Subject: Kearny Mesa Community Plan Update
Hazardous Materials Technical Study
San Diego, California

Dear Ms. Dramko,

We are pleased to submit our Hazardous Materials Technical Study Report for the Kearny Mesa Community Plan Update in San Diego, California. This report identifies hazardous materials release properties within the Kearny Mesa Plan area and the relative significance of these releases to proposed land use in the Plan area.

Respectfully submitted,

THE BODHI GROUP, INC.

1. INTRODUCTION

The Bodhi Group, Inc. (Bodhi Group) has completed a Hazardous Materials Technical Study (HMTS) in support of the Kearny Mesa Community Plan Update (Project). The Project area is a major industrial, office, and commercial center located in central San Diego (Figure 1).

The purpose of the Kearny Mesa Community Plan Update is to continue to guide growth and development to the Kearny Mesa Community. The plan describes goals for enhancing the community and managing change. The Plan will provide land use designations for implementation through the corresponding zoning and policies to address issues important to the community (AECOM, 2017) There are currently three proposed land use zoning scenarios for future redevelopment incorporating open spaces and parks with urban, industrial, commercial, and residential land use.

This HMTS addresses the presence and levels of hazardous chemicals that could have potentially adverse effects to the proposed land uses of the Project area. Locations within the Project area where hazardous chemicals and petroleum have been used, stored, conveyed, and/or dispensed, and properties where there have been spills or unauthorized releases of hazardous chemicals or petroleum to the subsurface will be identified and assessed based on the degree of potential adverse effects to human health, the environment, and groundwater resources. The HMTS was prepared in compliance with Compensation, and Liability Act (CERCLA), Section VIII 'Hazards and Hazardous Materials' of (Environmental Checklist Form) of the California Environmental Quality Act (CEQA) Statute and Guidelines and closely follows the American Society for Testing and Materials (ASTM) standard for preparing Phase I Environmental Site Assessment (ESA) reports, discussed below (ASTM, 2013).

Consistent with the requirements of a Phase I ESA, this study identified locations (also referred to as properties in this report) in or adjacent to the Project area where hazardous chemicals and petroleum have been used, stored, conveyed, or dispensed, and properties where there have been documented spills or unauthorized releases of hazardous chemicals or petroleum to the subsurface. However, the investigation was performed on a much larger regional area than a Phase I ESA, and individual properties were not analyzed with the same level of detail.

Based on the type of hazardous materials released, the toxicity and persistence of the chemicals involved, location, depths of affected media, residual contamination, and date of release, we have reviewed hazardous material properties in the Project area, screened those properties with the potential to have adverse effects to future land use, evaluated the types of hazardous chemicals present, medium affected, and potential adverse effects and presented our opinion regarding the potential exposure pathways, and possible mitigation measures.

Intrusive investigation, including the collection and analysis of subsurface media samples, was beyond the scope of this evaluation. Intrusive investigations (referred to as Phase II ESAs) may be required as properties are redeveloped to confirm or revise the findings of this study of the presence of hazardous materials and petroleum constituents below ground and to assess the adverse effects at the individual property-level of detail.

1.1. Significant Assumptions

Documentation and data referred to in the preparation of this assessment are assumed to be complete and correct and have been used and referenced with the understanding that the Bodhi Group assumes no responsibility or liability for their accuracy. The conclusions contained herein are based upon such information and documentation that was available at the time of preparation of this report. Because the Project area and subsurface conditions may change significantly over time and additional data may become available, conclusions drawn in this report are limited to current conditions and may not be relied upon on a significantly later date or if changes have occurred in the Project area that were not known at the time of report preparation.

1.2. Limitations and Exceptions

Reasonable efforts were made to identify properties of potential adverse effects from hazardous materials. "Reasonable efforts" are limited to information gained from recorded database information and regulatory records readily-accessible to the public. Such methods may not identify contaminant sources that are not listed in information readily-accessible to the public. While some observations and discussion in this report may address conditions and/or operations that may be regulated, the regulatory compliance of those conditions and/or operations is outside the scope of this evaluation. Nothing in this report constitutes a legal opinion or legal advice.

This evaluation does not address asbestos-containing materials (other than those in shallow soil), radon, lead in drinking water, wetlands, protected environments and habitat, threatened or endangered species, industrial hygiene concerns, human health risk assessment, indoor air quality, high voltage power lines, geotechnical conditions, cultural and historical resources, health and safety, and mold. Monetary valuation was not performed for this assessment. In some instances, we may provide opinion on the potential for adverse health effects from the intrusion of volatile chemicals from the subsurface into indoor air.

1.3. User Reliance

This report was prepared for the use solely and exclusively by Helix Environmental Planning, Inc. and the City of San Diego. The report is not for the use or benefit of, nor may it be relied upon by, any other person or entity for any purpose without the advance written consent of the Bodhi Group. In the preparation of this report, the Bodhi Group has used the degree of care and skill ordinarily exercised by a reasonably prudent environmental professional in the same community in the same time frame given the same or similar facts and circumstances.

2. PROJECT AREA DESCRIPTION AND SETTING

2.1. Location and Description

The Project area, located in the city of San Diego, within San Diego County, encompasses approximately 4,000 acres and is bounded by State Route 52 (SR52) on the north and Interstate 805 (I-805) and Interstate 15 (I-15) on the west and east, respectively. The southern boundary consists of properties just south of Aero Drive, and properties along I-15 as far south as Friars Road (Figure 1) Montgomery Field Airport, located in the southern portion of the Project area, is excluded from this scope as it is being assessed under a separate project.

