Site History:

This case was opened after contaminated soils were discovered during the removal of 12 gasoline and diesel dispensers and associated piping on the east side of the building on July 15, 2003. Additional contaminated soil was encountered during the removal of 12 dispensers and piping located on the west side of the building on August 12, 2003. During July and August 2003, 37.52 tons of contaminated soil were excavated from the two dispenser areas and removed for disposal offsite. Confirmation soil samples indicated that diesel fuel concentrations at a maximum of 600 mg/kg, remained at 6 of 24 former dispenser locations. The consultant estimated that 8 cubic yards of diesel fuel contaminated soil remained after the excavation. A waste oil tank was removed from the site on July 29, 2005 and soil contamination was discovered in two places associated with the piping which led to the dispenser islands. Additional assessment was conducted in these two areas. Two borings (P4A & P6A) were drilled to 25 feet and soil samples were collected and analyzed. Only one sample, at a depth of four feet, contained diesel fuel at 13 mg/kg. Volatile organic compounds were not detected in any of the samples. The consultant concluded that the limited amount of contaminated soil remaining at the site was not expected to pose a threat to human health or the environment. The contaminated soil was not found to be deeper than four feet below ground surface. The depth to groundwater is estimated to be at least 50 feet based on monitoring wells located northeast of the site, and groundwater in the area is designated as having no existing beneficial uses. The consultant recommended no further action at the site and DEH concurred with this recommendation.

Admin Agency: San Diego County Health Services Dept.

Location: 3700 block Ruffin Road

Description: This incident was caused by a plane that crashed into the ground and damaged the transformer. The Fire Dept used wet water to clean up the crash site. There is a 1/2 mile long fuel streak going down the hill towards the storm drain. The R/P does not know how much (if any) of the non-pcb oil got into the storm drain. The Hazardous Materials response team is at scene. Most of the release is in the soil. The FAA did not let San Diego Gas & Electric onto the scene until 3 this afternoon as there were 2 fatalities at the plane crash.

Violation Notes:

Returned to compliance on 09/17/2015.

Violation Description:

Failure of the owner or operator to conduct inspections and maintain inspection records at the facility of the following tank equipment:
1) Overfill/spill control equipment (e.g., waste-feed cutoff systems, bypass systems, and drainage systems) to ensure that it is in good working order;
2) The aboveground portions of the tank system, if any, to detect corrosion or releases of waste;
3) Data gathered from monitoring equipment and leak-detection equipment, (e.g., pressure and temperature gauges, monitoring wells) to ensure that the tank system is being operated according to its design;
4) The construction materials and the area immediately surrounding the externally accessible portion of the tank system including secondary containment structures (e.g., dikes) to detect erosion or signs of releases of hazardous waste (e.g., wet spots, dead vegetation); and
5) For uncovered tanks, the level of waste in the tank, to ensure compliance with section 66265.194(b)(3).

Site History:

The San Diego Air National Guard (ANG) Station is home to the 147th CBCS of the CA ANG. The CA ANG has occupied the installation since 1988 and has used the property for communications and satellite imagery operations, vehicle maintenance, administrative support, and equipment and materials storage. A preliminary assessment (PA) and site inspection was conducted in January 2009 to identify areas of potential concern based on a review of historical records. These areas of concer (AOCs) include: Storm Water Discharge Area from wash rack and vehicle maintenance bays, Former Underground Storage Tanks, Oil/Water Separators (OWSs), Vehicle Lift Pits, and Battery Pit Closure. Based on the 2009 study reults, additional soil investigation was recommended at the Storm Water Discharge Area, Former Battery Sump, and the OWSs. Groundwater investigation was recommended in the area of the Former Hydraulic Lifts and OWSs, and soil vapor investigation was recommended in the area near the OWSs. A Preliminary Assessment (PA) was conducted in May 2012. The objectives of the PA were to determine if there had been any significant events (such as equipment or mission changes, leaks, or spills) at the Station since the 2009 study that may have impacted the AOCs, and to verify that additional investigation of the AOCs was necessary. No additional impacts were discovered. A Draft Final Site Investigation Report (September 2013) has been submitted. The Final Site Investigation Report (February 2014) has been submitted.

Violation Description:

Failure of the owner or operator to conduct inspections and maintain inspection records at the facility of the following tank equipment:
1) Overfill/spill control equipment (e.g., waste-feed cutoff systems, bypass systems, and drainage systems) to ensure that it is in good working order;
2) The aboveground portions of the tank system, if any, to detect corrosion or releases of waste;
3) Data gathered from monitoring equipment and leak-detection equipment, (e.g., pressure and temperature gauges, monitoring wells) to ensure that the tank system is being operated according to its design;
4) The construction materials and the area immediately surrounding the externally accessible portion of the tank system including secondary containment structures (e.g., dikes) to detect erosion or signs of releases of hazardous waste (e.g., wet spots, dead vegetation); and
5) For uncovered tanks, the level of waste in the tank, to ensure compliance with section 66265.194(b)(3).

Violation Notes:

Returned to compliance on 05/15/2015.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:
(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and
3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Citation: 22 CCR 15 66265.193 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.193

Violation Notes:

Returned to compliance on 05/15/2015.

