Re: PTS File No: 46158  
Physical Properties Data  
Alhambra Campus Soil Confirmation Sampling

Dear Mr. Blackmer:

Please find enclosed report for Physical Properties analyses conducted upon samples received from your Alhambra Campus Soil Confirmation Sampling project. All analyses were performed by applicable ASTM, EPA, or API methodologies. The samples are currently in storage and will be retained for thirty days past completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

PTS Laboratories appreciates the opportunity to be of service. If you have any questions or require additional information, please give me a call at (562) 347-2502.

Sincerely,  
PTS Laboratories, Inc.

Michael Mark Brady, P.G.  
Laboratory Director

Encl.

 Project No: N/A

SAMPLE ID.	DEPTH, ft.	SAMPLE ORIENTATION (1)	METHODS: ANALYSIS DATE	API RP40/ ASTM D2216		API RP 40		API RP 40			Mod. ASTM D425	API RP40
				MOISTURE CONTENT,		DENSITY		POROSITY, (2)			EFFECTIVE, cm <sup>3</sup> /cm <sup>3</sup>	TOTAL PORE FLUID SATURATIONS (3), % Pv
				% weight	cm <sup>3</sup> /cm <sup>3</sup>	DRY BULK, g/cm <sup>3</sup>	GRAIN, g/cm <sup>3</sup>	TOTAL, cm <sup>3</sup> /cm <sup>3</sup>	AIR-FILLED, cm <sup>3</sup> /cm <sup>3</sup>	WATER-FILLED, cm <sup>3</sup> /cm <sup>3</sup>		
Boring 9a	9.7	V	20160331	5.6	0.084	1.49	2.67	0.440	0.357	0.084	0.175	19.0
Boring 9b	4.75	V	20160331	15.9	0.267	1.67	2.67	0.374	0.107	0.267	0.029	71.3

(1) Sample Orientation: H = horizontal; V = vertical; R = remold

(2) Total Porosity = all interconnected pore channels; Air Filled = pore channels not occupied by pore fluids; Effective = drainage porosity.

(3) Fluid density used to calculate pore fluid saturations: Water = 0.9996 g/cc.

Vb = Bulk Volume, cc; Pv = Pore Volume, cc; ND = Not Detected

PTS File No: 46158  
 Client: Equipoise Corporation  
 Report Date: 04/13/16

**AIR PERMEABILITY DATA - VAPOR TRANSPORT PACKAGE**

Project Name: Alhambra Campus Soil Confirmation Sampling  
 Project No: N/A

METHODS: **API RP40**

SAMPLE ID.	DEPTH, ft.	SAMPLE ORIENTATION (1)	ANALYSIS DATE	25 PSI CONFINING PRESSURE	
				EFFECTIVE PERMEABILITY TO AIR (2), millidarcy	SPECIFIC PERMEABILITY TO AIR (3), millidarcy
Boring 9a	9.7	V	20160331	3620	4390
Boring 9b	4.75	V	20160331	0.25	21.3

(1) Sample Orientation: H = horizontal; V = vertical; R = remold  
 (2) Effective (Native) = With as-received pore fluids in place.  
 (3) Specific = No pore fluids in place.  
 Air = Nitrogen gas.

PTS File No: 46158  
 Client: Equipoise Corporation  
 Report Date: 04/13/16

**HYDRAULIC CONDUCTIVITY DATA - VAPOR TRANSPORT PACKAGE**

Project Name: Alhambra Campus Soil Confirmation Sampling  
 Project No: N/A

**METHODS: API RP40 / EPA 9100**

SAMPLE ID.	DEPTH, ft.	SAMPLE ORIENTATION (1)	ANALYSIS DATE	25 PSI CONFINING STRESS		
				EFFECTIVE PERMEABILITY TO WATER (2,3), millidarcy	HYDRAULIC CONDUCTIVITY (3), cm/s	INTRINSIC PERMEABILITY TO WATER (3), cm <sup>2</sup>
Boring 9a	9.9	V	20160408	39.1	3.90E-05	3.86E-10
Boring 9b	4.9	V	20160408	0.20	2.04E-07	1.99E-12

(1) Sample Orientation: H = horizontal; V = vertical; R = remold  
 (2) Effective (Native) = With as-received pore fluids in place.  
 (3) Permeability to water and hydraulic conductivity measured at saturated conditions.  
 Water = filtered Laboratory Fresh (tap) or Site water.

PTS File No: 46158  
 Client: Equipoise Corporation  
 Report Date: 04/13/16

**SOIL CLASSIFICATION DATA - VAPOR TRANSPORT PACKAGE**  
 ATTERBERG LIMITS DATA - FINE FRACTION < No. 40 SIEVE

Project Name: Alhambra Campus Soil Confirmation Sampling  
 Project No: N/A

SAMPLE ID.	DEPTH, ft.	METHODS: ANALYSIS DATE	ASTM D4318			ASTM D4318	ASTM D2487	USDA
			ATTERBERG LIMITS (1)			USCS / PLASTICITY CHART SYMBOL (Fines: <#40 Sieve)	USCS CLASSIFICATION, Group Symbol: Name	USDA SOIL TEXTURE SCHEME (2)
			LIQUID LIMIT	PLASTIC LIMIT	PLASTICITY INDEX			
Boring 9a	9.7	20160411	17.8	NON-PLASTIC		NP	SM: Silty sand	Sandy loam
Boring 9b	4.65	20160411	20.7	12.8	7.9	CL	CL: sandy lean clay	Loam

(1) Silt assumed as fine fraction for NON-PLASTIC (NP) samples.  
 (2) Sand considered to be >No. 200 sieve for USDA SOIL TEXTURE SCHEME.  
 USCS: Unified Soil Classification System  
 USDA: US Department of Agriculture  
 SCS: Soil Conservation Service

# Phase I Environmental Site Assessment

The Alhambra

1000 & 1127-1131 South Fremont Avenue  
Alhambra, California

EBI Project No. 1116004804

September 27, 2016

Prepared for:

Holliday Fenoglio Fowler LP  
10250 Constellation Blvd  
Suite 1000  
Los Angeles, CA 90067

Prepared by:

September 27, 2016

Mr. Ryan Ash  
Holliday Fenoglio Fowler LP  
10250 Constellation Blvd  
Suite 1000  
Los Angeles, CA 90067

**Subject: Phase I Environmental Site Assessment  
The Alhambra  
1000 & 1127-1131 South Fremont Avenue, Alhambra, California  
EBI Project No. 1116004804**

Dear Mr. Ash:

Attached please find our *Phase I Environmental Site Assessment* (the report) for the above-mentioned asset (the Subject Property). During the survey and research, our surveyor met with agents representing the Subject Property, or agents of the owner, and reviewed the Subject Property and its history. The report was completed according to the terms and conditions authorized by you. This report has been completed in general conformance with the ASTM Standard E 1527-13.

The purpose of this report is to acquire environmental information, observe the general condition and maintenance status of the Subject Property, to suggest remediation and/or maintenance practices considered customary for the Subject Property to continue in its current operation, compared to properties of similar age and condition, and to identify recognized environmental conditions in connection with the Subject Property described in this report.

Reliance on the report and the information contained herein shall mean (i) the report may be relied upon by a lender to be selected by *Holliday Fenoglio Fowler LP*, in determining whether to make a loan evidenced by a note secured by the Subject Property ("the Mortgage Loan"); (ii) the report may be relied upon by any purchaser in determining whether to purchase the Mortgage Loan (but not the Subject Property) from that lender, or an interest in the Mortgage Loan or securities backed or secured by the Mortgage Loan, and any rating agency rating securities representing an interest in the Mortgage Loan or backed or secured by the Mortgage Loan; (iii) the report may be referred to in and included, in whole or in part, with materials offering for sale the Mortgage Loan or an interest in the Mortgage Loan or securities backed or secured by the Mortgage Loan; (iv) the report speaks only as of its date in the absence of a specific written update of the report signed and delivered by EBI Consulting.

There are no intended or unintended third party beneficiaries to this report, except as expressly stated herein.

EBI is an independent contractor, not an employee of either the issuer or the borrower, and its compensation was not based on the findings or recommendations made in the report or on the closing of any business transaction.

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312 and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Thank you very much for the opportunity to provide environmental consulting services to *Holliday Fenoglio Fowler LP*. Should you have any questions or require additional information, please do not hesitate to contact the undersigned.

Respectfully submitted,

**EBI CONSULTING**

## EXECUTIVE SUMMARY

At the request of Holliday Fenoglio Fowler LP, EBI has performed a Phase I Environmental Site Assessment (ESA) of the property located at 1000 & 1127-1131 South Fremont Avenue in Alhambra, California, herein referred to as the Subject Property. The main objective of this ESA was to identify *recognized environmental conditions* in connection with the Subject Property, defined in ASTM Practice E 1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: 1) due to any release to the environment, 2) under conditions indicative of a release to the environment, or 3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions. This ESA also includes a preliminary evaluation of certain potential environmental conditions that are outside the scope of ASTM Practice E 1527-13.

The Subject Property consists of 15 contiguous and non-contiguous irregular-shaped parcels, cumulatively totaling approximately 45 acres. The Subject Property consists of a 19-building campus, including various office and retail buildings, parking garage structures, landscaped courtyards and patio areas, concrete walkways, and surface parking lots. The Subject Property also includes several outbuildings, which are utilized for storage purposes, a decommissioned cooling tower, and a solid waste center. The Subject Property was constructed in various phases between 1926 and 1982. The Subject Property buildings total approximately 941,128-net rentable square feet.

At the time of inspection, the Subject Property was occupied by various office, educational, and retail tenants. There are currently no manufacturing or industrial operations conducted at the Subject Property.

Below is the Assessment Summary Table presenting our recommended actions for the Subject Property. EBI's Findings and Opinions are presented in Section 8.0, and recommendations for further action or investigation are presented in Section 9.0.

ASSESSMENT SUMMARY TABLE								
THE ALHAMBRA								
1000 & 1127-1131 SOUTH FREMONT AVENUE, ALHAMBRA, CALIFORNIA								
ASSESSMENT COMPONENT	SECTION	NO FURTHER ACTION	REC	HREC	CREC	OTHER	RECOMMENDED ACTION	ESTIMATED COST

## I.0 INTRODUCTION

This report documents the findings, opinions, and conclusions of a Phase I Environmental Site Assessment (ESA) of the property located at 1000 & 1127-1131 South Fremont Avenue in Alhambra, California.

## **I.1 PURPOSE**

The purpose of this ESA was to identify *recognized environmental conditions* and certain environmental conditions outside the scope of ASTM Practice E 1527-13 in connection with the property at the time of the property reconnaissance.

## **I.2 SCOPE-OF-SERVICES**

This ESA was conducted utilizing a standard of good commercial and customary practice that was consistent with the ASTM Practice E 1527-13. Any significant scope-of-work additions, deletions or deviations to ASTM Practice E 1527-13 are noted below or in the corresponding sections of this report. The scope-of-work for this assessment included an evaluation of the following:

- Physical characteristics of the Subject Property through a review of referenced sources for topographic, geologic, soils and hydrologic data.
- Subject Property history through a review of referenced sources such as land deeds, fire insurance maps, city directories, aerial photographs, prior reports, and interviews.
- Current Subject Property conditions, including observations and interviews regarding the following: the presence or absence of hazardous substances or petroleum products; generation, treatment, storage, or disposal of hazardous, regulated, or biomedical waste; equipment that utilizes oils which potentially contain PCBs; and storage tanks (aboveground and underground).
- Usage of surrounding area properties and the likelihood for releases of hazardous substances and petroleum products (if known and/or suspected) to migrate onto the Subject Property.
- Information in referenced environmental agency databases and local environmental records, within specified minimum search distances.
- Past ownership through a review of available prior reports and local municipal file review.

The scope-of-work also included consideration of the following potential environmental conditions that are outside the scope of ASTM Practice E 1527-13: asbestos-containing materials (ACM), lead-based paint (LBP), lead in drinking water, and radon.

### **I.3 ASSUMPTIONS, LIMITATIONS AND EXCEPTIONS**

This Phase I Environmental Site Assessment (the report) has been prepared for the use of Holliday Fenoglio Fowler LP, in accordance with our Standard Conditions for Engagement and Authorization Letter and Agreement for Environmental Services approved and signed by Holliday Fenoglio Fowler LP (the Agreement), and with the limitations described below, all of which are integral parts of this report. A copy of the signed Standard Conditions For Engagement and Authorization Letter and Agreement for Environmental Services is maintained at the EBI Consulting office in Burlington, Massachusetts. To the extent any provisions of this report conflict with the terms of the Agreement, the Agreement will control.

