Appendix F: Costco Trip Data

COSTCO TRIP GENERATION DATABASE

Trip generation studies were conducted at Costco Wholesale sites located across the western region of the United States using industry standard engineering practices consistent with guidance within the Institute of Transportation Engineers (ITE) standard reference, *Trip Generation Handbook, 9th Edition Volume 1*. These cordon surveys were conducted between 2001 and 2010, and include 22 surveys of Costco Warehouses with fuel centers in California, Oregon, Washington, Montana, Utah, and Colorado.

The Costco Wholesale buildings surveyed range in size between 120,000 square feet and 162,115 square feet, with an average size of 143,782 square feet and had Costco Gasoline fuel centers. As a result, the Costco Wholesale trip generation rates inherently account for Costco Gasoline fuel center trips within the overall rate. Table 1 summarizes the average trip rates recorded.

Table 1: Average Trip Characteristics for a Costco Warehouse with Fuel Center

Land Use	Weekday Daily Trip Rate (per KSF)	Weekday PM Peak Hour of Adjacent Street Traffic Trip Rate (per KSF)			Weekend Midday Peak Hour (per KSF)		
		Total	In	Out	Total	In	Out
Costco Warehouse With Fuel Center	79.27	7.17	48.5%	51.5%	9.79	51%	49%
Primary Trips	No Data		35.1%			50%	
Pass-by Trips	No Data		33.3%			29%	
Diverted Trips	No Data		31.5%			21%	

Source: Kittelson & Associates, Inc. 2018

COMPARISON TO NATIONAL DATA

Trip data for member-based retail establishments is available through the *Trip Generation Manual* published by ITE. Both the 9th Edition (published in 2012) and the 10th Edition (published in 2017) of the document include Land Use 857, Discount Club (the daily, weekday PM peak hour, and Saturday peak hour data by building size is identical in both editions). Discount Club is defined in the *Trip Generation Manual* as follows "A discount club is a discount store or warehouse where shoppers pay a membership fee in order to take advantage of discounted prices on a wide variety of items such as food, clothing, tires and appliance; many items are sold in large quantities or bulk. Some sites may include on-site fueling pumps." The *Trip Generation Manual* Discount Club definition clearly conveys a land use comparable to a Costco Wholesale.

Table 2 compares the trip rates for Discount Club[1] and the Costco Rates while Table 3 compares the trip type data for the two uses. As shown in the two tables, use of the Costco data results in a higher trip rate per square foot and a lower pass-by percentage compared to use of Discount Club data from the *Trip Generation Manual.* Kittelson & Associates uses the Costco-specific data in lieu of traditional

[1] Discount Club trip type data obtained from Tables E.18 and E.19 in the *Trip Generation Handbook, 3rd Edition* published by ITE in September 2017.

Trip Generation Manual to provide both Costco and the impacted review agencies with data that is representative of potential site development impacts.

Table 2: Trip Rate Comparison

Land Use	Weekday Daily Trip Rate	Weekday PM Peak Hour of Adjacent Street Traffic Trip Rate			Weekend Midday Peak Hour of Generator Trip Rate		
		Total	In	Out	Total	In	Out
Costco	79.27	7.17	48.5%	51.5%	9.79	51%	49%
Discount Club	41.8	4.18	50%	50%	6.37	49%	51%
Difference*	37.47	2.99			3.42

SUPPLEMENTAL COSTCO TRIP DATA

Data supporting the trip rates shown in Table 1 is summarized in further detail below in a graphical format similar to the data presented in *Trip Generation Manual, 9th Edition*.

Daily Trip Data

Daily trip data is available for six sites as shown in Exhibit 1, along with a data point representing the trip estimate for the proposed Loomis site. Following the data plot format used in the *Trip Generation Manual*, Exhibit 1 illustrates that the daily trip estimate for proposed Loomis Costco is supported by the trip rate data, reflecting an average trip rate amongst the sites surveyed.

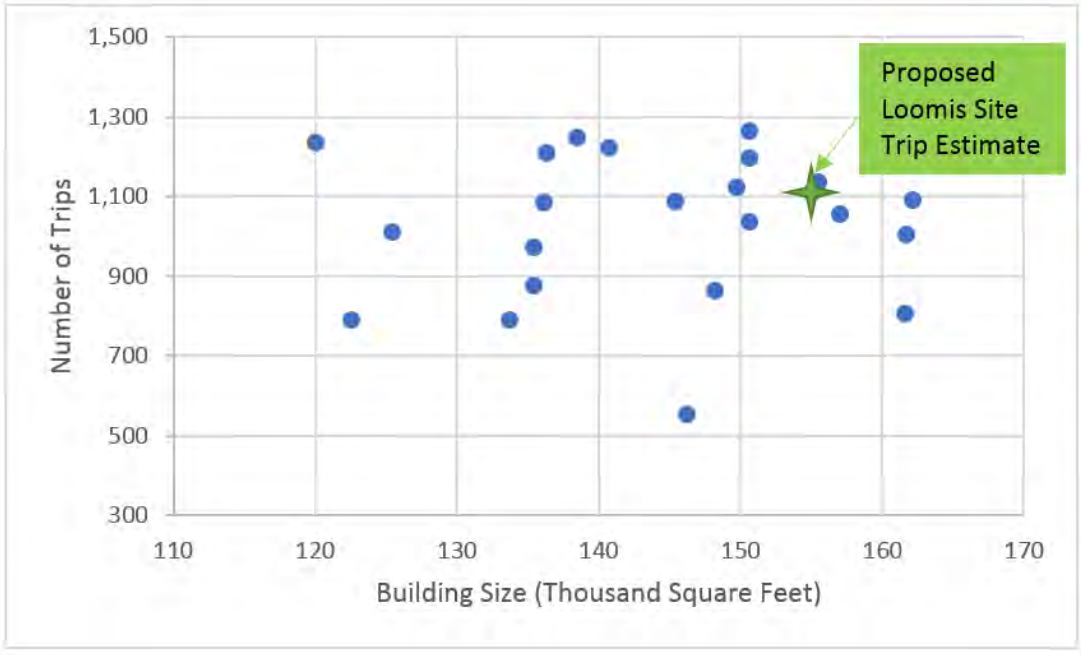

Exhibit 1. Costco Daily Trip Data

Weekday PM Peak Hour Trip Data

Weekday PM peak hour trip data is available for 19 sites (including 3 studies of one site) as shown in Exhibit 2. Exhibit 2 illustrates that the weekday PM peak hour trip estimate for proposed Loomis Costco is supported by the trip data, reflecting an average trip rate amongst the sites surveyed.

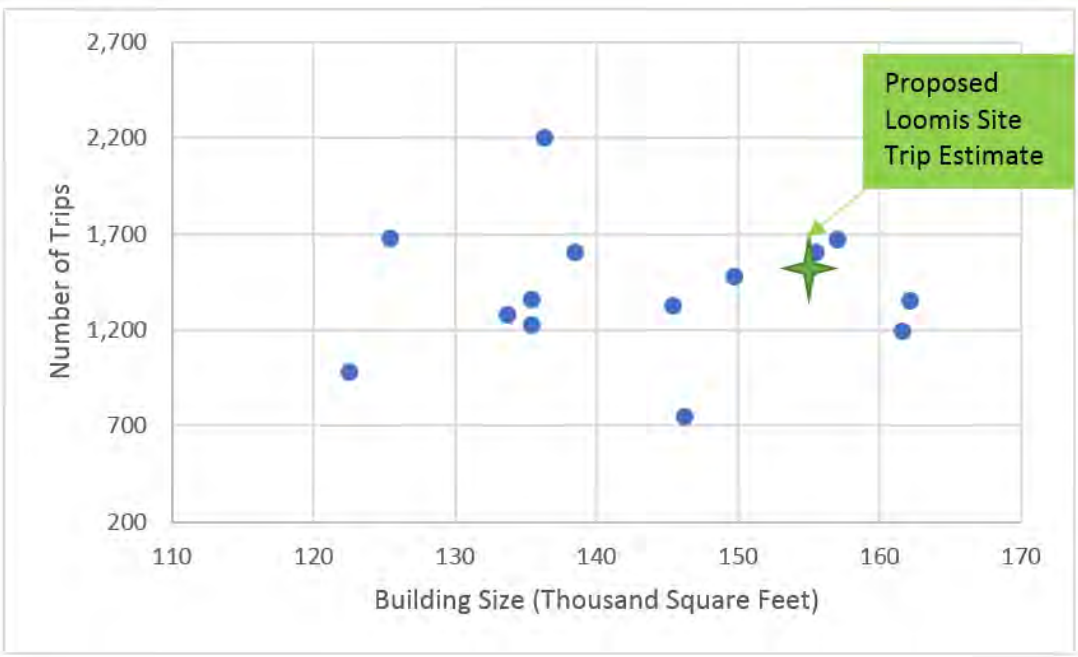

Exhibit 2. Costco PM Peak Hour Trip Data

Saturday Peak Hour Trip Data

Saturday Peak Hour trip data is available for 14 sites as shown in Exhibit 3. Exhibit 3 illustrates that the Saturday midday trip estimate for proposed Loomis Costco is supported by the trip rate data, reflecting an average trip rate amongst the sites surveyed.

Exhibit 3. Costco Saturday Midday Peak Hour Trip Data

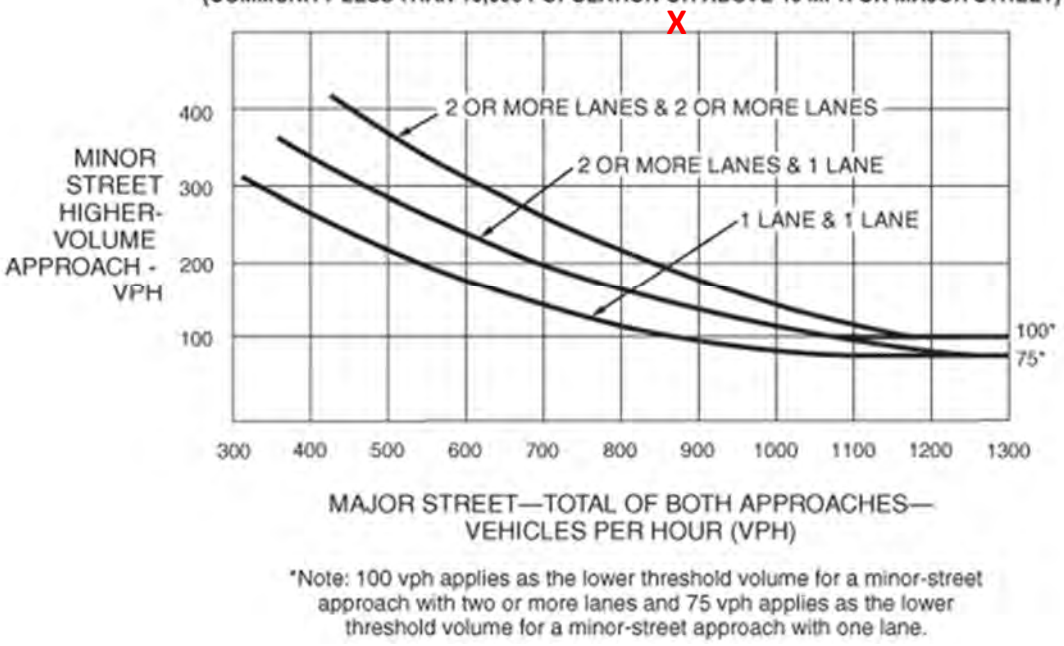
Scenario: **Existing Plus Project Conditions – Weekday PM Peak Hour**
Intersection: **Sierra College Boulevard/SR193**

PART A or PART B SATISFIED YES ☒ NO ☐

PART A SATISFIED YES ☐ NO ☒

(All parts 1, 2, and 3 below must be satisfied)



1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds four vehicle-hours for a one-lane approach and five vehicle-hours for a two-lane approach; AND — YES ☐ NO ☒
2. The volume on the same minor street approach equals or exceeds 100 vph for one moving lane of traffic or 150 vph for two moving lanes; AND — YES ☒ NO ☐
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with four or more approaches or 650 vph for intersections with three approaches. — YES ☒ NO ☐

PART B SATISFIED YES ☒ NO ☐

APPROACH LANES	Lanes	VPH
Both Approaches – Major Street	1	876
Highest Approaches – Minor Street	1	626

The plotted points for vehicles per hour on major streets (both approaches) and the corresponding per hour higher volume minor street approach (one direction only) for one hour (any consecutive 15 minute period) fall above the applicable curves in MUTCD Figure 4C-4.

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

*Note: 100 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor-street approach with one lane.

MANAGEMENT SUMMARY

AECOM was contracted by the Town of Loomis Planning Department to conduct a cultural resources inventory as part of an Environmental Impact Report (EIR) for the construction of a Costco Warehouse and associated facilities in Loomis, California. The project is located in the Town of Loomis, Placer County, on the Rocklin U.S. Geological Survey 7.5-minute topographic quad and Township 11N Range 7E Section 16.

No cultural resources inventories had been previously conducted within the project area; 17 cultural resources inventories conducted within 0.25 mile of the project area identified three prehistoric bedrock milling features and six historic resources, generally related to mining. Pursuant to regulations under Assembly Bill 52, Native American tribes that had requested to be included in the planning process were contacted by the Town of Loomis to identify any tribal cultural resources that may be affected by the project. One response was received from the United Auburn Indian Community (UAIC). While this correspondence did not indicate any specific concerns for the project, UAIC indicated that they would like to receive a copy of this technical report and the EIR and requested tribal representatives be present during cultural resources surveys.

A pedestrian cultural resources survey of the project area was conducted on August 28, 2017. One historic cultural resource site, consisting of house foundations, a historic road, and a trash scatter, and two isolated ground stone fragments were observed. These resources are not considered significant under National Register of Historic Places or California Register of Historical Resources criteria. Therefore, it is recommended that the proposed project will have a finding of no historic properties affected.

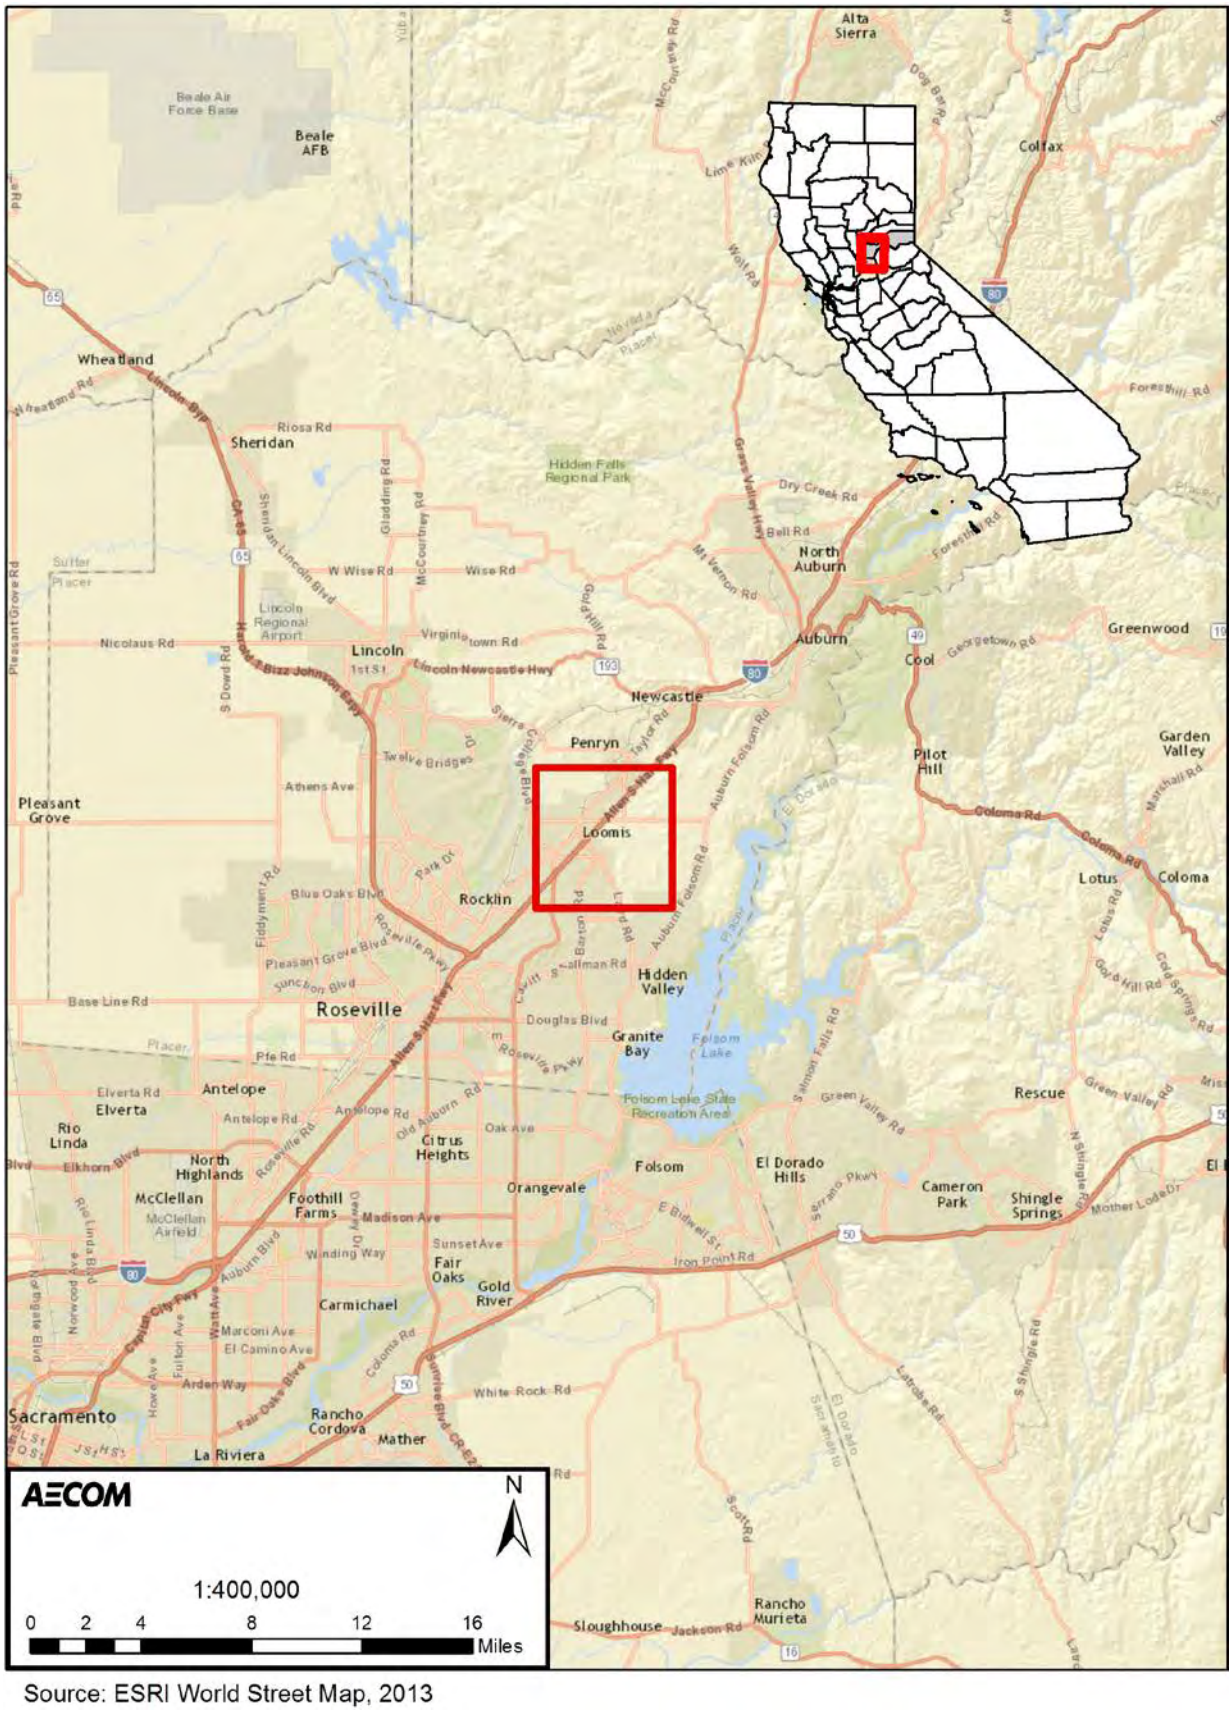
1 INTRODUCTION

Under contract to the Town of Loomis, AECOM conducted a cultural resource investigation for the proposed Loomis Costco Warehouse. This document was prepared in compliance with the California Environmental Quality Act (CEQA) and Section 106 of the National Historic Preservation Act (NHPA). The purpose of this study was to assess the potential for the Project to affect cultural resources potentially eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historic Places (CRHP). Cultural resources are defined as buildings, sites, districts, structures, geographic areas, or objects having historical, architectural, archaeological, or cultural importance. Site research was conducted according to current professional and legal standards. The study team consisted of professionally trained archaeologists meeting the federal Secretary of the Interior's Standards and technical support staff.

1.1 PROJECT LOCATION

The proposed project is located in the Town of Loomis, Placer County, California, immediately southeast of the Brace Road and Sierra College Boulevard intersection (Figure 1). The project is located on the Rocklin, California U.S. Geological Survey (USGS) 7.5-minute quadrangle in Section 16 of Township 11 North, Range 7 East (Figure 2). The project area consists of assessor parcel numbers 045-042-034, 045-042-035, 045-042-036, 045-042-037, 045-042-011, and 045-042-012.

1.2 PROJECT DESCRIPTION



The Town of Loomis is preparing an Environmental Impact Report (EIR) for the proposed construction of a 152,101-square-foot (ft^2) Costco Wholesale warehouse building with approximately 777 parking stalls, a 24–30 dispenser fuel facility, and associated landscaping on an approximately17.38-acre parcel.

1.3 DEFINITION OF UNDERTAKING

The project requires authorization from the U.S. Army Corps of Engineers (USACE) for water quality permits under the Clean Water Act, including a Section 401 water quality certification and Section 404 permits for discharge of fill into waters of the United States associated with impacts on 0.15 acre of vegetated palustrine emergent wetlands. These actions constitute undertakings requiring compliance with Section 106 of the National Historic Preservation Act (NHPA) (16 USC Section 470f). USACE is the lead federal agency for Section 106 compliance.

1.4 DEFINITION OF AREA OF POTENTIAL EFFECT

The Area of Potential Effect (APE) is the "geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of the undertaking and may be different for different kinds of effects caused by the undertaking" (Title 36, Section 800.16[d] of the Code of Federal Regulations [36 CFR 800.16(d)]). For this project, the APE is considered to be the limits of construction and construction-related activities where ground disturbance would occur. The APE for this project is the footprint of the proposed Costco Warehouse, parking lot, dispenser fuel facility and associated landscaping (Figure 2).

2 REGULATORY CONTEXT

Cultural resources in California are protected by a number of federal, state, and local regulations and ordinances. The most frequently applied legislation consists of the provisions of Section 106 and CEQA that provide for the documentation and protection of significant prehistoric and historic period resources.

2.1 FEDERAL

Section 106 of the National Historic Preservation Act of 1966, as amended, requires that federal agencies, or those that they fund or permit, to take into account the effects of the undertaking on any historic properties listed on or eligible for listing on the NRHP and offer the Advisory Council on Historic Preservation and other interested parties an opportunity to comment on the actions. To determine whether an undertaking could affect historic properties, cultural resources (including archaeological, historical, architectural, and traditional cultural properties) must be inventoried and evaluated for inclusion on the NRHP. Cultural resources can be significant on the federal, state, or local level. The 36 CFR § 60.4 regulations describe the criteria to evaluate cultural resources for inclusion in the NRHP:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

a) That are associated with events that have made a significant contribution to the broad patterns of our history; or

b) That are associated with the lives of persons significant in our past; or

c) That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

d) That have yielded, or may be likely to yield, information important in prehistory or history

2.2 STATE REGULATIONS

2.2.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA offers directives regarding impacts on historical resources and unique archaeological resources. CEQA states generally that if implementation of a project would result in significant environmental impacts, then public agencies should determine whether such impacts can be substantially lessened or avoided through feasible mitigation measures or feasible alternatives. This general mandate applies equally to significant environmental effects related to certain cultural resources.

Only significant cultural resources (e.g., “historical resources” and “unique archaeological resources”) need to be addressed. State CEQA Guidelines define a “historical resource” as, among other things, “a resource listed or eligible for listing in the California Register of Historical Resources” (CRHR) (CEQA Guidelines, Section 15064.5, subdivision (a)(1); see also Public Resources Code Sections 5024.1, 21084.1.) A historical resource may be eligible for inclusion in the CRHR, as determined by the State Historical Resources Commission or the lead agency, if the resource:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; or

2. Is associated with the lives of persons important in our past; or

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition, a resource is presumed to constitute a "historical resource" if it is included in a "local register of historical resources" unless "the preponderance of evidence demonstrates that it is not historically or culturally significant" (CEQA Guidelines, Section 15064.5, subdivision (a)(2)). The State CEQA Guidelines require consideration of unique archaeological sites (Section 15064.5). (See also Public Resources Code Section 21083.2.) A "unique archaeological resource" is defined as "an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.

3. Is directly associated with a scientifically recognized important prehistoric or historic event or person (Section 21083.2).

If a cultural resource does not meet the criteria for inclusion in the CRHR but does meet the definition of a unique archaeological resource as outlined in the Public Resources Code (Section 21083.2), it is entitled to special protection or attention under CEQA. Treatment options under Section 21083.2 of CEQA include activities that preserve such resources in place in an undisturbed state. Other acceptable methods of mitigation under Section 21083.2 include excavation and curation or study in place without excavation and curation (if the study finds that the artifacts would not meet one or more of the criteria for defining a "unique archaeological resource").

Public Resources Code Section 15064.5(e) of the State CEQA Guidelines requires that excavation activities be stopped whenever human remains are uncovered and that the county coroner be called in to assess the remains. If the county coroner determines that the remains are those of Native Americans, the Native American Heritage Commission (NAHC) must be contacted within 24 hours. At that time, Section 15064.5(d) of the State CEQA Guidelines directs the lead agency to consult with the appropriate Native Americans as identified by the NAHC and directs the lead agency (or applicant), under certain circumstances, to develop an agreement with the Native Americans for the treatment and disposition of the remains.

3 BACKGROUND

3.1 ENVIRONMENTAL SETTING

The proposed project is located in the foothill region of the Sierra Nevada. Elevations within the project area range from 97 meters (m) (320 feet) to 103 m (340 feet) above mean sea level. Geologically, the area is characterized by Andregg coarse sandy loam soils (Wagner et al. 1987). The climate of the region is classified as Mediterranean with cool, wet winters and dry, hot summers. Oak woodland mixed with disturbance-loving plant species such as star thistle (*Centaurea solstitaialis*) and cheat grass (*Bromus tectorum*) dominates the project area. Amphibians and reptiles found in oak woodlands include Pacific tree frog (*Hyla regilla*), western fence lizard (*Sceloporus occidentalis*), and California kingsnake (*Lampropeltis getulus*). Common resident birds in these forests include acorn woodpecker (*Melanerpes formicivorus*), western scrub-jay (*Aphelocoma californica*), oak titmouse (*Baeolophus inornatus*), and wrentit (*Chaemaea fasciata*). Common mammals in these mixed woodlands include gray fox (*Urocyon cinereoargenteus*), bobcat (*Lynx rufus*), mule deer (*Odocoileus hemionus*), and Douglas' squirrel (*Tamiasciurus douglasi*) (Deis 2007). During survey, wild turkeys (*Meleagris gallopavo*) and feral cats (*Felis catus*) were also noted in the project area.

3.2 PREHISTORIC CONTEXT

The archaeology of the project area is included within the broad framework established by archaeologists for the Sacramento Valley. Although human occupation of the northern Sacramento Valley may extend back 10,000 years or more, reliable evidence of the presence of such an early human presence is lacking. Early archaeological sites bearing evidence of these Paleo-Indian populations may be present in the valley but deeply buried under alluvium (Moratto 1984).

For the Sacramento Valley and foothill regions, Lillard and Purves (1936) recognized a three-part cultural sequence (Early, Middle, and Late horizons) that was derived from the archaeological analysis of midden and cemetery sites in Central California. This scheme was later described in more detail by Lillard et al. (1939) and was refined by Beardsley (1948 and 1954). In an attempt to unify the various hypothesized cultural periods in California, Fredrickson (1973, 1974, and 1993) proposed an all-encompassing scheme for cultural development, while acknowledging that these general trends may manifest themselves differently and some variation between subregions may exist. These general cultural periods (Paleo-Indian, Early, Middle and Late Archaic, and Emergent periods) are used here in connection with the North-Central Sierra Nevada chronology.

This horizon scheme, referred to as the Central California Taxonomic System, does not account well for cultural variation between subregions, or for gradual changes through time. It deals primarily with material culture and pays little attention to subsistence and settlement, social organization, or other patterns of behavior. As Moratto (1984:201) has observed, "central California prehistory was far too complex and dynamic to have been represented by [such] a monolithic scheme." Consequently, later researchers have broken the region and its prehistory into local districts and phases (Elsasser 1978). New radiocarbon determinations adjusted with modern calibration curves are now used for a more precise time frame (Rosenthal et al. 2007:147–153). These different cultural patterns are characterized as:

- **The Paleo-Indian Period:** The Paleo-Indian Period (12,000 to 10,500 Before Present [BP]) saw the first demonstrated entry and spread of humans into California. Characteristic artifacts recovered from archaeological sites of this time period include fluted projectile points (constructed from chipped stones that have a long groove down the center called a "flute") and large, roughly fashioned cobble and bifacially-flaked stone tools that were used in hunting "big game" such as mastodon, bison, and mammoth that roamed the land during this time.

- **The Lower Archaic Period:** The beginning of the Lower Archaic Period (10,500 to 7500 BP) coincides with that of the Middle Holocene climatic change that resulted in widespread floodplain deposition. This episode resulted in most of the early archaeological deposits being buried. Most tools were manufactured of local materials, and distinctive artifact types include large dart points and the milling slab and handstone.

- **The Middle Archaic Period:** The Middle Archaic Period (7500 to 2500 BP) is characterized by warm, dry conditions that brought about the drying up of pluvial lakes. Economies were more diversified and may have included the introduction of acorn processing technology, although hunting remained an important source of food. Artifacts characteristic of this period include milling stones and pestles and a continued use of a variety of implements interpreted as large dart points.

- **The Upper Archaic Period:** The Upper Archaic Period (2500 to 850 BP) corresponds with a sudden turn to a cooler, wetter and more stable climate. The development of status distinctions based upon wealth is well documented in the archaeological record. The development of specialized tools, such as bone implements and stone plummets, and manufactured shell goods were prolific during this time. The regional variance of economies was largely due to the seasonality of resources, which were harvested and processed in large quantities.

- **The Emergent Period:** Several technological and social changes distinguish the Emergent Period (850 BP to Historic) from earlier cultural manifestations. The bow and arrow were introduced, ultimately replacing the dart and throwing spear, and territorial boundaries between groups became well established. In the latter portion of this period (450 to 1800 BP), exchange relations became highly regularized and sophisticated. The clam disk bead developed as a monetary unit of exchange, and increasing quantities of goods moved greater distances. It was at the end of this time period that contact with Euroamericans became commonplace, eventually leading to intense pressures on Native American populations.

3.2.1 ETHNOGRAPHIC CONTEXT

The project site is situated within the traditional territory of the Nisenan. The western boundary of Nisenan territory was the western bank of the Sacramento River; the eastern boundary was the crest of the Sierra Nevada; and the southern boundary was likely a few miles south of the American River. The northern boundary has not been clearly established due to similarities in language with neighboring tribes (Wilson and Towne 1978:387–389).

Nisenan settlement locations depended primarily on elevation, exposure, and proximity to water and other resources. Permanent villages were usually located on low rises along major watercourses. Houses were domed structures measuring 10 to 15 feet in diameter and covered with earth and grass. Brush shelters were used in the summer and at temporary camps during food-gathering rounds. Larger villages often had semi-subterranean dance houses that were covered in earth, grass, or brush; a central hole at the top to allow the escape of smoke, and an east-facing entrance. Another common village structure was the granary, which was used for storing acorns.

The rich valley environment the Nisenan occupied provided abundant year-round food resources. Hunting, gathering, and fishing went on throughout the year though what was procured depended on seasonal availability. Due to this seasonal variability, the Nisenan did not rely on a single crop, but on many different staples such as acorns, seeds, nuts, grasses, herbs, roots, tubers, berries, and wild fruits. Deer, rabbit, and salmon were the chief sources of animal protein in the aboriginal diet, but many insect and other animal species were taken when available (Wilson and Towne 1978:389). Today, Nisenan descendants are reinvesting in their traditions and represent a growing and thriving community.

3.3 HISTORIC CONTEXT

Aside from early Spanish explorers, the Sierra Nevada foothill region and Sacramento Valley were virtually unknown by Europeans before the Gold Rush. A wave of gold seekers descended on California and the foothill and mountain regions of the Sierra Nevada following the discovery of gold at Coloma on the South Fork American River in January 1848. The 1850 U.S. Census put the population of Placer County at 11,417, consisting of 6,945 whites, 3,019 Chinese, 89 blacks, 634 other foreign races, and 730 Native Americans (U.S. Census 1850). However, the population was likely larger as the Census was biased against minority groups, which were underrepresented.

Mining sites consist of artifact concentrations and feature systems that reflect the myriad of operations and technologies that have been used in the area. These cycles of occupation and abandonment create layers or components of mining technology and systems that are horizontally stratified, often altering or obliterating previous operations, and can often be viewed as discontinuous with underground structure (Hardesty 1988:11–12). Many times, only fragments of technologies and operations are visible. For example, Lindstrom (1989:38) found that placer mining operations resulted in finer sediments being carried away during the washing process, with only larger cobbles or boulders remaining at the processing site.

Mining camps were ubiquitous in mid-19th century Placer County. Secret Ravine, a perennial tributary of Dry Creek that feeds into the Sacrament River, runs southwest from Auburn to Roseville and was the site of extensive placer mine workings during the Gold Rush and granite mining after the Gold Rush. Mining camps along Secret Ravine include Newcastle, Stewart's Flat, Penryn, and the Town of Loomis.

The Town of Loomis was originally known as the Pine Grove mining camp, which was established in 1850 (Hoover et al. 1966:272). The Pine Grove mining camp was associated with the Placer Post Office, which changed its name to Smithville in 1862, then to Pino in 1869 after the mining camp, and finally to Loomis in 1890 with the arrival of the Southern Pacific Railroad (Durham 1998:516). Loomis incorporated in 1984 as a way to avoid being annexed by Rocklin.

The Central Pacific Railroad, which was the western portion of the first transcontinental railroad in the United States, started construction in Sacramento in 1863. In 1885, the Central Pacific Railroad was leased to Southern Pacific Railroad. The Town of Loomis moved about a mile northwest of its original mining camp location to better access the railroad in 1864 (Windmiller 2006). While the transcontinental railroad was important nationally as it linked the east and west coasts of the United States, locally the existence of the railroad made it easier to transport the foothills products such as agriculture, timber, and granite to the markets in Sacramento and San Francisco, allowing for continual economic development after the Gold Rush.

After the Gold Rush panned out, granite mining continued in Placer County around the Rocklin area, including the Loomis area. Granite occurs as residual surface boulders and batholith from Folsom to Lincoln (Davis 1990:13). Folsom Granite Company was the largest company, but over 60 independent operations existed in the Rocklin area (Derr and Rondeau 1979). The local granite was used as a building material in Sacramento, San Francisco and the Bay Area, and even as far away as Hawaii (Davis 1990:129). The waste material from granite mining was also used in railroad and levee construction.

By the late 19th century, the increase of new mining camps appearing in Placer County slowed considerably, and other economic pursuits, such as ranching and agriculture, became the backbone of Placer County's economy. Ranching and agriculture, which had once been support systems that provided food to the miners, grew to become dominant industries. As thousands of miners poured into the area during the early 1850s, farmers and ranchers put additional acreage into production to meet the demand for potatoes, flour, and various dairy products.

The first of such settlements in Placer County was Sicard's Ranch, a Mexican grant on the south bank of the Bear River, west of the project area. The grant was given to Theodore Sicard in 1844. Sicard, a French sailor, built an adobe house on the land in 1846, which later became a prominent stopping place for travelers on the way to Sutter's Fort in Sacramento. Sicard and fellow countryman Claude Chana, who had arrived at the ranch in late 1846, planted peach and almond trees, which became the start of the commercial orchard business in the Sacramento Valley. Chana later bought the Sicard grant, and sold the products of his orchard, vineyard, and vegetable garden to area miners (Hoover et al. 1966).

Closer to the project area, the Takahashi farm (CA-PLA-1078H) was located approximately 250 m to the south of the project area, at the current location of the Rocklin Commons mall, between Sierra College Boulevard and Granite Drive. The Takahasi farm had originally been part of the Himes Tract, which was subdivided into 10-acre lots during the 1890s (ECORP 2006). In the early 20th century, Japanese families, including the Takahashi family, were buying lots in the Himes Tract. The Takahashi farm was occupied by three generations of the family from 1924 to 1990 (ECORP 2006:11).

3.4 SIGNIFICANCE REQUIREMENTS

This inventory report is intended to identify the presence of cultural resources in the APE that are considered significant under NRHP or CRHR criteria, and are therefore determined to be historic properties; determine whether the project would adversely affect any historic properties; and provide mitigation measures to limit potential impacts on historic properties.

Given the region's prehistoric, ethnographic, and historic contexts as described above, cultural resources in the project area are expected to reflect the mining, ranching, and agricultural activities that occurred in the general project vicinity. However, prehistoric cultural resources may also be present, in the form of bedrock milling features or small campsites.

3.4.1 ELIGIBILITY CONSIDERATIONS

3.4.2 PREHISTORIC RESOURCES

Based on documentary investigations, Native American consultation, and fieldwork, prehistoric resources that may be uncovered include local manifestations of regional subsistence, settlement, and exchange. Typically, prehistoric resources are bedrock milling features; the remains of human habitation including midden soils, lithic, and faunal remains; and lithic scatters.

To be recommended as significant under NHPA Section 106 or the State CEQA Guidelines, prehistoric sites must possess integrity, and must qualify under one or more of the four NRHP/CRHR significance criteria described in Chapter 2, as explained further below.

- **NRHP Criterion A or CRHR Criterion 1:** The resource must be associated with events significant to the broad patterns of history. Resources must contain some evidence of such an association. For prehistoric sites, there should be evidence that the site was especially important to the Native American residents of the area as a village, meeting place, or ceremonial site, or in some other capacity. Examples of such evidence include large numbers of residential features and ceremonial objects.

- **NRHP Criterion B or CRHR Criterion 2:** The resource must be associated with the lives of persons significant in the past. Documentary or artifactual evidence could demonstrate, or oral tradition could attest to, such an association. If the evidence were not artifactual, it would have to specify the site's location with

sufficient accuracy to allow unequivocal identification of the location. Artifactual evidence would have to support the claim of association, or to reasonably corroborate documentary or testamentary claims.

- **NRHP Criterion C or CRHR Criterion 3:** The resource must embody the distinctive characteristics of a type, period, or building method; represent the work of a master; possess high artistic value; or represent a distinguishable entity whose components lack individual distinction. The presence of prehistoric architecture or rock art would most likely qualify a site under NRHP Criterion C or CRHR Criterion 3.

- **NRHP Criterion D or CRHR Criterion 4:** The resource must contain, or must be likely to contain data, that can further our understanding of prehistory. These data must also be in a context that has not been significantly affected by natural processes or subsequent cultural activities.

3.4.3 HISTORIC RESOURCES

A review of historic documents indicates that historic mining and ranching/ agriculture constitute the primary historic themes that may be present in the project area. The discussions below address NRHP/CRHR eligibility considerations and integrity considerations for these themes, along with the theme of irrigation and water conveyance systems.

MINING-RELATED FEATURES

The remains of small-scale operations, consisting of prospects, placer mining, and associated refuse, are the types of mining-related sites most likely to be encountered in the project area. These features are limited in duration of use and scale, but they have the potential to provide data not often described in the historic literature.

NRHP/CRHR Eligibility Considerations

To be considered eligible under NRHP and/or CRHR criteria, mining-related properties must:

- display evidence of a permanent operation that contributed to the development of mining or mining technology in the region;

- exhibit evidence of new approaches or represent innovative approaches to mining; or

- be the first or last of an era.

The presence of archaeological deposits may qualify the site as eligible under NRHP Criterion D and/or CRHR Criterion 4 if the data have the potential to address one or more of the research issues mentioned above. Refuse deposits may provide information about the success of the mining operation, the ability of the operators to adjust to changing technology, operations during a particular period of history, or the lifeways and/or composition of work groups.

Integrity Considerations

Mining features must retain the character and feeling of the original resource, with limited impacts from natural processes or subsequent historic modifications or impacts. Associated archaeological deposits must be in the original matrix and not mixed with subsequent operations or other historic events.

RANCHING AND AGRICULTURE

Since the Gold Rush, the project area has been dominated by ranching and farming. The heritage of farming and ranching in the project vicinity dates to the 1850s, when settlers established ranches to meet the food demands of mining operations. Local ranchers and farmers have experienced many economic fluctuations since those early years, and rural development has replaced many farms and ranches recently.

Permanent ranch or farming operations with complexes of buildings have been documented in the cultural resources inventory for HFRP. The following types of facilities and remains are likely to be encountered:

- Water conveyance systems, including dams and catchment basins
- Corrals
- Barns and sheds
- Structural remains
- Refuse dumps and scatters

NRHP/CRHR Eligibility Considerations

To be eligible for the NRHP or CRHR, ranching and agriculture–related resources must display the characteristics summarized below.

- **NRHP Criterion A or B or CRHR Criterion 1 or 2:** The resource must have been permanent and used for a number of sequential years, and thus must be capable of interpretation for its role in the development of the local livestock and farming industry. Alternatively, the site could be associated with the career of a person important in the local evolution of the livestock or farming industry. In this case, to be considered eligible under NRHP Criterion B or CRHR Criterion 2, the locale must have been used and occupied by an important personage, not simply owned or remotely operated by the person.

  The resource also must maintain enough of its historic fabric to make its function readily apparent. The properties may be found either singularly or as part of a complex or system. In a complex or system, the contributing resource must be at least 50 years old. The features or objects must be in their original location or their location during the period of significance, and the setting must convey their historic feeling or function. For architectural resources, additions or modification must not impair the quality of the historic fabric (design, materials, and workmanship) of the individual resource.

- **NRHP Criterion D or CRHR Criterion 4:** The resource must be able to offer significant quantities of information to address research questions and retain a sufficient degree of integrity (as summarized below).

Sites and features in the project area tend to have minimal built or constructed features and generally are considered more important for the information they may contain than for their architectural presence. Thus, these resources generally will not be considered eligible under NRHP Criterion C or CRHR Criterion 3.

Integrity Considerations

For archaeological expressions to be considered to possess integrity, all of the aforementioned properties, features, and site types must not exhibit evidence of extensive post-depositional disturbance.

For farms and ranches, the resource must convey its historic function and modern repairs. Additions and maintenance activities must not have significantly impaired the resource's historic fabric and character and its relationship to ranching operations. Those same activities are also considered when determining the site's integrity as an archaeological resource, because they would disturb the archaeological matrix.

IRRIGATION AND WATER CONVEYANCE SYSTEMS

Historically, adequate water has been available for use in Placer County; however, the water was not always conveniently located to meet the irrigation needs of farming, ranching, and mining. Securing water supplies has been a key element of successful Euro-American use of Placer County and California as a whole. During the past 150 years, growing numbers of people in California have recognized the need for adequate and reliable water supplies, at first to supply the needs of miners and later to supply electrical generation facilities and enable irrigation. This recognition led to the development of water storage and distribution systems, which can be categorized by their funding type (private or public), size and scale (small to very large), number of users served, and type of water usage.

The property types pertinent to the study area and the theme of water resource development are irrigation and their component elements, consisting of dams, canals, ditches, laterals or spreaders, diversion dams, head gates, pipes, siphons, drop boxes, flumes, and silt boxes. In the project area, the purpose is to provide irrigation water for agricultural expansion on arid lands. These resources may be eligible under NRHP Criteria A–C or CRHR Criteria 1–3. These resources may also be eligible under NRHP Criterion D or CRHR Criterion 4 if associated archaeological deposits are present. Beyond that, any features must be among the earliest in a given drainage or watershed. For this region of California, any ditches and their water rights must be dateable to the mid-19th or early 20th century (1850–1910). The property types and registration requirements outlined below were determined based on archival research and a review of published sources that show the types of ditches recorded and expected to be found in the study area.

NRHP/CRHR Eligibility Considerations

To be eligible for the NRHP or CRHR, resources related to irrigation and water conveyance systems must meet the requirements summarized below.

- **NRHP Criterion A or CRHR Criterion 1:** Irrigation and water conveyance systems (e.g., diversion dams, head gates, pipes, canals, siphons, drop boxes, flumes, silt boxes) must be associated with one or more historic themes important to the development of the region, and must clearly portray that theme. In addition, the features must be good examples of those systems.

- **NRHP Criterion B or CRHR Criterion 2:** The components or system must be associated with an individual or group of individuals who were important in the development of water conveyance systems, ranching, or farming. Furthermore, the associated individuals must have been actively engaged in the operations, and not merely investors or owners.

- **NRHP Criterion C or CRHR Criterion 3:** Construction materials, features, or methods of construction must be representative of irrigation systems, with engineered elements that are significant or that demonstrate an evolution in the construction of irrigation systems.

- **NRHP Criterion D or CRHR Criterion 4:** Archaeological deposits associated with the resources must be capable of use to further define methods of construction, time periods, cultural affinity, or uses of the system.

Integrity Considerations

Segments of irrigation and water conveyance systems may be found either singularly or as a system. A singular element's function, purpose, and role within the larger system should be capable of interpretation. The feature or object must be in its original location or the location during the period of significance, and the setting must be present to convey a historic feeling and function. Although additions or modifications must not impair the quality or the historic fabric (e.g., design, materials, and workmanship) of the individual element or system, ditches and their

associated delivery systems must be viewed as dynamic when assessing integrity. For example, ongoing maintenance activities must be conducted periodically, which will cause changes to any given ditch. However, substantial upgrades, such as adding concrete lining or converting a dirt ditch to pipe, will be considered to have compromised the historic fabric and feeling. Therefore, a substantially altered ditch, or the altered portions, will be considered ineligible.

In summary, features of irrigation and water conveyance systems should be clearly evident, not filled in or substantially modified, and accurately dated. The only exceptions applicable to these property types occur when the property is representative of a once-larger property category that has now become relatively scarce.