The majority of the Project area sits at an elevation of between 390 and 430 North American Vertical Datum of 1988 in feet (NAVD 88), and slopes to between 70 feet and 300 feet NAVD 88 on the eastern portion, along I-15.

2.2. Project Area Geology and Regional Hydrogeology

The following sections describe the geology and the hydrogeology within the Project area.

2.2.1. Project Area Geology

In increasing order of age, soils in the Project area consist of artificial fill (both documented and undocumented), young alluvium, very old paralic deposits (Units 9, 8 and 8a), the Mission Valley Formation, Stadium Conglomerate and Friars Formation (Kennedy and Tan, 2008). Descriptions of the general characteristics of these units are presented below.

- Af – Artificial fill (late Holocene). Manmade fill underlies large portions of the Project area. Most areas underlain by fill are associated with construction of buildings or infrastructure.
- Qya – Young alluvial flood-plain deposits (Holocene and late Pleistocene). Young alluvial flood-plain deposits are characterized as poorly consolidated, poorly sorted, permeable floodplain deposits of sandy, silty, or clay-bearing alluvium.
- Qvop9 – Very old paralic deposits, Unit 9 (middle to early Pleistocene). The Unit 9 deposits consist of poorly sorted, moderately permeable, well consolidated, reddish brown, interfingered strandline, beach, estuarine, and colluvial deposits composed of siltstone, sandstone, and conglomerate.
- Qvop8 – Very old paralic deposits, Unit 8 (middle to early Pleistocene). The Unit 8 deposits consist of poorly sorted, moderately permeable, well consolidated, poorly to moderately cemented, reddish brown, interfingered strandline, beach, estuarine, and colluvial deposits composed of siltstone, sandstone, and conglomerate.
- Qvop8a – Very old paralic deposits, Unit 8a (middle to early Pleistocene). Unit 8a of the very old paralic deposits is characterized as poorly sorted, moderately permeable, reddish-brown, dune and back beach (“beach ridge”) deposits composed of cross bedded sandstone.
- Tmv – Mission Valley Formation (middle Eocene). The Mission Valley Formation consists predominantly of light olive-gray, soft and friable, fine- to medium-grained marine and non-marine sandstone containing cobble conglomerate tongues.
- Tst – Stadium Conglomerate (middle Eocene). The Stadium Conglomerate contains slightly metamorphosed volcanic and volcaniclastic rocks and quartzite. The conglomerate is very well consolidated and locally very well cemented.
- Tf – Friars Formation (middle Eocene). This formation consists of yellowish-gray, medium-grained, massive, poorly indurated non-marine and lagoonal sandstone and claystone with tongues of cobble conglomerate.

2.2.2. Regional Hydrogeology

According to the Regional Water Quality Control Board (RWQCB) San Diego Basin Plan (RWQCB, 1994), the Project area lies within three separate hydrologic basins. The hydrologic basins and beneficial use information is listed below and the basins are depicted on Figure 2.

- The northwestern portion of the Project area is located in the Miramar Hydrologic Subarea (HSA) in the Miramar Hydrologic Area (HA) of the Penasquitos Hydrologic Unit (HU). The Miramar HA is

excepted from beneficial use for municipal supply and has potential beneficial use for industrial supply.

- The western portion of the Project area is located in the Tecolote HSA in the Tecolote HA of the Penasquitos HU. The Tecolote HA is excepted from beneficial use for municipal supply and does not have any other beneficial uses.
- The eastern portion of the Project area is located within the Mission San Diego HSA in the Lower San Diego HA of the San Diego HU. The Mission San Diego HSA has existing beneficial uses for agricultural, industrial service supply, and industrial processing supply, and potential beneficial use for municipal supply.

Because the Mission San Diego HSA (Figure 2) has potential beneficial use for municipal supply, the water quality should meet California Code of Regulations Maximum Contaminant Levels (MCLs) for drinking water requirements at properties in the Project area within this hydrologic basin (RWQCB, 1994).

Based on a review of previous environmental investigation reports and monitoring well data collected from State Water Resources Control Board-managed GeoTracker website (Geotracker), groundwater levels vary across the Project area and groundwater has been encountered as shallow as 10 feet (or shallower), and deeper than 100 feet bgs. The groundwater flow directions vary within the Project area. Localized groundwater flow direction and groundwater levels can influence the potential adverse effects caused by hazardous chemicals present in groundwater. The general effects of chemicals in groundwater are discussed in Section 4.

The San Diego County Water Authority has classified the Mission Valley portion of the San Diego River to be a principal alluvial aquifer (referred to as the Mission Valley Aquifer). Presently, the City of San Diego, the local water purveyor, is not using this alluvial aquifer for municipal water supply; however, in the future the City may evaluate potential groundwater use from this aquifer (RWQCB, 2012). The Mission Valley aquifer is located outside of the southernmost boundary of the Project area (Figure 2) and any changes in groundwater use to the aquifer are not anticipated to affect the Project at this time.

3. PROJECT AREA HISTORY

The following sections present a general overview of the historical uses of the Project area, as documented through our review of historical aerial photographs and historical topographic maps provided by Environmental Risk Information Services (ERIS) and online resources. The purpose of the aerial photograph and topographic map review is to observe historical use that may have impacted the subsurface in the Project area and may have left residual contamination.