EBI has performed this Phase I Environmental Site Assessment in conformance with the scope and limitations of *ASTM Standard E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. This report was prepared with no exceptions or deletions from ASTM Standard E 1527-13.

This Phase I Environmental Site Assessment has been prepared to assess a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) and petroleum products. As such, this practice is intended to permit Holliday Fenoglio Fowler LP to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability: that is, the practices that constitute “all appropriate inquiry into the previous ownership and uses of the Subject Property consistent with good commercial or customary practice” as defined in 42 U.S.C. § 9601(35)(B).

In defining a standard of good commercial and customary practice for conducting an environmental site assessment of a parcel of property, the goal of the processes established by this practice is to identify *recognized environmental conditions*. The term recognized environmental conditions means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to a release to the environment, (2) under conditions that indicate an existing release or a past release, or (3) under conditions that pose a material threat of a future release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term does not include *de minimis conditions* that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

The information reported was obtained through sources deemed reasonably ascertainable, as defined in ASTM Standard E 1527-13; a visual site survey of areas readily observable, easily accessible or made accessible by the Subject Property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property and a review of standard federal, state, and tribal environmental record sources. Municipal information was obtained through review of reasonably ascertainable standard government record sources and interviews with the authorities having jurisdiction over the Subject Property. Findings, conclusions, and recommendations included in the report are based on our visual observations in the field, the standard environmental record sources and municipal information reasonably obtained, information provided by the Client, and/or a review of readily available and supplied documents and drawings. EBI relies completely on the information, whether written, graphic, or verbal, provided by the Subject Property contact or as shown on any documents reviewed or received from the Subject Property contact, owner or agent, or municipal source, and assumes that information to be true and correct unless the information is known to be

inaccurate or if it is obvious, based on other information obtained as part of the assessment, that the information is not accurate. Although there may have been some degree of overlap in the information provided by these various sources, EBI did not attempt to verify independently the accuracy or completeness of all information reviewed or received during the course of these environmental services.

The information reported, as well as EBI's findings, conclusions, and recommendations are based upon sources deemed reasonably ascertainable, as defined in ASTM Standard E 1527-13; a visual site survey of areas readily observable, easily accessible or made accessible by the Subject Property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property and a review of standard federal, state, and tribal environmental record sources. Municipal information was obtained through review of reasonably ascertainable standard government record sources and interviews with authorities having jurisdiction over the Subject Property. Holliday Fenoglio Fowler LP agrees that EBI has no obligation to independently verify the accuracy or completeness of the information reviewed or received during the course of these environmental services.

EBI renders no opinion as to the presence of hazardous substances or petroleum products in, on or under un-surveyed and/or inaccessible portions of the Subject Property. Unsurveyed and inaccessible portions of the Subject Property are described below. In addition, EBI renders no opinion as to the presence of hazardous substances or petroleum products in, on or under the Subject Property where direct observation of the interior walls, floor, or ceiling of a structure was obstructed by objects or coverings on or over these surfaces.

EBI Services and opinions are based on the scientific or technical tests or procedures specifically set forth in the scope of the Services described in this report. The ASTM Standard E 1527-13 does not encompass analytical testing to evaluate asbestos containing materials, radon, lead-based paint, drinking water quality, indoor air quality, stored chemicals, debris, fill materials, surface water, or subsurface samples (soil and groundwater) as part of a Phase I ESA. Because geologic and soil formations are inherently random, variable, and indeterminate in nature, the Services and opinions provided under this Agreement are not guaranteed to be a representation of actual conditions on the Subject Property, which are also subject to change with time as a result of natural or man-made processes, including water permeation. In performing the Services, EBI used that degree of care and skill ordinarily exercised by environmental consultants or engineers performing similar services in the same or similar locality at the same time and under similar circumstances. No other representation, expressed or implied, and no warranty or guarantee is included or intended. The report speaks only as of its date, in the absence of a specific written update of the report, signed and delivered by EBI. Additional information that becomes available after our survey and draft submission concerning the Subject Property should be provided to EBI so that our conclusions may be revised and modified if necessary, at additional cost.

The assessment was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession, and in accordance with generally accepted practices of other consultants currently practicing in the same locality under similar conditions.

#### **I.4 SPECIAL TERMS AND CONDITIONS**

This Phase I Environmental Site Assessment (the report) has been prepared to assist a lender to be selected by Holliday Fenoglio Fowler LP in determining whether to make a loan evidenced by a note secured by the Subject Property. Reliance upon this report does not extend to entities or individuals interested in purchasing the Subject Property. Amendments to EBI's limitations as stated herein that may occur after issuance of the report are considered to be included in this report. EBI's liability to a purchaser wishing to use this report is limited to the cost of the report. Payment for the report is made by, and EBI's contract and report extends to Holliday Fenoglio Fowler LP only, in accordance with our Standard Conditions For Engagement and, Authorization Letter and Agreement for Environmental Services.

#### **I.5 DATA GAPS**

Any data gaps identified herein, as defined by ASTM Practice E 1527-13 § 3.2.20, are not considered to have significantly affected the ability to identify recognized environmental conditions in connection with the Subject Property and do not alter the conclusions of this report.

## 2.0 SUBJECT PROPERTY DESCRIPTION

### 2.1 OWNERSHIP AND LOCATION

According to Los Angeles County Assessor’s Office, the Subject Property is currently owned by The Alhambra Office Community, LLC.

The Subject Property is located at 1000 & 1127-1131 South Fremont Avenue in Alhambra, Los Angeles County, California. The Subject Property consists of 15 contiguous and non-contiguous irregular-shaped parcels, identified by the Los Angeles County Assessor’s Office as Parcel Numbers 5342-001-021, 5342-001-025, 5342-001-026, 5342-001-027, 5342-001-022, 5342-001-006, 5342-001-007, 5342-001-008, 5342-001-023, 5342-001-024, 5342-001-009, 5342-001-010, 5342-032-016, 5342-032-017, and 5342-032-018, cumulatively totaling approximately 45 acres. The Subject Property encompasses almost the entire block located on the northeast corner of Fremont Avenue and Mission Road, and three parcels located approximately 60 feet north of the intersection of Fremont Avenue and Mission Road, on the west side of Fremont Avenue. Figure 1 - Location Map depicts the location of the Subject Property on a street map of Alhambra, California. Figure 2 - Locus Map depicts the location of the Subject Property on the Los Angeles, California United States Geological Survey (USGS) 7.5 Minute Topographic Quadrangle. Figure 3 - Site Plan depicts the configuration of the Subject Property and adjoining properties.

### 2.2 SUBJECT PROPERTY IMPROVEMENTS

The Subject Property consists of a 19-building commercial campus, including various office and retail buildings, parking garage structures, landscaped courtyards and patio areas, concrete walkways, and surface parking lots. The Subject Property also includes several outbuildings, which are utilized for storage purposes, a decommissioned cooling tower, and a solid waste center. The Subject Property was constructed in various phases between 1926 and 1982. The Subject Property buildings total approximately 941,128-net rentable square feet. Land and building areas are as follows:

SUBJECT PROPERTY IMPROVEMENTS					
Address or Name	Floors	Basement	Area (SF)	DOC	Lot Size (Acres)
Building A0	2	Yes	Not provided	1944/1947	45
Building A1	2	Yes	Not provided	1942/1953	Inclusive

DOC: Date of Construction as reported by Management

### 2.3 CURRENT USE OF THE SUBJECT PROPERTY

At the time of inspection, the Subject Property was occupied by various office, educational, and retail tenants. There are currently no manufacturing or industrial operations conducted at the Subject Property. Some significant tenants are summarized in the table below:

<b>CURRENT OCCUPANTS AND OPERATIONS</b>			
<b>Occupant</b>	<b>Location</b>	<b>Operations</b>	<b>Notable Hazardous Substances / Petroleum Products Identified</b>
Pick Up Stix Restaurant	1129 Fremont Ave	Restaurant	No
Starbucks	1131 Fremont Ave	Coffee Shop	No
Vacant	1127 Fremont Ave	Vacant	No
Vacant	1129 Fremont Ave	Vacant	No
Alliant International University	1000 S Fremont Ave, Buildings A6 to A8 and B1	Educational institution	No
Health Management Systems Inc	1000 Fremont Ave # 65	Office	No
Ahmc Healthcare	1000 S Fremont Ave. Building A-9 East	Office	No
LA Fitness	920 Fremont Ave	Health Club	No
Vacant Building	1000 Fremont Ave. Building A12	Vacant Building	No

Please refer to Section 5.2 for further discussion regarding hazardous substances and petroleum products at the Subject Property.

## 2.4 MUNICIPAL SERVICES & UTILITIES

The Subject Property is serviced by the following municipal services and utilities:

<b>MUNICIPAL SERVICES AND UTILITIES</b>	
<b>Utility</b>	<b>Provider/Source</b>
Potable Water Supply	City of Alhambra Utilities Department
Sewage Disposal System	City of Alhambra Utilities Department
Electrical Service	Southern California Edison (SCE)
Natural Gas Service	Southern California Gas Company (SCGS)
Oil Service	Not Provided
Heating/Cooling Systems	Rooftop-mounted electric / natural gas HVAC units; and a central plant system consisting of two cooling towers, a gas-fired hot water boiler, and two chiller units.
Emergency Power	Four backup generators with belly tank ASTs

## 2.5 ADJOINING PROPERTIES

Property use in the vicinity of the Subject Property is characterized by office, retail/commercial, educational, light industrial, and residential development.

<b>ADJOINING PROPERTIES</b>	
<b>North</b>	The Subject Property is bound to the north by Orange Street, across which is the Los Angeles County Department of Public Works Office Complex (900 Fremont Avenue).
<b>East</b>	The Subject Property is bound to the east by Date Avenue, across which are various commercial/retail facilities (614-822 Date Avenue, 2145 West Mission Road, and 2121 Orange Street). The Subject Property is also bound to the east by AHMC (2215 West Mission Road).
<b>South</b>	The Subject Property is bound to the south by West Mission Road, followed by a self-storage facility (2000 West Mission Road) and single-family residential dwellings.
<b>West</b>	The Subject Property is bound to the west by single-family residential dwellings (beyond the intersection of Fremont Avenue and West Mission Road), a Kohl's retail store and associated parking lot (1201 Fremont Avenue), an abandoned former industrial building (1146 South Meridian Avenue), as well as vacant land and light industrial buildings (875-1111 South Fremont Street).

No visual evidence of adverse environmental conditions was observed during the survey of the adjoining properties. Adjoining properties identified on the regulatory database report are further discussed in Section 4.1.

### **3.0 USER PROVIDED INFORMATION**

The following section summarizes information provided by Holliday Fenoglio Fowler LP with regard to this Phase I Environmental Site Assessment. Additionally, a User Questionnaire was forwarded to the designated Client contact. The User Questionnaire has been completed and returned to our offices. The information requested in the User Questionnaire is intended to assist in gathering information that may be material to identifying recognized environmental conditions in connection with the Subject Property. The User Questionnaire and any other relevant documentation referenced below is presented in Appendix C.

#### **3.1 TITLE RECORDS**

Title record information associated with the Subject Property has not been provided to EBI by Holliday Fenoglio Fowler LP. A detailed discussion regarding review of information obtained from other sources is presented in Section 4.3.5 of this report.

#### **3.2 ENVIRONMENTAL LIENS AND ACTIVITY AND USE LIMITATIONS**

Holliday Fenoglio Fowler LP has provided no information regarding environmental liens or activity and use limitations in connection with the Subject Property. A discussion regarding environmental liens is presented in Section 4.3.7 of this report. A detailed discussion regarding activity and use limitations is presented in Sections 4.1.1 and 4.1.2 of this report.

#### **3.3 SPECIALIZED KNOWLEDGE**

Holliday Fenoglio Fowler LP provided no specialized knowledge that is material to recognized environmental conditions in connection with the Subject Property. EBI was not provided with or made aware of previous environmental assessments or other documentation that is material to recognized environmental conditions in connection with the Subject Property, except as presented in Section 4.3.8 of this report.

#### **3.4 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION**

Holliday Fenoglio Fowler LP has provided no commonly known or reasonably ascertainable information within the local community about the Subject Property that is material to recognized environmental conditions in connection with the Subject Property.

#### **3.5 VALUATION REDUCTION FOR ENVIRONMENTAL ISSUES**

Holliday Fenoglio Fowler LP has provided no information regarding valuation reduction for environmental issues in connection with the Subject Property.

#### **3.6 OWNER, PROPERTY MANAGER, AND OCCUPANT INFORMATION**

Holliday Fenoglio Fowler LP provided contact information for the Subject Property owner, manager and/or occupants.

#### **3.7 REASON FOR PERFORMING PHASE I ESA**

Holliday Fenoglio Fowler LP retained EBI to complete this Phase I Environmental Site Assessment in connection with a real estate transaction.