4 PREFIELD INVESTIGATIONS

Cultural resource investigations for the proposed project consisted of several elements: Native American consultation, pre-field research including previous investigations, and pedestrian survey of the project area. All aspects of the cultural resource study were conducted in accordance with guidelines outlined in the federal *Secretary of the Interior's Standards and Guidelines for the Identification of Cultural Resources* (48 Federal Register [FR] 44720–23) and the Office of Historic Preservation's (OHP's) *Instructions for Recording Historical Resources* (OHP 1995).

4.1 RECORDS SEARCH RESULTS

Pre-field research consisted of a records search at the North Central Information Center (NCIC) of the California Historical Resources Information System, conducted on August 2, 2017. Records maintained by the NCIC include California Department of Parks and Recreation (DPR) Series 523 archaeological site records, site location maps, maps of previous study coverage, National Register of Historic Places (NRHP) Nomination Forms, and relevant historical documentation and maps. The NCIC research also included a review of the following sources, all of which are on file at the information center:

- NRHP (National Park Service 1996, and computer updates 1966–present)
- CRHR (State of California, through present)
- California Points of Historical Interest (State of California 1992 and updates)
- Historic Spots in California (State of California 1966)
- Directory of Properties in the Historical Resources Inventory (State of California 1976 and updates)
- Historic Property Data File (OHP)
- California Historical Landmarks (OHP, DPR 1990)
- General Land Office (GLO) plat map (Bureau of Land Management)

This review indicated that no cultural resources investigations have occurred within the project area and 17 have been conducted within 0.25 mile (Table 1).

No cultural resources have been recorded within the project area. A total of nine prehistoric and historic archaeological sites have been recorded within 0.25 mile of the project area (Table 2). Resources generally consist of prehistoric bedrock milling features and historic habitation, mining, or ranching sites.

4.2 HISTORIC MAPS

4.2.1 GENERAL LAND OFFICE (GLO)

A review of historic maps was conducted to define past landscape conditions and determine what buildings or structures may have existed within or near the project area. The 1856 GLO plat map of T11N R7E does not depict any structures or roads within the project area (see Figure 3Figure 3. T11N R7E 1856 GLO plat, APE outlined in red.). Few features are indicated in the surrounding area; but “Clover Valley” is named and multiple residences are noted, including Indian Valley Hotel (Section 1), unnamed farmhouse and house (Section 4), Gouldsby’s House (Section 5), Howe and Richardson’s (Section 18), Thompson’s House (Section 10), and Crow’s House (Section 11).

4.2.2 HISTORIC USGS TOPOGRAPHIC MAPS

The mid-20th century USGS 7.5-minute topographic maps show little development in the project area, beyond the building of the apartment block north of the project area (Figure 4 and Figure 5). However, the construction of the Rocklins Commons mall and the Walmart SuperCenter, south of the project area at the intersection of Sierra College Boulevard and Interstate 80, demonstrate a change from agricultural land use to commercial and industrial in the late 20th/early 21st century, as a result of the eastward expansion of Rocklin. The 1967 topographic map shows the construction of the 4105 Starlight Lane house and the presence of Starlight Lane. No other structures are shown on historic topographic maps within the project area.

4.3 NATIVE AMERICAN HERITAGE COMMISSION SACRED LANDS SEARCH

AECOM contacted the NAHC August 1, 2017, to request a search of the NAHC Sacred Lands Files. At the time of final report writing, no response had been received.

4.4 NATIVE AMERICAN CONSULTATION

The Town of Loomis sent letters announcing the Notice of Preparation to the tribal organizations who had requested to be informed of CEQA projects under Assembly Bill (AB) 52 on May 15, 2017. One response was received from the United Auburn Indian Community (UAIC) on June 19, 2017. While this correspondence did not indicate any specific concerns for the project, it did indicate that UAIC would like to receive a copy of this technical report and the EIR. In addition, UAIC requested that tribal representatives be present for any cultural resources surveys. UAIC was informed of the planned cultural resources survey date so representatives could attend. The Town of Loomis also sent formal letters requesting consultation with UAIC under AB 52 on August 1, 2017.

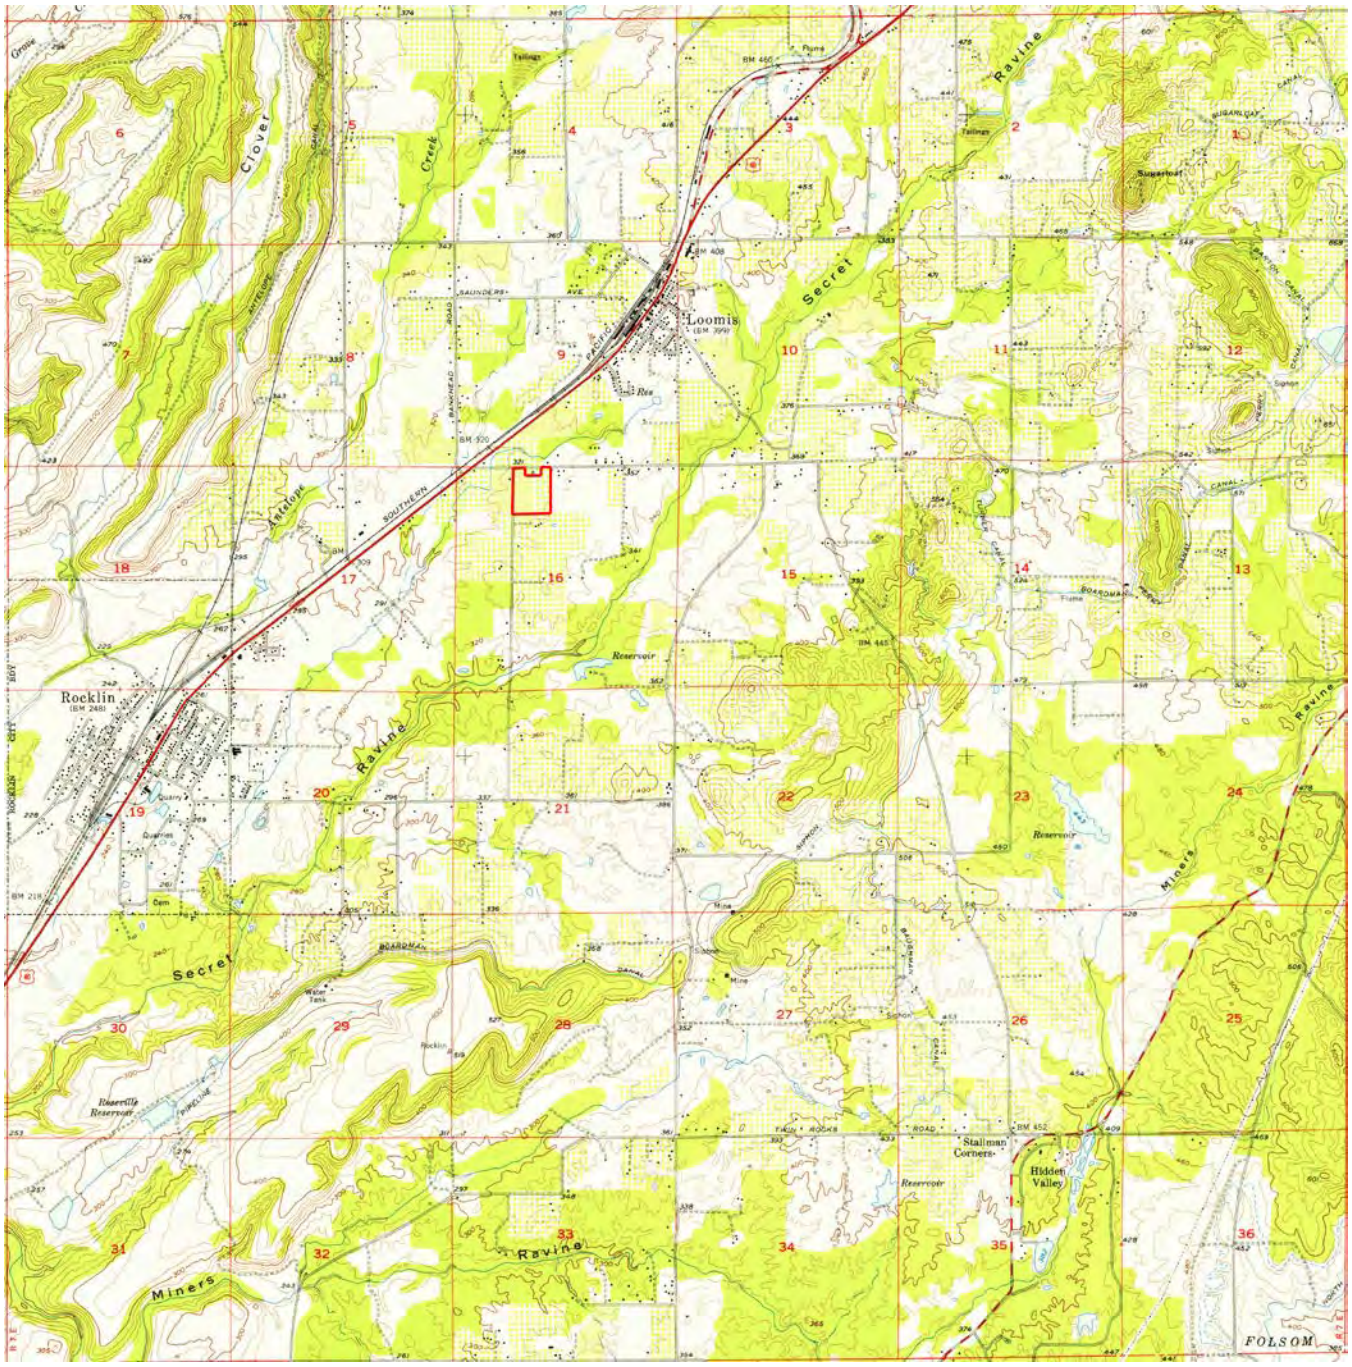

Figure 4. T11N R7E on USGS 7.5' Rocklin Quad, 1954. APE outlined in red.

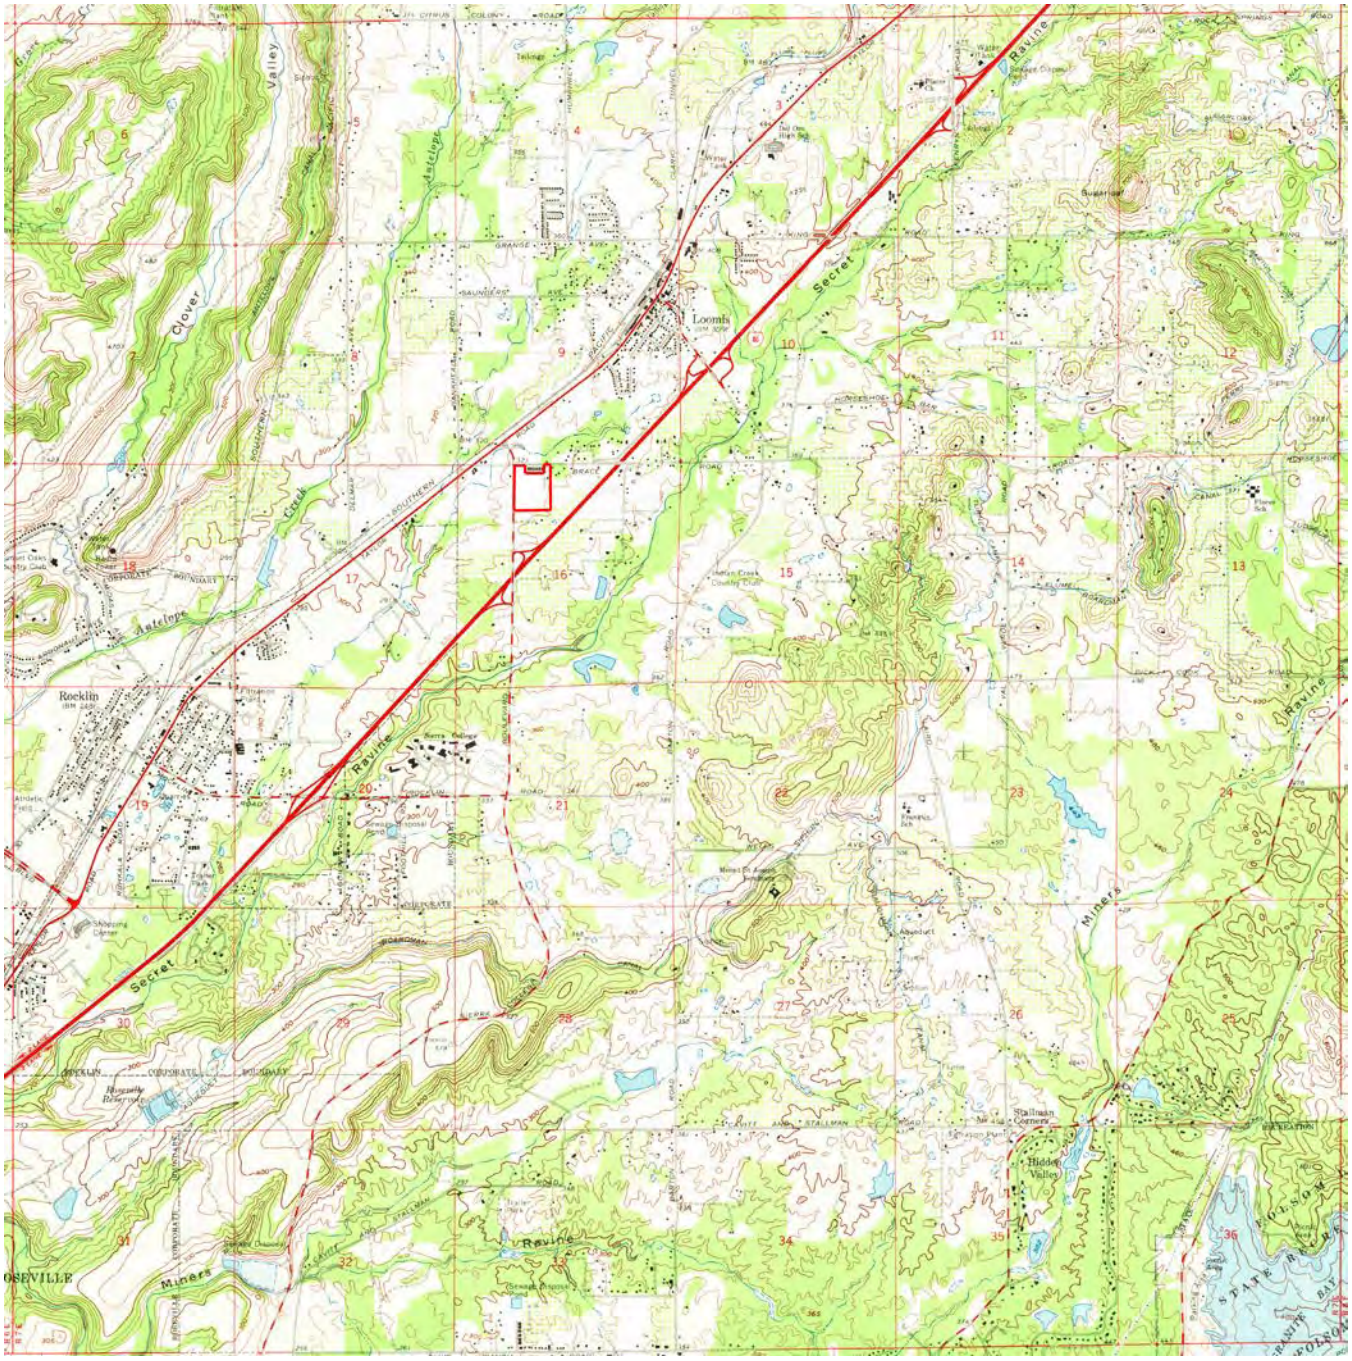

Figure 5. T11N R7E on USGS 7.5' Rocklin Quad, 1967. APE outlined in red.

This page intentionally left blank.

5 FIELD INVENTORY

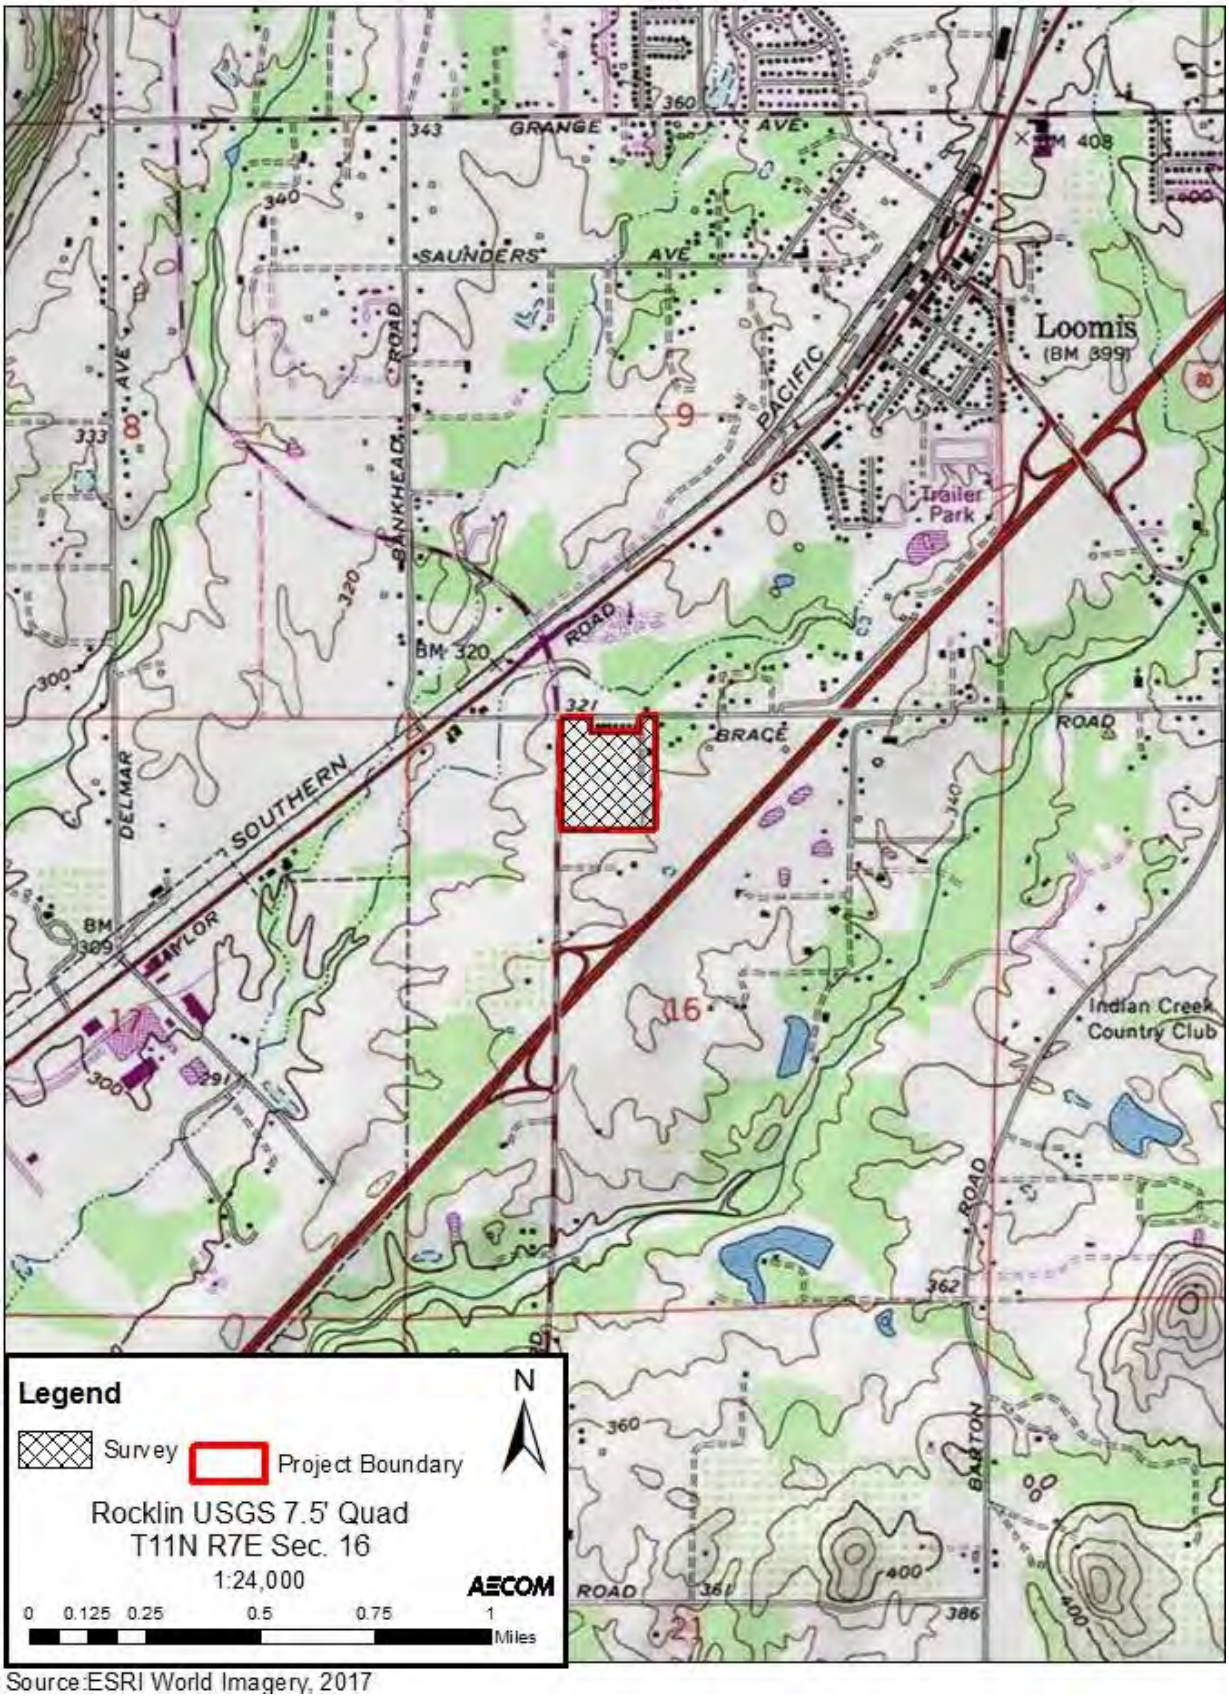
Although no sites and no archaeological investigations have been documented within the area of potential effects (APE), previous studies and information provided by the NCIC indicate that the project area and the surrounding vicinity are sensitive for containing evidence of Native American occupation, early mining, and homesteads.

5.1 PEDESTRIAN SURVEY

AECOM cultural resources specialists Amy Jordan, PhD, and Laura Cook conducted the field surveys on August 28, 2017. Charles Hutcheson from UAIC accompanied AECOM archaeologists on the survey.

5.1.1 QUALIFICATIONS

Dr. Amy Jordan, received her PhD and MA degrees in Anthropology from the University of Washington, and received her undergraduate degree in archaeology from the University of Wisconsin. She meets the Secretary of the Interior's standards for work in archaeology. She has more than 10 years of experience in field and laboratory archaeology and archaeological collections management. She is familiar with California and Pacific Northwest Coast prehistory and history and has experience with preparing technical studies incompliance with CEQA, National Environmental Policy Act (NEPA), and NHPA Section 106. She has project management experience, including budget development and management and has extensive experience communicating to diverse audiences.



Laura Cook is an archaeologist with more than 9 years of experience in the western United States with an emphasis in California and Nevada. Mrs. Cook, received her BA in anthropology from U.C. Davis, and is an archaeological technician at AECOM where she is involved in all phases of archaeological documentation, including pedestrian survey, staged testing, excavation, construction monitoring, and technical report writing. Laura has worked extensively in the Sierra Nevada, including the Stanislaus National Forest where she was crew lead for 3 years, and the Eastern Sierra; throughout the Great Basin; and the Mojave Desert. While employed with the Forest Service, Laura completed rigorous fire trainings and functioned as a Burn Area Emergency Response team member on the 2013 Rim Fire and as a Resource Advisor on the 2014 El Portal Fire and 2015 South and Fork Complex Fires. Additionally, she has contributed significantly to numerous cultural resource reports for ISs, Environmental Assessments (EAs) EIRs, Initial Study/Mitigated Negative Declarations (IS/MNDs), and Environmental Impact Statements (EISs) and is knowledgeable with the implementation of CEQA, NEPA and Section 106.

5.1.2 METHODOLOGY

AECOM cultural resource specialists conducted an intensive field survey of the proposed project area on August 28, 2017 (Figure 6). Consistent with the Secretary of the Interior's standards and guidelines, the entire project area was surveyed using parallel 20- to 30 m transects. Disturbed areas with ground visibility were intensively examined for artifacts or other evidence of cultural activity.

Accurate and complete survey coverage of the project area was ensured through the use of a Trimble GeoXH 6000 series hand-held global positioning system (GPS) unit, which was cross-checked with topographic features represented on a USGS 7.5-minute quadrangle map with a projected NAD 83 UTM grid, and aerial photographic images. All sites and relevant features were mapped using the same GPS technology mentioned above.

Site information was recorded on appropriate DPR Series 523 forms. A Primary Record (DPR 523A) and an Archaeological Site Record (DPR 523C) was completed for documented resources, as appropriate.

Source:ESRI World Imagery, 2017

Figure 6. Surveyed Areas.

Ground surface visibility was relatively poor throughout the APE with 5% visibility due to non-native grasses, star thistle, and other pioneer species. Open areas under oak trees were examined for the presence of artifacts as were the freshly disturbed areas of heavy equipment tracks/ fire breaks.

5.1.3 FINDINGS

The inventory of the project area identified one historic cultural resource site, consisting of house foundations, a historic road, and a trash scatter, and two isolated ground stone fragments. Site documentation is presented in Appendix A.

5.1.3.1 4105 STARLIGHT LANE HOUSE FOUNDATIONS AND TRASH SCATTER

This site consists of three historic components: house foundation at 4105 Starlight Lane (Figure 7), the remnants of Starlight Lane, and a historic trash scatter located approximately 115 m southwest of the house foundations. The house was built in 1963, according to the Placer County tax assessor, and was demolished in early 2012. Starlight Lane continued to, and slightly past, the house, but the road is no longer in use and is blocked off before reaching the house foundation. The small historic trash scatter with aqua, colorless, and brown glass fragments, and fragmented ceramics may be contemporaneous with the extant residence, although the use of aqua-colored glass pre-dates the house construction.

Figure 7. 4105 Starlight Lane House Foundations, looking south.

Feature 1 is the 4105 Starlight Lane house foundation. Is approximately 40 feet by 70 feet in size and an associated concrete driveway pad measures approximately 40 feet by 25 feet. The perimeter house foundation consist of 6-inch-wide poured concrete with rebar.

The tax assessor's website states that the structure was a single-family 5-bedroom, 2.5-bath house with approximately 2,300 ft^2 of living space witha 572 ft^2 garage and fireplace. Additional construction elements consist of a concrete set of stairs to the yard on the northwest side of the parcel, a set of brick steps on the south side of the foundation, and a brick porch foundation wall to the east. A pile of large concrete rubble is in the middle of the west side of the house foundation and a circular fire pit made from smaller chunks of concrete and brick was created in the middle of the foundation. Three large chunks of the brick chimney are located to the north of the driveway pad. A domestic well and pressure tank are located on a 10-foot by 8-foot brick-lined concrete pad is located at the northeast corner of the driveway. The east side of the house has a wire fence running parallel to the house and property line. Landscaping includes *vinca*, Italian cypress (*Cupresses sempervirens*), and decorative bushes around the house. Currently, the foundations are overgrown with star thistle, grasses, poison oak, blackberry, and other disturbance-loving early colonizers.

Feature 2 is the remains of Starlight Lane, which is paved with asphalt and extends from Brace Road. Overall the lane is approximately 20 feet wide by 400 feet in length. Starlight Lane appears on the 1967 USGS topographic map and was most likely constructed at the same time as the house. The road is no longer in use, has been roped off at the end of the apartment building parking lot, and is mostly overgrown.

Feature 3 is a light distribution of historic refuse, measuring approximately 63 feet east to west by 30 feet north to south, and is located 115 m southwest (255 degrees) of the southwest corner of the house. Observed refuse consists of aqua, colorless, and brown glass fragments, white glazed stoneware fragments, a metal pipe segment, large glazed ceramic fragments, a light bulb base, a Hamm's pull-tab beer can, and milled lumber. The trash scatter was identified in freshly disturbed heavy equipment tracks. It is possible that additional artifacts exist between the house and those found, but were obscured by heavy ground cover. The use of aqua glass (c. 1850–1920s) pre-dates the construction of the house in the 1960s, but other elements appear to be contemporaneous with the residence.

NRHP/CRHR Assessment

NRHP/CRHR assessment is based upon establishing a theme's background. However, this information does not necessarily make the theme significant, nor are the associated resources necessarily considered eligible for listing in the NRHP/CRHR. Rather, the significance of the theme, including structural remains, roads, and refuse deposits, must be established at the local, state, or national level by the context. The following NRHP/CRHR assessment of the residential remains and loosely associated refuse deposit (Features 1, 2, and 3) are based upon the theme of residential development and lifeways during the mid to late 1900s.

While Feature 1, the residential foundation and associated concrete pad, and ancillary elements, are in their original location during the period of significance (the middle 1900s), and the setting appears to convey its historic feeling or function, subsequent demolition significantly impairs the quality of the historic fabric (design, materials, and workmanship) of the resource. Neither the house or concrete pad and associated ancillary remains at 4105 Starlight Lane are associated with important people or events (NRHP Criteria A and B, CRHR Criteria 1 and 2). Further, the remaining foundation and associated residential remains have no distinctive characteristics of construction nor do they appear to represent the work of an important or creative individual (NRHP Criterion C, CRHR Criterion 3). There is no evidence of artifacts directly associated with the remains that possess potential data that can contribute to a further understanding of residential development (Criterion D/4). Therefore, Feature 1 does not contribute to the NRHP/CRHR eligibility/significance of the site.

To be eligible under Criterion A/1, Starlight Lane (Feature 1) does not appear to be related to a transportation route that is historically significant to the development within the region. In addition, the road is/was not a primary route from one historically significant location to another that would qualify the route as eligible under Criterion A/1. In addition, the route is not associated with individual groups or individuals (Criterion B/2). Nor does the route

display unique features or engineered elements that would qualify it as eligible under Criterion C/2, or associated archaeological deposits that would significantly add to an understanding of construction techniques during the middle 1900s (Criterion D/4). Therefore, Starlight Lane does not appear to contribute to the NRHP/CRHR eligibility/significant.

Refuse scatters, such as Feature 3, represent limited dumping event or events associated with one or more of the themes and are assessed for their NRHP/CRHR eligibility/significance based upon their potential for contributing information that might be unavailable through documentary or other sources. These resources are therefore assessed for eligibility/significance based upon their archaeological value (Criterion D/4). Deposits with the least potential for important information are those that represent an accumulation of artifacts from a wide variety of sources over a long period of time, or that lack a clear association with a particular theme.

In addition, the general configuration of the debris scatter should remain as when the items were discarded, and new or modern materials should not be present. This may be the most significant element of integrity for refuse scatters, since information potential relating to domains such as chronology may be obscured by deposition of modern artifacts. Accordingly, unassociated historic artifact scatters are most likely not eligible for inclusion in the NRHP or CRHR. While the location and content of the refuse suggests that it may be associated with the residence, it consists of utilitarian items that lack the potential to further an understanding of mid 1900s lifeways that are well documented elsewhere, and as such does not appear to contribute to the eligibility of the site for inclusion in the NRHP/CRHR under Criterion D/4.

Also, none of the features appear to be a historic resources for the purposes of CEQA using the criteria outlined in Section 5024.1 of the California Public Resources Code, and evaluated in accordance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines.

In summary, this site is not considered eligible for listing in the NRHP or CRHR.

5.1.3.2 ISOLATED FINDS

Two isolated ground stones (Figure 8) were found in a recently disturbed heavy equipment track in a fallow field. No evidence of midden soil, bedrock milling features, or other artifacts were noted. Ground stone 1 is a possible chopper or mano fragment and measures 11.5 cm long by 11.5 cm wide by 5.5 cm thick. Ground stone 2 (Figure 8, on the right) appears to be an unshaped mano and measures 14.6 cm long by 8.1 cm wide and 4.2 cm thick. Due to the lack of context or association with other evidence of prehistoric cultural activity, these artifacts are not considered eligible for listing in the NRHP/ CRHR and are not considered a unique archaeological resource.

Figure 8. Isolated groundstone fragments.

6 CONCLUSIONS AND MANAGEMENT RECOMMENDATIONS

Potential effects on sites that are currently listed or potentially eligible for listing in the NRHP or CRHR are considered significant and must be mitigated to the extent feasible. On the basis of the eligibility of the resources, a finding of **no historic properties affected** is recommended.

Although survey methods were developed to identify resources that may be located in the APE, it is possible that unidentified cultural deposits are present in shallow subsurface contexts. Subsurface prehistoric resources may take the form of stone tools or tool fragments, rock concentrations, burned and/or unburned shell or bone, and/or darkened midden sediments containing some of the above-mentioned constituents. Historic deposits include fragments of glass, ceramic, and metal objects; milled and split lumber; and structure and feature remains, such as building foundations and dumps. Given the potential for subsurface deposits, it is recommended that if undocumented resources are encountered during construction, all destructive work in the vicinity of the find should cease until a qualified archaeologist can assess the significance of the find and, if appropriate, provide recommendations for treatment.

In accordance with the California Health and Safety Code, if human remains are uncovered during ground-disturbing activities, the contractor and/or the project proponent shall immediately halt potentially damaging excavation in the area of the burial and notify the Placer County Coroner and a professional archaeologist to determine the nature of the remains. The coroner is required to examine all discoveries of human remains within 48 hours of receiving notice of a discovery on private or state lands (Health and Safety Code Section 7050.5[b]). If the coroner determines that the remains are those of a Native American, he or she must contact the NAHC within 24 hours of making that determination (Health and Safety Code Section 7050[c]).

Following the coroner's findings, the archaeologist and the NAHC-designated Most Likely Descendant (MLD) shall determine the ultimate treatment and disposition of the remains and take appropriate steps to ensure that additional human interments are not disturbed. The MLD shall have 48 hours to complete a site inspection and make recommendations after being granted access to the site. A range of possible treatments for the remains, including nondestructive removal and analysis, preservation in place, relinquishment of the remains and associated items to the descendants, or other culturally appropriate treatment may be discussed. Site protection measures undertaken by the property owner may include one or more of the following:

1. Record the site with the NAHC or the appropriate information center.
2. Utilize an open-space or conservation zoning designation or easement.
3. Record a document with the county in which the property is located.

The landowner or their authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance. If the NAHC is unable to identify an MLD or the MLD fails to make a recommendation within 48 hours after being granted access to the site, the landowner or their authorized representative may also reinter the remains in a location not subject to further disturbance if they reject the recommendation of the MLD and mediation by the NAHC fails to provide measures acceptable to the landowner.

Attention: Mr. Michael Okuma
Director of Real Estate Development

SUBJECT: **DRAFT Geotechnical Study**
Proposed Costco Wholesale Warehouse
Sierra College Boulevard and Brace Road
Loomis, California
CW# 16-0132

Dear Mr. Okuma:

Kleinfelder is pleased to present this report summarizing our geotechnical study for the proposed Costco Wholesale Warehouse located southeast of the intersection of Sierra College Boulevard and Brace Road in Loomis, California. The site is currently very wet as a result of heavy rainfall causing perched groundwater near the ground surface and the planned infiltration tests could not be performed. However, based upon subsurface soil conditions, these tests are no longer considered necessary and, therefore, will not be performed. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

We appreciate the opportunity to provide geotechnical engineering services to you on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact Andrea Traum at 408.595.3275, or Andy Franks, Kleinfelder's Client Account Manager for Costco, at 480.650.4905.

Sincerely,

KLEINFELDER

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can

construction project.

Geotechnical-Engineering Services Are Performed for

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

This Report May Not Be Reliable

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed*. The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

This Report's Recommendations Are

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

Obtain Professional Assistance to Deal with Moisture

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

EXECUTIVE SUMMARY

This report presents the results of our geotechnical study for the proposed Costco Wholesale Warehouse (CW# 16-0132) located southeast of the intersection of Sierra College Boulevard and Brace Road in Loomis, California. The purpose of our study was to evaluate soil and groundwater conditions beneath the site and provide geotechnical recommendations for design and construction. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2016, dated September 19, 2016. The site is currently very wet with perched groundwater near the ground surface and the planned infiltration tests could not be performed. However, based upon subsurface soil conditions, these tests are no longer considered necessary and, therefore, will not be performed.

Kleinfelder understands Costco plans to develop an approximately 18-acre site to construct a new, approximately 150,000-square-foot warehouse and fuel facility. The warehouse building will be a single-story, steel-framed structure (30 feet in height) with concrete masonry unit and metal walls. The fuel facility will contain 24 fueling locations, three underground storage tanks (USTs), a diesel UST, a fuel additive UST, four fueling islands, and a pre-manufactured metal canopy.

The building surroundings will consist mainly of surface parking with some landscape areas. Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips, typical wall loads will be approximately 4.5 kips per lineal foot, canopy column loads will be approximately 50 kips, and the total slab load (dead plus live loads) will be approximately 500 psf.

Surface elevations interpreted from a preliminary grading plan prepared by Kier & Wright Civil Engineers & Land Surveyors, Inc., undated, indicate that existing surface elevations vary from a high of approximately Elevation 340 feet (datum not provided) in the south-eastern portion of the site to a low of approximately Elevation 320 feet in the north-western portion of the site. According to the preliminary grading plan, we understand that the finished floor elevation (FFE) for the warehouse will be established at approximately Elevation 331.50 feet. Based on the preliminary grading plan and approximate surface elevations, the warehouse building pad area will be raised as much as approximately 10 feet and cut as much as about 5 feet. The fuel facility area will be raised approximately 1 to 5 feet.

At the time of our field exploration, much of the site was undeveloped and covered by native grass and weeds with scattered clusters of trees. A foundation and miscellaneous improvements associated with a former residence is located on the northwest corner of the property. A concrete

box culvert crosses Sierra College Boulevard with a drainage swale flowing on the west border of the site and crosses near the southwestern corner of the proposed Costco warehouse pad. A concrete pipe was encountered near the former residence in Test Pit TP-7 at a depth of approximately 7 feet. It is unknown if this utility pipe is in use.

Subsurface conditions at the site were explored by drilling 38 borings, excavating 10 test pits, and performing a seismic refraction survey. The seismic refraction survey consisted of six 230-foot long seismic lines located within/across the warehouse footprint and fuel facility. A total of 21 borings and 5 test pits were drilled/excavated in the warehouse building area; 13 borings and 3 test pits were drilled/excavated in the parking and drive areas; and 4 borings and 1 test pit were drilled/excavated in the fuel facility area. The borings were drilled using track-mounted hollow-stem-auger drilling and HQ-3 rock coring equipment to depths between approximately 7 and 30 feet below the existing ground surface (bgs) in the warehouse building area; approximately 10 feet bgs in the parking and drive areas; and between approximately 10 and 30 feet bgs in the fuel facility area. Seventeen of the borings (Borings B-1, B-4, B-6 through B-10, B-12 through B-19, B-22, and B-23) were terminated short of their planned depth due to practical auger refusal on bedrock. Eight of these borings that encountered refusal were cored to a depth of at least 4 feet into the bedrock (Borings B-4, B-7, B-9, B-17 through B-19, B-22, and B-23). Ten test pits were excavated to depths ranging from approximately 8 feet to 15 feet bgs. Five of these test pits were terminated short of their planned depth due to practical refusal on bedrock (Test Pits TP-2, TP-3, TP-7, TP-9, and TP-10). All test pits were backfilled with soil cuttings and borings were backfilled with neat cement grout or soil cuttings.

Perched water was encountered in a majority of our borings and test pits as shallow as 1 foot. Portions of the site had ponded surface water with small stream flowing through the low area in the middle of the site to a culvert beneath Sierra College Boulevard. This surface water infiltrated the near surface soils, collected on less permeable soil and rock at shallow depth, was observed seeping into the test pit excavations, and was encountered in the soil borings at various depths. The approximate locations of the borings and test pits are presented on Figure 2, Exploration Location Plan.

The soils across the site generally consist of loose to very dense sands with varying amounts of silt and clay. These sand soils are residual soils generated from weathering of the underlying granite bedrock. Gravel to cobble-sized rock fragments were commonly encountered below approximately 5 feet. Many of the soil samples exhibited faint bedrock structure typical of

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

decomposed rock. The heterogeneous depth to bedrock encountered is typical of a granitic bedrock weathering profile. Due to bedrock fracture, weathering environment, and mineral composition, the bedrock surface can weather to soil at varying rates and depths resulting in an inconsistent bedrock surface. The bedrock encountered is consistent with the quartz diorite mapped by Olmsted (1971).

Based on the results of our field exploration, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in the geotechnical report are incorporated into the project design and construction. We identified the following key geotechnical considerations during our study.

- The proposed Costco warehouse building and fuel facility may be supported on a conventional shallow foundation system. Based on the preliminary grading plan, the warehouse building footprint is situated on a cut/fill transition with fills up to approximately 10 feet in the south-western corner of the building and cuts up to about 5 feet in the south-eastern corner. Overexcavation and recompaction of on-site soils/weathered bedrock is recommended to reduce the potential for differential settlement and provide relatively uniform support for the proposed warehouse and other improvements.

- Soils within 10 feet laterally of the warehouse pad (including the entrance canopy, building aprons, utility pads, stairs, ramps, stoops, and the loading dock) should be overexcavated to a depth of at least 2 feet below existing grade, 3 feet below the bottom of the footings, or 3 feet below the bottom of the floor slabs, whichever is deeper. If existing fill soils are encountered at the base of the overexcavation, the overexcavation should continue until the fill is removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill.

- Gravel to cobble-sized rock fragments generated from weathering of the underlying granite bedrock were commonly encountered below approximately 5 feet and may impact excavations for foundations and utilities in the building pads and site. Depth to refusal in the soil borings and test pits ranged between 7 and 20 feet. The seismic refraction survey results (see Appendix C) indicate variability in depth to bedrock across the warehouse and fuel station sites and a general depth of rippability of approximately 12 feet. It should be noted that the depth to less weathered rock is highly variable and difficult excavation,

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

which may require blasting, may be encountered at shallower depths. Further discussion is provided in Section 5.2.5.

- Rock or other soil fragments greater than 6 inches in size should not be used in fills. Within the upper 3 feet of building pads, rock or other soil fragments greater than 3 inches in size should not be used. Screening of oversized materials will be necessary to reuse the on-site material as structural fill. It is also likely that deeper onsite excavations may generate oversized material that will need to be disposed of off-site.

- For pavement, sidewalk, and other flatwork areas (including the fuel facility), soils should be overexcavated to a depth of at least 18 inches below existing grade. Overexcavation is not required in cut areas provided loose/soft shallow soils and organic rich materials are removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill. The over-excavation should extend beyond the proposed improvements a horizontal distance of at least 2 feet.

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, the contractor will likely encounter shallow perched groundwater in excavations, particularly in the northern half of the site and the northern portion of the fuel facility following rainfall events and in the winter and spring months. During a large portion of our field work, a majority of the entire site was not drivable using trucks and truck mounted equipment due to multiple rainfall events passing through the area. The perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events. Temporary and permanent drainage provisions will likely be required for these areas as discussed in Section 5.2.3

- Fill soils should be compacted to at least 95 percent of the maximum dry unit weight (ASTM D1557) in accordance with the Costco Wholesale Development Requirements (CWDRs). Fill soils should be compacted to moisture contents between -2 and +1 percent of the optimum moisture content during compaction. If both compaction and moisture content criteria are not within the specified tolerances, the fill should not be accepted, and the contractor should rework the material until the fill is placed within the specified tolerances.

- Import soils should have no particles greater than 3 inches in maximum dimension, no less than 70 percent of the particles passing the No. 4 sieve, no more than 25 percent of

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

the particles passing the No. 200 sieve, and a Plasticity Index (PI) less than 5. The contractor should provide documentation that all imported soil is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals. Test results with the geotechnical and analytical properties of the proposed import material should be provided to Costco for approval prior to transportation and use on site.

- The site soils contained approximately 25 to 30 fines and are moisture sensitive and susceptible to disturbance, rutting, and pumping during construction. The contractor should plan to repair subgrade conditions that become unstable/disturbed and should develop a plan to manage subgrade trafficability across the site throughout the construction period. Features of this plan may include temporary surface haul roads, limited traffic routes, etc.

- Should grading be performed during or following extended periods of rainfall, the moisture content of the near-surface soils will be significantly above the optimum moisture content. These conditions could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include deep scarification and drying, removal and replacement with crushed rock and geotextile fabric, and/or treatment with portland cement.

- Pursuant to current Costco Wholesale standard construction design practices, we have evaluated the necessity of using a steel-reinforced slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.

- Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations for the Costco warehouse that does not include installation of a moisture barrier with the understanding that there will be an increased risk for adverse moisture issues.

- Due to a poor draining subgrade as a result of near surface bedrock, we recommend installing perimeter foundation drains for the warehouse building and radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

- The Placer County, California currently uses the 2016 California Building Code (CBC) as the governing code.
- Based on our field exploration and understanding of the regional geology, we classify the site as Seismic Site Class C, Soft Rock.
- Performance Grade (PG) Binder oil of 70-10 may be used asphalt concrete pavements.
- The minimum resistivity of the samples tested indicate that the soil may be mildly corrosive towards ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318 Table 4.2.1 (ACI, 2011). Therefore, in accordance with ACI Building Code 318-11, no special provisions for selection of cement type are required.
- We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site based on soil type and laboratory testing. The onsite soils in the upper 10 to 20 feet below the existing ground surface at the site are comprised primarily of clayey and silty sand. Seasonal perched groundwater was also observed within these sandy soils above the bedrock. Given the moderate infiltration capacity of the on-site soils and observed perched groundwater, we recommend alternatives to infiltration Best Management Practices (BMPs), such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the project site.

The findings, conclusions, and recommendations presented in this executive summary should not be relied upon without consulting our geotechnical report for more information. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

1 INTRODUCTION

This report presents the results of Kleinfelder's geotechnical study for the proposed Costco Wholesale Warehouse (CW# 16-0132) located southeast of the intersection of Sierra College Boulevard and Brace Road in Loomis, California. The location of the project site is presented on Figure 1, Site Location Map. The purpose of our geotechnical study was to evaluate soil and groundwater conditions at the site and provide geotechnical recommendations for project design and construction. The scope of our services was presented in our proposal titled, "Proposal for Geotechnical Study, Proposed Costco Wholesale Warehouse, Sierra College Boulevard and Brace Road in Loomis, California, CW# 16-0132, MG2# 16-5254-01," dated December 14, 2016. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2016, dated September 19, 2016. The site is currently very wet with perched groundwater near the ground surface and the planned infiltration tests could not be performed. However, based upon subsurface soil conditions, these tests are no longer considered necessary and, therefore, will not be performed.