3.1. Historical Aerial Photographs and Topographic Maps

The Bodhi Group reviewed aerial photographs from 1953, 1956, 1966, 1974, 1981, 1985, 1989, 1994, 1996, 2002, 2005, 2009, 2010, 2012, and 2014 from ERIS and Historical Aerials online resources. Topographic maps were also provided by ERIS for years 1903, 1930, 1942/1943 (the Project area was split between years), 1947, 1953, 1967, 1975, 1994, 1996, and 2015. The aerial photographs and topographic maps provided by ERIS are included in Appendix A.

- In the 1903 and 1930 topographic maps, the Project area is depicted as generally vacant and undeveloped with the exception of multiple roads traversing the Project area. Murphy Canyon is

located along the eastern Project area boundary and portions of San Clemente Canyon are present in the northernmost portion of the Project area. Both canyons are depicted as narrow washes or intermittent streams. Adjacent properties are depicted with some roads. Canyons are located north and south of the Project area. The adjacent properties are otherwise undeveloped and a small water body is depicted south of the Project area.

- The 1942 through 1947 topographic maps are similar to the 1930 map with the addition of a "landing field" on the southern portion of the Project area (in a similar location to the present-day Montgomery Field). "Rosedale Landing Field" is depicted west of the Project area.
- Aerial photograph and topographic map coverage were both available for the year 1953. Montgomery Field is located on the southern portion of the Project area and a circular feature, labeled "race track" is located on the northeast portion of the Project area. A main road labeled "Cabrillo Freeway," in a similar configuration to present-day State Route 163, is observed aligned northeast/southwest through the central portion of the Project area. Portions of the Project area appear to be graded, in the initial phases of development. Surrounding communities appear to be under development to the south and southwest of the Project area.
- In the late 1960s Clairemont Mesa Boulevard and Balboa Avenue are in their present-day configurations. The 1966 aerial photograph and 1967 topographic map show multiple structures and associated roads throughout the Project area, including a large industrial General Dynamics (GD) Facility, located south of Clairemont Mesa Boulevard. A road in a similar configuration to present-day I-15 is present along the eastern boundary of the Project area. The Project area appears to have been generally developed for commercial and industrial use, with some residential developments along the western portion. The adjacent properties are observed to be developed on the west and south and remain undeveloped on the east. The area adjacent to the north of the Project area, present-day South Miramar Landfill, appears to be graded and disturbed. According to the City of San Diego's website, the South Miramar Landfill was active by 1959.
- In the 1970s through the 1990s, the Project area and adjacent properties are similar to the previous years with increased development. Aero Drive and SR-52 are in their current configurations on the north and south portions of the Project area, respectively, in the 1974 aerial photograph. I-805 and I-15 border the west and east sides of the Project area, respectively, in the 1974 aerial photograph and 1975 topographic map. Residential development appears to be increasing east of I-15.
- The Project area remains significantly developed with industrial and commercial properties from the 2000s to the present. The GD facility is no longer apparent in the 2002 aerial photograph and the area appears to be in the process of redevelopment. The adjacent properties are developed with residential and commercial properties, and the landfill remains adjacent to the north.

3.2. Fire Insurance Maps

There is no Fire Insurance Map coverage for the Project area.

4. TYPES OF HAZARDOUS CHEMICALS AND EXPOSURE PATHWAYS

Past and present land use in the Project area (historical uses summarized in Section 3.1), including industrial and waste disposal, may have resulted in releases of hazardous chemicals to the environment. In addition, spills and leaks of fuel from locations where fuel was stored and dispensed have impacted the subsurface. Release of hazardous substances along transportation corridors and deterioration of building materials that contained hazardous chemicals could also have impacted the environment.

Releases of these hazardous chemicals can leave residual contamination in soil, soil vapor, and groundwater within the Project area. These chemicals are classified based on their properties, persistence in the environment, and general adverse effects, as described below.

4.1. Total Petroleum Hydrocarbons

Total petroleum hydrocarbons (TPH) is a term used to describe a large family of chemical compounds that originate from crude oil and are used to make petroleum and other industrial products. Benzene, toluene, ethylbenzene, naphthalene, and xylenes are part of the more volatile fractions of TPH (gasoline mixture) and polynuclear aromatic hydrocarbons (e.g., benzo(a)pyrene) are part of the less volatile fractions (diesel and heavier mixtures). Both groups, volatile organic compounds (VOCs) and fractions that are non-volatile, can have adverse health effects based on the type of chemical, routes of exposure (inhalation, direct contact, ingestion), and the mass of chemical available for exposure.

Relative to other classes of hazardous substances, petroleum hydrocarbons will degrade in aerobic conditions (in the presence of oxygen). If present in significant quantities in groundwater, TPH can exist in its own phase (as product) and will float on the surface of the water table (EPA, 2012).

The most common pathways for exposure to the volatile fraction of TPH is inhalation, followed by direct contact (if the pathways of exposure are complete). The most common pathway of exposure to the non-volatile fractions of TPH is direct contact. The inhalation exposure pathway is incomplete (with the exception of TPH-impacted dust particles that can be inhaled in areas of soil disturbance).