## 4.0 RECORDS REVIEW

### 4.1 STANDARD ENVIRONMENTAL RECORDS

A review of standard environmental databases maintained by Federal, state, and tribal offices was completed through Environmental Data Resources, Inc. (EDR) of Shelton, Connecticut. The databases were searched for properties with reported environmental conditions located within approximate minimum search distances as specified by ASTM Standard E 1527-13, by using geocoding information that identified the coordinates of the properties in the databases or by checking the street addresses of practically reviewable non-geocoded “orphan” properties within the same zip code. The database report is presented in Appendix E.

The database report identified four “orphan sites”. Orphan sites are those sites that could not be accurately mapped or geocoded due to inadequate location information. EBI attempted to locate these sites via vehicular reconnaissance and interviews with personnel familiar with the area. Based on this research, EBI did not identify listed orphan sites within the approximate minimum search distances that may be considered likely to have impacted conditions at the Subject Property, except for the following:

The Subject Property is identified in the Orphan summary as a National Pollutant Discharge Elimination System (NPDES) stormwater permit site. Based on the nature of this database (stormwater permit), it is considered unlikely that conditions associated with the identified NPDES listing represent an environmental concern to the Subject Property.

The San Gabriel Groundwater Basin 3 – Alhambra Area site is identified on the CA BOND EXP. Plan database. This site is further discussed in the NPL database section below.

The former southwest adjoining gas station (2601 Mission Street) is identified in the Orphan summary as a HIST UST site. This listing is further discussed in the UST database section below.

It should be noted that plotted locations of listed sites are not always accurate. With regard to listings that are determined or suspected to be inaccurate, based on information from other sources such as direct observation or consultation with individuals familiar with the property, EBI uses the best available data when evaluating the location of listed sites discussed below.

The following table provides a summary of the findings of the environmental database report. Specific properties identified within the database report are further discussed below.

<b>SUMMARY OF FEDERAL, STATE, AND TRIBAL AGENCY DATABASE FINDINGS</b>			
<b>Regulatory Database</b>	<b>Approximate Minimum Search Distance</b>	<b>Subject Property Listed</b>	<b>Off-site Listings Within Search Distance</b>
Federal NPL Sites	1.0 mile	No	1

EDR Historical Cleaners	Property & Adjoining	Yes	0

#### 4.1.1 Federal Agency Database Records

##### National Priority List (NPL)

The NPL database, also known as the Superfund List, is a subset of CERCLIS and identifies sites that are ranked as high priority for remedial action under the Federal Superfund Act. The Subject Property was not identified on the NPL. However, one site located within 1.0 mile of the Subject Property was identified on the NPL. Information regarding the listed site is presented in the following table:

<b>NPL</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>EPA ID No.</b>	<b>Regulatory Status</b>

<b>NPL</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>EPA ID No.</b>	<b>Regulatory Status</b>
San Gabriel Valley (Area 3) Main Street & Garfield Avenue Alhambra, California	Subject Property and Vicinity	1000709322 CAD980894893	Discovery: 10/15/84 Proposed and Finalized: 06/10/86 Status: Currently on the Final NPL Contaminants: Tetrachloride Media Impacted: Soil & GW

\* Presumed hydrogeologic gradient based upon regional topography

The San Gabriel Valley Area 3 site is identified on the National Priorities List (NPL), Superfund Enterprise Management System (SEMS), potentially responsible parties (PRP), and California Bond Expenditure (CA BOND EXP. Plan) databases. The San Gabriel Valley Area 3 site is a 19 square-mile area of contaminated groundwater in Los Angeles, California. It is one of four Superfund sites in the 170-square-mile San Gabriel Valley. Area 3 comprises portions of the cities of Alhambra, Rosemead, San Gabriel, San Marino, South Pasadena, and Temple City. Multiple potentially responsible parties (PRPs) contaminated over 30 square miles of groundwater under the Valley with volatile organic compounds (VOCs) and industrial solvents. About 400 facilities in the region have soil contamination. Groundwater in Area 3 is contaminated with VOCs, including trichloroethylene (TCE) and tetrachloroethylene (PCE), at concentrations that exceed 20 times the maximum contaminant levels (MCLs) allowed by federal and State law. Soil also is contaminated with various VOCs. People who inhale vapors from groundwater or soil that contains VOCs could be exposed to hazardous substances. All drinking water served within Area 3 meets federal and State drinking water standards. The key contaminants of potential concern (COPCs) are tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-Dichloroethene (cis-1,2-DCE), 1,2,3-trichloropropane (1,2,3-TCP), carbon tetrachloride, perchlorate, and nitrate.

The USEPA is overseeing the groundwater remediation in the San Gabriel Valley Area 3 NPL site. The Los Angeles Regional Water Quality Control Board (LARWQCB) is primarily overseeing facility specific soil remediation at properties located within the San Gabriel Valley Area 3 NPL site that might have soils impacted with VOCs and might be contributing to the groundwater plume. These properties are considered potentially responsible parties (PRPs) for the San Gabriel Valley Area 3 NPL site contaminated groundwater plume. When a PRP is found, the LARWQCB initiates the following activities at that property: investigation of shallow soil vapor contamination; investigation of deep soil vapor contamination; investigation of groundwater contamination; and/or contaminant source remediation.

The Subject Property and surrounding area are located within the known contaminated groundwater plume (Southwestern Area 3) of the San Gabriel Valley Area 3 NPL site. Groundwater flow in the Subject Property vicinity of the San Gabriel Valley Area 3 NPL site is reported to generally be to the southeast. However, please note that recent groundwater flow data from the southeast adjoining SLIC site shows a localized groundwater flow to the northeast. Multiple former Subject Property occupants, as well as multiple adjoining properties, are being or have been investigated under the California Spills, Leaks, Investigations, and Cleanups (SLIC) Program due to soil and groundwater impacts from VOCs. Six current and former Subject Property addresses are identified on the SLIC database. Thirteen (13) adjoining property addresses are also identified on the SLIC database. All of the Subject Property and adjoining property SLIC listings are reportedly associated with VOC impacts to soil and groundwater.

The six Subject Property SLIC listings include the following:

- The Alhambra (SLIC Site Number T10000001005), 1000 South Fremont Avenue, with a cleanup status of “Open – Site Assessment” as of April 13, 2009.

- A-I Signal Division (SLIC Site Number SL603799147), 635 S. Date Avenue, with a cleanup status of “Open – Inactive” as of January 29, 2015.
- Dickinson Ink Corporation (SLIC Site Number SL603799396), 625 S. Date Avenue, with a cleanup status of “Open – Inactive” as of October 28, 2014.
- The Witteman (SLIC Site Number SL603799518), 705 S. Date Avenue, with a cleanup status of “Completed – Case Closed” as of July 29, 2015.
- Balance Plating (SLIC Site Number SL603799361), 2204 West Orange Street, with a cleanup status of “Open – Inactive” as of October 28, 2014.
- Crown Pattern Works Foundry (SLIC Site Number SL603799394), 815 S. Date Avenue, with a cleanup status of “Open – Inactive” as of October 28, 2014.

With the exception of the database listing for The Alhambra, which specifically indicates that the listing is associated with the San Gabriel Valley Area 3 NPL site, the SLIC listings for the Subject Property each indicate that the listing is associated with VOC impacts to soil and groundwater. As such, it is assumed that these listings are for portions of the Subject Property being investigated by the LARWQCB in connection with the San Gabriel Valley Area 3 NPL site. No additional relevant information is provided in the regulatory database report or in the GeoTracker database for these six listings, with the exception of the listing for The Alhambra. As such, file reviews will need to be performed at the LARWQCB in order to obtain additional information regarding the Subject Property SLIC listings and in order to find out what steps need to be taken in order to obtain regulatory closure for any open listings.

Although 13 adjoining SLIC listings were identified with VOC impacts to soil and/or groundwater, groundwater contamination is already known to extend beneath the Subject Property vicinity due to the larger San Gabriel Valley Area 3 NPL site plume. Although the off-site SLIC listings may have contributed to the groundwater contamination, the extent of impacts to soil and soil vapor at the Subject Property from VOCs is known as further discussed below.

The online GeoTracker database for The Alhambra included a Soil Closure Risk Evaluation, prepared by Equipoise Corporation (Equipoise) and dated May 24, 2016. The scope of the 2016 Soil Closure Risk Evaluation included the entirety of the Subject Property, except for the parcels on the west side of Fremont Avenue. However, the parcels on the west side of Fremont Avenue were historically undeveloped and not expected to have contributed to VOC contamination in the area. The portions of the Subject Property included were divided into two sites (Site A and Site B). Site A includes the majority of the Subject Property minus Site B, which consists of a surface parking lot in the southeast portion of the Subject Property. According to the 2016 Soil Closure Risk Evaluation, the results of several previous field investigations performed at the property lead to a previous request for no further action. LARWQCB staff indicated that additional spatially distributed analytical data was required before they could concur with the results from previous assessments. Therefore, the objective of the 2016 Soil Closure Risk Evaluation was to provide sufficient spatially distributed analytical data characterizing the nature and extent of volatiles in subsurface soil vapor and provide high quality data for regulatory agency decision-making regarding the regulatory closure of the property under proposed future land use development conditions. The investigation activities performed in support of the following risk evaluation focused on soil and soil vapor sampling at both Site A and Site B. This scope of work was conducted to meet requirements for a “No Further Action” letter.

According to Equipoise, numerous soil and soil vapor investigations were performed at the Subject Property between 1999 and 2007 by Geomatrix, Equipoise and Project Navigator. Please note that these previous investigations were not provided to EBI for review. According to Equipoise, a total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project

Navigator investigations. The results of the soil analyses indicated that all compounds were below Preliminary Remediation Goals (PRGs) and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below Risk-Based Screening Levels (RBSLs) for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and the exception of samples collected in the vicinity of the southeast adjoining 2215 W. Mission Road property. Concentrations of PCE and TCE in shallow soil gas did exceed the industrial RBSL in 18 out of 93 samples for areas of the Subject Property immediately to the west and north of the 2215 W. Mission Road property. The Equipoise investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of soil vapor probe SG-21. Within probe SG-21, concentrations of PCE in shallow soil gas did exceed the industrial RBSL in six samples. However, soil vapor probe SG-21 was the closest point on the Subject Property to the soil vapor plume from the adjacent 2215 W. Mission Road property and Equipoise believed that the PCE exceedances from the six samples were attributable to activities associated with the 2215 W. Mission Road property that had been subsequently addressed by the operation of a soil vapor extraction (SVE) system at that location. In conclusion, Equipoise reported that the Project Navigator investigation found no detections of VOCs in any soil vapor samples and values less than the industrial and residential PRG or within the range of background concentrations for all soil samples. The stated purpose of the Project Navigator investigation was to: *provide additional information in order to determine whether or not soil contamination was present in the subsurface soil and whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Site.* During the Project Navigator investigation detections of other compounds in soil were either below residential/industrial PRGs, or soil levels for groundwater, or were within background for California soils and the soil and enhanced soil vapor investigations resulted in no detection of VOCs. Therefore, the Project Navigator investigation fulfilled the LARWQCB's request for additional investigations, at locations specified by the LARWQCB, and had shown that VOC contamination was not present in the subsurface soils and there was no evidence of any release at the Subject Property.

The objective of the 2016 Soil Closure Risk Evaluation was to provide sufficient spatially distributed analytical data characterizing the nature and extent of volatiles in subsurface soil vapor and provide high quality data for regulatory agency decision-making regarding the long-term protection of human health and the issuance of a No Further Action letter under proposed future land use development conditions at Site A (Office Areas) and Site B (Parking Areas). The 2016 Soil Closure Risk Evaluation included the collection of soil and soil vapor samples for analysis. Additionally, the results of the soil and soil vapor sample analysis was used to perform a human health risk analysis (HHRA) for the Subject Property.

Thirteen borings were advanced throughout Site A of the Subject Property. Soil sampling activities at Site A were performed on November 20 and 21, 2015 by Equipoise. Soil samples were collected at 5 and 10 feet bgs for chemical analysis at each sample locations proposed in the LARWQCB-approved work plans with the exception of ACP-A-SB-B12, which was limited to a single soil sample at 5 feet bgs because of wet utilities located between 5 and 10 feet. VOCs were not detected above their respective reporting limits in any of the Site A soil samples analyzed during this investigation. After the soil borings were advanced, soil vapor probes were constructed. Sampling of the Site A soil vapor probes contained a total of 17 VOCs. The primary constituent reported in Site A soil vapor samples was PCE, with the remaining 16 constituents found at low to trace levels.