This report presents a description of the services performed, a discussion of the geotechnical conditions observed at the site, and recommendations developed from our engineering analyses of field and laboratory data. Individuals using this report should read the limitations presented in Section 7.

1.1 PROJECT DESCRIPTION

Kleinfelder understands Costco plans to develop an approximately 18-acre site to construct a new approximately 150,000-square-foot warehouse, fuel facility, and parking lots. The warehouse building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry-unit (CMU) and metal walls. The fuel facility will contain three underground storage tanks (USTs), a diesel UST, a fuel additive UST, four fueling islands, and a pre-manufactured metal canopy. The building surroundings will consist mainly of surface parking with some landscape areas.

Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips, typical wall loads will be approximately 4.5 kips per lineal foot, canopy column loads will be approximately 50 kips, and the total slab load (dead plus live loads) will be approximately 500 psf. Flood slab loading is anticipated to include 250 psf (total) at the rack areas and 350 psf (live). The warehouse surroundings will consist mainly of parking with a loading dock and some

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

landscaped areas. Parking and driveway areas will be paved with either portland cement concrete or asphalt concrete pavements.

Based on our experience with fuel facilities in this area, the canopy for the service islands is typically founded on spread footings and the design is typically governed by overturning moments from wind loading. Typical column dead loads are anticipated to be approximately 4.5 kips and typical live loads are approximately 16 kips, which result in bearing pressures of less than 500 pounds per square (psf).

The 18-acre property is currently undeveloped and covered by native grass and weeds with scattered clusters of trees. An existing apartment complex is located immediately north of the property and a residential subdivision is located east of the property. Surface elevations interpreted from a preliminary grading plan prepared by Kier & Wright Civil Engineers & Land Surveyors, Inc., undated, indicate that existing surface elevations vary from a high of approximately Elevation 340 feet (datum not provided) in the south-eastern portion of the site to a low of approximately Elevation 320 feet in the north-western portion of the site. According to the preliminary grading plan, we understand that the finished floor elevation (FFE) for the warehouse will be established at approximately Elevation 331.50 feet. Based on the preliminary grading plan and approximate surface elevations, the warehouse building pad area will be raised as much as approximately 10 feet and cut as much as about 5 feet. The fuel facility area will be raised approximately 1 to 5 feet. We understand that fill material generated during grading of the site will be used to raise the site. Excavations for deep utilities and the loading dock may exceed 4 feet and installation of the USTs will require an excavation up to about 20 feet deep.

1.2 SCOPE OF SERVICES

The scope of our geotechnical study consisted of a literature review, subsurface explorations, geotechnical laboratory testing, engineering evaluation and analysis, and preparation of this report. Studies to assess environmental hazards that may affect the soil and groundwater at the site were beyond our geotechnical scope of services. The following paragraphs present a description of our services.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

1.2.1 Task 1 – Background Data Review

We reviewed readily-available published and unpublished geologic literature in our files and the files of public agencies, including selected publications prepared by the California Geological Survey and the U.S. Geological Survey. We also reviewed readily available seismic and faulting information, including data for designated earthquake fault zones as well as our in-house database of faulting in the general site vicinity.

1.2.2 Task 2a – Field Exploration (Soil Borings and Test Pits)

Subsurface conditions at the site were explored by drilling 38 borings and excavating 10 test pits. A total of 21 borings and 5 test pits were drilled/excavated in the warehouse building area; 13 borings and 3 test pits were drilled/excavated in the parking and drive areas; and 4 borings and 1 test pit were drilled/excavated in the fuel facility area. The borings were drilled using track-mounted hollow-stem-auger drilling with HQ-3 rock coring equipment used on selected borings to depths between approximately 7 and 30 feet below the existing ground surface (bgs) in the warehouse building area; approximately 10 feet bgs in the parking and drive areas; and between approximately 10 and 30 feet bgs in the fuel facility area. Seventeen of the borings (Borings B-1, B-4, B-6 through B-10, B-12 through B-19, B-22, and B-23) were terminated short of their planned depth due to practical auger refusal on bedrock. Eight of these borings that encountered refusal were cored to a depth of at least 4 feet into the bedrock (Borings B-4, B-7, B-9, B-17 through B-19, B-22, and B-23). Ten test pits were excavated to depths ranging from approximately 8 feet to 15 feet bgs. Five of these test pits were terminated short of their planned depth due to practical refusal on bedrock (Test Pits TP-2, TP-3, TP-7, TP-9, and TP-10). All test pits were backfilled with the excavated soil. Borings in the warehouse building area and tank excavation area were backfilled with neat cement grout and the remaining shallower borings were backfilled with the soil cuttings. The approximate locations of the borings and test pits are presented on Figure 2, Field Exploration Location Plan.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified and various geophysical techniques were used at the boring and test pit locations to identify potential conflicts with subsurface structures. A Kleinfelder staff engineer supervised the field operations and logged the explorations. Selected bulk and drive samples were retrieved, placed in plastic bags or sealed in sample tubes, and transported to our laboratory for further evaluation. The number of blows necessary to drive a Standard Penetration Test (SPT) sampler or California-type sampler was recorded. Rock coring was performed in select borings using HQ-3 equipment when

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

the target depth was not reached due to auger refusal on bedrock. Soil descriptions used on the logs result from field observations and data, as well as from laboratory test data. Stratification lines on the logs represent the approximate boundary between soil and/or rock types, and the actual transition may vary and can be gradual. Appendix A presents a description of the field exploration program, exploration logs, test pit logs, and a legend of terms and symbols used on the logs.

1.2.3 Task 2b – Field Exploration (Seismic Refraction Survey)

Advanced Geological Services under subcontract to Kleinfelder performed a geophysical seismic refraction survey of the proposed Costco warehouse building pad and fuel facility areas to evaluate the excavatability (rippability) of the granitic rock material. The methodology, equipment, field procedures, data processing, analyses and results are presented in a report dated February 13, 2017. A copy of the report is included in Appendix C.

1.2.4 Task 3 – Laboratory Testing

Laboratory testing was performed on representative bulk and relatively undisturbed samples to assist in soil classification and development of engineering parameters for geotechnical design. Laboratory testing was comprised of moisture content, dry unit weight, sieve analysis, wash sieve (percent passing No. 200 sieve), Atterberg limits, maximum laboratory density, and R-values, which were performed in our Sacramento laboratory. Corrosivity testing was performed by Sunland Analytical of Rancho Cordova, California. Appendix B presents the results of the laboratory testing performed for this study.

1.2.5 Task 4 – Geotechnical Analyses

We analyzed field and laboratory data in conjunction with the assumed finished grades, warehouse and fuel facility layout, and structural loads to provide geotechnical recommendations for design and construction. We evaluated feasible foundation systems, concrete slab support, pavement design, infiltration design (removed from the field investigation plan), and earthwork. Seismic design parameters in accordance with the 2016 California Building Code (CBC) are also presented.

1.2.6 Task 5 – Report Preparation

This report summarizes the services performed, data acquired, and our findings, conclusions, and geotechnical recommendations for the design and construction of the proposed improvements.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

Our report includes the following items:

- Vicinity map and field exploration location map showing the approximate boring, test pit, and seismic refraction line locations;
- Boring and test pit logs (Appendix A);
- Results of laboratory testing (Appendix B);
- Results of the seismic refraction survey (Appendix C);
- Discussion of general site conditions;
- Discussion of general subsurface conditions as encountered in our field exploration;
- Discussion of regional and local geology;
- Recommendations for seismic design parameters in accordance with Chapter 16 of the 2016 CBC;
- Recommendations for foundation design, allowable bearing pressures, embedment depths, and compatibility constraints under various loading conditions;
- Anticipated total and differential static settlements;
- Recommendations for site preparation, earthwork, temporary slope inclinations, fill placement, and compaction specifications, including the excavation characteristics of subsurface soil deposits and bedrock materials;
- Recommendations for support of floor slabs and slabs-on-grade;
- Recommendations for flexible and rigid pavement structural sections for light- and heavy-duty pavement based on Equivalent Single Axle loading presented in the CWDRs;
- Recommendations for design of retaining structures, including active and at-rest lateral earth pressures, passive and frictional resistance, and applicable surcharge loads; and
- Preliminary evaluation of the corrosion potential of the on-site soils.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

2 SITE CONDITIONS

2.1 SITE DESCRIPTION

The proposed Costco site is located southeast of the intersection of Sierra College Boulevard in Loomis, California, as shown on Figure 1. The site is currently bounded by residential properties and Brace Road to the north, Sierra College Boulevard to the west, vacant properties and existing commercial properties to the south, and residential properties to the east. At the time of our field exploration, the site was vacant and much of the site was covered by native grass and weeds with scattered clusters of trees. The project site is gently rolling with about 10 to 15 feet of relief across the site. A concrete box culvert crosses Sierra College Boulevard with a drainage swale flowing on the west border of the site and crosses near the southwestern corner of the proposed Costco warehouse pad. A foundation and miscellaneous improvements associated with a former residence is located on the northwest corner of the property. A concrete pipe was encountered near the former residence in Test Pit TP-7 at a depth of approximately 7 feet. It is unknown if this utility pipe is in use.

KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

3 GEOLOGY

3.1 GEOLOGIC SETTING

3.1.1 Regional Geology

The project site lies within the foothills of the Sierra Nevada Province just east of the western boundary of the adjacent Sacramento Valley (northern) portion of the Great Valley geomorphic province. About 400 miles long and 40 miles wide, the Great Valley is an asymmetrical, synclinal trough formed by tilting of the Sierran block, with the western side dropping to form the valley and the eastern side abruptly uplifted to form the Sierra Nevada Mountains. Great Valley sediments consist of a thick sequence of alluvial, basin, and plain sediments eroded from the Sierra Nevada Mountains and transported primarily by the Sacramento River and its tributaries.

The Sierra Nevada province is approximately 40 to 100 miles wide east to west and 400 miles long trending north to south and parallels the Great Valley Province to the west. The Sierra Nevada Mountains within the Sierra Nevada province are comprised primarily of large, north-south elongated blocks of Mesozoic granitic terrain (composed of numerous granitic intrusions) forming the backbone of California. Separating the Sierran granitic basement rocks from the Great Valley sediments is the northwest trending belt of metamorphosed volcanic rocks and sediments forming the western slopes (foothills) of the Sierra Nevada Mountains. These rocks are distributed within three major fault-bounded lithologic terrains that extend along the length of the metamorphic belt. Rocks within these terrains have been isoclinally folded and metamorphosed on a regional scale and represent a “collage” of tectonically accreted blocks emplaced during convergent plate tectonism that occurred during the late Paleozoic and early Jurassic. Bedding, foliation and major structural features throughout the metamorphic belt normally trend northwest and dip steeply to the east. The site is situated on a granitic intrusion within the metamorphic belt.

3.1.2 Site Geology

The site has been mapped by multiple geologists, the map that provides the most detail is by Olmsted at a scale of 1:48,000 (Olmsted, 1971). This map indicates the proposed Costco development is underlain by the Upper Jurassic/Lower Cretaceous (approximately 128 million years ago) granitic rock classified as a quartz diorite and mapped as the Penryn Pluton. The Penryn Pluton is one of numerous plutons that compose the Sierra Nevada Batholith and is characterized as relatively shallow intrusion, approximately 6 – 10 km deep. Quartz diorite is medium to coarse-grained porphorytic intrusive rock composed of plagioclase, quartz,

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

hornblende, and biotite minerals. The Penryn Pluton has varying degrees of weathering and fracturing in the project area which generates a gradational and heterogeneous weathering profile. Weathering tends to be more intense along fractures in the rock, which can result in blocks of less weathered rock separated by deeper highly weathered areas along vertical fractures.

3.2 SUBSURFACE CONDITIONS

The soils across the site generally consist of loose to very dense sands with varying amounts of silt and clay. These sand soils are residual soils generated from weathering of the underlying granite bedrock. Gravel to cobble-sized rock fragments were commonly encountered below approximately 5 feet. Many of the soil samples exhibited faint bedrock structure typical of decomposed rock. Seventeen of the borings were terminated due to practical auger refusal and five of the test pits were terminated due to practical equipment refusal on granitic bedrock above the targeted depth of exploration. These explorations are summarized in Table 1. It is likely refusal occurred when the borings encountered moderately weather to slightly weathered bedrock. The heterogeneous depth to bedrock encountered is typical of a granitic bedrock weathering profile. Due to bedrock fracture, weathering environment, and mineral composition, the bedrock surface can weather to soil at varying rates and depths resulting in an inconsistent bedrock surface. The bedrock encountered is consistent with the quartz diorite mapped by Olmsted (1971). Descriptions of the deposits are provided in our boring and test pit logs presented in Appendix A. Generalized geotechnical cross sections are presented on Figures 3 through 5.

Note: ^ indicates rock coring was performed below the point of refusal.

3.3 GROUNDWATER

Permanent groundwater was not encountered in our borings or test pits, which were explored to a maximum depth of approximately 30 feet. Groundwater levels in the area have been measured at depths deeper than 50 feet below the existing ground surface. However, perched water was encountered in a majority of the explorations as shallow as 1 foot below site grade. This perched groundwater is likely a result of recent heavy rainfall and is seasonal in nature. This condition may occur on an annual basis and would depend upon regional precipitation.

Localized zones of perched water, increased soil moisture content and fluctuations of the groundwater level should be anticipated during and following the rainy season. Irrigation of landscaped areas on or adjacent to the site can also cause a fluctuation of local groundwater levels and result in a perched or shallow groundwater condition at the site.

3.4 ASSESSMENT OF POTENTIAL GEOLOGIC HAZARDS

3.4.1 Localized Faulting

The site is not located within the California Geologic Survey (CGS) designated Alquist-Priolo Earthquake Fault Zone, and no mapped active fault traces are known to project towards or transverse the site (Hart and Bryant, 2007, Jennings et al., 2010, USGS, 2016). Because there are no mapped active or potentially active faults in the general vicinity of the site, the potential for fault-related ground surface rupture at the site is considered low.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

Tectonically, the site is situated between major, fault systems including (from west to east) the San Andreas Fault System, Great Valley Fault Zone, Foothills Fault System, and Sierra Nevada Frontal Fault System that are responsible for the deformational history of California. Both the San Andreas and Sierra Nevada Frontal Fault Systems are well known for Holocene rupture that has continued into historical time and represent the source of most of California's seismic history. The Great Valley Fault Zone and the Foothills Fault System are more controversial in that only minor segments are suspected to have generated seismic activity in the recent geologic past and the frequency of rupture and/or seismic activity of each of these fault systems is considerably lower than the San Andreas and Sierra Nevada Frontal Fault systems. The closest of these fault systems to the subject sites is the Foothills Fault System, located about 8 miles east of the site. The Foothills Fault System consists multiple fault segments of which the Deadman, Maidu, Spenceville, and Rescue are the closest to the project site. The Foothills Fault System was generated by an eastward plate convergence and subduction between the late Paleozoic and early Mesozoic time (roughly 140 to 300 million years ago).

3.4.2 Landslides

Landslides and other forms of mass wasting, including mud flows, debris flows, soil slips, and rock falls occur as soil or rock moves down slope under the influence of gravity. Landslides are frequently triggered by intense rainfall or seismic shaking.

The site and surrounding area are relatively flat to gently sloping; therefore, landslides or other forms of natural slope instability do not represent a significant hazard to the project.

3.4.3 Liquefaction and Seismic Compression

The term liquefaction describes a phenomenon in which saturated, cohesionless soils temporarily lose shear strength (liquefy) due to increased pore water pressures induced by strong, cyclic ground motions during an earthquake. Structures founded on or above potentially liquefiable soils may experience bearing capacity failures due to the temporary loss of foundation support, vertical settlements (both total and differential), and/or undergo lateral spreading. The factors known to influence liquefaction potential include soil type, relative density, grain size, confining pressure, depth to groundwater, and the intensity and duration of the seismic ground shaking. Liquefaction is most prevalent in loose to medium dense, silty, sandy, and gravelly soils below the groundwater table. Based on our review of available groundwater well data, it is our opinion that the regional groundwater is approximately 50 feet or deeper. Therefore, based on the depth to groundwater

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

and shallow rock encountered in the subsurface explorations, the potential for liquefaction is not considered a hazard at the site.

Seismic compression results from the accumulation of contractive volumetric strains in unsaturated soil during earthquake shaking. Loose to medium dense granular material with no fines or with low plasticity fines are most susceptible to seismic compression. Based on the shallow rock encountered in the subsurface explorations, the potential for seismic compression (dynamic dry settlement) is not considered a hazard at the site.

Lateral spreading is a movement in a nearly horizontal soil zone (usually attributable to liquefaction) that causes the overlying soil mass to shift down a gentle slope or toward a free face such as incised water bodies. Because the site and surrounding areas have generally insignificant topographic relief and no potentially liquefiable soils, the potential for lateral spreading is considered low.

3.4.4 Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Clay soils were not observed at the site; therefore, the potential for expansive soils to affect the project are considered low.

3.4.5 Subsidence

The site is not located in an area of known significant ground subsidence due to the withdrawal of subsurface fluids. Therefore, the potential for subsidence occurring at the site due to the withdrawal of oil, gas, or water is considered low.

3.4.6 Flooding

The Flood Insurance Rate Map prepared by the Federal Emergency Management Agency (FEMA) was reviewed to identify the potential flood hazard for the project. This map indicates the site is within Zone X or D, defined as being an area outside the Special Flood Hazard Area and higher than the elevation of the 0.2-percent-annual-chance flood or being in an area in which flood hazards are undetermined, respectively. Based on this information the potential for the project site to be impacted by regional flooding is considered low. However, the accuracy of this

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

information should be confirmed by a qualified civil engineer/hydrologist. The need and/or method for mitigation of potential flooding should also be addressed.

3.4.7 Oil and Gas Fields

The California Division of Oil, Gas & Geothermal Resources (2016) has mapped oil, gas, and geothermal fields in the region. Based on the map, the site is not situated within an area of known abandoned oil wells. No active wells are known to exist within the project boundary. The nearest gas field is the Nicolaus Gas field located approximately 17 miles west of the project site. This site has three wells (DOGGR, 2016).

4 GEOTECHNICAL DESIGN RECOMMENDATIONS

4.1 GENERAL

Based on the results of our field exploration, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in the geotechnical report are incorporated into the project design and construction. We identified the following key geotechnical considerations during our study.

- The proposed Costco warehouse building and fuel facility may be supported on a conventional shallow foundation system. Based on the preliminary grading plan, the warehouse building footprint is situated on a cut/fill transitional area with fills up to approximately 10 feet in the south-western corner of the building and cuts up to about 5 feet in the south-eastern corner. Overexcavation and recompaction of on-site soils/weathered bedrock is recommended to reduce the potential for differential settlement and provide relatively uniform support for the proposed warehouse and other improvements.

- Soils within 10 feet laterally of the warehouse pad (including the entrance canopy, building aprons, utility pads, stairs, ramps, stoops, and the loading dock) should be overexcavated to a depth of at least 2 feet below existing grade, 3 feet below the bottom of the footings, or 3 feet below the bottom of the floor slabs, whichever is deeper. If existing fill soils are encountered at the base of the overexcavation, the overexcavation should continue until the fill is removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill.

- Gravel to cobble-sized rock fragments generated from weathering of the underlying granite bedrock were commonly encountered below approximately 5 feet and may impact excavations for foundations and utilities in the building pads and site. Depth to refusal in the soil borings and test pits ranged between 7 and 20 feet. The seismic refraction survey results (see Appendix C) indicate variability in depth to bedrock across the warehouse and fuel station sites and a general depth of rippability of approximately 12 feet. It should be noted that the depth to less weathered rock is highly variable and difficult excavation, which may require blasting, may be encountered at shallower depths. Further discussion is provided in Section 5.2.5.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

- Rock or other soil fragments greater than 6 inches in size should not be used in fills. Within the upper 3 feet of building pads, rock or other soil fragments greater than 3 inches in size should not be used. Screening of oversized materials will be necessary to reuse the on-site material as structural fill. It is also likely that deeper onsite excavations may generate abundant boulders.

- For pavement, sidewalk, and other flatwork areas (including the fuel facility), soils should be overexcavated to a depth of at least 18 inches below existing grade. Overexcavation is not required in cut areas provided loose/soft shallow soils and organic rich materials are removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill. The over-excavation should extend beyond the proposed improvements a horizontal distance of at least 2 feet.

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, the contractor will likely encounter shallow perched groundwater in excavations, particularly in the northern half of the site and the northern portion of the fuel facility following rainfall events and in the winter and spring months. During a large portion of our field work, a majority of the entire site was not drivable using trucks and truck mounted equipment due to multiple rainfall events passing through the area. The perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events. Temporary and permanent drainage provisions will likely be required for these areas as discussed in Section 5.2.3.

- The site soils contained approximately 25 to 30 fines and are moisture sensitive and susceptible to disturbance, rutting, and pumping during construction. The contractor should plan to repair subgrade conditions that become unstable/disturbed and should develop a plan to manage subgrade trafficability across the site throughout the construction period. Features of this plan may include temporary surface haul roads, limited traffic routes, etc.

- Due to a poor draining subgrade as a result of near surface bedrock, we recommend installing perimeter foundation drains for the warehouse building and radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

- The minimum resistivity of the samples tested indicate that the soil may be mildly corrosive towards ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318 Table 4.2.1 (ACI, 2011). Therefore, in accordance with ACI Building Code 318-11, no special provisions for selection of cement type are required.

- We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site based on soil type and laboratory testing. The onsite soils in the upper 10 to 20 feet below the existing ground surface at the site are comprised primarily of clayey and silty sand, with gravel to cobble size rock fragments. Seasonal perched groundwater was observed within these sandy soils above the bedrock. Given the moderate infiltration capacity of the on-site soils and observed perched groundwater, we recommend alternatives to infiltration Best Management Practices (BMPs), such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the project site.

The following opinions, conclusions, and recommendations are based on the properties of the materials encountered in the borings and test pits, the results of the laboratory-testing program, and our engineering analyses performed.

4.2 2016 CBC SEISMIC DESIGN PARAMETERS

Based on information obtained from the investigation, published geologic literature and maps, and on our interpretation of the 2016 California Building Code (CBC) criteria, it is our opinion that the project site may be classified as Site Class C, Soft Rock, according to Section 1613.3.2 of 2016 CBC and Table 20.3-1 of ASCE 7-10. Approximate coordinates for the site are noted below.

- Latitude: 38.81011° N
- Longitude: 121.20501° W

The Risk-Targeted Maximum Considered Earthquake (MCE_R) mapped spectral accelerations for 0.2 seconds and 1 second periods (S_s and S_1) were estimated using Section 1613.3 of the 2016 CBC and the U.S. Geological Survey (USGS) web based application (available at http://geohazards.usgs.gov/designmaps/us/application.php). The mapped acceleration values and associated soil amplification factors (F_a and F_v) based on the 2016 CBC and corresponding

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

site modified spectral accelerations (S_{MS} and S_{M1}) and design spectral accelerations (S_{DS} and S_{D1}) are presented in Table 2.

According to Section 1803.5.12 of the 2016 CBC, in the absence of a site-specific ground motion hazard analysis, the MCE geometric mean peak ground acceleration adjusted for Site Class effects (PGA_M) can be determined based on Equation 11.8-1 in Section 11.8.3 of ASCE 7-10.

TABLE 2
2016 CBC SEISMIC DESIGN PARAMETERS

Design Parameter	Recommended Value
Site Class	C
S_s (g)	0.477
S_1 (g)	0.242

F_v	1.558
S_{MS} (g)	0.572
S_{M1} (g)	0.377
S_{DS} (g)	0.382
S_{D1} (g)	0.252
PGA_M (g)	0.186

4.3 FOUNDATIONS

4.3.1 General

Based on the results of our field exploration, laboratory testing, and geotechnical analyses, the proposed warehouse building and fueling facility may be supported on conventional shallow spread footing foundations founded on subgrade prepared in accordance with Section 5.2.2. Proposed light poles may be supported on short drilled pile foundations. Recommendations for the design and construction of shallow foundations and drilled pile foundations are presented below.

4.3.2 Shallow Foundations

Allowable Soil Bearing Pressure

Footings may be may be designed for a net allowable soil bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads. Footings should be embedded at least

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

18 inches below the lowest adjacent exterior grade. The footing dimension and reinforcement should be designed by the structural engineer; however, continuous and isolated spread footings should have minimum widths of 18 and 24 inches, respectively. A one-third increase in the above bearing pressures can be used for transient wind or seismic loads.

Estimated Settlements

We estimate total static settlement for foundations designed and constructed in accordance with the recommendations presented above to be less than 1 inch. Differential static settlement between similarly loaded footings is estimated to be less than ½ inch over 50 feet.

Lateral Resistance

Lateral load resistance may be derived from passive resistance along the vertical sides of the footings, friction acting at the base of the footing, or a combination of the two. An allowable passive resistance of 250 psf per foot of depth may be used for design. Allowable passive resistance values should not exceed 2,500 psf. An allowable coefficient of friction of 0.35 between the base of the footings and the engineered fill soils can be used for sliding resistance using the dead load normal stresses. Friction and passive resistance may be combined without reduction. We recommend that the first foot of soil cover be neglected in the passive resistance calculations if the ground surface is not protected from erosion or disturbance by a slab, pavement or in a similar manner.

4.3.3 Short Drilled Pile Foundations

Axial Capacity

The compressive axial capacity of drilled piles may be estimated based on an allowable skin friction capacity of 350 pounds per square foot. The upper 1 foot of the skin friction capacity should be ignored. The uplift capacity may be estimated as 70 percent of the allowable compressive axial capacity. A one-third increase in the allowable capacities may be used for transient loading conditions such as wind or seismic loads.

Settlement

Settlement of the proposed canopy supported on drilled piles, as recommended, is estimated to be less than ½ inch.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

Lateral Resistance

The drilled pile foundations lateral resistance can be designed in general accordance with Section 1807.3 of the 2016 CBC. We recommend a lateral soil bearing pressure of 250 psf per foot of depth below grade. The lateral soil bearing pressure should not exceed 2,500 psf. Since drilled piles will act as isolated pole foundations, the allowable lateral soil bearing pressure may be increased by a factor of 2 for short-term lateral loads provided the structure will not be adversely affected by ½ inch of lateral movement at the ground surface.

4.4 BUILDING SLAB-ON-GRADE

Concrete slab-on-grade floors are appropriate for the proposed warehouse, provided subgrade is prepared in accordance with Section 5.2.2. In accordance with the CWDRs, we recommend the slab be a minimum nominal thickness of 6 inches and underlain by at least 6 inches of aggregate base material. Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base. Please note that Caltrans Class 2 aggregate base may utilize recycled materials. The use of recycled material is typically not allowed under the warehouse building slab and requires Costco's approval.

A modulus of subgrade reaction of 125 pounds per cubic inch may be used for design of slabs underlain 6 inches of compacted aggregate base material. Pursuant to current Costco Wholesale standard construction design practices, we have evaluated the necessity of using a steel-reinforced slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.

Floor slab control joints should be used to reduce damage due to shrinkage cracking. Control joint spacing is a function of slab thickness, aggregate size, slump, and curing conditions. The requirements for concrete slab thickness, joint spacing, and reinforcement should be established by the designer, based on experience, recognized design guidelines and the intended slab use. Placement and curing conditions will have a strong impact on the final concrete slab integrity.

Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations that do not include installation of a

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

moisture barrier, with the understanding that there will be an increased risk for adverse moisture issues.

4.5 EXTERIOR FLATWORK

Exterior concrete slabs for pedestrian traffic within the Costco development should be underlain by at least a 4-inch layer of crushed aggregate base. Exterior flatwork subject to traffic loading should be designed as pavement. The subgrade should be prepared in accordance with Section 5.2.2.

4.6 SITE DRAINAGE

Foundation and slab performance depends greatly on proper irrigation and how well runoff water drains from the site. This drainage should be maintained both during construction and over the entire life of the project. The ground surface around structures should be graded such that water drains away from structures without ponding. The surface gradient needed to do this depends on the landscaping type. Surface gradients should conform to current Costco Wholesale standards and the 2016 CBC.

Due to poor draining subgrade from shallow bedrock, we recommend installing perimeter foundation drains for the warehouse building and radial finger drains below the new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.

Where slabs or pavement areas abut landscaped areas, the aggregate base and subgrade soil should be protected against saturation. Vertical cut off structures are recommended to reduce lateral seepage under slabs from adjacent landscaped areas. Vertical cut-off structures may consist of deepened concrete perimeters, or equivalent, extending at least three inches below the base/subgrade interface. Vertical cut-off structures should be poured neat against undisturbed native soil or compacted fill. The cut-off structures should be continuous.

Operations personnel should be instructed to limit irrigation to the minimum level necessary to properly sustain landscaping plants. Should excessive irrigation, waterline breaks or unusually high rainfall occur, saturated zones and “perched” groundwater may develop, which could soften the subgrade and reduce pavement life and could also create potholes. We also recommend that the downspouts from roof drains be connected to a designed subsurface drainage system such

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

as a storm sewer, etc. to avoid discharging water onto pavement areas as well as backfill zones around the warehouse.

Potential sources of water such as water pipes, drains, and the like should be frequently examined for signs of leakage or damage. Any such leakage or damage should be promptly repaired.

Sewer lines beneath the warehouse should have a sufficient slope (at least 1 percent). Plumbing and utility lines should be provided with flexible joints or oversized sleeves where they penetrate floor slabs to prevent breakage caused by differential slab movement. In addition, utility trenches should be plugged with cohesive backfill where they enter the building to reduce moisture infiltration along pipe bedding material. The cohesive backfill materials should have a plasticity index (PI) between 15 and 30 and no less than 70 percent of the particles passing the No. 200 sieve.

4.7 RETAINING STRUCTURES

Design earth pressures for retaining structures depend primarily on the allowable wall movement, wall inclination, type of backfill materials, backfill slopes, surcharges, and drainage. The earth pressures provided assume that on-site granular (sandy) soils will used as backfill within a horizontal distance of at least one-half the height of the wall. The on-site clays should not be used as retaining wall backfill. If a drainage system is not installed, the wall should be designed to resist hydrostatic pressure in addition to the earth pressure. Determination of whether the active or at-rest condition is appropriate for design will depend on the flexibility of the walls. Walls that are free to rotate at least 0.002 radians (deflection at the top of the wall of at least 0.002 x H, where H is the unbalanced wall height) may be designed for the active condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. The recommended active and at-rest earth pressures and passive resistance values are provided in Table 3.

TABLE 3
LATERAL EARTH PRESSURES FOR RETAINING STRUCTURES
(ON-SITE GRANULAR BACKFILL)

Wall Movement	Backfill Condition	Equivalent Fluid Pressure (pcf)
Free to Deflect (active condition)	Level	40
Restrained (at-rest condition)		60
Passive		250

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

Walls supporting more than 6 feet of backfill should be designed to support an incremental seismic lateral pressure of 8 pcf, applied as a regular triangle distribution (not inverted). The seismic lateral earth pressure was calculated using a pseudo-static acceleration corresponding to one-half of the Design Earthquake PGA, which is two-thirds of the PGA_M. When designing for seismic loads for restrained walls, the seismic lateral earth pressure should be combined with the active earth pressure. If designing for static loading only for restrained walls, the at-rest lateral earth pressure should be used.

The above lateral earth pressures do not include the effects of surcharges (e.g., traffic, footings), compaction, or truck-induced wall pressures. Any surcharge (live, including traffic, or dead load) located within a 1:1 (horizontal to vertical) plane drawn upward from the base of the excavation should be added to the lateral earth pressures. The lateral contribution of a uniform surcharge load located immediately behind walls may be calculated by multiplying the surcharge by 0.33 for cantilevered walls under active conditions and 0.50 for restrained walls under at-rest conditions. Walls adjacent to areas subject to vehicular traffic should be designed for a 2-foot equivalent soil surcharge (250 psf). Lateral load contributions from other surcharges located behind walls may be provided once the load configurations and layouts are known.

Walls should be properly drained or designed to resist hydrostatic pressures. Adequate drainage is essential to provide a free-drained backfill condition so that there is no hydrostatic buildup behind the wall. Walls should also be appropriately waterproofed to reduce the potential for staining. Drainage behind loading dock walls can consist of weep holes placed along the base of the wall. Weep holes should be spaced 10 to 15 feet apart and connected with a gravel drain consisting of approximately 3 cubic feet of clean gravel per foot of wall length wrapped with filter fabric. Other types of retaining walls should have a continuous back drain as described below.

Except for the upper 2 feet, the backfill immediately behind retaining walls (minimum horizontal distance of 2 feet measured perpendicular to the wall) should consist of free-draining ¾-inch crushed rock wrapped with filter fabric. The upper 2 feet of cover backfill should consist of relatively impervious material. A 4-inch-diameter perforated PVC pipe, placed perforations down at the bottom of the rock layer leading to a suitable gravity outlet, should be installed at the base of the walls.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

As an alternative to the gravel drain noted above, a manufactured drain panel may be utilized behind retaining walls in addition to normal waterproofing. This system generally consists of a prefabricated drain panel lined with filter fabric. At the wall base, we recommend that a gravel drain be installed to collect and discharge drainage to a suitable outlet. The drain should consist of a 4-inch-diameter perforated PVC pipe, perforations placed down at the bottom of approximately 3 cubic feet of clean gravel per foot of wall length. The gravel drain should be wrapped in filter fabric (Mirafi 140N or equivalent). The pipe should be sloped to drain to a suitable outlet and cleanouts should be provided at appropriate intervals. If drainage behind the wall is omitted, the wall should be designed for full hydrostatic pressure. The design of any drain panel system should be submitted to Kleinfelder for review to check that our recommendations have been properly incorporated into the design. Installation of the drainage system should be reviewed and documented by a Kleinfelder representative.

4.8 PAVEMENT SECTIONS

The required pavement structural sections will depend on the expected wheel loads, volume of traffic, and subgrade soils. We have provided asphalt concrete and portland cement concrete (PCC) pavement sections for traffic indices provided in the CWDRs (Costco, 2016).

Positive drainage of the paved areas should be provided since moisture infiltration into the subgrade may decrease the life of pavements. Curbing located adjacent to paved areas should be founded in the subgrade, not the aggregate base, in order to provide a cutoff, which reduces water infiltration into the base course.

The following pavement sections provided below are based on the soil conditions encountered during our field exploration, our assumptions regarding final site grades, and limited laboratory testing.

4.8.1 Costco Pavement Design Parameters

We developed pavement design recommendations using traffic loading parameters provided in the Costco Wholesale Development Requirements and the following test data:

- A 20-year pavement design life;
- Light-duty pavements subject to 6,600 passenger vehicle trips per day (Traffic Index of 5.0);
- Heavy-duty pavements subject to 30 tractor-trailer truck tips per day (Traffic Index of 7.0);

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

- For asphalt concrete pavements, a design R-value of 20; and
- For portland cement concrete (PCC) Pavements, a 28-day flexural strength (modulus of rupture determined by the third-point method) of at least 550 pounds per square inch (psi) (approximate compressive strength of 4,000 psi); a modulus of subgrade reaction (k value) of 100 pounds per cubic inch (pci) for native subgrade; and interlock at the control joints.

4.8.2 Asphalt Concrete Pavement

We designed asphalt concrete pavement, also referred to as Hot Mix Asphalt (HMA), in accordance with the Asphalt Institute Manual Series (MS-1), Asphalt Pavements for Highways and Streets. Alternatively, asphalt concrete pavement sections were also designed using the Caltrans Highway Design Manual for comparison. HMA should conform to requirements of the Costco Wholesale Specification Section 321216, Asphalt Paving. Pavement lifts should not exceed three inches. Table 4 presents recommended minimum HMA pavement sections. The designer should select the appropriate pavement sections based on projects requirements. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

TABLE 4
RECOMMENDED MINIMUM ASPHALT CONCRETE PAVEMENT SECTIONS

Traffic Use	Traffic Index, TI	Design Method	Asphalt Concrete* (inches)	Aggregate Base* (inches)
Light-Duty Pavement	5.0	MS-1	4.0	6.0
		Caltrans	3.5	6.0
Heavy-Duty Pavement	7.0	MS-1	5.0	12.0
		Caltrans	5.0	10.0

* Rounded to the closest ½ inch.

4.8.3 Asphalt Performance Grade Binder

Performance Grade (PG) Binder 70-10 may be used for the project. This recommendation was developed in accordance with Costco Wholesale Specifications Section 321216. This binder is commonly used throughout Northern California. Air temperature data nearest the project site was used with the MERRA Climate Data option and the PG was selected using the FHWA program LTTPBind Online web-based tool based on the AASHTO M323-13 standard. The high-end and low-end temperature ratings were selected to provide a reliability of at least 98 and 90 percent, respectively.

4.8.4 Portland Cement Concrete Pavement

We designed PCC pavement in accordance with the Portland Cement Association (PCA) Thickness Design for Concrete Pavements (PCA, 1984). The design assumes that the PCC will have a 28-day flexural strength (modulus of rupture determined by the third-point method) of at least 550 pounds per square inch (psi) (approximate compressive strength of 4,000 psi). A design modulus of subgrade reaction (k value) of 125 pounds per cubic inch (pci) was assumed for the top of the compacted aggregate base. It was also assumed that aggregate interlock would be developed at the control joints. The pavement sections are based on a theoretical design life of 20 years.

Recommended minimum PCC sections are presented in Table 5. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

TABLE 5
RECOMMENDED MINIMUM PCC PAVEMENT SECTIONS

Traffic Use	Traffic Index, TI	PCC * (inches)	Aggregate Base* (inches)
Light-Duty Pavement	5.0	6.5	6.0
Heavy-Duty Pavement	7.0	7.0	6.0

* Rounded to the closest ½ inch.

4.8.5 Aggregate Base

Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base. Please note that Caltrans Class 2 aggregate base may utilize recycled materials. The use of recycled material requires Costco's approval.

4.8.6 Pavement Maintenance

Pavements may undergo movement due to changes in subgrade moisture content. This movement tends to accelerate pavement deterioration. A crack sealing program should be performed annually to slow pavement deterioration. Any areas where surface water stands on the surface should be remediated. Over time as cracking becomes more pronounced, a slurry seal coat should be applied

4.9 SOIL CORROSIVITY

We performed laboratory testing for parameters commonly used to evaluate corrosivity of soils, including pH, minimum resistivity, oxidation reduction potential, redox, chloride and soluble sulfate content. Table 6 presents the results.

TABLE 6
CORROSION TEST RESULTS

Location	Depth (ft)	Minimum Resistivity, (ohm-cm)		pH	Oxidation Reduction Potential, mV	Water-Soluble Ion Concentration ^, ppm		
		Saturated	In-Situ Moisture			Chloride	Sulfide	Sulfate
TP-4	0-2	No Test	No Test	5.71	377	No Test	Not Present	No Test
TP-5	0-1	No Test	No Test	5.61	331	No Test	Not Present	No Test

B-17	3-4	20,640	No Test	5.35	309	6.1	Not Present	1.5

Note: ^ Water soluble ion concentrations are reported as % in soil by mass.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

These tests are a generalized indicator of soil corrosivity for the sample tested. Other soils on site may be more, less, or similarly corrosive in nature. Imported fill materials should be tested to confirm that their corrosion potential is not more severe than those noted.

Although Kleinfelder does not practice corrosion engineering, resistivity values greater than 10,000 ohm-cm are normally considered mildly corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318 Table 4.2.1 (ACI, 2011). Therefore, in accordance with ACI Building Code 318-11, no special provisions for selection of cement type are required.

We understand gasoline station equipment is constructed of corrosion resistant synthetic materials. We recommend the gasoline station designer review these results and consult a corrosion expert for further evaluation, if necessary.

4.10 STORM WATER MANAGEMENT

We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site based on soil type and laboratory testing. Pursuant to the current standard of practice, an infiltration evaluation is a two-step process. The first step is to characterize the site to assess whether infiltration is feasible. If infiltration is feasible, then infiltration testing is needed to provide a design infiltration rate (step two).

Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the onsite soils in the upper 10 to 20 feet below the existing ground surface at the site are comprised primarily of silty and clayey sand with gravel to cobble sized rock fragments. Seasonal perched groundwater was also observed within these sandy soils above the bedrock. Given the moderate infiltration capacity of the on-site soils and observed perched groundwater, we recommend alternatives to infiltration Best Management Practices (BMPs), such as bio filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the project site.

If bio-filtration/bio-retention systems are employed, we recommend that the BMPs be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. If planters are located within 10 feet of the structures, or adjacent to slabs and pavements, then some means of diverting water away from the building, building foundation soils, or soils that support slabs and pavements would be required, such as lining the planters.

5 CONSTRUCTION RECOMMENDATIONS

5.1 GENERAL

The following recommendations should be used by the contractor for construction of the project, attention to excavatability and perched groundwater should be noted.

5.2 EARTHWORK

5.2.1 General

Site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state or federal specifications, and the recommendations included in this report. References to maximum dry unit weights are established in accordance with the latest version of ASTM Test Method D1557 (Modified Proctor). The earthwork operations should be observed and tested by a representative of Kleinfelder.

5.2.2 Site Preparation

Abandoned utilities and other existing features within the proposed development areas (if any are encountered) should be removed and the excavation(s) backfilled with engineered fill. Debris produced by demolition operations, including wood, steel, piping, plastics, etc., should be separated and disposed of off-site. Existing utility pipelines or conduits that extend beyond the limits of the proposed construction and are to be abandoned in place, should be plugged with non-shrinking cement grout to prevent migration of soil and/or water. Demolition, disposal and grading operations should be observed and tested by a representative of Kleinfelder.

Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Additional stripping is not anticipated.

Based on the preliminary grading plan, the warehouse building footprint is be situated on a cut/fill transition with fills up to approximately 10 feet in the south-western corner of the building and cuts up to about 5 feet in the south-eastern corner. Overexcavation and recompaction of on-site soils/weathered bedrock is recommended to reduce the potential for differential settlement and provide relatively uniform support for the proposed warehouse and other improvements.

Soils within 10 feet of the warehouse pad (including the entrance canopy, building aprons, utility pads, stairs, ramps, stoops, and the loading dock) should be overexcavated to a depth of at least

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

2 feet below existing grade, 3 feet below the bottom of the footings, or 3 feet below the bottom of the floor slabs, whichever is deeper. If existing fill soils are encountered at the base of the overexcavation, the overexcavation should continue until the fill is removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill.

Gravel to cobble-sized rock fragments generated from weathering of the underlying granite bedrock were commonly encountered below approximately 5 feet below the existing grade and may significantly impact excavations for foundations and utilities in the building pad and fuel center site. Rock or other soil fragments greater than 6 inches in size should not be used in fills. Within the upper 3 feet of building pads, rock or other soil fragments greater than 3 inches in size should not be used. Screening of oversized materials will be necessary to reuse the on-site material as structural fill.

For pavement, sidewalk, and other flatwork areas (including the fuel facility), soils should be overexcavated to a depth of at least 18 inches below existing grade. Overexcavation is not required in cut areas provided loose/soft shallow soils and organic rich materials are removed. The overexcavated soils can be moisture conditioned and recompacted as structural fill. The over-excavation should extend beyond the proposed improvements a horizontal distance of at least 2 feet.

Following overexcavation and prior to replacing soils with compacted fill, the exposed subgrade should be proof-rolled with a fully-loaded tandem-axle dump truck or water truck. Areas identified as being soft or yielding may require additional compaction or over-excavation as determined by a representative of the geotechnical engineer.

The site soils contained approximately 25 to 30 fines and are moisture sensitive and susceptible to disturbance, rutting, and pumping during construction. The contractor should plan to repair subgrade conditions that become unstable/disturbed and should develop a plan to manage subgrade trafficability across the site throughout the construction period. Features of this plan may include temporary surface haul roads, limited traffic routes, etc.

5.2.3 Groundwater Impacts

Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Perched groundwater above the bedrock was encountered in the soil borings and test pits that were advanced following a period of heavy rainfall and may be encountered during

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

construction. This is most likely to occur following periods of rainfall and in the winter and spring months. If encountered, excavations which extend below the perched groundwater level (currently estimated to be at approximately 1 to 10 feet below existing site grade) will need to be dewatered. In our opinion, dewatering of narrow trench excavations, which penetrate less than a few feet below the groundwater level and do not encounter loose and/or cohesionless soils, may be possible by directing inflow to a sump where water can be removed by a pump. Temporary dewatering of wider, deeper, and/or more extensive excavations may require well points, deep wells, and/or deep sumps. To help maintain bottom stability of wider, deeper, and/or more extensive excavations, groundwater levels should be drawn-down a minimum of 2 feet below the lowest portion of the excavation. Since temporary dewatering will impact and be dependent on construction methods and scheduling, we recommend the Contractor be solely responsible for the design, installation, maintenance, and performance of all temporary dewatering systems.

Perched groundwater levels can fluctuate depending on rainfall, runoff conditions, or other factors. Therefore, water levels presented in this report may not be representative of those encountered at the time of construction. We recommend the Contractor verify perched groundwater conditions and evaluate dewatering requirements prior to bidding and/or construction.

Depending on the depth of excavation below perched groundwater, soil conditions encountered along the excavation face, and slope inclination, caving or sloughing of excavation slopes is likely within the vicinity of a sump dewatering system. Sloughing or caving of excavation slopes could endanger personnel working within or adjacent to the excavation as well as nearby equipment, structures, or other existing improvements. The Contractor should be aware of the potential for caving and take appropriate precautions to insure the safety of site personnel as well as the integrity of the excavation slopes and any existing, nearby structures or other improvements.

5.2.4 Foundation Excavations

Shallow Foundations

Following excavation to the foundation subgrade elevations, the exposed subgrade should be observed by a representative of the geotechnical engineer to evaluate the presence of satisfactory materials at design elevations. If unsatisfactory material, such as soft or disturbed soil, debris or otherwise unsuitable soil is present at the base of footing excavations, it should be overexcavated and replaced with structural concrete, 2-sack sand-cement slurry, or structural fill to the depth determined by the geotechnical engineer.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

Drilled Pile Foundations

The performance and capacities of piles can be influenced significantly by the selected construction methods and procedures used. Construction methods that create large zones of disturbance around the drilled shafts can lead to lower than expected skin friction due to excessive stress relief around the shaft length. Drilling of the pile shafts should be accomplished using heavy-duty excavation equipment maintained in good condition. It should be noted that gravel- to cobble-sized rock fragments and granite bedrock were encountered in the test pits and borings below a depth of about 5 feet below existing grades and difficult excavation conditions may be encountered. In addition, practical auger refusal on bedrock was encountered at depths as shallow as approximately 7 feet below grade in the borings. The foundation drilling contractor should select equipment and tooling that is capable of reaching the planned foundation depths in such material, especially in cut areas.