4.2. Chlorinated Volatile Organic Compounds

Chlorinated volatile organic compounds (CVOCs) were commonly used for cleaning and degreasing and were associated with dry cleaning, manufacturing, automobile maintenance, and at former military facilities. Some common CVOCs in the environment are tetrachloroethylene (PCE), trichloroethylene (TCE), and their breakdown products, such as cis-1,2-dichlorethene, trans-1,2-dichloroethene, and vinyl chloride. Exposure to CVOCs can result in adverse health effects. CVOCs are generally more persistent and can remain in the environment (soil, groundwater, soil vapor) for extended periods of time. CVOCs can migrate into indoor air from soil vapor and result in adverse health effects from inhalation exposure (EPA, 2012).

4.3. Lead

Lead is a heavy metal with multiple industrial and other applications. Along well-traveled transportation road corridors that existed prior to the phasing out of leaded gasoline in the late 1970s, exposed shallow soil may have been contaminated with aerially-deposited lead (ADL) caused by historical emissions from vehicle exhausts (tetraethyl lead was mixed with gasoline from the 1920s to the 1970s as an anti-knock agent).

Lead-based paint (LBP) can be found on structures built before 1978 (when it was banned in paint). Deteriorating LBP can contaminate shallow soil around the structures. Soil contaminated lead (e.g., from ADL and LBP), when disturbed, can become airborne in dust. Exposure to lead, either through direct contact, inhalation of dust containing lead, or through ingestion (can be a problem in younger children who may ingest deteriorating LBP or soil contaminated with lead) at significant concentrations can result in adverse health effects (lead is a known neurotoxin).

4.4. Other Metals

Metals can be found in manufacturing and industrial facilities and landfills (e.g., arsenic, chromium, mercury, and copper). Although metals can be naturally occurring, in higher concentrations they can be toxic to human health. If released to the environment in significant quantities, metals are more likely to be present in shallow soil. Exposure to metals in soil can occur through direct contact and inhalation of dust containing metals. Some chemicals used in industrial processes, such as hexavalent chromium can contaminate groundwater and threaten drinking water sources.

4.5. Contaminants of Emerging Concern

Because of the many chemicals in commerce, improved methods for detecting chemicals in environmental and biological media, and the increased interest by scientists and the public in understanding the types of toxicity that chemicals may pose, scientists and toxicologists are identifying "emerging chemicals of concern," or ECCs. Recent studies have shown that some of these ECCs can act as endocrine disruptors, disrupting normal hormone function, and can produce effects at the parts per billion or parts per trillion level (EPA, 2017a). Also, effects of some ECCs can be transgenerational - when animals are exposed in utero, effects are transmitted not only to the offspring, but are inherited for many generations thereafter.

Some examples of ECCs include bis-phenol-A, phthalates, arsenic, perchlorate, nonylphenols, synthetic musks and other personal care product ingredients, nitrosodimethylamine, brominated flame retardants, nanoparticles, pharmaceutical wastes, and industrial chemical additives, stabilizers and adjuvants (EPA, 2017a). Many properties within the Project area may contain ECCs and even cases under regulatory oversight may not have been tested for ECCs. ECCs may be present in the subsurface and can be harmful to human health through ingestion, direct contact, and by inhalation.

4.6. Asbestos

Asbestos is a fibrous mineral that occurs naturally in rock and soil (EPA, 2017b). It has been used in a wide variety of building materials such as insulation, roofing materials, and tiles. It has also been commonly used in automobile parts such as brakes and transmissions. Asbestos is likely present in structures within the Project area and may be present in shallow soil near buildings and near busy right-of-way corridors (ROW). The most common route of exposure is through inhalation of tiny particles of deteriorated (friable) asbestos containing materials. Exposure to asbestos is harmful to human health.

4.7. Pesticides

Pesticides are chemicals used for agricultural purposes. Pesticides are commonly found in shallow soil in areas where agricultural use is present or was historically present. Pesticides are potentially harmful to human health through direct contact, and through inhalation. Parts of the Project area may have a history of agricultural use, and it is possible that residual pesticides remain in shallow soil in these areas.

4.8. Polychlorinated Biphenyls

Polychlorinated Biphenyls (PCBs) belong to a broad family of man-made organic chemicals and were manufactured from 1929 to 1979 (when manufacturing was banned). PCBs are chemically stable and have a high boiling point and electrical insulation and because of these properties, were used in a wide range of industrial and commercial applications. PCBs were commonly used in electrical and hydraulic

equipment, as a plasticizer in paints, plastics and rubber manufacturing, and may be found in transformers and capacitators, electrical equipment, hydraulic systems, fluorescent light ballasts, cable installation, oil based paint, plastics caulking, adhesives, and floor finishes (EPA 2018). Even though they are no longer manufactured, PCBs can be released into the environment from past applications, and from the disposal or storage of PCBs wastes. The EPA, International Agency for Research on Cancer, and the National Toxicology Program have concluded that PCBs are a probable human carcinogen (EPA, 2018). If released to the environment, PCBs are more likely to be present in soil (relative to other media) and building materials, and can be harmful to human health through ingestion and direct contact.

5. ENVIRONMENTAL DATABASE SEARCH AND REGULATORY INFORMATION

In order to assess the significance of properties on and in the vicinity of the Project area with documented hazardous waste impacts, a search and review of federal, state, local, and regional environmental regulatory agency databases was conducted for facilities located within the Project area and adjacent properties within a 1/8-mile radius of the Project area. The following sections summarize the results of searches of federal, state, and local databases by ERIS, regulatory agency records, and online database searched.