Two borings were advanced on Site B of the Subject Property. Soil samples were collected for chemical analysis at the two locations proposed in the work plans. VOCs were not detected above their respective reporting limits in any of the Site B soil samples analyzed. Sampling of the Site B soil vapor

probes contained a total of nine VOCs. The primary constituent reported in Site A soil vapor samples was PCE, with the remaining eight constituents found at low to trace levels.

The human health risk analysis (HHRA) process consisted of a three-part comparative-analysis in which published California screening levels (DTSC, 2016), default modeled risk screening values (RSVs), and site-specific RSVs were used sequentially to identify and target constituents posing potential future risk in soil vapor at the Subject Property. Based on the results of the HHRA, no significant risks are projected to future site users associated with soil vapors reported in Site A under unrestricted land use conditions. It is recommended that Site A be granted the status of “No Further Action” with regards to soil and soil vapor constituents. However, potential risks were projected to future site users associated with soil vapors reported in Site B under unrestricted land use conditions. Risk management would be necessary to mitigate potential unrestricted land use and subsequent receptor exposure potential. A restricted land use condition was viable and consistent with planned future development of Site B as commercial/industrial. It was recommended that Site B be granted the status of “No Further Action” with regards to soil and soil vapor constituents following the implementation of institutional controls whereby future land use is limited to commercial industrial purposes. Commercial/industrial land use at Site B was consistent with the current zoning, site use, and planned future development. It is EBI’s understanding that Site B will be redeveloped into a parking garage structure.

EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. Per a telephone interview performed on September 21, 2016, Mr. Blackmer reported that Equipoise has been involved in the remediation and regulatory process of the Subject Property since 2007. Mr. Blackmer reported that the 2016 Soil Closure Risk Evaluation Report indicated Site A (Office Areas) at the Subject Property was “clean.” Site B (Parking Lot at southeast corner) at the Subject Property had very little contamination due to contamination from the southeast adjacent property. However, Equipoise is expecting to obtain a No Further Action (NFA) letter for this parcel as well, based on the low levels of contamination, proposed future use of Site B as a parking garage, and the on-going remediation of the southeast adjacent property (2215 W. Mission Road). Mr. Blackmer reported that a determination from the LARWQCB to the NFA request is still pending.

EBI contacted Mr. Curt M. Charmley, Case Manager with the LARWQCB, for information regarding the NFA status of the Subject Property. Mr. Charmley indicated that he is in the process of reviewing the report submitted by Equipoise, in conjunction with the Office of Environmental Health Hazard Assessment (OEHHA). He indicated that, as of September 20, 2016, “I received notification from OEHHA that they conducted review of the Equipoise Report for the Subject Property. He would contact Rick (Professional Geologist with Equipoise) tomorrow (Thursday September 21, 2016) regarding the next steps for the case evaluation closure consideration for the Subject Property.”

According to a Memorandum, dated September 31, 2016 and prepared by the Office of Environmental Health Hazard Assessment (OEHHA), the OEHHA reviewed the Soil Closure Risk Evaluation Report. Following their review, the OEHHA concluded the following:

- Although the OEHHA’s RSV estimates differed slightly from Equipoise’s estimates, these differences did not change the conclusions.
- The maximum detected PCE concentrations at Site A were less than the RSVs, suggesting that vapor intrusion risk at Site A is de minimis.
- Equipoise recommended that Site B be granted the status of “No Further Action” with regards to soil and soil vapor constituents following the implementation of institutional controls whereby future land use is limited to commercial industrial purposes. The OEHHA reported that they do

not make decisions regarding institutional controls. The OEHHA agreed with Equipoise on findings that residential use is not recommended for the Site. However, the OEHHA indicated that, if development of the Site is inconsistent with the land uses identified, or if remediation is not performed in accordance with the remedial scenario proposed in this risk assessment, additional evaluation of potential health risks would be necessary. Please note that, although not stated in the OEHHA letter, it is likely that residential use would be allowed at Site B (Parcel No. 5342-001-024) if a vapor mitigation system is installed for Site B. However, consultation with the LARWQCB and OEHHA would need to occur prior to a land use change to residential.

On September 22, 2016, EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. EBI has not received a response as of to this date.

The known groundwater contamination beneath the Subject Property and the open case status of the SLIC listing for The Alhambra and four of the five additional listings constitutes a *recognized environmental condition (REC)*.

Delisted National Priority List (NPL)

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate. Neither the Subject Property nor any sites located within 0.5 mile of the Subject Property were identified on the Delisted NPL database.

Superfund Enterprise Management System (SEMS)

SEMS tracks federal hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of the USEPA's Superfund Program. The list was formerly known as CERCLIS and was renamed at the end of 2015. The list contains data regarding potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). SEMS also contains sites that are either proposed to or on the National Priority List (NPL), as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Subject Property was not identified on the SEMS database. However, two sites located within 0.5 mile of the Subject Property were identified on the SEMS database. Information regarding the listed sites is presented in the following table:

SEMS			
Site	Distance / Direction / Gradient*	EPA ID No.	Regulatory Status
San Gabriel Valley (Area 3) Main Street & Garfield Avenue Alhambra, California	Subject Property and Vicinity	1000709322 CAD980894893	Discovery: 10/15/84 Proposed and Finalized: 06/10/86 Status: Currently on the Final NPL Contaminants: Tetrachloride Media Impacted: Soil & GW
A-American Environmental 3033 W Mission Road Alhambra, California	0.312 mile / West-southwest / Crossgradient	1005440859 / CAN000905907	Discovery: 03/25/02 Proposed and Finalized: 03/25/02 Status: Removal Only Site (No Site Assessment Work Needed) Contaminants: Not Reported Media Impacted: Not Reported

\* Presumed hydrogeologic gradient based upon regional topography

The San Gabriel Valley (Area 3) was previously discussed in the NPL Section above. Based upon the current regulatory status and distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the remaining identified SEMs site represent an environmental concern to the Subject Property.

**SEMS – ARCHIVE**

SEMS-ARCHIVE tracks sites that have been removed from the SEMs list. This list was formerly known as the CERCLIS- NFRAP list and was renamed SEMs-Archive at the end of 2015. SEMs-ARCHIVE sites may be sites where, following an initial investigation, no contamination was found, contamination was removed without the need for the site to be placed on the NPL, or the contamination was not considered sufficient to warrant Federal Superfund action or NPL consideration. The Subject Property was not identified on the SEMs-ARCHIVE database. However, one site located within 0.5 mile of the Subject Property was identified on the SEMs-ARCHIVE database. Information regarding the listed site is presented in the following table:

<b>SEMS-ARCHIVE</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>EPA ID No.</b>	<b>Regulatory Status</b>
Mercury Dye & Container 3201 W Mission Road Alhambra, California	0.423 mile / West-southwest / Crossgradient	1015732835 / CAD980816771	Discovery: 06/01/80 Preliminary Assessment Completed: 03/15/89 Status: NFRAP-Site does not qualify for the NPL based on existing information Contaminants: Not reported Media Impacted: Not reported

\* Presumed hydrogeologic gradient based upon regional topography

Based upon the current regulatory status and distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified SEMs-ARCHIVE facility represent an environmental concern to the Subject Property.

**Resource Conservation and Recovery Act (RCRA) – Corrective Action Tracking System (CORRACTS)**

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information regarding sites that generate, transport, store, treat, and/or dispose of hazardous waste as defined by RCRA. The RCRA-CORRACTS database identifies TSD facilities that have conducted, or are currently conducting, corrective action(s) as regulated under RCRA. The Subject Property was not identified on the RCRA CORRACTS database. However, one site located within 1.0 mile of the Subject Property was identified on the RCRA CORRACTS database. The listed site, A-American Environmental, was previously discussed in the SEMs database above.

**RCRA non-CORRACTS Treatment, Storage and/or Disposal (TSD) Facilities**

RCRA non-CORRACTS Treatment, Storage and/or Disposal (TSD) facilities are required to register hazardous waste activity under the Resource Conservation and Recovery Act (RCRA). The Subject Property was not identified on the RCRA non-CORRACTS TSD database. However, one site located within 0.5 mile of the Subject Property was identified on the RCRA non-CORRACTS TSD database. The listed site, A-American Environmental, was previously discussed in the SEMs database above.

**RCRA Hazardous Waste Generators**

Hazardous waste generators tracked under the Resource Conservation and Recovery Act (RCRA) are classified as either Large Quantity Generators (LQGs), Small Quantity Generators (SQGs), or Conditionally Exempt Small Quantity Generators (CESQG). A RCRA-LQG is defined as a facility that generates over 1,000 kilograms (Kg) of hazardous waste, or over 1 Kg of acutely hazardous waste per month. A RCRA-SQG is defined as a facility that generates between 100 Kg and 1,000 Kg of hazardous waste per month. A RCRA-CESQG is defined as a facility that generates less than 100 Kg of hazardous waste, or less than 1 Kg of acutely hazardous waste per month. The Subject Property and seven adjoining properties were identified on the RCRA Generator database. Information regarding the listed sites is presented in the following table:

<b>RCRA GENERATORS</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>EPA ID No.</b>	<b>Regulatory Status</b>
Fractionation Research Inc 1000 S Fremont Alhambra, California	Subject Property (Former Occupant)	1000181083	Type: RCRA NonGen / NLR (As of 1989) No violations reported.
Braun C F & Co Research Fac 1000 S Fremont Alhambra, California	Subject Property (Former Occupant)	1000426354	Type: SQG (Last reported RCRA operation on 1996) No violations reported.
Jones Excavating 704 S Date Avenue Alhambra, California	Adjacent / East / Crossgradient	1000441073	Type: SQG No violations reported.
Copy-Rite Press Inc 614 S Date Avenue Alhambra, California	Adjacent / East / Crossgradient	1000290402	Type: SQG No violations reported.
Avalon Plating Company 816 S Date Avenue Alhambra, California	Adjacent / East / Crossgradient	1000857431	Type: SQG No violations reported.
Baker Engineering Co 1011 S Fremont Avenue Alhambra, California	Adjacent / West / Upgradient	1000310415	Type: SQG No violations reported.
Qc Group 1011 S Fremont Avenue Alhambra, California	Adjacent / West / Upgradient	1001959060	Type: SQG No violations reported.
The Corner Company 2215 W Mission Road Alhambra, California	Adjacent / Southeast / Upgradient (per known GW flow at this property)	1010313186	Type: SQG No violations reported.
Nardon MFG CO Inc. 2215-25 W Mission Road Alhambra, California	Adjacent / Southeast / Upgradient (per known GW flow at this property)	110002631572	Type: RCRA NonGen / NLR (As of 1980) No violations reported.

\* Presumed hydrogeologic gradient based upon regional topography

Two former occupants of the Subject Property are listed in the RCRA Generator database. Environmental concerns associated with the historic uses of the Subject Property are discussed in the NPL database section (4.1.1) and the Historical Use section (4.3).

Based upon the absence of reported violations and off-site locations, it is considered unlikely that conditions associated with the identified RCRA Generator site listings represent an environmental concern to the Subject Property. However, please note that multiple releases are associated with the adjoining properties as discussed in relevant database areas of Sections 4.1.1. and 4.1.2.

#### Federal Engineering Control / Institutional Control Registries

The completion of site cleanup activities may include the implementation of engineering controls or institutional controls as part of the response action. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls. Neither the Subject Property nor any sites located within 0.5 mile of the Subject Property were identified on Federal Engineering Control or Institutional Control Registries.

#### Emergency Response Notification System (ERNS)

ERNS is a national database used to collect information regarding reported releases of petroleum products and/or hazardous substances. The database contains information from spill reports submitted to Federal agencies, including the EPA, the U.S. Coast Guard, the National Response Center, and the U.S. Department of Transportation. A review of this database was conducted in order to determine whether any spills or incidents involving releases of hazardous substances or petroleum products have occurred at the Subject Property. The Subject Property was not identified on the ERNS database.

#### 4.1.2 State and Tribal Agency Database Records

##### Annual Workplan Sites (AWP)

The California Department of Toxic Substance Control (DTSC) Annual Workplan Sites (AWP) identifies known hazardous substance release sites targeted for cleanup. The data source is the California Environmental Protection Agency. Neither the Subject Property nor any sites located within 1.0 mile of the Subject Property were identified on the AWP database.

##### California High-Priority Confirmed Release Sites (RESPONSE)

The California High-Priority Confirmed Release Sites (RESPONSE) database contains confirmed release sites where the California Department of Toxic Substance Control (DTSC) is involved in the remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. The Subject Property was not identified on the RESPONSE database. However, two sites located within 1.0 mile of the Subject Property were identified on the RESPONSE database. The listed sites are located greater than 0.34 mile from the Subject Property in presumed crossgradient directions. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified sites represent an environmental concern to the Subject Property.