Concrete should be placed immediately after drilling of the hole is complete. The concrete should be pumped to the bottom of the drilled shaft using a down-hole tremie.

5.2.5 Fill Material and Compaction Criteria

The on-site soils, minus debris, organic matter, or other deleterious materials, may be used as general engineered fill. Rock or other soil fragments greater than 6 inches in size should not be used in fills. Within the upper 3 feet of building pads, rock or other soil fragments greater than 3 inches in size should not be used. Screening of oversized materials will be necessary to reuse the on-site material as structural fill.

Import soils should have no particles greater than 3 inches in maximum dimension, no less than 70 percent of the particles passing the No. 4 sieve, no more than 25 percent of particles passing the No. 200 sieve, and a Plasticity Index (PI) less than 5. The contractor should provide documentation that all imported soil is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals. Test results with the geotechnical and analytical properties of the proposed import material should be provided to Costco for approval prior to transportation and use on site.

Fill soils should be compacted to at least 95 percent of the maximum dry unit weight (ASTM D1557) in accordance with the Costco Wholesale Development Requirements (CWDRs). Fill soils should be compacted to moisture contents between -2 and +1 percent of the optimum moisture content during compaction. If both compaction and moisture content criteria are not

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

within the specified tolerances, the fill should not be accepted, and the contractor should rework the material until the fill is placed within the specified tolerances.

Processing may require ripping the material, disking to break up clumps, and blending to attain uniform moisture contents necessary for compaction. Utility trench backfill should be mechanically compacted. Flooding should not be permitted. Table 7 presents structural fill placement and compaction criteria.

TABLE 7
STRUCTURAL FILL PLACEMENT AND COMPACTION CRITERIA

Fill Location/Use	Material Type	Relative Compaction[1] (ASTM D1557)	Moisture Content Range	Minimum Compaction Testing Frequency Per Lift
Aggregate base for pavements and concrete slabs	Aggregate Base	At least 95 percent	-2 to +2% of optimum	10,000 Square Feet
Structural Areas (Warehouse Building Pad and Fuel Facility Canopy)	On-site Soils or Imported Material	At least 95 percent	-2 to +1% of optimum	10,000 Square Feet
Subgrade for Pavements, Sidewalks and Other Flatwork Areas	On-site Soils or Imported Material	At least 95 percent	-2 to +1% of optimum	15,000 Square Feet
Retaining Wall backfill	Imported Material	At least 92 percent	-2 to +1% of optimum	1,000 Square Feet
Utility trenches backfill	On-site Soils or Imported Material	At least 95 percent	-2 to +1% of optimum	150 Linear Feet
Lawns or Unimproved areas	On-site Soils or Imported Material	At least 90 percent	At least optimum	20,000 Square Feet

Note: [1] Where two or more compaction specifications coincide, the more stringent specification should be utilized.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

5.2.6 Excavation and Rippability

Thirty eight (38) borings drilled as part of our field exploration were advanced using hollow-stem-auger drilling equipment. Drilling effort was hard in the soils with significant gravel and cobble sized rock fragments and refusal on granitic bedrock was encountered in 18 of the borings. Ten (10) test pits were excavated to depths of about 8 to 15 feet using a John Deere 160 backhoe equipped with a 24-inch wide bucket. Bedrock was encountered in all of the test pits and refusal was encountered in five of the test pits. Bedrock encountered across the site includes variably fractured and weathered granite. The results of the seismic refraction survey (see Appendix C) indicate variability in depth to bedrock across the warehouse and fuel facility areas and a general depth of rippability of approximately 12 feet. The majority of the shallow rock is anticipated to be highly weathered and rippable to marginally rippable but will likely contain areas of less weathered rock that will be very hard and difficult to excavate. Hammering, pre-drilling and hammering, or similar procedures are anticipated to be required in such hard zones of the rock where excavation equipment meets with refusal. Blasting may be an option. It has been our experience that mechanical removal by hammering may be difficult in some cases and require pre-drilling to help break up the rock where blasting is not feasible. Rock trenchers (rock saws and belted trenchers) or large excavators equipped with rock buckets have generally been able to excavate within the highly weathered rock units but will likely not be able to remove very hard and less weathered zones of rock. Rock trenchers have the added advantage of pulverizing the soil and rock units such that they are generally suitable for trench backfill. This generally eliminates the need to screen out or crush rock fragments for use as trench backfill. It is also likely that deeper onsite excavations may generate abundant boulders. The contractor should consider the difficult excavation conditions to be encountered across a majority of the site when selecting construction equipment.

5.2.7 Temporary Excavations

For planning purposes, we estimate that temporary slopes up to 10 feet in height may be sloped back at an inclination of about 1.5:1 (horizontal to vertical). Sloughing and/or raveling of sandy slopes should be anticipated as they dry out. Where space for sloped embankments is not available, shoring will be necessary. Actual sloping requirements should be determined by contractor's competent person. A contingency should be considered in the event that flatter slopes and/or shoring are required.

If signs of slope instability are observed, the inclination recommended above should be decreased until stability of the slope is obtained. In addition, at the first signs of slope instability, the

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

geotechnical engineer should be contacted. Where space for sloped embankments is not available, shoring will be necessary. We recommend the design team and contractor consult with Kleinfelder during the bid development stage. The amount of room available for sloping excavations may dictate whether shoring should be included. Excavations within a 1:1 plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements should not be attempted without bracing and/or underpinning the improvements. Personnel from the geotechnical engineer should observe the excavations so that modifications can be made to the excavations, as necessary, based on variations in the encountered soil conditions. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met.

Where sloped excavations are used, tops of the slopes should be barricaded so that vehicles and storage loads do not encroach within a distance equal to the depth of the excavation. Greater setback may be necessary when considering heavy vehicles, such as concrete trucks and cranes. The geotechnical engineer should be advised of such heavy vehicle loadings so that specific setback requirements can be established. If temporary construction slopes are to be maintained during the rainy season, berms are recommended along the tops of the slopes to reduce runoff that may enter the excavation and erode the slope faces.

All trench excavations should be braced and shored in accordance with good construction practice and all applicable safety ordinances and codes. The contractor should be responsible for the structural design and safety of the temporary shoring system, and we recommend that this design be submitted to Kleinfelder for review to check that our recommendations have been incorporated. For planning purposes, the upper on-site soils may be considered a Type C soil, as defined using the current OSHA soil classification.

5.2.8 Oversize Material

Cobble-sized rock fragments were observed during our field investigation and may significantly impact excavations for foundations and utilities in the warehouse pad, fuel facility, and site. Larger rock fragments may also be encountered. The contractor should consider the oversize material to be encountered across a majority of the site when selecting construction equipment. Screening of oversized materials will be necessary to reuse the on-site material as structural fill.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

5.2.9 Trench Backfill

Pipe zone backfill (i.e. material beneath and in the immediate vicinity of the pipe) should consist of imported or on-site sandy soil less than ¾-inch in maximum dimension. Trench zone backfill (i.e., material placed between the pipe zone backfill and finished subgrade) may consist of onsite soil or imported fill that meets the requirements for engineered fill provided above. Due to the coarse particles present in onsite fill material, we recommend that the pipe zone material extend a minimum of 1 foot above the top of the conduit. This will protect the conduit from point loads from individual large particles.

If imported or on-site material is used for trench zone backfill, we recommend it consist of silty sand. In general, gravel should not be used for trench zone backfill due to the potential for soil migration into the relatively large void spaces present in this type of material and water seepage along trenches backfilled with coarse-grained sand and/or gravel.

Recommendations provided above for pipe zone backfill are minimum requirements only. More stringent material specifications may be required to fulfill local building requirements and/or bedding requirements for specific types of pipes. We recommend the project civil engineer develop these material specifications based on planned pipe types, bedding conditions, and other factors beyond the scope of this study.

Trench backfill should be placed and compacted in accordance with recommendations provided for structural fill in Section 5.2.4. Mechanical compaction is recommended; ponding or jetting should not be performed, especially in areas supporting structural loads or beneath concrete slabs supported on grade, pavements, or other improvements.

5.3 UNSTABLE SUBGRADE CONDITIONS

Should grading be performed during or following extended periods of rainfall, the moisture content of the near-surface soils will also be significantly above the optimum moisture content. Additionally, some low lying areas of the site may become ponded with water and stream flow. These conditions could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include the following:

- Drying: Drying unstable subgrade involves disking or ripping wet subgrade to a depth of approximately 18 to 24 inches and allowing the exposed soil to dry. Multiple passes of the equipment (likely on a daily basis) will be needed because as the surface of the soil dries,

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

a crust forms that reduces further evaporation. Frequent disking will help prevent the formation of a crust and will promote drying. This process could take several days to several weeks depending on the material, the depth of ripping, the number of passes, and the weather.

- Removal and Replacement with Crushed Rock and Geotextile Fabric: Unstable subgrade could be overexcavated 12 to 24 inches below existing grade and replaced with ¾- or 1-inch crushed rock underlain by geotextile fabric. The geotextile fabric should consist of a woven geotextile, such as Mirafi 600X or equivalent. The final depth of removal will depend upon the conditions observed in the field once overexcavation begins. The geotextile fabric should be placed in accordance with the manufacturer's recommendations.
- Cement Treatment: Unstable subgrade could be stabilized by mixing the upper 12 to 18 inches of the subgrade with portland cement. For estimating purposes, an application rate of 4 to 6 percent may be used. Final application rates should be determined in the field at the time of construction in consultation with the geotechnical engineer. Cement treatment should be performed by a specialty contractor experienced in this work and should be performed in accordance with Caltrans Standard Specifications. Since cement treatment uses the on-site soil, the expense of importing material can be avoided.

5.4 EXTERIOR FLATWORK

Prior to casting exterior flatwork, the subgrade soils should be prepared, as recommended in Section 5.2.2. The moisture content of the subgrade soils should be maintained around optimum for sandy subgrade soils prior to the placement of any flatwork or fill. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing.

5.5 PAVEMENTS

The pavement sections provided above are contingent on the following recommendations being implemented during construction.

- Pavement subgrade should be prepared as recommended in Section 5.2.2.
- Subgrade soils should be in a stable, non-pumping condition at the time the aggregate base materials are placed and compacted.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

- Aggregate base materials should be compacted to at least 95 percent relative compaction (ASTM D1557).
- Asphalt paving materials and placement methods should meet current Costco Wholesale Specifications Section 321216.
- Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet.

Note that pavement materials and construction must be completed in strict accordance with the Costco's specifications that contain very specific pavement material (asphalt, aggregate and concrete) criteria and construction practices to be used (compaction and material sampling). The general contractor and pavement construction subcontractor should be aware that asphalt and concrete mix designs must be submitted to the design architect and Kleinfelder at least 45 days prior to the scheduled production and laydown for review and approval.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

6 ADDITIONAL SERVICES

6.1 PLANS AND SPECIFICATIONS REVIEW

We recommend Kleinfelder perform a review of geotechnical related portions of the project plans and specifications before they are finalized to see that geotechnical recommendations have been properly interpreted and implemented during design. If we are not accorded the privilege of performing this review, we can assume no responsibility for misinterpretation of our recommendations.

6.2 CONSTRUCTION OBSERVATION AND TESTING

The construction process is an integral design component with respect to the geotechnical aspects of a project. Because geotechnical engineering is an inexact science due to the variability of natural processes, and because we sample only a limited portion of the soils affecting the performance of the proposed structure, unanticipated or changed conditions can be encountered during grading. Proper geotechnical observation and testing during construction are imperative to allow the geotechnical engineer the opportunity to verify assumptions made during the design process. Therefore, we recommend that Kleinfelder be retained during the construction of the proposed improvements to observe compliance with the design concepts and geotechnical recommendations, and to allow design changes in the event that subsurface conditions or methods of construction differ from those assumed while completing this study.

Our services are typically needed at the following stages of grading:

- After demolition and grubbing;
- During grading;
- After the overexcavation, but prior to subgrade preparation;
- During utility trench backfill;
- During base placement and site paving; and
- After excavation for foundations.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

7 LIMITATIONS

This geotechnical study has been prepared for the exclusive use of Costco Wholesale and their agents for specific application to the proposed Costco Wholesale Warehouse (CW# 16-0132) located southeast of the intersection of Sierra College Boulevard and Brace Road in Loomis, California. The findings, conclusions and recommendations presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, express or implied, is made.

The scope of services was limited to a background data review and the field exploration described in Section 1.2. It should be recognized that definition and evaluation of subsurface conditions are difficult. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present due to the limitations of data from field studies. The conclusions of this assessment are based on our field exploration and laboratory testing programs, and engineering analyses.

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service, which provide information for their purposes at acceptable levels of risk. The client and key members of the design team should discuss the issues covered in this report with Kleinfelder, so that the issues are understood and applied in a manner consistent with the owner's budget, tolerance of risk and expectations for future performance and maintenance.

Recommendations contained in this report are based on our field observations and subsurface explorations, limited laboratory tests, and our present knowledge of the proposed construction. It is possible that soil or groundwater conditions could vary between or beyond the points explored. If soil or groundwater conditions are encountered during construction that differ from those described herein, the client is responsible for ensuring that Kleinfelder is notified immediately so that we may reevaluate the recommendations of this report. If the scope of the proposed construction, including the estimated Traffic Index or locations of the improvements, changes from that described in this report, the conclusions and recommendations contained in this report are not considered valid until the changes are reviewed, and the conclusions of this report are modified or approved in writing, by Kleinfelder.

© 2017 Kleinfelder
KLEINFELDER 40 Clark Street, Suite J, Salinas, CA 93901 **p |** 831.755.7900 **f |** 831.755.7909

The scope of services for this subsurface exploration and geotechnical report did not include environmental assessments or evaluations regarding the presence or absence of wetlands or hazardous substances in the soil, surface water, or groundwater at this site.

Kleinfelder cannot be responsible for interpretation by others of this report or the conditions encountered in the field. Kleinfelder must be retained so that all geotechnical aspects of construction will be monitored on a full-time basis by a representative from Kleinfelder, including site preparation, preparation of foundations, and placement of engineered fill and trench backfill. These services provide Kleinfelder the opportunity to observe the actual soil and groundwater conditions encountered during construction and to evaluate the applicability of the recommendations presented in this report to the site conditions. If Kleinfelder is not retained to provide these services, we will cease to be the engineer of record for this project and will assume no responsibility for any potential claim during or after construction on this project. If changed site conditions affect the recommendations presented herein, Kleinfelder must also be retained to perform a supplemental e valuation and to issue a revision to our original report.

This report, and any future addenda or reports regarding this site, may be made available to bidders to supply them with only the data contained in the report regarding subsurface conditions and laboratory test results at the point and time noted. Bidders may not rely on interpretations, opinion, recommendations, or conclusions contained in the report. Because of the limited nature of any subsurface study, the contractor may encounter conditions during construction which differ from those presented in this report. In such event, the contractor should promptly notify the owner so that Kleinfelder's geotechnical engineer can be contacted to confirm those conditions. We recommend the contractor describe the nature and extent of the differing conditions in writing and that the construction contract include provisions for dealing with differing conditions. Contingency funds should be reserved for potential problems during earthwork and foundation construction.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party

Appendix A

APPENDIX A
FIELD EXPLORATIONS

APPENDIX A
FIELD EXPLORATIONS

GENERAL

Subsurface conditions at the site were explored by drilling 38 borings and excavating 10 test pits. The borings were drilled by Taber Drilling of West Sacramento, California using a CME-55 track-mounted, hollow-stem auger drilling and HQ-3 coring equipment to depths between approximately 7 to 30 feet below the existing ground surface (bgs) in the warehouse building area; approximately 10 feet bgs in the parking and drive areas; and between approximately 10 and 30 feet bgs in the fuel facility area. Seventeen of the borings (Borings B-1, B-4, B-6 through B-10, B-12 through B-19, B-22, and B-23) were terminated short of their planned depth due to practical auger refusal on bedrock. Eight of these borings that encountered refusal were cored to a depth of at least 4 feet into the bedrock (Borings B-4, B-7, B-9, B-17 through B-19, B-22, and B-23). The test pits were excavated by RAH Environmental of Rocklin, California using a tire-mounted backhoe (John Deere 160). Ten test pits were excavated to depths ranging from approximately 8 feet to 15 feet bgs. Five of these test pits were terminated short of their planned depth due to practical refusal on bedrock (Test Pits TP-2, TP-3, TP-7, TP-9, and TP-10). The approximate locations of the borings and test pits are presented on Figure 2. Elevations shown on the boring logs were estimated from the Preliminary Grading and Drainage Plan prepared by Kier and Wright (K&W No. A16658, Print date 3/06/2017).

The borings were drilled using track-mounted hollow-stem-auger drilling and HQ-3 rock coring equipment to depths between approximately 7 and 30 feet below the existing ground surface (bgs) in the warehouse building area; approximately 10 feet bgs in the parking and drive areas; and between approximately 10 and 30 feet bgs in the fuel facility area.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified to identify potential conflicts with subsurface structures. A private utility locator was also subcontracted to scan for existing utilities at each of the proposed exploration locations.

The boring and test pit logs are presented as Figures A-4 through A-51. An explanation to the log is presented as Figures A-1 and A-2 and a Rock Description Key is provided as Figure A-3. The Boring/Test Pit Log describes the earth materials encountered, samples obtained and show field and laboratory tests performed. The log also shows the location, boring/test pit number, drilling/excavation date and the name of the drilling/excavation subcontractor. The borings and test pits were logged by a Kleinfelder engineer or geologist using the Unified Soil Classification

© 2017 Kleinfelder

System. The boundaries between soil types shown on the logs are approximate because the transition between different soil layers may be gradual. Bulk and drive samples of selected earth materials were obtained from the borings and test pits.

A California sampler was used to obtain drive samples of the soil encountered. This sampler consists of a 3.0-inch O.D., 2.5-inch I.D. split barrel shaft that is driven a total of 18-inches into the soil at the bottom of the boring. The soil was retained in 6-inch brass tubes for laboratory testing. An additional 2 inches of soil from each drive remained in the cutting shoe and was usually discarded after visually classifying the soil. The sampler was driven using a 140-pound hammer falling 30 inches. The total number of blows required to drive the sampler the final 12 inches is termed blow count and is recorded on the Log of Boring. In some borings rock coring was performed when refusal was encountered above the target depth. This coring was completed using HQ-3 rock coring equipment and rock cores were collected, placed in cardboard core boxes, and transported to the Kleinfelder Sacramento laboratory.

The procedures we employed in the field are generally consistent with those described in ASTM Standard Test Method D1586.

Bulk and grab samples of the near-surface soils were directly retrieved from the auger cuttings from the borings and the excavated material in the test pits.

- WATER LEVEL (level after exploration completion)
- WATER LEVEL (additional levels after exploration)
- OBSERVED SEEPAGE

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

NAME	ABBR	NAME	ABBR
Albite	Al	Muscovite	Mus
Apatite	Ap	None	No
Biotite	Bi	Pyrite	Py
Clay	Cl	Quartz	Qz
Calcite	Ca	Sand	Sd
Chlorite	Ch	Sericite	Ser
Epidote	Ep	Silt	Si
Iron Oxide	Fe	Talc	Ta
Manganese	Mn	Unknown	Uk

DENSITY/SPACING OF DISCONTINUITIES

DESCRIPTION	SPACING CRITERIA
Unfractured	>6 ft. (>1.83 meters)
Slightly Fractured	2 - 6 ft. (0.061 - 1.83 meters)
Moderately Fractured	8 in - 2 ft. (203.20 - 609.60 mm)
Highly Fractured	2 - 8 in (50.80 - 203.30 mm)
Intensely Fractured	<2 in (<50.80 mm)

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	RECOGNITION
Pit (Pitted)	Pinhole to 0.03 ft. (3/8 in.) (>1 to 10 mm.) openings
Vug (Vuggy)	Small openings (usually lined with crystals) ranging in diameter from 0.03 ft. (3/8 in.) to 0.33 ft. (4 in.) (10 to 100 mm.)
Cavity	An opening larger than 0.33 ft. (4 in.) (100 mm.), size descriptions are required, and adjectives such as small, large, etc., may be used
Honeycombed	If numerous enough that only thin walls separate individual pits or vugs, this term further describes the preceding nomenclature to indicate cell-like form.
Vesicle (Vesicular)	Small openings in volcanic rocks of variable shape and size formed by entrapped gas bubbles during solidification.

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	CRITERIA
Unweathered	No evidence of chemical / mechanical alternation; rings with hammer blow.
Slightly Weathered	Slight discoloration on surface; slight alteration along discontinuities; <10% rock volume altered.
Moderately Weathered	Discoloring evident; surface pitted and alteration penetration well below surface; Weathering "halos" evident; 10-50% rock altered.
Highly Weathered	Entire mass discolored; Alteration pervading most rock, some slight weathering pockets; some minerals may be leached out.
Decomposed	Rock reduced to soil with relic rock texture/structure; Generally molded and crumbled by hand.

RELATIVE HARDNESS / STRENGTH DESCRIPTIONS

GRADE		UCS (Mpa)	FIELD TEST
R0	Extremely Weak	0.25 - 1.0	Indented by thumbnail
R1	Very Weak	1.0 - 5.0	Crumbles under firm blows of geological hammer, can be peeled by a pocket knife.
R2	Weak	5.0 - 25	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer.
R3	Medium Strong	25 - 50	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with a single firm blow of a geological hammer.
R4	Strong	50 - 100	Specimen requires more than one blow of geological hammer to fracture it.
R5	Very Strong	100 - 250	Specimen requires many blows of geological hammer to fracture it.
R6	Extremely Strong	> 250	Specimen can only be chipped with a geological hammer.

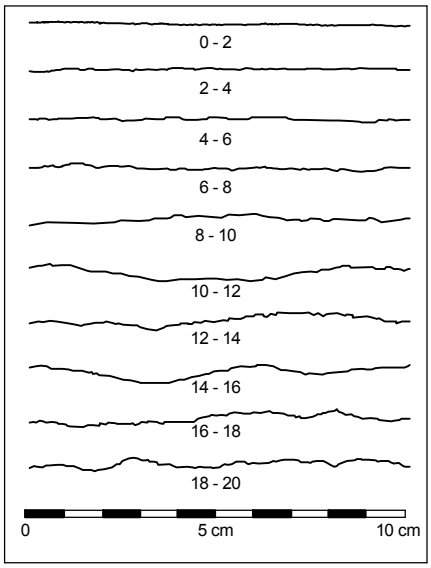
DESCRIPTION	CRITERIA [in (mm)]
Tight	<0.04 (<1)
Open	0.04 - 0.20 (1 - 5)
Wide	>0.20 (>5)

BEDDING CHARACTERISTICS

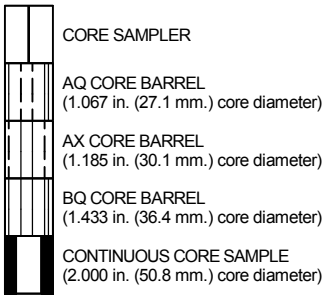


DESCRIPTION	Thickness [in (mm)]
Very Thick Bedded	>36 (>915)
Thick Bedded	12 - 36 (305 - 915)
Moderately Bedded	4 - 12 (102 - 305)
Thin Bedded	1 - 4 (25 - 102)
Very Thin Bedded	0.4 - 1 (10 - 25)
Laminated	0.1 - 0.4 (2.5 - 10)
Thinly Laminated	<0.1 (<2.5)

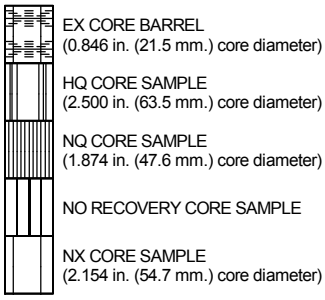
Bedding Planes — Planes dividing the individual layers, beds, or stratigraphy of rocks.

Joint — Fracture in rock, generally more or less vertical or traverse to bedding.

Seam — Applies to bedding plane with unspecified degree of weather.



JOINT ROUGHNESS COEFFICIENT (JRC)



From Barton and Choubey, 1977

RQD — Rock-quality designation (RQD) Rough measure of the degree of jointing or fracture in a rock mass, measured as a percentage of the drill core in lengths of 10 cm. or more.

The boring was terminated because of practical auger refusal ( ) at approximately 14 ft. below ground surface. The boring was backfilled with neat cement grout on January 26, 2017.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration elevation is approximate and was estimated from the Preliminary Grading and Drainage Plan prepared by Kier & Wright.

The boring was terminated at approximately 21 ft. below ground surface. The boring was backfilled with neat cement grout on January 19, 2017.

GROUNDWATER LEVEL INFORMATION:
▽ Groundwater was observed at approximately 2 ft. below ground surface during drilling.

GENERAL NOTES:
The exploration elevation is approximate and was estimated from the Preliminary Grading and Drainage Plan prepared by Kier & Wright.

The boring was terminated at approximately 10 ft. below ground surface. The boring was backfilled with soil cuttings on January 05, 2017.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.

GENERAL NOTES:
The exploration elevation is approximate and was estimated from the Preliminary Grading and Drainage Plan prepared by Kier & Wright.

320													
	15												
315													

The test pit was terminated because of excavator refusal (↑) at approximately 10 ft. below ground surface. The test pit was backfilled with soil on January 12, 2017.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during excavation or after completion.

GENERAL NOTES:
The exploration elevation is approximate and was estimated from the Preliminary Grading and Drainage Plan prepared by Kier & Wright.

Appendix B

APPENDIX B
LABORATORY TESTING

APPENDIX B
LABORATORY TESTING

GENERAL

Laboratory tests were performed on selected samples as an aid in classifying the soils and to evaluate physical properties of the soils that may affect foundation design and construction procedures. The tests were performed in general conformance with the current ASTM or Caltrans standards. A description of the laboratory-testing program is presented below.

MOISTURE AND UNIT WEIGHT

Moisture content and dry unit weight tests were performed on selected samples recovered from the borings. Moisture contents were determined in general accordance with ASTM Test Method D 2216; dry unit weight was calculated using the entire weight of the samples collected. Results of these tests are presented on the boring logs.

WASH SIEVE

Selected soil samples were tested for the percent passing the No. 200 sieve, which was performed by wash sieving in accordance with ASTM Standard Test Method D 1140. The test results are presented on the boring logs.

GRAIN SIZE DISTRIBUTION

The grain-size distribution was determined for selected samples of the materials encountered at the site to aid in their classification. The tests were performed in general accordance with ASTM Test Method D422. These tests were performed on the gravel to clay fraction of the sample, the cobbles and boulders were removed from the test. Results of the testing are attached to this appendix.

PLASTICITY INDEX

Plasticity Index (liquid and plastic limit) testing was performed on selected samples of the on-site soils to determine plasticity characteristics and to aid in the classification of the soil. The tests were performed in accordance with ASTM Standard Test Method D 4318. The results are presented on the boring logs and attached to this appendix.

© 2017 Kleinfelder

R-VALUE

Resistance value (R-value) tests were performed on selected bulk soil samples obtained to evaluate pavement support characteristics of the near-surface onsite soils. R-value tests were performed in accordance with Caltrans Standard Test Method 301. The test results are attached.

PRELIMINARY SOIL CORROSIVITY

A series of chemical tests were performed on a selected sample of the near-surface soils to estimate pH, resistivity, oxidation reduction potential, redox, and soluble sulfate and chloride contents. The sample was tested in general accordance with California Test Methods 643, 422, and 417 for pH and minimum resistivity, soluble chlorides, and soluble sulfates, respectively, ASTM G-200 for Redox Potential, and AWWA C105/A25.5 for Sulfides. Test results may be used by a qualified corrosion engineer to evaluate the general corrosion potential with respect to construction materials. The tests were performed by Sunland Analytical of Rancho Cordova, California. The results of the tests are presented in Table 6 of Section 4.9 of the report and attached to this appendix.

TOPSOIL ANALYTICAL TESTS

Topsoil analytical testing was performed on 3 samples of the near-surface soils from the project site by Sunland Analytical of Rancho Cordova, California. The topsoil was tested for percentages of organic matter, percentages of macro and micro nutrients, deleterious material, pH, mineral content, and herbicide presence. The test results are attached to this appendix.

WATER QUALITY TESTS

Water quality testing was performed by the local water supply agency, Placer County Water Agency, on potable water samples collected within the area surrounding the project site. The public document provided by Placer County Water Agency is attached to this appendix.

LABORATORY CONTROL REPORT
Metal Analysis and Preparation for Sun Nos. 153713,153714,153715.
Method of Sample Preparation:

Analyte	Conc. of Analyte	Accuracy %	Precision (+/- RPD)
Arsenic	5.000	104	4
Cadmium	5.000	100	<1
Chromium	5.000	101	1
Copper	2.500	105	2
Lead	5.000	96	2
Mercury	0.050	100	<1
Nickel	5.000	97	4
Selenium	5.000	93	2
Silver	1.000	104	<1
Vanadium	2.500	101	1
Zinc	5.000	98	<1

NOTES (All of the following are specific for the current analysis process.)

1. Analyte concentration is obtained from purchased Quality Control Standards
2. Accuracy is the percent of the known analyte concentration determined and should fall within the range of 85 - 115%.
3. Precision is the relative percent difference of two determinations (D1 & D2) of the know analyte. RPD= ((D1-D2)/(D1+D2)/2) * 100

SOIL RECOMMENDATIONS FOR LANDSCAPE GARDENING

SOIL pH (Acidity and Alkalinity)

The pH of this sample indicates the soil is moderately acid and should be modified for non acid-tolerant plants. Apply 28 pounds of Dolomite Lime per 1000 sq.ft. and work into ground before planting.

DISSOLVED SALTS (Indicated by E.C. & TDS)

These conditions are in the normal range for plant growth.

SOIL TEXTURE AND RATE OF WATER INFILTRATION

The infiltration rate for all soil textures decreases with increasing ground slope. At 0 to 4%, 5 to 8%, 9 to 12%, 13 to 16% and above 16% the infiltration rate of this sample decreases from 0.54 to 0.43, 0.32, 0.22, 0.14, respectively. Infiltration rate also decreases with percent of ground cover and by compaction.

WATER PENETRATION OF SOIL DUE TO CHEMICAL CHARACTERISTICS

When exchangable Sodium increases in the soil, water penetration decreases. Based on SAR and ESP values this sample has no penetration problem due to soil Sodium. No Gypsum required.

ORGANIC MATTER

Organic matter provides a slow nitrogen release and aids water retention. This sample has a moderate Organic Matter content.
To maintain moisture and provide sustained nitrogen release a level of 10% organic matter is recommended. Use amending material that is approximately 75% organic matter (i.e. many ground fir barks). Based on the analysis of this soil sample apply 4 yards per 1000 sq.ft. Spread evenly and blend into the top six inches of soil. It is a reasonable practice to apply a top dressing of 3 inches of organic mulches to aid water penetration and retention.

SOIL BORON

Boron concenrations are in a range allowing normal plant growth.

SOIL MICRONUTRIENTS

Micronutrients, Copper, Iron, Manganese and Zinc, in soil are present in small amounts. However, they play a necessary role in plant metabolism. Without appropriate amounts plants will not thrive. Apply the following per 1000/ sq.ft. Do not mix micronutrients during application (use a separate application for each element indicated).

Because copper, manganese and zinc are in very small amounts, dissolve (each) in 2 gallons of water and use a sprayer to obtain an even application.
Apply 0.2 # Copper Sulfate, 0.5 # Zinc Sulfate and water.

SOIL RECOMMENDATIONS FOR LANDSCAPE GARDENING

SOIL MACRONUTRIENTS : NITROGEN-PHOSPHORUS-POTASSIUM (N-P-K)
GENERAL N-P-K RECOMMENDATION

Use ONE of these NPK preparations for the first fertilizer application.

Standard NPK Fertilizer Preparations	6-20-20	5-20-10	16-16-16	0-10-10	28-3-4	21-0-0	Customer Choice None
#/1000 sq.ft.	21	25	N/A	N/A	N/A	N/A	**

GRASS OR SOD PREPARATION

Till in organic matter, N,P,K and micro nutrients in addition to any lime gypsum or sulfur as directed above. Smooth soil surface and follow seed or sod producers direction for moisture and product application.

TREES AND SHRUBS

Excavate holes for planting shrubs and trees to at least twice the volume of the container. Prepare backfill for tree and shrub planting holes by mixing three parts of native soil (or imported top soil) with one part organic amendment (preferably nitrogen and iron fortified) and 2.5 pounds of 6-20-20 per yard of mix. For extended fertilization, place slow release fertilizer tablets in each hole per manufacturer's instructions. If 6-20-20 was not directly added to backfill mix, during backfill apply uniformly 1/2 oz of 6-20-20 per gallon containers, 2.5 oz per 5 gallons, 6 oz per 24 inch boxes.

Summary and Suggested Sequence of Soil Improvements (#/1000 Sq.Ft.)

Dolimite Lime	28	#	
Organic Amendment	4	Yd./1000 Sq.Ft.	Bulk organic amendment (nitrofied).
N-P-K Fertilizer	See above chart		
Micro Nutrients			
Copper	0.2	#	Copper sulfate
Zinc	0.5	#	Zinc Sulfate
Sulfate-Sulfur	1	#	Ammonium Sulfate

Maintenance Fertilization

Apply 5 pounds of Ammonium sulfate (21-0-0) per 1000 sq.ft.every month until plants become established. After established, apply 28-3-4 (or similar preparation) to provide desired growth rate and color.

SOIL RECOMMENDATIONS FOR LANDSCAPE GARDENING

SOIL pH (Acidity and Alkalinity)

The pH of this sample indicates the soil is in a range for normal growth of most plants. No modification is required.

DISSOLVED SALTS (Indicated by E.C. & TDS)

These conditions are in the normal range for plant growth.

SOIL TEXTURE AND RATE OF WATER INFILTRATION

The infiltration rate for all soil textures decreases with increasing ground slope. At 0 to 4%, 5 to 8%, 9 to 12%, 13 to 16% and above 16% the infiltration rate of this sample decreases from 0.54 to 0.43, 0.32, 0.22, 0.14, respectively. Infiltration rate also decreases with percent of ground cover and by compaction.

WATER PENETRATION OF SOIL DUE TO CHEMICAL CHARACTERISTICS

When exchangable Sodium increases in the soil, water penetration decreases. Based on SAR and ESP values this sample has no penetration problem due to soil Sodium. No Gypsum required.

ORGANIC MATTER

Organic matter provides a slow nitrogen release and aids water retention. This sample has a moderate Organic Matter content.
To maintain moisture and provide sustained nitrogen release a level of 10% organic matter is recommended. Use amending material that is approximately 75% organic matter (i.e. many ground fir barks). Based on the analysis of this soil sample apply 4 yards per 1000 sq.ft. Spread evenly and blend into the top six inches of soil. It is a reasonable practice to apply a top dressing of 3 inches of organic mulches to aid water penetration and retention.

SOIL BORON

Boron concenrations are in a range allowing normal plant growth.

SOIL MICRONUTRIENTS

Micronutrients, Copper, Iron, Manganese and Zinc, in soil are present in small amounts. However, they play a necessary role in plant metabolism. Without appropriate amounts plants will not thrive. Apply the following per 1000/ sq.ft. Do not mix micronutrients during application (use a separate application for each element indicated).

Because copper, manganese and zinc are in very small amounts, dissolve (each) in 2 gallons of water and use a sprayer to obtain an even application.
Apply 0.2 # Copper Sulfate, 0.5 # Zinc Sulfate and water.

SOIL RECOMMENDATIONS FOR LANDSCAPE GARDENING

SOIL MACRONUTRIENTS : NITROGEN-PHOSPHORUS-POTASSIUM (N-P-K)
GENERAL N-P-K RECOMMENDATION

Use ONE of these NPK preparations for the first fertilizer application.

Standard NPK Fertilizer Preparations	6-20-20	5-20-10	16-16-16	0-10-10	28-3-4	21-0-0	Customer Choice None
#/1000 sq.ft.	21	25	N/A	N/A	N/A	N/A	**

GRASS OR SOD PREPARATION

Till in organic matter, N,P,K and micro nutrients in addition to any lime gypsum or sulfur as directed above. Smooth soil surface and follow seed or sod producers direction for moisture and product application.

TREES AND SHRUBS

Excavate holes for planting shrubs and trees to at least twice the volume of the container. Prepare backfill for tree and shrub planting holes by mixing three parts of native soil (or imported top soil) with one part organic amendment (preferably nitrogen and iron fortified) and 2.5 pounds of 6-20-20 per yard of mix. For extended fertilization, place slow release fertilizer tablets in each hole per manufacturer's instructions. If 6-20-20 was not directly added to backfill mix, during backfill apply uniformly 1/2 oz of 6-20-20 per gallon containers, 2.5 oz per 5 gallons, 6 oz per 24 inch boxes.

Summary and Suggested Sequence of Soil Improvements (#/1000 Sq.Ft.)

Organic Amendment	4		Yd./1000 Sq.Ft. Bulk organic amendment (nitrofied).
N-P-K Fertilizer	See above chart		
Micro Nutrients			
Copper	0.2	#	Copper sulfate
Zinc	0.5	#	Zinc Sulfate
Sulfate-Sulfur	1	#	Ammonium Sulfate

Maintenance Fertilization

Apply 5 pounds of Ammonium sulfate (21-0-0) per 1000 sq.ft.every month until plants become established. After established, apply 28-3-4 (or similar preparation) to provide desired growth rate and color.

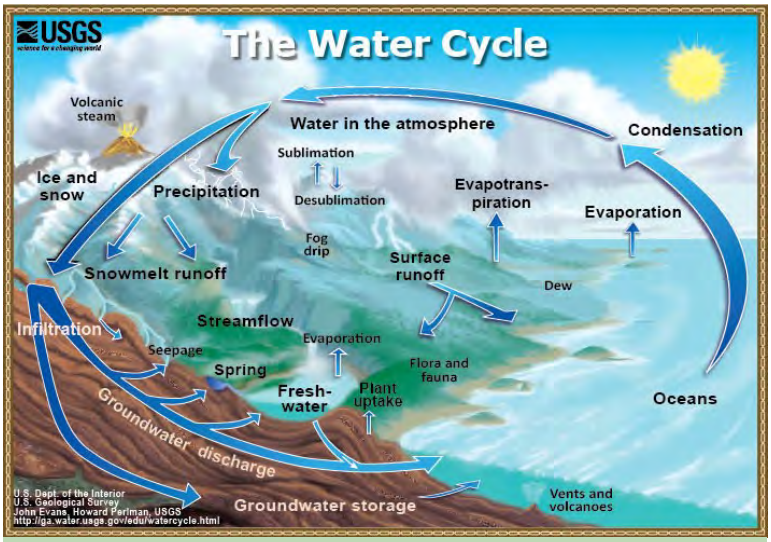
Water Quality Consumer Con eport

For samples collected during 2015 in the Foothill/Sunset Water System



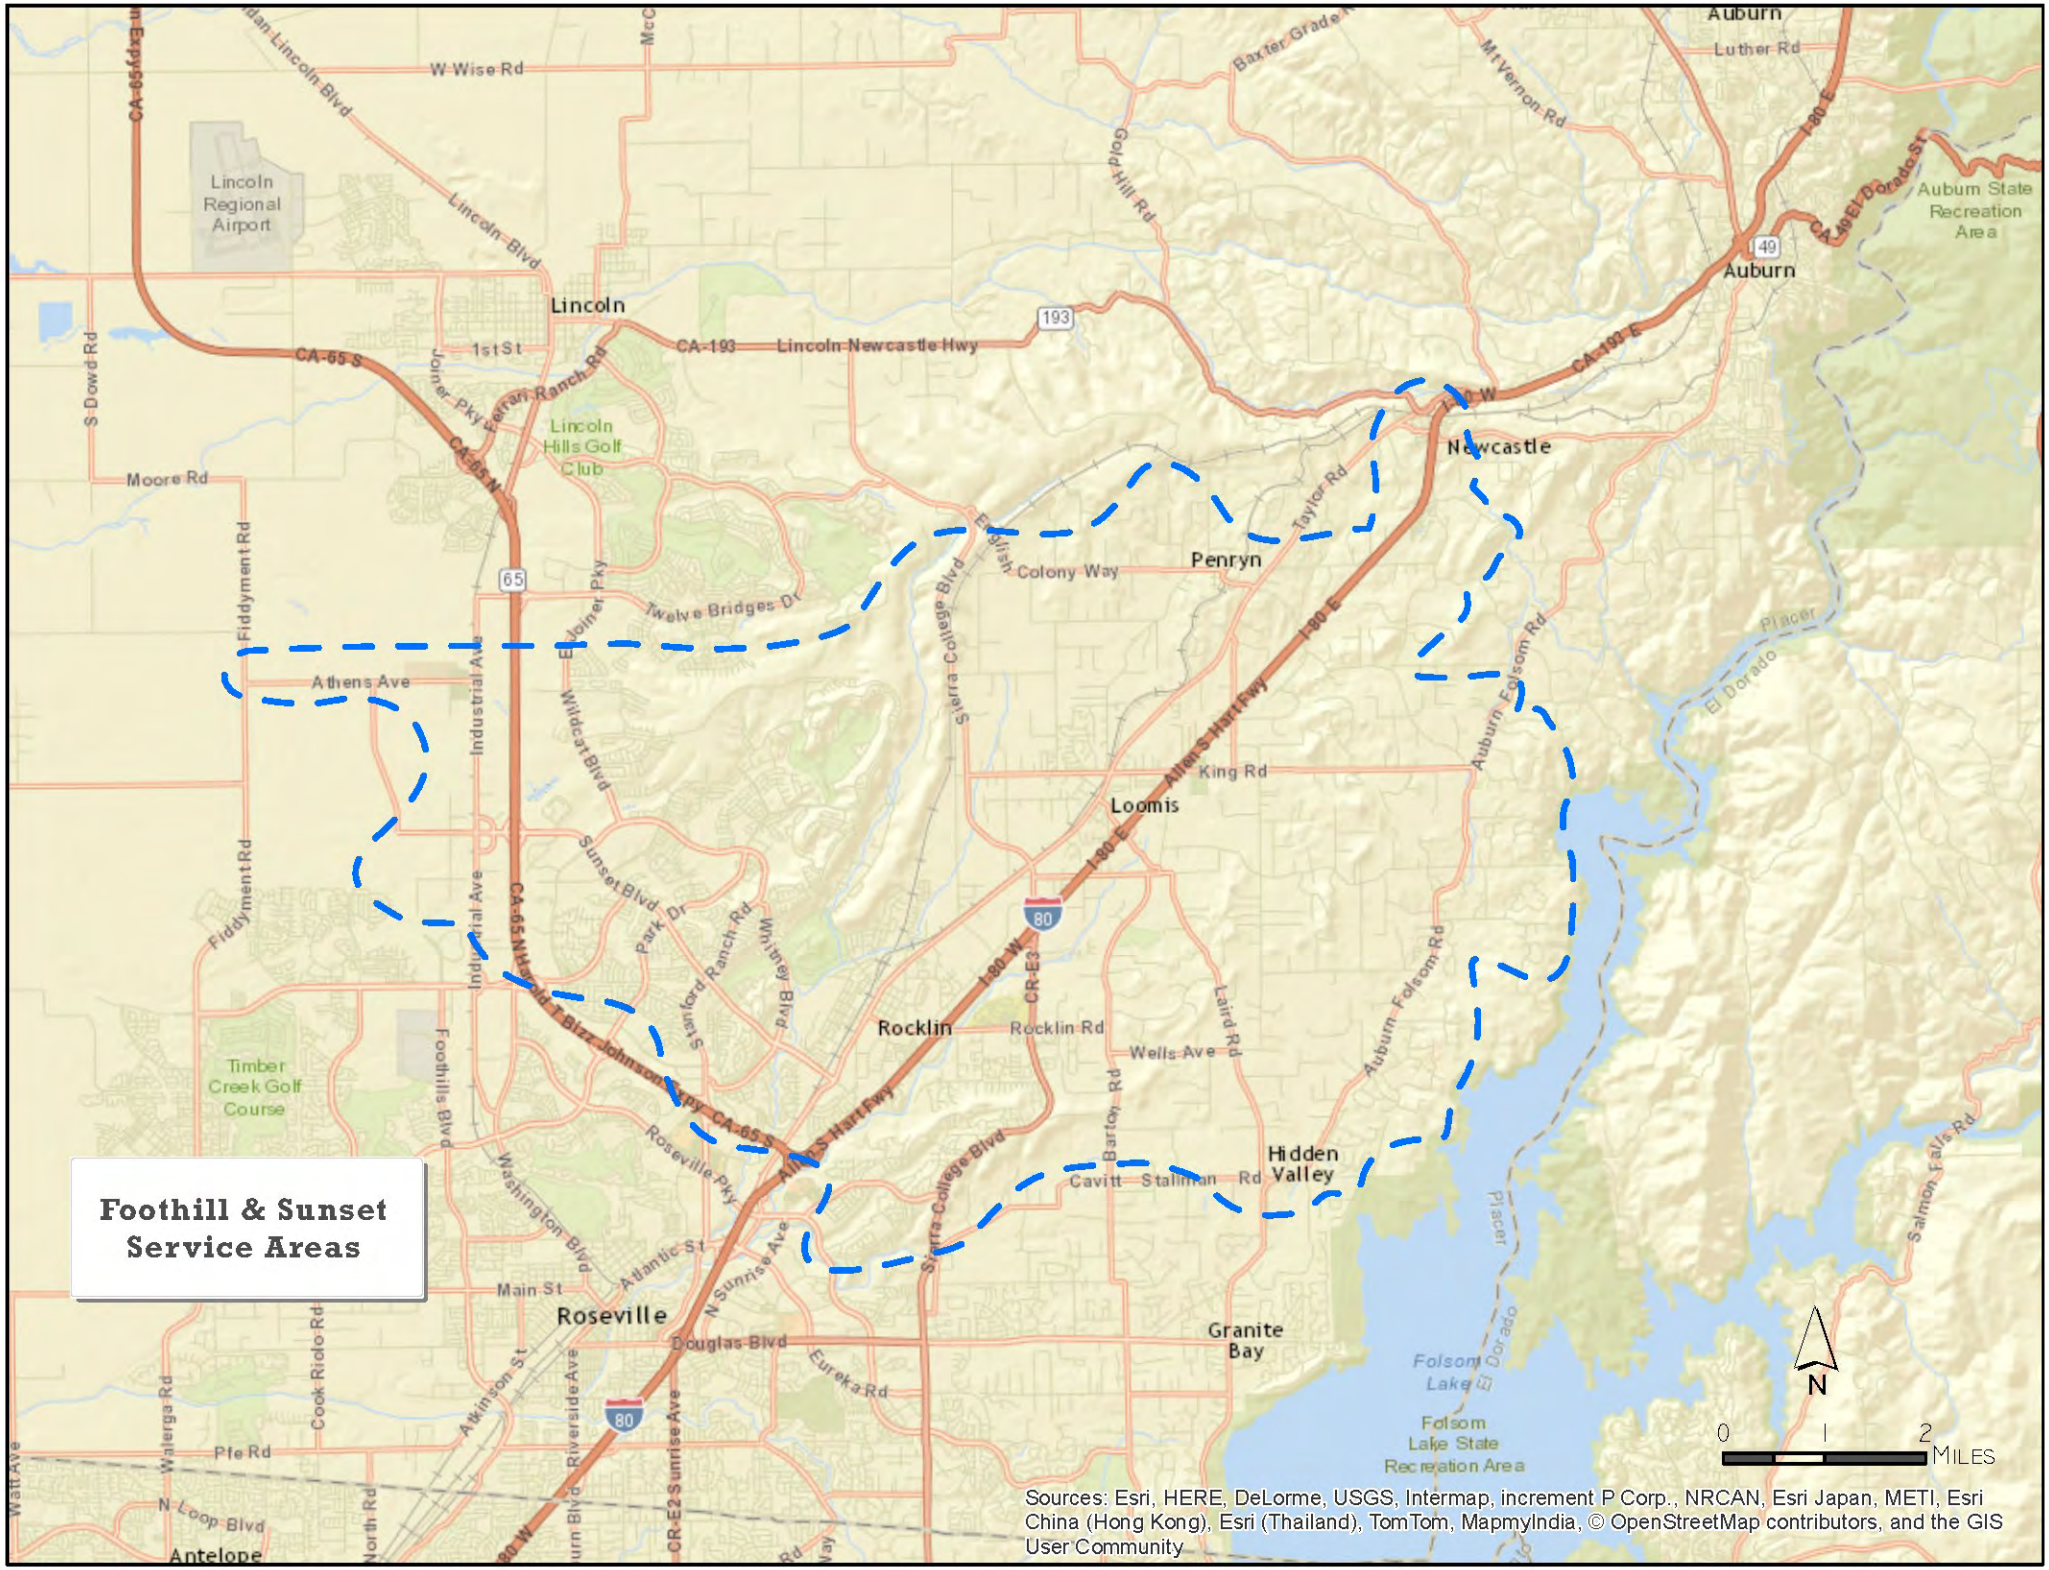
Placer County Water Agency is pleased to report this year - as we have each and every year since 1991 - that the drinking water supplied to you meets or exceeds state and federal public health standards for drinking water quality and safety. California water retailers, including PCWA, are required by law to inform customers about the quality of their drinking water. The results of PCWA's and monitoring programs of 2015 are reported in this If you have any ns about this report, please contact the PCWA Customer Services Center at (530) 823-4850 or (800) 464-0030.

