established. Based on the guidelines from each jurisdiction above, Table 1 lists the study intersections, the responsible jurisdiction, and the corresponding operating standard.

Table 1: Study Intersections & Applicable Operating Standards

ID	Street Name		Jurisdiction	LOS Operating Goal	Significant Impact Threshold
	North-South	East-West			
1	Taylor Rd	King Rd	Loomis	D	LOS E/F or 5.0 seconds + added[1]
2	Taylor Rd	Horseshoe Bar Rd	Loomis	D	LOS E/F or 5.0 seconds + added [1]
3	Horseshoe Bar Rd	I-80 WB Ramp	Caltrans	D	LOS E/F or 5.0 seconds + added [1]

36	Taylor Rd	Webb Street	Loomis	C	LOS D/E/F or 5% Project Trips
37	Project Driveway East	Brace Rd	Loomis	C	LOS D/E/F or 5% Project Trips[4]

Notes:

[1] For signalized intersections, impact is significant if the Project increases delay to unacceptable levels from acceptable levels. Impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project trips cause the average intersection delay to increase by 5.0 seconds or more.

[2]Caltrans direction for acceptable LOS of E at this location.

[3]For existing roadway network configuration the intersection was stop controlled; however, under future conditions the intersection would become signalized and therefore would be evaluated with the signalized intersection threshold.

[4]For unsignalized intersections, impact is significant if the Project increases delay to unacceptable levels from acceptable levels. Impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project adds trips to the intersection exceeding 5% of the total traffic already at the intersection.

[5] For signalized intersections, impact is significant if the Project increases delay to unacceptable levels from acceptable levels. Impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project trips cause the average intersection delay to increase by 4.0 seconds or more.

[6]For unsignalized intersections, impact is significant if the Project increases delay to unacceptable levels from acceptable levels and meets MUTCD signal warrants. Impact is significant in situations when the intersection is already operating at unacceptable LOS, meets MUTCD signal warrants, and the Project trips cause the average intersection delay to increase by 2.5 seconds or more.

2.6.2 Intersection Queuing

The Town and neighboring jurisdictions do not have formally-adopted guidelines on queuing analysis methodology or criterion that establishes thresholds of significance for vehicle queues at intersections. For the purposes of this study, a vehicle queue that overflows the available storage for a turn pocket blocking the adjacent travel lane or that queues to an upstream signal blocking through traffic is considered a potential safety hazard and would be considered a significant impact. Therefore, this study identifies a significant impact as occurring at locations where the project traffic would cause the queue length for a turn pocket to overflow its available storage compared to no project conditions or cause a queue to spillback into an upstream signalized intersection. Further, in cases, where the no project queue already overflows the queue storage and the project would contribute 5% of the total traffic for the movement, the impact would be considered significant.

Section 3
Methods of Evaluation

3.0 METHODS OF EVALUATION

The efficiency of traffic operations at a location is measured in terms of vehicular LOS. LOS is the primary unit of measurement for documenting the operating quality of a highway, roadway, or intersection. In general, LOS is measured by the traffic volume-to-capacity (V/C) ratio or by the average delay experienced by vehicles on the facility.

The Highway Capacity Manual 2010 (HCM 2010) (Transportation Research Board, 2010) analysis methodology, as approved by the Town, was applied to all study area intersections as described below. The HCM 2010 is a widely referenced source for the techniques to measure transportation facility performance. Using the HCM 2010 procedures, the quality of traffic operation is graded into one of six LOS designations: A, B, C, D, E, or F, with A representing excellent (free-flow) conditions and F representing extreme congestion. LOS is measured during the course of one peak hour at intersections and on a daily basis on roadway segments.

3.1 LEVEL OF SERVICE METHODOLOGY

At intersections, LOS is defined based on the delay experienced per vehicle. The LOS methodology for signalized intersections accounts for several variables including, but not limited to, the effects of signal type, timing, phasing and progression on average delay. Table 2 defines average delay per vehicle and LOS for signalized intersections.

Table 2: LOS and Average Vehicular Delay Definition for Signalized Intersections

LOS	Delay per Vehicle (seconds)	Definition
A	≤10	LOS A describes operations with a control delay of 10 s/veh or less. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.
B	>10 and ≤20	LOS B describes operations with control delay between 10 and 20 s/veh. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.
C	>20 and ≤35	LOS C describes operations with control delay between 20 and 35 s/veh. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	>35 and ≤55	LOS D describes operations with control delay between 35 and 55 s/veh. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.
E	>55 and ≤80	LOS E describes operations with control delay between 55 and 80 s/veh. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.
F	>80	LOS F describes operations with control delay exceeding 80 s/veh. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Source: Highway Capacity Manual 2010 Exhibit 18-4
s/veh: seconds of delay per vehicle

Unsignalized intersections include two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections. The LOS for an AWSC intersection is defined by delay for the intersection as a whole, whereas, for a TWSC intersection, LOS is based on the delay for the worst operating movement. Table 3 lists the LOS and delay parameters for unsignalized intersections.

Table 3: LOS and Average Vehicular Delay Definition for Unsignalized Intersections

LOS	Delay per Vehicle (seconds)
A	≤10
B	>10 and ≤15
C	>15 and ≤25
D	>25 and ≤35
E	>35 and ≤50
F	>50

Source: Highway Capacity Manual 2010 Exhibit 19-1

Placer County Road Segment Criteria

The Placer County General Plan identifies roadway segment-based traffic volume and LOS evaluation criteria as shown in Table 4.

Table 4: Placer County Evaluation Criteria for Roadway Segment LOS

Roadway Capacity Class	Maximum Daily Traffic Volume Per Lane Levels of Services				
	A	B	C	D	E
Arterial – Moderate Access Control	5,400	6,300	7,200	8,100	9,000

Source: Placer County General Plan Table 4-17 for relevant classifications for County roadways analyzed in this study.

3.2 QUEUING METHODOLOGY

Queues were evaluated at study intersections using the Synchro 9 software and 95th percentile queue lengths were reported to identify locations where the queues may exceed the available storage capacity (queues may be longer during five percent of the peak hour traffic signal cycles). The 95th percentile queue is typically used in traffic engineering as a conservative measure of reporting queuing and because it only has a 5-percent probability of being exceeded, the average driver would likely experience shorter queue lengths than the reported value. As such, the analysis is considered conservative given the reported queues would be less than those experienced by the average driver. Average queues can be found on the Synchro output sheets provided in the appendix.

In addition to assessing queuing with Synchro, queuing along the Sierra College Boulevard corridor was also simulated as discussed further in Section 3.4 of this report.

3.3 FREEWAY MAINLINE

For mainline segments, LOS is measured in terms of density as shown in Table 5 below. Density describes the proximity to other vehicles and is related to the freedom to maneuver within the traffic stream.

Table 5: Level of Service and Density Definition for Basic Freeway Segments

LOS	Density (passenger cars/mile/lane)
A	≤11
B	>11 and ≤18
C	>18 and ≤26

3.4 SUPPLEMENTAL EVALUATIONS

While not required, supplemental analysis is provided per the request of the City and Caltrans to provided additional information as documented below.

3.4.1 Supplemental Simulation Evaluation

A microsimulation analysis was conducted using the SimTraffic software for the Sierra College Boulevard corridor from Taylor Road to Dominguez Road/Bass Pro Drive per Town direction[3]. The analysis was prepared for Existing and Long Term Conditions as requested by the lead agency. The purpose of this microsimulation analysis was to supplement the Synchro analysis.

Neither the lead agency, the Town of Loomis, the City, nor Caltrans have adopted methodology or significance criteria for the simulation evaluation. Therefore, these analyses are not used to evaluate Project impacts and are shown for informational purposes only.

For the purposes of this analysis, seed time was set to 10 minutes and the simulation was recorded for 60 minutes per typical industry practice (seed time represents the time used to load vehicles to the road network prior to measuring performance during the simulation). A total of five simulation runs were prepared for each analysis scenario and the results of all five runs were averaged to obtain the results presented below. The results of each individual run were reviewed to confirm that none of the runs were major outliers that would result in an inaccurate average. Qualitative assessment of simulated existing

[3] The study corridor was extended to include Stadium Way to the south to meter traffic flow into the roadway network.

conditions queueing confirmed that the operating conditions shown in the simulation model represented observed existing field conditions.

3.4.2 Ramp Metering Evaluation

Caltrans requested ramp metering analysis to determine whether future queues from the proposed ramp meter at the I-80 Westbound slip ramp from southbound Sierra College Boulevard would exceed storage and affect operations along the arterial. Ramp metering is currently installed but not activated at the study location. Caltrans was not able to provide ramp metering rates; therefore, a minimum metering rate of 240 vehicles per hour[4] was used as the base rate and adjusted if queues exceeded the available storage capacity of the ramp of approximately 1,200 feet.

The Caltrans Ramp Metering Design Manual (Caltrans, April 2016) arrival discharge chart was used as the basis for a spreadsheet analysis tool to evaluate queues associated with the proposed ramp meter. The ramp metering analysis spreadsheets are set up for three hours of arrival data; however, data is only available for a two-hour period. An adjustment was made to the arrival volumes for the first hour based on the arrival patterns for the two-hour period available data. Additionally, the ramp lanes, an average vehicle length, and the ramp storage length are input for each ramp. Because one of the two southbound to westbound freeway ramp lanes is designed for high occupancy vehicles (HOV) and arrival volumes cannot be differentiated, the assumed lane capacity was reduced to 1.5 lanes in the analysis (the HOV is not metered, however, for this evaluation all vehicles are processed through the meter in 1.5 lanes).

[4] Per Caltrans Ramp Metering Design Manual arrival discharge chart

Section 4
Existing Conditions

4.0 EXISTING CONDITIONS

The existing conditions analysis identifies the site conditions and current operational and geometric characteristics of the roadways within the study area. These conditions are compared with future conditions later in this report.

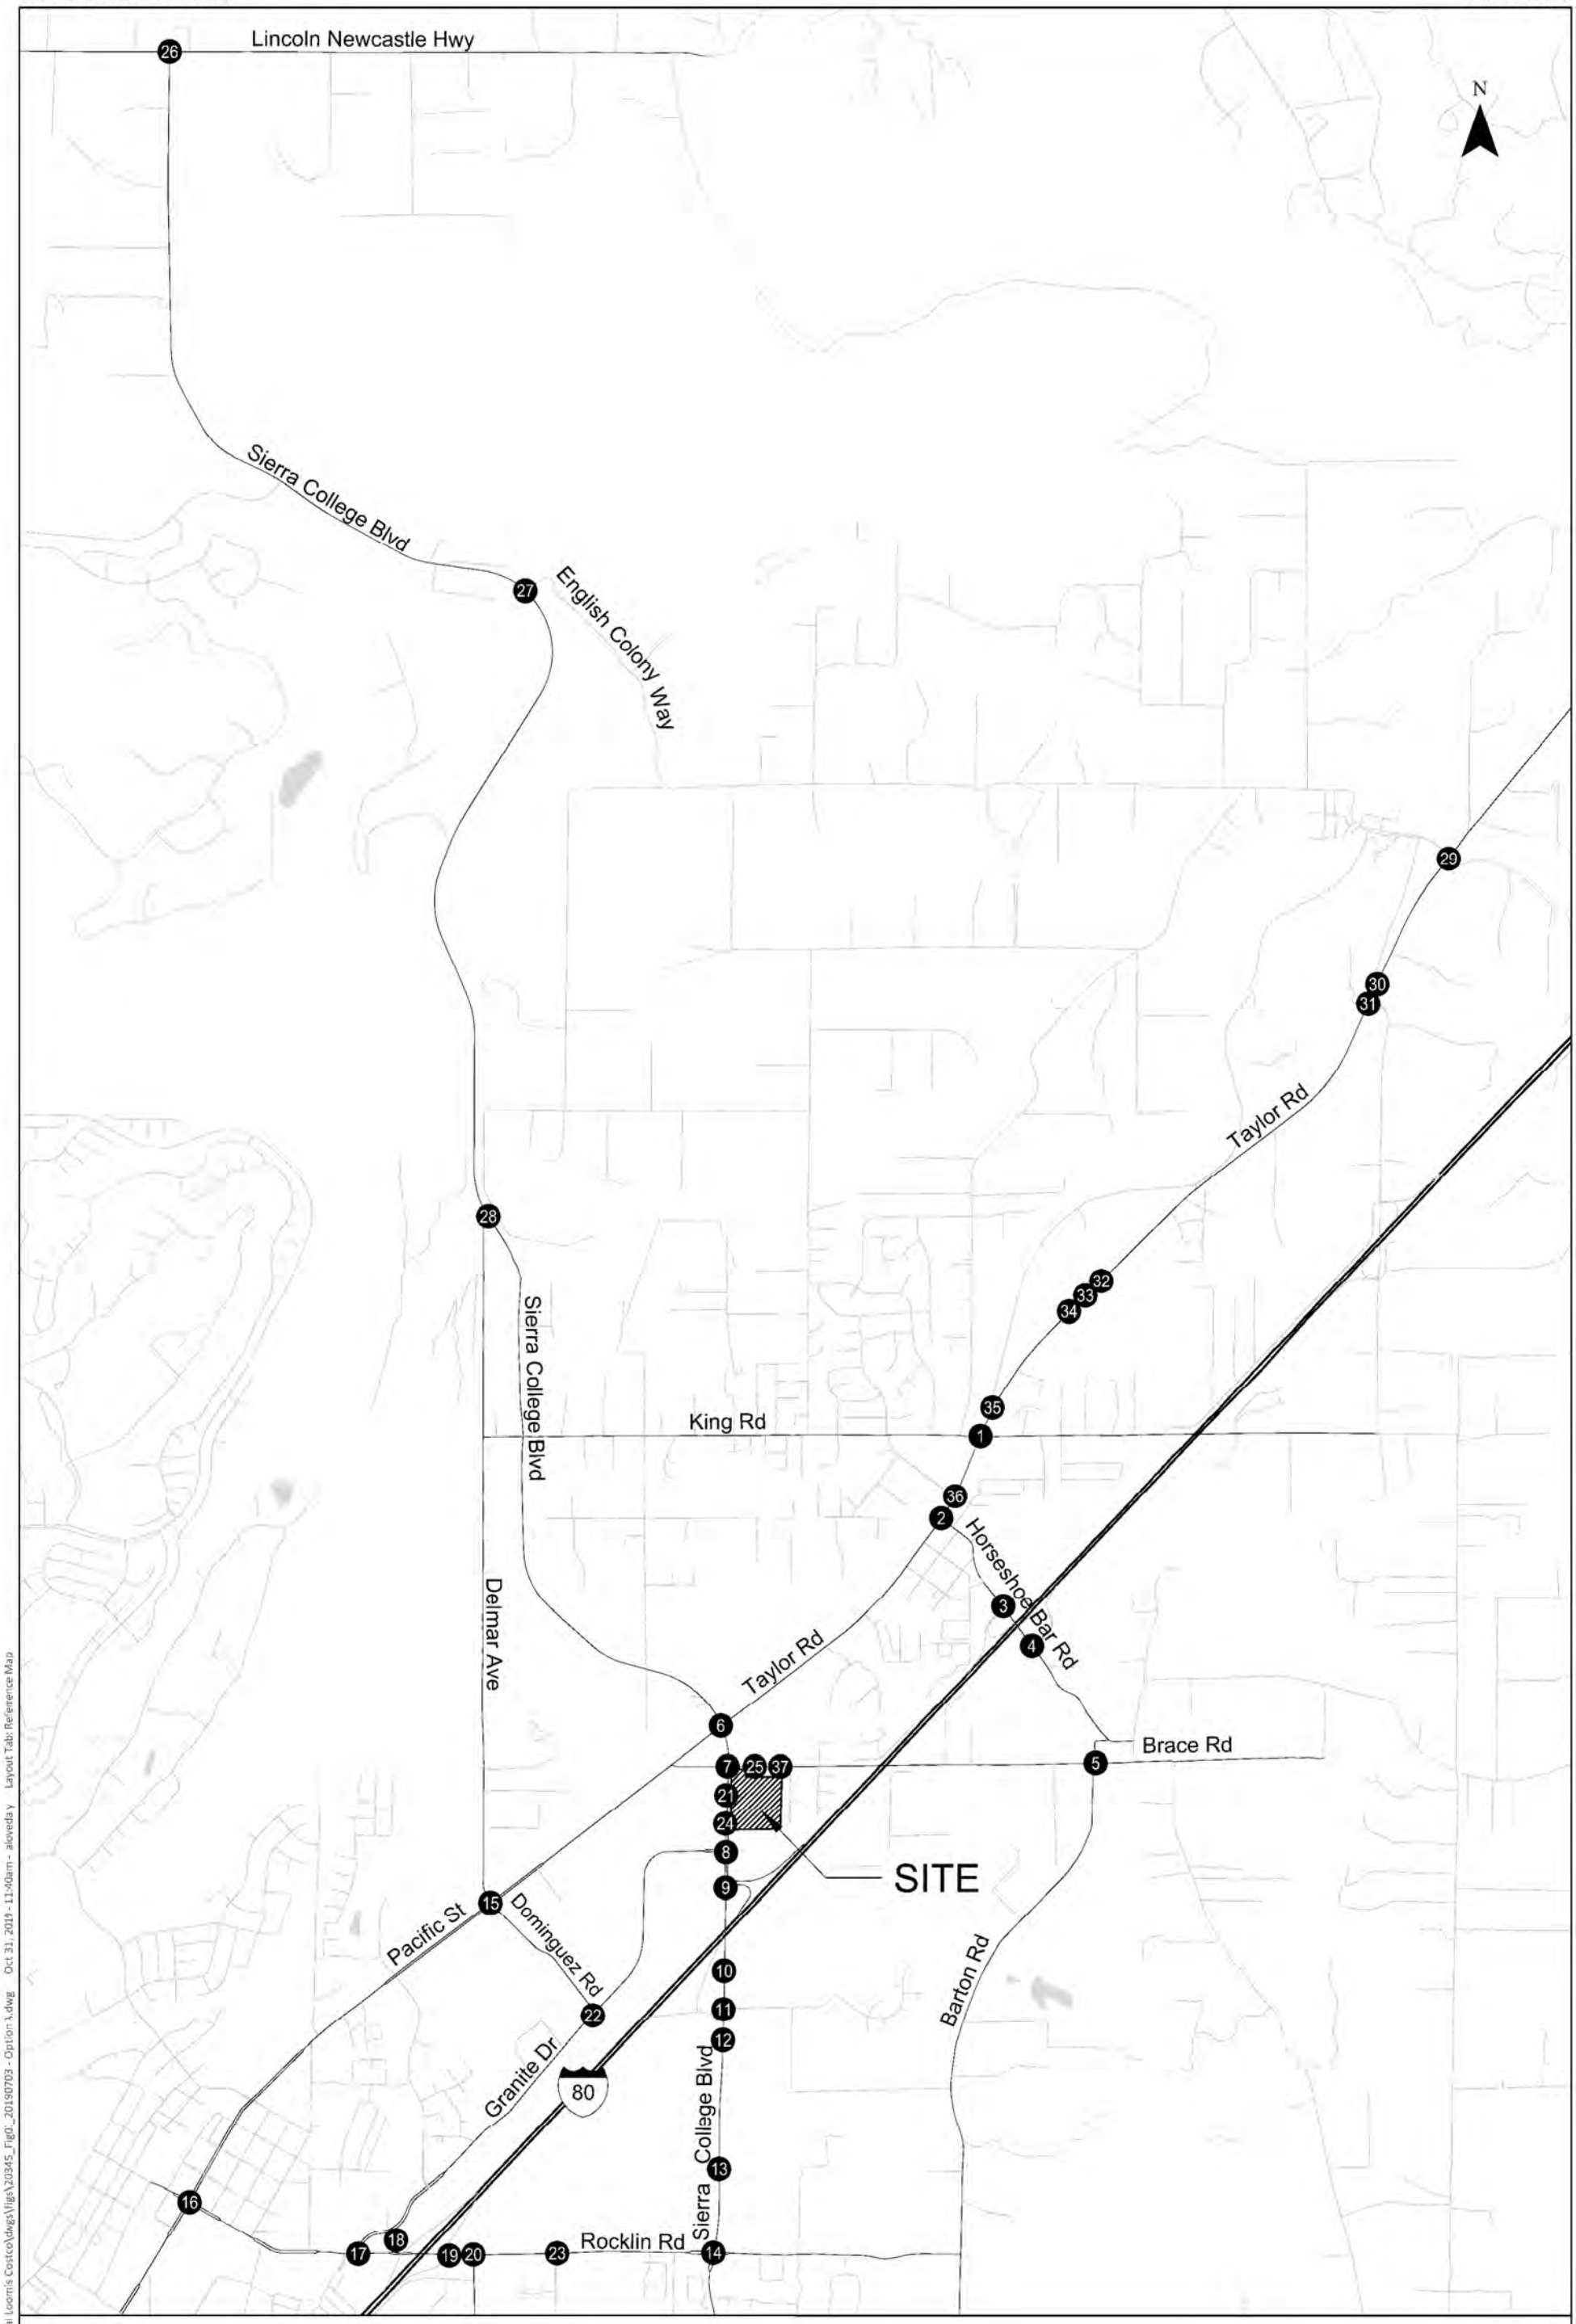
Kittelson & Associates, Inc. (KAI) staff visited and inventoried the proposed development site and surrounding study area, most recently in September 2018. At that time, KAI collected information regarding site conditions, adjacent land uses, existing traffic operations, and transportation facilities in the study area.

4.1 SITE CONDITIONS AND ADJACENT LAND USES

The proposed site is within the Town of Loomis, is currently vacant, and is zoned for commercial development. The site is bordered by Sierra College Boulevard to the west and Brace Road to the north. Land uses in the vicinity of the site include residential homes to the north and east, a mix of vacant and developed commercial land to the south, and a mix of vacant land and office space to the west across Sierra College Boulevard.

4.2 TRANSPORTATION FACILITIES

This report section provides an overview of the existing transportation facilities serving the study area. Figure 2 outlines the study intersection locations.



4.2.1 Highway/Roadway Facilities

An overview of key roadway facilities in the study area is provided below.

I-80 – I-80 is an east-west freeway that provides regional access to and through the Project study area. Interchanges along I-80 near the Project site are provided at Rocklin Road, Sierra College Boulevard, and Horseshoe Bar Road. In the study area, I-80 provides three travel lanes in each direction.

Sierra College Boulevard – Sierra College Boulevard is a north-south roadway providing primary access to the Project site. This roadway is classified as an Arterial with an ultimate six-lane cross-section south of Taylor Road in both the Town of Loomis and City of Rocklin General Plan Circulation Elements. Within the study area, Sierra College Boulevard varies from two lanes to a four to five-lane roadway; however, segments near the I-80 ramps are provided with additional travel lanes.

Granite Drive – Granite Drive is a four-lane southwest-northeast roadway located west of I-80. Granite Drive is classified as an arterial in the City of Rocklin's General Plan Circulation Element. Granite Drive connects from Rocklin Road to the south and extends through the Sierra College Boulevard intersection to terminate just east of this roadway.

Study Area Network
Loomis, California

Figure

H:\20\20345 - Confidential Loomis Costco\dwgs\Vigs\20345_Fig01_20190703 - Option 1.dwg Oct 31, 2019 - 11:40am - aloveday Layout Tab: Reference Map

KITTELSON & ASSOCIATES

Taylor Road - Taylor Road is a major arterial street that runs parallel to I-80. Taylor Road is generally a two-lane road through Loomis, but incremental half section widening has occurred in conjunction with private development frontage improvements in some areas.

Horseshoe Bar Road - This arterial street originates at an intersection on Taylor Road in downtown Loomis and continues east past the Project site to an interchange on I-80. Beyond I-80, Horseshoe Bar Road continues for several miles into the rural area of Placer County near Folsom Lake. Horseshoe Bar Road is a two-lane road with auxiliary left turn lanes at major intersections.

Brace Road - Brace Road is a minor street that begins at Taylor Road and continues east over I-80. Brace Road is a two-lane road providing secondary access to the Project site.

4.2.2 Pedestrian and Bicycle Facilities

Pedestrian facilities include sidewalks, crosswalks, pedestrian signals, curb ramps, and streetscape amenities. In general, a network of sidewalks, crosswalks, pedestrian signals, and curb ramps are provided in the vicinity of the proposed Project site; however, significant sidewalk gaps were noted in the study area. Sidewalks are partially provided on Sierra College Boulevard, King Road, Taylor Road, and Horseshoe Bar Road. Crosswalks are provided at all signalized intersections and at a number of other unsignalized locations.

Bicycle paths, lanes and routes are typical examples of bicycle transportation facilities, which are defined by Caltrans as being in one of the following three classes:

Class I – Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized.

Class II – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and cross-flows by pedestrians and motorists permitted.

Class III – Provides a route designated by signs or permanent markings and shared with pedestrians and motorists.

The Town of Loomis developed the 2010 Bicycle Transportation Plan (Figure 2) and the 2010 Trails Master Plan (Figure 3) in an effort to provide the long term framework to improve and encourage the enhancement of the local and regional bikeway and pedestrian network. The existing bicycle system consists of a series of Class I (Multi-Use Paths) and Class II (Bike Lanes).

A Class I bike trail exists on the southeast side of Taylor Road between King Road and Del Oro High School. Also, a Class I bike trail exists on the northwest side of Taylor Road between Circle Drive and Sierra College Boulevard, but lacks connectivity to downtown Loomis. A short portion of King Road east of Bankhead Road also features a Class I bike trail. Class II bike lanes are provided at the following locations:

- Sierra College Boulevard between Granite Drive and Del Mar Avenue,
- Taylor Road between Sierra College Boulevard and Oak Street,
- Taylor Road between Oak Street and Webb Street on the south side only, and
- King Road between Sierra College Boulevard and I-80.

In the study area, the following Class II bike lanes are provided within the City of Rocklin:

- Granite Drive between Sierra College Boulevard and Rocklin Road,
- Rocklin Road from Sierra College Boulevard to I-80 Northbound on/off ramp, and from I-80 Southbound on/off ramp to 5th Street, and
- Pacific Street between Sierra Meadows Drive and E Midas Avenue.