##### California Hazardous Waste Sites (ENVIROSTOR)

The California Hazardous Waste Sites (ENVIROSTOR) database contains potential or confirmed hazardous substance release sites, or sites for which there may be reasons to investigate further, identified by the California DTSC. The database includes the following site types: Federal NPL; State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. The Subject Property was not identified on the ENVIROSTOR database. However, 11 sites located within 1.0 mile of the Subject Property were identified on the ENVIROSTOR database. Seven of the eleven

listed sites are located over 0.31 mile from the Subject Property in presumed crossgradient directions. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified sites represent an environmental concern to the Subject Property. Information regarding the four remaining listed sites is presented in the following table:

<b>ENVIROSTOR</b>			
<b>Site</b>	<b>Distance / Direction / Gradient</b>	<b>ID No.</b>	<b>Regulatory Status</b>
International Extrusion Corp 1000 Meridian Avenue Alhambra, California	0.12 miles / Southwest / Crossgradient	S103619846	Notification Date: Not reported Contaminants: Not reported Media Impacted: Soil Status: Cleanup is complete Date of Closure: Not reported
Ortel, A division of Emcore 2015 W Chestnut Street Alhambra, California	0.17 miles / East / Crossgradient	CAD038071643	Notification Date: Not reported Contaminants: Not reported Media Impacted: Soil Status: Cleanup is complete Date of Closure: 06/30/2000
Pemaco Metal Process 2125 Lemon Street Alhambra, California	0.17 miles / North-northeast / Crossgradient	CAD051475036	Notification Date: 05/26/1998 Contaminants: Not reported Media Impacted: Not reported Status: Site Inspections/Visit (Non LUR) Date of Closure: NA
Crown Brass 400 S Palm Avenue Alhambra, California	0.18 miles / Northeast / Crossgradient	CAD981368467	Notification Date: 04/16/2004 Contaminants: Not reported Media Impacted: Not reported Status: Not reported Date of Closure: Not reported

\* Presumed hydrogeologic gradient based upon regional topography

Based upon the current regulatory status, distance/presumed hydrogeologic gradient relative to the Subject Property, and/or reported nature/extent of contamination, it is considered unlikely that conditions associated with the identified ENVIROSTOR sites represent an environmental concern to the Subject Property.

Cal-Sites/HIST Cal-Sites

Formerly known as ASPIS, this database contains both known and potential hazardous substance sites. The source is the California Department of Toxic Substance Control (DTSC). This database is no longer updated by the state agency. It has been replaced by ENVIROSTOR. The Subject Property was not identified on the Cal-Sites database. However, two sites located within 1.0 mile of the Subject Property were identified on the Cal-Sites database. Both sites are located over 0.34 mile from the Subject Property in presumed crossgradient directions. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified sites represent an environmental concern to the Subject Property.

Proposition 65 Notification Records

Proposition 65 Notification Records contain facility notifications regarding any release that could potentially impact drinking water and thereby expose the public to a potential health risk. The Subject Property was not identified on the Proposition 65 Notification Records database. However, two sites located within 1.0 mile of the Subject Property were identified on the Proposition 65 Notification

Records. Both sites are located over 0.31 mile from the Subject Property in presumed crossgradient directions. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified sites represent an environmental concern to the Subject Property.

Toxic Pits Cleanup Act Sites (Toxic Pits)

The Toxic Pits Cleanup Act Sites (Toxic Pits) database contains sites identified by the California Water Resources Control Board that are suspected to contain hazardous substances where cleanup has not yet been completed. Neither the Subject Property nor any sites located within 1.0 mile of the Subject Property were identified on the Toxic Pits database.

California Bond Expenditure Plan

The California Bond Expenditure Plan was developed by the California Department of Health Services as a site-specific expenditure plan for the appropriation of Hazardous Substance Cleanup Bond Act funds. The Subject Property was not identified on the California Bond Expenditure Plan database. However, the San Gabriel Groundwater Basin 3 – Alhambra Area site is identified in the Orphan Summary as a CA BOND EXP. Plan site. This listing was previously discussed in the NPL database above.

Hazardous Waste and Substances Sites List (Cortese) and Historic Cortese

The Hazardous Waste and Substance Site List (also known as the Cortese List) is a planning document used by the State, local agencies, and developers to comply with California Environmental Quality Act requirements in providing information regarding the location of hazardous materials releases. Government Code Section 65962.5 requires the California Environmental Protection Agency to develop at least annually an updated Cortese List. The California Department of Toxic Substance Control (DTSC) is responsible for preparing a portion of the information that comprises the Cortese List, and other state and local government agencies are required to provide additional hazardous material release information for the Cortese List. The Subject Property is not identified on the Cortese List. However, 17 sites located within 0.5 mile of the Subject Property were identified on the Historic Cortese List. The listed sites are all cross-listed in the LUST/LAST, ENVIROSTOR, and/or SLIC database and are further discussed in those database sections.

Spill, Leaks, Investigations, and Cleanup (SLIC)

The Spills, Leaks, Investigations, and Cleanups (SLIC) database, maintained by the California Water Resources Control Board, includes unauthorized discharges from spills and leaks, other than from underground storage tanks or other regulated sites. The Subject Property (listed six times) and 13 adjoining properties were identified on the SLIC database and are further discussed in the table below. Based upon the current regulatory status, distance, presumed hydrogeologic gradient relative to the Subject Property, and/or reported nature/extent of contamination, it is considered unlikely that conditions associated with the 96 remaining identified sites represent an environmental concern to the Subject Property.

SLIC			
Site	Distance / Direction / Gradient*	ID No.	Regulatory Status
The Alhambra 1000 S. Fremont Avenue Alhambra, California	Subject Property	T10000001005	Notification Date: 1965 Contaminants: VOCs Media Impacted: Soil & GW Status: <u>Open – Site Assessment</u> Date of Closure: Not Applicable

<b>SLIC</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>ID No.</b>	<b>Regulatory Status</b>
A-I Signal Division 635 S. Date Avenue Alhambra, California	Subject Property	SL603799147	Notification Date: 1/2/1965 Contaminants: VOCs Media Impacted: Soil & GW Status: <u>Open – Inactive as of 1/29/2015</u> Date of Closure: Not Applicable
The Witteman 705 S. Date Avenue Alhambra, California	Subject Property	SL603799518	Notification Date: 01/29/2015 Contaminants: Not reported Media Impacted: Soil & GW Status: <u>Case Closed</u> Date of Closure: 07/29/2015

\* Presumed hydrogeologic gradient based upon regional topography

SLIC listings associated with the Subject Property were previously discussed in the NPL database section above.

Although 13 adjoining SLIC listings were identified with VOC impacts to soil and/or groundwater, groundwater contamination is already known to extend beneath the Subject Property vicinity due to the larger San Gabriel Valley Area 3 NPL site plume. Although the off-site SLIC listings may have contributed to the groundwater contamination, the extent of impacts to soil and soil vapor at the Subject Property from VOCs is known as previously discussed in the NPL database section above.

Voluntary Cleanup Program (VCP) Properties

The Voluntary Cleanup Program (VCP) Properties database identifies low threat level properties with either confirmed or unconfirmed releases, for which the project proponents have requested that Department of Toxic Substances Control (DTSC) oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs. Neither the Subject Property nor any sites located within 0.5 mile of the Subject Property were identified on the VCP database.

Leaking Underground and Aboveground Storage Tank Sites (LUST/LAST)

The Regional Water Quality Control Board (RWQCB) maintains a database of reported Leaking Storage Tank (LUST/LAST) sites. The Subject Property was not identified in the LUST/LAST databases. However, 18 sites are located within 0.5-mile of the Subject Property. Please note that one site is listed twice. As such, only 17 sites are reported to be within 0.5-mile of the Subject Property. Five adjoining sites are identified on LUST/LAST databases and are further discussed in the table below. Based upon the current regulatory status, distance, presumed hydrogeologic gradient relative to the Subject Property, and/or reported nature/extent of contamination, it is considered unlikely that conditions associated with the 12 remaining identified sites represent an environmental concern to the Subject Property.

<b>LUST/LAST</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>ID No.</b>	<b>Regulatory Status</b>
Steed Brothers Construction 714 Date Street Alhambra, California	Adjacent / East / Crossgradient	SI00945776	Notification Date: 5/3/1996 Contaminants: Aviation Fuel Media Impacted: Soil Status: <u>Completed - Case Closed</u> Date of Closure: 06/22/1994
Jones Excavating 704 Date Street Alhambra, California	Adjacent / East / Crossgradient	I000473091	Notification Date: 09/02/1993 Contaminants: Gasoline Media Impacted: Soil Status: <u>Completed - Case Closed</u> Date of Closure: 07/18/1994
LA County Dpte. Of Public Works 900 S Fremont Avenue Alhambra, California	Adjacent / North / Crossgradient	SI03956754	Notification Date: 02/23/1988 Contaminants: Gasoline Media Impacted: Soil Status: <u>Completed - Case Closed</u> Date of Closure: 03/28/2001
Alhambra Save-On Gas 2601 Mission Road Alhambra, California	Adjacent / Southwest / Crossgradient	U002284105	Notification Date: 02/14/1991 Contaminants: Gasoline Media Impacted: Soil Status: <u>Completed - Case Closed</u> Date of Closure: 07/08/1992

<b>LUST/LAST</b>			
<b>Site</b>	<b>Distance / Direction / Gradient*</b>	<b>ID No.</b>	<b>Regulatory Status</b>
Moran Company (also listed as Heath & Company) 2121 Orange Street Alhambra, California	Adjacent / Northeast / Crossgradient	SI05032681	Notification Date: 11/9/1988 Contaminants: Gasoline Media Impacted: Soil Status: <u>Completed - Case Closed</u> Date of Closure: 4/16/1990

\* Presumed hydrogeologic gradient based upon regional topography

Based upon the current regulatory status, distance, type of media impacted (soil only), it is considered unlikely that conditions associated with the identified LUST/LAST sites represents an environmental concern to the Subject Property.

California UST Databases (AST, UST, FID UST, HIST UST, SWEEPS UST)

The California Environmental Protection Agency, the California Water Resources Control Board and other entities previously maintained or currently maintain various lists recording permitted aboveground and underground storage tank (AST/UST) sites in California. The Subject Property and five adjoining properties were identified on the UST databases. Information regarding the listed sites is presented in the following table:

<b>AST, UST, FID UST, HIST UST, SWEEPS UST</b>				
<b>Location</b>	<b>Distance / Direction / Gradient</b>	<b>Capacity / Contents</b>	<b>Year Installed</b>	<b>Status</b>
C F Braun and Co (also listed as Santa Fe International Corp) 1000 S Fremont Avenue Alhambra, CA	Subject Property	Various USTs	Various	Not reported
Steed Brothers Construction 714 Date Street Alhambra, California	Adjacent / East / Crossgradient	Not reported	Not reported	Not reported Please refer to the LUST/LAST Section above.
Jones Excavating 704 Date Street Alhambra, California	Adjacent / East / Crossgradient	Not reported	Not reported	Not reported Please refer to the LUST/LAST Section above.
LA County Dpte. Of Public Works 900 S Fremont Avenue Alhambra, California	Adjacent / North / Crossgradient	Not reported	Not reported	Not reported Please refer to the LUST/LAST Section above.
Alhambra Save-On Gas 2601 Mission Road Alhambra, California	Adjacent / Southwest / Crossgradient	Not reported	Not reported	Not reported Please refer to the LUST/LAST Section above.
Moran Company (also listed as Heath & Company) 2121 Orange Street Alhambra, California	Adjacent / Northeast / Crossgradient	Not reported	Not reported	Not reported Please refer to the LUST/LAST Section above.

\* Presumed hydrogeologic gradient based upon regional topography

The USTs associated with the Subject Property are discussed in Section 4.3. All five adjoining UST sites were previously discussed in the LUST/LAST database section above.

Solid Waste Information System (SWIS and SWF/LF)

The Solid Waste Information System (SWIS and SWF/LF) facility database contains information on solid waste facilities, operations, and disposal sites throughout the State of California. The types of facilities found in this database include landfills, transfer stations, material recovery facilities, composting sites, transformation facilities, waste tire sites, and closed disposal sites. For each facility, the database contains information about location, owner, operator, facility type, regulatory and operational status, authorized waste types, local enforcement agency and inspection and enforcement records. The Subject Property was not identified on the SWIS and SWF/LF databases. However, one site located within 0.5 mile of the Subject Property was identified on the SWIS and SWF/LF databases. Information regarding the listed site is presented in the following table:

<b>SWIS and SWF/LF</b>			
<b>Site</b>	<b>Distance / Direction / Gradient</b>	<b>ID No.</b>	<b>Facility Status</b>
Heritage Disposal 704 S Date Street Alhambra, California	Adjacent / East / Crossgradient	S104567996	Facility Type: Waste Hauler Facility Status: Active No Reported Violations

\* Presumed hydrogeologic gradient based upon regional topography

Based on the type of listing (waste hauler), off-site location, and absence of reported violations, it is considered unlikely that conditions associated with the identified SWF/LF site represents an environmental concern to the Subject Property. However, please note that environmental concerns associated with adjoining properties were previously discussed in the NPL database section (4.1.1) above.