Ensuring The Safety of Your Drinking Water

In order to ensure that tap water is safe to drink, the U.S. Environmental Prote Agency (USEPA) and the State Water Resources Controll Board (State Board) prescribe re ns which limit the amount of certain contaminants in water provided by public water systems. State Board regul ns also establish limits for contaminants in bo water that must provide the same prote n for public health.

About Your Drinking Water

Drinking water, including d water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More infor n about contaminants and pot al health ects can be obtained by calling the U.S. Environmental Protec n Agency's **Safe Drinking Water Hotline: 1-800-426-4791**



The Source of Your Water Supply

Your water originates in the Sierra snowpack. Surface water from the Yuba and Bear River watersheds and Lake Spaulding ws into the PG&E and PCWA delivery systems. This is supplemented with American River water. The water is treated at the water treatment plants listed in this report. PCWA has completed a Sanitary Survey and Source Water Assessment of the Yuba-Bear River watershed (2012) as well as for the American River watershed (2013). It was found the watersheds were vulnerable to contaminants from highways, roadways and railroads near rivers and canals, sep tanks, pipelines crossing canals, upstream re n, historic and mining o ons, o ns, and ber harvest. Contaminants associated with these a that could pose a threat to source water include but are not limited to sediment, bacteria, viruses, parasites, es, herbicides and trace metals. Historically, contaminant levels have been very low in the source water and watersheds. Full details of the Source Water Assessments may be seen at the Placer County Water Agency Business Center, 144 Ferguson Road, in Auburn.

Note about connection between PCWA and Roseville: During warm summer months, most customers in the area found at the link below receive City of Roseville water from about 6 a.m. to noon.

Foothill/Sunset Water Quality Results

Primary Drinking Water Standards

Turbidity Performance Standards (that must be met through the water treatment process)

Turbidity is a measurement of clarity or the level of suspended matter in the water. In reporting turbidity, the highest single measurement and the lowest monthly percentage of samples meeting the turbidity limits are specified.

Turbidity of th tered water must:

1. Be less than or equal to 0.3 NTU in 95% of measurements in a month.
2. Not exceed 1 NTU at a me.

	PCWA	Roseville
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1	**100%**	**100%**
Highest single turbidity measurement during the year	**0.18**	**0.06**
Number of violations of any surface water treatment requirements	**0**	**0**

DEFINITIONS: Understanding Your Water Quality Report

MCL: Maximum Contaminant Level. The highest level of a contaminant that is allowed in drinking water. Primary MCL's are set as close to the PHG's (or MCLG's) as is economically and technologically feasible. Secondary MCL's are set to protect the odor, taste and appearance of drinking water.

MCLG: Maximum Contaminant Level Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. Set by the U.S. Environmental Prot n Agency.

MRDL: Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that ad n of a disinfectant is necessary for control of microbial contaminants.

MRDLG: Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLG's do not ect the ben ts of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standard. MCL's and MRDL's for contaminants that health along with their monitoring and repor g requirements, and water treatment requirements.

PHG: Public Health Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. PHG's are set by the California Environmental Prot n Agency.

AL: Action Level. The concentr on of a contaminant, which if exceeded, triggers treatment or other requirements which a water system must follow.

NTU: Nephelometric Turbidity Units. A measure of the clarity of water. Turbidity is monitored because it is a good indicator of water quality. High turbidity can hinder t veness of disinfectants.

TT: Treatment Technique. A required process intended to reduce the level of a contaminant in drinking water.

pCi/L: picocuries per liter. A measure of ra on.

mg/L: milligrams per liter or parts per million (ppm)

ug/L: micrograms per liter or parts per billion (ppb)

uS/cm: MicroSiemens per centimeter

RAA: Running Annual Average

HRAA: Highest Running Annual Average

<: Less Than

ND: ND or Non-Detected: An analysis result below detectable levels.

NA: Non-Applicable

Environmental Influences on Drinking Water

The sources of drinking water (both tap and water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, ra material, and can pick up substances res from the presence of animals or from human ty. Contaminants that may be present in source water include:

• **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, sep systems, agricultural livestock o ons, and wildlife.

• **Inorganic contaminants**, such as salt and metals, which can be naturally-occurring or result from urban storm water industrial or domes c wastewater discharges, oil and gas pro , mining or farming.

• **Pesticides and herbicides**, that may come from a variety of sources such as agriculture, urban storm water and res s.

• **Organic chemical contaminants**, including synthe and vol organic chemicals, which are by-products of industrial processes and petroleum produc , and can also come from gas , urban storm water agricultural appli on and c systems.

• **Radioactive contaminants**, that can be naturally-occurring or be the result of oil and gas produ and mining

Statement on Lead

(none found in this system)

Infants, young children, and pregnant women are typically more vulnerable to lead in drinking water than the general pop on. It is possible that lead levels at your home may be higher than at other homes in the community as a result of the materials used in your home's plumbing. If your water faucet has not been used for several hours, you can minimize the for lead exposure by ushing the faucet for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about elevated lead levels in your home's water, you may wish to have your water tested. Addi informa is available from the USEPA Safe Drinking Water Hotline (1-800-426-4791) or at *http://www.epa.gov/safewater/lead*.

Note to At-Risk Water Users

Some people may be more vulnerable to contaminants in drinking water than the general pop on. Immune-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be ularly at risk from These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infec by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

What You Should Know About Cryptosporidium

Cryptosporidium is a microbial pathogen found in most surface waters throughout the U.S.. Although n removes Cryptosporidium, the most commonly used methods cannot guarantee 100 percent removal. We conducted a two-year study on Cryptosporidium during 2006 and 2007, and our monitoring indicated the presence of these organisms in our source water in ranges from non-detect to 0.2 organisms per liter. We are in the middle of another 2 years of monitoring, and so far all results are non-detect. Again, these results are from the untreated, raw water. The design of the EPA study conducted here did not call for treated water samples. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Inges of Cryptosporidium may cause an abdominal n. Symptoms of infe n include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immune-compromised people are at greater risk of developing life-threatening illness. We encourage immune-compromised individuals to consult their health care provider regarding appropriate prec ns to take to avoid n. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

2015 Testing Results

Measurements reported here were collected in 2015 (unless otherwise noted). In accordance with federal ns, data is from the most recent tests. We are allowed to monitor for some contaminants less than once per year because concentra of these contaminants do not change frequently.

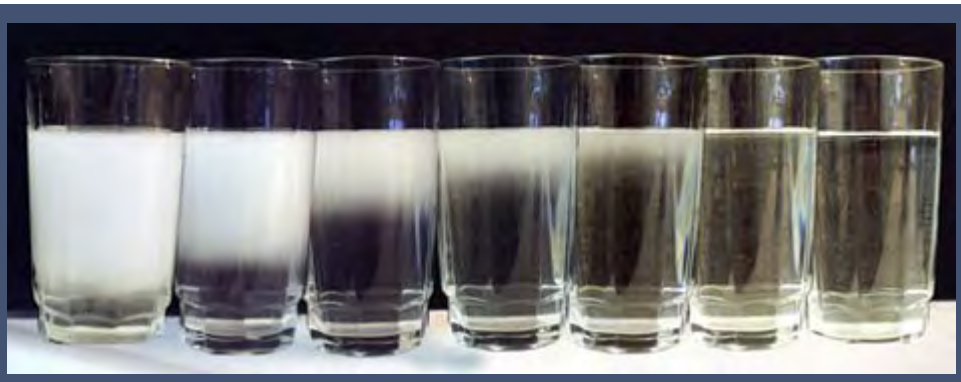
Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

Frequently Asked Questions About Water Quality

It is important for you to know that we take our customers' concerns very seriously. We feel that you wouldn't be calling if there weren't cause for concern, so we investigate every claim fully and in a timely manner before closing a case. Below are some answers to the most common questions or concerns. FOR INFORMATION about this report or to report any concerns with the quality of water in your home or a perceived risk to the quality of our water source, PCWA customers are invited to contact the PCWA Customer Service Center at (530) 823-4850 or (800) 464-0030.

Do we have hard water?

Most of the water served to you is less than 20 mg/L (milligrams per liter) PCWA water in general is on the low end of water. Roseville water, at 37 mg/L is l withing the range. General guidelines for class ca of waters are: 0 to 60 mg/L as calcium carbonate is class ed as 61 to 120 mg/L as moderately hard; 121 to 180 mg/L as hard; and more than 180 mg/L as very hard.



Is there Fluoride in my water?

PCWA does not date its water. Fluoride does exist naturally in a PCWA well which was run brie uring the year. There is a very small n of the City of Rocklin, which receives water from the City of Roseville during high demand in warm months only. In addi our Bianchi system receives Roseville water at all s. Roseville is required to oridate its water. To maps of these areas, you can go to: h p:// www.pcwa.net/water-resources/water-quality.html

My water smells like Chlorine!

Chlorine is required in the distr on system to keep bacteria from making it to your tap. We regulate our Chlorine dosage very strictly so that we have just enough without having too much. The maximum residual level for Chlorine is 4 mg/L (milligrams per liter), and a common level for our systems is between 0.5 and 1.5 mg/L. Some people are more sensi e to the smell of Chlorine in water. It is common for people to think that the level of the Chlorine must be too high under these circumstances; however, we've found that the most common reason for smelling Chlorine at your tap is when the Chlorine is diss ng or the level is dropping. The reason for this is that the water sits in your plumbing before you use it. Most likely, if you your taps out, the smell will disappear.

Why is my tap water milky or cloudy?

This is caused by air bubbles in the water. It is completely harmless. Cold water from snowmelt has the to hold lots of air. As the water warms a bit on its way to your tap, it has more to release that air. When you turn on your tap, the rapid red on in pressure causes the air to come out of so and creates the milky look you see. If this is the case, it will clear before your eyes as in the picture.

How do I know my water is safe?

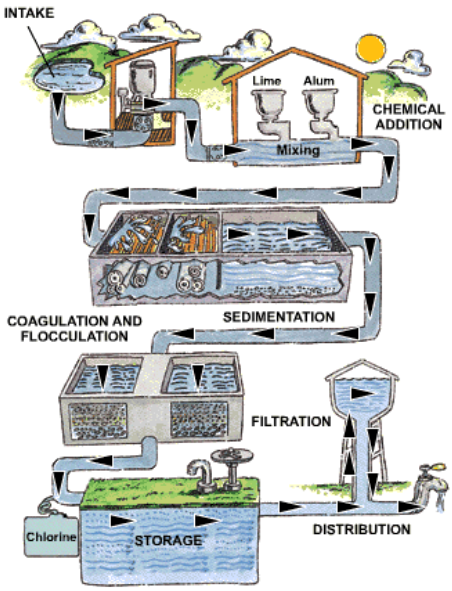
Distr operators and treatment plant operators d by the State Water Resources Control Board collect hundreds of bacteriological samples each year throughout the water distr n systems as well as performing thousands of individual tests in the treatment facili and in the distrib system, of which only the detected co ts are found in your annual Consumer nce Report. Field tests for things like temperature, turbidity, pH and chlorine residual help to let us know that our water is maintaining its quality throughout the distribu n system.

Frequently Asked Questions About Water Quality

Continued...

My water is dirty!

It is actually very common for people to experience discolored or "dirty" water at their tap. In most cases, we can trace this n to a ular aspect of the household plumbing. It is very common for a water heater to corrode or rust and cause discolored water in the hot water. You can test this by turning your tap to the full hot posi and observe whether the water is discolored. If the water is discolored in your hot water, but not cold, you can be reasonably certain the issue lies in your water heater. If the problem occurs in the cold water as well, and doesn't clear up running for a few minutes, we may need to the main line. If you get discolored water out of your cold water tap and it clears up a running for several minutes, the main line is likely clean and you may have a plumbing xture or an old galvanized line causing the problem.



Why are there pink or dark stains in my toilet or around my drains?

Airborne organisms are usually the cause. You will see grey, black, or some s pink my stains on surfaces that are regularly moist, including toilet bowls, shower heads, shower drains, sink drains, dishwashers, shower and bath s and walls. These organisms are not in the drinking water, but they moist areas of your house to thrive. The only way to control these organisms is to disinfect the surfaces regularly, and ven the area well.

How is my water treated?

Your water is treated by conve onal methods, zing , , sedim n, ltr and nally disinfec n. The facility or facili serving your area are operated by State Water Resources Control Board cer d operators. It may also be comfor for you to know that our facili have built-in fail-safes which will immediately shut the treatment process down and not allow any water to the system if something within the facility is not operated correctly. The operators receive alarms for immediate inter- ve so they can correct the problem and begin trea water again.

My water tastes like chemicals!

Another common call we get is that the water has a strong chemically taste all of a sudden. Most s, this can be traced to the either the Chlorine topic covered earlier, or to a hose bib being le on. This is most common during warm s of year when the hot sun beats down on a pressurized hose and creates backpressure. When you open a tap inside the house, you can be sure that high pressure hose water feeds right into your house, and it doesn't taste good. The best way to avoid this is to always shut your hose at the hose bib shut- valve, and depress- urize your hose. For this reason, it is not a good idea to have your hose bib set up as it is in the picture.

Subject: Seismic Refraction Survey
Costco Loomis Site
Sierra College Blvd and Brace Road
Loomis, California

Dear Mr. Williams:

1.0 INTRODUCTION

This letter presents the results of Advanced Geological Services, Inc. (AGS) seismic refraction survey in support of planned grading operations for the development of a Costco store at the corner of Sierra College Boulevard and Brace road in Loomis, California (Figure 1). The objective was to assess the depth and excavation characteristics (rippability) of bedrock. The survey was performed on January 27 and 31, 2017 by AGS senior geophysicist Roark W. Smith and his assistant. As directed by Kleinfelder, the survey consisted of six 230-foot long seismic lines arranged in three groups of two lines configured in an "+" or cross pattern.

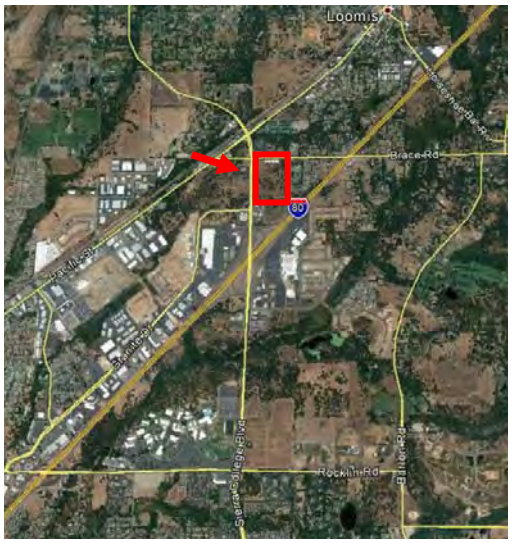

Figure 1- Site Location in Loomis CA

2.0 SUMMARY OF FINDINGS

The results of the seismic refraction survey are presented on Figures 2 through 6, which show the seismic line locations and profiles of subsurface velocity layering. In general, the refraction data indicate the presence of three velocity layers within the upper 40 feet of subsurface— Layer V_1 is the uppermost 2- to 10-foot thick low-velocity layer representing surficial soil and deeply-weathered bedrock. Layer V_2 is the middle, medium-velocity layer ranging from 5 to 27 feet in thickness that represents more compacted soil and weathered bedrock. Layer V_3 is the high-velocity basement layer ranging from 12 to 30 feet in depth that represents little-weathered bedrock.

Layer V_2 exhibits P-wave velocities ranging from 2,400 to 3,400 feet per second (fps), which indicates that the subsurface should be readily rippable through this layer to depths ranging from 12 to 30 feet; although, except for a small area, the entire site appears to be rippable to a depth of

at least 20 feet. Layer V_3 occurs at depths ranging from 12 to 30 feet below ground surface (bgs) and, exhibiting P-wave velocities in excess of 9,000 fps, is considered to be "non-rippable." The rippability assessment is made on the basis of the Caterpillar Performance Handbook "rip chart", which correlates seismic velocity and rippability.

3.0 SITE DESCRIPTION

The survey was performed within a roughly 800- by 1,000-foot undeveloped lot east of Sierra College Boulevard and south of Brace Road (Figure 2). At the time of the survey, the lot was largely an open, gently undulating grassy field with some trees, and standing water from a recent rainfall event was present in low-lying areas.

4.0 SEISMIC REFRACTION (SR) METHOD OVERVIEW

The seismic refraction method uses compressional (P-) wave energy to delineate seismic velocity layers within the subsurface. Interpretation entails correlating the velocity layers to geologic features such as soil and various types of bedrock. To perform a refraction survey, an elastic wave (compressional, or P-wave) is generated at certain locations (shotpoints) along a survey line. The P-wave energy is usually produced with a small explosion or by striking the ground with a sledgehammer. As the P-wave propagates through the ground it is refracted along boundaries between geologic layers with different seismic velocities.

Part of the refracted P-wave energy returns to the ground surface where it is detected by vibration-sensitive devices called geophones, which are placed in a co-linear array along the seismic survey line. The geophone data are fed to a seismograph, where they are recorded, and then to a computer, where they are analyzed to determine the depth and velocities of subsurface seismic layers. Key data for refraction analysis are the positions of the geophones and shotpoints along a seismic line, and the amount of time it takes for the refracted wave to travel from the shotpoint to each geophone location. Because the P-wave is the fastest traveling of all types of seismic waves, it can be readily identified as the first deflection ("first break") on a seismic trace.

Additional discussion of the refraction method, its limitations, and the relationship between seismic velocity and geologic materials is presented in Appendix A.

5.0 FIELD PROCEDURES

AGS obtained seismic refraction data along six lines as shown on an aerial image map that was emailed to AGS by Kleinfelder before the field work began. As shown on the map, the six lines were grouped into three sets of two perpendicular lines arranged in an "+" pattern; two pairs of lines were located in the northern half of the site and the third pair was located in southwest corner of the site.

Before beginning the seismic survey, AGS marked the line locations in the field using adjacent buildings and onsite trees for reference. Using a fiberglass tape measure, AGS then placed 24

geophones on the ground at 10-foot intervals to form a 230-foot long geophone array. The geophones were coupled to the ground by means of the 3-inch metal spikes attached to the geophone base. From five to seven shotpoints were used along each array, with shot points located 5 feet beyond each end geophone, at the midpoint of the geophone array, and at quarter-points along the array. Off-end shotpoints located 20 feet beyond the end geophones of the arrays were also used. AGS produced P-waves through multiple impacts with a 16-lb sledge hammer against a metal plate placed on the ground surface at each shotpoint location. Fifteen hammer blows were used ("stacked") at the off-end shotpoints, 10 blows were used for end shots, seven blows at the quarter shots, and five blows were used at the center shotpoint. The P-waves produced by the hammer impacts were detected using Mark Products 14-Hz high output geophones. The detected seismic signals were recorded using a DAQLink II seismic system connected to a laptop computer.

After the seismic data were obtained, AGS performed a hand-level survey to measure the relative elevation changes along the seismic line so the ground surface topography could be incorporated into the data analysis. After marking the shotpoint locations with florescent pink spray paint, AGS then picked up and moved the seismic gear to the next line and repeated the process until the survey was completed. After the seismic survey was completed AGS used a Trimble Pro-XR Global Positioning System (GPS) to record the seismic line locations. To help reference the seismic survey to the site AGS also GPS-mapped nearby survey lath marking test pit and control point locations.

6.0 DATA PROCESSING AND ANALYSIS

The seismic refraction data quality for this project was good and, for the most part, first break picks could be made with confidence. Data quality was enhanced by "stacking," which entailed using multiple hammer blows at each shotpoint location to improve the signal-to-noise ratio. The additive affect of stacking multiple hammer blows at the same location enhances or increases the amplitude of the signal (i.e., the refracted wave arrival) while amplitude of the background noise, which, being random in nature, tends to cancel itself on successive hammer blows and remains largely unchanged. Stacking was made necessary by the vibratory noise from the nearly constant vehicle traffic along the nearby Sierra College Boulevard. Kleinfelder's concurrent drilling activities also produced some noise but, for the most part, the drill crews silenced their equipment during seismic data acquisition.

Seismic data were transferred from the seismograph to a desktop computer where they were processed using the *SeisImager* software package by Geometrics, Inc. Briefly, *SeisImager* is a computer inversion program that generates an initial velocity layer model, produces synthetic data from the model, and then adjusts the model so that the synthetic data better matches the observed field data (i.e., the arrival times). The agreement between the synthetic and observed data provides an indication of how well the model represents the actual subsurface conditions.

First, AGS used the *SeisImager* module *PickWin* to interpret ("pick") the P-wave arrivals ("first breaks") for each of the shotpoint data sets ("shot gathers") per line. *PickWin* was also used to

check (against the geophysicist's field log) that the proper locations were assigned to the geophones and shotpoints. Next, the first break files were fed to the SeisImager module *PlotRefra*, which was used review time-distance (TD) plots for the seismic lines and assign a seismic layer to each arrival time. For the initial refraction analysis, each P-wave arrival is considered to have refracted from a distinct seismic layer. The number of layers resolved by the seismic survey, and their thickness and average velocity, is indicated by straight line segments on the TD plot; because these straight-line segments indicate a constant velocity condition within the subsurface, they tend to represent a distinct geologic layer. The topographic elevation files were incorporated into the analysis at this point. Next, a time-term inversion was performed to produce preliminary layered velocity models.

The layered velocity models were then used as starting models for the tomographic inversion process, which was used to assess lateral velocity variations along each seismic line. Briefly, tomographic inversion is a grid-based modeling process wherein the subsurface is divided into rectangular cells based on the geophone spacing. The tomography software assigns a velocity to each cell, produces a synthetic arrival-time data set based on seismic raypaths projected through the velocity grid, and then compares the synthetic data to the real data recorded in the field. The cell velocities are then adjusted and re-adjusted until the synthetic data achieve a "best fit" with the observed field data. Tomographic modeling is often used to complement layered modeling at sites where gradual velocity transitions, such as those often seen between weathered and unweathered bedrock, are expected. Tomographic modeling can also depict lateral velocity variations within the subsurface more accurately than a layered modeling approach.

7.0 RESULTS

The results of the seismic refraction survey are summarized on Table 1, below, and presented on Figures 2 through 5, which show the seismic line locations and models (profiles) of subsurface velocity layering that were calculated from the seismic refraction data. Figure 6 presents the tomographic models, which were prepared to assess localized velocity variations along the seismic lines.

In general, the refraction data indicate the presence of three velocity layers within the upper 40 feet of subsurface, which have been designated as V_1, V_2 and V_3. Layer V_1 is the uppermost 2- to 10-foot thick low-velocity layer representing surficial soil and deeply-weathered bedrock. Layer V_2 is the intermediate medium-velocity layer ranging from 5 to 27 feet in thickness representing compacted soil and/or weathered bedrock. Layer V_3 is the high-velocity basement layer ranging from 12 to 30 feet in depth that represents little-weathered bedrock.

Layer V_2 exhibits P-wave velocities ranging from 2,400 to 3,400 feet per second (fps), which indicates that the subsurface should be readily rippable through this layer to depths ranging from 12 to 30 feet; although, except for a small area (see Figure 2), the entire site appears to be rippable to a depth of at least 20 feet. Layer V_3 occurs at depths ranging from 12 to 30 feet below ground surface (bgs) and, exhibiting P-wave velocities in excess of 10,000 fps, is considered to be "non-rippable." It is worth noting that layer V_3 exhibits lower velocity along

lines SL-3 and SL-4 (in the northeast portion of the site), which may be caused by a natural geologic variation of bedrock properties across the site.

The rippability assessment is made on the basis of the Caterpillar Performance Handbook "rip chart", which correlates seismic velocity and rippability. The Handbook classifies granitic rock exhibiting a P-wave velocity less than 6,800 feet per second (fps) as "rippable" with a D9, while such rock exhibiting P-wave velocities between 6,800 and 8,000 fps is classified as "marginally rippable". Rock exhibiting P-wave velocities greater than 8,000 fps is classified as "non-rippable". Velocity information from the seismic survey is summarized in Table 1; rippability information is summarized in Table 2.

Table 1 Velocity Summary (feet per second) from Layer Models

Seismic Line	Layer V_1 (topsoil)	Layer V_2 (weathered bedrock)	Layer V_3 (little-weathered bedrock)	Approx depth to V_3 (feet)
SL-1	950	2,750	17,700	18 - 30
SL-2	1,000	2,400	13,900	12 - 20
SL-3	950	3,100	9,900	18 - 24
SL-4	1,050	3,250	10,600	18 - 21
SL-5	1,250	3,400	12,300	12 - 29
SL-6	1,100	3,400	12,600	19 - 25

The tomographic models (Figure 6) indicate that the boundary between layers V_1 (soil) and V_2 (weathered bedrock) is transitional in nature, while the boundary between layers V_2 (weathered bedrock) and V_3 (little-weathered bedrock) is more pronounced. A line showing the V_2 - V_3 boundary from the velocity layer models is shown on the tomographic models for reference. Localized lower-velocity zones in layer in V_3, indicative of more deeply-weathered bedrock, are evident along lines SL-1, SL-2, SL-5 and SL-6. These lower–velocity zones may be associated with more intense weathering along bedrock fractures.

8.0 EXCAVATION CHARACTERISTICS (RIPPABILITY)

Seismic velocity charts relating seismic velocity and excavation characteristics have been developed from field tests by others. These charts list the seismic velocity of various types of bedrock materials and their relative ease of excavation using different types of rippers. Caterpillar Tractor Company publishes a performance manual that lists ripper performance charts for various size tractors and types of rippers. The range of rippability obtained from the ripper performance chart from the Caterpillar Performance Handbook, 12th Edition (2000) is as follows (in feet per second):

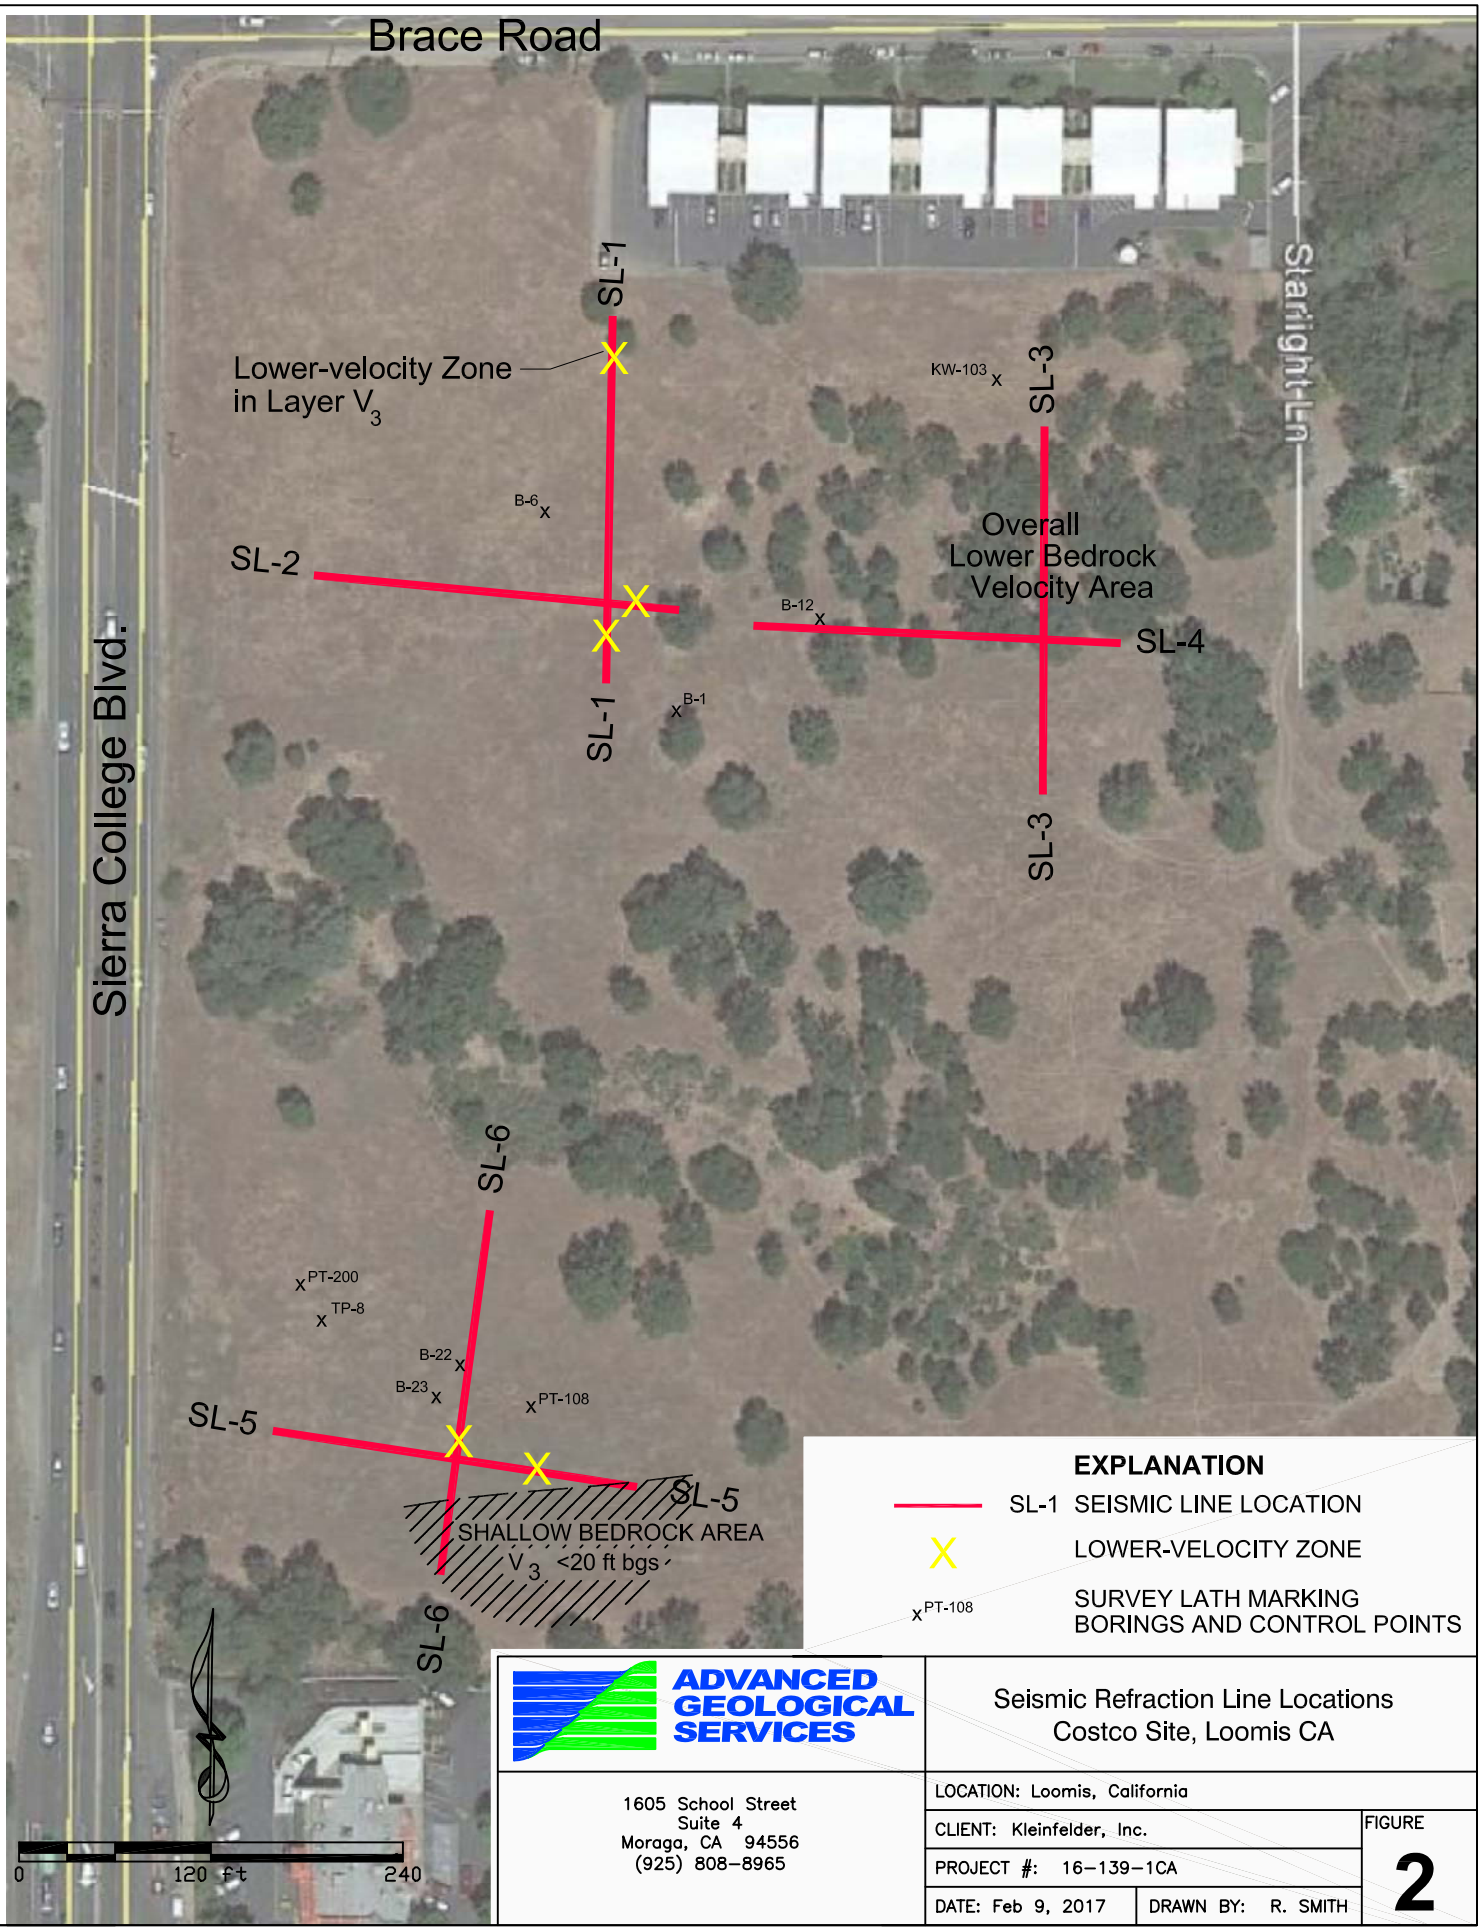
Table 2 Rip Chart for Granitic Rock (from Caterpillar Performance Handbook)

Ripper	Rippable	Marginally Rippable	Non-Rippable
D8R	less than 5,800	5,800 to 6,800	greater than 6,800
D9R	less than 6,800	6,800 to 8,000	greater than 8,000
D10R	less than 7,200	7,200 to 8,500	greater than 8,500

This information should only be used as a general guide, however, as many other factors should also be considered. These factors include the rock jointing and fracture patterns, the experience of the equipment operator, and the equipment and excavation methods selected. Based on the observed velocities, it appears that the bedrock beneath the seismic refraction lines is rippable for a D9R to a depth of at least 40 feet. However, this information should be combined with a complete and thorough analysis of geotechnical boring data, as well as local ripping experience (if available) to make a final assessment.

9.0 CLOSING

All geophysical data and field notes collected as a part of this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.



AGS appreciates working for you. We enjoyed this project and we look forward to working with you again.

Sincerely,

Roark W. Smith
Senior Geophysicist
Advanced Geological Services, Inc.

APPENDIX A

SEISMIC VELOCITY AND LIMITATIONS OF THE REFRACTION METHOD

The physical properties of earth materials (fill, sediment, rock) such as compaction, density, hardness, and induration dictate the corresponding seismic velocity of the material. Additionally, other factors such as bedding, fracturing, weathering, and saturation can also affect seismic velocity. In general, low velocities indicate loose soil, poorly compacted fill material, poorly to semi-consolidated sediments, deeply weathered, and highly fractured rock. Conversely, high velocities are indicative of competent rock or dense and highly compacted sediments and fill. The highest velocities are measured in unweathered and little fractured rock.

There are certain limitations associated with the seismic refraction method as applied for this investigation. These limitations are primarily based on assumptions that are made by the data analysis routine. The data analysis routine assumes that the velocities along the length of each spread are uniform. If there are localized zones within each layer where the velocities are higher or lower than indicated, the analysis routine will interpret these zones as changes in the surface topography of the underlying layer. A zone of higher velocity material would be interpreted as a low in the surface of the underlying layer. Zones of lower velocity material would be interpreted as a high in the underlying layer. The data analysis routine also assumes that the velocity of subsurface materials increase with depth. Therefore, if a layer exhibits velocities that are slower than those of the material above it, the slower layer will not be resolved. Also, a velocity layer may simply be too thin to be detected.

The quality of the field data is critical to the construction of an accurate depth and velocity profile. Strong, clear “first-break” information from refracted interfaces will make the data processing, analysis, and interpretation much more accurate and meaningful. Vibrational noise or poor subsurface conditions can decrease the ability to accurately locate and pick seismic waves from the interfaces.

Due to these and other limitations inherent to the seismic refraction method, resultant velocity cross-sections should be considered only as approximations of the subsurface conditions. The actual conditions may vary locally.

Appendix H Environmental Site Assessments

Phase I Environmental Site Assessment

Dear Mr. Okuma:

Enclosed is the Phase I Environmental Site Assessment (ESA) report for the above-referenced property. We trust the information presented in this report meets your needs at this time.

An executive summary is provided. However, we recommend that the report be read in its entirety for a comprehensive understanding of the items contained therein.

We appreciate the opportunity to provide these services to Costco Wholesale. If you have questions regarding this report or if we can be of further service, please do not hesitate to contact Paolo Dizon at 949.727.4466 or Andy Franks, Kleinfelder's Client Account Manager for Costco, at 480.650.4905.

Sincerely,

KLEINFELDER, INC.

1 EXECUTIVE SUMMARY

This report documents a Phase I Environmental Site Assessment (ESA) performed by Kleinfelder, Inc. (Kleinfelder) for Costco Wholesale Corporation (Costco / Client), of the proposed location of a Costco Wholesale Warehouse and Fuel Facility (collectively referred to as the "Site"). The Site is located at the southeast corner of Brace Road and Sierra College Boulevard in the Town of Loomis, Placer County, California (see Figure 1, Site Location Map). Kleinfelder understands the Client has requested a Phase I ESA be performed prior to purchasing and developing the Site.

This report was prepared using the ASTM International (ASTM, formerly known as the American Society for Testing and Materials) Designation E 1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the "Standard Practice"), the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law), and Costco's Development Requirements, Version 2014, revised June 13, 2014. The Phase I ESA findings include the following:

- The Site totals 17.2 acres and is vacant land, located at the southeast corner of the intersection of Brace Road and Sierra College Boulevard. The Site is designated by Placer County Assessor Parcel Numbers (APNs) 045-042-034-000, 045-042-035-000, 045-042-036-000, and a portion of 045-042-037-000. APN 045-042-034-000 is the largest of the four parcels, and consists of 6.90 acres.
- Most of the Site was historically developed as orchards from at least 1938 until sometime between 1954 and 1966. Dirt roads were present at the Site as early as 1938. A structure associated with a residential building located off-Site to the north was present on the northern Site boundary in 1938. A second structure (unknown purpose) was present in the center of the Site from at least 1938 until prior to 1952, and a third structure (unknown purpose) was present on the eastern side of the Site between 1966 and 2009. A well and a pole-mounted transformer were located on the eastern side of the Site adjoining the remains of the former eastern structure. Although the use of the structures is not known, the potential exists that they may have been associated with agricultural operations and storage of equipment and/or chemicals.
- A rectangular feature was visible in aerial photographs near the south end of a dirt road (Starlight Lane), extending in an east-west direction toward the eastern Site boundary from at least 1966 through 1993. A small structure was observed in the area between the road and the feature. It is not clear what this feature is, but an area of disturbed ground was noted in the general vicinity during the Site reconnaissance.

Copyright 2017 Kleinfelder

- A gate was observed in the fencing that marked the boundary of the Site and the residences to the east, at the southeastern portion of the Site. Piles of wood, wooden pallets, fencing, dirt, brush and other debris were observed adjacent to the gate on Site. This location appears to be used as a storage/disposal area by the adjoining resident. Hazardous materials were not observed in the debris pile.
- A gasoline station with underground storage tanks (USTs) has operated since approximately 1999 on the adjacent property south of the Site. The gasoline station property is believed to be hydrogeologically cross-gradient to potentially up-gradient relative to the Site. Groundwater in the vicinity has been reported at depths as shallow as 2 feet below ground surface (bgs). No releases at the gasoline station have been reported.

In summary, the following RECs were noted for the Site:

- The former orchard use of the Site, and associated structures that may been used for storage of equipment and/or chemicals. Orchards typically utilize smudge pots which use petroleum hydrocarbons to reduce the potential for freezing, and also may have been routinely treated with pesticides (such as lead arsenate) and other chemicals, which may remain in the Site soils. Also, according to Placer County Environmental Health, lead and arsenic are contaminants commonly found at former orchards in Placer County.
- The gasoline station adjoining the Site, which has operated for approximately 18 years. Although no releases have been reported at the gasoline station, its operation for almost two decades increases the likelihood that undetected spills or leakage have occurred during operations, resulting in impacts to the shallow groundwater. Based on the gasoline station's potentially up-gradient location relative to the Site, impacted groundwater beneath the gasoline station may make its way towards and beneath the Site.

Although not a REC, in Kleinfelder's opinion, the location of the former rectangular feature of unknown use at the east central portion of the Site warrants further investigation.

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment:

- Shallow soils across the Site may have been impacted with residual pesticides and petroleum hydrocarbons from historical orchard operations. However, in order to confirm this conclusion and further define Costco's risk, it would be necessary to perform sampling and analysis of the surficial soils.
- Based on proximity of the adjoining service station, conducting baseline subsurface sampling is recommended at the location of the proposed Costco fueling facility.

Copyright 2017 Kleinfelder

- Based on the unknown use of the former rectangular feature observed in the aerial photographs, Costco should sample soils at this location to assess for contaminants in the subsurface.
- Debris and stored material along the eastern portion of the Site should be removed prior to construction.
- Prior to Site development, the domestic groundwater well located on the eastern side of the Site should be properly abandoned per state and county standards.

In addition to these conditions, deviations from the Phase I ESA Standard (if any) are discussed in Section 8 of this report. This report is subject to the limitations in Section 2.5.

Copyright 2017 Kleinfelder

2 INTRODUCTION

This report is a summary of work performed using the guidelines set forth in the Standard Practice, and as set forth in Costco's Development Requirements, Version 2014, revised June 13, 2014. This report also generally conforms to the Standard Practice's suggested table of contents. Minor format modifications have been made to the Standard Practice's suggested table of contents to assist in better reading and understanding the report findings.

2.1 PURPOSE

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the scope of services defined in our Proposal Number (No.) MPCOSTCO.001C/IRV16P45931, dated August 29, 2016, the scope defined in the Standard Practice, and limitations discussed in this report, RECs Standard Practice and limitations discussed in this report, RECs and other environmental issues related to the Site.

As defined in the Standard Practice, an REC is:

> *"The presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."*

As defined in the Standard Practice, a de minimis condition is:

> *"A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."*

The 2013 Standard Practice also introduced the designation of CREC. As defined in the Standard Practice, a CREC is:

> *"… a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)."*

Copyright 2017 Kleinfelder

The 2013 Standard Practice defines a historical REC (HREC) as:

> *"…a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to environmental controls."*

The final decision regarding whether a past release is an HREC rests with the environmental professional (EP), and will be influenced by the current impact (if any) of the past release to the Site.

This report describes Kleinfelder's assessment methodology and documents its findings, subject to the limitations presented in Section 2.5 of this report.