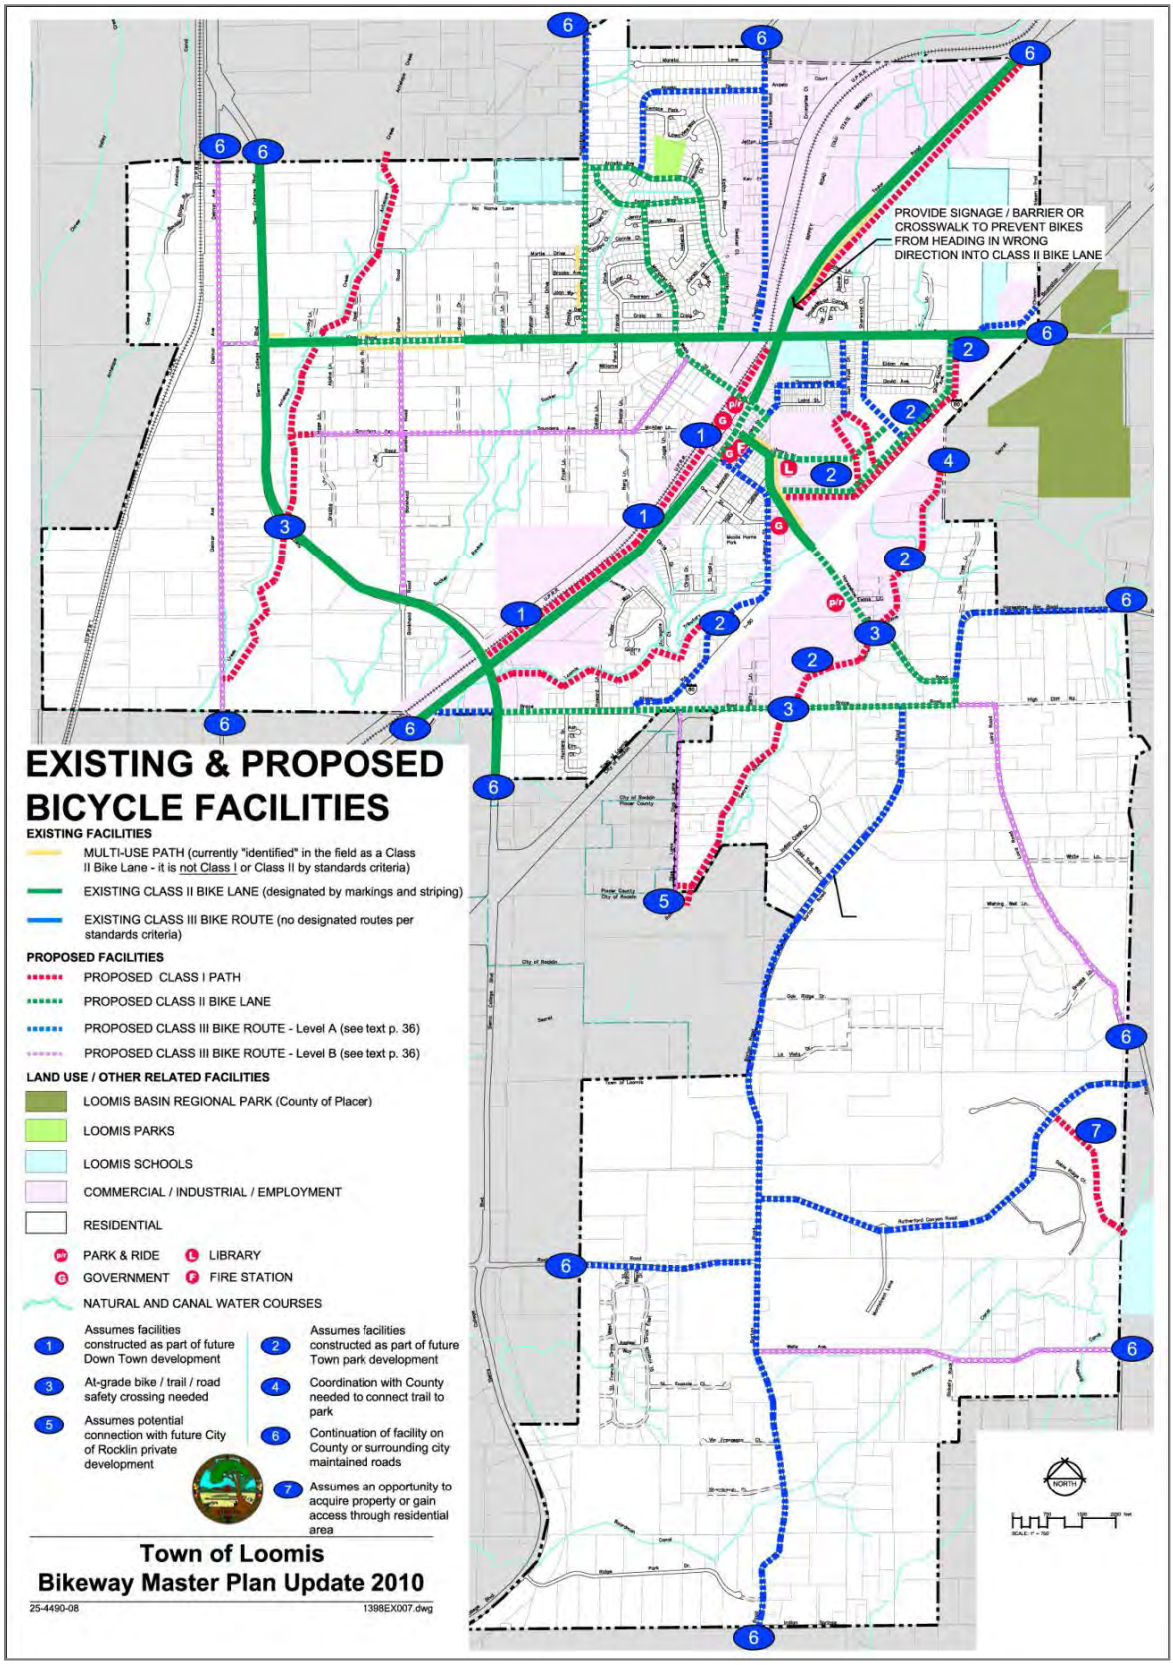

Figure 2: 2010 Bicycle Transportation Plan

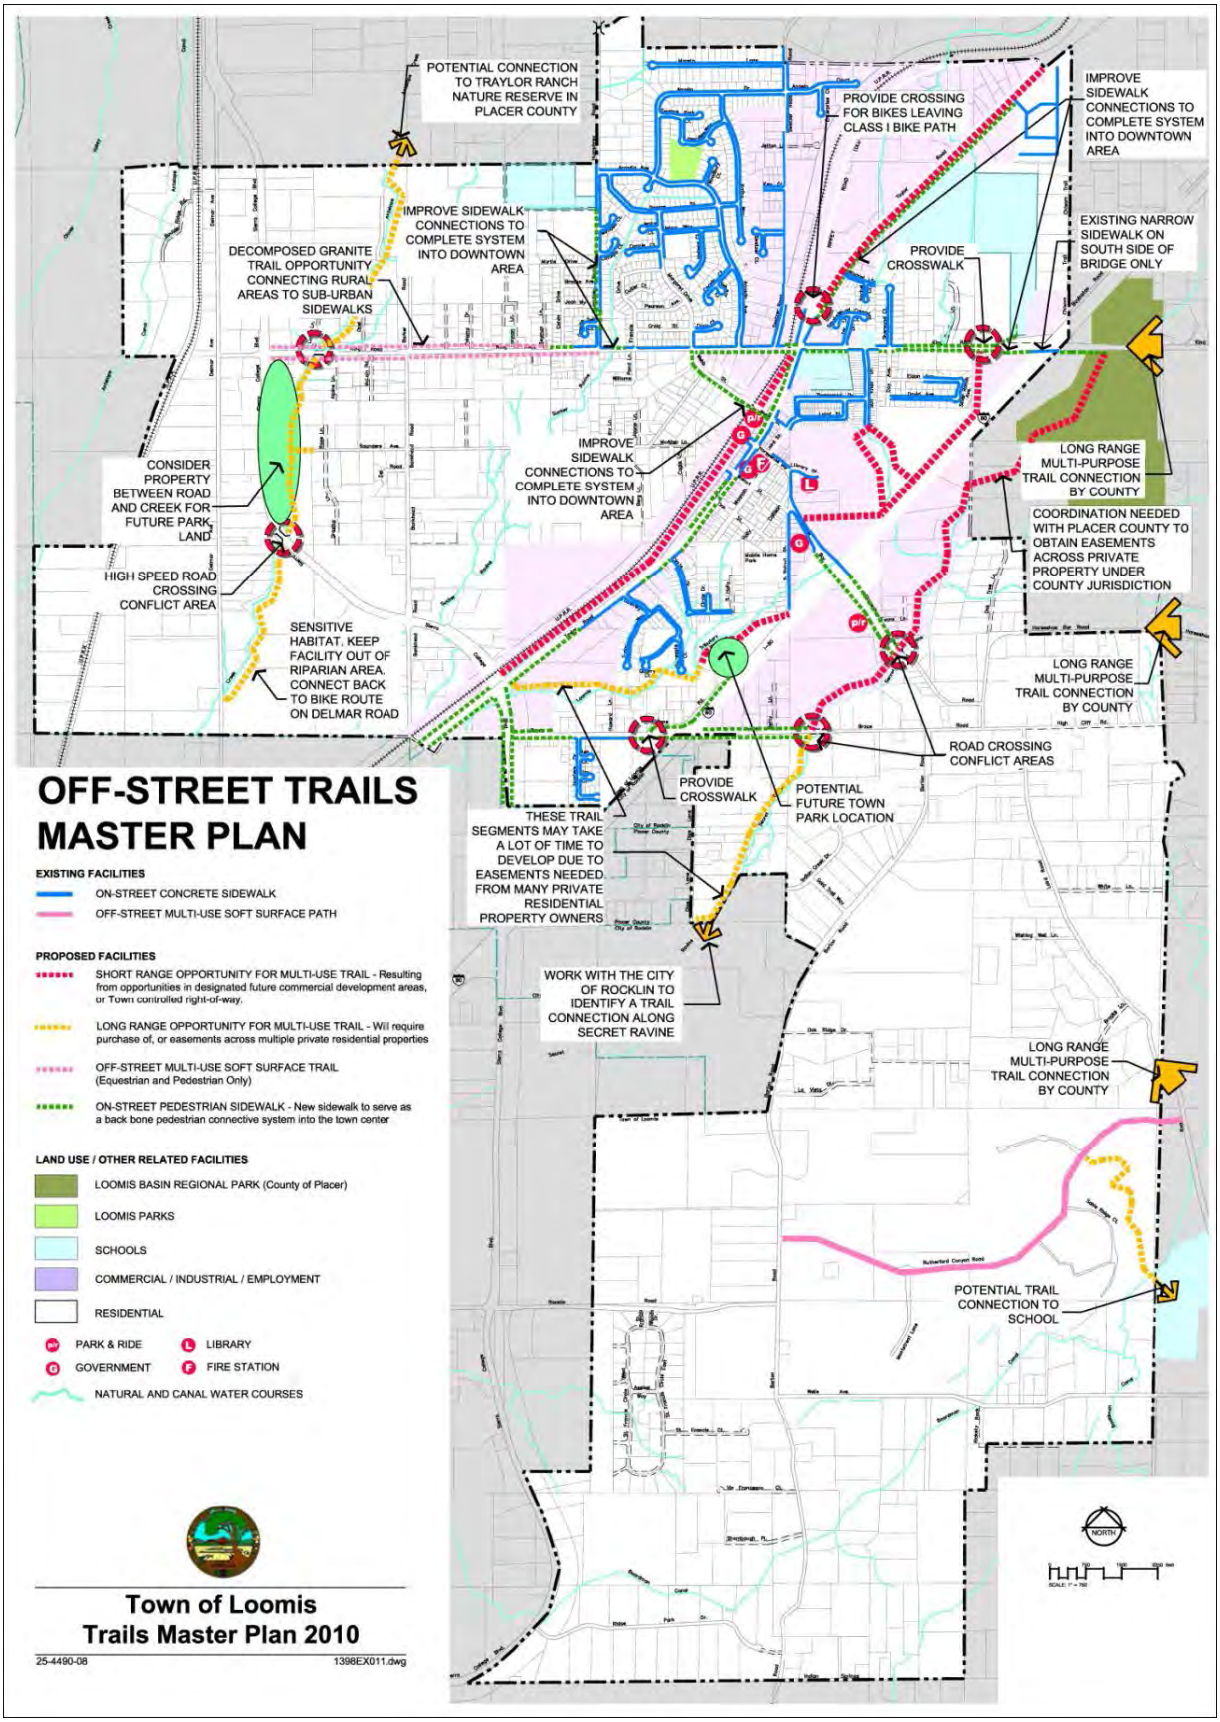

Figure 3: 2010 Trails Master Plan

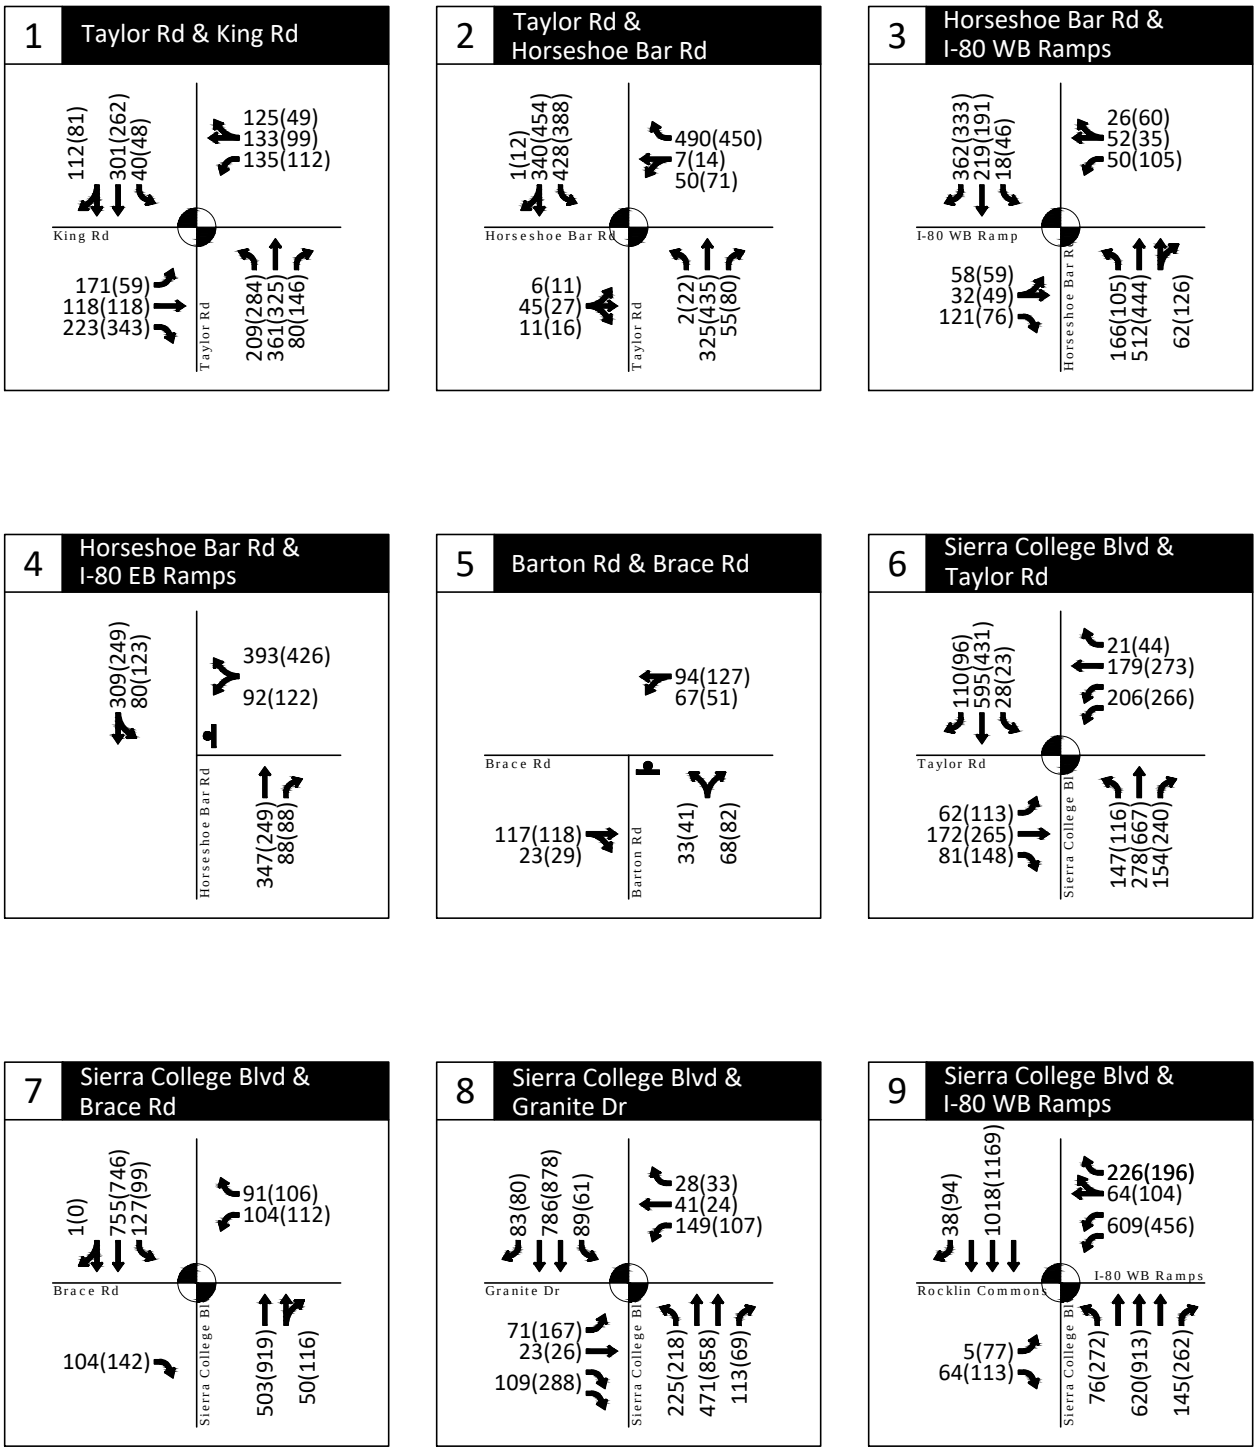
4.2.3 Transit Facilities

Bus transit service in the Project area is provided by Placer County Transit. Placer County Transit operates local bus routes from Monday to Saturday, with three routes operating in the Project study area. The Auburn to Light Rail Bus Route operates on one hour headways during the morning and afternoon commute periods and stops at the Sierra College Transfer Center. The Lincoln/Sierra College Bus Route operates on one hour headways between Sierra Community College and the City of Lincoln. The Taylor Road Shuttle operates with two hour headways during the morning and afternoon commute periods and travels between Auburn and the Sierra College Transfer center. The Taylor Road Shuttle provides the nearest service to the Project site along Sierra College Boulevard.

4.3 INTERSECTION OPERATIONS



Turning-movement counts were obtained at each of the existing study intersections.

The traffic count dates vary by intersection location. All of the Placer County maintained study intersections were counted in October 2018. The remaining weekday peak hour counts were conducted in November 2016 with two exceptions. Traffic counts at the Granite Drive & Dominguez Road and Rocklin Road & El Don Drive intersections (collected in April 2016) were provided by the City of Rocklin because these locations were added after the Project scoping process was completed. The counts were conducted on a typical weekday during the morning (7:00 to 9:00 AM) and evening (4:00 to 6:00 PM) peak time periods. Figure 4 provides a summary of the weekday peak hour turning-movement counts, which represent the hour with the highest volumes in the counting periods. Counts represent Project year 2017 baseline conditions consistent with the date of the notice of preparation (NOP), excluding the County study intersections that were counted in the fall of 2018[5].

In January 2017, manual turning-movement counts were obtained during Saturday for each of the non-County study intersections except for Granite Drive & Dominguez Road and Rocklin Road & El Don Drive (again because these locations were added after the Project scoping process was completed). Counts were conducted on a typical weekend during the midday (11:00 AM to 1:00 PM) peak time period. Counts at Granite Drive & Dominguez Road and Rocklin Road & El Don Drive were conducted in September 2017. Figure 5 provides a summary of the weekend turning-movement peak hour counts, which represent the hour with the highest volumes in the counting periods. Appendix "A" contains the traffic count worksheets used in this study. Counts were balanced between closely spaced intersections and between different data collection dates, as needed.

Existing signal timing at each of the signalized intersections was obtained from the jurisdiction operating the respective intersection and was used for to conduct the analysis for existing conditions.

[5] Use of the 2017 baseline traffic counts in this report is appropriate recognizing 1) review traffic volumes at key locations on the Sierra College Boulevard corridor found comparable volumes between 2017 and 2018, 2) the cumulative short-term analyses were developed accounting for all identified approved in-process developments as of the time of the counts in 2017, and 3) the cumulative long-term conditions analysis was developed based on long-term travel demand model volumes.

4.3.1 Levels of Service Analysis

LOS analysis was performed for the AM and PM peak hours during weekday, and midday peak hour during weekend, using existing turning movement volumes. Table 6 summarizes the level-of-service analysis for the study intersections under existing traffic conditions. As shown, the following intersections operate at an unsatisfactory LOS:

- Horseshoe Bar Road & I-80 Eastbound Ramp (AM, PM)
- Sierra College Boulevard & Taylor Road (PM)
- Sierra College Boulevard & Rocklin Road (AM and PM)
- Pacific Street & Dominguez Road/Delmar Avenue (PM)
- Pacific Street & Rocklin Road (AM)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (AM and PM)
- Sierra College Boulevard & SR-193 (PM)
- Sierra College Boulevard & Delmar Avenue (AM and PM)
- Taylor Road & Penryn Road (South) (AM)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Webb Street (PM and MD)

Appendix "B" includes the level-of-service worksheets.

Table 6: Existing Conditions Intersection LOS Analysis, Weekday AM/PM & Weekend Midday Peak Hours

Notes:
AWSC: All-way stop control – The average intersection delay is reported.
TWSC: Two-way stop control - The delay is reported for the worst movement.
Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.
Source: Kittelson & Associates, Inc. 2019

4.3.2 Queuing Analysis

The queueing analysis below follows the significance criteria and queueing methodology defined in Sections 2 and 3. Appendix C provides the summary tables for the weekday AM, PM, and weekend midday peak hours as well as the storage lengths at each intersection.

As shown in the summary tables, the 95th percentile queues would extend beyond the available storage lengths at the following intersections:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Sierra College Boulevard & Taylor Road (PM)
- Sierra College Boulevard & Brace Road (PM)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- Sierra College Boulevard & Rocklin Road (AM and PM)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM)
- I-80 Eastbound Ramps & Rocklin Road (AM and PM)
- El Don Drive & Rocklin Road (AM and PM)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (PM)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (PM)

4.3.3 Simulation Supplemental Evaluation

The evaluation was prepared for informational purposes. The total network performance results of the simulation runs are presented in Table 7 and the arterial performance results are presented in Table 8.

As shown, all vehicles are able to access (zero vehicles denied entry) the network during the AM and midday study peak hours and only one vehicle was denied access during the PM peak hour. Review of the SimTraffic output files also showed that the Synchro queueing analysis captured queueing impacts shown in SimTraffic. SimTraffic does show longer queues for certain movements; however, both Synchro and SimTraffic queues exceed storage capacity, and therefore the impact would be captured per the significance criteria.

For the Sierra College Boulevard corridor, the posted speed limit along the majority of the corridor is 40 miles per hour and the approximate length of the corridor from Taylor Road to Stadium Way is 1.5 miles. Under free flow conditions and without stop delay at controlled intersections, the travel time along the corridor would be about 135 seconds. Total travel time reported includes delay associated with stops at controlled intersections as well as some congestion along the corridor. The average arterial speed also shows that the corridor is operating under posted signed limits; however, this again includes delay associated with controlled intersections.

Table 7: Existing Conditions – Simulation Total Network Performance Results

Peak Hour	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
AM	46.8	5,333	5,325	0
PM	54.7	7,131	7,125	1
MD	40.0	5,795	5,797	0

Notes:
(s): seconds
Total Delay/Vehicle: Total delay is equal to the travel time minus the travel time for a vehicle with no other vehicles or control devices. This delay is divided by the number of vehicles to obtain the total delay per vehicle.

Vehicles Entered/Exited: Represents the number of vehicles counted entering and exiting the link or area during the interval. This value does not include vehicles moving from one intersection to the next with the arterial or network.

Vehicles Denied Entry: This value represents the number of vehicles unable to enter a link due to congestion and are waiting to enter. These vehicles can either be from an external link or from a mid-block source.

Source: Kittelson & Associates, Inc. 2019

Table 8: Existing Conditions – Simulation Sierra College Boulevard Arterial Performance Results

Segment	Peak Hour	Direction	Total Delay (s)	Total Travel Time (s)	Average Arterial Speed (mph)
Sierra College Boulevard between Taylor Road & Stadium Way	AM	Northbound	70.8	191.0	28
		Southbound	137.9	326.1	25
	PM	Northbound	138.2	257.2	21
		Southbound	123.9	309.8	26
	MD	Northbound	85.8	205.4	26
		Southbound	100.1	286.0	29

Notes:
(s): seconds
Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.
Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.
Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.
Source: Kittelson & Associates, Inc. 2019

The detailed network and arterial performance output sheets are presented in Appendix "D".

4.4 PLACER COUNTY ROADWAY OPERATIONS

Following consultation with Placer County staff, five County roadway segments were analyzed. Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. Table 9 outlines the existing roadway volume and associated level of service for the study segments. As shown, all study segments currently satisfy the County's LOS C standard.

Table 9: Existing Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	ADT	LOS
Sierra College Boulevard	SR-193 to English Colony Way	2	8,290	A
	English Colony Way to Delmar Ave	2	11,120	B
	Delmar Ave to Loomis Town Limits	2	11,120	B
SR-193	Lincoln City Limits to Sierra College Boulevard	2	10,360	A
	Sierra College Boulevard to Clark Tunnel Road	2	7,200	A

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates.
Source: Kittelson & Associates, Inc. 2019

4.5 FREEWAY FACILITIES OPERATIONS

Following consultation with Caltrans District 3 staff, freeway mainline analysis was prepared for the I-80 mainline segments east and west of the Sierra College Boulevard interchange. The Caltrans Performance Measurement System (PeMS) was queried for mainline traffic during the intersection data collection period; however, limited data was available due to Caltrans equipment issues (poor detector health). Additional time periods were queried for the year outside of the weeks of intersection data collection all of which showed poor detector health until Fall 2017. The Caltrans freeway data quality improved in September 2017; therefore, for the following analysis, data was collected between September 19th and October 21st of 2017 for each Tuesday, Wednesday, Thursday for weekday conditions and for each Saturday for weekend conditions. Peak hour factors were calculated from ramp volume data sourced from intersection counts.

4.5.1 Freeway Mainline Basic Segment Analysis

Analysis for the study segments was conducted using the Highway Capacity Software 2010 (HCS 2010). Table 10 outlines the existing mainline volume, density and associated level of service for the study segments. As shown, all study segment operations satisfy the applicable Caltrans LOS D standard.

Appendix "E" includes the freeway mainline level-of-service worksheets.

Table 10: Existing Conditions – I-80 Mainline LOS Analysis, Weekday AM/PM Peak Hour

ID	Segment	Direction	Number of Lanes	Weekday AM			Weekday PM			Weekend MD		
				Volume	Density	LOS	Volume	Density	LOS	Volume	Density	LOS
1	I-80 east of Sierra College Boulevard	Eastbound	3	3,110	19.0	C	4,398	25.8	C	3,980	22.5	C
		Westbound	3	4,062	25.4	C	3,803	22.5	C	3,892	21.5	C
2	I-80 west of Sierra College Boulevard	Eastbound	3	3,118	19.1	C	4,042	23.4	C	3,963	22.4	C
		Westbound	3	3,702	22.9	C	3,716	22.0	C	3,812	21.1	C

Notes:
Density: passenger cars/mile/lane
Source: Kittelson & Associates, Inc. 2019

4.5.2 Ramp Metering Supplemental Evaluation

Ramp metering analysis was requested by Caltrans to determine whether queues from the future ramp meter at the I-80 Westbound slip ramp from southbound Sierra College Boulevard would exceed storage and affect operations along the arterial. While documented later in this report for future conditions, no ramp metering assessment was prepared for existing conditions because the ramp meter had not been activated at the time of data collection.

Section 5
Project Characteristics

5.0 PROJECT CHARACTERISTICS

5.1 PROJECT DESCRIPTION

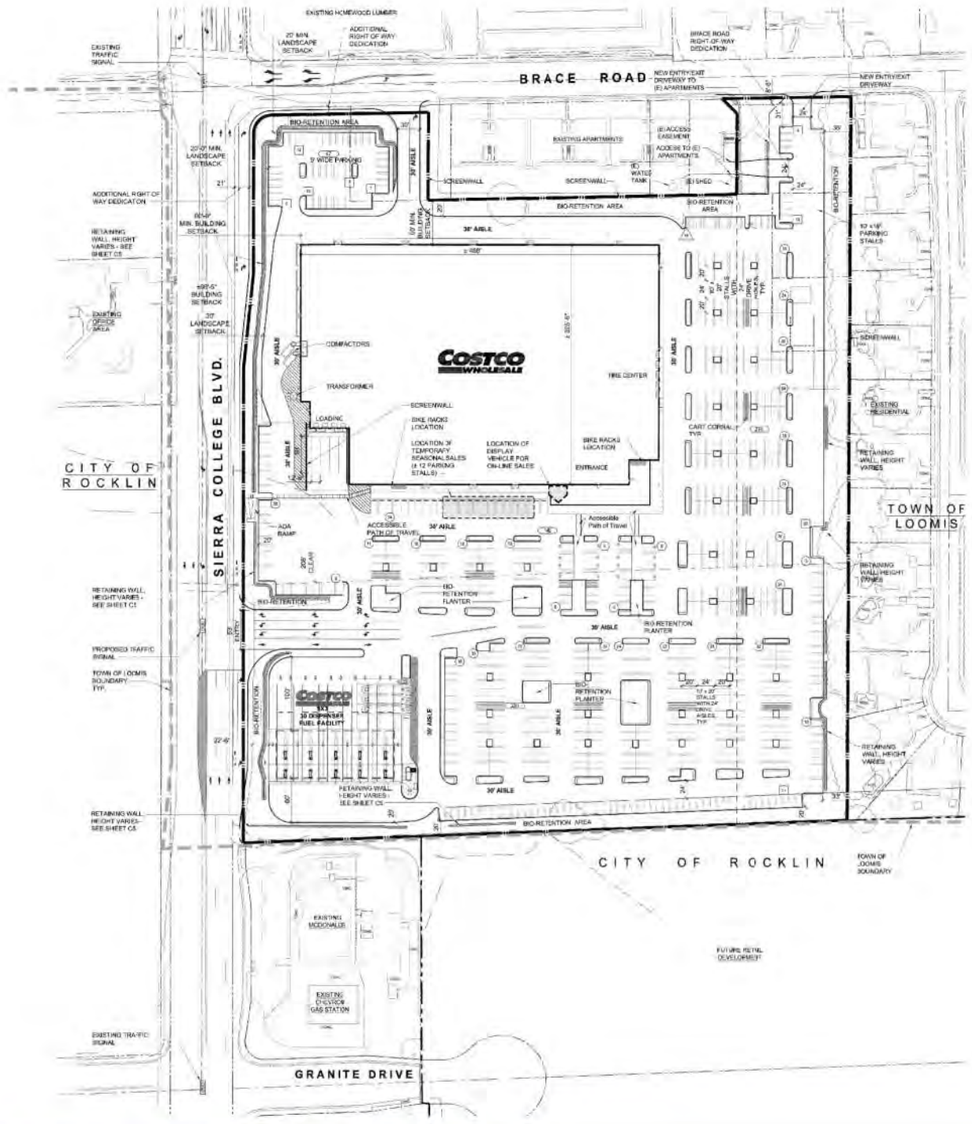
The Project proposes an approximately 155,000 square foot Costco Warehouse with a tire center and a Costco Gasoline fuel station. The Costco Gasoline fuel station is expected to open with 24 fueling positions and is designed to expand to 30 fueling positions. To capture all the potential impacts, the traffic analysis presented in this report assumes all 30 fueling positions are in service. The approximately 17.4-acre site would provide 778 parking stalls including 16 accessible parking stalls. The proposed site plan exceeds the Town's minimum parking requirement of five stalls per thousand square feet (775 spaces). Opening is anticipated in 2020.