Violation Description:

Failure of the LQG and/or TP generator, on all new and existing hazardous waste tank systems and ancillary equipment, to meet the following secondary containment requirements:
1) Designed, installed, and operated to prevent any migration of wastes or accumulated liquid out of the system to the soil, ground water, or surface water at any time during the use of the tank system; and
2) Capable of detecting and collecting releases and accumulated liquids until the collected material is removed.
3) Constructed of or lined with materials that are compatible with the waste(s) to be placed in the tank system and shall have sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrological forces), physical contact with the waste to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation (including stresses from nearby vehicular traffic);
4) Placed on a foundation or base capable of providing support to the secondary containment system and resistance to pressure gradients above and below the system and capable of preventing failure due to settlement, compression, or uplift;
5) Provided with a leak detection system that is designed and operated so that it will detect the failure of either the primary and secondary containment structure or any release of hazardous waste or accumulated liquid in the secondary containment system within 24 hours, or at the earliest practicable time if the existing detection technology or site conditions will not allow detection of a release within 24 hours;
6) Sloped or otherwise designed or operated to drain and remove liquids resulting from leaks, spills, or precipitation. Spilled or leaked waste and accumulated precipitation shall be removed from the secondary containment system within 24 hours, or in as timely a manner as is possible to prevent harm to human health or the environment, if removal of the released waste or accumulated precipitation cannot be accomplished within 24 hours.
7) Secondary containment for tanks shall include one or more of the following devices:
a) A liner (external to the tank); b) a vault; c) a double-walled tank; or d) an equivalent device as approved by the Department.
8) The secondary containment systems shall satisfy the following requirements:
a) External liner systems shall be designed or operated to contain 100 percent of the capacity of the largest tank within its boundary; or
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Free of cracks or gaps; and
d) Designed and installed to completely surround the tank and to cover all surrounding earth likely to come into contact with the waste if released from the tank(s) (i.e., capable of preventing lateral as well as vertical migration of the waste).
9) Vault systems shall be:
a) Designed or operated to contain 100 percent of the capacity of the largest tank within its boundary;
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Constructed with chemical-resistant water stops in place at all joints (if any);
d) Provided with an impermeable interior coating or lining that is compatible with the waste being transferred, stored or treated and that will prevent migration of waste into the concrete;
e) Provided with a means to protect against the formation of and ignition of vapors within the vault, if the w

Description of Events: DRIVER OF THE VEHICLE WAS APPROACHING A LEFT TURN ONTO SAN DIEGO MISSION RD. THE ROAD WAS ON A DOWN-HILL PLANE CAUSING AN OFF-CAMBER EFFECT WHILE TURNING. THE ACCIDENT WAS FURTHER EXACERBATED BY THE FACT THAT THE DRIVER WAS TRYING TO MAKE THE TURN BEFORE THE LIGHT TURNED RED WHICH LED TO HIM GOING INTO THE TURN TOO FAST FOR THE ROAD AND VEHICLE SAFETY CONDITIONS. AS THE DRIVER COMPLETED THE TURN ONTO SAN DIEGO MISSION RD. THE LOAD IN THE TANK VEHICLE SHIFTED BECAUSE OF THE SPEED AT WHICH THE TURN WAS EXECUTED CAUSING THE ROLL-OVER. EMERGENCY PERSONNEL WERE CALLED BY THE DRIVER AFTER HE EXTRICATED HIMSELF FROM THE WRECKED VEHICLE. SD FIRE DEPARTMENT SET UP DAMS TO CONTROL THE SPREAD OF PRODUCT THAT WAS LEAKING ROM THE TRAILER DUE TO THE ACCIDENT. SD FIRE SET UP A QUARANTINE AREA AROUND THE ACCIDENT SCENE AND ONLY FIRE DEPARTMENT PERSONNEL WERE ALLOWED INTO THE ACCIDENT SCENE FOR APPROXIMATELY 8 HOURS AFTER THE TIME OF THE ACCIDENT. NRC ENVIRONMENTAL SERVICES INC. (REMEDIATION COMPANY HIRED BY APEX FOR CLEN-UP EFFORTS) WAS ALLOWED IN AT APPROXIMATELY 4AM TO PUMP OFF THE REMAINING PRODUCT FROM THE TANK VEHICLE AND TO START VACUUMING UP PRODUCT THAT HAD LEAKED OUT.

Recommend Actions Taken: SPECIFIC TRAINING FOR ROLL-OVER ACCIDENTS IS PROVIDED TO EACH HAZ-MAT CDL DRIVER DURING ORIENTATION. MR. LUCAS HAD GONE THROUGH THIS TRAINING LESS THAN 60 DAYS PRIOR TO THE ACCIDENT. AFTER THE ACCIDENT A SAFETY MEETING WAS HELD WITH ALL DRIVERS (NOT INCLUDING MR. LUCAS AS HE IS OUT ON WORKER'S COMP) TO READDRESS THIS ISSUE AND RE-STRESS THE IMPORTANCE OF THE SPEED-ADAPTATION PHENOMENON AND LOOKING AT YOUR SPEEDOMETER BEFORE ENTERING A CURVE OR TURN. ALSO STRESSED WAS THE IMPORTANCE OF NOT TRYING TO BEAT TRAFFIC LIGHTS WHEN PERFORMING THEIR NORMAL DUTIES.

Location: Balboa and Genesea at Tecolote Cyn.
Description: Gravity line break caused this release into the nearby creek. This creek is normally dry, however due to the heavy rains, the sewage flowed into the creek mixiing with the rain, causing it to be dilluted when it entered Mission Bay, and clean up was impossible. No impact to drinking water.

Location:	Storm Drain at Scholars Drive and Gilman, UC San Diego Central Utilities Plant
Description:	Caller states substance released due to overflow of water on a cooling tower. Water is treated with Sulfuric Acid and Sodium Hypochlorite; PH levels are 7.2 - 7.4 and Conductivity is 4500 mmho. In addition, overflow was stopped at 1630 hours. Caller states substance made it into a dry storm drain that runs to Rose Canyon Creek but the distance is too far for the substance to make it all the way to the creek. Caller states water that entered the storm drain can't be recovered but it will dry up; no clean up necessary.