2.2 DETAILED SCOPE OF SERVICES

The following sections describe Kleinfelder's work scope:

- Section 2, **Introduction**, includes a discussion of the purpose/reason for performing the Phase I ESA, additional services requested by the Client (e.g., an evaluation of business environmental risk factors associated with the Site), significant assumptions (e.g., property boundaries if not marked in the field), limitations, exceptions, special terms and conditions (e.g., contractual), and user reliance parameters.
- Section 3, **Site Description**, is a compilation of information concerning the Site location, legal description (if provided by the Client), current and proposed use of the Site, a description of structures and improvements on the Site at the time of Kleinfelder's assessment, and adjoining property use.
- Section 4, **Records Review**, is a compilation of Kleinfelder's review of several databases available from Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the Site; and for off-Site facilities within the search distances specified by the Standard Practice. Records provided by the Client are summarized, and copies of relevant documents are included in the appendices of this report. Physical setting sources (including topography and soil and groundwater conditions) and typical Client-provided information (e.g., title records, environmental liens, specialized knowledge, valuation reduction for environmental issues, and owner, property manager, and occupant information) are also summarized. Other interviews with people knowledgeable about the Site (including the Client) are included in Section 7.

Copyright 2017 Kleinfelder

- Section 5, **History of the Site**, summarizes the history of the Site and adjoining properties. This Site history is based on various sources, which may include a review of historical aerial photographs, Sanborn Fire Insurance Maps, city or suburban directories, historical topographic maps, building department records, and results of previous Site assessments (if any and reasonably ascertainable).
- Section 6, **Site Reconnaissance**, describes Kleinfelder's observations during the Site reconnaissance. The methodology used and limiting conditions are also described.
- Section 7, **Interviews**, is a summary of telephone and personal interviews performed with "Key Site Managers" that may include the Site owner/manager, occupants/tenants, local government officials, and the Client. Additional interview sources may be contacted if Key Site Managers were not available prior to production of this report, and may include adjoining landowners and people with historical knowledge of the area.
- Section 8, **Evaluation**, is a presentation of findings and opinions regarding the information provided in Sections 3 through 7, and presents the conclusions regarding the presence of RECs connected with the Site, and Kleinfelder's recommendations.
- Section 9, **References**, is a summary listing of the resources used to compile this report.

A statement of qualifications of the signatories of this report is provided in Appendix A of this report, and pertinent documentation regarding the Property is included in Appendices B through E.

2.3 ADDITIONAL SERVICES

Kleinfelder's scope of services did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources; and environmental regulatory compliance that may be required for a Phase I ESA pursuant to Costco's Development Requirements publication (revised June 13, 2014). In addition, the Phase I ESA did not include an assessment for asbestos containing materials (ACMs), radon, lead-based paint (LBP), lead in drinking water, molds and mildews, indoor air quality, industrial hygiene, health and safety, wetlands, and other Standard Practice non-scope considerations not described herein. At the request of the Client, a wetlands survey was not included as part of the scope of services for this Phase I ESA.

The Phase I ESA included an evaluation of threatened, endangered, and other protected species that are required for a Phase I ESA pursuant to Costco's Development Requirements (Appendix E). No other additional services were provided by Kleinfelder for this Phase I ESA.

Copyright 2017 Kleinfelder

2.4 SIGNIFICANT ASSUMPTIONS

Kleinfelder does not guarantee the accuracy of information supplied by its sources, but reserves the right to rely on the information in forming a professional opinion regarding the potential for contamination at the Site. It is assumed the Client provided Kleinfelder all applicable and available environmental records and specialized knowledge in its possession regarding the Site. Kleinfelder has not made other significant assumptions during the performance of this Phase I ESA.

2.5 LIMITATIONS AND EXCEPTIONS

Phase I ESAs are non-comprehensive by nature and may not identify all environmental problems, and will not eliminate all risk. This report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of its clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help the Client understand and better manage risks. Since such detailed services involve greater expense, Kleinfelder asks its clients to participate in identifying the level of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

Kleinfelder performed this Phase I ESA consistent with the guidelines set forth in the Standard Practice; Costco's Development Requirements, Version 2014 (revised June 13, 2014); and the proposed scope of services subsequently approved by Costco. No other warranty, either express or implied, is made. Environmental issues not specifically addressed in this report were beyond the scope of Kleinfelder's services and not included in the evaluation.

This report may be used only by Costco and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land or facility use, on- and off-Site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Since Site activities and regulations beyond Kleinfelder's control may change at any time after the completion of this report, the observations, findings, and opinions provided herein are considered valid only as of the date of the Site visit. Pursuant to Section 4.6 of the Standard Practice, this report should not be relied upon after 180 days from the date of its oldest component. The Phase I ESA has been conducted in accordance with and conforms to the Costco Wholesale Development Requirements Document and the latest edition of ASTM E 1527. This assessment has been prepared for the sole use of Costco Wholesale Corporation. Its contents should not be used or relied upon by other parties without the express written consent of Costco and Kleinfelder. Based on the intended use of the report,

Copyright 2017 Kleinfelder

Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the Client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, but only to the extent of any such non-compliance by the Client.

2.6 SPECIAL TERMS AND CONDITIONS

No special terms and conditions were agreed to by the Client and Kleinfelder.

Copyright 2017 Kleinfelder

3 SITE DESCRIPTION

The Site description is presented in this section and describes the condition of the Site at the time of the Phase I ESA. The Site location is shown on Figure 1. Tables 3-1 through 3-4 summarize the physical characteristics of the Site and adjoining properties.

3.1 LOCATION AND LEGAL DESCRIPTION

The information presented in Table 3-1 denotes the physical location and legal description of the Site. This information was obtained from review of various maps (such as topographic maps and tax assessor maps), aerial photographs, public records at City and/or County offices, interviews, and/or information provided by the Client.

TABLE 3-1
Location and Legal Description

PARAMETER	INFORMATION/COMMENTS
LOCATION	The Site is located at the southeast corner of the intersection of Brace Road and Sierra College Boulevard in the Town of Loomis, Placer County, California (see Figure 1 – Site Location Map and Figure 2 – Site Vicinity Aerial Photograph).
LEGAL DESCRIPTION	The legal description of the Site is presented in the Environmental Data Resources, Inc. (EDR), EDR Environmental Lien and AUL Search report (EDR, 2016a) provided in Appendix C.
ASSESSOR'S PARCEL NUMBER / ADDRESSES	The following APNs are associated with the Site: 045-042-034-000 (No street address) 045-042-035-000 (No street address) 045-042-037-000 (No street address) A portion of 045-042-036-000 (No street address)
SECTION, TOWNSHIP, AND RANGE	Township 11 North, Range 7 East, Section 16, Mount Diablo Base Meridian.

3.2 CURRENT / PROPOSED USE OF THE PROPERTY

At the time of Kleinfelder's assessment, the Site was vacant. Current and proposed Site uses are described in Table 3-2.

TABLE 3-2
Current and Proposed Uses

PARAMETER	GENERAL OBSERVATIONS
CURRENT USE	Vacant
PROPOSED USE	Costco Wholesale Warehouse and Fuel Facility

Copyright 2017 Kleinfelder

3.3 DESCRIPTION OF STRUCTURES / IMPROVEMENTS

Structures and/or improvements observed on the Site at the time of Kleinfelder's reconnaissance are described in Table 3-3.

TABLE 3-3
Structures and Improvements

PARAMETER	GENERAL OBSERVATIONS
STRUCTURES	No structures are located on the Site.
IMPROVEMENTS	One domestic well and a pole-mounted transformer were observed in the eastern portion of the Site. Storm drains were observed near the boundaries of the Site.

3.4 CURRENT USES OF ADJOINING PROPERTIES

Kleinfelder performed a brief drive-by survey of the properties immediately adjoining to the Site on September 19 2016. A summary of the observations regarding the surrounding properties is presented in Table 3-4 and shown on Figure 2, Site Vicinity Aerial Photograph.

TABLE 3-4
Adjoining Properties

DIRECTION	LAND USE DESCRIPTION
NORTH	Residential area and Brace Road, beyond which is a retail lumber yard and a residential area.
EAST	Residential area.
SOUTH; SOUTHWEST	Vacant land, Chevron Station and McDonald's restaurant.
WEST	Sierra College Boulevard, beyond which are an office building and vacant land.

Hazardous materials and petroleum products were not observed to be stored on the properties adjoining to the Site, other than petroleum products associated with the adjoining gasoline service station. No other indications of obvious or suspect RECs were apparent on the adjoining properties at the time of Kleinfelder's Site reconnaissance.

Copyright 2017 Kleinfelder

4 RECORDS REVIEW

4.1 STANDARD ENVIRONMENTAL RECORD SOURCES

The purpose of the records review is to obtain and review records that would help to evaluate RECs in connection with the Site and bordering properties. Federal, State, and local regulatory agencies publish databases or "lists" of businesses and properties that handle hazardous materials or hazardous waste, or are the known location of a release of hazardous substances to soil and/or groundwater. These databases are available for review and/or purchase at the regulatory agencies, or the information may be obtained through a commercial database service. Kleinfelder contracted a commercial database service, EDR, of Shelton, Connecticut, to perform the government database search for listings within the appropriate Standard Practice minimum search distance of the Site, and the distances set forth in Costco's Development Requirements, Version 2014, revised June 13, 2014. Kleinfelder provided EDR with a Site map to incorporate the search distances from the Site boundary. Included in the EDR Radius Map™ Report with GeoCheck® (EDR, 2016b) is a listing of specific databases outlined by the Standard Practice. A listing of the search distances, databases evaluated, dates the databases were last updated, and types of information contained in each database are included in the regulatory database search report provided in Appendix B of this report.

EDR utilizes a geographical information system to plot the locations of reported spills, leaks, incidents, etc. Kleinfelder reviews this information to help establish if the Site or nearby properties are listed in the databases and lists. Each of the listings was reviewed by Kleinfelder to assess whether the corresponding property details included in EDR's report revealed a potential environmental impact to the Site. Many listings in the report were concluded not to have the potential to impact the Site based on the following, or a combination thereof:

- The listed property is located at a distance where the facility is unlikely to impact the Site based on Kleinfelder's evaluation of the relevant data in EDR's report and knowledge of the Site vicinity.
- The listed property is located in a down-gradient or cross-gradient direction from the Site, based on the anticipated direction of groundwater flow at the property being evaluated, and is located at a distance such that it is unlikely to impact the Site. Note that the groundwater flow direction is estimated to be predominantly to the northwest based on review of available information (although it has been reported to the north in nearby

Copyright 2017 Kleinfelder

facilities), and judgements as to down- or cross-gradient direction are best made if groundwater flow direction information is available for a specific property.

- The listed property is identified in the underground storage tank (UST) or Small Quantity Generator (SQG) databases and does not immediately adjoin the Site. The property is furthermore not listed in other databases that report a release of a hazardous substance or petroleum product and/or is not listed as having environmental violations. The listing of a facility in these databases alone is not indicative of an unauthorized release.
- The listing for the facility suggested a short-term release occurred (e.g., from incidental traffic accidents or involving limited quantities of chemicals from illegal drug labs found at residences), with associated response actions completed.
- The quantity of the hazardous substances or petroleum product released from an off-Site, non-adjoining facility was not judged to have resulted in contamination above the most stringent criteria requiring regulatory action. Therefore, no impact to the Site is anticipated.
- The listed property record indicates that the property was characterized, the reported release affected soil only, the listed property was not on or adjacent to the Site, and the release was not recognized as indicative of area-wide conditions or was characterized as a soil removal action only.
- The listed property record indicates that contamination on the property is limited to relatively non-mobile contaminants, including polyaromatic hydrocarbons (PAHs) and metals, in soil only, on a non-adjacent property.
- The listed property record indicates that the case for the property has been closed to the satisfaction of the designated lead regulatory agency, and residual contamination, if present, is not considered likely to affect the Site based on one or more of the criteria mentioned in the bulleted items above (a condition referred to by the Standard Practice as an HREC).

Based on these criteria indicating no material threat of a release that affected the Site and/or no release that could require future regulatory agency oversight, the listings concluded not to have the potential to impact the Site were not evaluated further and are not discussed in the following sections.

4.2 RESULTS OF DATABASE SEARCH

The remaining property listings were reviewed to assess whether these properties had environmental releases that may have resulted in RECs in relation to the Site. If the listed

Copyright 2017 Kleinfelder

properties had a reported release which may have resulted in an REC, the property was further assessed by performing a review of agency files available via the GeoTracker™ website (http://geotracker.waterboards.ca.gov/) of the State Water Resources Control Board (SWRCB) and/or other relevant regulatory agency websites to evaluate whether the listed release represents a potential impact to the Site.

4.2.1 Site Listings

The Site was not listed in databases searched by EDR.

4.2.2 Off-Site Listings

Certain off-Site properties were listed in standard Federal, State, and local lists within the Standard Practice search distances and the distances set forth in Costco's Development Requirements, Version 2014, revised June 13, 2014. Kleinfelder reviewed the listing information to assess the potential for impacts to soil, soil vapor, and groundwater beneath the Site. One off-Site property was found within the search distances and in an estimated hydrogeologically up-gradient direction to the Site which appears to have the potential to impact the Site.

One off-Site property listed is adjacent to the Site to the south (cross-gradient to potentially upgradient). This property is addressed as 4211 Sierra College Boulevard, and has been listed as a Chevron gasoline station since at least 1999. Identified in the EDR report as Chevron Station No 2, Chevron USA-Sierra, and Chevron-Rocklin, the facility is listed in the following databases: Resource Conservation and Recovery Act Small Quantity Generator (RCRA-SQG), Facility Index System/Facility Registry System (FINDS), Hazardous Waste Facility and Manifest Data (HAZNET), Enforcement & Compliance History Information (ECHO), Emissions Inventory Data (EMI), Placer County Master List of Facilities (CA PLACER CO. MS), UST, and EDR's Exclusive Historic Gas Stations (Hist Auto). Based on current aerial photographs, this property appears to have three USTs. No releases are indicated in the database report. These listings alone are not indicative of a REC to the Site.

4.2.3 Orphan List

Facilities not plotted by EDR due to poor or inadequate address information are referred to as orphan sites. Five unmapped orphan sites are listed in the EDR report. The orphan summary/unmapped site report was reviewed to assess the potential for listed facilities to pose a REC to the Site. Based on our review, these listings were assessed not to pose an environmental concern to the Site.

Copyright 2017 Kleinfelder

4.3 OTHER RECORDS REVIEWED / AGENCIES CONTACTED

The following additional sources of environmental records were reviewed during this Phase I ESA for the purposes of meeting the Standard Practice. Local regulatory agencies were contacted for reasonably ascertainable and practically reviewable documentation regarding RECs present at the Site and adjoining facilities. Summaries of interviews with local regulatory agency representatives, when performed, are included in Section 7 of this report (with interview documentation included in Appendix C). The following agencies (if marked with an "X") were contacted for documentation:

- ☒ Placer County Environmental Health Department (EHD)
- ☒ Placer County Recorder-Clerk
- ☒ Loomis Fire Prevention District
- ☒ Town of Loomis Building Department
- ☒ Placer County Community Development, Building and Planning Services Divisions
- ☒ State Water Resources Control Board (SWRCB) / GeoTracker™ Database
- ☒ Pipeline and Hazardous Materials Safety Administration (PHMSA), National Pipeline Mapping System (NPMS)
- ☒ State Department of Toxic Substances Control (DTSC) / EnviroStor Database
- ☒ Placer County Air Pollution Control District (PCAPCD)

Information obtained from these agencies is summarized below.

4.3.1 Placer County Environmental Health Department

Kleinfelder searched the Placer County Electronic Document Center on September 8, 2016 for Environmental Health Department documents recorded under the parcel numbers associated with the Site, and for the parcel associated with the adjacent Chevron gasoline station located south of the Site at address 4211 Sierra College Boulevard. Kleinfelder also submitted a written request to the EHD on September 8, 2016 for information pertaining to hazardous materials usage and storage, including AST and UST records, for the parcel numbers associated with the Site. A response from the EHD was received on September 9, 2016, which confirmed that the documents available in the Electronic Document Center were the only files available for the Site. A summary of the available files is provided as follows:

- Documentation of an email conversation and records search for the Site parcels conducted in 2009. The conversation began with a query to the Environmental Health Department, in which someone recalled that in 1990 or 1991 the parcels were determined to be underlain by three contaminated groundwater aquifers. At the time of the query, the

Copyright 2017 Kleinfelder

Town of Loomis was considering the parcels as a potential location for affordable housing. Environmental Health reviewed the files for the parcels and found no records related to groundwater contamination. EHD noted that three former USTs were located south of the parcels and were closed by the Central Valley Regional Water Quality Control Board as low risk sites. These appear to be related to a former Chevron station that was previously located at 4365 Sierra College Boulevard, approximately 750 feet south of the Site (EDR, 2016b).

- An Environmental Review Application was submitted in April 1989 by Sunrise Marketing Group and Frontier Land Development Company for proposed development and rezoning of the Site.

Copies of the EHD files are included in Appendix C.

4.3.2 Placer County Recorder-Clerk

Kleinfelder reviewed files for the Site at the Placer County Recorder-Clerk's office, on September 19, 2016. The following documents were available:

- An easement recorded August 11, 1987 between Donald Tanklage and Loomis Town for ditch digging. The location was described as the northwest quarter of Section 16, Township 11 North, Range 7 East, which encompasses the Site.
- A grant deed was recorded February 25, 1994 from Rob Douglas to Carole and Don Tanklage for APNs 045-042-036 and -037.
- A survey map was recorded May 2, 1994 for Donald Tanklage for property described as Township 11 North, Range 07 East, Section 16, which encompasses the Site.
- A quit claim deed was recorded from Donald Tanklage and Carole Tanklage (individuals) to the Donald Tanklage and Carole Tanklage Foundation. The property was described as Lots 25 and 26 of the Himes Tract, at the intersection of Himes and Brace Roads, and included the Site.

4.3.3 Loomis Fire Prevention District

Kleinfelder contacted the Loomis Fire Prevention District on September 8, 2016 for documents recorded under the parcel numbers associated with the Site. The District responded on September 13, 2016 with the information that they do not have records for properties without structures.

Copyright 2017 Kleinfelder

4.3.4 Town of Loomis Building Department

Kleinfelder submitted a request via email to the Town Building Inspector on September 8, 2016 regarding available records of improvements for the parcel numbers associated with the Site. On September 13, 2016, the Town Building Inspector responded there are no building files for the parcel numbers associated with the Site.

4.3.5 Placer County Community Development, Building and Planning Services Divisions

Kleinfelder searched the Placer County Electronic Document Center on September 8, 2016 for Building Services Division and Planning Services Division documents recorded under the parcel numbers associated with the Site. No documents were found. A request for records was also submitted to the Building Services and Planning Services Division on September 10, 2016. Responses were received from both Divisions on September 12, 2016, which stated that the Site is under the jurisdiction of the Town instead of the County.

4.3.6 State Water Resources Control Board / GeoTracker™ Database

Kleinfelder reviewed the SWRCB GeoTracker™ website (http://geotracker.waterboards.ca.gov/) on September 8, 2016 for information associated with releases of hazardous materials or substances at the Site. No listings were reported to be associated with the Site. Four off-Site listings were found within approximately one-quarter mile of the Site.

A closed leaking UST (LUST) case was listed for the 7-Eleven Store, located approximately 450 feet south of the Site at 4281 Sierra College Boulevard. Groundwater beneath this facility was impacted with gasoline constituents. Based on information from groundwater monitoring conducted during Third Quarter 2007, groundwater was encountered at depths of 5 to 8 feet below ground surface (bgs) and flowed to the northwest (SECOR International Incorporated [SECOR], 2007). Gasoline constituents were not detected in nearest wells to the Site (MW-6 and MW-7). The 7-Eleven facility was granted No Further Action by the California Regional Water Quality Control Board – Central Valley Region (CVRWQCB) in June 2008, and is not considered a REC likely to affect soil, soil vapor or groundwater beneath the Site.

A closed LUST case was listed for Shamrock Pump & Equipment, located approximately 700 feet northwest of the Site. Groundwater beneath this facility was impacted with gasoline and fuel constituents. Based on the most recent groundwater monitoring event performed in October 2001 for this facility, groundwater was encountered at approximately two to seven feet below ground surface, and groundwater flow direction was reported to have fluctuated from southeast to northwest (CVRWQCB, 2002). The nearest domestic groundwater well was sampled, with

Copyright 2017 Kleinfelder

analytical results below laboratory detection limits. No Further Action was granted in May 2002 (CVRWQCB, 2002). Based on the direction of this facility from the Site, groundwater sampling results, and case closure, this facility is not considered a REC likely to affect soil, soil vapor or groundwater beneath the Site.

A closed LUST case was listed for former Chevron #9-6705, located at 4365 Sierra College Boulevard, approximately 750 feet south of the Site. Other than the receipt of a No Further Action letter from the CVRWQCB in 2004 (CVRWQCB, 2004), no additional information was available in GeoTracker™.

A closed LUST case was listed for the former Unocal SS#6008, located at 4390 Sierra College Boulevard, approximately 1,500 feet south of the Site. Groundwater beneath this facility was impacted with gasoline constituents. Based on information from groundwater monitoring conducted during October 2006, groundwater was encountered at depths of 8 to 19 feet bgs and flowed to the northwest (TRC, 2006). Historically, groundwater at the former Unocal facility ranged from depths of 2 to 21 feet bgs, with groundwater flow directions ranging from northwest to north (TRC, 2005). No Further Action was granted in February 2007 (CVRWQCB, 2007). Based on the distance of this facility from the Site, most recent groundwater sampling results, and case closure, this facility is not considered a REC likely to affect soil, soil vapor or groundwater beneath the Site.

4.3.7 Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System

Pipeline information is available at the PHMSA's online NPMS website (https://www.npms.phmsa.dot.gov). Kleinfelder researched pipeline information on the website on September 8, 2016 for the Site. Based on Kleinfelder's review of the NPMS website, no mapped natural gas transmission pipelines or hazardous liquid pipelines are located on Site, or on properties that adjoin the Site. One active natural gas transmission pipeline owned by Pacific Gas & Electric Company is located approximately 600 feet northwest of the Site, and runs along the east side of Taylor Road. One active hazardous liquids pipeline managed by Kinder Morgan is located approximately 840 feet northwest of the Site, and run along the west side of the Union Pacific railroad tracks. This pipeline is listed as containing non-highly volatile liquid products. A copy of the NPMS map is included in Appendix C.

Copyright 2017 Kleinfelder

4.3.8 State Department of Toxic Substances Control / EnviroStor

Kleinfelder reviewed the DTSC EnviroStor website (http://www.envirostor.dtsc.ca.gov/) on September 10, 2016 for information pertaining to the Site. Based on Kleinfelder's review of the website, no listings were found pertaining to the Site or for properties immediately adjoining to the Site.

4.3.9 Placer County Air Pollution Control District

Kleinfelder submitted a written request to the APCD on September 10, 2016 for permits for the parcel numbers associated with the Site. On October 19, 2016, Kleinfelder received an email response from Mr. Zach Lee of Placer County APCD indicating that they had no records pertaining to the Site.

4.4 PHYSICAL SETTING SOURCE(S)

Table 4-1 presents information concerning the physical setting of the Site. The information was primarily obtained from published maps.

TABLE 4-1
Physical Setting

DATA	GENERAL INFORMATION
USGS TOPOGRAPHIC QUADRANGLE	Based on the United States Geological Survey (USGS), Rocklin, CA Quadrangle 7.5-Minute Series (Topographic) Map, dated 2012, the Site elevation is shown between approximately 330 and 340 feet above Mean Sea Level (MSL). Topography in the vicinity of the Site is shown as sloping down to the west and southwest (EDR, 2016b).
SOIL TYPE	The Site is underlain by *Andregg* coarse sandy loam (EDR, 2016b).
OIL AND GAS WELLS	Information concerning oil and gas fields was obtained by Kleinfelder from published maps available for download on the Division of Oil, Gas, and Geothermal Resources (DOGGR)'s internet web site (http://maps. conservation.ca.gov/doggr/index.html). Kleinfelder researched oil well information on the DOGGR website on September 10, 2016 for the Site and Site vicinity. Based on Kleinfelder's review, no oil wells are located on the Site or in the immediate Site vicinity.

Copyright 2017 Kleinfelder

Table 4-2 presents information concerning regional geology and hydrogeology. The information was obtained from published maps and other sources.

TABLE 4-2
Regional Geology and Hydrogeology

PHYSICAL PARAMETER	INFORMATION/COMMENTS
REGIONAL PHYSIOGRAPHY AND GEOLOGY	The Site is located in the Town of Loomis, which is located in the Sacramento Valley portion of the Great Valley geomorphic province, which consists of an alluvial plain drained by the Sacramento River. The Great Valley is a trough between the surrounding mountain ranges in which sediments have accumulated since the Jurassic Age (California Department of Conservation, California Geological Survey [CGS], 2002; USGS, 1966).
REGIONAL HYDROGEOLOGY	The Site is located outside of any named groundwater basins. (California Department of Water Resources [CDWR], 2004).
DEPTH TO GROUNDWATER DIRECTION OF ANTICIPATED FLOW [1]	Based on review of available groundwater information from nearby facilities located within approximately 0.25-mile of the Site, groundwater was encountered at depths historically ranging from approximately 2 to 21 feet bgs, with a predominantly northwest flow direction (TRC, 2007; SECOR,2007); however, groundwater was observed to also flow to the southeast (CRWQCB, 2002) and to the north (TRC, 2005). A groundwater elevation contour map for the adjacent North American Groundwater Sub-basin showed a regional groundwater flow direction to the southwest in Spring 2005 (MWH, 2007).
REGIONAL GROUNDWATER QUALITY PROBLEMS	A review of the groundwater principal contamination sites described for the adjacent North American Groundwater Sub-basin revealed that the nearest site is more than four miles from, and downgradient from, the Site (MWH, 2007).
WATER SUPPLY	The well search performed by EDR indicated no private or public water supply wells are located on or adjacent to the Site (EDR, 2016b). However, one groundwater well was observed in the eastern portion of the Site during the Site reconnaissance.
FLOOD ZONE DESIGNATION	According to The EDR Radius Map™ Report with GeoCheck®, the Site is not located within a 100-year or 500-year flood zone (EDR, 2016b).

[1] Groundwater flow direction is based on regional information sources. Site-specific conditions may vary due to a variety of factors including geologic anomalies, utilities, nearby pumping wells (if present), and others.

4.5 USER PROVIDED INFORMATION

According to the Client, the purpose for performing this Phase I ESA is to evaluate the potential for RECs at the Site for the purpose of constructing a new Costco Warehouse and fuel facility. Information regarding the current owners/occupants of the Site is summarized in Table 4-3.

Copyright 2017 Kleinfelder

TABLE 4-3
Owner and Occupant Information

ENTITY	NAME
OWNER	Based on the EDR Environmental Lien and AUL Search (EDR, 2016a), the Site parcels and current owners are as follows: 045-042-034-000 – Donald B & Carole F Tanklage Foundation 045-042-035-000 - Donald B & Carole F Tanklage Foundation 045-042-036-000 - Donald B & Carole F Tanklage Foundation 045-042-037-000 - Donald B & Carole F Tanklage Foundation
OCCUPANT(S)	Not occupied.

Summaries of interviews of key individuals with knowledge of the Site ("Key Site Managers") are provided in Section 7. The following sections present information provided to Kleinfelder by the Client.

4.6 TITLE RECORDS

Chain-of-title information was not provided by the Client. Therefore, a review of a chain-of-title report was not reviewed as part of this Phase I ESA.

4.7 ENVIRONMENTAL LIENS AND USAGE LIMITATIONS

According to information provided in EDR's regulatory agency database search report (EDR, 2016b), there are no liens pertaining to the Site listed in the Federal superfund liens list maintained by the United States Environmental Protection Agency (US EPA), nor known recorded land-use environmental deed restrictions pertaining to the Site listed in the State Liens Database. Kleinfelder's review of the *EDR Environmental Lien and AUL Search* report (EDR, 2016a) for the Site indicates there are no environmental liens or activity and use limitations (AULs) associated with the Site.

4.8 VALUE REDUCTION

As part of the Standard Practice process, information is to be gathered regarding the prospective purchase price of the Site relative to its fair market value. If there appears to be a value reduction, that reduction must be identified with respect to whether the difference may be attributed to environmental degradation of the property. Kleinfelder submitted a "User Questionnaire" to the Client that included a question about the prospective purchase price of the Site relative to its fair market value. Based on Kleinfelder's review of a questionnaire completed on December 8, 2016 by Mr. Michael Okuma with Costco, Mr. Okuma is not aware of environmental conditions

Copyright 2017 Kleinfelder

associated with the Site that would reduce the purchase price of the property relative to its fair market value. A copy of the User Questionnaire is provided in Appendix C.

4.9 OTHER INFORMATION / DOCUMENTS PROVIDED

No other information was provided by the Client for review by Kleinfelder.

Copyright 2017 Kleinfelder

5 SITE HISTORY

The history of the Site was researched to identify obvious uses. Historical land use was researched to the first developed use, or back to 1940, whichever was earlier or readily available. Table 5-1 summarizes the availability of information reviewed during this assessment.

TABLE 5-1
Historical Information Sources

SOURCE	YEARS REVIEWED	SOURCE / AVAILABILITY
SANBORN FIRE INSURANCE MAPS	Not available	EDR, 2016c
AERIAL PHOTOGRAPHS	1938, 1952, 1966, 1975, 1984, 1993, 1999, 2005, 2006, 2009, 2010, and 2012	EDR, 2016d
CITY DIRECTORIES	1974 – 2013 (select years)	EDR, 2016e
HISTORICAL TOPOGRAPHIC MAPS	1891, 1892, 1893, 1944, 1954, 1967, 1981, and 2012	EDR, 2016f
BUILDING DEPARTMENT	Not available	EDR, 2016g
PREVIOUS ASSESSMENT(S)	Not applicable	Not available

5.1 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance Maps provide historical land use information for some metropolitan areas and small, established towns. Kleinfelder requested EDR to search its library of Sanborn Fire Insurance Maps for maps of the Site. EDR responded that Sanborn Fire Insurance Maps were not available for the Site (EDR, 2016c).

5.2 AERIAL PHOTOGRAPHS

A review of historical aerial photography may indicate past activities at a property that may not be documented by other means or observed during a reconnaissance visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Aerial photographs were obtained from several historical photograph collections through EDR (2016d), and span a period of 74 years. A tabulation of the aerial photographs reviewed by Kleinfelder is presented in Table 5-2. Copies of the aerial photographs provided by EDR are included in Appendix D.

Copyright 2017 Kleinfelder

TABLE 5-2
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1938	1"=500'	**Site:** The Site appeared to be developed as agricultural land containing an orchard on the eastern half and another crop on the western half. A dirt road bisects the Site from north to south with a structure visible halfway through the Site. A curved drainage crossed the Site from east to west. A second structure associated with a residential building off-Site to the north is present adjoining the road on the northern boundary of the Site. **Surrounding Area:** Brace Road was visible along the north side of the Site and appeared to be dirt. A residential building and associated structures were located off-Site, north of the northern Site boundary. Railroad tracks and a paved parallel road were visible to the west of the Site. The surrounding area appeared to be primarily developed as orchards with rural residential structures and dirt roads.
1952	1"=500'	**Site:** The structures in the center and northern portions of the Site were removed, but the agricultural crops and dirt road remain. **Surrounding Area:** Brace Road appeared to be paved and the residential structure north of the Site was removed. The surrounding area was generally unchanged from the 1938 aerial photograph.
1966	1"=500'	**Site:** The orchards and associated dirt road were no longer present on the Site. A dirt road, a new structure, and a rectangular feature were visible on the eastern side of the Site. This dirt road extended southward from the northern boundary, along the west side of the structure and ended halfway into the Site at the rectangular feature. The rectangular feature was visible southeast of the end of the dirt road, extending in an east-west direction toward the eastern Site boundary. A small structure is present in the area between the road and the feature. It is not clear what this feature is and it is not shown on the topographic maps (Table 5-3). **Surrounding Area:** Seven large residential structures were visible adjacent to the northern boundary, on the south side of Brace Road. A structure was visible on the east side of the dirt road, adjacent to the eastern Site boundary. The southern extension of Sierra College Boulevard was visible and appeared to be paved. The surrounding area remained rural residential, but with fewer orchards visible. Interstate 80 was visible to the southeast of the Site.
1975	1"=500'	**Site:** The Site remained generally unchanged. Due to the poor quality of the photograph, features were not clear. **Surrounding Area:** Due to the poor quality of the photograph, features were not clear. However, the rural residential structures and orchards in the surrounding area no longer appeared to be visible. What appear to be two service stations are visible on the east and west sides of Sierra College Boulevard in the vicinity of the southbound Interstate 80 on/off ramps.
1984	1"=500'	**Site:** The Site appeared generally unchanged. **Surrounding Area:** The surrounding area appears unchanged relative to the 1975 photograph.

Copyright 2017 Kleinfelder

TABLE 5-2 (Continued)
Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1993	1"=500'	**Site:** A narrow dirt road appeared to extend from the south end of the existing dirt road on the east side of the Site, winding across the Site to the west, and then exiting the Site to the north, to Brace Road. Possible structures are present in trees in the northeastern portion of the Site, near this dirt road. Due to the poor quality of the photograph, features were not clear. **Surrounding Area:** A new residential area was visible adjacent to the Site on the east, and a large commercial structure was visible across Sierra College Boulevard to the west. A dirt road was visible south of the Site in the area of the future Granite Drive. The surrounding area appeared to be increasingly developed with residential and commercial areas.
1999 2005 2006 2009 2010	1"=500'	**Site:** The Site appeared generally unchanged from the 1993 aerial photograph except that no structures appear to be on Site adjoining the dirt road. The east-west rectangular feature is no longer visible in the 1999 aerial photograph, although there now appear to be a stand of trees in the approximate location. The 2006 aerial photograph only shows the northern portion of the Site. The 2010 aerial photograph shows dirt paths winding through the Site and the structure on the eastern side of the Site no longer appears to be present. **Surrounding Area:** In the 1999 aerial photograph, the gasoline station on the east side of Sierra College Boulevard was no longer visible; however, another gasoline station was visible at the southeast corner of Sierra College Boulevard and Granite Drive, and another gasoline station was visible adjacent to the southern Site boundary. The gasoline station on the west side of Sierra College Boulevard near Interstate 80 is no longer visible in the 2009 aerial photograph.
2012	1"=500'	**Site:** The Site appeared generally unchanged. **Surrounding Area:** New commercial development was visible across Brace Road to the north of the Site. Additional construction was in progress to the south of the site, beyond the two gasoline stations.

Note: Aerial photographs only provide information concerning indications of land use, and no conclusions regarding the release of hazardous substances or petroleum products can be drawn from the review of photographs alone.

5.3 CITY DIRECTORIES

City directories provide information regarding property occupants by address. EDR provided a city directory image report (EDR, 2016e), included in Appendix D, for properties along Brace Road and Sierra College Boulevard for the period between 1974 and 2013. The Site has no physical address and was therefore not listed.

Copyright 2017 Kleinfelder

Adjoining properties included residential listings at the addresses of 5340, 5350, 5360, 5370, 5380, and 5390 Brace Road, north of the Site, and commercial listings at the addresses 4020 and 4211 Sierra College Boulevard, west and south of the Site, respectively. The commercial listings at 4020 Sierra College Boulevard included multiple office and medical tenants. Commercial listings at address 4211 Sierra College Boulevard included a Chevron gasoline station and a McDonald's restaurant.

5.4 HISTORICAL TOPOGRAPHIC MAP REVIEW

Kleinfelder obtained information regarding historical topographic maps of the Site vicinity from EDR (2016f). The topographic maps reviewed for this assessment are listed in Table 5-3 and copies of the maps are included in Appendix D.

TABLE 5-3
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1891, 1892, 1893	1:125,000	**Site:** The Site was vacant with no structures. **Surrounding Area:** The surrounding properties were shown as vacant. Railroad tracks were shown to the west of the Site, with a road shown running parallel to the tracks.
1944	1:62,500	**Site:** The Site was shown as vacant, although a single structure was shown on the northern property line. **Surrounding Area:** The surrounding area showed rural development, with a network of paved and dirt roads and structures scattered along both. Paved roads were shown on the northern and western boundaries of the Site. The Town of Loomis was shown to the north as developed with paved roads and structures.
1954	1:24,000	**Site:** The Site was developed as orchard. The single structure remained on the northern property line. **Surrounding Area:** The surrounding area was developed with orchards and vineyards.
1967	1:24,000	**Site:** The Site was shown as vacant, and the orchard no longer present. The single structure on the northern boundary was no longer present. A second structure was now present on the eastern boundary of the Site adjacent to a dirt road running north-south from Brace Road in the northeast corner of the Site, and extending into the Site approximately 500 feet. **Surrounding Area:** Seven new, large structures were shown adjacent to the northern boundary. Additional structures were shown to the north and east of the Site. Interstate 80 is shown to the east of the Site.
1981	1:24,000	**Site:** The Site is depicted as essentially unchanged from the 1967 topographic map. **Surrounding Area**: The northern extension of Sierra College Boulevard, across the railroad tracks from the Site, was shown.

Copyright 2017 Kleinfelder

TABLE 5-3 (Continued)
Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
2012	1:24,000	**Site:** The 2012 topographic map depicted roads and other physical features, but did not depict structures in the area. Thus, no structures or other features were depicted on the Site. **Surrounding Area:** Roads in the Site vicinity included Brace Road (adjoined to the north of the Site) and Sierra College Boulevard (adjoined to the west of the Site).

5.5 BUILDING DEPARTMENT

EDR provided an EDR Building Permit Report (EDR, 2016g) for the Site. EDR responded that it does not have access to the building parcel information for the Site. Additional information is presented in Sections 4.3.4 and 4.3.5.

5.6 PREVIOUS ASSESSMENTS

A previous Phase I Environmental Site Assessment, performed in 2005 by Soil Search Engineering, was provided to Kleinfelder for review. Soil Search Engineering reported that they found no RECs for the Site (Soil Search Engineering, 2005).

Copyright 2017 Kleinfelder

6 SITE RECONNAISSANCE

Kleinfelder's Phase I ESA activities included a Site reconnaissance. This section summarizes the findings from the Site reconnaissance.

6.1 METHODOLOGY AND LIMITING CONDITIONS

Mr. Mark Lee of Kleinfelder performed a Site reconnaissance on September 19, 2016. The Site reconnaissance included a visual inspection of the Site to assist in identifying the presence or likely presence of hazardous substances or petroleum hydrocarbons under conditions that indicate an existing release, a past release, or threat of release into structures, soil, groundwater, or surface water at the Site (i.e., RECs). Observations of readily-apparent environmental conditions are summarized in Table 6-1, and color photographs of the Site are presented on Figures 3 through 8. The approximate Site boundaries are shown on Figure 2.

6.2 GENERAL SITE SETTING

The Site is located at the southeast corner of the intersection of Brace Road (located north of the Site) and Sierra College Boulevard (located west of the Site) in the Town of Loomis, California. At the time of the Site reconnaissance, the Site was vacant land.

6.3 SITE OBSERVATIONS

Kleinfelder's Site observations are summarized in Table 6-1.

TABLE 6-1
Site Observations

GENERAL OBSERVATIONS	REMARKS	OBSERVED	NOT OBSERVED
Current use	Vacant lot	X	
Current use likely to indicate RECs	None observed.		X
Past use	Not observed, although historical aerial photographs and topographic maps indicate the Site was once an orchard		X
Past use likely to indicate RECs	Not observed; however, persistent pesticides and petroleum hydrocarbons from smudge pots can be associated with orchards.		X
Structures	None observed.		X
Roads	Dirt paths, foot trails	X	
Topography of Site and surrounding area	Mostly flat with trees and brush	X	
ASTs	None observed on Site.		X

Copyright 2017 Kleinfelder

GENERAL OBSERVATIONS	REMARKS	OBSERVED	NOT OBSERVED
Below grade vaults	One traffic signal vault at the northwest corner of the Site, along Brace Road.	X	
Burned or buried debris	None observed.		X
Chemical storage	None observed.		X
Chemical mixing areas	None observed.		X
Discolored soil or water	None observed.		X
Ditches, streams	Dry, running northwest-southeast through the center of the Site and west-east along the southern fence line.	X	
Drains and piping	None observed.		X
Drums	None observed.		X
Electrical or hydraulic equipment (polychlorinated biphenyls [PCBs])	One pole-mounted transformer adjacent to the east of the Site; potentially on Site. No Non-PCB sticker observed.	X	
INTERIOR AND EXTERIOR OBSERVATIONS OR ENVIRONMENTAL CONDITIONS THAT MAY INVOLVE THE USE, STORAGE, DISPOSAL OR GENERATION OF HAZARDOUS SUBSTANCES OR PETROLEUM PRODUCTS.		**OBSERVED**	**NOT OBSERVED**
Fill dirt from an unknown source	None observed.		X
Fill dirt from a known source	None observed.		X
Hazardous chemical and petroleum products in connection with known use	None observed.		X
Hazardous chemical and petroleum products in connection with unknown use	None observed.		X
Non-hazardous containers with contents	None observed.		X
Hazardous waste storage	None observed.		X
Heating and cooling system and fuel source	None observed.		X
Industrial waste treatment equipment	None observed.		X
Loading and unloading areas	None observed.		X
Odors	None observed.		X
Pits, ponds, or lagoons	None observed.		X
Pools of liquid	None observed.		X
Process waste water	None observed.		X
Sanitary sewer system	None observed.		X

Copyright 2017 Kleinfelder

INTERIOR AND EXTERIOR OBSERVATIONS OR ENVIRONMENTAL CONDITIONS THAT MAY INVOLVE THE USE, STORAGE, DISPOSAL OR GENERATION OF HAZARDOUS SUBSTANCES OR PETROLEUM PRODUCTS.		OBSERVED	NOT OBSERVED
Septic system (e.g. tank and leach fields)	None observed.		X
Soil piles	A small soil pile was observed at the southeast corner of the Site (see Solid Waste below). Small soil piles were observed in the southeastern portion of the Site, created as dirt bike jumps.	X	
Solid waste/evidence of unauthorized dumping	Wood, wooden pallets, fencing material, miscellaneous debris, soil and brush were observed on the southeastern portion of the Site, adjacent to a gate built into the fence.	X	
Stained pavement, soil or concrete	None observed.		X
Stains or corrosion (interior, non-water)	None observed.		X
Storm drains/catch basins	Culverts and storm drains along Sierra College Boulevard, storm drains on Brace Road and Starlight Lane.	X	
Stressed vegetation	None observed.		X
Sumps and clarifiers	None observed.		X
Surface water	None observed.		X
Underground storage tank(s) (including heating oil tanks)	None observed.		X
Unidentified substance containers	None observed.		X
Waste water discharge	None observed.		X
Water supplies (potable and process)	None observed.		X
Wells (irrigation, monitoring, or domestic)	One domestic well along eastern Site boundary.	X	
Wells (dry)	None observed.		X
Wells (oil and gas)	None observed.		X

6.4 RESULTS OF SITE RECONNAISSANCE

The Site consists of vacant land with no structures or other features observed, other than Starlight Lane, which runs in a north-south direction at the northeastern corner of the Site. A dry stream crosses the Site from northwest to southeast. One domestic well adjacent to the eastern Site

Copyright 2017 Kleinfelder

boundary may be on-Site. A gate was observed in the fencing that marked the boundary of the Site and the residences to the east, at the southeastern portion of the Site. Piles of wood, wooden pallets, fencing, dirt, brush and other debris were observed adjacent to the gate on Site (Figure 7). Hazardous materials were not observed in the debris pile, and it appeared to be used as a storage/disposal area by the adjoining resident. An area of disturbed ground was observed in the southeastern portion of the Site, which included small dirt piles as dirt bike jumps and associated small excavations.

Evidence of USTs, ASTs, pits, ponds, or lagoons was not observed on the Site during the reconnaissance. One AST was observed on the adjacent property to the north, which appeared to be a water tank (Figure 8).

Copyright 2017 Kleinfelder

7 INTERVIEWS

Key Site Managers are contacted to obtain current and historical environmental information concerning the Site. The following sections highlight information revealed during the interviews.

7.1 INTERVIEW WITH CLIENT

Kleinfelder submitted a Phase I ESA User Questionnaire to the Client. The questionnaire was completed on December 8, 2016 by Mr. Michael Okuma with Costco. The questionnaire responses indicated the following:

- Costco, the User of this Phase I ESA, has no specialized knowledge or experience related to the Site or nearby properties.
- Costco does not have any information indicating that the purchase price being paid for the Site does not reasonably reflect the fair market value of the Site.
- Costco is not aware of conditions indicative of releases or threatened releases at the Site.
- Costco is not aware of obvious indicators that point to the presence or likely presence of contamination at the Site.

A copy of the User Questionnaire is provided in Appendix C.

7.2 INTERVIEW WITH OWNER/MANAGER

On September 14, 2016, Kleinfelder spoke with Peter Saetes, of Saetes Investments, who is the owner's representative for the Site. Mr. Saetes stated that there are 0.13 acre of wetlands present on the Site, and that the national permit is currently being prepared. He also noted that there were two residential structures formerly located adjacent to the Site east of Starlight Lane. These structures were demolished and removed as a fire project for the local fire department.

7.3 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

During a January 17, 2017 telephone conversation between Kleinfelder and Ms. Laura Rath, Environmental Health Specialist at Placer County Environmental Health, Ms. Rath indicated that lead arsenate was historically used in former orchards in Placer County, and that lead and arsenic are contaminants that are commonly found in soils.

Copyright 2017 Kleinfelder

8 EVALUATION

Kleinfelder performed this Phase I ESA of the Site in conformance with the scope and limitations of the Standard Practice, the scope of services in our Proposal No. MPCOSTCO.001C/IRV16P45931, dated August 29, 2016, and in accordance with Costco Wholesale Development Requirements, Version 2014, Revised June 13, 2014. The following sections describe Kleinfelder's findings and provide general background information about the Site. Findings address RECs, HRECs, CRECs, and notation of *de minimis* quantities, as applicable to the Site. In summary, Kleinfelder's assessment revealed the following information concerning the Site:

8.1 BACKGROUND

The following is a summary of Site background information:

- The Site is located on Placer County APNs 045-042-034-000, 045-042-035-000, 045-042-036-000, and a portion of 045-042-037-000. The Site totals 17.2 acres.
- Most of the Site was historically developed as orchards from at least 1938 until sometime between 1954 and 1966. Dirt roads were present at the Site as early as 1938. A structure associated with a residential building located off-Site to the north was present on the northern Site boundary in 1938. A second structure (unknown purpose) was present in the center of the Site from at least 1938 until prior to 1952, and a third structure (unknown purpose) was present on the eastern side of the Site between 1966 and 2009. A well and a pole-mounted transformer were located on the eastern side of the Site adjoining the remains of the former eastern structure. Although the use of the structures is not known, the potential exists that they may have been associated with agricultural operations and storage of equipment and/or chemicals.