Waste Management Unit Database / Solid Waste Assessment Test (WMUDS/SWAT)

The Waste Management Unit Database (WMUDS) is used by the California Water Resources Control Board and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. WMUDS is composed of the following databases: Facility Information, Scheduled Inspections Information, Waste Management Unit Information, SWAT Program Information, SWAT Report Summary Information, SWAT Report Summary Data, Chapter 15 (formerly Subchapter 15) Information, Chapter 15 Monitoring Parameters, TPCA Program Information, RCRA Program Information, Closure Information, and Interested Parties Information. Neither the Subject Property nor any sites located within 0.5 mile of the Subject Property were identified on WMUDS/SWAT database. The Subject Property was not identified on the WMUDS/SWAT database.

California Hazardous Material Incident Report System (CHMIRS)

The California Hazardous Material Incident Report System (CHMIRS) contains information regarding reported hazardous material incidents (i.e. accidental releases or spills). The data source is the California Office of Emergency Services.

The Subject Property was identified on the CHMIRS database. The Subject Property is listed as The Alhambra, 1000 S. Fremont Avenue, with OES Incident No. 803575. The current regulatory status is listed as “Completed” as of November 1, 1988. There is no additional information provided in this database. However, upon the current regulatory status and reported nature and/or extent of the release, it is considered likely unlikely that conditions associated with the identified listing represents an

existing release, past release, or material threat of release of hazardous substances or petroleum products on the Subject Property.

#### State and Tribal Engineering Control / Institutional Control Registries

The completion of site cleanup activities may include the implementation of engineering controls or institutional controls as part of the response action. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls. The Subject Property was not identified on the state or tribal Engineering Control or Institutional Control Registries. However, one site located within 0.5 mile of the Subject Property was identified on the state or tribal Engineering Control or Institutional Control Registries. The listed site was determined to be located 0.31 mile from the Subject Property in a presumed crossgradient direction. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified site represent an environmental concern to the Subject Property.

#### Tribal Environmental Databases

The United States Bureau of Indian Affairs (BIA) is responsible for the administration and management of 55.7 million acres of land held in trust by the United States for American Indians, Indian tribes, and Alaska Natives. There are 562 federally recognized tribal governments in the United States. The environmental database report identifies tribal administered lands of the United States that have any area equal to or greater than 640 acres. No tribal administered lands were identified within 1.0 mile of the Subject Property.

#### EDR MGP

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination. The Subject Property was not identified on the EDR MGP database. However, one site located within 1.0 mile of the Subject Property was identified on the EDR MGP database. The listed site was determined to be located 0.67 mile from the Subject Property in a presumed crossgradient direction. Based upon the distance/presumed hydrogeologic gradient relative to the Subject Property, it is considered unlikely that conditions associated with the identified site represent an environmental concern to the Subject Property.

**Hazardous Waste Information System (HAZNET)**

The California Environmental Protection Agency maintains a list of facilities that issue hazardous waste manifests. The source of the manifest records is the California Department of Toxic Substance Control (DTSC). Inclusion on the HAZNET database does not necessarily indicate the existence of an environmental concern, such as a release or spill incident. The Subject Property was identified on the HAZNET database. Information regarding the listed site is presented in the following table:

<b>HAZNET</b>			
<b>Site</b>	<b>Distance / Direction / Gradient</b>	<b>ID No.</b>	<b>Facility Status</b>
Global Electric 1000 S Fremont Ave Alhambra, California	Subject Property	SI12844625	Ceased operations in 1997 Status: No Violations. No releases or spills reported. Waste transported off-site: Polychlorinated biphenyls and material containing PCBs
Santa Fe (Us Holdings) Inc 1000 S Fremont Ave Alhambra, California	Subject Property	SI13074069	Ceased operations in 1999 Status: No Violations. No releases or spills reported. Waste transported off-site: Unspecified aqueous solution, Other inorganic solid waste, Alkaline solution without metals pH = 12.5, and Waste oil and mixed oil
Los Angeles County Sheriff Dept 1000 S Fremont Ave Alhambra, California	Subject Property	SI12920451	Last reported in 2002 Status: No Violations. No releases or spills reported. Waste transported off-site: Off-specification, aged or surplus organics
Brown&Root Braun-Alhambra 1000 S Fremont Ave Alhambra, California	Subject Property	SI13048046	Ceased operations in 1998 Status: No Violations. No releases or spills reported. Waste transported off-site: Off-specification, aged or surplus organics and Alkaline solution without metals pH = 12.5
Campus One Thousand Freemont Llc Alhambra 1000 S Fremont Ave Alhambra, California	Subject Property	SI13109104	Reported in 2007 Status: No Violations. No releases or spills reported. Waste transported off-site: Asbestos containing waste and Other organic solids
The Alhambra 1000 S Fremont Ave Alhambra, California	Subject Property	SI13459317	Reported in 2010 Status: No Violations. No releases or spills reported. Waste transported off-site: Asbestos containing waste
Braun, C F & Co Research Facility 1000 S Fremont Ave Alhambra, California	Subject Property	SI12999014	Reported in 1994 Status: No Violations. No releases or spills reported. Waste transported off-site: Other inorganic solid waste, and unspecified aqueous solution

HAZNET			
Site	Distance / Direction / Gradient	ID No.	Facility Status
The Alhambra Office Community Llc 1000 S Fremont Ave Alhambra, California	Subject Property	S113147114	Reported in 2014 Status: No Violations. No releases or spills reported. Waste transported off-site: Asbestos containing waste, Unspecified oil-containing waste, Polychlorinated biphenyls and material containing PCBs, Off-specification, aged or surplus inorganics
Heath & Company 1000 S Fremont Ave Alhambra, California	Subject Property	S113077036	Reported in 2001 Status: No Violations. No releases or spills reported. Waste transported off-site: Aqueous solution with total organic residues less than 10 percent

\* Presumed hydrogeologic gradient based upon regional topography

Several current and former occupants of the Subject Property are listed in the HAZNET database. Based upon the reported nature of this database (proper disposal of regulated waste under manifest), it is considered unlikely that conditions associated with the identified listings represent an environmental concern to the Subject Property. However, environmental concerns associated with the historic uses of the Subject Property are discussed in the NPL database section (4.1.1) and the Historical Use section (4.3).

Los Angeles County Hazardous Material Storage (HMS)

This report contains information pertaining to industrial waste and underground storage tank sites. The Subject Property is listed in the HMS database. The Subject Property is listed as SFIC Properties, 1000 Fremont Avenue, with ID No. S100581325. The Subject Property is listed due to former permits to operate USTs. The listing is reported as “Closed” under Closed Permit No. 00000217T. Environmental concerns associated with the historic uses of the Subject Property are discussed in the NPL database section (4.1.1), the UST database Section (4.1.2), and the Historical Use section (4.3).

National Pollutant Discharge Elimination System (NPDES)

The RWQCB maintains a database of listing of NPDES permits, including stormwater. The Subject Property is listed in the NPDES database with listing: The Alhambra, 1000 S Fremont Avenue. The Property is listed as an active facility with an active NPDES permit to discharge into municipal stormwater system, Construction Program type. There are no records of active or former violations associated with this NPDES listing tenant. Based upon the absence of open or reported violations, it is considered unlikely that conditions associated with the identified NPDES listing of the Subject Property represents an environmental concern to the Subject Property at this time.

EDR Dry Cleaners and Hist Cleaners

A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners’ agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants except rugs; carpet and upholstery cleaning; industrial launderers; laundry and garment services. The Subject Property was identified on the Dry Cleaners List. None of the adjoining properties were identified on the Dry Cleaners or Historical Dry Cleaners List. The Subject Property is listed as Xpress Cleaner at the address of 1000 S Fremont

Avenue. The HIST Cleaner database indicates that this dry cleaner operated in at least 2010 and 2011. Site representatives reported that this was a drop off dry cleaning facility only. No on-site dry cleaning was conducted. Additionally, this drop off dry cleaner no longer operates at the Subject Property. Based upon the reported nature of this former dry cleaning facility, it is considered unlikely that conditions associated with the identified listing represents an environmental concern to the Subject Property.

**EDR Historical Auto Stations**

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR’s review was limited to those categories of sources that might, in EDR’s opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. The Subject Property and several adjoining properties were identified on the EDR Historical Auto Stations List. Information regarding the listed sites is presented in the following table:

<b>EDR Historical Auto Stations</b>			
<b>Site</b>	<b>Distance / Direction / Gradient</b>	<b>ID No.</b>	<b>Facility Status</b>
Jack Auto Service 701 S Date Ave Alhambra, California	Subject Property	1015606287	Status: No Violations. No releases or spills reported.
Upgrade Auto Service 1007 S Fremont Ave Alhambra, California	Adjacent / West / Crossgradient	1015123292	Status: No Violations. No releases or spills reported.
Auto Tricks 919 S Fremont Ave Alhambra, California	Adjacent / West / Crossgradient	1015193639	Status: No Violations. No releases or spills reported.
Mickey’s Geo W Union 2601 W Mission Blvd Alhambra, California	Adjacent / Southwest / Crossgradient	1009121529	Status: No Violations. No releases or spills reported.

\* Presumed hydrogeologic gradient based upon regional topography

Environmental concerns associated with the historic uses of the Subject Property are discussed in the NPL database section (4.1.1) and the Historical Use section (4.3). Releases associated with the adjoining properties were previously discussed in the regulatory databases above.

**4.1.3 Local Regulatory Agency Records**

Local municipal offices consulted during the completion of this assessment included the following:

City of Alhambra Development Service Department – Building Division

EBI reviewed available files regarding the Subject Property at the City of Alhambra Development Service Department – Building Division for information regarding past uses of the Subject Property. Computer records indicate that the parking structure, Building B7, was originally constructed in 1981, and strengthened in 1995. The three one-story multi-tenant retail buildings (1127, 1129 & 1131 S. Fremont Avenue) were constructed in 2004. The LA Fitness Building and south adjacent parking garage structure were constructed in 2009. Records prior to 1980 are only available via a Freedom of Information Act (FOIA) request. As of the date of this report, EBI has not received a response to this inquiry. The personnel at the building department reported that the Subject Property was formerly occupied by C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus.

#### City of Alhambra Department of Public Works

EBI reviewed available files regarding the Subject Property at the City of Alhambra Department of Public Works. The Department of Public Works provides municipal water and sanitary sewer service to the Subject Property. Problems regarding drinking water quality or sewer system contamination were not identified in Department of Public Works files. However, the department representative indicated that groundwater at the Subject Property area is contaminated and is undergoing remediation under the San Gabriel Valley Area 3 NPL site (previously discussed in Section 4.1.1.). The Subject Property has been connected to municipal water and sanitary sewer systems since construction of the buildings in early 1920s. All stormwater catch basins located at the adjacent streets discharge to the municipal stormwater sewerage system, operated by the City of Alhambra.

#### Los Angeles County Department of Environmental Health (SDCDEH)

EBI has submitted a written request to the DEH regarding any relevant information on the Subject Property, in accordance with the FOIA. As of the date of this report, EBI has not received a response to this inquiry. Upon receipt of the agency response, if the provided information has a material affect on the findings of this report, EBI will forward this information as an addendum to this report. If no response is received, or no material information is identified, our report will not be modified.

#### City of Alhambra Fire Department

EBI has submitted a written request to the City of Alhambra Fire Department for information on the Subject Property, in accordance with the FOIA. As of the date of this report, EBI has not received a response to this inquiry. Upon receipt of the agency response, if the provided information has a material affect on the findings of this report, EBI will forward this information as an addendum to this report. If no response is received, or no material information is identified, our report will not be modified.

#### Los Angeles County Department of Public Works (DPW)

EBI also has submitted a written request to the Los Angeles County DPW for information regarding removal or closure of former USTs at the Subject Property, in accordance with the FOIA. As of the date of this report, EBI has not received a response to this inquiry. Upon receipt of the agency response, if the provided information has a material affect on the findings of this report, EBI will forward this information as an addendum to this report. If no response is received, or no material information is identified, our report will not be modified.

#### Los Angeles Regional Water Quality Control Board (LARWQCB)

EBI also has submitted a written request to the LARWQCB for information regarding the SLIC and UST listings for the Subject Property. As of the date of this report, EBI has not received a response to this inquiry. Upon receipt of the agency response, if the provided information has a material affect on the findings of this report, EBI will forward this information as an addendum to this report. If no response is received, or no material information is identified, our report will not be modified.