5.1.1 Site Driveway Access

Figure 6 illustrates the proposed development plan. Three Project Driveway Options are proposed as follows:

Project Driveway Option 1A:

- An unsignalized right-in/right-out only on Brace Road located approximately 215 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west curb of access)
  - The driveway will be open to the public and serve entering warehouse delivery trucks.
  - A raised median will be installed on Brace Road to limit the proposed west Costco driveway to right-turns only. The median will be installed between Sierra College Boulevard and the existing Homewood Lumber access on the north side of Brace Road. The median will maintain the existing eastbound left turn pocket on Brace Road that provides access to Homewood Lumber (no change to Homewood Lumber access) and will also maintain the existing queue storage for the westbound left turn at Sierra College Boulevard.
- A new signalized intersection along Sierra College Boulevard located approximately 750 feet south of Brace Road and 625 feet north of Granite Drive (measured centerline to centerline)
  - The proposed new intersection will include a northbound right-turn lane with right-turn signal overlap, one eastbound (entry) lane to the Costco site and three westbound (exit) lanes (interim dual left-turns and a separate right-turn).
  - The new intersection will be designed to accommodate a potential fourth approach (west leg) to serve potential future development on the vacant lot to the west.
- An unsignalized full access on Brace Road located approximately 675 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west curb of access). This new access would be shared with an existing apartment building located to the west. Starlight Lane would be closed and vacated.



Project Driveway Option 1B:

- An unsignalized right-in/right-out only on Brace Road located approximately 215 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west curb of access)
  - The driveway will be open to the public and serve entering warehouse delivery trucks.
  - A raised median will be installed on Brace Road between Sierra College Boulevard and the existing driveway to the east to limit Costco access to right-turns only to maintain access to land use on the north side of the street and not impact the queue storage for the westbound left turn at Sierra College Boulevard.
- A new signalized intersection along Sierra College Boulevard located approximately 750 feet south of Brace Road and 625 feet north of Granite Drive (measured centerline to centerline)
  - The proposed new intersection will include a northbound right-turn lane with right-turn signal overlap, one eastbound (entry) lane to the Costco site and three westbound (exit) lanes (interim dual left-turns and a separate right-turn).
  - The new intersection will be designed to accommodate a potential fourth approach (west leg) to serve potential future development on the vacant lot to the west.
- A roadway connection between the south side of the Costco site and Granite Drive
  - The north-south drive aisle connection to Granite Drive will be located approximately 165 feet east of the existing private driveway access on the north side of Granite Drive serving McDonald's and Chevron (distance measured from east curb existing driveway to west curb of proposed of north-south drive aisle).
  - Granite Drive will be modified between Sierra College Boulevard and the new north-south Costco connection to provide side-by-side eastbound and westbound left-turn lanes separated by a new raised median on Granite Drive.

Project Driveway Option 1C:

- An unsignalized right-in/right-out only on Brace Road located approximately 215 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west curb of access)
  - The driveway will be open to the public and serve entering warehouse delivery trucks.
  - A raised median will be installed on Brace Road between Sierra College Boulevard and the existing driveway to the east to limit Costco access to right-turns only to maintain access to land use on the north side of the street and not impact the queue storage for the westbound left turn at Sierra College Boulevard.
- An unsignalized full access on Brace Road located approximately 675 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west curb of access). This new access would be shared with an existing apartment building located to the west. Starlight Lane would be closed and vacated.

- A new signalized intersection along Sierra College Boulevard located approximately 750 feet south of Brace Road and 625 feet north of Granite Drive (measured centerline to centerline)
  - The proposed new intersection will include a northbound right-turn lane with right-turn signal overlap, one eastbound (entry) lane to the Costco site and three westbound (exit) lanes (interim dual left-turns and a separate right-turn).
  - The new intersection will be designed to accommodate a potential fourth approach (west leg) to serve potential future development on the vacant lot to the west.
- A roadway connection between the south side of the Costco site and Granite Drive
  - The north-south drive aisle connection to Granite Drive will be located approximately 165 feet east of the existing private driveway access on the north side of Granite Drive serving McDonald's and Chevron (distance measured from east curb existing driveway to west curb of proposed of north-south drive aisle).
  - Granite Drive will be modified between Sierra College Boulevard and the new north-south Costco connection to provide side-by-side eastbound and westbound left-turn lanes separated by a new raised median on Granite Drive.

5.1.2 Proposed Roadway Infrastructure Improvements

Costco will provide the following transportation infrastructure in conjunction with site development.

- Sierra College Boulevard Changes
  - Restripe the existing northbound right-turn lane on Sierra College Boulevard approaching Granite Drive from an exclusive right-turn lane to a shared through/right-turn lane (for Project Driveway Options 1B and 1C only).
  - Dedicate right-of-way and widen Sierra College Boulevard along the Project site frontage and restripe the roadway to provide three northbound through travel lanes and a northbound Class II bicycle lane between Granite Drive and Brace Road.
  - Signalize the proposed new Costco site access intersection on Sierra College Boulevard.
  - Provide traffic signal interconnect between the proposed new Costco site access signalized intersection and the adjacent intersections along Sierra College Boulevard at Brace Road and Granite Drive.
  - Construct a separate northbound right-turn lane on Sierra College Boulevard approaching the proposed new signalized site access intersection. Provide a right-turn overlap signal phase at the intersection.
  - Construct a southbound left-turn lane on Sierra College Boulevard approaching the proposed new signalized Costco site access intersection.
  - Construct a separate northbound right-turn lane on Sierra College Boulevard approaching the signalized Brace Road intersection (the turn lane is proposed to include a 90-foot long taper and 200 feet of right-turn storage). Provide a right-turn overlap signal phase at the intersection.
- Brace Road
  - Dedicate right-of-way and construct standard half-street improvements along the Brace Road site frontage.
  - Install a raised median on Brace Road between Sierra College Boulevard and the existing Homewood Lumber driveway to the east to limit Costco access to right-turns only.
- Granite Drive (for Project Driveway Options 1B and 1C only)
  - Reconstruct Granite Drive east of Sierra College Boulevard to provide side-by-side eastbound and westbound left-turn lanes separated by a new raised median between Sierra College Boulevard and the new north-south drive aisle to the Costco Project site (including widening east of the existing private driveways on Granite Drive to accommodate the side-by-side left-turn lane).

5.2 PROJECT TRIP GENERATION

This section provides an overview of trip generation rates and trip characteristics of Costco Warehouses with Costco Gasoline fuel stations as well as the proposed Project trip generation.

5.2.1 Costco Wholesale Trip Characteristics

Costco Warehouse facilities are open to members only and operate seven days a week. Typically, the warehouse building is open to members on weekdays between the hours of 10:00 AM and 8:30 PM. Weekend operating hours open to members are typically from 9:30 or 10:00 AM to 6:00 PM. The warehouses are typically closed on major holidays. Costco Gasoline fuel stations co-located on the site are typically open seven days a week between 5:00 AM and 10:00 PM.

Trip data has been collected at Costco Warehouses across the United States and documented that they typically generate higher traffic volumes than other commercial land uses with similar building sizes. In addition to the number of trips, the Costco trip generation database also documents trip type based on member survey information that provides the percentage of primary, pass-by, and diverted trips, as further described below.

- Primary Trips (an entirely new trip on the roadway system for the express purpose of driving to and from Costco),
- Pass-by Trips (existing trips that are on roadways adjacent to the site which allow the motorist to turn into the Costco development, and then continue on to their ultimate destination when their shopping is concluded), and
- Diverted Trips (existing trips on nearby roadways in which the motorist makes a decision to drive out-of-direction for a distance to stop at Costco, and when their shopping is concluded, continue on their trip to the ultimate destination).

The Costco Warehouse trip database was used to estimate trips associated with the proposed Project.

5.2.2 Trip Characteristics Application

This report assesses the impacts of pass-by and diverted trip impacts at the study intersections. Typically, pass-by trips have an impact only at the site-access driveways, whereas the impact of diverted trips could extend through additional study area intersections beyond the site access points (diverted trips are typically modeled similar to net new trips at many or all of the study area intersections).

Diverted and pass-by trips were considered together with engineering judgment to identify how these two trip characteristics should be applied to the Project. Recognizing the context of the Project site relative to key transportation corridors, this study assumes that all diverted trips would travel to and from I-80 to access Costco. The diverted trips were treated as new trips to each of the study intersections they were routed through, including the I-80 ramp terminals. Assigning all diverted trips as new trips along the Sierra College Boulevard corridor between the I-80 ramps and the Project site results in a more conservative analysis by assuming worst-case impacts through the interchange ramps and the Sierra College Boulevard corridor.

5.2.3 Trip Generation Estimate

Trip generation studies were conducted at Costco Wholesale sites located across the western region of the United States using industry standard engineering practices consistent with guidance within the Institute of Transportation Engineers (ITE) standard reference, Trip Generation Handbook, 9th Edition Volume 1[6]. These cordon studies were conducted between 2001 and 2010, and include 22 surveys of Costco Warehouses with Costco Gasoline fuel stations in California, Oregon, Washington, Montana, Utah, and Colorado[7].

The Costco Wholesale buildings surveyed range in size between 120,000 square feet and 162,115 square feet, with an average size of 143,782 square feet and had Costco Gasoline fuel stations. As a result, the Costco Wholesale trip generation rates inherently account for Costco Gasoline fuel station trips within the overall rate. Table 11 summarizes the average trip rates recorded.

Table 11: Average Trip Characteristics for a Costco Warehouse with Fuel Station

Land Use	Weekday Daily Trip Rate (per KSF)	Weekday PM Peak Hour of Adjacent Street Traffic Trip Rate (per KSF)			Weekend Midday Peak Hour (per KSF)		
		Total	In	Out	Total	In	Out
Costco Warehouse With Fuel Station	79.27	7.17	48.5%	51.5%	9.79	51%	49%
Primary Trips	No Data		35.1%			50%	
Pass-by Trips	No Data		33.3%			29%	
Diverted Trips	No Data		31.5%			21%	

KSF: Thousand square feet
Source: Kittelson & Associates, Inc. 2019

[6] Note that the Trip Generation Manual (9th Edition and 10th Edition) includes trip data for a "Discount Club" (Land Use Code 857) that is described as follows: "A discount club is a discount store or warehouse where shoppers pay a membership fee in order to take advantage of discounted prices on a wide variety of items such as food, clothing, tires and appliances; many items are sold in large quantities or bulk. Some sites may include on-site fueling pumps." By comparison, the trip rates presented in Trip Generation for the Discount Club are 41.80 trips/KSF per day weekdays, 4.18 trips/KSF for the weekday PM peak hour, and 6.37 trips/KSF for the Saturday peak hour of the generator; each lower than the Costco trip rates shown in Table 12. Per the Trip Generation Handbook, 3rd Edition, the weekday PM peak hour pass-by rate for Land Use Code 857 is 37% and the Saturday midday peak hour pass-by rate is 30% (both slightly higher than the values shown in Table 12 for Costco) while no diverted trip data was reported (not collected).

[7] Additional documentation of the Costco Trip database is provided in Appendix "F".

Note that no weekday AM peak hour trip rate is shown in Table 11 because the Warehouse building is not open to members during the morning commute hours. Weekday AM peak hour trip generation for the Project site is impacted by the Costco Gasoline fuel station, which is discussed in the next section.

Table 12 presents trip generation estimates for the proposed Loomis Costco Warehouse with Costco Gasoline fuel station facility based on the data shown in Table 11 (daily trips were rounded to the nearest 10). No adjustments for employee transportation demand management (TDM) measures were made as employee trips occur primarily outside of the analysis peak hours.

Table 12: Proposed Loomis Costco Trip Generation Estimate

Land Use	Size	Weekday Daily Trips	Weekday PM Peak Hour of Adjacent Street Traffic			Weekend Midday Peak Hour		
			Total	In	Out	Total	In	Out
Costco Warehouse With Fuel Station	155,000 square feet	12,290	1,111	539	572	1,518	773	745
Pass-by Trips (33.3% PM/28.9% MD)		*(4,090)*	*(370)*	*(179)*	*(191)*	*(439)*	*(223)*	*(216)*
Diverted Trips (31.5% PM/20.6% MD)		*(3,870)*	*(350)*	*(170)*	*(180)*	*(313)*	*(159)*	*(154)*
Net New Trips		**4,330**	**391**	**190**	**201**	**766**	**391**	**375**

Note that the number of weekday and weekend daily (primary, pass-by, and diverted) trips were estimated using weekday PM peak hour trip type percentages.

Source: Kittelson & Associates, Inc. 2019

5.2.4 Weekday AM Peak Hour Trips Associated with Costco Gasoline Fuel Station

Tables 11 and 12 do not show site trips generated during the commuter weekday AM peak hour because the Costco Warehouse will not be open; however, the Costco Gasoline fuel station will be. Weekday AM peak hour trips associated with gasoline operations were estimated based on trip generation data collected at existing Costco Gasoline facilities.

Table 13 below presents the trip characteristics for the fuel station for the weekday AM Peak hour assuming the planned future 30 fueling position capacity. The averages summarized in Table 13 reflect data collected at multiple California locations based on comparable size and available data including Lancaster, Cypress, Commerce, Roseville, and Sunnyvale. Note that only members can access the fuel stations, which require a membership card for pump activation.

Table 13: Costco Gasoline Fuel Station Trip Characteristics

Trip Characteristics	Weekday AM Peak Hour	Weekday AM Peak Hour Trips (30 fueling positions)		
		Total	In (50%)	Out (50%)
Total Trip Rate	13.98 trips/fuel position	420	210	210
Internal Trip Percentage	0%[1]	(0)	(0)	(0)
Pass-by Trip Percentage[2]	32.5%	(136)	(68)	(68)
Diverted Trip Percentage[2]	36.8%	(154)	(77)	(77)
Net New Trips		**130**	**65**	**65**

[1]Warehouse not open during weekday AM peak period

5.3 PROJECT TRIP DISTRIBUTION

This section provides an overview of trip distribution percentages for the proposed Project. The distribution patterns were developed based on review of Costco Warehouse membership data, consideration of population centers and the roadway network that serves them, as well as review of existing travel patterns in the study area.

Figure G-1 in Appendix "G" shows the overall distribution pattern. As shown in the figure, the majority of site-generated trips are expected to be oriented south and east of the Project site for reasons described below.

Influence of Existing Costco Wholesale Sites

The project trip distribution pattern is influenced by the presence of multiple Costco Wholesale sites located to the south and west of Loomis including Roseville, Citrus Heights, Folsom, Cal Expo (Sacramento), Rancho Cordova and Woodland as shown in Exhibit 1.

Exhibit 1. Existing Costco Warehouse Sites

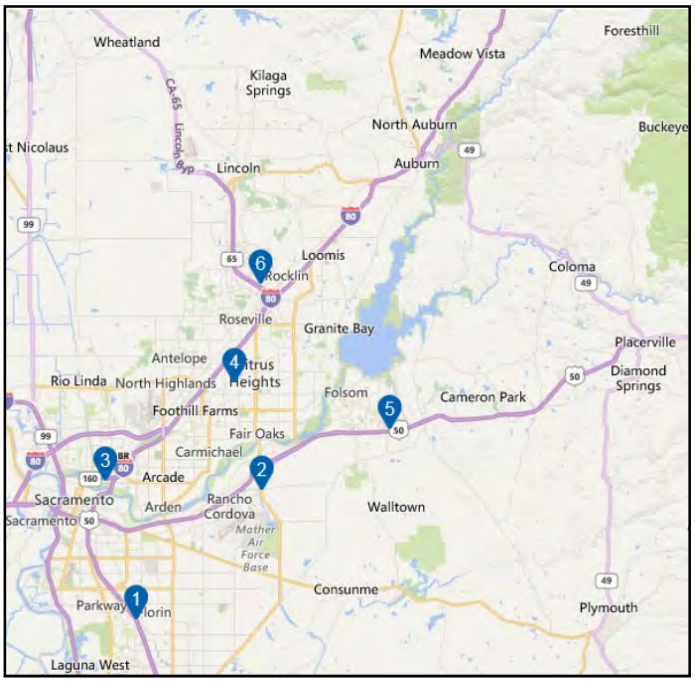

Image Source: Costco Wholesale, https://www.costco.com/warehouse-locations

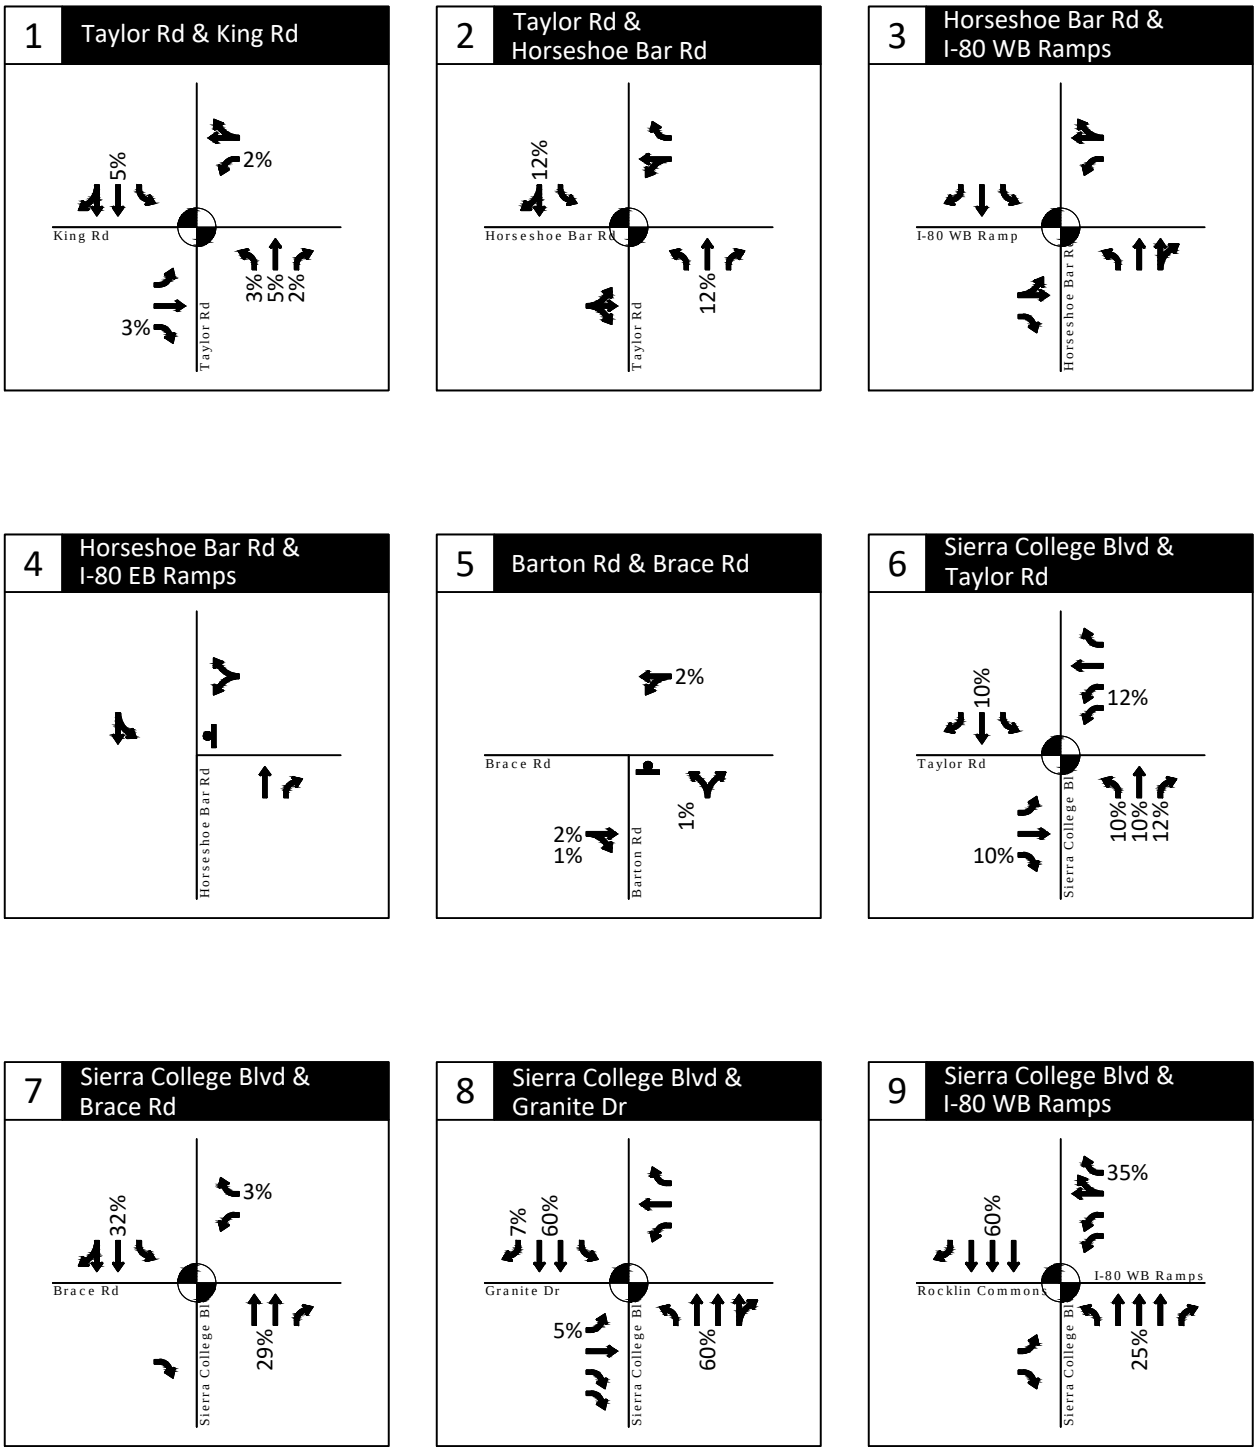
Existing Costco Warehouse locations shown in Exhibit 1 are:

1. 7981 E Stockton Boulevard in Sacramento
2. 11260 White Rock Road in Rancho Cordova
3. 1600 Expo Parkway (Cal Expo) in Sacramento
4. 7000 Auburn Boulevard in Citrus Heights
5. 1800 Cavitt Drive in Folsom
6. 6750 Stanford Ranch Road in Roseville



The proposed Project is situated approximately five miles east of the existing Roseville Costco Warehouse (warehouse location 6 in Exhibit 1) and is expected to impact the market area of the Roseville Costco. For example, Costco Wholesale anticipates the proposed Project will directly serve some existing Costco members residing east of the Roseville Costco Warehouse, particularly those along the I-80 corridor that currently drive past Loomis on I-80 to reach Roseville (for example, members residing in Auburn).

General Distribution Considerations

Based on the Project site location and the existing Costco Warehouses, approximately 45 percent of the Project net new site-generated trips are expected to travel to and from the Project site via I-80, including 35 percent traveling east of Sierra College Boulevard and approximately 10 percent traveling west of Sierra College Boulevard). The remaining trips were routed to Town of Loomis, City of Rocklin, and Placer County roadway facilities.

The presence of the Roseville Costco directly impacts (limits) the amount of new traffic anticipated to the proposed Project site from points to the north and west. For example, the number of project-generated trips on Sierra College Boulevard north of Taylor Road is expected to be relatively limited (approximately 10 percent) because residents of Lincoln and portions of the housing west of Sierra College Boulevard are able to access the Roseville Costco via Highway 65. Similarly, while resident population is generally denser west of Sierra College Boulevard, the number of net new trips routing on Pacific Street west of Sierra College Boulevard was estimated at 10 percent while the portion routed on Taylor Road east of Sierra College Boulevard was estimated higher at 12 percent recognizing that some residents to the west will continue to shop at the Roseville Costco.

Figure 7 presents the Project trip distribution patterns for Project Driveway Option 1A by intersection for the weekday AM peak hour for fuel trips given the warehouse is closed during this peak hour. Figure 8 presents the Project trip distribution patterns Project Driveway Option 1A by intersection for the weekday PM and weekend midday peak hours with the warehouse in operation. The trip distribution patterns were approved by the Town of Loomis and the City of Rocklin confirmed they were appropriate. Project Driveway Options 1B and 1C would affect the Project trip distribution at study intersections 7, 8, 21, 24, 25, and 37. All other study intersections would have the same trip distribution under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Figures 9 and 10 present the trip distribution patterns for Project Driveway Options 1B and 1C at those study intersections affected by the options.

5.4 PROJECT TRIP ASSIGNMENT

This section provides the trip assignment for the proposed Project based on the trip generation and distribution patterns described above. Figures 11 and 12 present the Project trip assignment for Project Driveway Option 1A within the study area. Project Driveway Options 1B and 1C would affect the trip assignment at study intersections 7, 8, 21, 24, 25, and 37. All other study intersections would have the same trip assignment under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Figures 13 and 14 present the Project trip assignment for Project Driveway Options 1B and 1C at those study intersections affected by the options. Please note that the Project proposes a shared access with the existing apartment use at the East Project Driveway on Brace Road under Driveway Options 1A and 1C[8]. Additional figures showing an overall distribution pattern on a map as well as diverted trip assignments are provided in Appendix "G". The percent of traffic added by the Project at each study intersection is also provided in Appendix "G".

Trips were assigned to the network based on the previously described trip distribution pattern, existing turning movement patterns, and considering the proposed site access locations. Of note:

- Pass-by trips were assumed to be traveling along the Sierra College Boulevard Project site frontage prior to site development and thus only impact the Sierra College Boulevard Project site driveways.
- All diverted trips were routed between the Project site and I-80.
    - The diverted trips were analyzed as net new trips to the roadway network between the I-80 ramp intersections and the Costco site.
- Costco Wholesale anticipates the proposed Project will directly serve some existing Costco members residing east of the Roseville Costco Warehouse, including those living in Loomis and Rocklin. *No trip credits or re-routing of existing Costco member trips were made in the intersection operations analysis presented in this report.*
    - In reality, some trips currently traveling through one more of the study intersections traveling to and from the Roseville Costco site will likely divert to the new site.
    - Assuming all of the Costco member trips are new to the study intersections provides a more conservative analysis.

[8] Due to the shared access arrangement between the Costco site and the existing apartments under Driveway Options A and C, some apartment trips will use the East Project Driveway on Brace Road. Apartment trips at the shared access were estimated for the 28-unit apartment building using apartment trip rates in the *Trip Generation Manual, 10th Edition* published by the Institute of Transportation Engineers in 2017 (documentation provided in Appendix G). The estimated apartment trips were assigned to the East Project Driveway based on the direction split of volumes along Brace Road.

KITTELSON & ASSOCIATES

5.5 TRUCK DELIVERY CONSIDERATIONS

As described in Section 5.1 of this report, publicly accessible driveways are proposed to serve the Project site.

The right-in/right-out Brace Road driveway was designed to serve Costco members as well as deliveries. Warehouse delivery trucks would enter the Project site via Brace Road, complete the delivery and subsequently exit the site at the new signalized Project access along Sierra College Boulevard for each of the three Project driveway options evaluated in this study. The proposed northbound right-turn lane on Sierra College Boulevard at Brace Road will facilitate truck entry.