8.2 FINDINGS AND OPINIONS

The following is a summary of the findings and opinions of this Phase I ESA:

- Shallow soils across the Site and beneath the former Site structures may have been impacted with residual pesticides and petroleum hydrocarbons from historical orchard operations. Although the use of the structures is not known, the potential exists that they may have been associated with agricultural operations and storage of equipment and/or chemicals. Orchards typically utilize smudge pots which use petroleum hydrocarbons to reduce the potential for freezing, and also may have been routinely treated with pesticides (such as lead arsenate) and other chemicals, which may remain in the Site soils. Also,

Copyright 2017 Kleinfelder

according to Placer County Environmental Health, lead and arsenic are contaminants commonly found at former orchards in Placer County.

- A rectangular feature was visible in aerial photographs near the south end of a dirt road (Starlight Lane), extending in an east-west direction toward the eastern Site boundary from at least 1966 through 1993. It is not clear what this feature was, but an area of disturbed ground was noted in the general vicinity during the Site reconnaissance. In Kleinfelder's opinion, the location of the former unknown feature warrants further investigation.
- A gate was observed in the fencing that marked the boundary of the Site and the residences to the east, at the southeastern portion of the Site. Piles of wood, wooden pallets, fencing, dirt, brush and other debris were observed adjacent to the gate on Site. This location appears to be used as a storage/disposal area by the adjoining resident. Hazardous materials were not observed in the debris pile.
- A gasoline station with USTs has operated since approximately 1999 on the adjacent property south of the Site. The gasoline station property is believed to be hydrogeologically cross-gradient to potentially up-gradient relative to the Site. Groundwater in the vicinity has been reported at depths as shallow as 2 feet bgs. Although no releases have been reported at the gasoline station, its operation for almost two decades increases the likelihood that undetected spills or leakage have occurred during operations, resulting in impacts to the shallow groundwater. Based on the gasoline station's potentially up-gradient location relative to the Site, impacted groundwater beneath the gasoline station may make its way towards and beneath the Site.

8.3 DEVIATIONS AND ADDITIONAL SERVICES

Kleinfelder's scope of services did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources, ACM, radon, LBP, lead in drinking water, industrial hygiene, health and safety, indoor air quality/vapor intrusion, high-voltage power lines, or wetlands and surface water. Kleinfelder understands these non-scope evaluations may be requested by Kleinfelder at a later time. At the request of the Client, a wetlands survey was not included as part of the scope of services for this Phase I ESA.

Kleinfelder's scope of services included evaluations of threatened, endangered, and other protected species pursuant to Development Requirements, Version 2014, revised June 13, 2014. A summary of the results of these evaluations is provided in Section 8.3.1 below.

Copyright 2017 Kleinfelder

8.3.1 Protected Plant/Wildlife Assessment

Kleinfelder contracted with Rincon Consultants to perform a biological survey for the potential occurrence of special status plant and wildlife species at the Site. A copy of Rincon's report is provided in Appendix E.

Rincon queried the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB). Based on Rincon's review of the database search results and the habitats observed at the Site during the Site reconnaissance, 31 special status plant species and 23 special status wildlife species have potential to occur at the Site.

Additionally, the Site contains nesting habitat for several bird species including raptors, and one nest consistent with a small raptor was observed on-Site. Nesting birds are protected by the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC).

Rincon's report identified the following:

- All 31 of the special status plant species identified from within two miles of the Site have a moderate to high potential of occurrence on-Site, although the regular disking of the Site reduces the likelihood of occurrence.
- Twelve special status wildlife species are identified from within two miles of the Site. Of these, the purple martin and the white-tailed kite have a moderate to high potential for occurrence based on current Site conditions.
- Further analysis is needed to determine if the Site could support vernal pools and if, therefore, any vernal pool dependent species may potentially occur.
- Biological surveys are required for any plants listed in vernal pool areas for projects requiring 404 permits. Surveys should be conducted during the spring and summer months.
- The presence of numerous, large trees presents a high possibility for nesting birds to become present on the Site during the nesting season, generally February through August.
- To comply with MBTA and CFGC, all construction activities should be conducted outside of nesting season (February 1 through August 31). If nesting season is unavoidable, an initial bird survey must be conducted no more than 14 days prior to initiation of project activities (land clearing or vegetation removal). If nesting birds are found, construction activities must be conducted outside a buffer zone from the nest (minimum 100 feet for non-raptor species and 1,320 feet for raptor species).

Copyright 2017 Kleinfelder

8.4 CONCLUSIONS

Kleinfelder has performed a Phase I ESA in conformance with the scope and limitations of ASTM E 1527-13 of the properties located at the southeast corner of Brace Road and Sierra College Boulevard in the Town of Loomis, Placer County, California. Any exceptions to, or deviations from, this practice are described in Section 8.3 of this report. This assessment has revealed the following RECs:

- The former orchard use of the Site, and associated structures that may been used for storage of equipment and/or chemicals. Orchards typically utilize smudge pots which use petroleum hydrocarbons to reduce the potential for freezing, and also may have been routinely treated with pesticides (such as lead arsenate) and other chemicals, which may remain in the Site soils. Also, according to Placer County Environmental Health, lead and arsenic are contaminants commonly found at former orchards in Placer County.
- The gasoline station adjoining the Site, which has operated for approximately 18 years. Although no releases have been reported at the gasoline station, its operation for almost two decades increases the likelihood that undetected spills or leakage have occurred during operations, resulting in impacts to the shallow groundwater. Based on the gasoline station's potentially up-gradient location relative to the Site, impacted groundwater beneath the gasoline station may make its way towards and beneath the Site.

Although not a REC, in Kleinfelder's opinion, the location of the former rectangular feature of unknown use at the east central portion of the Site warrants further investigation.

8.5 RECOMMENDATIONS

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment.

- To assess for impacts that may have resulted from historical orchard operations, Kleinfelder recommends sampling and analysis of the surficial soils across the Site and soils beneath the former Site structures for pesticides (specifically lead arsenate) and petroleum hydrocarbons.
- Based on the unknown use of the former rectangular feature observed in the aerial photographs, Kleinfelder recommends soil sampling at this location assess for contaminants in the subsurface.

Copyright 2017 Kleinfelder

- Based on proximity and potential releases from the adjoining service station, conducting baseline soil and groundwater sampling is recommended at the location of the proposed Costco fueling facility.
- Debris and stored material along the eastern portion of the Site should be removed prior to construction.
- The groundwater well located on the eastern side of the Site should be abandoned per state and county standards.

8.6 DATA GAPS

Based on information obtained/reviewed as part of this Phase I ESA, it is Kleinfelder's opinion that no data gaps (which may constitute a data failure) have been identified.

APPENDIX A
STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in CFR Part 312.

Karin F. Hagan
Environmental Professional

Lizanne Simmons, PG
Senior Principal Geologist

The resumes of above-listed environmental professionals performing this Phase I ESA are on file at the Kleinfelder office and are available upon request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting

the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/21/2016 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, has revealed that there is 1 RESPONSE site within approximately 1 mile of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 05/02/2016 has revealed that there are 3 ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Facility Id: 00000060740

Other Ascertainable Records

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/20/2015 has revealed that there are 6 FINDS sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
Not reported	4390 SIERRA COLLEGE	SSW 1/8 - 1/4 (0.195 mi.)	25	43

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History: Forest Products Company is a wood product coating facility which operated at the Site since 1977. In 1980, the company built two unlined evaporation ponds to handle thier waste stream. When the ponds were dry, the bottom of the ponds were scraped, and the scrapings placed into 55-gallon drums. In 1983, Forest Product conducted a cleanup of the ponds for mercury and lead and in 1986 the

FOREST PRODUCTS MANUFACTURING (Continued) **S106486453**

Department of Health Services (DHS) concurred the cleanup was adequate. In 1990, Simas Enterprises purchased the property. In 1987, DHS conducted a drive-by of the Site and observed soil contamination from recent discharges to a drainage ditch and recommended a full site inspection. Department of Toxic Substances Control (DTSC) oversaw the investigation and remediation of the Site. On 15 October 1993, DTSC notified Simas that the residual soil and groundwater contamination do not pose a risk to human health or the environment. More information can be found at the DTSC Envirostor website (http://www.envirostor.dtsc.ca.gov/public/profile_report.asp?global_id=31240008)

Completed Sub Area Name:	Not reported
Completed Document Type:	Certification
Completed Date:	10/15/1993
Comments:	SMALL CERTIFICATION: Forest Products Manufacturing-Rocklin certification of Parcel #5 has been completed. On site soils contain trace amounts of bis(2-ethylhexyl)phthalate, however, the levels do not pose a health threat. On-site ground water sampling showed that the above chemical in no longer present in the ground water, but is present in low levels on an off-site well. The levels found in the

FOREST PRODUCTS MANUFACTURING, PARCEL 5 (Continued) **S101481497**

off-site well also do no pose a health threat. The certification of this site was based on these risk assessment conclusions.

ROCKLIN OPERATION (Continued) **S102005395**

WDS:

Facility ID:	Sacramento River 312036001
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number:	Not reported
Subregion:	0
Facility Telephone:	Not reported
Facility Contact:	DENNIS MOORE
Agency Name:	SIERRA PINE LIMITED
Agency Address:	4300 DOMINGUEZ RD

Waste2:	Not reported
Primary Waste Type:	Not reported
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The POTW Does not have an approved pretreatment program. Some POTWs may have local pretreatment programs that have not been approved by the regional board and/or EPA.
Treat To Water:	Moderate Threat to Water Quality. A violation could have a major adverse impact on receiving biota, can cause aesthetic impairment to a significant human population, or render unusable a potential domestic or municipal water supply. Awsthetic impairment would include nuisance from a waste treatment facility.
Complexity:	Category B - Any facility having a physical, chemical, or biological waste treatment system (except for septic systems with subsurface disposal), or any Class II or III disposal site, or facilities without treatment systems that are complex, such as marinas with petroleum products, solid wastes, and sewage pump out facilities.

FOREST PRODUCTS MFG. CO (Continued) **S100833489**

Project Revenue Source Desc:	This site is projected to be remediated by the responsible parties with reimbursement to DHS for its oversight. If the RPs are unable to fund site investigation and cleanup, another source of funds will need to be identified.
Site Description:	A wood coating facility operated by Forest Products, Inc. was located at this site. Paint wastes were stored in drums and disposed of in an onsite pond. This site was identified as H. Investment Company in the last Expenditure Plan.
Hazardous Waste Desc:	The material in question was composed of paint film from dry evaporation ponds, paint solids in drums, and paint solids from around paving at the site. Mercury was identified as the primary hazardous component of the wastes.
Threat To Public Health & Env:	The primary concern is the possibility of ground water contamination, as the soils in the area are known to have a medium to high permeability. Ground water flow generally is south towards Sacker Ravine, which is located approximately 500 to 600 feetsouth of the ponds.
Site Activity Status:	Approximately 65 cubic yards of soil was removed and disposed of in an approved landfill in November, 1983. Additional soil was removed from the pond areas in November, 1985. In January, 1986, H. Investment contacted DHS to evaluate the cleanup measures taken.

Agency Contact:	BRIAN FRAGIAO
Agency Telephone:	9166521840
Agency Type:	City
SIC Code:	9199
SIC Code 2:	Not reported
Primary Waste Type:	Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Primary Waste:	STORMS
Waste Type2:	Not reported
Waste2:	Stormwater Runoff
Primary Waste Type:	Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Completed Date: 09/18/1981
Comments: FACILITY IDENTIFIED CHAMBER OF COMMERCE DIRECTORY QUESTIONNAIRE SENT.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 03/26/1993
Comments: Preliminary Endangerment Assessment required low priority. The manufacturing of fiberboard at the facility has led to elevated level of tannins and lignins in the area ground water up to 4.2 milligrams per liter (mg/L) and in the area surface water up to .9 mg/L. These contaminants are considered non-hazardous. The RWQCB has inspected the ponds on-site. Placer County is involved in the ground water and surface water monitoring. The Air Resources Board and local air pollution control district are monitoring formaldehyde releases into the air from the facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 05/04/2016

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

UTM Y (Meters):	4296930.5
Elevation:	336 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5629068 ROCKLIN, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

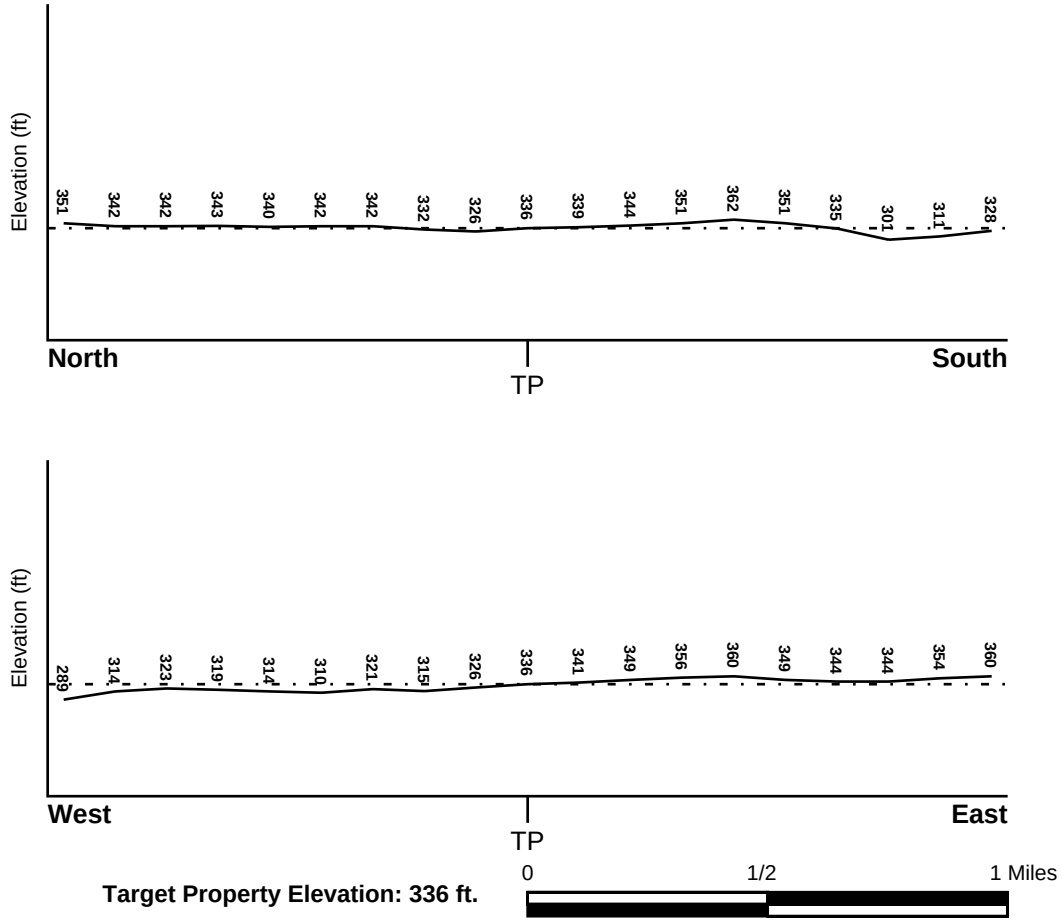
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
PLACER, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property:	0607210001A - FEMA Q3 Flood data
Additional Panels in search area:	0602390418D - FEMA Q3 Flood data 0602420005C - FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
ROCKLIN	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: ANDREGG

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 5.6
2	14 inches	29 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 6.5 Min: 5.6
3	29 inches	33 inches	weathered bedrock	Not reported	Not reported	Max: 0.42 Min: 0	Max: Min:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: XERORTHENTS

Soil Surface Texture: variable

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Subject: FW: Loomis - APNs 045-042-034,035,036, and 036, Sierra College south of Brace

Kathy,

I have reviewed the APN files for the above parcels and there is no reference of contamination. The only information in our file is an application for a rezone and EIAQ. Let me know if you have any additional questions.

Thanks,
Laura Rath

Kathy,

We have reviewed our hazardous materials files and found nothing referring to contamination of the above sites.

(see below) The land team may have other information to check.

To: Virginia Lineberry
Subject: RE: Loomis - APNs 045-042-034,035,036, and 036, Sierra College south of Brace

Virginia-
First, I assumed the last APN referenced is actually 037. I looked in the site mitigation files, the EH AP files downstairs and on Geotracker. I did not find a file for the subject APNs in the site mitigation files or on Geotracker I found an EH AP file for 045-042-036 and 037 but it appears to be related to a re-zone and not groundwater contamination.

There are 3 former underground storage tank sites located south of the property (7-Eleven, Former Chevron and Former Unocal). Each of these sites were closed by the Central Valley Regional Water Quality Control Board as "low risk" sites.

If the Town of Loomis would like a complete history of the subject parcels, it could have a qualified consultant prepare a Phase I Site Assessment.

Let me know if you have any additional questions.

To: Brian Jones
Subject: Loomis - APNs 045-042-034,035,036, and 036, Sierra College south of Brace

Hi Brian- Hope all is going well. Since you are the "easy send" for me at Placer County and know the appropriate people to send this on to- would you please send on to the right person regarding a 1990-1991 finding of 3 contaminated acquifers on the above listed properties? Thank you so much!

I received a call this morning about one of the sites the Town is considering for affordable housing (APNs above). Evidently the person's son worked for an environmental driller in 1990-1991 and the subject site, along with the adjacent McDonalds and Circle K sites were found to have 3 acquifers underneath which were so contaminated, that it was found that it was "not suitable for even cattle to graze on"... Is there some way I can verify this – or respond to the concern? Incidentally, the verified wetlands report for the site shows minimal wetlands. Thank you so much – Kathy Kerdus (916-652-1840), Planning Director, Town of Loomis.

SUBJECT # 89-15, Sunrise Marketing, General Plan Amendment, Rezone, EIAQ

TO: Town of Loomis
P.O Box 1327
Loomis, CA 95650

ATTENTION: Cathleen Spence-Wells
(Recipient: Write reply, return white to sender, keep the pink copy.)

MESSAGE: Environmental Health has reviewed the application for a development permit for the above referenced project and has the following comments. South Placer Municipal Utility District has indicated there is a sewer line available for the subject parcels. Placer County Water Agency has indicated there is a treated water main at the intersection of Sierra College Blvd and Brace Rd. It appears that a pipeline extension agreement between the applicants and PCWA will be required. Environmental Health requests that the Town consider connection to public sewer and treated public water as a condition in the processing of the development application. Environmental SIGNED D Kuselman 889 7363

REPLY: Health also requests consideration of the standard hazardous materials and underground tank conditions (please see attached).

Gentlemen:

The Town of Loomis has received an application for a development permit for the above referenced project. A copy of the application and tentative map are enclosed.

We have tentatively scheduled this item for the **JULY 5 , 1989** Planning Commission Public Hearing. We would appreciate hearing from you within **10 working days** regarding any concerns your agency may have with the proposed development or any conditions you would wish the Town to consider in its processing for the development application.

Yours truly,

Cathleen Spence-Wells

ENVIRONMENTAL REVIEW APPLICATION

Applicant to submit 10 copies of application with other requested permits.

ENVIRONMENTAL REVIEW APPLICATION

Date Filed 4-3-89

General Information

1. Name and address of developer or project sponsor: SUNRISE MARKETING GROUP, 9256 MADISON AVE. ORANGEVALE CA. 95662

2. Address of project: SIERRA COLLEGE BLVD. LOOMIS
Assessor's Block and Lot Number: 45-042-36 & 37

3. Name, address, and telephone number of person to be contacted concerning this project: BILL ROSS, FRONTIER LAND DEVELOPMENT Co 5900 KING RD. LOOMIS, CA 95650 (916) 652-0475

4. Indicate number of the permit application for the project to which this form pertains: N/A

5. List and describe any other related permits and other public approvals required for this project, including those required by city, regional, state and federal agencies: GENERAL PLAN AND REZONING AMENDMENT

6. Existing zoning district: R-2-A-DL-8

7. Proposed use of site (Project for which this form is filed): COMMERCIAL/ BUISNESS PROFESSIONAL OFFICES

Project Description

8. Site size. 6.8 ACRES ±

9. Square footage. 296,000 # ±

10. Number of floors of construction. N/A

11. Amount of off-street parking provided. N/A

12. Attach plans. N/A

13. Proposed scheduling. N/A

14. Associated project. NONE

15. Anticipated incremental development. NONE

16. If residential, include the number of units, schedule of unit sizes, range of sale prices or rents, and type of household size expected. N/A

17. If commercial, indicate the type, whether neighborhood, city or regionally oriented, square footage of sales area, and loading facilities. N/A

18. If industrial, indicate type, estimated employment per shift, and loading facilities. N/A

19. If institutional, indicate the major function, estimated employment per shift, estimated occupancy, loading facilities, and community benefits to be derived from the project. N/A

20. If the project involves a variance, conditional use or rezoning application, state this and indicate clearly why the application is required.

Are the following items applicable to the project or its effects? Discuss below all items checked yes (attach additional sheets as necessary).

	Yes	No
21. Change in existing features of any bays, tidelands, beaches, or hills, or substantial alteration of ground contours.	—	✓
22. Change in scenic views or vistas from existing residential areas or public lands or roads.	—	✓
23. Change in pattern, scale or character of general area of project.	—	✓
24. Significant amounts of solid waste or litter.	—	✓
25. Change in dust, ash, smoke, fumes or odors in vicinity.	—	✓
26. Change in ocean, bay, lake, stream or ground water quality or quantity, or alteration of existing drainage patterns. SOME DRAINAGE PATTERNS MAY REQUIRE RELOCATION AND CHANNELIZATION	✓	—
27. Substantial change in existing noise or vibration levels in the vicinity.	—	✓
28. Site on filled land or on slope of 10 percent or more.	—	✓
29. Use of disposal of potentially hazardous materials, such as toxic substances, flammables or explosives.	—	✓
30. Substantial change in demand for municipal services (police, fire, water, sewage, etc.).	—	✓
31. Substantially increase fossil fuel consumption (electricity, oil, natural gas, etc.).	—	✓
32. Relationship to a larger project or series of projects.	—	✓

Environmental Setting

33. Describe the project site as it exists before the project, including information on topography, soil stability, plants and animals, and any cultural, historical or scenic aspects. Describe any existing structures on the

site, and the use of th[illegible] tructures. THE [illegible]JECT IS C[illegible]RENTLY ON VACANT LAND WITH NO BUILDINGS. T[illegible] PROJECT SLOPES WESTWARD @ 2% SLOPE ON S[illegible] DECOMPOSED GRANITE SOIL. THE VEGITATION CONSISTS OF GRASSES, OAKS, COTTONWOOD & RIPARIAN PLANTS

34. Describe the surrounding properties, including information on plants and animals and any cultural, historical or scenic aspects. Indicate the type of land use (residential, commercial, etc.), intensity of land use (one-family, apartment houses, shops, department stores, etc.), and scale of development (height, frontage, set-back, rear yard, etc.). TO THE EAST EXISTS A 39 LOT RESIDENTIAL SUBDIVISION. TO THE SOUTH EXISTS VACANT COMMERCIAL LAND WITH A GAS STATION. TO THE WEST EXISTS VACANT COMMERCIAL LAND AND A MEDICAL SUPPLY BLDG. TO THE NORTH EXISTS VACANT RESIDENTIAL LAND (R2-A-DL-B) AND APARTMENTS. THERE ARE NO ENDANGERED PLANTS OR ANIMALS KNOWN TO THIS AREA. THE ANIMALS FOUND ARE SQUIRRELS, POSSUM, RACCOON, GOPHER, VARIOUS BIRD SPECIES, MICE AND RATS

Certification

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this initial evaluation to the best of my ability, and that the facts, statements, and in formation presented are true and correct to the best of my knowledge and belief.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Subject: File review request

Good afternoon Rhonda,

I'm working on an environmental assessment for a property in Loomis, and as part of that assessment I need to review any records regarding permits or improvements (buildings, tanks, pipelines, septic systems, etc.) on the property.

Do you/the Town keep such files, and what is the best way for me to obtain copies or review them in person?

The property in question is located on the southeastern corner of Brace Road and Sierra College Boulevard, and includes the following APNs:
045-042-034-000
045-042-035-000
045-042-036-000
045-042-037-000

Thank you,
Karin

ASTM E1527-13
Phase I Environmental Site Assessment
User Questionnaire

INTRODUCTION

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"),[2] the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

(1.) Environmental liens that are filed or recorded against the *property* (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

HAVE NOT PERFORMED SEARCH

Note 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property* (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* above) identify any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

HAVE NOT PERFORMED SEARCH

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

[1] *Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.
[2] P.L. 107-118.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

Do not know

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

No

For example,

(a.) Do you know the past uses of the *property*?

No

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

No

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

No

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

No

(6.) The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of releases at the *property*?

No

KLEINFELDER
Bright People. Right Solutions.

ASTM E1527-13
Phase I Environmental Site Assessment
User Questionnaire

In addition, certain information should be collected, if available, and provided to the *environmental professional* conducting the *Phase I Environmental Site Assessment*. This information is intended to assist the *environmental professional*, but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the reason why the Phase I is being performed, PERFORMANCE OF DUE DILIGENCE

(b) the type of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc., SALES

(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful), SEC SIERRA COLLEGE BLVD & PLACER RD

(d) the scope of services desired for the Phase I ESA (including whether any parties to the *property* transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered), STANDARD

(e) identification of all parties who will rely on the Phase I *report*, YES

(f) identification of the site contact and how the contact can be reached, YES.

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and NO

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

PHASE I
ENVIRONMENTAL SITE ASSESSMENT

LOOMIS PROPERTY
SIERRA COLLEGE BOULEVARD AND BRACE ROAD
PLACER COUNTY, CALIFORNIA

INTRODUCTION

This report presents our findings from phase I environmental site assessment for the above subject property located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California.

The primary objective of the Phase I Site Assessment, was to evaluate the property for evidence of potential soil and ground water contamination resulting from former site activities according to the following scope of work.

SCOPE OF WORK

The scope of work performed to develop the information contained in this phase I environmental site assessment, was defined pursuant to the American Society of Testing and Materials (ASTM) Standard E 1527-00, Standard Practice for Environmental Site Assessments. This Report presents all work performed by SSE to date with regard to this project. The scope of work includes the following:

A site reconnaissance of the property and surrounding areas to observe general area features and identify potential indications of usage, storage, handling and disposal of hazardous materials. This included a walk-through inspection of the subject property, and a drive-by survey of nearby properties. Personal and telephone interviews with representatives of various regulatory agencies as well as persons familiar with the site history.

A review of Federal, State, County and Local regulatory agencies' records concerning the site and contamination cases in the area to identify potential environmental hazards of the subject property, and off-site properties that might affect the subject property.

A review of the history of site usage to identify potential sources of hazardous materials on the subject property by obtaining and/or reviewing selected aerial photographs and/or other pertinent sources of information covering the property.

The principal findings are outlined throughout the body of this text and are summarized in the summary section of this report. In preparing this report, SSE has engaged the services of Environmental Data Resources, Inc., EDR, of Milford, Connecticut. The report, provided by EDR, is a radius search of government records which conforms to the ASTM standard for Phase I preliminary site assessments. Subsurface exploration or chemical screening of soil and groundwater beneath the site, is not within the scope of work in this study.

SITE DESCRIPTION

The site is irregular in shape and the general topography of the area is relatively flat terrain. At the time of our site observation, the site was covered with moderate growth of grass, weeds and a number of native trees. There were two residential structures, appeared to be occupied, at the approximate corner of Brace Road and Starlite Lane, north east part of the site. It is our understanding that the proposed project consists of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements.

The property is approximately 18 acres in size, located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California, as shown on Vicinity Map, Plate Number 1, Appendix A. The parcel map for the area, presented on Plates Number 2, shows the subject property and the neighboring sites. The property has Assessor's Parcel Numbers (APN) 045-042-011, 012, 023, 034, 035, 036 & 037.

Surrounding sites are vacant lots/residential structures on north and east and commercial structures/vacant lots, on south and west. The photographs of the area around the subject property are presented on Plates Number 3 through 6, Appendix A. We understand that the proposed development will consist of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements.

REVIEW OF FEDERAL AND STATE REGULATORY AGENCY DATABASE SEARCHES

A search of available environmental records was conducted by Environmental Data Resources, Inc., EDR. The report meets the government records search requirements of ASTM Environmental Data Resources, Inc., EDR. The report, provided by EDR, meets the government records requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00 Search distances are per ASTM standard. Selected section of the report is presented in Appendix "B". The complete report will be kept on file and may be reviewed upon request. The report out-line is presented next.

REVIEW OF COUNTY AND LOCAL REGULATORY AGENCY DATABASE SEARCHES

Placer County Environmental Management Department

Inquiries were made with the Placer County Environmental Management Department, General Information-Public File Review-Enforcement-site, Assessment & Mitigation, in an attempt to determine if there are any files present at that agency which indicate that the subject property is on the County Toxic, Hazardous Materials and/or Complaint and Incident Response Log list. According to our conversation with the office of Brenda Noxon on February 28, March 1 and 2, 2005, the subject property, located at Sierra College Boulevard and Brace Road, Loomis, Placer County, California, does not appear on the Placer County Toxic, Hazardous Material, and/or Complaint and Incident Response Log lists.

Fire Department

Inquiries were made with the Fire Department at Roseville, General Information-Public File Review-Enforcement-site, in an attempt to determine if there are any files present at that agency which indicate that the subject property is on the city , Hazardous Materials and/or Complaint and Incident Response Log list. According to our conversation with Steve Anderson on February 28, 2005, the subject property does not appear on the Roseville Hazardous Material, and/or Complaint and Incident Response Log lists.

Placer County, Public Works Agency

The property is approximately 18 acres in size, located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California. The parcel map for the area, presented on Plates Number 2, shows the subject property and the neighboring sites. The property has Assessor's Parcel Numbers APN 045-042-011, 012, 023, 034, 035, 036 & 037. We understand that the proposed development will consist of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements. Inquiries should be made with the Placer County, Public Works Agency, Planning Department by the project civil engineer for other related information.

Placer County Agricultural Commissioner's Office

Inquiries were made with the Placer County Agricultural Commissioner's Office in an effort to determine whether the subject property had been used in the past for agricultural purposes, and whether agricultural chemicals had been used on the subject property. According to our phone conversation on February 28, 2005, with Josh Huntsinger at the Agricultural Commissioner's Office, there is no records of the agricultural history on the subject property or of agricultural chemical use on the subject property at this time. We were also informed that this office normally keeps the records for two years only.

Air Pollution Control District

The Sacramento Metropolitan Air Quality Management District was contacted by telephone, in an effort to determine whether the air in the study area is in attainment status according to State and Federal standards, and to determine whether any Air Standards Violations have been issued to the subject property or to sites within a one-half (½) mile radius of the subject property. According to our conversation with the office of Air Quality Management District, on February 28, 2004, the information will be released upon written request. Additional information will be presented as an addendum, upon request.

REVIEW OF PROPERTY - PAST OWNERSHIP AND USE

Our office had conversations with Tina Davis, escrow title officer of Fidelity National Title Company of Redwood City, Dennis Wagstaffe of Wagstaffe & Wagstaff , Redwood City, owner representative, and Dunmore Communities of Roseville, California, in order to attempt to determine past history of the ownership and use of the above subject property. A preliminary title report of the above subject project, dated January 12, 2005, was prepared by Fidelity National Title Company.

Donald B. Tanklage and Carole F. Tanklage Foundation, a nonprofit public benefit corporation is the present owner of the property. It is our understanding that Donald and Carole Tanklage own the property for more than 25 yeas and Dunmore is in agreement to buy the property. The property is approximately 18 acres in size located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California. The property has Assessor's Parcel Numbers APN 045-042-011, 012, 023, 034, 035, 036 & 037. At the time of our site observation, there were two residential structures on the site. Surrounding sites are vacant lots/residential structures on north and east and commercial structures/vacant lots, on south and west. We understand that the proposed

development will consist of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements.

AERIAL PHOTOGRAPH REVIEW

The aerial photographs is a screening tool designed to assist professionals in evaluating potential liability on a target property resulting from the past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. Aerial photographs, taken from available recent, back to the property's obvious first developed use or back to 1940, whichever is earlier, will be reviewed when available.

The aerial photographs taken in 1952, 1962, 1984, 1993 and 1998, depicts the subject property, were reviewed. The aerial photographs taken in 1952, depicts the subject property as a vacant lot with no structure on the site and no indication of Interstate Highway 80. The aerial photographs taken in 1962, depicts the subject property as a vacant lot with no structure on the site. Interstate Highway 80 and the Sierra College Intersection were in place. The aerial photographs taken in 1993, depicts the neighboring residential structures on the north and the new residential subdivision on the east side of the subject property. The aerial photo taken in 1952, 1962, 1984, 1993 and 1998 are presented in Appendix "A".

GEOLOGIC AND HYDRO GEOLOGIC FEATURES

The area of the subject site lies in the western margin of Sierra Nevada province. The Sierra Nevada extends about 400 miles, terminating in the north at Lassen Peak in the Cascade Range province. The rock and structural patterns of the Sierra disappear beneath the lavas of the Cascades and the volcanic and sedimentary cover of the northern Sacramento Valley. To the south, Sierra grades into the Tehachapi Mountains, which enclosed the southern end of the Great Valley. The Sierra basement terminates near the western margin of the Great Valley, presumably in contact with the Franciscan formation. The Sierra is from 40 to 100 miles wide. Its elevations vary from 400 feet at the Great Valley boundary to summits of more than 14,000 feet adjacent to the Basin Ranges. (Norris & Webb, 1976).

The foothills and mountains of the Sierra Nevada and the Sacramento Valley are the result of a complex geologic history, some aspects of which are unclear even now (Butte County Planning Department, L. Painter, 10-94). The old bedrock, or metamorphic base rock, series of the Sierra

Nevada has been subjected to an intense deformation resulting in dynamically metamorphosed rocks. Intense folding and faulting have produced an area of steep, commonly eastwardly dipping, northwesterly striking bedrock series through the center of the Sierra Nevada. This bedrock series is bound on the east and west by zones of active and potentially active faults.

In the eastern portion, granite has intruded into the older metamorphic bedrock. These intrusives may extend to the west under the metamorphics at the relatively shallow depth. Contact between the granitic intrusives and metamorphics is in many cases marked by seismic evidence which indicates faulting may be continuing today.

On the west, the sediment of the Sacramento Valley overlaps the rocks of the Sierra Nevada foothills. These sediments, for the most part, are relatively flat and dip gently west to southwest with only minor faulting and folding parallel to the structural trend of the valley and the Sierra Nevada range.

The area containing the subject site is mapped by Charles W. Jennings, 1977, fifth printing 2000, Geologic map of California, as Mesozoic granite, quartz monzonite, granodiorite, and quartz diorite.

SITE OBSERVATION

A visual reconnaissance of the subject property was conducted, on February 4, 2005, prior to the compilation of this report. The subject property is approximately 18 acres in size, located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California.

The site is irregular in shape and the general topography of the area is flat terrain. At the time of our site observation, there were two residential structures, appeared to be occupied, at the approximate corner of Brace Road and Starlite Lane, north east part of the site. The site was covered with moderate growth of grass. weeds and a number of native trees.

Surrounding sites are vacant lots/residential structures on north and east and commercial structures/vacant lots, on south and west. The photographs of the area around the subject property are presented on Plates Number 3 through 6, Appendix A. We understand that the proposed development will consist of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements.

SUMMARY

This Environmental Site Assessment, Phase I, Report is prepared pursuant to the scope of work and limitations specified within this document.

The subject property is approximately 18 acres in size, located at the south east corner of Sierra College Boulevard and Brace Road, Loomis, Placer County, California. We understand that the proposed development will consist of a new subdivision for construction of one/two story wood frame single family residential structures and related improvements.

As reported above, our office conducted a field reconnaissance of the site and surrounding area, a review of the regulatory agencies' records as well as interviewed regulatory officials and other individuals to obtain information concerning the known and potential use, storage, disposal and/release of hazardous materials at the subject property. Chemical analysis of soil and groundwater samples to quantify levels of contamination is not within the scope of work to develop a Phase I, Environmental Site Assessment report . No evidence of recognized environmental conditions in connection with the subject property was found at this time.

Executive Summary, Overview Map, Detail Map, Map finding Summary, Physical Setting Source Addendum, Physical Setting Source Summary, Physical Setting Source Map Findings and Physical Setting Source Records Searched are presented in the Executive Summary, Appendix B. Additional information will be presented upon request.

CONCLUSIONS AND RECOMMENDATIONS

This assessment has revealed no evidence of recognized environmental conditions in connection with the subject property at this time. However, should there be a need to conduct an investigation into a specific question not addressed in this report, contact our office immediately regarding your concerns.

Any existing septic tanks and/or water/dry wells, if any, should be abandoned/removed pursuant to the Environmental Management Requirements. We recommend that our firm be retained to perform observations during the demolition of the structures as well as the cleaning process to verify that the recommendations have been properly interpreted and implemented. Additional recommendations may be presented during the demolition and cleaning process.

LIMITATIONS

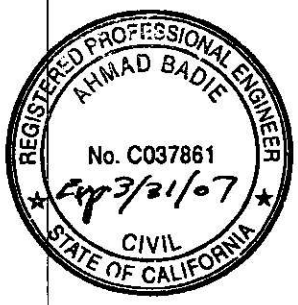
This report was compiled as a Phase I, Environmental Site Assessment for the subject project. In preparing this report Soil Search Engineering, SSE, has engaged the services of Environmental Data Resources, Inc., EDR, of Milford Connecticut.

This report contains information and data provided to Soil Search Engineering, by several sources. SSE in no way warrants the accuracy or completeness of the information provided to this investigation by those sources. It should be noted that when an assessment is completed without adequate subsurface exploration or chemical screening of soil and groundwater beneath the site, as in this study, no statement of scientific certainty can be made regarding latent subsurface conditions which may be the result of on-site or off-site sources.

This report contains information obtained from a variety of public and other sources. No warranty expressed or implied, is made whatsoever in connection with this report. SSE specifically disclaims the making of any such warranties, including without limitation, merchantability or fitness for a particular use or purpose.

The findings and conclusions of this report are not scientific certainties, but rather, probabilities based on professional judgement concerning the significance of the data gathered during the course of this investigation. SSE is not able to represent that the site or adjoining land contains no hazardous waste, oil, or other latent condition beyond that detected or observed by SSE during the Phase I, Environmental Site Assessment.

The possibility always exists for contaminants to migrate through surface water, air, or groundwater. An investigation to determine whether or not contaminants are present in the surface and subsurface soil is not within the scope of work required to produce the "Phase I, Environmental Site Assessment".



Chemical analysis of soil and groundwater samples to quantify levels of contamination is also not within the scope of work required to develop a "Phase I, Environmental Site Assessment". Our office has not been provided with specific criteria for the development of this report other than a request to evaluate the property in question for possible problems related to toxic or hazardous agents, nor have we been directed to address any specific questions concerning the site.

This report is the property of SSE and prepared exclusively for the specified client and project to develop environmental data to aid in the evaluation of the subject project. This report shall not be reproduced or used for any other purposes without express written consent of our firm. This report is applicable only to the investigated site and should not be utilized for any other site. Should there be a need to conduct an investigation into a specific question not addressed in this report, contact our office immediately regarding your concerns.

Environmental Data Resources, Inc.
Aerial Photography Print Service

Environmental Data Resources, Inc.'s (EDR) Aerial Photography Print Service is a screening tool designed to assist professionals in evaluating potential liability on a target property resulting from past activities. ASTM E 1527-00, Section 7.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. The ASTM standard requires a review of *reasonably ascertainable standard historical sources. Reasonably ascertainable means information that is publicly available, obtainable from a source with reasonable time and cost constraints, and practically reviewable.*

To meet the prior use requirements of ASTM E 1527-00, Section 7.3.4, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-00 requires *"All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historical sources as are necessary, and that are reasonably ascertainable and likely to be useful."* (ASTM E 1527-00, Section 7.3.2, page 12.)

Aerial Photographs

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Aerial photographs are a valuable historical resource for documenting past land use and can be particularly helpful when other historical sources (such as city directories or fire insurance maps) are not reasonably ascertainable. The EDR Aerial Photograph Print Service includes a search of local aerial photograph collections flown by public and private agencies. EDR's professional field-based researchers provide digitally reproduced historical aerial photographs at ten year intervals.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STATE ASTM STANDARD

CAL-SITES: Formerly known as ASPIS, this database contains both known and potential hazardous substance sites. The source is the California Department of Toxic Substance Control.

A review of the Cal-Sites list, as provided by EDR, has revealed that there is 1 Cal-Sites site within approximately 1 mile of the target property.

Lower Elevation	Address	Dist / Dir	Map ID	Page
FOREST PRODUCTS MANUFACTURING,	ANTHONY COURT	1/2 - 1 WSW	10	14

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 3 Cortese sites within approximately 0.5 miles of the target property.

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 01/10/2005 has revealed that there are 4

LUST sites within approximately 0.5 miles of the target property.

GOVERNMENT RECORDS SEARCHED/DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 12/14/04
Date Made Active at EDR: 02/03/05
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 02/01/05
Elapsed ASTM days: 2
Date of Last EDR Contact: 02/01/05

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/14/04
Date Made Active at EDR: 02/08/05
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 12/21/04
Elapsed ASTM days: 49
Date of Last EDR Contact: 12/21/04

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

GEOCHECK® - PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

LOOMIS PROPERTY
SIERRA COLLEGE BLVD, BRACE RD
LOOMIS, CA 95650

TARGET PROPERTY COORDINATES

Latitude (North):	38.808800 - 38° 48' 31.7"
Longitude (West):	121.204300 - 121° 12' 15.5"
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	655919.9
UTM Y (Meters):	4296883.5
Elevation:	334 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

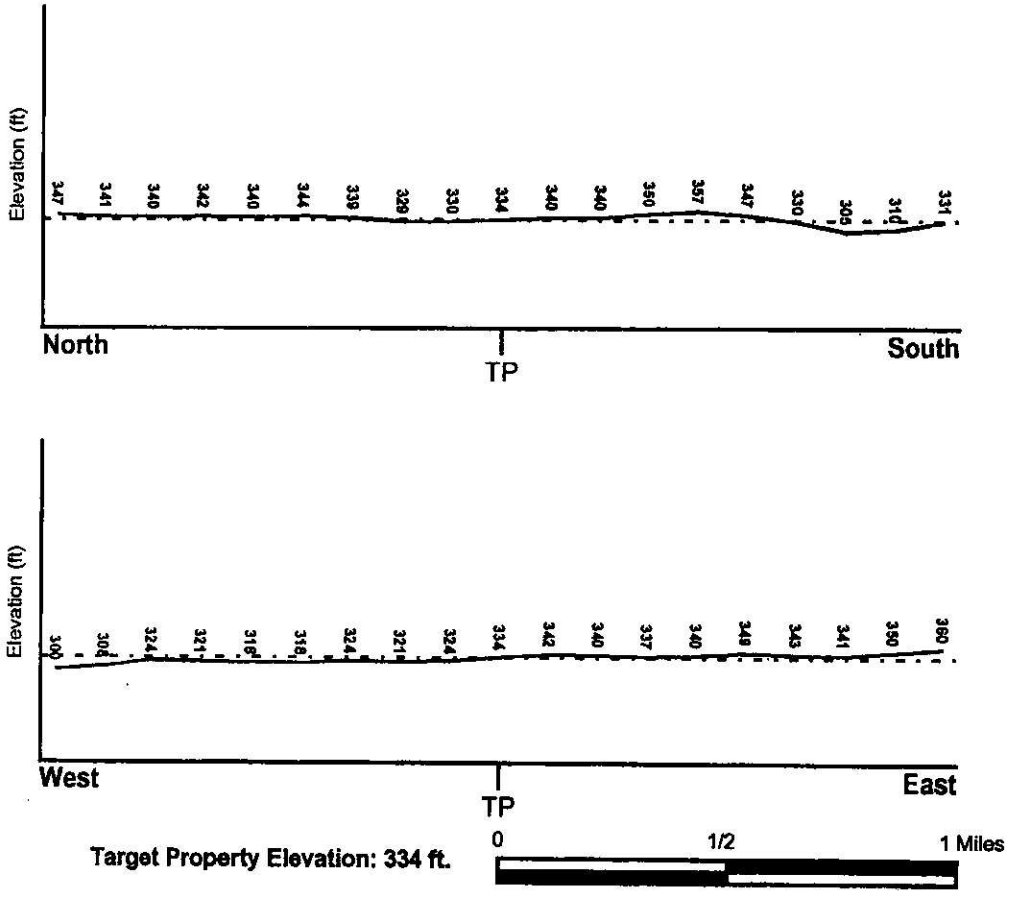
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map:	38121-G2 ROCKLIN, CA
General Topographic Gradient:	General WNW
Source:	USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
PLACER, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property:	0607210001A
Additional Panels in search area:	0602390418D 0602420005C

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
ROCKLIN	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Mesozoic
System:	Jurassic
Series:	Jurassic
Code:	Jg *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Jurassic granitic rocks

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	ANDREGG
Soil Surface Texture:	coarse sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 20 inches
Depth to Bedrock Max:	> 40 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	15 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 7.30 Min: 5.60
2	15 inches	29 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 6.50 Min: 5.60
3	29 inches	33 inches	weathered bedrock	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: gravelly - coarse sandy loam
sandy loam
unweathered bedrock

Surficial Soil Types: gravelly - coarse sandy loam
sandy loam
unweathered bedrock

Shallow Soil Types: clay

Deeper Soil Types: unweathered bedrock

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW[R] Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations for District 2, 3, 5 and 6
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

DEED-IN-LIEU OF FORECLOSURE

THE UNDERSIGNED GRANTORS DECLARE:

(1) The grantee herein was the foreclosing beneficiary.
(2) The amount of the unpaid debt together with costs was: $3,000,000.00
(3) The amount paid by the grantee over and above the unpaid debt was: #1.00
(4) The documentary transfer tax is: - 0 -
(5) Said property is in the City of Loomis, County of Placer, State of California.

FOR VALUABLE CONSIDERATION, receipt of which is hereby acknowledged, STEPHEN C. PATTERSON AND VIRGINIA A. PATTERSON, TRUSTEES OF THE PATTERSON FAMILY TRUST hereby **GRANT** to DONALD B. TANKLAGE AND CAROLE F. TANKLAGE FOUNDATION, a nonprofit public benefit corporation, the following described real property in the City of Loomis, County of Placer, State of California, described as follows:

SEE LEGAL DESCRIPTION ATTACHED AS EXHIBIT "A"

RECITALS

This Deed-in-Lieu of Foreclosure is an absolute conveyance the grantors having sold said real property to the grantee for a fair and adequate consideration such consideration in addition to that above recited being full satisfaction of all personal obligations of the Trustors under that certain promissory note dated August 31 2005. Said note is secured by the deed of trust executed by STEPHEN C. PATTERSON and VIRGINIA A. PATTERSON, Trustees of the Patterson Family Trust to FIDELITY NATIONAL TITLE COMPANY, a California Corporation as trustee, for the benefit of DONALD B TANKLAGE AND CAROLE F. TANKLAGE FOUNDATION a non profit public benefit corporation, as beneficiary recorded August 31 2005 as instrument No. 2005-0116417, Official Records of Placer County. Said deed of trust is NOT being reconveyed and remains secured against the said real property.