5.1. Standard Environmental Record Sources

The environmental databases searched ("standard environmental record searches") for properties within the Project area and adjacent properties within 1/8th of a mile. Because of the scope of the HMTS and volume of properties listed, the properties identified on the Database Report were not evaluated with the same level of detail as a Phase I ESA. Accordingly, individual properties that are subject to redevelopment or change in land use should be evaluated at an individual property-specific level of detail.

There are over 100 leaking underground storage tank (LUST) facilities, 250 San Diego County Site Assessment and Mitigation (SAM), and over 400 Hazardous waste properties listed on the database report. Properties with documented releases of chemicals and resulting conditions that could adversely affect the Project were analyzed and the results are summarized in Section 7 of this report. The ERIS Database Report is provided in Appendix B.

5.2. Regulatory Records Review

In addition to the database report, properties regulated for unauthorized releases of chemicals were identified through a search of the State Water Resources Control Board (SWRCB)-managed Geotracker website, the California Environmental Protection Agency Department of Toxic Substances Control (DTSC)-managed EnviroStor website (Envirostor), County of San Diego Department of Environmental Health (DEH) file review, CalRecycle records, and ERIS Database reports. Select files from the regulatory records review are included in Appendix C.

6. EVALUATION OF HAZARDOUS MATERIALS

Based on the Project area history, and review of regulatory records, online databases, and the database report, sources of contamination within and near the Project area with the potential for adverse effects on Project construction and/or land use changes include the following:

- Unauthorized releases of petroleum from storage systems such as underground storage tanks (USTs) and above ground storage tanks (ASTs) can result in impacts from petroleum hydrocarbons, which can contain chemicals of concern in the volatile and non-volatile fractions as discussed previously;
- Unauthorized releases of petroleum products, waste oil, and solvents from vehicle/equipment maintenance and storage that can result in impacts from petroleum hydrocarbons, CVOCs, and metals;
- Unauthorized releases of solvents, metals, and PCBs from industrial processes,
- Lead in shallow soil from ADL and LBP.
- Asbestos from building materials and industrial applications.
- Unauthorized releases of PCBs from electrical equipment, including transformers, waste oil, and building materials that may have contained PCBs.
- Pesticides in shallow soil from former agricultural use in the Project area.

Three hundred and seventy (370) properties with potential hazards identified by CalRecycle, Envirostor, and Geotracker, and one thousand and eighty-three (1083) records listed in the ERIS database report were screened to eighty-eight (88) properties that could result in potential adverse effects to the Project. The full list of properties is presented in Appendix D. Some properties had multiple releases for the same facility and/or address and these have been consolidated to one. The properties and conditions identified were based on at least one of the criteria listed below.

- Properties with documented unauthorized releases of hazardous chemicals or petroleum in or near the Project area.
- Properties with documented residual concentrations of hazardous chemicals in soil in or near the Project area.
- Properties with documented residual concentrations of hazardous chemicals in groundwater in or near the Project area.
- Properties outside the Project area but where hazardous chemicals in the subsurface have the potential to migrate and affect soil, soil vapor and groundwater in the Project area.

The remaining properties that were evaluated for this study and were not included in Section 7 did not meet one of the above criteria. The degree of potential adverse effects differ based on the specifics of each release case and are influenced by the type and quantity of chemicals released (i.e., volatility, solubility, toxicity, persistence), affected media (i.e., soil, groundwater, soil gas), source area concentrations, physical characteristics of the property such as geology, preferential pathways for contaminant migration, and whether the chemicals have effectively attenuated or have been actively remediated to levels that are less than significant.

Properties with documented storage or use of hazardous chemicals in or near the Project area but without an unauthorized release or documented evidence of spills or releases into the subsurface are not considered to have a significant adverse effect at a regional level (i.e., at the level of this study). Additional studies at an individual property-specific level may indicate potential effects that may need to be considered prior to change in land use or redevelopment.

The six potentially complete pathways of exposure of contaminants to receptors from planned land use changes and redevelopment are listed below.

- Long term exposure and potential risks to human health from vapor intrusion of volatile chemicals into occupied structures.
- Long-term exposure to hazardous chemicals in groundwater that may be a source of drinking water and other beneficial municipal use.
- Long-term direct exposure of residents to hazardous chemicals in soil through dermal contact.
- Short-term direct exposure of construction workers to hazardous chemicals in soil through dermal contact.
- Short-term inhalation exposure of construction workers and the public to potential chemicals in dust generated by Project construction. Dust is an irritant on its own, but could also carry contaminants, such as lead, asbestos, polynuclear aromatic hydrocarbons, PCBs, and organochlorine pesticides (ATSDR, 2001).
- Short-term inhalation exposure of construction workers to VOCs that may volatilize from impacted soil and groundwater and may accumulate in trenches during construction. According to data collected from Geotracker, groundwater has been encountered as shallow as approximately 6 feet bgs in some locations within the Project area and may be encountered during subsurface work.

Additionally, standards for evaluating risks to human health are evolving and new emerging contaminants are being discovered that may not have been evaluated in the past. Cases with closed regulatory status may need to be re-evaluated based on evolving standards or new information.

7. HAZARD EVALUATION

The properties determined to be a potential hazard to the planned redevelopment and proposed land use scenarios within the Project area were evaluated with respect to the classes of hazardous chemicals and potential exposure pathways described in Sections 4 and 6.