Costco Gasoline delivery trucks would enter and exit the site via the new signalized Project access along Sierra College Boulevard for Project Driveway Option 1A, completing a counter-clockwise rotation through the Project site. Project Driveway Options B and C would route the Costco Gasoline truck into the Project site via the new signalized Project access along Sierra College Boulevard and would involve an exit path to Granite Drive. Similar to the Brace Road delivery truck access route, the proposed northbound right-turn lane on Sierra College Boulevard at the Project access will facilitate Costco Gasoline truck entry for all three Project driveway options.

On-site circulation was evaluated for adequate maneuverability for passenger vehicles as well as delivery trucks and emergency vehicles. The AutoTurn software application was used to evaluate maneuverability of larger trucks throughout the site as shown on the site plan as shown in Figure 6D. The Project access driveways have adequate widths and curve radii to accommodate delivery trucks and member vehicles.

Adequate sight lines should be provided at the internal intersections and site access points to provide conformance with Town of Loomis standards.

Warehouse Deliveries

Costco anticipates an average of about 10-13 Costco trucks a day delivering goods to the Costco Warehouse. The Costco trucks typically measure up to approximately 70 feet long for double-axle trailers. Typical receiving time is from 2:00 AM to 1:00 PM, averaging two to three trucks per hour, with most of the deliveries completed before the 10:00 AM warehouse opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California. In addition to the Costco depot trucks, deliveries such as bread are expected to be made by local vendors using single unit trucks and/or single-axle trailers.

Costco Gasoline Deliveries

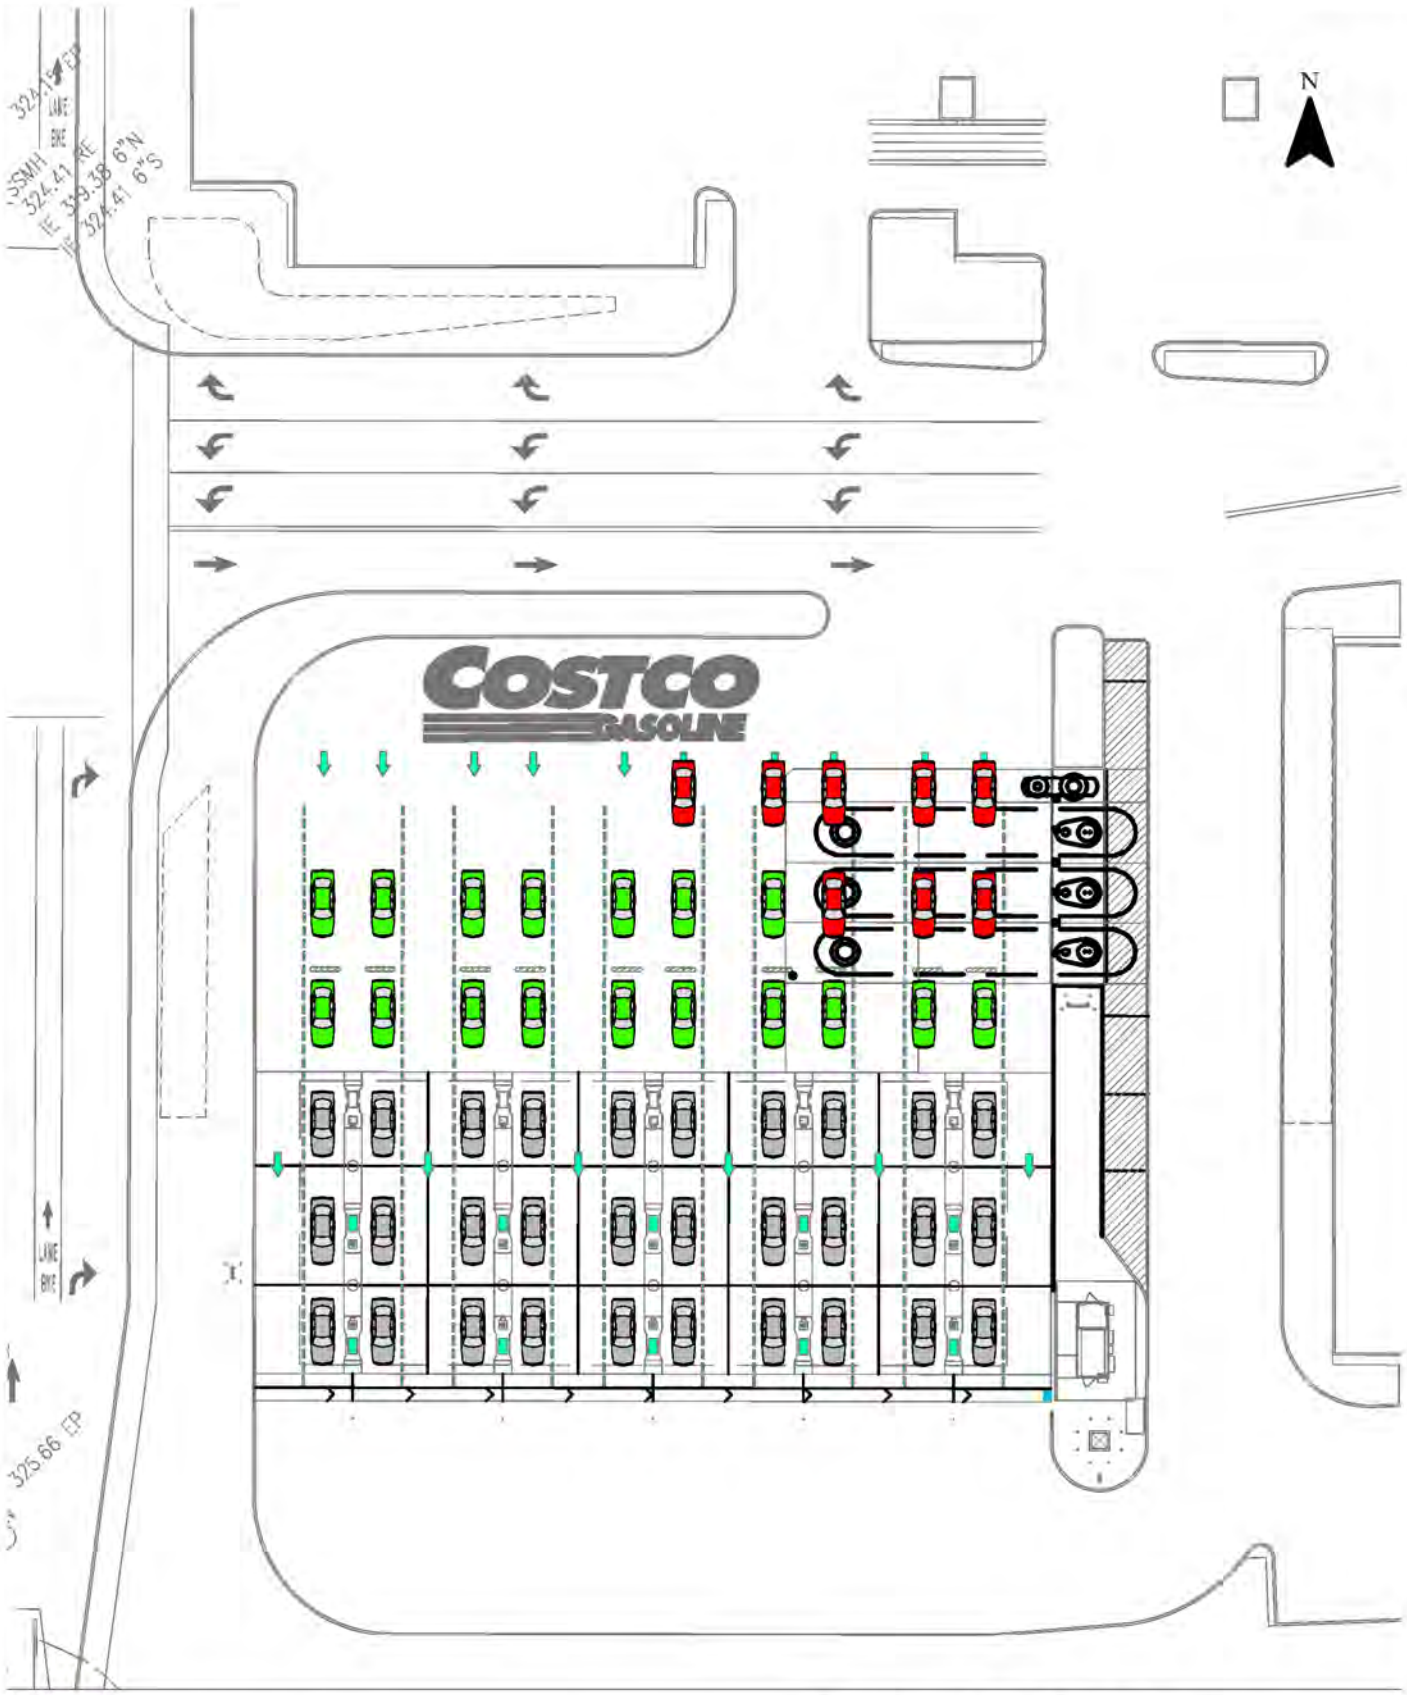
Costco anticipates that the Costco Gasoline fuel station will receive five to seven fuel deliveries per day on average. During busy holiday weeks, an additional delivery is often required during the day. These deliveries occur any time between 6:00 AM and 7:00 PM.

5.5.1 Costco Gasoline Site Queuing Needs

The proposed site plan locates the proposed inbound (one-way) access to the Costco Gasoline fuel station approximately 155 feet east of Sierra College Boulevard (measured from Sierra College Boulevard curb to west driveway curb) along the Project entrance within the Project site. On-site queuing associated with the Costco Gasoline area was assessed to determine whether fuel station operations would impact the Project entrance as described below.

Costco Fuel Station Operations

By way of introduction, Costco Gasoline fuel stations all function as ancillary uses to the main Costco warehouses that share their sites. The fuel stations can only be accessed by members and require a Costco membership card to activate the pumps for dispensing gasoline. Payment can only be made with a credit card and, unlike traditional gas/service station operations, there are no other automotive services (such as repairs) or other type of sales (including food or sundries) associated with the Costco Gasoline fuel station. All Costco Gasoline fuel stations have a minimum of one attendant working during all operating times who is responsible for expediting members' use of the fuel pumps, directing entering vehicles to open pump locations, and managing on-site queues from the pumps.



On-Site Queuing

The proposed Costco Gasoline fuel station area at the Loomis site would initially provide five islands (10 fueling aisles) with four fueling positions each, offering a total of 20 fueling positions where vehicles can simultaneously purchase fuel. The site plan is expandable, adding a third row of fuel dispensers that would result in a total of 30 fueling positions.

Based on the current site plan, the queueing area beyond the pumps extending toward the primary entry aisle from Sierra College Boulevard measures approximately 80 feet, assuming all 30 fuel dispensers are in operation.

Vehicular queuing data has been collected at other representative Costco Gasoline fuel station sites to provide reliable information related to the anticipated queues for the proposed facility. Table 14 summarizes the five comparable locations[9].

[9] Queuing data was collected in 2016 and 2017 at Costco Gasoline sites each having 24 fueling positions (largest fuel facility sites with available data). The locations shown represent the largest and busiest Costco Gasolines in California for which data is available as well as a site in Portland, Oregon that has the highest Costco sales in the state (in part reflecting proximity to nearby Washington State where sales and fuel taxes are higher). Therefore, they are considered representative of the Project's fuel station.

- 50th Percentile Queue
- 95th Percentile Queue

Each vehicle assumed to occupy 25 feet.

Costco Gasoline Fuel Station Queueing (Weekend Peak)
Loomis, California

Figure 15

H:\20\28545 - Confidential Loomis CostcoVdwgs\Figs\20345_Fig1.dwg Oct 22, 2019 - 4:42pm - aloveday Layout Tab: Layout1

Observed queues were reported for maximum, average, and 95th percentile scenarios during both the weekday PM peak hour and during a weekend midday peak. The 95th percentile queue is defined to be the queue length (in vehicles) that has only a 5-percent probability of being exceeded during the analysis time period. The industry standard methodology for queuing analysis considers the 95th percentile queues.

Table 14: Costco Gasoline Queuing Observations

Location	Dates Collected	Size (pumps)	Weekday PM Peak Queue					Weekend Midday Peak Queue				
			Volume	Min	Max	Average	95th	Volume	Min	Max	Average	95th
Tustin II, CA	7/28/16 & 7/30/16	22	662	11	35	26	34	610	14	38	29	35
Rohnert Park, CA	8/18/16 & 8/20/16	24	498	0	8	3	7	632	0	22	8	16
Concord, CA	8/25/16 & 8/27/16	24	550	0	10	3	8	700	11	32	19	28
NE San Jose, CA	2/9/17 & 2/11/17	24	458	6	6	1	3	686	10	31	20	29
Portland, OR	2/9/17 & 2/11/17	24	404	0	12	3	8	616	2	20	10	16
Average		24	514	3	14	7	**12**	649	7	29	17	**25**

As shown in Table 14, the highest recorded 95th percentile queue was 35 vehicles observed at the Tustin II Costco Gasoline site during the weekend midday peak period while the lowest 95th percentile queue was 16 vehicles and was observed at both the Portland and Rohnert Park Costco Gasoline sites. The average 95th percentile queue for all five sites is 25 vehicles.

Extrapolating the observed data to the 30-fueling position configuration proposed at Loomis and assuming each queued vehicle occupies 25 feet, each lane leading to a fueling position can store up to three vehicles (75 feet) without impacting the primary entry aisle from Sierra College Boulevard (not counting the vehicles at the fuel pump position). With ten fueling aisles each holding three vehicles, the queue storage area between the fuel pumps and primary entry aisle from Sierra College Boulevard can accommodate at least 30 vehicles before affecting operations at the drive aisle. The 30 available spaces would be in excess of the average 95th percentile queue observed at the five Costco Gasoline sites (25 vehicles). In addition, the five sites studied were limited to fewer fueling positions (24 vs. 30) which suggests queues at the proposed Project site should be shorter given the ability to fuel more vehicles simultaneously at the Project site.

Figure 15 illustrates the available queue storage area and the projected queues. As shown in the figure, the proposed Loomis Costco Gasoline fuel station site plan provides sufficient storage to accommodate the average 95th percentile queue anticipated without interference to the on-site drive aisle that leads to Sierra College Boulevard.

5.6 PROJECT VMT CALCULATION

Per the request of Caltrans District 3 staff, a general project-based Vehicle Miles Traveled (VMT) calculation was conducted for informational purposes and is documented in this section[10]. The request for VMT information stems from the State of California Senate Bill 743, which mandates a change in the way that public agencies evaluate transportation impacts of projects under the California Environment Quality Act.

The Governor's Office of Planning and Research has prepared the Technical Advisory on Evaluating Transportation Impacts in CEQA (Technical Advisory) published November 2017 to provide an initial alternative approach to evaluating project effects on the transportation system. The Technical Advisory provides the following guidelines specific to retail projects:

- Lead agencies should usually analyze the effects of a retail project by assessing the change in total VMT, because a retail project typically re-routes travel from other retail destinations. A retail project might lead to increases or decreases in VMT, depending on previously existing retail travel patterns.
- Recommended threshold for retail projects: A net increase in total VMT may indicate a significant transportation impact.
- Because new retail development typically redistributes shopping trips rather than creating new trips, estimating the total change in VMT (i.e. the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project's transportation impacts.
- By adding retail opportunities to the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. Lead agencies generally, therefore, may presume such development creates a less than significant transportation impact. Regional-serving retail development, on the other hand, which can lead to substitution of longer trips for shorter ones, might tend to have a significant impact. Where such development decreases VMT, lead agencies may consider it to have a less than significant impact.
- Many cities and counties define local-serving and regional-serving retail in their zoning codes. Lead agencies may refer to those local definitions when available, but should also consider any project-specific information, such as market studies or economic impacts analyses that might bear on customers' travel behavior. Because lead agencies will best understand their own communities and the likely travel behaviors of future project users, they are likely in the best position to decide when a project will likely be local serving. Generally, however, development including stores larger than 50,000 square feet might be considered regional-serving, and so lead agencies should undertake an analysis to determine whether the project might increase or decrease VMT.

[10] It should be noted that VMT evaluation is not an adopted methodology for determining significant impacts.

5.6.1 VMT Estimate Overview

At the time this report was prepared, no VMT evaluation methodology had been established by the lead agency (Town of Loomis) nor the City of Rocklin, Placer County or Caltrans. As such, a VMT assessment was prepared for informational purposes as described below considering the guidance enumerated by the Technical Advisory. The VMT estimate reflects factors including the anticipated site trip generation and distribution, Project membership, as well associated VMT changes at the existing Roseville Costco site. The VMT estimate development process included:

- assessment of Project trip generation
- assessment of Project trip length based on Costco member location
- assessment of anticipated growth in Costco membership at both the Project site and the existing Roseville Costco site
- estimation of Project site VMT associated with Costco members derived by adding the VMT associated with Project primary, diverted, and pass-by trips new to the surrounding roadway network
- estimating latent demand at the Roseville Costco site and adding that additional VMT to account for potential new trips to the Roseville Costco site
- combining the VMT for the Project site and the Roseville Costco site to develop a total new regional VMT
- adding VMT based on the regional trip length estimate to account for new Costco employees trips

In addition to the steps above, a trip length reduction associated with the opening of the Project site was estimated to document the potential VMT reduction that may be realized at the Roseville Costco site when some existing Roseville member trips re-route to the Project site. As will be described below, the total new VMT for the Project combined with new members to the Roseville site is estimated to be less than the overall regional VMT reduction realized at the existing Roseville site. Appendix “F” includes the analysis details.

5.6.2 Trip Generation and Trip Length

The total average daily trip generation for the Project is approximately 12,290 trips. As previously documented in Section 5.2, a significant number of these trips are pass-by and diverted trips (refer to Table 12). Pass-by trips are already on the roadway network and simply turn in and out of the Project site thereby not contributing additional mileage to the roadway network. Diverted trips are already on the roadway network and turn from a major route to access the site. For the purposes of this study, diverted trips were assumed to travel between the I-80 ramps and the Project site (approximately 0.5 mile). Trip generation for the Project site accounts for all trips to and from the site (members, employees, and deliveries).

A Costco Wholesale membership database-derived trip length for the Project site was estimated to be approximately 22 miles (average distance from member address to the Project site)[11]. The 22-miles estimate reflects only member trips.

Projected Costco Membership Growth

Due to the proximity of the Roseville Costco warehouse and proposed Project warehouse in Loomis, the market share projections provided by Costco Wholesale shows significant redistribution of existing members between the two sites. The Costco market projections estimate a total regional membership of 104,200 for both the Roseville and Loomis warehouses. Of these members 9,100 are projected to be new members (approximately 8.7 percent of the total membership). The remaining 95,100 members are existing members who are currently visiting the Roseville site and are already traveling on the regional transportation network.

5.6.3 VMT Projection

The following analysis is provided for informational purposes only, as the Town of Loomis has not yet adopted a VMT methodology or significance threshold.

Loomis Site VMT Projection

Projected VMT was estimated for the Loomis site using the Project trip generation estimates by trip type along with corresponding trip length as shown in Table 15.

Table 15: Estimated New Costco Daily VMT for Project Site

Trip	Average Trip Length (miles)	Project Daily Trips[1]	New Trips to Roadway Network (8.7%)	Estimated New CostcoVMT[2]
Costco Wholesale Membership Data	22.0	4,330	375	8,250 miles
Pass-by Trips	0.0	4,090	355	-
Diverted Trip Length[3]	0.5	3,870	335	170 miles
Estimated VMT				**8,420 miles**

Notes:
[1]Based on the average Costco trip characteristics in Table 12
[2] Estimated VMT reflects average trip length × Project daily trips
[3] Reflects assumed diverted trip length from I-80 to the Project site
Source: Kittelson & Associates, Inc. 2019

[11] Costco Wholesale provided the zip code location of existing and potential new members that would likely use the proposed warehouse in Loomis. A ratio was developed for each zip code to the total members being served by the proposed Costco Warehouse. With the general location of members by zip code known, a trip length of was estimated from the proposed Project site to the centroid of each zip code polygon using a GIS tool. The weighted average of all trip lengths shows the average trip length from the Project site for members is approximately 22 miles.

As shown, the projected VMT increase attributable to the Project site is 8,420 miles. This estimate does not reflect a potential reduction in VMT associated with re-routing of Costco member trips that currently are made to the Roseville site but that may transfer to the Project site out of convenience/shorter travel distance.

Roseville Site VMT Projection

Latent demand is expected to be realized at the Roseville warehouse as it becomes less crowded with the new Loomis Project opening and new Costco members shop the existing warehouse. To account for new members at the existing Roseville warehouse, VMT was also estimated for potential new trips to the Roseville site. Similar to the format of Table 15, Table 16 summarizes the projected new VMT for the Roseville site. The daily trip estimates shown were developed using the Costco average trip rates in Table 11. Trip lengths were based on the Costco Wholesale membership data assuming development of Project.

Table 16: Estimated New Costco Daily VMT for Roseville Site

Trip	Average Trip Length (miles)	Daily Trips[1]	New Trips to Roadway Network (8.7%)	Membership Estimated VMT[2]
Costco Wholesale Membership Data[3]	7.2	3,815	330	2,375 miles
Pass-by Trips	0.0	3,620	315	0 miles
Diverted Trip Length[4]	0.5	3,425	300	150 miles
Estimated VMT				**2,525 miles**

Notes:
[1] Based on the average Costco trip characteristics in Table 11 (same database as Project site) and a warehouse size of 136,954 square feet.
[2] Estimated VMT reflects average trip length × daily trips
[3] Trip lengths based on projected Costco market share for Roseville site assuming development of Project site (Project site development results in some longer distance trips currently shopping at Roseville shifting to the Project site in Loomis, resulting in a reduced average trip length compared to existing)
[4] Reflects assumed diverted trip length from SR-65 to the Roseville warehouse site
Source: Kittelson & Associates, Inc. 2019

Total Costco VMT Increase

Combining the VMT estimates in Tables 15 and 16 yields a total new daily regional VMT of approximately 10,945 miles (8,420 miles for Project site + 2,525 miles for Roseville site).

Recognizing the Costco membership database methodology described above does not account for trips made by Costco employees, additional VMT was calculated reflecting an average of 250 employees on-site per day and using the City of Rocklin Travel Demand Model trip length for commercial land uses[12]. The VMT generated by employees is estimated to be 3,900 miles (500 trips x 7.8 miles).

[12] The City of Rocklin 2030 Travel Demand Model was used to generate a select zone analysis for the traffic analysis zone (TAZ) that contains the Project. The resultant select zone analysis provides an estimated average one-way trip length for the Project of 7.8 miles.

In addition, Costco would have delivery trucks for the warehouse and fuel facility. Costco estimates 13 warehouse deliveries a day, most likely from their facility located in Tracy, California which is approximately 100 miles from the Project site. Therefore, the average daily VMT for warehouse deliveries would be 26 trips (13 trucks inbound and outbound) multiplied by 100 miles which is approximately 2,600 VMT. The 7 fuel delivery trucks per day are expected to travel between the Project site and the West Sacramento terminal location (identified by the Air Quality study). The West Sacramento terminal is located approximately 30 miles from the Project site and is located with the SACOG region. Therefore, the average daily VMT for fuel deliveries would be 14 trips (7 trucks inbound and outbound) multiplied by 30 miles which is approximately 420 VMT within the region. Total VMT for truck trips to the Project site is approximately 3,020 miles (2,600 miles by warehouse deliveries + 420 miles by fuel deliveries).

Therefore, the membership database methodology yields total new daily VMT of 17,865 miles (10,945 miles + 3,900 miles + 3,020 miles).

Potential Regional VMT Reduction

The proposed Costco warehouse would be located approximately 5 miles north of the existing Roseville Costco warehouse. Based on Costco membership data, an estimated 31 percent of existing Roseville Costco members are located north of the Project site. These members to the north could realize a trip length reduction of approximately 5 miles by switching membership from the Roseville site to the Project site, benefiting the transportation system with a VMT reduction.

Final VMT

In summary, total new daily VMT for the Project and new members to the Roseville site is estimated to be 17,865 miles. A VMT reduction could be realized as a function of the shorter trip length experienced by the 31 percent of existing Roseville Costco members who shorten their shopping trip length by changing membership to and shopping at the Project site.

Section 6
Existing plus Project Conditions

6.0 EXISTING PLUS PROJECT CONDITIONS

The Existing plus Project traffic conditions analysis forecasts how the study area's transportation system would operate with the addition of traffic generated by the proposed Project. The proposed roadway infrastructure improvements as outlined in Section 5.1.2 would be constructed in this condition.

6.1 INTERSECTION EVALUATION

Existing conditions traffic volumes for the weekday AM and PM and weekend midday peak hours were added to the site-generated traffic to arrive at the total traffic volumes. Figure 16 shows the Existing Plus Project (Project Driveway Option 1A) traffic condition during weekday AM and PM peak hours and Figure 17 shows the Existing Plus Project (Project Driveway Option 1A) traffic condition during weekend midday peak hour.

The site-generated trip assignment with Project Driveway Options 1B and 1C results in different existing plus Project peak hour traffic volumes at study intersections 7, 8, 21, 24, 25, and 37 due to the routing of site trips to the driveways. All other study intersections would have the same Existing Plus Project traffic volumes under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Figure 18 shows the Existing plus Project traffic condition during weekday AM and PM peak hours for all three Project driveway options at those study intersections affected by the driveway options. Similarly, Figure 19 shows the Existing Plus Project traffic condition during weekend midday peak hour for all three Project driveway options at those study intersections affected by the driveway options.

6.1.1 Level-of-Service Analysis

To gauge the impact of the Project traffic on the existing roadway network, the Project analysis assumed that signal timings would be unchanged from those in existing baseline conditions except at study locations where the Project provides geometric improvements.

Project Driveway Option 1A

Table 17 shows the baseline Existing No-Project and Plus Project (Project Driveway Option 1A) delays for and LOS for the study intersections during weekday AM and PM peak hours. Table 18 shows the baseline Existing No-Project and Plus Project (Project Driveway Option 1A) delays and LOS for the study intersections during the weekend midday peak hour.

As shown in Table 17 and Table 18, the following intersections operate at unacceptable LOS:

- Horseshoe Bar Road & I-80 Eastbound Ramp (AM and PM)
- Sierra College Boulevard & Taylor Road (PM)
- Sierra College Boulevard & Rocklin Road (AM and PM)
- Pacific Street & Dominguez Road/Delmar Avenue (PM)

- Pacific Street & Rocklin Road (AM)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (AM)
- Sierra College Boulevard & SR-193 (PM)
- Sierra College Boulevard & Delmar Avenue (AM, PM, and MD)
- Taylor Road & Penryn Road (South) (AM)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Webb Street (PM and MD)

Based on the impact criteria defined earlier, the following intersections would be significantly impacted by the proposed Project (Project Driveway Option 1A):

- Sierra College Boulevard & SR-193 (PM)
- Taylor Road & Penryn Road (South) (AM)
- Taylor Road & Webb Street (MD)

Appendix “B” includes the level-of-service worksheets.

Notes:
AWSC: All-way stop control – The average intersection delay is reported.

TWSC: Two-way stop control - delay reported reflects the critical movement.

DNE: Intersection does not exist under no Project conditions.

Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.

Shaded cell indicates Project impact

[1] An impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project adds trips to the intersection exceeding 5% of the total traffic already at the intersection. At these locations, the project does not contribute 5% or more of the volumes.

[2] Intersection does not meet signal warrants for impacts condition, therefore per the Placer County guidelines, this intersection is not significantly impacted. Traffic signal warrants provided in Appendix J.

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to the previously cited Project driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Table 19 shows the baseline Existing No-Project and Plus Project delays and LOS at those study intersections affected by the options during weekday AM and PM peak hours. Table 20shows the baseline Existing No-Project and Plus Project delays and LOS at those study intersections affected by the options during the weekend midday peak hour.

As shown in the two tables, none of the six study intersections affected by site trip routing to the Project driveways are significantly impacted by the proposed Project for Project Driveway Options 1B and 1C.

Source: Kittelson & Associates, Inc. 2019

6.1.2 Queuing Analysis

The 95th percentile queues at the study intersections were reviewed to identify locations where the queues may exceed the available storage capacity. Appendix C provides the summary table for the weekday AM, PM and weekend midday peak hours. Appendix "G" includes the Project contribution tables.