ST

Grantors declare that this conveyance is freely and fairly made.

Dated: 10/11, 2011

ESTOPPEL AFFIDAVIT

Affidavit of Individual Giving Deed in Lieu of Foreclosure

STATE OF CALIFORNIA

COUNTY OF PLACER

STEPHEN C. PATTERSON and VIRGINIA A. PATTERSON, as Co-trustees of the Patterson Family Trust, being first duly sworn, depose and say:

That they are the identical parties who made executed and delivered that certain grant deed to the DONALD B. TANKLAGE AND CAROLE F. TANKLAGE FOUNDATION, a non profit public benefit corporation dated 1-1 2011, conveying the real property situated in the City of Loomis, County of Placer, State of California, more particularly described in Exhibit "A" attached hereto.

That afiants now are and at all times herei mentioned were STEPHEN C. PATTERSON and VIRGINIA A. PATTERSON.

That the aforesaid Deed is intended to be and is an absolute conveyance of the title to said premises ot the Grantee named herein, and was not and is not now intended as a mortgage, trust conveyance, or security of any kind; that it was the intention of affiants as Grantors in said Deed to convey, and by said Deed these affiants did convey to the Grantee therein all their right, title, and interest absolutely in and to said premises; that possession of said premises, subject to the possessory rights of tenants therein, has been surrendered to the Grantee;

That in the execution and delivery of said Deed, affiants were not acting under any misapprehension as to the effect thereof, and acted freely and voluntarily and were not acting under coercion or duress;

That the consideration for said Deed was and is cancellation of all debts, obligations, costs and charges of STEPHEN C. PATTERSON, VIRGINIA A. PATTERSON and the Patterson Family Turst secured by that certain Deed of Trust heretofore existing on said property executed by STEPHEN C. PATTERSON and VIRGINIA A. PATTERSON, Trustees of the Patterson Family Trust to FIDELITY NATIONAL TITLE COMPANY, a California Corporation as trustee, for the benefit of DONALD B TANKLAGE AND CAROLE F. TANKLAGE FOUNDATION a non profit public benefit corporation, as beneficiary recorded August 31, 2005 as instrument No. 2005-0116417, Official Records of Placer County.

That said deed of trust is NOT being reconveyed and remains secured against the said real property.

That at the time of making said Deed affiants believed and now believe that the aforesaid consideration therefore represents the fair value of hte property so deeded;

This affidavit is made for the protection and benefit of the Grantee in said Deed, its successors and assigns and all other parties hereafter dealing with or who may acquire an interest in the property herein described, and particularly for the benefit of Fidelity National Title Company which is about to insure the title to said property in reliance thereon and any other title company which may hereafter insure the title to said property.

That affiants and each of them will testify declare depose or certify before any competent tribunal officer or person in any case now pending or which may hereafter be instituted to the truth of the particular facts herein above set forth.

Dated: 10/11, 2011

STEPHEN C. PATTERSON, Trustee

VIRGINIA A. PATTERSON, Trustee

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

SEC Brace Rd and Sierra Colle	2 Ada, Suite 250
Loomis, CA 95650	Irvine, CA 92618-0000
EDR Inquiry # 4722099.4	Contact: Karin Hagan

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:		*Coordinates:*	
P.O.#	NA	**Latitude:**	38.809213 38° 48' 33" North
Project:	201720162	**Longitude:**	-121.203369 -121° 12' 12" West
		UTM Zone:	Zone 10 North
		UTM X Meters:	655995.90
		UTM Y Meters:	4297138.22
		Elevation:	335.81' above sea level

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

Subject: Biological Resources Constraints Analysis for APNs 045-042-035-000, 045-042-034-000, 045-042-037-000 and 045-042-036-000 in the City of Loomis, Placer County, California

Dear Ms. Carroll:

Rincon Consultants, Inc. (Rincon) is pleased to submit to Kleinfelder this biological resources constraints analysis for the approximately 17-acre property located at the corner of Sierra College Boulevard and Brace Road in the City of Loomis, Placer County, California (Assessor's Parcel Numbers [APNs]: 045-042-035-000, 045-042-034-000, 045-042-037-000 and 045-042-036-000). This report documents the existing conditions of the proposed development area within these parcels (hereafter known as the "project site"), identifies sensitive biological resources that represent potential constraints to development of the project, and provides recommendations to address any potential constraints associated with such resources.

PROJECT LOCATION AND DESCRIPTION

The project site is located on the southeast corner of Sierra College Boulevard and Brace Road in the Town of Loomis, Placer County, California (Figure 1). A small portion of the project site includes a proposed driveway that is south of the Town limits, within Placer County. The site is approximately one quarter-mile north of Interstate 80 and about 25 miles northeast of the City of Sacramento. The parcel lies within the United States Geological Survey (USGS), *Rocklin, California* quadrangle (approximate center coordinates 38.809060°N, 121.204165°W, WGS 84) and within the Secret Ravine watershed (Hydrologic Unit Code Number 180201110101 – U.S. EPA, 2016) within the Dry Creek basin. Folsom Lake occurs about six miles to the southeast.

Land uses surrounding the project site consist of single residence homes and multiple residence apartments, commercial development, and undeveloped open space with vegetation communities similar to that which occurs on the project site (Photographs 1 and 2). The project site is bordered on the western side by a major surface street, Sierra College Boulevard (Photograph 3). The project site consists of oak woodland savannah, with groundcover

understory dominated by non-native grasses (Photographs 4 and 5). Open areas between trees are dominated by non-native annual grasses and some riparian vegetation occurs at the mouth of two culverts allowing water to drain from the project site under Sierra College Boulevard.

METHODOLOGY

This biological constraints analysis provides a desktop review and field reconnaissance survey to document the biological conditions of the project site and to provide information on the potential constrains to development of the project due to the presence of sensitive biological resources. Information on biological resources was compiled from a variety of publicly available sources including:

- Aerial maps,
- California Natural Diversity Database (CNDDB) (CDFW 2016a),
- California Native Plant Society (CNPS) Rare and Endangered Plant Inventory (CNPS 2016),
- Biogeographic Information and Observation System (BIOS) (CDFW 2016b),
- Special Animals List (CDFW 2016c),
- Special Vascular Plants, Bryophytes, and Lichens List (CDFW 2016d)
- U.S. Fish and Wildlife Service (USFWS) Critical Habitat Portal (USFWS 2016a),
- USFWS Information for Planning and Conservation (IPaC) (USFWS 2016b),
- USFWS National Wetland Inventory (NWI) (USFWS 2016c),
- U.S. Geological Survey (USGS) National Hydrography Dataset (NHD) (USGS 2016), and
- Placer County online GIS data.

Finally, a review of the publicly available California Habitat Connectivity Project (CHCP) data, available as GIS layers in BIOS (CDFW 2016b), was conducted to determine if the study area overlays any potential wildlife movement corridors. The sources outlined above provide a fairly coarse desk top assessment of the biological conditions of the study area consistent with the high-level evaluation of potential constraints to development from sensitive biological resources.

Mr. Eric Schaad, Rincon Senior Biologist, conducted a reconnaissance-level field survey on September 19, 2016, between the hours of 1000 and 1130. Average temperatures were approximately 89 to 92 degrees Fahrenheit (˚F), with less than ten percent cloud cover and winds of zero to two miles per hour. The purpose of the reconnaissance-level field survey was to document existing site conditions, and to evaluate the potential for the presence of sensitive plant communities, special status plant species, special status wildlife species, habitat for nesting birds, jurisdictional wetlands or other waters, riparian habitat, and other biological conditions that may present a constraint on the project. The field survey included visual inspection of the entire project site, during which Mr. Schaad recorded general site conditions and biological resources encountered.

The potential presence of special status species is based on the literature review and field

survey, which are intended to assess general habitat suitability within the project site only. Definitive surveys to confirm the presence or absence of special status species were not performed and are not included in this analysis. Definitive surveys for special status plant and wildlife species generally require specific survey protocols, extensive field survey time, and are required to be conducted at specific time periods. The findings and opinions included in this report are based exclusively on the above methodology.

EXISTING SITE CONDITIONS

Vegetation Communities and General Land Cover Types

The project site occurs in a region that consists of a patchwork of open, undeveloped space interspersed with urban and residential development. One sensitive vegetation community, Northern Volcanic Mudflow Vernal Pool (Holland code: 44132), is reported as occurring within two miles of the project site (CDFW 2016a); however, no evidence of this community type was detected during the reconnaissance survey. Evidence of regular disking is apparent throughout the project site and the majority of herbaceous vegetation on site is ruderal regrowth (Photograph 6). The project site generally consists of oak woodland savannah dominated by oak trees and non-native grasses and weedy forbs. In some instances, oak woodlands are considered sensitive vegetation communities and require additional impact avoidance and/or mitigation considerations. Trees occurring on the project site are a mix of old trees and young saplings. It appears disking was conducted in a manner that avoided damage to trees by avoiding root crowns. Tree species identified on site include:

- California foothill pine (*Pinus sabiniana*)
- California white oak (*Quercus lobata*)
- Interior live oak (*Quercus wislizeni*)
- Italian cypress (*Cupressus sempervirens*)
- White willow (*Salix alba*)
- Freemont cottonwood (*Populus fremontii*)

Grasses and forbs that were identifiable during the reconnaissance level survey consisted of bromes (*Bromus* spp.), wild oat (*Avena* sp.), mustard (*Brassica* sp.), and a single foothill poppy (*Eschscholzia caespitosa*). In general, given the seasonal timing of the survey, grasses and forbs were too dried and dead to be identifiable with certainty (note understory vegetation in photographs), and additional herbaceous species are likely present.

Potentially Jurisdictional Features

No wetlands or waters are identified to occur on the project site according to federal agency databases (USFWS 2016; USGS 2016). Topography varies by less than 15 feet throughout the project site with the lowest areas lying in the center and along on the southern edge of the project site. A low-lying swale runs through the center of the project site; however, no defined channel is currently apparent due to disking and no evidence of water flow was visible. Given surrounding development, no upstream channel exists and the project site could only receive

runoff flow from the streets of the adjacent residential neighborhood to the east. An outflow culvert allows flow off-site to the west under Sierra College Boulevard (Photograph 7).

A second channel occurs along the southern edge of the project site. This channel appears to have been created along with the commercial development adjacent to the south and provides drainage of runoff (Photograph 8). An outflow culvert also exists for this channel on the west side of the project site and running under Sierra College Boulevard. The culver is completely overgrown with vegetation and covered by a buildup of soil and debris. Some vegetation consistent with riparian vegetation community, namely, Freemont cottonwood and white willow, was identified in the southwest of the project site; however, its presence is most likely due to occasional runoff water from the adjacent commercial property and not necessarily the presence of riparian forest.

The region in which the project site occurs is known to support vernal pools (CDFW 2016a; USFWS 2016b). Further analysis is needed to determine if the project site could support vernal pools and vernal pool dependent species. A more detailed study of the soils and topography would be necessary to confirm this conclusion.

Wildlife Movement Corridors

The California Essential Habitat Connectivity project has not identified any wildlife movement corridors to occur on or in the vicinity of the project site (CDFW 2016b). Natural Landscape Blocks and Essential Connectivity Areas are identified well to the east and west, but are outside of the range of any potential project impacts. No Critical Habitat is present on the project site (USFWS 2016a, b)

Special Status Species and Migratory and Nesting Birds

The natural range of special status species of State and federal concern overlaps the region of the study area. Resource agency databases report 31 special status plant species and 12 special status wildlife species with the potential to occur on or within two miles of the project site (CDFW 2016a; CNPS 2016; USFWS 2016b). Of these special status species, nine are State and/or federally listed, including but not limited to, vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), California red-legged frog (*Rana draytonii*), and giant garter snake (*Thamnophis gigas*). Non-listed special status species such as purple martin (*Progne subis*), and white-tailed kite (*Elanus leucurus*) are also reported from the vicinity.

Migratory birds, covered under the Migratory Bird Treaty Act (MBTA), are known to occur and nest in the region of the study area. During the reconnaissance –level survey, a red-shouldered hawk (*Buteo lineatus*) was observed alighting in an oak tree in the center of the project site. Acorn woodpeckers (*Melanerpes formicivorus*) were also observed in abundance. One single, cup-style, stick nest consistent with small raptor species was observed in a large oak tree in the center of the project site (see Figure 1). Suitable nesting habitat is present for a variety of native birds.

REGULATORY SETTING

State and federal resource agencies regulate sensitive biological and waters resources through various laws, policies, and acts. The following is a list of the primary regulations governing impacts to sensitive biological resources that could occur within the study area:

- National Environmental Policy Act (42 U.S. Code [USC], § 4321 et seq.)
- Federal Endangered Species Act (16 USC, § 1531 - 1544)
- Migratory Bird Treaty Act (16 USC § 703 - 711)
- Federal Clean Water Act (33 USC § 1251 - 1376)
- California Environmental Quality Act (Title 14, CA Code of Regulations [CCR] § 753)
- California Endangered Species Act (Fish and Game Code [FGC] § 2050 et seq.)
- Porter-Cologne Water Quality Control Act (Water Code Division 7 and Related Sections)
- Fully Protected Species (FGC § 3511; 4700; 5050; 5515)
- Raptors, migratory birds, and non-game birds (FGC § 3503, 3503.5, 3513, 3800)
- Lake and Streambed Alteration Agreement (LSAA) (FGC § 1600 - 1616)
- Native Plant Protection Act (FGC § 1900 – 1913)

POTENTIAL CONSTRAINTS

Potential Impacts to Special Status Species, and Migratory and Nesting Birds

All 31 of the special status plant species identified from within two miles of the project site have a moderate to high potential to occur, although regular disking that occurs on the site greatly reduces the likelihood that any of these plant species are or will become present. Focused protocol botanical surveys, conducted during the appropriate blooming period, would be necessary to determine presence or absence of plant species with any certainty.

Twelve special status wildlife species are identified from within two miles of the project site. Of these 12 species, only purple martin and white-tailed kite have a moderate to high potential for occurrence based on current site conditions. Further analysis is needed to determine if the project site could support vernal pools and if, therefore, any vernal pool dependent species may potentially occur.

The presence of numerous, large trees presents a high possibility for nesting birds to become present on the project site during the nesting season, generally February through August. Any cutting of trees and clearing of vegetation could impact nesting birds. Prior to any tree cutting or vegetation clearing, a nesting bird survey should be conducted by a qualified biologist experienced in bird species identification and behavior to ensure nesting birds are not present.

Development of the project site generally presents a very low risk to many of the special status species known to occur in the region of the project site due to the disturbed condition of the ground and herbaceous vegetation. The site does present a high potential for nesting birds to be present. If special status species become present in areas proposed for ground disturbance or construction, they could be killed, injured, or indirectly impacted through habitat modification

as a result of project activities. Pre-construction biological surveys, and possibly focused protocol surveys, and the completion of a full biological resources assessment would be necessary to determine the potential for these species to occur within the study area and to evaluate the extent of potential impacts to these species. Recommendations for species- and project-specific mitigation would be based on the results of further analyses.

Potential Impacts to Sensitive Natural Communities

Based on review of aerial imagery, available mapping data, and the reconnaissance-level survey, oak woodland is the only potential sensitive natural communities occurring on the project site. A more detailed study is necessary to determine if soil, topographic, and hydrologic conditions exist that could support vernal pools. Based on the current analysis, no impacts to Sensitive Natural Communities are anticipated to occur as a result of development of the project. If determined to occur thought further analysis, any loss of Sensitive Natural Communities may need to be mitigated through restoration of vegetation communities on or off site, or through acquisition of lands that possess similar or better quality vegetation communities to be preserved in perpetuity.

Potential Impacts to Jurisdictional Waters and Streambeds

Based on review of aerial imagery, online data, and the reconnaissance survey, regulated aquatic resources subject to the permitting authority of the United States Army Corps of Engineers (USACE) and/or the Regional Water Quality Control Board (RWQCB) may occur on the project site. Surface wetland or water features, including riparian vegetation community, subject to the authority of the CDFW may also be present. More detailed analysis is needed to make a determination of potential agency jurisdiction over the low-lying areas and associated vegetation occurring on the project site. Agency jurisdiction is dependent on a number of physical factors, and a formal jurisdictional delineation is recommended. Preparation of a jurisdictional delineation report followed by consultation with the regulatory agencies is necessary to obtain a determination of no jurisdiction. Based on the findings of the recommended delineation, permitting for impacts to wetlands and waters may be necessary through FGC Section 1602, Clean Water Act sections 401 and 404, and/or the Porter-Cologne Water Quality Control Act.

Potential Impacts to Wildlife Movement and Habitat Connectivity

As discussed above, the study area does not lie within any identified Essential Connectivity Area of Natural Landscape Block. Development of the project is not likely to result in the disruption of wildlife movement. Existing residential and commercial development are present on two sides of the site, with I-80 less than 1000 feet to the southeast and a major roadway to the west. These existing developments and transportation features already greatly restrict movement of wildlife to and through the site. Project design measures to enhance wildlife movement around the project may be recommended and could potentially be required by State and federal agencies, if permits or take authorizations are required.

Consistency with Local Biological Policies and Ordinances

The Placer County Tree Preservation Ordinance (Placer County Code, Article 12.16) restricts the cutting of native oak and other trees. Coordination and cooperation with the County may be

required and permits for tree removal may need to be obtained. The Town of Loomis has a Tree Conservation Ordinance (Ordinance No. 252) that restricts the cutting of protected trees or any other activity that could result in the long-term, permanent harm of a protected tree without a permit issued by the Town Manager. Project development activities would need to be reviewed to ensure that they are not in conflict with tree preservation ordinances. No inconsistencies with applicable policies protecting biological resources have been identified.

Consistency with Habitat Conservation Plans

A federal Section 10 habitat conservation plan (HCP) and State Natural Communities Conservation Plan (NCCP) is in development for Placer County and covers the area encompassed by the project site. Known as the Placer County Conservation Plan (PCCP), the goal of the plan is to balance development in Placer County with preservation of open, natural space. A detailed review the PCCP should be conducted to ensure that development of the project is not in conflict with future goals and objectives outlined in the plan.

CONCLUSIONS

The purpose of this report is to provide a general perspective on potential biological constrains to the development of the Loomis Costco project. The approximately 17-acre project site consists of oak woodland savanna dominated by California white oak, interior live oak, and non-native grasses and forbs. Some riparian vegetation was observed where two low-lying swales occur on site and lead to drainage culverts that pass under Sierra College Boulevard. The site has been disked and herbaceous vegetation is primary ruderal. No sign of special status wildlife was present, however, one nest consistent with small raptor species was observed toward the top of an oak tree. A red-shouldered hawk was observed landing in an oak tree during the reconnaissance survey and the site provides ample opportunity for nesting birds. The potential exists for the project to result in impacts to special status plants, nesting birds, and wetlands and waters. Based on existing site conditions, Rincon recommends further analysis during appropriate seasonal timing to conduct botanical surveys, nesting bird surveys, and a jurisdictional delineation.

Sincerely,
RINCON CONSULTANTS, INC.

Phase II Environmental Site Assessment

March 19, 2018
Kleinfelder Project No.: 20172062.001A

Costco Wholesale
9 Corporate Park, Suite 230
Irvine, California 92606

Attention: Mr. Michael Okuma

SUBJECT: Supplemental Phase II Environmental Site Assessment
Proposed Costco Wholesale Warehouse and Fuel Facility
Southeast Corner of Brace Road and Sierra College Boulevard
Loomis, Placer County, California
CW#: 16-0132

Dear Mr. Okuma:

Kleinfelder is pleased to provide Costco Wholesale Corporation (Costco) this report of a Supplemental Phase II Environmental Site Assessment (ESA) of the site of a proposed Costco Wholesale warehouse and fuel facility, located at the southeast corner of Brace Road and Sierra College Boulevard (the Site) in the City in Loomis, Placer County, California (Figure 1). The Supplemental Phase II ESA was performed to further assess concentrations of lead and arsenic in soils, and diesel-range extractable petroleum hydrocarbons (TPH-d) in groundwater, which were previously identified in samples collected by Kleinfelder during April and May 2017.

In summary, the Supplemental Phase II ESA results indicate elevated arsenic and lead concentrations are present in shallow soil across much of the Site, and may have resulted from application of lead arsenate pesticide during former Site use as an orchard. Kleinfelder recommends coordination with a regulatory agency to develop a mitigation strategy appropriate for intended Site use. Groundwater sampling results indicate diesel-range TPH was not present at a concentration at or above its laboratory reporting limit, so no further groundwater assessment is recommended.

The following sections provide a Site description and background information and discuss the Supplemental Phase II ESA methodology and analytical results of its soil and groundwater samples, which were collected at the Site by Kleinfelder during December 2017 and January 2018.

SITE DESCRIPTION AND BACKGROUND INFORMATION

The Site consists of 17.2-acres of undeveloped land located southeast of the intersection of Brace Road and Sierra College Boulevard in the City of Loomis, California. Costco is planning to construct a Costco Warehouse with fuel facility at the Site, and initially requested Kleinfelder to perform a Phase I ESA of the Site. Kleinfelder performed the Phase I ESA, which identified recognized environmental conditions including former use of the Site as an orchard and the presence of a retail gasoline station on the property adjoining to the south of the Site. Costco

Copyright 2018 Kleinfelder

24411 Ridge Route Dr., Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

then requested Kleinfelder to perform a Limited Phase II ESA of the Site to address findings of the Phase I ESA and collect baseline environmental data before Site redevelopment.

The Limited Phase II ESA field activities occurred in April and May, 2017, and are discussed in further detail in Kleinfelder's report issued to Costco during August 2017.[1] The Phase II ESA included collection of soil, groundwater and soil vapor samples that were analyzed by a subcontracted laboratory. Kleinfelder compared the soil analytical results to soil "Tier 1" Environmental Screening Levels (ESLs) issued by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB). The "Tier 1" ESLs were designed to protect properties with unrestricted land and water use, addressing media including soil, groundwater, and soil vapor, along with a range of concerns including direct exposure human health risks, impact to drinking water, vapor intrusion, and impact to aquatic life. Use of the Tier 1 ESLs applies the most conservative ESL for each considered constituent of concern. Soil analytical results were also compared to human-health risk-based screening levels for residential and commercial/industrial soil recommended in the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), Office of Human and Ecological Risk (HERO) Human Health Risk Assessment (HHRA) Note Number (No.) 3, for analytes having such values. For those analytes without published DTSC-SLs, Kleinfelder compared the measured concentrations to the US EPA's Regional Screening Levels (RSLs) for residential and industrial soil (for Hazard Quotient of 1.0). Groundwater analytical results were compared to groundwater Tier 1 ESLs. A summary of the findings of the Limited Phase II ESA follows:

- Organochlorine pesticides (OCPs) were either not present in the soil samples at concentrations at or above laboratory reporting limits or their measured concentrations did not exceed respective soil ESLs, DTSC-SLs, and RSLs (as applicable).
- TPH and VOCs were either not present in the soil samples at concentrations at or above laboratory reporting limits or their measured concentrations did not exceed respective soil ESLs, DTSC-SLs, and RSLs (as applicable).
- Arsenic was present in many Site soil samples, with the concentrations of shallow soil from several locations exceeding the soil "Tier 1" arsenic ESL and the arsenic DTSC-SLs for residential and commercial/industrial soil. It has been acknowledged by regulatory agencies, including the DTSC, that background concentrations of arsenic in California soils commonly exceed established arsenic human-health risk-based screening levels. The arsenic concentrations of surface and near-surface soil samples collected at the Site are most variable, whereas the concentrations tend to be generally lower in deeper soil samples. Maximum arsenic concentrations did not exceed the arsenic Total Threshold Limit Concentration (TTLC) that is one characteristic of a California-hazardous waste. Further vertical and horizontal assessment for arsenic in soil was recommended.
- Lead concentrations in two shallow soil samples exceeded the Tier 1 lead ESL and the lead residential soil DTSC-SL; however, they did not exceed the DTSC-SL for commercial/industrial soil. Four lead concentrations also exceeded 10 times the lead Soluble Threshold Limit Concentration (STLC) of 5 mg/L. One of these samples was further analyzed for soluble lead using the waste extraction test (WET) procedure

[1] Kleinfelder, 2017. Letter report with subject "Limited Phase II Environmental Site Assessment, Proposed Costco Wholesale Warehouse and Fuel Facility, Southeast Corner of Brace Road and Sierra College Boulevard, Loomis, Placer County, California, CW#: 16-0132." August 30.

Copyright 2018 Kleinfelder

discussed in California Code of Regulations (CCR) Title 22 Appendix II. The result did not exceed the STLC.

- Except for cobalt, concentrations of the various other metals present in the soil samples were below their respective human health risk-based screening levels. One soil sample, collected from 7 feet below ground surface (bgs), contained a cobalt concentration exceeding the cobalt human health risk-based screening levels. The chromium concentration of the same sample exceeded 10 times the chromium STLC. The elevated cobalt and chromium concentrations in this sample may be from native minerals present in the Site region that are associated with the decomposed granite beneath the Site vicinity. Reported concentrations of each metal present (including arsenic) were below their respective threshold values for Federal and California hazardous waste.
- Groundwater analytical results indicated TPH-d was present at a concentration above the diesel ESL.
- VOC groundwater analytical results indicated VOCs were not present in the samples at concentrations at or above their respective reporting limit.
- Soil vapor analytical results indicated VOCs were not present in the samples at concentrations at or above their respective reporting limits.

As requested by Costco, Kleinfelder has performed this Supplemental Phase II Environmental Site Assessment to further assess concentrations of lead and arsenic in soil, and TPH-d in groundwater. The assessment is discussed in detail in the following section.

SUPPLEMENTAL PHASE II ESA SCOPE OF SERVICES

Health and Safety Plan Preparation

Prior to initiation of field activities, Kleinfelder updated its Site-Specific Health and Safety Plan (HSP) containing information regarding potential chemical and physical hazards, monitoring equipment, and contingency plans for emergencies during the field activities. The HSP was based on the general knowledge of chemical characteristics of materials reportedly present on the Site. Based on the proposed field services and probable environmental conditions, it was assumed that Level D Protection (personal protective equipment including gloves, steel-toe rubber boots, hard hat, and eye protection) would be adequate for performing the field activities described herein. An upgrade was not required during the field work.

Permit Procurement

Prior to initiation of field activities, and on Costco's behalf, Kleinfelder obtained the permit required for well installation activities from Placer County Department of Health and Human Services, Environmental Health Services. The well permit (copy attached) was issued on December 7, 2017.

Bore Location Marking and Geophysical Utility Clearance and Survey

Kleinfelder and its utility locating subcontractor, Ground Penetrating Radar Systems, Inc., marked the bore locations and buried utility lines in proximity to them on December 7, 2017. In addition, and as required by State of California law, Underground Service Alert of Northern/Central California and Nevada (USA North) was notified, on December 4, 2017.

Copyright 2018 Kleinfelder

Soil Sampling

The limited soil sampling activities initially included advancement of 35 bores (designated Bores SB-01 through SB-35), each to an approximate total depth of 3 feet bgs, and collecting soil samples from the bores. Based on laboratory results of the collected samples, 23 additional bores (designated Bores SB-36 through SB-60) were proposed, to laterally assess the extent of impact in several areas where elevated lead and arsenic concentrations appeared to be present. Bore advancement and soil sampling activities at these additional locations, each to an approximate total depth of 3.5 feet bgs, were performed on December 7, 8, and 15, 2017, and January 24 and 25, 2018.

Each bore was advanced using a hand auger or direct-push drilling rig. After completion of soil sampling, the bore was backfilled with neat cement grout, and the surface was patched using soil from the immediately surrounding area.

The soil samples were collected from the hand auger bucket, and promptly transferred into laboratory-provided, 4-ounce glass jars. After a jar was filled with soil, it was capped with its lid, labeled with pertinent sampling information, and placed into an ice-chilled cooler for temporary storage until delivered to the analytical laboratory.

Kleinfelder field staff, under the supervision of a State of California-registered Professional Geologist, observed the sampled soils, logged them consistent with Unified Soils Classification System visual-manual methods specified in ASTM International's Designation D 2488, and prepared field lithologic logs of the soils encountered during the drilling activities.

Groundwater Sampling Activities

On December 15, 2017, in an effort to perform "grab" groundwater sampling in the southern portion of the Site where the fuel facility is to be constructed, three bores (designated Bores GW-1 through GW-3) were advanced at the Site using the drilling subcontractor's track-mounted, direct-push drilling rig. Bore GW-1 was advanced to an approximate depth of 18 feet bgs, at which it encountered refusal, and Bores GW-2 and GW-3 encountered refusal at approximately 6 feet bgs. The driller temporarily placed 1-inch diameter polyvinyl chloride (PVC) casing with slotted PVC well screen at the bottom in each bore, and allowed time for groundwater to enter the bore. At the end of the field day, no groundwater was evident. Pursuant to Placer County requirements, the three bores were abandoned by backfilling with cement grout, and each location was capped with soil from the immediately surrounding area.

On January 24, 2018, Kleinfelder returned to the Site with the drilling subcontractor and its track-mounted drilling rig equipped with hollow stem augers, and the rig was used to drill a new bore adjacent to the location of each bore advanced on December 15, 2017. Bore GW-1 was drilled to an approximate depth of 18.5 feet bgs, at which it encountered refusal caused by apparent bedrock. A 2-inch diameter PVC well was constructed in the bore using 5 feet of well screen containing machine-cut, 0.010-wide slots, and blank casing above it. The screen was placed from 18.5 feet to 13.5 feet bgs. Monterey 2/20 sand filter pack was then placed into the annulus around the casing, from the bottom of the bore to approximately 11.5 feet bgs, bentonite chips were placed above that to approximately 9.5 feet bgs, and neat cement grout was placed above that nearly to the ground surface. A 6-inch diameter well vault was placed in cement at the surface, to prevent unauthorized access to the well.

KLEINFELDER 24411 Ridge Route Dr., Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

Bore GW-2 was drilled to a depth of approximately 11 feet bgs, at which it encountered refusal on apparent bedrock. A 2-inch diameter PVC well was constructed in the bore, similar to Well GW-1, except Well GW-2's screen interval is set from approximately 11 feet to 6 feet bgs, the top of its sand filter pack is at approximately 5 feet bgs, and its bentonite chips extend to approximately 4 feet bgs.

Bore GW-3 was drilled to a depth of approximately 10.5 feet bgs, at which it encountered refusal on apparent bedrock. As with the other two bores, a 2-inch diameter PVC well was constructed, except its screen interval is set from approximately 10.5 feet to 5.5 feet bgs, the top of its sand filter pack is at approximately 4.5 feet bgs, and its bentonite chips extend to approximately 3.5 feet bgs.

On January 25, 2018, prior to purging and sampling a given well, the groundwater level in the well and its total depth were gauged, and then the well was developed, purged, and sampled. The groundwater volume purged from each of Wells GW-1 and GW-3 was approximately 5.3 gallons, equivalent to approximately 3.3 saturated well casing volumes for Well GW-1 and 4.7 saturated well casing volumes for Well GW-3. The volume purged from Well GW-2 was approximately 3.2 gallons, equivalent to approximately 2.4 saturated well casing volumes. A few hours after purging, groundwater was sampled using a peristaltic pump. The samples were collected in laboratory-provided containers. Copies of completed Groundwater Sampling Data Sheets documenting the monitoring and purging are attached.

Laboratory Analyses

Soil Samples. The soil samples were submitted to a subcontracted California Environmental Laboratory Accreditation Program-accredited laboratory, California Laboratory Services (CLS), for analysis of arsenic and lead using US EPA Method 6010B. In addition, if a reported concentration of an individual metal in a given sample exceeded 10 times its California Title 22 Soluble Threshold Limit Concentration (STLC), the sample was analyzed for the soluble metal using the California Waste Extraction Test and US EPA Method 6010B. Based on their total lead concentrations, 16 samples were analyzed for soluble lead in this manner.

Groundwater Samples. The three groundwater samples collected from Wells GW-1 through GW-3 were submitted to CLS for analysis of TPH-d using US EPA Method 8015B.

FIELD OBSERVATIONS AND ANALYTICAL RESULTS

Field Observations

Subsurface soil at the Site was observed to consist of silty sand and silty clayey sand, underlain by poorly-graded sand. The soil samples collected emitted no noticeable hydrocarbon or other chemical odor, nor did they contain obvious indications suggestive of potential contamination, such as hydrocarbon like or other chemical-like staining.

Groundwater was not encountered in the shallow bores used for the arsenic and lead sampling, nor in initial Bore GW-1 that was advanced to an approximate depth of 18 feet bgs during the December 15, 2017 "grab" groundwater sampling effort. On January 24, 2018, groundwater was encountered in Bores GW-1, GW-2 and GW-1 at respective depths of 14 feet, 11 feet, and 6 feet bgs. On January 25, 2018, the respective measured groundwater depths in Wells GW-1 through GW-3 (prior to their development, purging, and sampling) were 8.78 feet, 3.25 feet,

Copyright 2018 Kleinfelder

and 3.63 feet below the given well's top-of-casing reference point. In each well, the groundwater surface measured on January 25, 2018 was above the top of its screen interval, by distances ranging from approximately 2 feet to 5 feet depending on the given well.

Soil Sampling Analytical Results

Analytical results of the soil samples are summarized as follows:

- As indicated in Table 1, 91 discrete shallow soil samples (of which 56 were collected from approximately 0.5 foot bgs and 35 from approximately 3 feet bgs) were analyzed for arsenic and lead. Arsenic was present at a concentration at or above its laboratory reporting limit in 67 samples (including 53 samples from 0.5 foot bgs and 14 samples from 3 feet bgs), with reported concentrations ranging from 1.0 mg/kg to 31 mg/kg. Sample SB-09-0.5, collected from an approximate depth of 0.5 foot at Location SB-09, contained the highest reported arsenic concentration.
- Lead was present at a concentration at or above its reporting limit in 74 of the 91 samples (including each sample from 0.5 foot bgs and 18 samples from 3 feet bgs), with reported concentrations ranging from 2.6 mg/kg to 160 mg/kg. Sample SB-09-0.5 also contained the highest reported lead concentration.

CLS's laboratory reports for its soil sample analyses are attached. Kleinfelder's evaluation of the soil analytical results is provided in the subsequent "Evaluation of Analytical Results" section of this report.

Groundwater Sampling Analytical Results

As indicated in Table 2, three groundwater samples, collected from Wells GW-1 through GW-3, were analyzed for TPH-d. The results indicated TPH-d was not present in the samples at concentrations at or above its laboratory reporting limit.

CLS's laboratory report of its groundwater sample analyses is attached. Kleinfelder's evaluation of the groundwater analytical results is provided in the subsequent "Evaluation of Analytical Results" section of this report.

EVALUATION OF ANALYTICAL RESULTS

Soil Sampling Analytical Results Evaluation

To evaluate measured concentrations of arsenic and lead present in the soil samples, they were compared to February 2016 soil "Tier 1" ESLs for arsenic and lead, and to January 2018 lead DTSC-SLs for residential and commercial/industrial soil. Kleinfelder also compared the measured concentrations to the US EPA's June 2017 RSLs for residential and industrial soil (for Hazard Quotient of 1.0). These screening values are included in Table 1.

Also, in consideration of concentration thresholds for California and Federal hazardous waste, reported concentrations of arsenic and lead were compared to its respective CCR Title 22 TTLC value. The reported concentrations were also compared to 10 times the metal's STLC value and 20 times its Federal Toxicity Characteristic Leaching Procedure (TCLP) value. These screening values are included in Table 1.

KLEINFELDER 24411 Ridge Route Dr., Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

As Table 1 indicates, arsenic concentrations ranging from 1.0 mg/kg to 31 mg/kg in 67 soil samples (including 53 soil samples collected at approximately 0.5 foot bgs and 14 soil samples collected at approximately 3 feet bgs) exceed the arsenic "Tier 1" soil ESL (0.067 mg/kg) as well as both the arsenic residential and commercial/industrial soil DTSC-SLs (0.11 mg/kg and 0.36 mg/kg, respectively) and RSL for residential soil (0.68 mg/kg), with the concentrations of several samples also exceeding the RSL for industrial soil (3.0 mg/kg). The samples collected at Location SB-09 contained the highest arsenic concentration reported for both sampling depths. Regulatory agencies including the DTSC and US EPA have acknowledged arsenic background concentrations of soils in California commonly exceed established arsenic human-health risk-based screening levels. It is possible that the arsenic concentrations present in the 0.5-foot and 3-foot bgs soil samples represent Site background concentrations for soil at those depths. The reported arsenic concentrations do not exceed the TTLC threshold for a California hazardous waste, and none warranted testing of the samples for soluble arsenic.

As Table 1 indicates, lead was present at a concentration at or above its reporting limit in 74 of the 91 samples (including each sample from 0.5 foot bgs and 18 samples from 3 feet bgs), with reported concentrations ranging from 2.6 mg/kg to 160 mg/kg. Lead concentrations of 11 shallow soil samples exceed the soil "Tier 1" lead ESL (80 mg/kg) and the lead residential soil DTSC-SL (also 80 mg/kg), but are below the DTSC-SL for commercial/industrial soil of 320 mg/kg. Each reported lead concentration is below the lead RSLs for residential and industrial soil (400 mg/kg and 800 mg/kg, respectively). Lead concentrations of 21 samples exceed 10 times the lead STLC of 5 mg/L. These 21 samples were assessed for soluble lead using the CA WET. The soluble lead result of one sample, SB-09-0.5, was equal to the STLC of 5.0 mg/L. This sample was further analyzed using the TCLP, with the result below the lead TCLP limit (Table 1).

Based on the analytical results summarized above, arsenic and lead are present in shallow soil at the Site at concentrations that exceed their respective soil Tier 1 ESLs and residential soil DTSC-SLs. In addition, arsenic concentrations of many of the samples exceed the DTSC-SL for commercial/industrial soil.

Groundwater Sampling Analytical Results Evaluation

As Table 2 indicates, TPH-d was not present in the groundwater samples from Wells GW-1 through GW-3 at concentrations at or above the laboratory reporting limit. To evaluate the TPH-d reporting limit, it was compared to the SFBRWQCB's February 2016 TPH-d "Tier 1" ESL for groundwater. This screening level is included in Table 2. The laboratory reporting limit is below the ESL.

CONCLUSIONS AND RECOMMENDATIONS

Kleinfelder's evaluations of the analytical results of samples collected during the subject Limited Phase II ESA have revealed the following:

- Arsenic concentrations in shallow soil exceeded the arsenic "Tier 1" soil ESL, the arsenic residential soil DTSC-SL, and the DTSC-SL for commercial/industrial soil. However, it has been acknowledged by regulatory agencies, including the DTSC, that background concentrations of arsenic in soils in California commonly exceed established arsenic human-health risk-based screening levels. Arsenic concentrations do not exceed the TTLC threshold for a California hazardous waste.

Copyright 2018 Kleinfelder

- Lead concentrations in 11 shallow soil samples exceed the “Tier 1” lead ESL (80 mg/kg) and the lead residential soil DTSC-SL (80 mg/kg), although they are below the DTSC-SL for commercial/industrial soil (320 mg/kg). Lead concentrations of 21 soil samples were more than 10 times the lead STLC of 5 mg/L, so these samples were analyzed for soluble lead using the WET. The results of one sample (SB-09-05) was equal to the 5.0-mg/L STLC. The sample was analyzed by the TCLP, the result of which did not exceed the TCLP limit.
- Based on the soil analytical results, Kleinfelder recommends that soil disturbed during Site redevelopment activities be sampled, with the samples to be analyzed for lead and arsenic, to assess appropriateness for reuse of the soil on Site and to establish an analytical waste profile for its off-Site transportation and disposal if it is found not to be suitable for reuse.
- It is possible that some of the elevated arsenic and lead concentrations present in shallow soil across much of the Site resulted from application of lead arsenate pesticides during former use of the Site as an orchard. Kleinfelder recommends coordination with a regulatory agency to develop a mitigation strategy appropriate for the intended Site use.
- The groundwater analytical results indicated diesel-range TPH was not present at a concentration at or above its laboratory reporting limit. No further groundwater assessment is recommended.

LIMITATIONS

Kleinfelder performed this assessment and prepared this report in accordance with generally accepted standards of care that exist in California at this time. This report may be used only by Costco and only for the purposes stated, within a reasonable time from its issuance but in no event later than 5 years from the report’s date. All information gathered by Kleinfelder is considered confidential and will be released only upon written authorization of Costco or as required by law. Non-compliance with any of these requirements by Costco, unless specifically agreed to in advance by Kleinfelder in writing, will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, but only to the extent of any such non-compliance by Costco. Further limitations applicable hereto may be set forth in Costco’s written agreement with Kleinfelder covering the work performed herein.

Kleinfelder’s professional opinions and recommendations are based on a limited number of field observations and tests, designed, collected, and performed in accordance with the generally accepted engineering practice that exists at the time. Consequently, no warranty or guarantee, expressed or implied, is intended or made.

Notes:

TTLC	California Code of Regulations Title 22 Total Threshold Limit Concentration.
STLC	California Code of Regulations Title 22 Soluble Threshold Limit Concentration.
TCLP	Toxicity Characteristic Leaching Procedure.
mg/kg	Milligrams per kilogram.
mg/L	Milligrams per liter.
bgs	Below ground surface.
6010B	United States Environmental Protection Agency analytical method number.
WET	California Code of Regulations Title 22 Waste Extraction Test.
NA	Sample not analyzed for indicated analyte.
ND<2.47	Analyte not present at concentration at or above indicated laboratory reporting limit.
Tier I ESL	San Francisco Bay Regional Water Quality Control Board Tier 1 Environmental Screening Level for soil (February 2016).
DTSC-SL	Recommended soil screening level provided in California Environmental Protection Agency, Department of Toxic Substances Control, Office of Human and Ecological Risk (HERO) Human Health Risk Assessment Note No. 3 (January 2018).
RSL	US EPA Regional Screening Level for soil (November 2017).
60.8	Result shown in bold font is higher than Tier I ESL.
65	Result shown in yellow-highlighted background is higher than 10 times the analyte's STLC.
110	Result shown in orange-highlighted background is higher than 20 times the analyte's TCLP.
NL	Analyte or value is not listed.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

ABBREVIATIONS
WOH - Weight of Hammer
WOR - Weight of Rod

UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D 2487)

COARSE GRAINED SOILS (More than half of material is larger than the #200 sieve)	**GRAVELS** (More than half of coarse fraction is larger than the #4 sieve)	CLEAN GRAVEL WITH <5% FINES	Cu ≥4 and 1≤ Cc≤3		**GW**	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES

Portland cement grout with 5-percent bentonite

2-in. diameter Schedule 40 solid PVC riser

Hydrated bentonite chips

Monterey 2/20 sand filter pack

2-in. diameter Schedule 40 0.010-in. wide slotted PVC screen

The bore was terminated at approximately 18.5 ft. below ground surface.

GROUNDWATER LEVEL INFORMATION:
- Groundwater was observed at approximately 14 ft. below ground surface during drilling.
- Groundwater was observed at approximately 9 ft. below ground surface at the end of drilling.
- Groundwater was observed at 8.78 ft. below top of casing before purging and sampling.

GENERAL NOTES:
ft. = feet.
in. = inches.
O.D. = outer diameter.
ppmv = parts per million by volume.
A photoionization detector (PID) was used for environmental field screening.

Groundwater was not observed during drilling or after completion.
GENERAL NOTES:
ft. = feet.
in. = inches.
O.D. = outer diameter.
ppmv = parts per million by volume.
A photoionization detector (PID) was used for environmental field screening.
The bore was backfilled with Portland cement grout mixed with 5-percent bentonite on December 07, 2017.

Hor.-Vert. Datum:	Not Available	**Drilling Equipment:**			
Plunge:	-90 degrees	**Drilling Method:**	See Drilling Method Column		
Weather:	Sunny, Clear	**Borehole Diameter:**	3 in. O.D.		

Depth (feet)	Drilling Method	Sample Type	Sample Number	Recovery (NR=No Recovery)	PID (ppmv)	Graphical Log	FIELD EXPLORATION
							Surface Condition: Grass
							Lithologic Description
	Hand Auger		SB-19-0.5		0.0		**Well-Graded SAND with Clay (SW-SC)**: dark brown, moist
			SB-19-3		0.0		**Well-Graded SAND (SW)**: brown, dry
5							
10							
15							

The bore was terminated at approximately 3.5 ft. below ground surface.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.
GENERAL NOTES:
ft. = feet.
in. = inches.
O.D. = outer diameter.
ppmv = parts per million by volume.
A photoionization detector (PID) was used for environmental field screening.
The bore was backfilled with Portland cement grout mixed with 5-percent bentonite on December 08, 2017.

FIELD EXPLORATION

Depth (feet)	Drilling Method	Sample Type	Sample Number	Recovery (NR=No Recovery)	PID (ppmv)	Graphical Log	Surface Condition: Grass / Lithologic Description
0	Hand Auger	☒	SB-48-0.5		0.0		**Well-Graded SAND with Clay (SW-SC)**: dark brown, moist
							Well-Graded SAND (SW): red, dry

The bore was terminated at approximately 3.5 ft. below ground surface.

GROUNDWATER LEVEL INFORMATION:
Groundwater was not observed during drilling or after completion.
GENERAL NOTES:
ft. = feet.
in. = inches.
O.D. = outer diameter.
ppmv = parts per million by volume.
A photoionization detector (PID) was used for environmental field screening.
The bore was backfilled with Portland cement grout mixed with 5-percent bentonite on January 25, 2018.

Paolo Dizon
Kleinfelder (Irvine)
2 Ada Ste 250
irvine, CA 92618

Project Name: Costco Loomis

Enclosed are the results of analyses for samples received by the laboratory on 12/07/17 16:48. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

CA SWRCB ELAP Accreditation/Registration number 1233

Notes and Definitions

QM-5	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
ICP/MS	It was run by ICP/MS (EPA method 200.8/6020).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified)
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Enclosed are the results of analyses for samples received by the laboratory on 12/08/17 11:55. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

CA SWRCB ELAP Accreditation/Registration number 1233

Notes and Definitions

QM-5	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
ICP/MS	It was run by ICP/MS (EPA method 200.8/6020).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified)
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Enclosed are the results of analyses for samples received by the laboratory on 01/25/18 15:30. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

CA SWRCB ELAP Accreditation/Registration number 1233

Notes and Definitions

QM-5	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
QM-4X	The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified)
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Enclosed are the results of analyses for samples received by the laboratory on 02/02/18 08:32. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

Enclosed are the results of analyses for samples received by the laboratory on 02/02/18 08:47. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director