#### 4.1.4 Vapor Migration

EBI conducted a vapor migration screening survey of the Subject Property. EBI's site observations and review of the environmental database report (cited in Section 4.1) did not identify any conditions on the Subject Property or on adjoining properties that would indicate a REC relative to vapor migration at the Subject Property, except as discussed in the NPL database section (4.1.1) and the Historical Use section (4.3).

This vapor migration screening was conducted in accordance with ASTM E1527-13 and is not intended to satisfy the requirements of ASTM E2600-15. The scope of this screening was limited to visual

observations and review of the environmental database report and did not include the collection and laboratory analysis of air samples to confirm or refute the presence of airborne contaminants by vapor intrusion.

## 4.2 PHYSICAL SETTING

### 4.2.1 Topography

The Subject Property is located at an elevation of approximately 466 feet above mean sea level (msl). The Subject Property is generally flat with a slight slope to the southwest. The general slope of the surrounding region is to the west-southwest (see Figure 2 - Locust Map, which depicts the location of the Subject Property on the Los Angeles, California USGS 7.5 Minute Topographic Quadrangle).

### 4.2.2 Geology and Soils

No bedrock outcroppings were observed at the Subject Property. The Site is located within San Gabriel Valley which lies at the southern foot of the San Gabriel Mountains. San Gabriel Valley is separated from the Coastal Plain by a series of low rolling hills including the Repetto, Merced, Puente, and San Jose Hills. The San Gabriel Mountains consist of crystalline and metamorphic rocks while the Repetto, Merced, Puente and San Jose Hills consist of sedimentary rocks of marine origin. The valley is filled with alluvial sediment from the surrounding mountains and hills overlaying marine bedrock (California Department of Water Resources [CDWR], 1966). The San Gabriel Valley is characterized by a broad piedmont plain that slopes from the San Gabriel Mountains toward the Whittier Narrows. The west side of the valley is drained by the Rio Hondo River, the Alhambra, Rubio, Eaton, Acadia and Santa Anita Washes. Both the Rio Hondo and San Gabriel Rivers, and their tributaries, drain the runoff in the valley, exiting at the Whittier Narrows. The Site is located between the Los Angeles River to the west, and the Rio Hondo River to the east. The Whittier Narrows is located approximately 5 miles to the southeast.

San Gabriel Valley is separated on the east from the Upper Santa Ana Valley by a bedrock high located between the cities of San Dimas and La Verne which serves as a divide between the two watersheds. The northwest boundary of the San Gabriel Valley is the Raymond Fault which separates the San Gabriel Basin from the Raymond Basin. The Raymond Fault cuts northeasterly from the north side of the Repetto Hills to the San Gabriel Mountains, just north of the city of Monrovia. The fault serves as a hydraulic barrier to flow into the valley from that direction and forms the northern boundary of USEPA Area 3.

The Subject Property is underlain by Quaternary older floodplain alluvium consisting of unsorted sand, silts and clay. Nearby outcrops of Miocene age formations (Puente, Topanga, or Punchbowl) are found to the southeast of the Site (CDWR, 1966). CH2M Hill (2009) reports that aquitards are common in the older alluvium deposits within the vicinity of the Site. Both CDWR (1966) and CH2M Hill (2009) indicate that the base of the alluvium slopes from the surrounding mountains and hills toward the cities of Rosemead and El Monte reaching elevations of 2,200 feet relative to mean sea level (msl). CH2M Hill (2009) reports that there is a geologic discontinuity traversing Area 3 which is possibly an unnamed fault associated with the Whittier fault system. The bedrock discontinuity apparently serves as a barrier to groundwater flow between the western and eastern portions of Area 3. The Subject Property is located west of this discontinuity, in the western portion of San Gabriel Valley Area 3 NPL site.

The Subject Property is generally underlain by alternating sequences of fine and coarse grained sediments. Coarse grained deposits encountered during drilling were predominately composed of fine-to-medium grained sands although interbedded pebbles and fine gravel were frequent throughout the

encountered formation. Fine grained sediments were comprised predominately of low plasticity silty clays.

#### 4.2.3 Hydrogeology and Hydrology

No natural surface water bodies were identified on or adjacent to the Subject Property. According to information reviewed for the multiple assessments in the Subject Property, groundwater flow in the Subject Property vicinity of the San Gabriel Valley Area 3 NPL site is reported to generally be to the southeast. However, please note that recent groundwater flow data from the southeast adjoining SLIC site shows a localized groundwater flow to the northeast. Further, shallow groundwater in the Subject Property vicinity has been found to be at depths greater than 150-feet below ground surface (bgs).

Monitoring wells were observed on the Subject Property and are associated with the assessment and remediation activities conducted as the Subject Property. These monitoring wells are further discussed in Section 5.6.

### 4.3 HISTORICAL USE OF THE SUBJECT PROPERTY AND ADJOINING PROPERTIES

EBI attempted to determine the history of the Subject Property dating back to 1940 or first developed use. The following table summarizes the historical use of the Subject Property and surrounding area.

<b>HISTORICAL USE SUMMARY</b>			
<b>Period</b>	<b>Historical Uses</b>		<b>Source(s)</b>
	<b>Subject Property</b>	<b>Surrounding Area</b>	
<b>Prior to 1920</b>	Undeveloped land	Primarily undeveloped land	Topographic Maps
<b>At least 1925 – 1938</b>	C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops; and residential dwellings	Office, industrial, manufacturing, commercial facilities, and residential dwellings	Aerial Photographs Fire Insurance Maps Topographic Maps City Directories Municipal Records Previous reports
<b>1940 – Late 1970s</b>	C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops; and residential dwellings	Office, industrial, manufacturing, commercial facilities, and residential dwellings	Aerial Photographs Fire Insurance Maps Topographic Maps City Directories Municipal Records Previous reports
<b>Late 1970s to 1990s</b>	Santa Fe Industries and Kuwait Oil Corporation, office facilities.	Office, industrial, manufacturing, commercial facilities, and residential dwellings	Aerial Photographs Fire Insurance Maps Topographic Maps City Directories Municipal Records Previous reports
<b>Mid-1990s to Present</b>	The Alhambra: Offices, education institutions, and retail tenants	Office, industrial, manufacturing, commercial facilities, and residential dwellings	Aerial Photographs Topographic Maps City Directories Municipal Records Previous reports

No environmentally significant conditions were identified on the Subject Property or surrounding properties during the historical review, except for the following:

Historical tenants of potential environmental concern include F. Braun & Co. Manufacturing and Oil Refinery Office Campus, machine shops, foundry activities, railroad spurs, unspecified manufacturing facilities, power generation buildings, maintenance shops, and automotive repair shops. Potential environmental concerns associated with these types of occupants include soil, soil-gas, and groundwater impacts. Groundwater at the Subject Property is known to be impacted with VOCs from the San Gabriel Valley Area 3 NPL site. Soil and soil-gas VOC impacts have been assessed at the Subject Property as part of the investigations for the NPL site. These findings were previously discussed above in the San Gabriel Valley Area NPL listing. Numerous soil and soil vapor investigations were performed at the Subject Property between 1999 and 2016 by Geomatrix, Equipoise and Project Navigator. According to Equipoise, between 1999 and 2007, a total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project Navigator investigations. Soil samples were collected from various areas identified as Areas of Concern (near former plating or manufacturing operations, machine shops, spray paint booths, railroad tracks, cooling tower, factories, USTs, sumps, clarifiers, etc.) due to the historic use of the Subject Property and analyzed for metals, mercury, hexavalent chromium, pH, TPHcc (total petroleum hydrocarbons – carbon chain), VOCs, Semi-VOCs (Semi-volatile organic compounds), pesticides, polychlorinated biphenyls (PCBs), polyaromatic hydrocarbons (PAHs), herbicides, perchlorate, and/or dioxins and furans. The results of the soil analyses indicated that all compounds were below Preliminary Remediation Goals (PRGs) and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below Risk-Based Screening Levels (RBSLs) for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and the exception of samples collected in the vicinity of the southeast adjoining 2215 W. Mission Road property (previously discussed in the San Gabriel Valley Area NPL listing). Based on the results of the numerous previous investigations at the Subject Property, it appears that the historic use of the Subject Property does not represent an environmental concern, with the exception of the SLIC listings that were previously discussed above.

A historic Subject Property occupant, C.F. Braun and Co, 1000 South Fremont Avenue, is identified as a HIST UST, CA FID UST, and SWEEPS UST site. USTs associated with this occupant included one 10,000-gallon gasoline UST installed in 1980, one 3,000-gallon gasoline UST installed in 1968, one 1,500-gallon gasoline UST installed in 1968, and one 61,500-gallon diesel fuel UST installed in 1944. The current status of the USTs is not reported. According to documents provided, the three gasoline USTs were removed from the Subject Property from two separate UST pits in 1998. Soil samples were collected from the excavation pits, as well as from the associated piping and dispenser islands. The soil samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg); benzene, toluene, ethylbenzene, total xylenes (BTEX); methyl tertiary butyl ether (MTBE); and/or lead. Laboratory results indicated that no significant gasoline contamination; however, some MTBE was found. Re-analysis of two samples for MTBE confirmed that no MTBE was present in the soil samples. No further action was recommended. Also in 1998, one 61,500-gallon diesel fuel UST was abandoned-in-place. Soil samples were collected from beneath the UST, adjacent to the fill port and fill piping, and adjacent to the product piping. Soil samples were analyzed for TPH as diesel (TPHd), BTEX, and MTBE. Laboratory results indicated that no diesel fuel contamination. No further action was recommended. As such, these USTs are considered a *historic recognized environmental condition (HREC)*, and no further action is recommended.

A fuel oil tank is depicted on the north side of a former research building located along Fremont Avenue in the 1960 and 1981 fire insurance maps. The former research building has since been demolished and the area redeveloped with a parking garage. Additionally, two solvent USTs were reportedly associated with the former Subject Property address of 2400 West Orange Street, which was located on the northern portion of the Subject Property. Previous reports indicate that permits on file found from the

Los Angeles County Department of Public Works (LACDPW) indicated that the tanks were operated by Union Oil Company from 1930 to 1932. Additionally, the reports note that, if these tanks were ever installed, they likely contained mineral spirits or toluene, not chlorinated solvents because chlorinated solvents had not been developed at the time of the permits. The property associated with 2400 West Orange Street was redeveloped with the existing building at some point between 1960 and 1964. Both the tank areas were reportedly investigated as part of the 2007 Supplemental Subsurface Investigation performed by Project Navigator in 2007. No hydrocarbons were detected at the locations of the heating oil or the solvent tanks. Although the information regarding the UST removals was not found, the redevelopment of these areas with the existing improvements would likely have uncovered any remaining USTs. As such, and based on the results of the 2007 Project Navigator investigation, these USTs are considered a *historic recognized environmental condition (HREC)*, and no further action is recommended.

#### 4.3.1 Aerial Photographs

Historical aerial photographs may be used to evaluate changes in land use and to identify visible areas of potential environmental concern. A search for historical aerial photographs depicting the Subject Property and vicinity was conducted by Environmental Data Resources, Inc. (EDR). Aerial photographs depicting the Subject Property were reviewed and are summarized in the following table. Copies of the aerial photographs are presented in Appendix F.

AERIAL PHOTOGRAPH SUMMARY		
Year	Issues Noted	Observations
1928, 1938	Yes	<b>Subject Property:</b> The Subject Property appears to consist of office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and some portions with undeveloped land, and small structures that appear to be residential dwellings along the eastern side of the site. Some industrial buildings are also depicted at the retail buildings parcels.
		<b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1948	Yes	<b>Subject Property:</b> The Subject Property appears to consist of office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. Undeveloped portions are depicted along the eastern side of the site. Some industrial buildings are also depicted at the retail buildings parcels.
		<b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1952, 1964, 1977	Yes	<b>Subject Property:</b> The Subject Property appears to consist of office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. Some industrial buildings are also depicted at the retail buildings parcels.
		<b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1964	Yes	<b>Subject Property:</b> The Subject Property appears to consist of office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. Undeveloped land is depicted at the retail buildings

AERIAL PHOTOGRAPH SUMMARY		
Year	Issues Noted	Observations
		parcels. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road. A large office and retail complex is depicted adjacent to the north, and reportedly occupied by the Sears Headquarters.
1977, 1979, 1981, 1989, 1994, 2002, 2009, 2012	No	<b>Subject Property:</b> The Subject Property appears to consist mostly of office buildings and parking areas. Formerly existing large manufacturing and industrial buildings are no longer depicted. An open surface parking lot is depicted at the retail buildings parcels. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road. A large office and retail complex is depicted adjacent to the north, and reportedly the Sears Headquarters.