Project Driveway Option 1A

One or more 95th percentile queues would extend beyond the available storage lengths at the following intersections for Project Driveway Option 1A:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Sierra College Boulevard & Taylor Road (PM)
- Sierra College Boulevard & Granite Drive (AM and PM)
- Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- Sierra College Boulevard & Rocklin Road (AM and PM)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM)
- I-80 Eastbound Ramps & Rocklin Road (AM and PM)
- El Don Drive & Rocklin Road (AM and PM)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (PM and MD)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (PM)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflows under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following intersections under Project Driveway Option 1A:

- Taylor Road & King Road (MD)
- Sierra College Boulevard & Granite Drive (PM)
- Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- Granite Drive & Rocklin Road (MD)

Project Driveway Options 1B & 1C

As previously explained, Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Of the six affected intersections, one or more 95th percentile queues would extend beyond the available storage lengths at the following intersections (for those intersections affected by the driveway options):

- Sierra College Boulevard & Brace Road (AM, PM, and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown (for those intersections affected by the driveway options):

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (PM and MD)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflows under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following affected study area intersections:

- Sierra College Boulevard & Brace Road (PM and MD)[13]
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)

[13] Weekday PM and Weekend Midday peak hour impacted for Project Driveway Option 1B only.

6.1.3 Simulation Supplemental Evaluation

The Existing plus Project conditions simulation evaluation was conducted with the same assumptions as outlined in Section 4.0 for Existing Conditions and is provided for informational purposes only.

Project Driveway Option 1A

The total network performance results of the simulation runs for Project Driveway Option 1A are presented in Table 21 and the arterial performance results are presented in Table 22. Please note that signal timing was not modified with the addition of Project trips.

As shown, the Project traffic increases network delay for all peak hours. In addition, the increased congestion on the network results in vehicles being denied entry into the network during the simulation period.

Table 21: Existing Plus Project Conditions – Simulation Total Network Performance Results – Project Driveway Option 1A

Peak Hour	Existing				Existing Plus Project			
	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
AM	46.8	5,333	5,325	0	44.7	5,707	5,661	0
PM	54.7	7,131	7,125	1	93.6	7,479	7,255	12
MD	40.0	5,795	5,797	0	58.9	6,722	6,652	1

Notes:
(s): seconds
Total Delay/Vehicle: Total delay is equal to the travel time minus the travel time for a vehicle with no other vehicles or control devices. This delay is divided by the number of vehicles to obtain the total delay per vehicle.

Vehicles Entered/Exited: Represents the number of vehicles counted entering and exiting the link or area during the interval. This value does not include vehicles moving from one intersection to the next with the arterial or network.

Vehicles Denied Entry: This value represents the number of vehicles unable to enter a link due to congestion and are waiting to enter. These vehicles can either be from an external link or from a mid-block source.

Source: Kittelson & Associates, Inc. 2019

As shown, for the Sierra College Boulevard corridor, the Project increases delay, travel time, and reduces arterial speed for all peak hours and direction.

Table 22: Existing Plus Project Conditions – Simulation Sierra College Boulevard Arterial Performance Results – Project Driveway Option 1A

Segment	Peak Hour	Direction	Existing			Existing Plus Project		
			Delay (s)	Travel Time (s)	Arterial Speed (mph)	Delay (s)	Travel Time (s)	Arterial Speed (mph)
Sierra College Boulevard between Taylor Road and Stadium Way	AM	Northbound	70.8	191.0	28	73.8	244.3	22
		Southbound	137.9	326.1	25	133.9	398.6	20
	PM	Northbound	138.2	257.2	21	190.7	366.1	14
		Southbound	123.9	309.8	26	259.2	526.0	16
	MD	Northbound	85.8	205.4	26	114.2	288.1	18
		Southbound	100.1	286.0	29	138.1	405.6	20

Notes:
Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.
Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.
Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.
Source: Kittelson & Associates, Inc. 2019

The detailed network and arterial performance output sheets are presented in Appendix "D".

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations along the Sierra College Boulevard Corridor due to the driveway trip routing; therefore Exiting plus Project conditions simulation evaluation was also conducted for Project Driveway Options 1B and 1C. The total network performance results of the simulation runs are presented in Table 23 and the arterial performance results are presented in Table 24. Please note that signal timing was not modified with the addition of Project trips.

As shown, the Project traffic increases network delay for all peak hours. In addition, the increased congestion on the network results in vehicles being denied entry into the network during the simulation period.

Table 23: Existing Plus Project Conditions – Simulation Total Network Performance Results – Project Driveway Options 1B & 1C

Peak Hour	Existing				Existing Plus Project			
	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
Driveway Option 1B								
AM	46.8	5,333	5,325	0	50.3	5,744	5,722	2
PM	54.7	7,131	7,125	1	69.5	8,534	8,503	16

		Southbound	100.1	286.0	29	130.3	396.1	21

Notes:
Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.
Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.
Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.
Source: Kittelson & Associates, Inc. 2019

6.2 PLACER COUNTY ROADWAY OPERATIONS

Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. The three Project driveway options do not affect the Project traffic volumes for the roadway segments analyzed. Table 25 outlines the roadway volumes and associated level of service for the study segments and is applicable for all three Project driveway options. As shown, all study segments continue to satisfy the acceptable LOS C standard with the addition of Project trips regardless of the Project driveway option considered. Therefore, Project impacts would be less than significant.

Table 25: Existing Plus Project Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	Existing		Existing Plus Project		
			ADT	LOS	Project ADT	ADT	LOS
Sierra College Boulevard (SCB)	SR-193 to English Colony Way	2	8,290	A	180	8,470	A
	English Colony Way to Delmar Ave	2	11,120	B	200	11,320	B
	Delmar Ave to Loomis Town Limits	2	11,120	B	220	11,340	B
SR-193	Lincoln City Limits to SCB	2	10,360	A	90	10,450	A
	SCB to Clark Tunnel Road	2	7,200	A	50	7,250	A

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates.
Source: Kittelson & Associates, Inc. 2019

6.3 FREEWAY FACILITIES EVALUATION

Existing conditions traffic volumes for the weekday AM and PM peak hours were added to the site-generated traffic to arrive at the Existing plus Project traffic volumes.

6.3.1 Freeway Mainline Basic Segment Analysis

The three Project driveway options do not affect the Project traffic volumes for the freeway segments analyzed. Table 26 through Table 28 outline the Existing and Existing plus Project mainline volume, density and associated level of service for the study segments and are applicable for all three Project driveway options. As shown, all study segments operate at acceptable LOS D or better with Project traffic regardless of the Project driveway option considered. Therefore, no significant impacts occur to the freeway mainline under the Existing Plus Project Conditions. Appendix "E" includes the freeway mainline level-of-service worksheets.

Table 26: Existing Plus Project Conditions – I-80 Mainline LOS Analysis, Weekday AM Peak Hour

ID	Segment	Direction	Existing			Existing Plus Project			Change in Density
			Volume	Density	LOS	Volume	Density	LOS	
1	I-80 east of Sierra College	Eastbound	3,110	19.0	C	3,132	19.1	C	0.1
		Westbound	4,062	25.4	C	4,085	25.6	C	0.2
2	I-80 west of Sierra College	Eastbound	3,118	19.1	C	3,125	19.1	C	0.0

6.3.2 Ramp Metering Analysis

No ramp metering analysis was provided for the existing plus Project conditions because the ramp meter has not been activated.

6.4 PEDESTRIAN AND BICYCLE EVALUATION

The proposed Project would provide pedestrian facilities on-site linking with public facilities along the site frontages on Sierra College Boulevard and Brace Road to provide connectivity with existing facilities. Pedestrian crosswalks would be provided at proposed new signalized Costco site access intersection on Sierra College Boulevard. The project would reconstruct the Type II bicycle facility on Sierra College Boulevard northbound along the site frontage, including providing separate northbound right-turn lanes at the proposed signalized Project access and at Brace Road. In addition, the Project would provide bicycle parking on site for both members and employees.

Due to the nature of products and services provided by the Project, the Project would minimally increase pedestrian and bicycle traffic in the study area off-site. Sidewalk connections would be provided along the Project site frontage with the proposed development along Sierra College Boulevard. The Project site

would not be in conflict with applicable Town pedestrian and bicycle plans for any of the Project driveway options considered. The Project would have a less than significant impact on pedestrian and bicycle facilities.

6.5 TRANSIT EVALUATION

Due to the nature of products and services provided by the Project and limited transit connectivity provided adjacent to the site, the Project would minimally increase transit ridership in the study area. The nearest stop is approximately 0.6 mile from the Project site for routes with one hour and two hour headways. Due to the distance to the stop, relatively long bus headways, and employee shift times, it is unlikely that a significant number of employee trips would be added to the transit network. The project site would not be in conflict with applicable Placer County Transit plans or encroach on any lines or stops. The Project would have a less than significant impact on transit services and a new transit stop is not warranted at the Project site.

Project impacts on traffic flow could affect travel time for transit vehicles. Traffic flow impacts are addressed in the intersection evaluation sections of this study for all Project driveway options considered.

Section 7
Cumulative Conditions – Short Term Baseline

7.0 CUMULATIVE CONDITIONS – SHORT TERM BASELINE

The Cumulative Short Term Baseline traffic conditions analysis forecasts how the study area's transportation system would operate with the traffic generated by the approved/pending projects in the area prior to the proposed site development.

The Town of Loomis, the City of Rocklin, and Placer County collectively provided a list of approved/pending projects that would affect traffic volumes in the study area. Table 29 lists the approved/pending projects for the short term accounted for in the Cumulative Short Term Baseline traffic condition analysis. Appendix "H" provides *Trip Generation Manual* - based trip estimates for all approved/pending projects as estimated based on the data provided as well as a location map.

Table 29: Approved/Pending Projects List

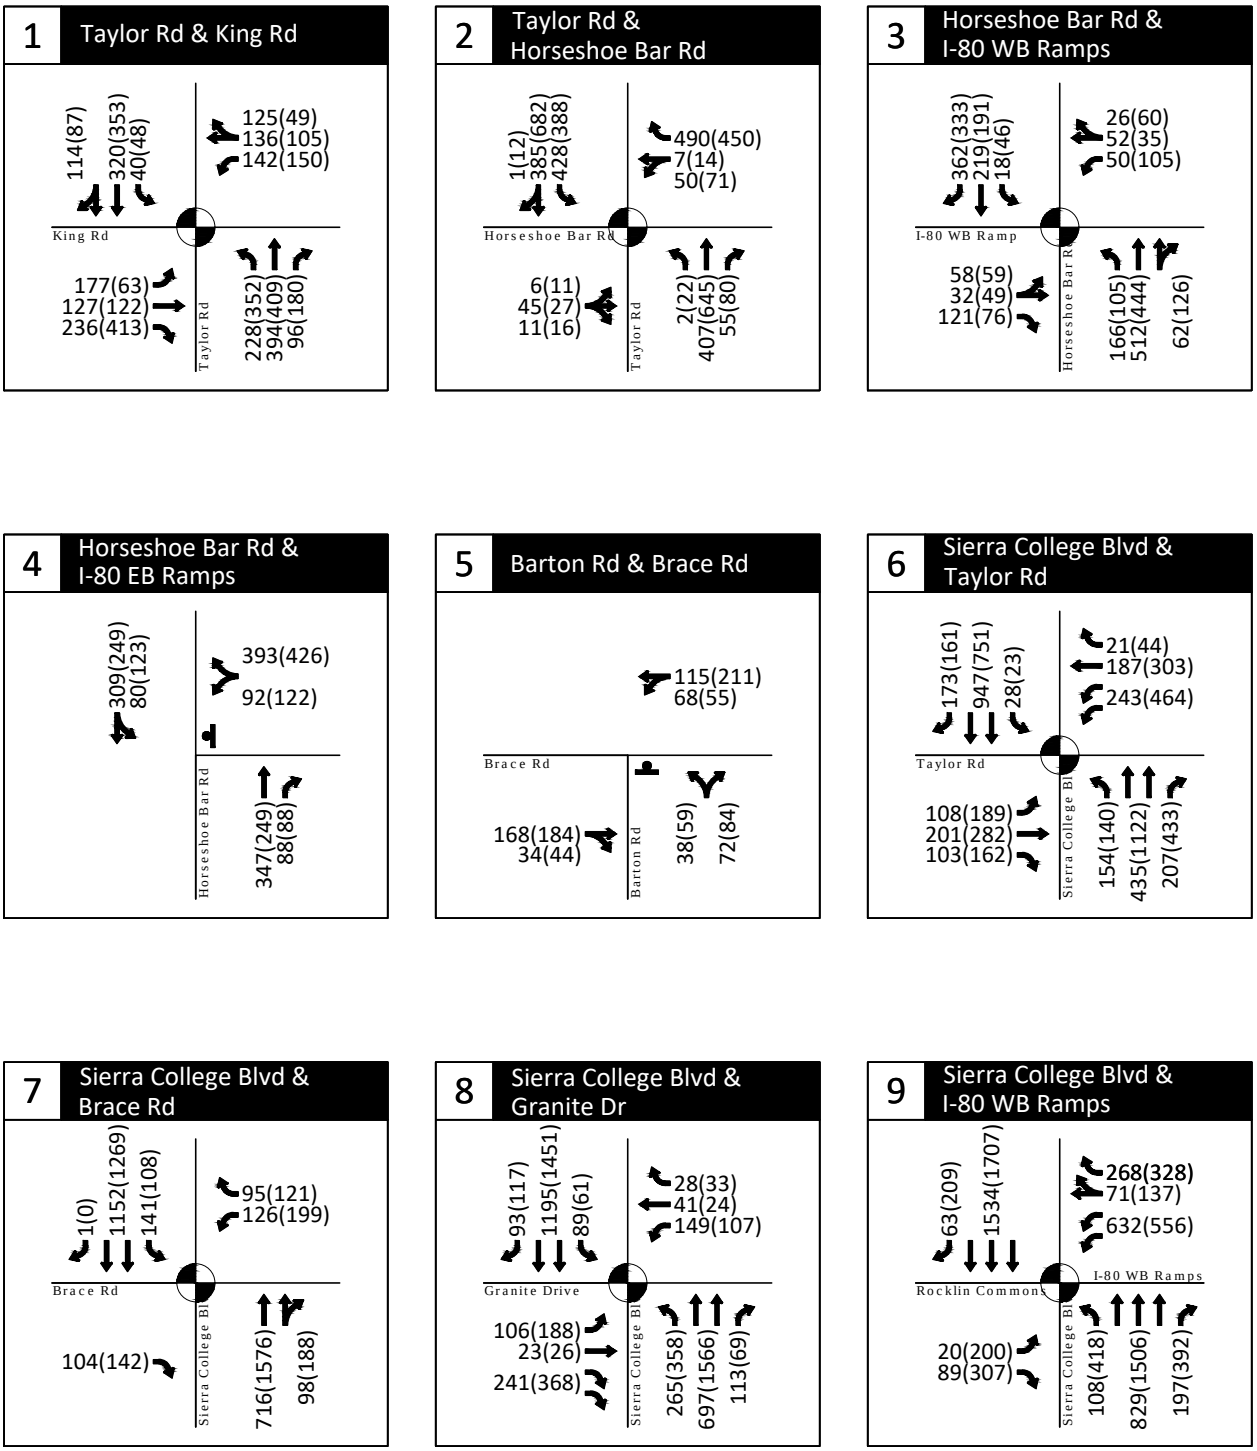
The Villages of Loomis development is not anticipated to be constructed and occupied by the Project opening of 2020.
Source: Kittelson & Associates, Inc. 2019
N/A = not applicable/not available

Peak hour trips associated each of the approved pending projects were distributed through the study area using trip distribution percentages obtained from recently completed commercial and residential development project traffic studies in Rocklin. Because the proposed Project study area is larger than the study areas used in the other available development studies, trips were distributed throughout the larger study area using traffic patterns from existing counts, available traffic studies in the area, and engineering judgement.

Funded Transportation Improvements

Some of the existing study intersection configurations will be modified in association with Approved/Pending development projects. Specifically, a western approach would be added on Schriber Way at Sierra College Boulevard and the intersection of Sierra College Boulevard/Schriber Way would be signalized by the Rocklin Station project.

In addition to the approved/pending development projects noted above, the Town of Loomis has a funded widening of Sierra College Boulevard between Brace Road and Taylor Road identified in the adopted 2018-2023 Capital Facility Plan. The Town's roadway project is expected to widen the roadway to provide three northbound vehicle travel lanes, three southbound vehicle travel lanes, as well as a Class II bicycle facility both northbound and southbound for the length of the project. The northbound approach of Sierra College Boulevard at Taylor Road will provide a separate left-turn lane, two through lanes, and a separate northbound right-turn lane with traffic signal overlap plus the separate bicycle lane. The southbound approach of Sierra College Boulevard at Brace Road will provide a left-turn lane, two through lanes, and interim de-facto right-turn trap lane (to later be restriped as a shared through/right-



turn lane by others) as well as a separate bicycle lane. Construction of the Town's roadway widening project is expected in 2020-2021.

The planned/funded improvements were assumed to be completed in conjunction with the approved pending development project.

7.1 INTERSECTION EVALUATION

Weekday AM and PM as well as weekend midday peak hours associated with the approved/pending projects were added to the existing conditions traffic volumes to derive the Cumulative Short Term Baseline traffic volumes. Given the number of approved/pending projects contributing trips to the study area, the traffic signal timing at the study intersections was optimized for the Cumulative Short Term Baseline conditions. Per Caltrans staff direction, the I-80 ramps at Sierra College Boulevard were analyzed with coordination timing as determined by the Synchro software.

Figure 20 shows the Cumulative Short Term Baseline traffic condition during the weekday AM and PM peak hours while Figure 21 shows the Cumulative Short Term Baseline traffic condition during the weekend midday peak hour.

7.1.1 Level-of-Service Analysis

Table 30 summarizes the LOS analysis for the study intersections under Cumulative Short Term Baseline conditions. Please note that the delays at some study intersections may be lower when compared to existing conditions due to signal timing optimization and/or recirculation of traffic due to the addition approved/pending projects.

As shown in Table 30, the following intersections would operate at unacceptable LOS:

- Taylor Road & King Road (PM)
- Horseshoe Bar Road & I-80 Eastbound Ramp (AM and PM)
- Sierra College Boulevard & Taylor Road (PM)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM and PM)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (PM)
- Sierra College Boulevard & SR-193 (AM, PM, and MD)
- Sierra College Boulevard & English Colony Way (PM and MD)
- Sierra College Boulevard & Delmar Avenue (AM, PM, and MD)
- Taylor Road & Penryn Road (South) (AM and PM)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM and MD)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Webb Street (AM, PM, and MD)

Appendix “B” includes the level-of-service worksheets.

Table 30: Cumulative Short Term Baseline Conditions - Intersection LOS Analysis, Weekday AM/PM and Weekend Midday Peak Hour

ID	Intersection	Traffic Control Type	Weekday AM		Weekday PM		Weekend MD	
			Delay	LOS	Delay	LOS	Delay	LOS
1	Taylor Rd/King Rd	Signal	38.9	D	**59.8**	**E**	42.5	D

Notes:
AWSC: All-way stop control – The average intersection delay is reported.
TWSC: Two-way stop control - The delay reported reflects the critical movement.
Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.
Source: Kittelson & Associates, Inc. 2019

7.1.2 Queuing Analysis

Appendix C provides the queue summary for the weekday AM, PM and weekend midday peak hours. The queues at the following intersections would extend beyond the storage lengths available at these locations:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Sierra College Boulevard & Taylor Road (AM, PM, and MD)
- Sierra College Boulevard & Brace Road (PM and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM, and MD)
- Sierra College Boulevard & I-80 EB Ramps (PM and MD)
- Sierra College Boulevard & Schriber Way (AM, PM, and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM and MD)
- I-80 Eastbound Ramps & Rocklin Road (AM and PM)
- Aguilar Road & Rocklin Road (AM and PM)
- El Don Drive & Rocklin Road (AM)
- Sierra College Boulevard & SR-193 (MD)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (AM, PM and MD)
- The southbound through at Sierra College Boulevard & Schriber Way would affect operations at Sierra College Boulevard & I-80 EB Ramps (AM, PM, and MD)
- The westbound left at I-80 Westbound Ramps & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (PM)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (AM and PM)
- The eastbound through at Aguilar Road & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (AM)

7.2 PLACER COUNTY ROADWAY OPERATIONS

Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. Table 31 outlines the roadway volume and associated level of service for the study segments. As shown, all study segments satisfy the LOS C or better standard.

Table 31: Cumulative Short Term Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	ADT	LOS
Sierra College Boulevard (SCB)	SR-193 to English Colony Way	2	9,040	A
	English Colony Way to Delmar Ave	2	12,130	B
	Delmar Ave to Loomis Town Limits	2	12,130	B
SR-193	Lincoln City Limits to SCB	2	11,300	B
	SCB to Clark Tunnel Road	2	7,850	A

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates. Source:
Kittelson & Associates, Inc. 2018

7.3 FREEWAY FACILITIES EVALUATION

Freeway mainline traffic volumes were calculated by adding approved/pending project trips to the existing data collected from PeMS.

7.3.1 Freeway Mainline Basic Segment Analysis

Table 32 outlines the Short Term Cumulative mainline volume, density and associated level of service for the study segments. As shown, all study segments operate at acceptable LOS D or better.

Appendix "E" includes the freeway mainline level-of-service worksheets.

Table 32: Cumulative Short Term Baseline Conditions – I-80 Mainline LOS Analysis, Weekday AM/PM Peak Hours

ID	Segment	Direction	Weekday AM			Weekday PM			Weekend MD		
			Volume	Density	LOS	Volume	Density	LOS	Volume	Density	LOS
1	I-80 east of Sierra College Boulevard	Eastbound	3,288	20.1	C	4,564	29.0	D	4,187	23.8	C
		Westbound	4,134	26.0	C	4,068	25.5	C	4,243	23.6	C
2	I-80 west of Sierra College Boulevard	Eastbound	3,216	19.7	C	4,419	27.8	D	4,392	25.1	C
		Westbound	3,923	24.4	C	4,016	25.1	C	4,198	23.3	C

Notes:
Density: passenger cars/mile/lane
Source: Kittelson & Associates, Inc. 2019

7.3.2 Ramp Metering Supplemental Evaluation

The evalaution was prepared for informational purposes. Table 33 shows the calculated queues in feet and the minimum metering rate in vehicles per hour. The generated queues are accommodated within the available 1,200-foot long storage area.

Appendix "I" includes the ramp metering worksheets.

Table 33: Cumulative Short Term Baseline Conditions – I-80 Westbound Slip-Ramp Ramp Meter Analysis

Peak Hour	Meter Rate (vehicles/hour)	Calculated Queue (feet)
AM	240	11
PM	300	134
MD	300	0

Notes:
Boldface type indicates if queue exceeds available ramp storage capacity of 1,200 feet.
Source: Kittelson & Associates, Inc. 2019

7.4 PEDESTRIAN AND BICYCLE EVALUATION

No pedestrian or bicycle facility improvements were programmed under Cumulative Short Term Conditions beyond typical frontage improvements associated with approved development projects.

7.5 TRANSIT EVALUATION

No transit service improvements were programmed under Cumulative Short Term Conditions. The effect of approved in-process development on traffic flow could affect travel time for transit vehicles. Traffic flow effects due to approved in-process development are addressed in the intersection evaluation sections of this study.

Section 8
Cumulative Conditions – Short Term Plus Project

8.0 CUMULATIVE CONDITIONS – SHORT TERM PLUS PROJECT

The Cumulative Short Term plus Project traffic conditions analysis forecasts how the study area's transportation system would operate with the traffic generated by the proposed Costco development.

8.1 INTERSECTION EVALUATION

Development of the proposed Costco Project would include construction of multiple access points and several roadway capacity improvement measures. The changes to be constructed are detailed in Sections 5.1 and 5.1.2 of this report and include widening of Sierra College Boulevard to three lanes northbound between Granite Drive and Brace Road, signalization of the Sierra College Boulevard Project access, addition of northbound turn lanes on Sierra College Boulevard at the new traffic signal and Brace Road, changes to the Brace Road site frontage, and reconfiguration of Granite Drive east of Sierra College Boulevard (Project Driveway Options B and C only).

Cumulative Short Term Baseline Conditions traffic volumes for the weekday AM and PM as well as weekend midday peak hours were added to the site-generated traffic to arrive at the Short Term plus Project traffic volumes.

Figure 22 shows the Cumulative Short Term plus Project (Project Driveway Option 1A) traffic condition during weekday AM and PM peak hours and Figure 23 shows the Cumulative Short Term plus Project (Project Driveway Option 1A) traffic condition during the weekend midday peak hour. Project Driveway Options 1B and 1C would affect Cumulative Short Term plus Project traffic volumes at study intersections 7, 8, 21, 24, 25, and 37 due to the driveway trip routing. All other study intersections would have the same Cumulative Short Term plus Project traffic volumes under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Figure 24 shows the Cumulative Short Term plus Project traffic condition during the weekday AM and PM peak hours for all three Project driveway options at those study intersections affected by the options. Figure 25 shows the Cumulative Short Term plus Project Alternative traffic condition during the weekend midday peak hour for all three Project driveway options at those study intersections affected by the options.

8.1.1 Level-of-Service Analysis

To gauge the impact of the Project traffic on the roadway network, the Project analysis assumed that study intersection signal timings would be unchanged from those in baseline conditions (including coordination timing at the I-80 ramps at Sierra College Boulevard) except at study locations where the Project provides geometric improvements.

Project Driveway Option 1A

Table 34 shows the baseline Cumulative Short Term No-Project and Plus Project (Project Driveway Option 1A) delays and LOS for the study intersections during the weekday AM and PM peak hours. Table 35 shows the baseline Cumulative Short Term No-Project and Plus Project (Project Driveway Option 1A)

delays and LOS for the study intersections during the weekend midday peak hour. Please note that the delays at some study intersections may be lower when compared to existing or existing plus Project conditions due to geometric improvements and corresponding signal timing optimization and/or recirculation of traffic associated with the addition of approved/pending projects.

As shown in the tables below, the following intersections operate at unacceptable LOS:

- Taylor Road & King Road (PM)
- Horseshoe Bar Road & I-80 Eastbound Ramp (AM and PM)
- Sierra College Boulevard & Taylor Road (PM and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 Westbound Ramps (PM and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM, PM, and MD)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (PM and MD)
- Sierra College Boulevard & SR-193 (AM, PM, and MD)
- Sierra College Boulevard & English Colony Way (PM and MD)
- Sierra College Boulevard & Delmar Avenue (AM, PM, and MD)
- Taylor Road & English Colony Way (MD)
- Taylor Road & Penryn Road (South) (AM and PM)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM and MD)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Webb Street (AM, PM, and MD)

Based on the impact criteria defined earlier, the following intersections would be significantly impacted by the proposed Project:

- Sierra College Boulevard & Taylor Road (MD)
- Sierra College Boulevard & Granite Drive (PM and MD)
- Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (MD)
- Granite Drive & Rocklin Road (MD)
- Sierra College Boulevard & SR-193 (PM and MD)
- Sierra College Boulevard & English Colony Way (PM and MD)
- Taylor Road & English Colony Way (MD)

- Taylor Road & Penryn Road (South) (AM)
- Taylor Road & Webb Street (MD)

Appendix "B" includes the level-of-service worksheets.

Notes:
AWSC: All-way stop control – The average intersection delay is reported.

TWSC: Two-way stop control - The delay reported reflects the critical movement.

DNE: Intersection does not exist under no Project conditions.

Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.

Shaded cell indicates Project impact

[1] An impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project adds trips to the intersection exceeding 5% of the total traffic already at the intersection. At these locations, the project does not contribute 5% or more of the volumes.

[2] Intersection does not meet signal warrants for impacts condition, therefore per the Placer County guidelines, this intersection is not significantly impacted. Traffic signal warrants provided in Appendix J.