Of the 88 properties evaluated, twenty-five (25) had documented releases impacting groundwater, eighty-seven (87) had documented releases impacting soil, and sixty-five (65) had document releases impacting soil vapor (more than one medium was impacted on some properties). The mitigation measures recommended for the impacted medium based on the type of hazardous chemicals present are described in the table below. The properties of potential concern included in the table below are illustrated on Figure 3 and are listed in Appendix D.

Table 1 – Hazard Summary and Mitigation Measures

Mitigation Measures	Medium Affected			Types of Hazardous Chemical						
	Ground-water	**Soil**	**Soil Vapor**	Non-Volatile fraction of TPH	Petroleum VOCs	CVOCs	Lead and other metals	PCBs	Pesticides	Asbestos
Construction-Related Measures: health and safety plans, risk management plans, environmental monitoring, waste management and disposal.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Properties located within groundwater basins designated for current or potential municipal beneficial uses may require remediation of impacted groundwater to drinking water standards.	✓			✓	✓	✓	✓			
Vapor intrusion study and appropriate response action may be required.	✓	✓	✓		✓	✓				
Investigation of soil impacted with ADL, LBP, and other hazardous building materials and appropriate response action may be required.		✓					✓	✓		✓

As discussed in Section 4.5, Emerging Contaminants may be present at the properties evaluated or other properties within the Project area; however; have not been documented at the properties evaluated.

8. OPEN UNAUTHORIZED RELEASE CASES WITH ONGOING INVESTIGATIONS

The three properties discussed below are located in or adjacent to the Project area and warrant a more detailed investigation. The properties are included in the table above; however, hazardous chemical releases at these locations have affected large areas (multiple properties) and are undergoing active remediation with regulatory oversight. The facilities and the extent of the impacts to the Project area are discussed below and select regulatory documentation for these properties is included in Appendix C.

8.1. Mission Valley Terminal (9950 San Diego Mission Road)

The Mission Valley Terminal is an active 10.5-acre fuel farm located on the southernmost portion of the Project area. The terminal is owned by Kinder Morgan and portions have been historically been leased to Texaco, Shell, ExxonMobil, and CENCO-Powerine. The facility has been in operation since 1962 and has multiple unauthorized release cases affecting soil, soil vapor, and groundwater. Past releases include approximately 200,000 gallons of gasoline released in the northern manifold, petroleum releases from slop tanks, releases from cracks in the underground T-junction and gasoline releases from a failed pump seal (Bodhi, 2015). The RWQCB issued a Cleanup and Abatement Order on January 3,1992, which was most recently amended in July 2015 (Arcadis, 2018) The facility has been undergoing groundwater and soil gas remediation since 1999 and according to the most recent Groundwater Monitoring Report available on Geotracker (January 2018), residual contaminants of concern remain in soil, soil vapor, and groundwater. Two residual light non-aqueous phase liquid (LNAPL) zones are located within the Project area. Groundwater flow direction was documented to the south/southwest (Arcadis, 2018).

8.2. South Miramar Landfill (San Diego)

Miramar Landfill is separated into three areas; North Landfill, West Landfill, and South Landfill. The majority of the Landfill is located north of the Project area; however, a portion of the South Miramar Landfill is located in the northern portion of the Project area. The South Miramar Landfill is an inactive landfill (case number 9000000363) and is part of the RWQCB's Monitoring and Reporting Program. According to the most recent Water Quality Monitoring report on Geotracker, two sets of wells (SMMW-7S, -7D and SMMW-9S, -9D) are located within the Project area. The flow direction in the shallow zone is reportedly south to north and in the deep zone was documented to flow to the southeast and southwest (Geosyntec 2017). The onsite (deep) wells are located downgradient of the landfill, and concentrations of CVOCs were detected in both the shallow and deep aquifers. Depth to groundwater in the shallow aquifer was most recently measured as shallow as approximately 16 feet bgs and in the deep aquifer as deep as approximately 250 feet bgs within the Project area (Geosyntec, 2017). Based on this information, it is likely that soil and soil vapor, in the footprint of the landfill, and possibly downgradient (south) have also been affected by CVOCs. The North and West Landfills are located approximately 4,500 feet north of the Project area and are not considered a concern to the Project at this time.

8.3. Former General Dynamics Facility (4773 Paramount Drive and 5011 Kearny Villa Road)

The former GD Kearny Mesa Plant has six closed unauthorized release cases and one open unauthorized release case associated with addresses 5011 Kearny Villa Road and 4773 Paramount Drive. The facility was formerly an approximately 242-acre aerospace manufacturing facility, operational between 1989 and 1995. The facility included an underground TCE/trichloroethane storage tank farm where a solvent leak was discovered in 1986 during replacement of the USTs with ASTs (Brown and Caldwell, 2018). Soil

and groundwater assessment was approved by the DEH in 1997 and multiple soil borings were advanced and groundwater wells were installed in three water bearing zones at that time. Soil vapor has also been assessed and human health risk assessments (HHRAs) were performed for portions of the property. The most recent groundwater sampling event (November 2017), indicates elevated concentrations of VOCs remain in groundwater at the property. TCE, 1,1,1-trichloroethane (TCA), and 1,1-dichloroethene (DCE) plumes are located beneath the Spectrum Center Boulevard and Paramount Drive intersection. Groundwater flow direction at the property is to the southeast/east (Brown and Caldwell, 2018). HHRAs were performed at the property in 2008 and 2017 and were reportedly at levels considered less than significant by the EPA for the facility uses at the time (open space, residential, and commercial).