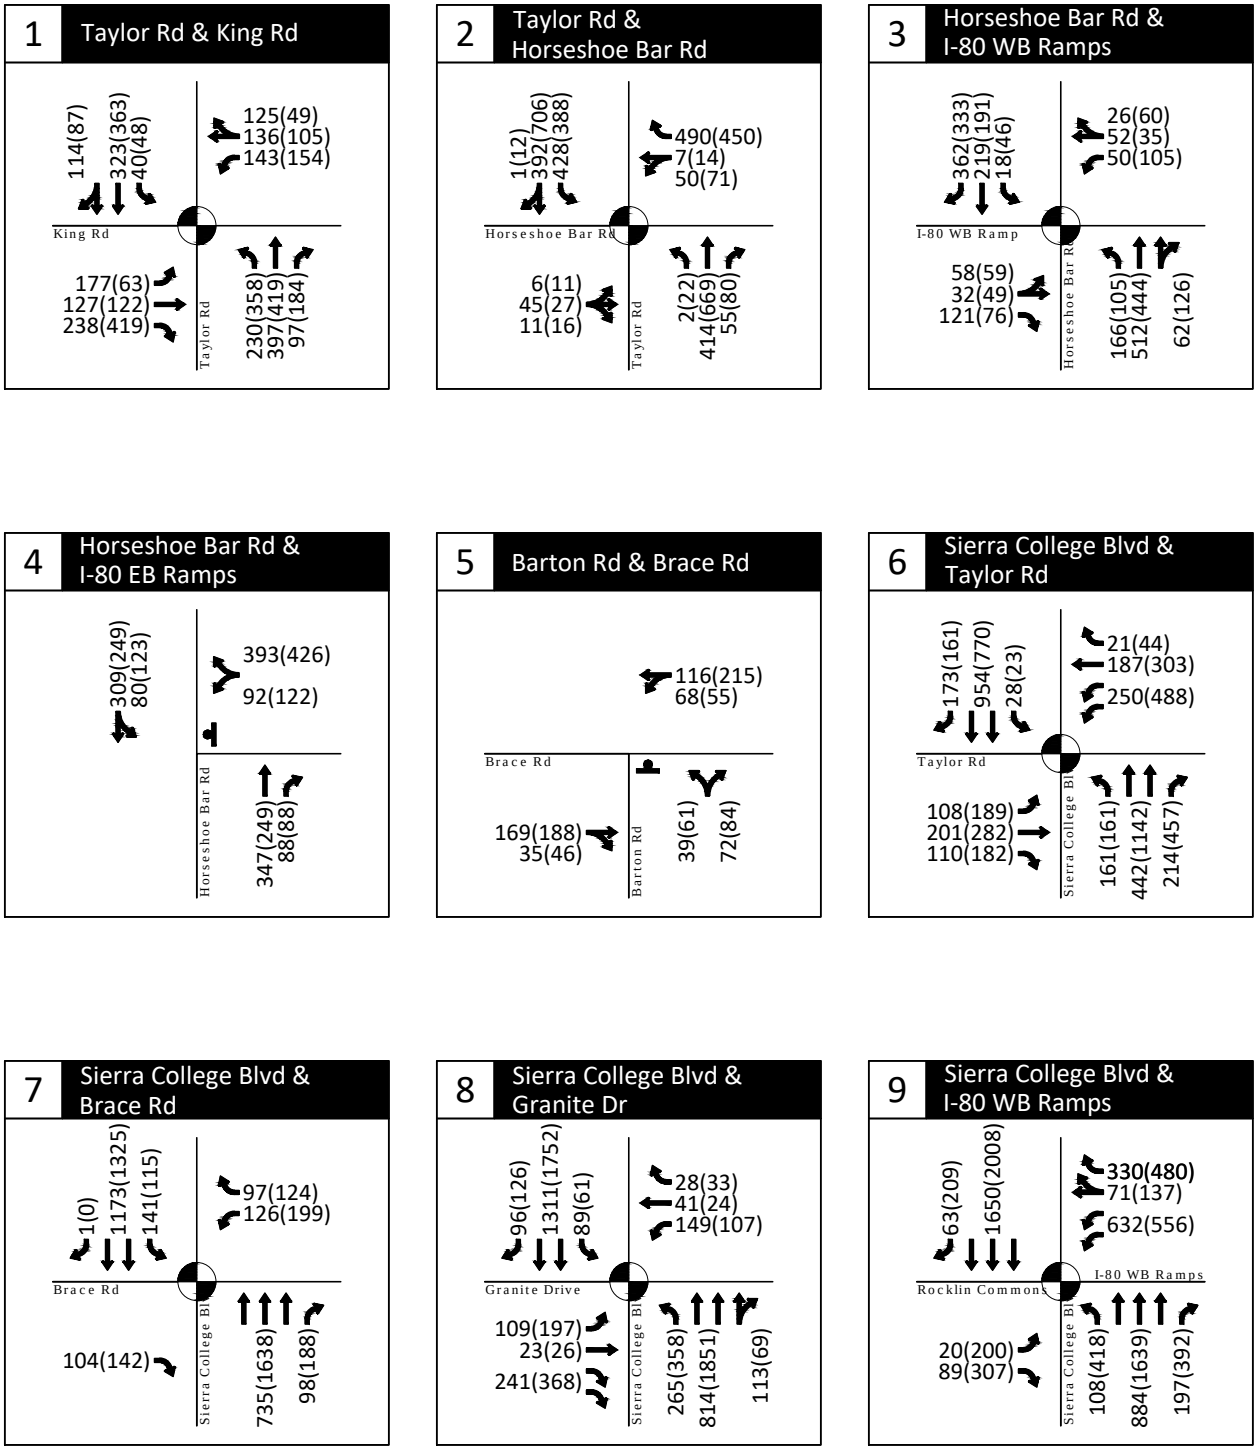
Notes:
AWSC: All-way stop control – The average intersection delay is reported.

TWSC: Two-way stop control - The delay reported reflects the critical movement.

DNE: Intersection does not exist under no Project conditions.

Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.

Shaded cell indicates significant Project impact



[1] An impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project adds trips to the intersection exceeding 5% of the total traffic already at the intersection. At these locations, the project does not contribute 5% or more of the volumes.

[2] Intersection does not meet signal warrants for impacts condition, therefore per the Placer County guidelines, this intersection is not significantly impacted. Traffic signal warrants provided in Appendix J.

[3] Due to the high volumes, HCM2010 was unable to report approach delay.

[4] Timing was held constant between No Project and Project conditions. Volume increases at certain movements adds more weight to the average intersection delay calculation, lowering the overall intersection delay

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to the driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Alternative driveway configurations would affect operations at a limited number of study intersections. Table 36 shows the baseline Cumulative Short Term No-Project and Plus Project delays and LOS at those study intersections affected by the options during weekday AM and PM peak hours.

Table 37 shows the baseline Cumulative No-Project and Plus Project delays and LOS at those study intersections affected by the options during the weekend midday peak hour.

The following affected study area intersections would be significantly impacted by the proposed Project for Project Driveway Options 1B and 1C :

- Sierra College Boulevard & Granite Drive (PM and MD)

Table 36: Cumulative Short Term Plus Project - Intersection LOS Analysis, Weekday AM/PM Peak Hour – Project Driveway Options 1B & 1C

8.1.2 Queuing Analysis

Appendix C provides the queue summary tables for the weekday AM, PM and weekend midday peak hours. Appendix "G" includes the Project contribution tables.

Project Driveway Option 1A

Forecast 95th percentile queues extend beyond the available storage lengths available for Project Driveway Option 1A at the following locations:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Sierra College Boulevard & Taylor Road (AM, PM, and MD)
- Sierra College Boulevard & Brace Road (PM and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM and MD)
- Sierra College Boulevard & I-80 EB Ramps (PM and MD)
- Sierra College Boulevard & Schriber Way (AM, PM, and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM and MD)
- I-80 Eastbound Ramps & Rocklin Road (AM, PM, and MD)
- Aguilar Road & Rocklin Road (AM)
- El Don Drive & Rocklin Road (AM)
- Sierra College Boulevard & Project Driveway (MD)
- Sierra College Boulevard & SR-193 (MD)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (AM, PM and MD)
- The southbound through at Sierra College Boulevard & Schriber Way would affect operations at Sierra College Boulevard & I-80 EB Ramps (AM, PM, and MD)
- The westbound left at I-80 Westbound Ramps & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (PM)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (AM and PM)
- The eastbound through at Aguilar Road & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (AM)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflows under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following intersections:

- Taylor Road & Horseshoe Bar Road (MD)
- Sierra College Boulevard & Taylor Road (PM and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM, and MD)
- Granite Drive & Rocklin Road (MD)
- Sierra College Boulevard & Project Driveway (MD)
- Sierra College Boulevard & SR-193 (MD)

Please note that the queues at some study intersections may be lower when compared to existing conditions due to signal timing optimization and/or recirculation of traffic due to the addition of approved/pending projects.

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. One or more 95th percentile queues would extend beyond the available storage lengths at the following intersections (for those intersections affected by the driveway options):

- Sierra College Boulevard & Brace Road (PM and MD)[14]
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM and MD)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (AM, PM and MD)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflows under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following affected study area intersections:

- Sierra College Boulevard & Brace Road (PM and MD)[14]
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)

[14] Weekday PM and Weekend Midday peak hour significantly impacted for Project Driveway Option 1B only.

8.2 PLACER COUNTY ROADWAY OPERATIONS

Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. The three Project driveway options do not affect the Project traffic volumes for the roadway segments analyzed. Table 38 outlines the Cumulative Short Term with and without Project roadway volumes and associated level of service for the study segments and is applicable for all three Project driveway options. As shown, all study segments continue to satisfy the LOS C or better standard with the addition of Project trips regardless of the Project driveway option considered. Therefore, Project impacts would be less than significant.

Table 38: Cumulative Short Term plus Project Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	Short Term		Short Term plus Project		
			ADT	LOS	Project ADT	ADT	LOS
Sierra College Boulevard (SCB)	SR-193 to English Colony Way	2	9,040	A	180	9,220	A
	English Colony Way to Delmar Ave	2	12,130	B	200	12,330	B
	Delmar Ave to Loomis Town Limits	2	12,130	B	220	12,350	B
SR-193	Lincoln City Limits to SCB	2	11,300	B	90	11,390	B
	SCB to Clark Tunnel Road	2	7,850	A	50	7,900	A

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates.
Source: Kittelson & Associates, Inc. 2019

8.3 FREEWAY FACILITIES EVALUATION

Cumulative Short Term Conditions traffic volumes for the weekday AM and PM peak hours were added to the site-generated traffic to arrive at the Short Term plus Project total traffic volumes.

8.3.1 Freeway Mainline Basic Segment Analysis

The three Project driveway options do not affect the Project traffic volumes for the freeway segments analyzed. Table 45 through Table 41 outline the Cumulative Short Term and Cumulative Short Term plus Project mainline volume, density and associated level of service for the study segments and are applicable for all three Project driveway options. As shown, all study segments operate at acceptable LOS D or better with Project traffic regardless of the Project driveway options considered. Therefore, no significant impacts occur to the freeway mainline under the Cumulative Short Term plus Project Conditions.

Appendix "E" includes the freeway mainline level-of-service worksheets.

Table 39: Cumulative Short Term – I-80 Mainline LOS Analysis, Weekday AM Peak Hour

ID	Segment	Direction	Short Term			Short Term plus Project			Change in Density
			Volume	Density	LOS	Volume	Density	LOS	
1	I-80 east of Sierra College	Eastbound	3,288	20.1	C	3,310	20.2	C	0.1
		Westbound	4,134	26.0	C	4,157	26.1	D	0.1
2	I-80 west of Sierra College	Eastbound	3,216	19.7	C	3,223	19.7	C	0.0

8.3.2 Ramp Metering Supplemental Evaluation

The evalaution was prepared for informational purposes. The three Project driveway options do not affect the Project traffic volumes for the freeway ramps analyzed. Table 42 outlines the calculated freeway on-ramp queues under Cumulative Short Term and Cumulative Short Term plus Project conditions and is applicable for all three Project driveway options. As shown in Table 42, the calculated queues with the minimum metering rate are projected to be accommodated within the available 1,200-foot long storage area for all Project driveway options considered.

Appendix "I" includes the ramp metering worksheets.

Table 42: Cumulative Short Term Plus Project – I-80 Westbound Slip-Ramp Ramp Meter Analysis

Peak Hour	Short Term		Short Term plus Project	
	Meter Rate (vehicles/hour)	Calculated Queue (feet)	Meter Rate (vehicles/hour)	Calculated Queue (feet)
AM	240	11	240	55
PM	300	134	240	316
MD	300	0	300	86

Notes:
Boldface type indicates if queue exceeds available ramp storage capacity of 1,200 feet.
Source: Kittelson & Associates, Inc. 2019

8.4 PEDESTRIAN AND BICYCLE EVALUATION

The proposed Project would provide pedestrian facilities on-site linking with public facilities along the site frontages on Sierra College Boulevard and Brace Road to provide connectivity with existing facilities. Pedestrian crosswalks would be provided at proposed new signalized Costco site access intersection on Sierra College Boulevard. The project would reconstruct the Type II bicycle facility on Sierra College Boulevard northbound along the site frontage, including providing separate northbound right-turn lanes at the proposed signalized Project access and at Brace Road. In addition, the Project would provide bicycle parking on site for both members and employees.

Due to the nature of products and services provided by the Project, the Project would minimally increase pedestrian and bicycle traffic in the study area. Sidewalk connections would be provided along the Project site frontage with the proposed development along Sierra College Boulevard. The Project site would not be in conflict with applicable Town pedestrian and bicycle plans for any of the Project driveway options considered. The Project would have a less than significant impact on pedestrian and bicycle facilities.

8.5 TRANSIT EVALUATION

Due to the nature of products and services provided by the Project and limited transit connectivity provided adjacent to the site, the Project would minimally increase transit ridership in the study area. The nearest stop is approximately 0.6 mile from the Project site for routes with one hour and two hour headways. Due to the distance to the stop, relatively long headways, and employee shift times, it is unlikely that a significant number of employee trips would be added to the transit network. The project site would not be in conflict with applicable Placer County Transit plans or encroach on any lines or stops. The Project would have a less than significant impact on transit services and a new transit stop is not warranted at the Project site.

Project impacts on traffic flow could affect travel time for transit vehicles. Traffic flow impacts are addressed in the intersection evaluation sections of this study for all Project driveway options considered.

Section 9
Cumulative Conditions – Long Term

9.0 CUMULATIVE CONDITIONS – LONG TERM BASELINE

The Cumulative Long Term baseline traffic conditions analysis forecasts how the study area's transportation system would operate with the traffic generated by overall background and development growth in the area.

Cumulative Long Term conditions were based on a modified model using the City of Rocklin 2030 Travel Demand Model as a base. Both the Town and City models were reviewed and both models were incomplete in accounting for projects and improvements in either jurisdiction. With consultation with Town and City staff, the City's model was selected and modified as needed to account for anticipated development within the Town, City, and County. The model is developed and maintained by the City of Rocklin and is used to predict the impact of travel growth and to evaluate potential transportation improvements. The model was updated to account for approved/pending projects not included in the model as well as missing roadways and roadway improvements in the Town of Loomis. The model volumes were post-processed using standard industry procedures in order to obtain intersection and link-level traffic volumes used in this analysis.

Existing lane configurations were assumed for future conditions unless a funded project was identified for future baseline conditions. The following roadway improvements were assumed under Cumulative Long Term conditions:

- Sierra College Boulevard: widened to 5-6 lanes from Taylor Road to south of Rocklin Road (includes assumed southbound frontage improvements along the currently vacant commercial property west of Sierra College Boulevard between Granite Drive and Brace Road and only 2 northbound lanes between Granite Drive and Brace Road)
- Sierra College Boulevard & Highway 193 intersection signalization
- Sierra College Boulevard & English Colony Way intersection signalization
- Sierra College Boulevard & Delmar Avenue intersection signalization
- Taylor Road & Penryn Road intersection signalization
- Taylor Road & English Colony Way intersection signalization
- Pacific Street: widened to 4 lanes from Town of Loomis boundary line to Delmar Avenue/Dominguez Road
- Rocklin Road: widened to 6 lanes from east of Granite Drive (not improved at Granite Drive) to west of Sierra College Boulevard; widened to 4 lanes east of Sierra College Boulevard
- Dominguez Road extension from Granite Drive to Sierra College Boulevard: 2 lanes provided (including signalization of the Granite Drive & Dominguez Road intersection)

Based on discussions with the Town, the forecast year of 2035 was identified for the Cumulative Long Term condition which is consistent with the Town's General Plan Circulation Element. Therefore, growth

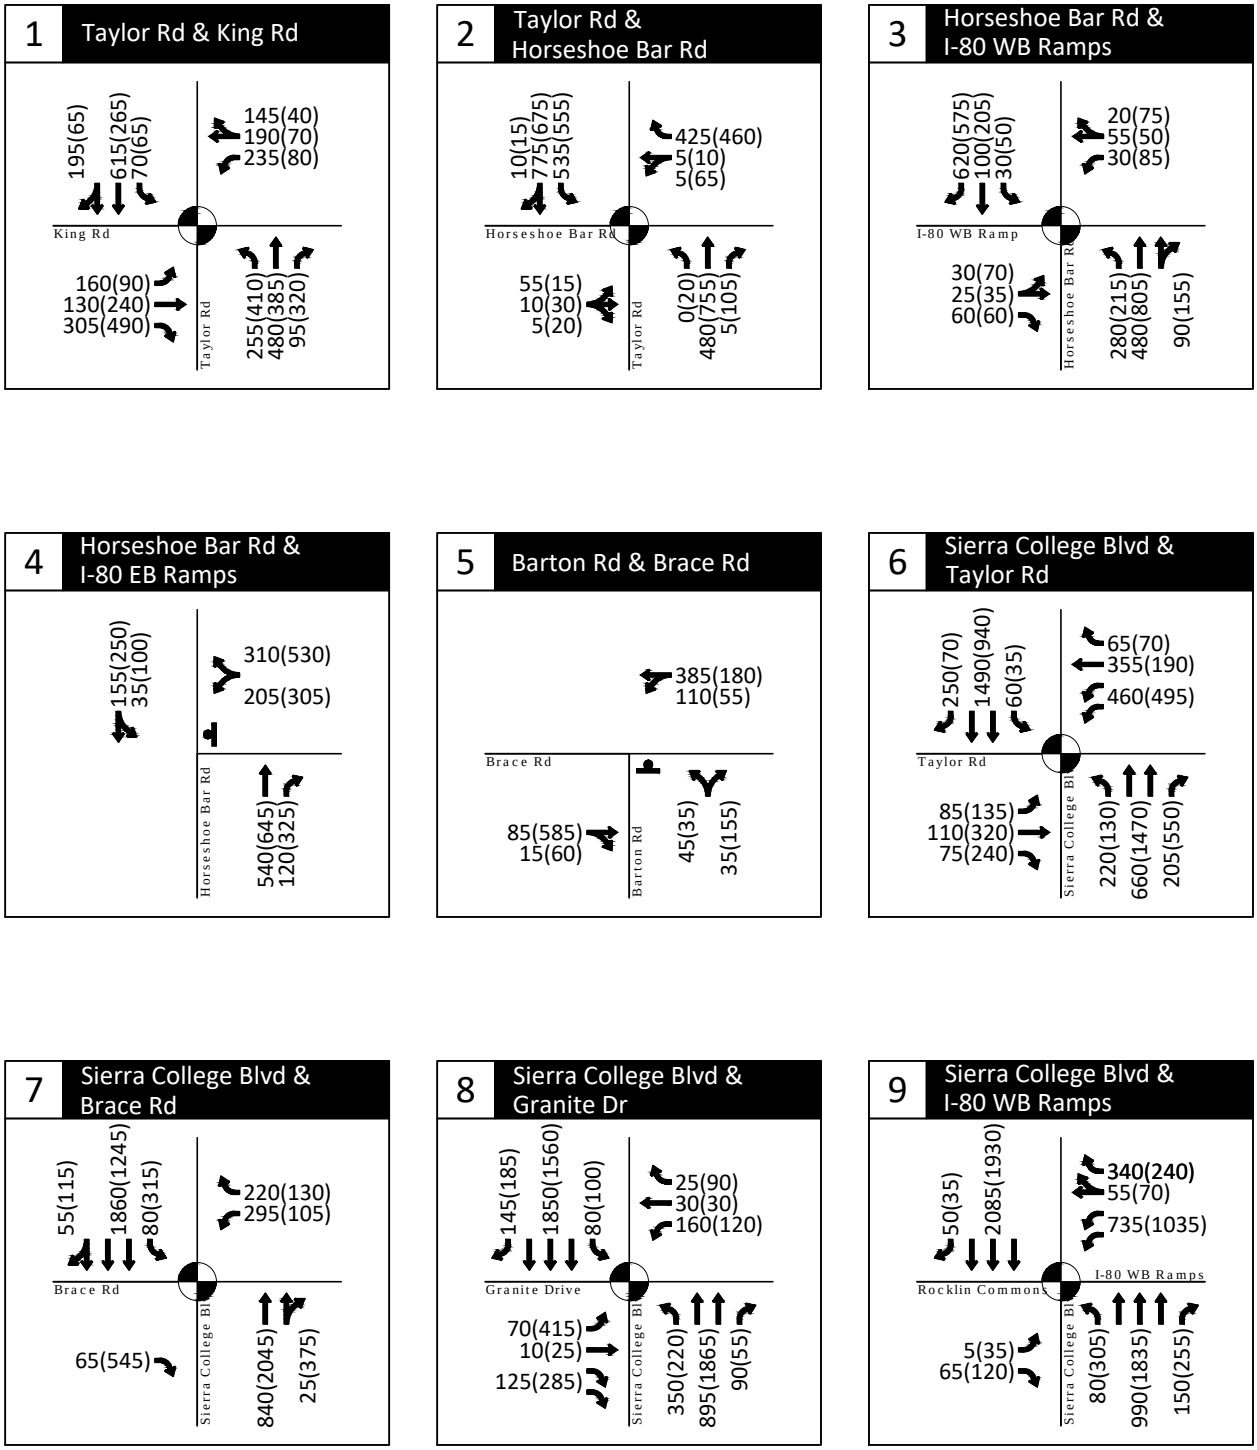
from the modified City of Rocklin 2030 model was forecast to year 2035 conditions. Link volumes for the calibration year of 2011 were compared with the analysis year of 2035 to obtain the growth factors for each intersection and freeway segment. The existing volumes for each facility were then multiplied by the growth factors to arrive at the future baseline condition volumes.

Future intersection post-processing procedures are predicated on existing counts and link volumes from the model. The baseline year for the model was 2011 and the future forecast year was 2030. Link volumes were interpolated using a straight-line growth between 2011 and 2030 to determine link volumes for the analysis year 2035. The Ratio Method was the primary forecasting methodology[15]. The resultant AM and PM peak-hour growth factors were applied to respective base year peak-hour traffic volumes to produce future turning movement volumes for analysis. In the situations where the resultant future-to-base-year ratio exceeds 2.0, the Difference Method[16] was applied. The difference between the base year and forecast year were added to the existing link volumes.

The future analysis year intersection turning movement volumes were developed following the post processing procedure (iterative method) documented in the National Cooperative Highway Research Program (NCHRP) Report 765: Highway Traffic Data for Urbanized Area Project Planning and Design (the most recent update of NCHRP Report 255). The post processed turning movements were rounded to the nearest five, recognizing the resultant data points are not field measured. Further adjustments were made to intersection locations where the baseline volumes may not have shown data and/or if a transportation analysis zone was not coded at specific intersections in the City of Rocklin 2030 model. For example, an approved development will provide the west approach at the Sierra College Boulevard and Schriber Way intersection that is not accounted for in the 2030 model. For this location, traffic volume data from the development traffic impact study was added to the intersection model volumes.

The City of Rocklin 2030 model does not forecast weekend conditions. Lacking weekend model data, weekend midday peak hour volumes were instead developed considering the relationship in growth between weekday AM and PM peak hour conditions. A comparison of ADT, AM and PM model growth projected on major corridors in the study area showed relatively consistent growth patterns. The PM peak hour growth was higher than AM peak hour and so was conservatively used as a basis to project weekend midday peak hour conditions. The base year and future year model data for each intersection approach was adjusted by the corresponding ratio of weekend midday volume to weekday PM volume. The data was post-processed using weekend midday turning movement volumes per the methodology described above. Final adjustments were made at intersections where model predicted negative growth occurred in projecting turning movement volumes.

[15] The Ratio Method computes the ratio of the base year and future year link volumes in the model to calculate separate growth factors for the entering and exiting volumes for each study intersection approach.



[16] The difference method adds (or subtracts) the difference between the base year traffic count and base year modeled volume to the forecasted model volume.

9.1 INTERSECTION EVALUATION

Cumulative Long Term Baseline conditions were assessed using the projected weekday AM and PM as well as weekend midday peak hour volumes. Given the growth from existing conditions, the traffic signal timing at the study intersections was optimized for the Cumulative Long Term Baseline conditions. Figure 26 shows the Cumulative Long Term Baseline traffic volumes during the weekday AM and PM peak hours while Figure 27 shows the Cumulative Long Term Baseline traffic volumes during the weekend midday peak hour. Please note that these volumes are based on the model outputs and may be lower for some movements when compared to existing or cumulative short term conditions. Overall intersection volumes for future conditions are higher as compared to existing or cumulative short term conditions.

The following intersection improvement was assumed in conjunction with the individual approved development projects:

- Sierra College Boulevard & Schriber Way intersection signalized and western approach added by approved development project.

9.1.1 Level-of-Service Analysis

Table 43 summarizes the LOS analysis for the study intersections under Cumulative Long Term Baseline conditions. As shown, the following intersections operate at unacceptable LOS:

- Taylor Road & King Road (AM and PM)
- Horseshoe Bar Road & I-80 Eastbound Ramp (AM, PM, and MD)
- Barton Road & Brace Road (MD)
- Sierra College Boulevard & Taylor Road (AM and PM)
- Sierra College Boulevard & Brace Road (PM)
- Sierra College Boulevard & Granite Drive (AM and PM)
- Sierra College Boulevard & Schriber Way (AM)
- Sierra College Boulevard & Bass Pro Drive/Dominguez Road (AM, PM, and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM, PM, and MD)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM)
- I-80 Eastbound Ramps & Rocklin Road (AM)
- Granite Drive & Dominguez Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (PM)
- Sierra College Boulevard & Project Driveway (not yet serving Project site development but assuming commercial development on the west side of Sierra College Boulevard) (AM, PM, and MD)
- Sierra College Boulevard & SR-193 (PM and MD)
- Sierra College Boulevard & English Colony Way (PM)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM and MD)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Rippey Road (AM)
- Taylor Road & Webb Street (AM and MD)

Appendix “B” includes the level-of-service worksheets.

Table 43: Cumulative Long Term Baseline Conditions - Intersection LOS Analysis, Weekday AM/PM and Weekend Midday Peak Hours

Notes:

AWSC: All-way stop control – The average intersection delay is reported.
TWSC: Two-way stop control - The delay reported reflects the critical movement.
Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards. Source: Kittelson & Associates, Inc. 2019

9.1.2 Queuing Analysis

Appendix C provides the queue summary tables for the weekday AM, PM and weekend midday peak hours. Forecast 95th percentile queues are projected to extend beyond the available storage lengths at the following intersections:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Eastbound Ramp (PM and MD)
- Sierra College Boulevard & Taylor Road (AM, PM, and MD)
- Sierra College Boulevard & Brace Road (AM, PM, and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM, and MD)
- Sierra College Boulevard & I-80 EB Ramps (AM, PM, and MD)
- Sierra College Boulevard & Schriber Way (AM, PM, and MD)
- Sierra College Boulevard & Bass Pro Drive/Dominguez Road (AM, PM, and MD)
- Sierra College Boulevard & Stadium Dwy (AM and PM)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM and PM)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (AM, PM, and MD)
- I-80 Eastbound Ramps & Rocklin Road (AM and PM)
- Aguilar Road & Rocklin Road (AM)

- Granite Drive & Dominguez Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (AM)
- Sierra College Boulevard & Project Driveway (AM, PM, and MD)
- Sierra College Boulevard & SR-193 (AM, PM, and MD)
- Sierra College Boulevard & English Colony Way (AM, PM, and MD)
- Taylor Road & English Colony Way (AM, PM, and MD)
- Taylor Road & Penryn Road (south) (AM, PM, and MD)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The westbound through at Horseshoe Bar Road & I-80 Eastbound Ramp would back up to the I-80 Eastbound mainline (PM and MD)
- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound left-turn at Sierra College Boulevard & Brace Road would affect operations at Sierra College Boulevard & Taylor Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (AM)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM)
- The southbound through at Sierra College Boulevard & I-80 Westbound Ramps would affect operations at Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- The southbound through at Sierra College Boulevard & Schriber Way would affect operations at Sierra College Boulevard & I-80 EB Ramps (AM and PM)
- The southbound through at Sierra College Boulevard & Bass Pro Drive/Dominguez Road would affect operations at Sierra College Boulevard & Schriber Way (AM and PM)
- The westbound left-turn at I-80 Westbound Ramps & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (PM)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (PM)

9.1.3 Supplemental Simulation Evaluation

The Cumulative Long Term Conditions simulation evaluation was conducted with the same assumptions as outlined in Section 4.0 for Existing Conditions and is provided for informational purposes only. The total network performance results of the simulation runs are presented in Table 44 and the arterial performance results are presented in Table 45.

As shown, under Cumulative Long Term Conditions the network is projected to experience congestion that contributes to increased delays as well as an increased number of vehicles being denied entry into the network.

For the Sierra College Boulevard corridor, delay and travel time increase by almost double those under Existing Conditions. In addition, the average arterial speed drops below 16 miles per hour.

Table 44: Cumulative Long Term Conditions – Simulation Total Network Performance Results

Peak Hour	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
AM	173.9	9,765	9,377	1,099
PM	198.6	11,954	11,718	2,258
MD	106.2	11,316	11,208	625

Notes:
(s): seconds
Total Delay/Vehicle: Total delay is equal to the travel time minus the travel time for a vehicle with no other vehicles or control devices. This delay is divided by the number of vehicles to obtain the total delay per vehicle.
Vehicles Entered/Exited: Represents the number of vehicles counted entering and exiting the link or area during the interval. This value does not include vehicles moving from one intersection to the next with the arterial or network.
Vehicles Denied Entry: This value represents the number of vehicles unable to enter a link due to congestion and are waiting to enter. These vehicles can either be from an external link or from a mid-block source.
Source: Kittelson & Associates, Inc. 2019

Table 45: Cumulative Long Term Conditions – Simulation Sierra College Boulevard Arterial Performance Results

Segment	Peak Hour	Direction	Delay (s)	Travel Time (s)	Arterial Speed (mph)
Sierra College Boulevard between Taylor Road and Stadium Way	AM	Northbound	291.2	417.2	13
		Southbound	468.0	1,361.8	11
	PM	Northbound	471.5	1,611.8	9
		Southbound	419.7	776.8	11
	MD	Northbound	246.4	662.3	15
		Southbound	273.9	447.5	16

Notes:
Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.
Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.
Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.
Source: Kittelson & Associates, Inc. 2019

The detailed network and arterial performance output sheets are presented in Appendix "D".

9.2 PLACER COUNTY ROADWAY OPERATIONS

Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. Table 46 outlines the Cumulative Long Term roadway volume and associated level of service for the study segments. As shown, with baseline volume increases the study segments satisfy the LOS C or better standard with the exception of Sierra College Boulevard between English Colony Way to the Loomis Town Limits.

Table 46: Cumulative Long Term Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	ADT	LOS
Sierra College Boulevard (SCB)	SR-193 to English Colony Way	4	20,150	A
	English Colony Way to Delmar Ave	4	31,360	D
	Delmar Ave to Loomis Town Limits	4	29,920	D
SR-193	Lincoln City Limits to SCB	4	26,530	C
	SCB to Clark Tunnel Road	2	11,880	B

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates.
Source: Kittelson & Associates, Inc. 2019

9.3 FREEWAY FACILITIES EVALUATION

Freeway mainline future forecast volumes were calculated following the same intersection data projection methodology.

9.3.1 Freeway Mainline Basic Segment Analysis

Table 47 outlines the Cumulative Long Term mainline volume, density and associated level of service for the study segments. As shown, operations of two study segments exceed acceptable LOS D:

- I-80 east of Sierra College Boulevard – Westbound (PM)
- I-80 west of Sierra College Boulevard – Westbound (PM)

Appendix "E" includes the freeway mainline level-of-service worksheets.

Table 47: Cumulative Long Term Baseline Conditions – I-80 Mainline LOS Analysis, Weekday AM/PM Peak Hours

ID	Segment	Direction	Weekday AM			Weekday PM			Weekend MD		
			Volume	Density	LOS	Volume	Density	LOS	Volume	Density	LOS
1	I-80 east of Sierra College Boulevard	Eastbound	4,780	30.9	D	5,060	30.9	D	5,340	324	D
		Westbound	4,700	30.7	D	5,440	35.8	E	5,030	28.9	D
2	I-80 west of Sierra College Boulevard	Eastbound	5,000	33.0	D	4,440	26.1	D	5,350	32.5	D
		Westbound	4,290	27.1	D	5,550	37.1	E	5,050	29.0	D

Notes:
Density: passenger cars/mile/lane
Source: Kittelson & Associates, Inc. 2019

9.3.2 Ramp Metering Supplemental Evaluation

The evalaution was prepared for informational purposes. Table 48 shows that the calculated queues with the assumed minimum metering rate generate can be accommodated within the 1,200 feet of available storage area.

Appendix "I" includes the ramp metering worksheets.

Table 48: Cumulative Long Term Baseline Conditions – I-80 Westbound Slip-Ramp Ramp Meter Analysis

Peak Hour	Meter Rate (vehicles/hour)	Calculated Queue (feet)
AM	240	0
PM	450	473
MD	450	134

Notes:
Boldface type indicates if queue exceeds available ramp storage capacity of 1,200 feet.
Source: Kittelson & Associates, Inc. 2019

9.4 PEDESTRIAN AND BICYCLE EVALUATION

No pedestrian or bicycle facility improvements were programmed under Cumulative Long Term Conditions.

9.5 TRANSIT EVALUATION

No transit service improvements were programmed under Cumulative Long Term Conditions. The impact of approved in-process and other non-Project future development on traffic flow could affect travel time for transit vehicles. Traffic flow effects due to approved in-process and other non-Project future development are addressed in the intersection evaluation sections of this study.

Section 10 Cumulative Conditions – Long Term plus Project

10.0 CUMULATIVE CONDITIONS – LONG TERM PLUS PROJECT

The Cumulative Long Term plus Project traffic conditions analysis forecasts how the study area's transportation system would operate with the traffic generated by the proposed Costco warehouse development.

10.1 INTERSECTION EVALUATION

Cumulative Long Term Baseline Conditions traffic volumes for the weekday AM and PM as well as weekend midday peak hours were added to the site-generated traffic to arrive at the Cumulative Long Term plus Project volumes.

Figure 28 shows the Cumulative Long Term plus Project (Project Driveway Option 1A) traffic condition during the weekday AM and PM peak hours and Figure 29 shows the Cumulative Long Term plus Project (Project Driveway Option 1A) traffic condition during the weekend midday peak hour. Project Driveway Options 1B and 1C would affect Cumulative Short Term plus Project traffic volumes at study intersections 7, 8, 21, 24, 25, and 37 due to the driveway routing. All other study intersections would have the same Cumulative Short Term plus Project traffic volumes under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. For Project Driveway Option 1A, Figure 30 shows the Cumulative Long Term plus Project traffic condition during the weekday AM and PM peak hours for all three Project driveway options at those study intersections affected by the options. Figure 31 shows the Cumulative Long Term plus Project Alternative traffic condition during the weekend midday peak hour for all three Project driveway options at those study intersections affected by the options.

10.1.1 Level-of-Service Analysis

To gauge the impact of the Project traffic on the baseline roadway network, the Project analysis assumed that study intersection signal timings would be unchanged from those under no Project conditions except at study locations where the Project provides roadway improvements (specifically, Sierra College Boulevard & Granite Drive as well as Sierra College Boulevard & Brace Road).

Project Driveway Option 1A

Table 49 shows the baseline Cumulative Long Term No-Project and Plus Project (Project Driveway Option 1A) delays and LOS for the study intersections during weekday AM and PM peak hours. Table 50 shows the baseline Cumulative Long Term No-Project and Plus Project (Project Driveway Option 1A) delays and LOS for the study intersections during weekend midday peak hour.

As shown in the tables below, the following intersections would operate at unacceptable LOS:

- Taylor Road & King Road (AM and PM)
- Horseshoe Bar Road & I-80 Eastbound Ramp (AM, PM, and MD)
- Barton Road & Brace Road (MD)
- Sierra College Boulevard & Taylor Road (AM, PM, and MD)
- Sierra College Boulevard & Brace Road (PM)
- Sierra College Boulevard & Granite Drive (AM and PM)
- Sierra College Boulevard & Schriber Way (AM)
- Sierra College Boulevard & Bass Pro Drive/Dominguez Road (AM, PM, and MD)
- Sierra College Boulevard & Rocklin Road (AM, PM and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM, PM, and MD)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (PM)
- I-80 Eastbound Ramps & Rocklin Road (AM)
- Granite Drive & Dominguez Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (PM)
- Sierra College Boulevard & SR-193 (PM and MD)
- Sierra College Boulevard & English Colony Way (PM)
- Taylor Road & English Colony Way (AM and MD)
- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM and MD)
- Taylor Road & Del Oro High School South Lot (AM)
- Taylor Road & Rippey Road (AM)
- Taylor Road & Webb Street (AM and MD)

Based on the impact criteria defined earlier, the following intersections would be significantly impacted by the proposed Project:

- Sierra College Boulevard & Taylor Road (MD)
- Sierra College Boulevard & Granite Drive (PM)
- Sierra College Boulevard & Bass Pro Drive/Dominguez Road (MD)
- Sierra College Boulevard & SR-193 (MD)
- Taylor Road & Webb Street (MD)

Appendix “B” includes the level-of-service worksheets.

Table 49: Cumulative Conditions – Long Term Traffic Conditions, Weekday AM and PM Peak – Project Driveway Option 1A

Notes:
AWSC: All-way stop control – The average intersection delay is reported.
TWSC: Two-way stop control - The delay reported reflects the critical movement.
DNE: Intersection does not exist.
Boldface type indicates intersections performing below acceptable LOS. Refer to Table 1 for applicable operating standards.
Shaded cell indicate significant Project impact
[1] An impact is significant in situations when the intersection is already operating at unacceptable LOS and the Project adds trips to the intersection exceeding 5% of the total traffic already at the intersection. At these locations, the project does not contribute 5% or more of the volumes.

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Table 51 shows the baseline Cumulative Long Term No-Project and Plus Project delays and LOS for those study intersections affected by the options during the weekday AM and PM peak hours. Table 52 shows the baseline Cumulative Long Term No-Project and Plus Project delays and LOS for those study intersections affected by the options during the weekend midday peak hour.

As shown in the two tables, none of the six affected study intersections affected by site trip routing to the Project driveways are significantly impacted by the proposed Project for Project Driveway Options B and C

10.1.2 Queuing Analysis

Appendix C provides the queue summary tables for the weekday AM, PM and weekend midday peak hours and the corresponding queuing worksheets. Appendix "G" includes the Project contribution tables.

Project Driveway Option 1A

The queues at the following intersections would extend beyond the storage lengths available at these locations for Project Driveway Option 1A:

- Taylor Road & King Road (AM, PM, and MD)
- Taylor Road & Horseshoe Bar Road (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Westbound Ramp (AM, PM, and MD)
- Horseshoe Bar Road & I-80 Eastbound Ramp (PM and MD)
- Sierra College Boulevard & Taylor Road (AM, PM, and MD)
- Sierra College Boulevard & Brace Road (AM, PM, and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM, and MD)
- Sierra College Boulevard & I-80 EB Ramps (AM, PM, and MD)
- Sierra College Boulevard & Schriber Way (AM, PM, and MD)
- Sierra College Boulevard & Bass Pro Drive/Dominguez Road (AM, PM, and MD)
- Sierra College Boulevard & Stadium Dwy (AM and PM)
- Sierra College Boulevard & Rocklin Road (AM, PM, and MD)
- Pacific Street & Dominguez Road/Delmar Avenue (AM and PM)
- Pacific Street & Rocklin Road (AM, PM, and MD)
- Granite Drive & Rocklin Road (AM, PM, and MD)
- I-80 Westbound Ramps & Rocklin Road (AM, PM, and MD)
- I-80 Eastbound Ramps & Rocklin Road (AM and PM)
- Aguilar Road & Rocklin Road (AM)
- Granite Drive & Dominguez Road (AM, PM, and MD)
- El Don Drive & Rocklin Road (AM and PM)
- Sierra College Boulevard & Project Driveway (AM, PM, and MD)
- Sierra College Boulevard & SR-193 (AM, PM, and MD)
- Sierra College Boulevard & English Colony Way (AM, PM, and MD)
- Sierra College Boulevard & Delmar Avenue (AM)
- Taylor Road & English Colony Way (AM, PM, and MD)
- Taylor Road & Penryn Road (south) (AM, PM, and MD)

- Taylor Road & Del Oro High School North Lot (AM)
- Taylor Road & Del Oro High School Drop Off (AM)
- Taylor Road & Del Oro High School South Lot (AM)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown:

- The westbound through at Horseshoe Bar Road & I-80 Eastbound Ramp would back up to the I-80 Eastbound mainline (PM and MD)
- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound left-turn at Sierra College Boulevard & Brace Road would affect operations at Sierra College Boulevard & Taylor Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (AM)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM)
- The southbound through at Sierra College Boulevard & I-80 WB Ramps would affect operations at Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- The southbound through at Sierra College Boulevard & Schriber Way would affect operations at Sierra College Boulevard & I-80 EB Ramps (AM and PM)
- The southbound through at Sierra College Boulevard & Bass Pro Drive/Dominguez Road would affect operations at Sierra College Boulevard & Schriber Way (AM and PM)
- The westbound left-turn at I-80 Westbound Ramps & Rocklin Road would affect operations at I-80 Eastbound Ramps & Rocklin Road (PM)
- The westbound through at I-80 Eastbound Ramps & Rocklin Road would affect operations at Aguilar Road & Rocklin Road (PM)
- The northbound through at Sierra College Boulevard & Project Driveway would affect operations at Sierra College Boulevard & Granite Drive (PM)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflow under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following intersections:

- Taylor Road & King Road (MD)
- Taylor Road & Horseshoe Bar Road (MD)
- Sierra College Boulevard & Taylor Road (PM and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & I-80 WB Ramps (AM, PM, and MD)
- Granite Drive & Rocklin Road (MD)

- Sierra College Boulevard & Project Driveway (MD)

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C would affect operations of study intersections 7, 8, 21, 24, 25, and 37 due to site driveway trip routing. All other study intersections would operate the same under Project Driveway Options 1B and 1C as they would under Project Driveway Option 1A. Of the six intersections affected by the driveway options, one or more 95th percentile queues would extend beyond the available storage lengths at the following intersections:

- Sierra College Boulevard & Brace Road (AM, PM, and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & Project Driveway (AM, PM, and MD)

In addition, the queues reported at the above locations would affect operations at the upstream locations as shown (for those intersections affected by the driveway options):

- The northbound through at Sierra College Boulevard & Taylor Road would affect operations at Sierra College Boulevard & Brace Road (PM)
- The southbound left-turn at Sierra College Boulevard & Brace Road would affect operations at Sierra College Boulevard & Taylor Road (PM)
- The northbound left-turn at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (AM)
- The northbound through at Sierra College Boulevard & Granite Drive would affect operations at Sierra College Boulevard & I-80 WB Ramps (PM)
- The northbound through at Sierra College Boulevard & Project Driveway would affect operations at Sierra College Boulevard & Granite Drive (PM)

Based on the intersection queuing significant impact criteria presented in Section 2 (Project traffic causes queue overflow or if queues overflows under no Project, the Project contributes 5% of the total traffic for the movement), an intersection queue significant impact occurs at the following affect study area intersections:

- Sierra College Boulevard & Brace Road (PM[17] and MD)
- Sierra College Boulevard & Granite Drive (AM, PM, and MD)
- Sierra College Boulevard & Project Driveway (MD)

[17] Weekday PM peak hour impacted for Project Driveway Option 1B only.

10.1.3 Supplemental Simulation Evaluation

The Cumulative Long Term plus Project conditions simulation evaluation was conducted with the same assumptions as outlined in Section 9.0 for Cumulative Long Term Conditions.

Project Driveway Option 1A

The Cumulative Long Term plus Project conditions simulation evaluation network performance results for Project Driveway Option 1A are presented in Table 53 and the arterial performance results are presented in Table 54. Please note that signal timing was not modified with the addition of Project trips. Recognizing the corridor is congested prior to adding Project trips, the two tables reflect increases in delay and the number of vehicles denied entry. Specifically, for the Sierra College Boulevard corridor, the Project increases delay, travel time, and reduces arterial speed for all peak hours and direction with the exception of weekday AM peak hour.

Table 53: Cumulative Long Term plus Project Conditions – Simulation Total Network Performance Results for Project Driveway Option 1A

Peak Hour	Long Term				Long Term plus Project			
	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
AM	173.9	9,765	9,377	1,099	266.0	9,038	8,196	1,104
PM	198.6	11,954	11,718	2,258	338.3	10,021	9,066	2,829
MD	106.2	11,316	11,208	625	222.8	10,519	9,773	1,349

Notes:
(s): seconds

Total Delay/Vehicle: Total delay is equal to the travel time minus the travel time for a vehicle with no other vehicles or control devices. This delay is divided by the number of vehicles to obtain the total delay per vehicle.

Vehicles Entered/Exited: Represents the number of vehicles counted entering and exiting the link or area during the interval. This value does not include vehicles moving from one intersection to the next with the arterial or network.

Vehicles Denied Entry: This value represents the number of vehicles unable to enter a link due to congestion and are waiting to enter. These vehicles can either be from an external link or from a mid-block source.

Source: Kittelson & Associates, Inc. 2019

Table 54: Cumulative Long Term plus Project Conditions – Simulation Sierra College Boulevard Arterial Performance Results for Project Driveway Option 1A

Segment	Peak Hour	Direction	Long Term			Long Term plus Project		
			Delay (s)	Travel Time (s)	Arterial Speed (mph)	Delay (s)	Travel Time (s)	Arterial Speed (mph)
Sierra College Boulevard between Taylor Road to Stadium Way	AM	Northbound	291.2	417.2	13	241.4	414.6	13
		Southbound	468.0	1,361.8	11	1,009.1	1,499.3	5
	PM	Northbound	471.5	1,611.8	9	1,130.6	2,527.8	4
		Southbound	419.7	776.8	11	527.0	735.3	9
	MD	Northbound	246.4	662.3	15	460.0	663.8	8
		Southbound	273.9	447.5	16	655.5	879.9	8

Notes:
(s): seconds

Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.

Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.

Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.

Source: Kittelson & Associates, Inc. 2019

It should be noted that the simulation results are inherently conservative considering the cumulative nature of how the Project trips were added without accounting for diversion of existing trips to and from the Roseville Costco and that the cumulative conditions do not necessarily fully account for trips made between residential, commercial, and employment uses within the developing community.

Project Driveway Options 1B & 1C

Project Driveway Options 1B and 1C affect operations along the simulated portion of the Sierra College Boulevard Corridor; therefore Cumulative Long Term plus Project conditions simulation evaluation was also conducted for Project Driveway Options 1B and 1C for informational purposes. The total network performance results of the simulation runs are presented in Table 55 and the arterial performance results are presented in Table 56. Please note that signal timing was not modified with the addition of Project trips.

As shown, the Project traffic increases network delay for all peak hours. In addition, the increased congestion on the network results in vehicles being denied entry into the network during the simulation period.

Table 55: Cumulative Long Term Plus Project Conditions – Simulation Total Network Performance Results – Project Driveway Options 1B & 1C

Peak Hour	Long Term				Long Term Plus Project			
	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry	Total Delay/Vehicle (s)	Vehicles Entered	Vehicles Exited	Vehicles Denied Entry
Driveway Option 1B								
AM	173.9	9,765	9,377	1,099	169.6	10,287	9,941	1,197
PM	198.6	11,954	11,718	2,258	207.7	13,196	12,936	2,544
MD	106.2	11,316	11,208	625	160.0	12,743	12,361	1,126
Driveway Option 1C

Total Delay/Vehicle: Total delay is equal to the travel time minus the travel time for a vehicle with no other vehicles or control devices. This delay is divided by the number of vehicles to obtain the total delay per vehicle.

Vehicles Entered/Exited: Represents the number of vehicles counted entering and exiting the link or area during the interval. This value does not include vehicles moving from one intersection to the next with the arterial or network.

Vehicles Denied Entry: This value represents the number of vehicles unable to enter a link due to congestion and are waiting to enter. These vehicles can either be from an external link or from a mid-block source.

Source: Kittelson & Associates, Inc. 2019

As shown, for the Sierra College Boulevard corridor, the Project increases delay, travel time, and reduces arterial speed for each of the peak hours analyzed. The detailed network and arterial performance output sheets are presented in Appendix "D".

Table 56: Cumulative Long Term Plus Project Conditions – Simulation Sierra College Boulevard Arterial Performance Results – Project Driveway Options 1B & 1C

Segment	Peak Hour	Direction	Long Term			Long Term Plus Project		
			Delay (s)	Travel Time (s)	Arterial Speed (mph)	Delay (s)	Travel Time (s)	Arterial Speed (mph)
Driveway Option 1B								
Sierra College Boulevard between Taylor Road and Stadium Way	AM	Northbound	291.2	417.2	13	245.2	377.1	15
		Southbound	468.0	1,361.8	11	454.8	1,151.3	11
	PM	Northbound	471.5	1,611.8	9	472.0	1,410.4	9
		Southbound	419.7	776.8	11	533.5	871.5	9
	MD	Northbound	246.4	662.3	15	307.7	822.5	12

		Southbound	273.9	447.5	16	502.7	728.6	9

Notes:
Total Delay: Total Delay for the average vehicle traveling the length of the corridor including stopped delay and congestion delay.
Total Travel Time: Time in seconds for the average vehicle to travel the length of the corridor.
Average Arterial Speed: Average speed of the average vehicle traveling the length of the corridor.
Source: Kittelson & Associates, Inc. 2019

10.2 PLACER COUNTY ROADWAY OPERATIONS

Analysis for the study segments was conducted using the LOS criteria defined as noted in Section 3.1. The three Project driveway options do not affect the Project traffic volumes for the roadway segments analyzed. Table 57 outlines the Cumulative Long Term with and without Project roadway volumes and associated level of service for the study segments and is applicable for all three Project driveway options.

As shown, Sierra College Boulevard between English Colony Way to the Loomis Town Limits continues to exceed the County's LOS C standard. The Project adds approximately 220 vehicles on the roadway segment which is under the impact threshold of 100 vehicles per lane, therefore the Project does not cause a significant impact. A second impact criteria is if the Project causes an increase in the V/C of 0.05 or more. Using the LOS E roadway capacity of 36,000 vehicles, the Long Term V/C is approximately 0.871 and for Long Term plus Project conditions the V/C is approximately 0.877. Therefore, the Project would contribute 0.006 to the V/C which is well under the 0.05 impact criteria and would not cause a significant impact under the secondary impact criteria.

Table 57: Cumulative Long Term plus Project Conditions – Placer County Weekday ADT Roadway Segment LOS Analysis

Roadway	Segment	Number of Lanes	Long Term		Long Term plus Project		
			ADT	LOS	Project ADT	ADT	LOS
Sierra College Boulevard (SCB)	SR-193 to English Colony Way	4	20,150	A	180	20,330	A
	English Colony Way to Delmar Ave	4	31,360	D	200	31,560	D
	Delmar Ave to Loomis Town Limits	4	29,920	D	220	30,140	D
SR-193	Lincoln City Limits to SCB	4	26,530	C	90	26,620	C
	SCB to Clark Tunnel Road	2	11,880	B	50	11,930	B

Notes:
ADT volumes sourced from Bickford Ranch Specific Plan EIR Addendum (October 2015) and adjusted based on City of Rocklin Travel Demand Model Growth Rates.
Source: Kittelson & Associates, Inc. 2019

10.3 FREEWAY FACILITIES EVALUATION

Cumulative Long Term Conditions traffic baseline traffic volumes for the weekday AM and PM peak hours were added to the site-generated traffic to arrive at the total traffic volumes.

10.3.1 Freeway Mainline Basic Segment Analysis

The three Project driveway options do not affect the Project traffic volumes for the freeway segments analyzed. Table 58 through Table 60 outline the Cumulative Long Term and Cumulative Long Term plus Project mainline volume, density and associated level of service for the study segments, and are applicable for all three Project driveway options. As shown two study segments exceed the acceptable LOS D with Project traffic:

- I-80 east of Sierra College Boulevard – Westbound (PM)
- I-80 west of Sierra College Boulevard – Westbound (PM)

No significant impacts occur to the freeway mainline under the Cumulative Long Term plus Project Conditions for all Project driveway options considered because there is no change in the LOS E projected under baseline (no project) conditions.

Appendix “E” includes the freeway mainline level-of-service worksheets.

Table 58: Cumulative Long Term – I-80 Mainline LOS Analysis, Weekday AM Peak Hour

ID	Segment	Direction	Long Term			Long Term plus Project			Change in Density
			Volume	Density	LOS	Volume	Density	LOS	
1	I-80 east of Sierra College	Eastbound	4,780	30.09	D	4,802	31.1	D	0.2
		Westbound	4,700	30.7	D	4,723	30.9	D	0.2
2	I-80 west of Sierra College	Eastbound	5,000	33.0	D	5,007	33.1	D	0.1
		Westbound	4,290	27.1	D	4,267	27.2	D	0.1

Source: Kittelson & Associates, Inc. 2019

10.3.2 Ramp Metering Supplemental Evaluation

The evalaution was prepared for informational purposes. The three Project driveway options do not affect the Project traffic volumes for the freeway ramps analyzed. Table 61 summarizes the projected queues associated with ramp metering assuming the ramp metering rate under no-Project conditions is held constant under plus Project conditions. The results are applicable for all three Project driveway options. The calculated queues with Project trips can be accommodated within the 1,200 feet of available storage area for all Project driveway options considered. Appendix "I" includes the ramp metering worksheets.

Table 61: Cumulative Long Term Plus Project – I-80 Westbound Slip-Ramp Ramp Meter Analysis

Peak Hour	Long Term		Long Term plus Project	
	Meter Rate (vehicles/hour)	Calculated Queue (feet)	Meter Rate (vehicles/hour)	Calculated Queue (feet)
AM	240	0	240	0
PM	450	473	450	954
MD	450	134	450	563

Notes:
Boldface type indicates if queue exceeds available ramp storage capacity of 1,200 feet.
Source: Kittelson & Associates, Inc. 2019

10.4 PEDESTRIAN AND BICYCLE EVALUATION

The proposed Project would provide pedestrian facilities on-site linking with public facilities along the site frontages on Sierra College Boulevard and Brace Road to provide connectivity with existing facilities. The project would reconstruct the Type II bicycle facility on Sierra College Boulevard northbound along the site frontage, including providing separate northbound right-turn lanes at the proposed signalized Project access and at Brace Road. In addition, the Project would provide bicycle parking on site for both members and employees.

Due to the nature of products and services provided by the Project, the Project would minimally increase pedestrian and bicycle traffic in the study area. Sidewalk connections would be provided along the Project site frontage with the proposed development along Sierra College Boulevard. The Project site would not be in conflict with applicable Town pedestrian and bicycle plans for any of the Project driveway options considered. The Project would have a less than significant impact on pedestrian and bicycle facilities.

10.5 TRANSIT EVALUATION

Due to the nature of products and services provided by the Project and limited transit connectivity provided adjacent to the site, the Project would minimally increase transit ridership in the study area. The nearest stop is approximately 0.6 mile from the Project site for routes with one hour and two hour headways. Due to the distance to the stop, relatively long headways, and employee shift times, it is unlikely that a significant number of employee trips would be added to the transit network. The project site would not be in conflict with applicable Placer County Transit plans or encroach on any lines or stops. The Project would have a less than significant impact on transit services and a new transit stop is not warranted at the Project site.

Project impacts on traffic flow could affect travel time for transit vehicles. Traffic flow impacts are addressed in the intersection evaluation sections of this study for all Project driveway options considered.

Section 11
Mitigation Measures

11.0 MITIGATION MEASURES

The following section outlines the mitigation measures and significance of each Project impact.

To reduce intensity of impacts to less than significant impact under CEQA, the following lists potential types of traffic mitigation measures for intersections:

- TR MM 1: Modify signal timing. Modify signal timing (to optimize cycle length and/or splits) at specific intersections to improve LOS and intersection operations.
- TR MM 2: Provide signal coordination. Provide signal communication interconnect to implement corridor signal timing plans.
- TR MM 3: Modify signal phasing. Modify traffic signal phasing sequence to improve LOS and intersection operations.
- TR MM 4: Restripe Intersection. Restripe intersection approaches to improve LOS and intersection operations.
- TR MM 5: Add exclusive turn lanes. Add exclusive turn lanes to improve LOS and intersection operations.
- TR MM 6: Provide a traffic signal.
- TR MM7: Provide additional storage. Modify median to provide additional storage for turn lane.

11.1 EXISTING PLUS PROJECT CONDITIONS

The following mitigation measures were evaluated to reduce the Project impacts to less than significant levels under CEQA. Table 62 presents the intersection and queuing mitigation measures under Existing plus Project Conditions.