9. CONCLUSIONS AND RECOMMENDATIONS

As part of the Kearny Mesa Community Plan update, the Bodhi Group evaluated over 1,000 properties for potential hazards to the Project area and prepared this HMTS. Information was gathered through multiple sources (ERIS, Geotracker, Envirostor, and CalRecycle) to evaluate the potential environmental hazards to the Project area. Based on the evaluations of the initial properties, the list was screened to 88 properties with potential concerns to the Project area from releases of hazardous chemicals. The 88 properties were then evaluated based on the types of chemicals anticipated to be present, the medium affected, and potentially complete exposure pathways to receptors. Mitigation measures based on the potentially complete exposure pathways are discussed in Section 7. Individual properties within the Project area will need to be individually evaluated at the time of redevelopment. Although over 1,000 database records were screened and 88 properties were evaluated, the possibility of undocumented releases within the Project area exists.

Permitting

Site Code:
Site Facility Type: CLOSED
Program Type: HAZARDOUS WASTE FACILITY
Assembly District: 77
Senate District: 39
Facility Type: UNKNOWN
Facility History:

Kyocera America Inc. (KAI) is located in San Diego and manufactures specialty ceramic and electronic products for military and civilian uses. KAI manufactures ceramic semi-conductor packages using water for various purposes including (a) making cleaning, etching, plating and stripping solutions (some containing cyanide or CN, some containing acids or caustics), (b) rinsing parts ("rinsewaters"), and (c) non-contact cooling. Some (but not all) of the solutions and rinses contain CN and
metals (primarily gold and nickel, but also occasionally tin, lead, and copper).

Starting in 2004, DTSC's Enforcement Program identified violations at KAI for operating a treatment and storage facility without a permit and for not complying with hazardous waste generator requirements. A 2008 order and judgment required KAI to pay a $1.4 million penalty and submit a Permit Application and operational information so DTSC could resolve technical issues of waste determination and applicable regulatory requirements. The judgment allowed KAI to continue operating while the Permit Application is reviewed.

KAI applied for a Series C Standardized Permit on March 13, 2009. The application lists seven units, but also asserts that all of the waste is either non-hazardous or exempt or the treatment is exempt. The permit was withdrawn as this facility was determined to be an Permit by Rule facility.

Site History:

Update 08/25/2016.

From 1969 until it closed in 1995, the former Teledyne Ryan Electronics Facility (Facility) manufactured components for electronic radar and navigational systems. The main manufacturing processes included manufacture of printed circuit boards and aluminum chassis/arrays, brass processing, transistor manufacture, a materials and process laboratory and x-ray photo processing.

The Facility submitted a Part A permit application in 1980, and was issued a Hazardous Waste Facility Permit in 1984. The Facility submitted the intent to close on June 22, 1989, and the Closure Plan was approved on June 22, 1995. Closure activities were completed in 1997. Corrective action activities for soil were initialed in 1996, and were completed in 2000.

Corrective action activities for groundwater were initiated in 2001. A Corrective Action Consent Agreement (Consent Agreement) was negotiated and then signed in June 2001. The Consent Agreement is the regulatory document governing the groundwater investigation at this Facility. The groundwater investigation at this site has been completed, with approval date of January 18, 2013. The work was completed in three phases: Phase I, Phase II, Phase III, and Supplemental Phase III. The reports are available on Envirostor. The results of the RFI revealed concentrations of several contaminants, including 1,1-dichloroethylene, trichloroethylene (TCE), perchloroethylene (PCE), Freon 113 and 1,4-dioxane.

A total of 24 monitoring wells have been installed to date. The groundwater investigation has revealed the presence of two primary water bearing zones beneath the site, a shallow water-bearing zone (A-zone) and a deeper zone (B-zone). The two zones are separated by a moderately impermeable boundary of consolidated and cemented sandstone; however, it appears there may be limited communication between the two zones. The B-zone is terminated by a relatively impermeable shale aquitard. Groundwater in the A-zone reportedly flows to the north-northeast and groundwater in the B-zone flows to the southeast and is consistent with the regional groundwater flow. In September 2008, the USEPA Environmental Indicator Goal of groundwater migration under control was met.

The project is currently in the Corrective Measures Study phase. To demonstrate monitored natural attenuation, four rounds of groundwater monitoring utilizing compound specific isotope analysis, along with other geochemical parameter,s were conducted between November 2013 and July 2014. The report documenting the results was submitted September 2014 and approved on April 16, 2015. The facility submitted the CMS for Groundwater Workplan Addendum on June 22, 2015. This workplan outlines the approach to be taken for completing the Groundwater CMS. DTSC provided comments on August 24, 2015 and the facility submitted responses on October 23, 2015. DTSC approved the document on January 21, 2016. In May 2016, the facility submitted the CMS for groundwater. This document outlines proposed treatment technologies for groundwater and includes a groundwater model. DTSC provided comments on the document on November 30, 2016. DTSC has held two meetings with the facility to discuss the comments on the report; one meeting in December 2016 and the other in April 2017. The facility is in the process of reviewing DTSC's comments.