Table 62: Existing plus Project Mitigation Measures

ID	Intersection	Project Driveway Option(s) Requiring Mitigation	Jurisdiction	Impact Type	Current Traffic Control	Mitigation Measure	Specific Actions Recommended	Effects of Mitigation
1	Taylor Road & King Road	Options 1A, 1B, 1C	Loomis	Queue	Signal	TR MM 1: Modify signal timing	Provide optimized cycle length with optimized splits based on current demand (110 second for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
7	Sierra College Boulevard & Brace Road	Option 1B	Loomis	Queue	Signal	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Restripe the westbound right lane to a shared westbound left-right lane. Optimize cycle length and splits (60 seconds for PM and MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
8	Sierra College Boulevard & Granite Dr	Option 1A	Rocklin	Queue	Signal	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Restripe northbound right turn lane to shared through-right lane. Optimize cycle length with optimized splits based on current demand. (115 seconds for PM peak hour)	Provides additional through lane, allowing more vehicles to travel through the intersection
8	Sierra College Boulevard & Granite Dr	Options 1B, 1C	Rocklin	Queue	Signal	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Restripe westbound through lane to left turn and restripe westbound right turn lane to a shared through-right lane. Optimize cycle length with optimized splits based on current demand. (95 seconds for AM peak hour, 115 seconds for PM peak hour, and 95 seconds MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
9	Sierra College Boulevard & I-80 Westbound Ramps	Options 1A, 1B, 1C	Caltrans	Queue	Signal	TR MM 1: Modify signal timing	Provide optimized cycle length with optimized splits based on current demand (105 seconds for PM peak hour and 115 second for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
17	Granite Drive & Rocklin Road	Options 1A, 1B, 1C	Rocklin	Queue	Signal	TR MM 1: Modify signal timing	Provide optimized cycle length with optimized splits based on current demand (100 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
26	Sierra College Boulevard & SR-193	Options 1A, 1B, 1C	Placer	LOS	TWSC	TR MM 6: Provide a traffic signal	Install a traffic signal.[1]	Provides protected time (stops major street) to facilitate minor street movements
31	Taylor Road & Penryn Road (South)	Options 1A, 1B, 1C	Placer	LOS	TWSC	TR MM 6: Provide a traffic signal	Install a traffic signal. [1]	Provides protected time (stops major street) facilitate minor street movements
36	Taylor Road & Webb Street	Options 1A, 1B, 1C	Loomis	LOS	TWSC	TR MM 4: Restripe Intersection[2]	Eliminate 3 parking spaces on the north side of Webb Street and provide a 50 foot westbound right turn pocket.	Provides right turn lane, allowing these vehicles to move through intersection without waiting behind left/through vehicles

Notes:
[1] Traffic signal warrants met for impacted condition and provided in Appendix J.
[2] This intersection does not meet traffic signal warrants for impacted condition.
Source: Kittelson & Associates, Inc. 2019

The proposed mitigation measures were applied to the study intersections to evaluate LOS and queuing effects. Table 63 presents the LOS results in comparison to no Project conditions and Table 64 outlines the corresponding queueing results. The mitigation measures would reduce the LOS and queue impacts to less than significant levels at some of the impacted locations; however, significant and unavoidable impacts remain as noted. Some impacts are deemed to be significant and unavoidable impacts because the intersections are located beyond the Town of Loomis (lead agency) jurisdiction.

Appendix "B" includes the level-of-service worksheets and Appendix "C" contains the queueing worksheets.

Table 63: Existing Plus Project - Intersection LOS Analysis, Mitigation Results

ID	Intersection	Jurisdiction	Scenario	Existing		Existing Plus Project Mitigated		Change in Delay (sec)	Impact with mitigation?
				Delay (sec)	LOS	Delay (sec)	LOS		
Project Driveway Option 1A									
26	Sierra College Blvd & SR-193	Placer	PM	43.1	E	9.1	A	-34.0	Significant unavoidable*
31	Taylor Road & Penryn Road (South)	Placer	AM	233.5	F	9.3	A	-224.2	Significant unavoidable*
36	Taylor Road & Webb Street	Loomis	MD	70.2	F	99.1	F	28.9	Significant unavoidable[1]
Project Driveway Option 1B									
26	Sierra College Blvd & SR-193	Placer	PM	Same results as Project Driveway Option 1A					
31	Taylor Road & Penryn Road (South)	Placer	AM	Same results as Project Driveway Option 1A					
36	Taylor Road & Webb Street	Loomis	MD	Same results as Project Driveway Option 1A					
Project Driveway Option 1C									
26	Sierra College Blvd & SR-193	Placer	PM	Same results as Project Driveway Option 1A					
31	Taylor Road & Penryn Road (South)	Placer	AM	Same results as Project Driveway Option 1A					
36	Taylor Road & Webb Street	Loomis	MD	Same results as Project Driveway Option 1A					

Notes:

*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures are outside of the lead agency jurisdiction authority to implement and determine feasibility.

[1] Temporary impact given this impact can be mitigated with the westbound right-turn mitigation measure under Short Term and Long Term conditions. Traffic volumes projected at intersection do not meet signal traffic warrants. Note that an alternative route is available for Webb Street traffic traveling to Taylor Road by routing to the traffic signal at Taylor Road/Horseshoe Bar Road. Further, the Project does not add trips to the failing approach.

Source: Kittelson & Associates, Inc. 2019

Table 64: Existing Plus Project - Intersection Queuing Analysis, Mitigation Results

ID	Intersection	Jurisdiction	Peak Hour	Movement	Storage (feet)	No Project Queue (feet)	Mitigated Queue (feet)	Impact with mitigation?

11.2 CUMULATIVE SHORT TERM PLUS PROJECT CONDITIONS

The following mitigation measures were evaluated to reduce the Project impacts to less than significant levels under CEQA. Initial evaluation of potential timing and phasing mitigations measures were not sufficient to address impacts. Geometric mitigation measures such as second through lanes and dual left turn lanes would be required to reduce impacts to less than significant levels. Table 65 presents the intersection mitigation measures under Cumulative Short Term plus Project Conditions.

Applying the mitigation measures identified in Table 65, intersection analysis was conducted. Table 66 presents the LOS results in comparison to no Project conditions and Table 67 outlines the queueing results. The mitigation measures would reduce the LOS and queue impacts to less than significant levels at some of the impacted locations; however, significant and unavoidable impacts remain as shown. Some impacts are deemed to be significant and unavoidable impacts because the respective intersections are located beyond the Town of Loomis (lead agency) jurisdiction.

Appendix “B” includes the level-of-service worksheets and Appendix “C” contains the queueing worksheets.

Table 65: Cumulative Short Term plus Project Mitigation Measures

ID	Intersection	Project Driveway Option(s) Requiring Mitigation	Jurisdiction	Impact Type	Current Traffic Control	Mitigation Measure	Specific Actions Recommended	Effects of Mitigation
2	Taylor Road & Horseshoe Bar Road	Options 1A, 1B, 1C	Loomis	Queue	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (90 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
6	Sierra College Boulevard & Taylor Road	Options 1A, 1B, 1C	Loomis	LOS/ Queue	Signal	TR MM 1: Modify signal timing TR MM 3: Modify signal phasing TR MM 7: Add storage to turn pockets	Provide eastbound right turn overlap phasing and optimize cycle length and splits (100 seconds for PM peak hour and 100 seconds for MD peak hour). Modify median to provide additional storage for northbound and westbound left turn lanes (Project to provide fairshare funding for modification to be implemented with the Town's Sierra College Boulevard roadway widening project between Taylor Road and Brace Road).	Provides right turn with green arrow allowing more vehicles to travel through the intersection. Creates longer turn pockets to hold more vehicles.
7	Sierra College Boulevard & Brace Road	Option 1B	Loomis	Queue	Signal	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Restripe the westbound right lane to a shared westbound left-right lane. Optimize cycle length and splits (75 seconds for PM peak hour and 65 seconds for MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
8	Sierra College Boulevard & Granite Drive	Option 1A	Rocklin	LOS/ Queue	Signal	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Restripe northbound right turn lane to shared through-right lane. Restripe the southbound right turn lane to a shared through-right lane. Provide eastbound right turn overlap phasing. Coordinate signal timing with I-80 ramps (120 seconds for AM peak hour, 135 seconds for PM peak hour and 130 seconds for MD peak hour)	Provides additional through lane, allowing more vehicles to travel through the intersection. Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
8	Sierra College Boulevard & Granite Drive	Options 1B, 1C	Rocklin	LOS/ Queue	Signal	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Restripe the southbound right turn lane to a shared through-right lane. Restripe westbound through lane to left turn and restripe westbound right turn lane to a shared through-right lane. Provide eastbound right turn overlap phasing. Coordinate signal timing with I-80 ramps (120	Provides additional through lane, allowing more vehicles to travel through the intersection. Provides additional left turn lane, allowing more vehicles to turn left during each signal
9	Sierra College Boulevard & I-80 WB Ramps	Options 1A, 1B, 1C	Caltrans	LOS/ Queue	Signal	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes	Provide an additional northbound left turn lane. Restripe westbound through-right lane to through lane and provide an additional westbound right turn lane. Optimize coordinated cycle lengths (120 seconds for AM, 136 seconds for PM and 130 seconds for MD peak hour)	Provides additional left turn lane, allowing more northbound vehicles to turn left during each signal phase. New right-turn lane allows for separation of through and right turn traffic, increasing capacity
15	Pacific St & Dominguez Rd-Delmar Ave	Options 1A, 1B, 1C	Rocklin	LOS	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (75 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
17	Granite Drive & Rocklin Road	Options 1A, 1B, 1C	Rocklin	LOS/ Queue	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (105 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
24	Sierra College Boulevard & Project Driveway	Option 1A	Loomis	Queue	Signal	TR MM 1: Modify signal timing	Provide cycle length optimized for queues with optimized splits based on current demand (70 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
26	Sierra College Boulevard & SR-193	Options 1A, 1B, 1C	Placer	LOS/Queue	TWSC	TR MM 6: Provide a traffic signal	Install a traffic signal.[1]	Provides protected time (stops major street) to facilitate minor street movements
27	Sierra College Boulevard & English Colony Way	Options 1A, 1B, 1C	Placer	LOS	TWSC	TR MM 6: Provide a traffic signal	Install a traffic signal.[1]	Provides protected time (stops major street to facilitate minor street movements
29	Taylor Road & English Colony Way	Options 1A, 1B, 1C	Placer	LOS	TWSC	TR MM 6: Provide a traffic signal.	Install a traffic signal.[1]	Provides protected time (stops major street) to facilitate minor street movements
31	Taylor Road & Penryn Road (South)	Options 1A, 1B, 1C	Placer	LOS	TWSC	TR MM 6: Provide a traffic signal.	Install a traffic signal. [1]	Provides protected time (stops major street) to facilitate minor street movements
36	Taylor Road & Webb Street	Options 1A, 1B, 1C	Loomis	LOS	TWSC	TR MM 4: Restripe Intersection	Eliminate 3 parking spaces on the north side of Webb Street and provide a 50 foot westbound right turn pocket.	Provides right turn lane, allowing these vehicles to move through intersection without waiting behind left/through vehicles

Notes:
[1] Traffic signal warrants met for impacted condition and provided in Appendix J.

*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures are outside of the lead agency jurisdiction's ability to determine feasibility and implement.
[1] The proposed mitigation does not reduce queues to No Project Conditions and additional geometric improvements are not feasible due to site constraints.
[2] Less than significant with 254 feet of storage provided for NBL and 290 feet of storage provided for WBL as mitigation measure.

[3] Note queuing analysis results at intersection impacted by changes at Sierra College Boulevard & Granite Drive intersection to the north that impact coordinated traffic signal timing and thus impact queuing.
Source: Kittelson & Associates, Inc. 2019

11.3 CUMULATIVE LONG TERM PLUS PROJECT CONDITIONS

The following mitigation measures were evaluated to reduce the Project impacts to less than significant levels under CEQA. Initial evaluation of potential timing and phasing mitigation measures were not sufficient to address impacts. Geometric mitigation measures such as second through lanes and dual left turn lanes would be required to reduce impacts to less than significant levels.

Table 68 presents the intersection mitigation measures under Cumulative Long Term plus Project Conditions.

The proposed mitigation measures were applied to the study intersections to evaluate LOS and queuing effects. Table 69 presents the LOS results in comparison to no Project conditions and Table 70 outlines the queueing results. The mitigation measures would reduce the LOS and queue impacts to less than significant levels at some of the impacted locations; however, significant and unavoidable impacts remain as shown. Some impacts are deemed to be significant and unavoidable impacts because the respective intersections are located beyond the Town of Loomis (lead agency) jurisdiction.

Appendix “B” includes the level-of-service worksheets and Appendix “C” contains the queueing worksheets.

Table 68: Cumulative Long Term plus Project Mitigation Measures

ID	Intersection	Project Driveway Option(s) Requiring Mitigation	Jurisdiction	Impact Type	Current Traffic Control	Mitigation Measure	Specific Actions Recommended	Effects of Mitigation
1	Taylor Road & King Road	Options 1A, 1B, 1C	Loomis	Queue	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (105 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
2	Taylor Road & Horseshoe Bar Road	Options 1A, 1B, 1C	Loomis	Queue	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (75 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
6	Sierra College Boulevard & Taylor Road	Options 1A, 1B, 1C	Loomis	LOS/ Queue	Signal	TR MM 1: Modify signal timing TR MM 3: Modify signal phasing TR MM 7: Add storage to turn pockets	Provide eastbound right turn overlap phasing and optimize cycle length and splits (120 seconds for PM peak hour and 100 seconds for MD peak hour). Modify median to provide additional storage for northbound and westbound left turn lanes (Project to provide fairshare funding for modification to be implemented with the Town's Sierra College Boulevard roadway widening project between Taylor Road and Brace Road)	Provides right turn with green arrow allowing more vehicles to travel through the intersection. Creates longer turn pockets to hold more vehicles.
7	Sierra College Boulevard & Brace Road	Option 1B	Loomis	Queue	Signal	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Restripe the westbound right lane to a shared westbound left-right lane. Optimize cycle length and splits (130 seconds for PM peak hour and 90 seconds for MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
8	Sierra College Boulevard & Granite Drive	Option 1A	Rocklin	LOS/ Queue	Signal	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Restripe northbound right turn lane to a shared through-right lane. Restripe eastbound right turn to shared through-right lane, restripe eastbound through lane to second left turn lane. Coordinate signal timing with I-80 ramps (145 seconds for AM peak hour, 150 seconds for PM peak hour, and 150 for MD peak hour)	Provides additional through and turn lane, allowing more vehicles to travel through the intersection. Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
8	Sierra College Boulevard & Granite Drive	Options 1B, 1C	Rocklin	Queue	Signal	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Restripe westbound through lane to left turn and restripe westbound right turn lane to a shared through-right lane. Provide eastbound right turn overlap phasing. Optimize cycle length and splits (145 seconds for AM peak hour and 115 for MD peak hour). Coordinate signal timing with I-80 ramps (150 seconds for PM peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
9	Sierra College Boulevard & I-80 WB Ramps	Option 1A	Caltrans	Queue	Signal	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes.	Provide an additional northbound left turn lane. Optimize coordinated cycle lengths (145 seconds for AM peak hour, 150 seconds for PM peak hour and 150 seconds for MD peak hour)*	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
9	Sierra College Boulevard & I-80 WB Ramps	Options 1B, 1C	Caltrans	Queue	Signal	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes.	Provide an additional northbound left turn lane. Optimize coordinated cycle lengths (145 seconds for AM peak hour, 150 seconds for PM peak hour and 126 seconds for MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
12	Sierra College Boulevard/ Bass Pro Dr-Dominguez Road	Options 1A, 1B, 1C	Rocklin	LOS	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (150 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
17	Granite Drive & Rocklin Road	Options 1A, 1B, 1C	Rocklin	Queue	Signal	TR MM 1: Modify signal timing	Optimize cycle length and splits (110 seconds for MD peak hour)	Assigns green time to the highest demand movements allowing more vehicles to travel through the intersection
24	Sierra College Boulevard & Project Dwy	Option 1A	Loomis	Queue	Signal	TR MM 2: Provide signal coordination	Coordinate signal timing with Granite Drive and I-80 ramps (75 seconds for PM peak hour and 75 for MD peak hour)	Provides better progression through corridor
24	Sierra College Boulevard & Project Dwy	Options 1B, 1C	Loomis	Queue	Signal	TR MM 7: Add storage to turn pockets	Modify median to provide additional storage for southbound left turn lane (Project to implement with Sierra College Boulevard roadway widening along Project frontage).	Creates longer turn pockets to hold more vehicles
26	Sierra College Boulevard & SR-193	Options 1A, 1B, 1C	Placer	LOS	Signal	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes	Provide an additional northbound left turn lane and optimize cycle lengths and splits (130 seconds for MD peak hour)	Provides additional left turn lane, allowing more vehicles to turn left during each signal phase
36	Taylor Road & Webb Street	Options 1A, 1B, 1C	Loomis	LOS	TWSC	TR MM 4: Restripe Intersection	Eliminate 3 parking spaces on the north side of Webb Street and provide a 50 foot westbound right turn pocket.	Provides right turn lane, allowing these vehicles to move through intersection without waiting behind left/through vehicles

Notes:
*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures are outside of the lead agency jurisdiction's ability to determine feasibility and implement. Note: queuing analysis results at intersection impacted by changes at Sierra College Boulevard & Granite Drive intersection to the north that impact coordinated traffic signal timing and thus impact queuing.

*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures are outside of the lead agency jurisdiction's ability to determine feasibility and implement.
[1] Less than significant with 288 feet of storage provided for WBL as mitigation measure for Option 1A and 356 for Option 1B.
[2] The impact could not be mitigated to less than significant levels. A fourth southbound through lane may be needed to accommodate traffic volumes.
[3] Note queuing analysis results at intersection impacted by changes at Sierra College Boulevard & Granite Drive intersection to the north that impact coordinated traffic signal timing and thus impact queuing.
[4] Less than significant with 207 feet of storage provided for SBL.
Source: Kittelson & Associates, Inc. 2019

11.4 SECONDARY IMPACTS OF MITIGATION MEASURES

The LOS and queue mitigation measures proposed to reduce the Project impacts to less than significant levels could potentially trigger additional LOS and queue impacts. The LOS and queue outputs for each mitigated intersection were reviewed to ensure that additional Project impacts did not occur after the mitigation measures were in place. The output sheets are provided in Appendix "B" for LOS and Appendix "C" for queueing. No additional impacts were found with the implementation of mitigation measures.

11.5 EMPLOYEE TRANSPORTATION DEMAND MANAGEMENT PROGRAM

Costco proposes to develop and implement an employee Transportation Demand Management (TDM) program at the Loomis site. The TDM program will seek to reduce peak period single-occupancy vehicle trips that would otherwise be made by site employees[18]. The TDM program will identify measures that encourage Costco employees to use alternatives to driving alone when traveling to and from work.

Key elements of the Loomis site TDM Program plan are expected to include[19]:

- use of a staggered shift operation, scheduling employee shift changes outside of the typical commuter peak time periods (7:00 to 9:00 AM and 4:00 to 6:00 PM)
- encouraging ride sharing in the form of employee carpools and vanpools
- an on-site employee transportation coordinator (ETC) who can assist and be responsible for promoting, facilitating, and coordinating carpools and vanpools for employees with similar shift patterns
- an employee orientation program addressing commuting options
- potential incentives encouraging employee participation in a rideshare program

[18] The nature of the Costco operations (i.e., bulk purchasing, business wholesale shopping, and fueling) necessitate vehicular travel by Costco members due to the need for vehicles to transport the goods and fuel purchased. This is consistent with other retail uses in that the retailer has little or no control over how and/or when customers travel to and from the subject site.

[19] Note that Costco employee use of Placer County Transit service to commute to and from the Project site is not included in the TDM program elements at this time based on the current lack of frequent transit service within a ¼ mile walking distance of the Project site as well as the shift times of Costco employees not being well served by current transit opportunities. Future incorporation of a transit element to the TDM program could be considered if future Placer County Transit service opportunities are located closer to the Project site and service times/frequency would better support Project site employee commuting.

- encouraging bicycling and walking as viable commute options, including provision of bicycle racks and employee lockers for storage of change clothing and personal items to provide more convenience to bicycle and walking commuters
- an employee kitchen and café/deli services on site that are available to employees within the Costco warehouse, reducing the need for employees to travel off site for meals and/or break periods

Section 12 Conclusions and Recommendations

12.0 CONCLUSIONS

The results of the traffic impact analysis indicate that the proposed Project would impact traffic operations and require appropriate mitigations to address the impacts. The proposed mitigation measures would not reduce Project impacts to less than significant levels under CEQA therefore significant unavoidable impacts remain.

12.1 FINDINGS

Based on the analysis methodology and significance criteria approved by the Town, Table 71 lists the study intersections performing at unacceptable level-of-service (LOS) as well as locations impacted by the Project. Table 72 lists the study intersections where queues extend beyond the available storage lengths as well as locations impacted by the Project.

The following assumptions were applied to the study conditions.

12.1.1 Project Development Plan

The proposed development was estimated to generate 4,330 daily net new trips; 130 net new trips (65 inbound, 65 outbound) were projected to occur during the weekday AM peak hour; 391 net new trips (190 inbound, 201 outbound) were projected to occur during the weekday PM peak hour and 766 net new trips (391 inbound, 375 outbound) were projected to occur during the weekend midday peak hour.

Costco will provide the following transportation infrastructure in conjunction with site development.

- Sierra College Boulevard Changes
  - Restripe the existing northbound right-turn lane on Sierra College Boulevard approaching Granite Drive from an exclusive right-turn lane to a shared through/right-turn lane (for Project Driveway Options 1B and 1C only).
  - Dedicate right-of-way and widen Sierra College Boulevard along the Project site frontage and restripe the roadway to provide three northbound through travel lanes and a northbound Class II bicycle lane between Granite Drive and Brace Road.
  - Signalize the proposed new Costco site access intersection on Sierra College Boulevard.
  - Provide traffic signal interconnect between the proposed new Costco site access signalized intersection and the adjacent intersections along Sierra College Boulevard at Brace Road and Granite Drive.
  - Construct a separate northbound right-turn lane on Sierra College Boulevard approaching the proposed new signalized site access intersection. Provide a right-turn overlap signal phase at the intersection.

- Construct a southbound left-turn lane on Sierra College Boulevard approaching the proposed new signalized Costco site access intersection.
- Construct a separate northbound right-turn lane on Sierra College Boulevard approaching the signalized Brace Road intersection (the turn lane is proposed to include a 90-foot long taper and 200 feet of right-turn storage). Provide a right-turn overlap signal phase at the intersection.

- Brace Road
  - Dedicate right-of-way and construct standard half-street improvements along the Brace Road site frontage.
  - Install a raised median on Brace Road between Sierra College Boulevard and the existing Homewood Lumber driveway to the east to limit Costco access to right-turns only.
- Granite Drive (for Project Driveway Options 1B and 1C only)
  - Reconstruct Granite Drive east of Sierra College Boulevard to provide side-by-side eastbound and westbound left-turn lanes separated by a new raised median between Sierra College Boulevard and the new north-south drive aisle to the Costco Project site (including widening east of the existing private driveways on Granite Drive to accommodate the side-by-side left-turn lane).

12.1.2 Cumulative Short Term Traffic Conditions

No background improvements were assumed on the transportation network with the exception of approved/pending project access to the existing roadway network.

12.1.3 Cumulative Long Term Traffic Conditions

The following roadway improvements were assumed under 2030 conditions:

- Sierra College Boulevard: widened to 5-6 lanes from Taylor Road to south of Rocklin Road (includes assumed southbound frontage improvements along the currently vacant commercial property west of Sierra College Boulevard between Granite Drive and Brace Road and only 2 northbound lanes between Granite Drive and Brace Road)
- Sierra College Boulevard & Highway 193 intersection signalization
- Sierra College Boulevard & English Colony Way intersection signalization
- Sierra College Boulevard & Delmar Avenue intersection signalization
- Taylor Road & Penryn Road intersection signalization
- Taylor Road & English Colony Way intersection signalization

- Pacific Street: widened to 4 lanes from Town of Loomis boundary line to Delmar Avenue/Dominguez Road
- Rocklin Road: widened to 6 lanes from east of Granite Drive (not improved at Granite Drive) to west of Sierra College Boulevard; widened to 4 lanes east of Sierra College Boulevard
- Dominguez Road extension from Granite Drive to Sierra College Boulevard: 2 lanes provided (including signalization of the Granite Drive & Dominguez Road intersection)

12.1.4 On-Site Circulation/Site Access Operations

All but one of the access points would function acceptably with the proposed geometry and control. In the Cumulative Long-term With Project condition, the southbound left turn at the signalized Sierra College Boulevard Project driveway requires 17 feet of additional storage under all Project driveway options. The additional southbound left-turn storage is expected to be required in the future in conjunction with installation of a third southbound through lane on Sierra College Boulevard which will result the shortening of the off-site northbound left-turn lane serving property on the west side of Sierra College Boulevard. The existing left-turn pocket is approximately 95 feet long and experiences queues of 20 feet or less during all analysis scenarios.

12.1.5 CEQA Conclusions Summary

Based on the mitigation measures proposed in Section 11, Table 73 outlines the CEQA conclusion for each impacted study location. Please note that mitigation measures outside of the lead agency jurisdiction to determine feasibility based on location and subsequently implement are considered significant and unavoidable.

24: Sierra College Boulevard & Project Driveway	Option 1A	Queue (SBL)	Loomis	TR MM 1: Modify signal timing	Less than significant
26: Sierra College Boulevard & SR-193	Options 1A, 1B, 1C	LOS/Queue (NBR)	Placer	TR MM 6: Provide a traffic signal	Significant unavoidable*
27: Sierra College Boulevard & English Colony Way	Options 1A, 1B, 1C	LOS	Placer	TR MM 6: Provide a traffic signal	Significant unavoidable*
29: Taylor Road & English Colony Way	Options 1A, 1B, 1C	LOS	Placer	TR MM 6: Provide a traffic signal	Significant unavoidable*
31: Taylor Road & Penryn Road (South)	Options 1A, 1B, 1C	LOS	Placer	TR MM 6: Provide a traffic signal	Significant unavoidable*
36: Taylor Road & Webb Street	Options 1A, 1B, 1C	LOS	Loomis	TR MM 4: Restripe Intersection	Less than significant
Cumulative Long Term plus Project Conditions					
1: Taylor Road & King Road	Options 1A, 1B, 1C	Queue (WBL)	Loomis	TR MM 1: Modify signal timing	Less than significant
2: Taylor Road & Horseshoe Bar Road	Options 1A, 1B, 1C	Queue (NBT)	Loomis	TR MM 1: Modify signal timing	Less than significant
6: Sierra College Boulevard & Taylor Road	Options 1A, 1B, 1C	LOS	Loomis	TR MM 1: Modify signal timing TR MM 3: Modify signal phasing	Less than significant
		Queue (NBL, WBL)			Less than significant
7: Sierra College Boulevard & Brace Road	Option 1B	Queue (SBL, WBL)	Loomis	TR MM 1: Modify signal timing TR MM 4: Restripe Intersection	Less than significant
8: Sierra College Boulevard & Granite Drive	Option 1A	LOS	Rocklin	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Significant unavoidable*
		Queue (NBT, SBT, EBL)			

Intersection	Project Driveway Option(s) Requiring Mitigation	Type of Impact	Jurisdiction	Mitigation Measure	Significance After Mitigation
8: Sierra College Boulevard & Granite Drive	Options 1B, 1C	Queue (NBT, SBT, WBL)	Rocklin	TR MM 2: Provide signal coordination TR MM 4: Restripe Intersection	Significant unavoidable*
9: Sierra College Boulevard & I-80 Westbound Ramps	Options 1A, 1B, 1C	Queue (SBT)	Caltrans	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes	Significant unavoidable[3]
17: Granite Drive & Rocklin Road	Options 1A, 1B, 1C	Queue (EBL)	Rocklin	TR MM 1: Modify signal timing	Significant unavoidable*
24: Sierra College Boulevard & Project Driveway	Option 1A	Queue (SBL)	Loomis	TR MM 2: Provide signal coordination	Less than significant
24: Sierra College Boulevard & Project Driveway	Options 1B, 1C	Queue (SBL)	Loomis	TR MM 7: Add storage to turn pockets	Less than significant
26: Sierra College Boulevard & SR-193	Options 1A, 1B, 1C	LOS	Placer	TR MM 1: Modify signal timing TR MM 5: Add exclusive turn lanes	Significant unavoidable*
36: Taylor Road & Webb Street	Options 1A, 1B, 1C	LOS	Loomis	TR MM 4: Restripe Intersection	Less than significant

Notes:
NB: northbound, SB: southbound, EB: eastbound, WD: westbound, L: left turn lane, T: through lane, R: right turn lane
*Though the mitigation measure improves the intersection operation to less than significant levels, the mitigation measures may be deemed infeasible or outside of the lead agency jurisdiction to implement.
[1]Temporary impact given this impact can be mitigated with the westbound right-turn mitigation measure under Short Term and Long Term conditions. Traffic volumes projected at intersection do not meet signal traffic warrants.

[2]The proposed mitigation does not reduce queues to No Project Conditions and additional geometric improvements are not feasible due to site constraints.

[3] The impact could not be mitigated to less than significant levels. A fourth southbound through lane may be needed to accommodate traffic volumes. The mitigation measures may be deemed infeasible or outside of the lead agency jurisdiction to implement.