The facility conducted additional sampling for polycyclic aromatic hydrocarbons (PAHs) on the adjacent vacant parcel on January 12 and 134, 2016. A

report documenting the results of the sampling was submitted on April 15, 2016 and DTSC provided comments on June 13, 2016. An additional risk assessment documenting the current human health risks for decision unit 2 on the vacant parcel was submitted by the facility on October 10, 2016 and DTSC approved both reports on September 21, 2017..

CUF Case: YES
Begin Date: 1989-06-01 00:00:00
How Discovered:
Stop Method:
County: San Diego
Latitude: 32.81998
Longitude: -117.141948
File Location: Local Agency
Potential Media Of Concern: Gasoline
Potential Media Affected: Soil
How Discovered Description:
Stop Description:
Cal Water Watershed Name: San Diego - Lower San Diego - Mission San Diego (907.11)
DWR Groundwater Subbasin Name:
Site History:

Failure to complete and electronically submit a site map with all required content.

Violations

Violation Date: 1/6/2015 ***Violation Program:*** HW
Violation Division: San Diego County Department of Env Health ***Violation Source:*** CERS
Citation: 22 CCR 15 66265.192(h) - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.192(h)
Violation Notes:

Returned to compliance on 02/18/2015.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:
(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Violation Date: 12/4/2014 ***Violation Program:*** HW
Violation Division: San Diego County Department of Env Health ***Violation Source:*** CERS
Citation: 22 CCR 23 66273.34 - California Code of Regulations, Title 22, Chapter 23, Section(s) 66273.34
Violation Notes:

Returned to compliance on 12/10/2014.

Violation Description:

Failure to properly label the following categories of universal waste as:
1) Each batteries or the container in which the batteries are contained as "Universal Waste-Battery(ies)".
2) Each mercury-containing equipment or the container in which the mercury-containing equipment is contained as "Universal Waste -Mercury-Containing Equipment".
3) Each Florescent lamp or the container or package in which the lamps are contained as "Universal Waste-Lamp(s)".
4) Each electronic devices or the container or pallet in or on which the electronic devices are contained as "Universal Waste-Electronic Device(s)".
5) Each CRTs or the container or pallet in or on which the CRTs are contained as "Universal Waste-CRT(s)".
6) A container of CRT glass shall be labeled or marked clearly with the following phrase: "Universal Waste-CRT glass".
7) In lieu of labeling individual electronic devices, CRTs, and/or containers of CRT glass pursuant to subsections d) through f) of this section, a universal waste handler may combine, package, and accumulate those universal wastes in appropriate containers or within a designated area demarcated by boundaries that are clearly labeled with the applicable portion(s) of the following phrase: "Universal Waste-Electronic Device(s)/Universal Waste - CRT(s)/Universal Waste-CRT Glass".

Violations

Violation Date: 9/26/2016 ***Violation Program:*** HMRRP
Violation Division: San Diego County Department of Env Health ***Violation Source:*** CERS
Citation: HSC 6.95 25508.2 - California Health and Safety Code, Chapter 6.95, Section(s) 25508.2
Violation Notes:

Returned to compliance on 10/25/2016.

Violation Description:

Failure to annually review and electronically certify that the business plan is complete and accurate on or before the annual due date.

Violations

Description of Incident: RECYCLING SYSTEM / HOUSING BROKE

Material Spill Information

Chris Code: TCE
CAS No:
UN No:
Amount of Material: 20000
Unit of Measure: POUND(S)
Name of Material: 1,1,1-TRICHLOROETHANE
If Reached Water: YES
Amount in Water: 0
Unit Reach Water: NONE

Calls Information

Potential Media Affected: OTHER GROUNDWATER AFFECTED (USES OTHER THAN DRINKING WATER), SOIL
Potential Contaminants:

1,1,1-TRICHLOROETHANE (TCA)
TRICHLOROETHYLENE (TCE)

Site History:

The General Dynamics Kearny Mesa Facility was first developed in the late 1950s. Building 5, which is part of the Convair Division, was in the center of the facility and was used for assembly and inspection of the launch vehicles and spacecraft manufactured by Space Systems. Currently land use North and West of the facility is commercial and residential. The General Dynamics facility is no longer present at this site.

Facility Information

Program Type: EVALUATION
Status: REFER: LOCAL AGENCY
Summary Link: http://www.envirostor.dtsc.ca.gov/public/profile_report?global_id=60000646

Completed Activities

Activity Type: Completed Activities
Area Name:
Sub Area:
Date Completed: 6/12/2007
Document Type: Site Screening

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB

Doc Link: http://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=60000646&doc_id=6015792
Comments: Site determined to be NFA for EPA.

Potential Media Of Concern:	Diesel
Potential Media Affected:	Soil
How Discovered Description:	During tank Removal
Stop Description:	CLOSE AND REMOVE TANK
Cal Water Watershed Name:	San Diego - Lower San Diego - Mission San Diego (907.11)
DWR Groundwater Subbasin Name:	
Site History:	

The Montgomery Field Air Control Tower had an Underground Storage Tank (UST) removed in 1998. The surrounding soil was found to be contaminated with petroleum hydrocarbons. There is a potentially complete exposure pathway for inhalation due to vapor intrusion into the adjacent building. For further information please see Additional Site Assessment Report for Montgomery Field air Traffic Control Tower dated April 2, 2008, under the Site Documents tab.