#### 4.3.2 Fire Insurance Maps

A search for historical fire insurance maps depicting the Subject Property and vicinity was conducted by Environmental Data Resources, Inc. (EDR). Historical fire insurance maps depicting the Subject Property were reviewed and are summarized in the following table. Copies of the fire insurance maps are presented in Appendix F.

FIRE INSURANCE MAPS SUMMARY		
Year	Issues Noted	Observations
1925	Yes	<b>Subject Property:</b> The Subject Property is depicted as office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and some portions with undeveloped land, and few small structures that appear to be residential dwellings along the eastern side of the site. The retail buildings parcels are depicted as the Boyd Lumber Company. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1950	Yes	<b>Subject Property:</b> The Subject Property is depicted as office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. The retail buildings parcels are depicted as the Boyd Lumber Company. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1960, 1981	Yes	<b>Subject Property:</b> The Subject Property is depicted as office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. The retail buildings parcels are depicted as undeveloped. A fuel oil tank is depicted on the north side of a former research building located along Fremont Avenue in the 1960 and 1981 fire insurance maps. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings

FIRE INSURANCE MAPS SUMMARY		
Year	Issues Noted	Observations
		are depicted to the south, across Mission Road. By 1981, the north adjacent property is depicted as the Sears Headquarters complex, across Orange Street.

### 4.3.3 Topographic Maps

Historical topographic maps provide information related to physical land configuration such as elevation, ground slope, surface water and other features. While most buildings in densely developed urban centers are not depicted, topographic maps typically show structures equal to or larger than the size of a single-family residence in rural areas. Other notable features such as woods, pipelines, municipal boundaries, and areas of filled land are often marked on topographic maps.

A search for historical topographic maps depicting the Subject Property and vicinity was conducted by Environmental Data Resources, Inc. (EDR). Historical topographic maps depicting the Subject Property were reviewed and are summarized in the following table. Copies of the topographic maps are presented in Appendix F.

TOPOGRAPHIC MAP SUMMARY		
Year	Issues Noted	Observations
1894, 1896, 1900	No	<b>Subject Property:</b> The Subject Property is depicted as undeveloped land. No structures or other notable features are depicted on the Subject Property. <b>Surrounding Properties:</b> The surrounding properties are depicted as undeveloped land. No structures or other notable features are depicted on the surrounding properties.
1924, 1926/ 1928	Yes	<b>Subject Property:</b> The Subject Property is depicted with industrial-type structures at the southwest corner of the Subject Property. Remaining areas are depicted as vacant. <b>Surrounding Area:</b> Surrounding properties to the north, east, and west are depicted with commercial and industrial buildings, and undeveloped land, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. Residential dwellings are depicted to the south, across Mission Road.
1953	Yes	<b>Subject Property:</b> The Subject Property is depicted within a pink-shaded area, indicative of urban development, and where site-specific information is not available. However, a large industrial-type structures is depicted at the center of the Subject Property. <b>Surrounding Area:</b> Surrounding properties to the north, south, east, and west are depicted within a pink-shaded area, indicative of urban development, and where site-specific information is not available.
1966	Yes	<b>Subject Property:</b> The Subject Property appears to consist of office and industrial buildings, part of the C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. Undeveloped land is depicted at the retail buildings parcels. <b>Surrounding Area:</b> Surrounding properties to the north, and west are depicted with commercial and industrial buildings, across Orange Street to the north, Date Street to the east, and Fremont Avenue to the west. South and east adjacent properties are depicted within a pink-shaded area, indicative of urban development, and where site-specific information is not available.
1972, 1981, 1994	Yes	<b>Subject Property:</b> Similar to the 1966 topographic map. <b>Surrounding Area:</b> Similar to the 1966 topographic map, with the exception that a large office and retail complex is depicted to the north, across Orange Street.

#### 4.3.4 Street Directories

Street directories are commercial publications containing names and addresses, and in many cases, occupations of the occupants of a particular community. The directories may also contain information pertaining to business processes conducted within a community. A search for historical street directories was conducted by Environmental Data Resources, Inc. (EDR). Historical street directories were reviewed and are summarized in the following table. Copies of the street directories are presented in Appendix F.

<b>STREET DIRECTORY SUMMARY</b>		
<b>Year</b>	<b>Issues Noted</b>	<b>Occupants</b>
1950 to 1971	Yes	The Subject Property is listed as Braun C F & Co Engineers, Heat-Transfer Research Inc.
1981 to 1990	Yes	The Subject Property is listed as Braun C F & Co Engineers; and Santa Fe Braun Inc., and Santa Fe International Corp.
1995 to 2013	Yes	The Subject Property is listed as Alhambra offices, with several offices, educational institutions listings, retail listings, and a drop-off dry cleaning facility.

#### 4.3.5 Recorded Land Title Records

Land title records provide information on previous ownership of a property. Typically, deeds signifying transfer of a land parcel are recorded in county files and can be researched to determine the identity of past owners. A “chain of title” is a continuous record of ownership for a specific parcel. A 50-year chain of title search was not included in the scope of work for this assessment.

#### 4.3.6 Property Tax Records

The property card for the Subject Property was obtained at the County of Los Angeles Assessor’s Office. The property card identifies the current owner as The Alhambra Office Community, LLC, who acquired the Subject Property in June 2006. Copies of the property tax records are presented in Appendix C.

#### 4.3.7 Environmental Liens and Activity and Use Limitations

A search for Environmental Liens and Activity and Use Limitations was not included in the scope of this assessment.

#### 4.3.8 Previous Environmental Reports

EBI was not provided with previous environmental assessments or other documentation regarding environmental investigations performed for the Subject Property. EBI did not identify previous environmental reports for the Subject Property at local agencies or other sources contacted during this assessment, except from those obtained from the online GeoTracker database and discussed in relevant below:

The online GeoTracker database for The Alhambra included a Soil Closure Risk Evaluation, prepared by Equipoise Corporation (Equipoise) and dated May 24, 2016. The 2016 Soil Closure Risk Evaluation included a summary of previous investigations performed on the Subject Property by Geomatrix Consultants, Inc. (Geomatrix) in 2002/2003; Equipoise in 2005; and Project Navigator, LTD (Project

Navigator) in 2007. The Geomatrix investigation was performed site-wide as part of a property transfer. Please note that these previous investigations were not provided to EBI for review. The summary of previous investigations does not indicate Equipoise provided the following summary of the previous investigations.

- May 1999: Law Crandall performs Phase I Environmental Site Assessment for 1000 South Fremont Avenue and 2601 West Mission Road for Santa Fe (U.S. Holdings) (Law Crandall, 1999).
- July 1999: Blasland, Bouck, and Lee (BBL) performed site investigation activities to support the prospective purchase of the Subject Property (BBL, 1999a). The investigation included the following tasks: review of available agency records, figures, maps, drawings, and reports associated with previous/current environmental conditions regarding the Subject Property and adjacent properties; a site reconnaissance to further identify potential areas of environmental concern; a subsurface soil investigation based on the findings of the document review and site walk over; and a building material survey including sampling for asbestos containing material (ACM), lead-based paint and other building materials of environmental concern.
- November 1999: BBL completes soil investigation in the former manufacturing area (BBL, 1999b). Six soil sampling locations were drilled and 24 soil samples were collected at depths of 3, 5, 10 and 15 feet below ground surface (feet bgs). Soil samples were analyzed for CAM 17 Metals using USEPA Test Method 6010 and results were within anticipated background concentrations for all metals.
- December 2000: BBL performs Phase I Environmental Site Assessment for 1000 South Fremont Avenue (BBL, 2000).
- 2003: USEPA sends letter “Request for Information – Area 3 Operable Unit –San Gabriel Valley Superfund Sites, East Los Angeles County, California” dated February 10, 2003.
- March 2003: Geomatrix (on behalf of iStar Financial, Inc. the lender on the property at the time) performed a Phase II Environmental Site Assessment for The Alhambra Campus, 1000 and 1101 South Fremont Avenue and the southeast and southwest adjacent 2215 and 2601 West Mission Road properties (Geomatrix, 2003).

A total of 37 soil samples were collected from 17 locations and analyzed for metals, mercury, hexavalent chromium, pH, TPHcc (total petroleum hydrocarbons – carbon chain), VOCs, Semi-VOCs (Semi-volatile organic compounds), pesticides, polychlorinated biphenyls (PCBs), herbicides, perchlorate, and/or dioxins. Soil samples were collected from depths ranging from 1.5 to 20 feet bgs. The results of the analyses for the soil samples collected were reportedly as follows: 1) Arsenic occurrences fell within the range of background concentrations in California soils. 2) Heavy metal concentrations (except arsenic) were below both their respective industrial and residential soil PRGs. 3) TPH hydrocarbon distribution components were below regulatory limits for diesel range hydrocarbons where depth to water is greater than 150 feet bgs. 4) PCE results detected in the soil analytical results were below residential RBSL values. 5) TCE was not detected in the soil analytical results. 6) Xylene results detected in the soil analytical results were below residential RBSL values. 7) SVOCs were not detected in the soil analytical results. 8) Pesticides were not detected in the soil analytical results. 9) PCBs were not detected in the soil analytical results. 10) Perchlorate detected in the soil analytical results were below residential RBSL values. 11) Dioxins were not detected in the soil analytical results. The Geomatrix investigation concluded that all concentrations of constituents detected in soil samples were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations (Geomatrix, 2003).

A total of 93 soil vapor samples (including duplicates) were collected from 43 locations and submitted for VOC analysis. Samples were collected from depths between 5 and 9 or 11 feet bgs from two locations, and 25 feet bgs from 43 locations, and 3.5 feet bgs at one location. Concentrations of PCE and/or 1,1-DCE in soil vapor exceeded the residential RBSL in 7 out of 93 samples for areas of the Subject Property not attributed to the adjacent 2215 W. Mission Road property. An additional 17 locations where concentrations of PCE, TCE, and/or 1,1-DCE in soil vapor exceeded the residential RBSL were immediately west and north of the 2215 W. Mission Road property and were attributed to the adjacent 2215 W. Mission Road property. Please note that the locations identified above (north and west of the 2215 W. Mission Road property, the former machine shop, and the former paint spraying area) where PCE, TCE, and 1,1-DCE were detected above the RBSL were further investigated as part of the 2005 Equipoise investigation and the 2007 Project Navigator investigation. In addition, it should be noted that the 2002/2003 Geomatrix Investigation was performed prior to implementation of remediation activities at the 2215 W. Mission Road property. In July 2003, an extensive soil vapor extraction (SVE) remediation program was implemented using multiple wells with multiple extraction zones. The SVE system operated at the 2215 W. Mission Road property for approximately 42 months between July 2003 and December 2006. The SVE remediation system operations dramatically reduced the VOC concentrations in soil vapor probes.

Geomatrix concluded the following:

- With the exception of the samples collected in the vicinity of the former Charter property (2215 W. Mission Road), concentrations of constituents detected during Geomatrix's assessment were all below regulatory screening levels used at the time of the assessment (RBSLs and PRGs), except for arsenic, which was within the range of background concentrations for California soils.
- 2) Concentrations of tetrachloroethene (PCE) in shallow soil gas exceed the industrial RBSL for PCE areas of the Site to the west and north of the Charter property.
- 3) Constituents including petroleum hydrocarbons and volatile organic compounds (VOCs) were detected at several locations across the site. The majority of the detections were low and below regulatory screening levels.
- April 2003: Submittal of response to USEPA letter "Request for Information – Area 3 Operable Unit – San Gabriel Valley Superfund Sites, East Los Angeles County, California" dated February 10, 2003.
- April 2005: California Regional Water Quality Control Board – Los Angeles Region requires preparation of a "Soil Vapor Survey work plan, 1000 South Fremont, Alhambra, California" for the seven areas identified within the letter dated April 8, 2005. The locations of interest identified by the LARWQCB are: 1101 South Fremont Avenue; northeast portion of 1000 South Fremont; former Sump/Clarifier and Gas Fractionation/Distillation Unit; Southwest Corner – Adjacent Areas to 2215 West Mission Road; Incinerator Locations; a 61,500 Gallon Diesel Tank; and 20,000 Gallon Solvent Tanks.
- May 2005: A Soil Vapor Survey Work Plan responsive to the following locations is submitted to LARWQCB by Equipoise on behalf of the property owner: Northeast portion of 1000 South Fremont; Former Sump/Clarifier and Gas Fractionation/Distillation Unit; Southwest Corner – Adjacent Areas to 2215 West Mission Road; Incinerator Locations; and 61,500 Gallon Diesel Tank. The LARWQCB was informed that the 1101 South Fremont property was owned by a different

entity. The LARWQCB required sampling be performed at the reported locations of the two 20,000-gallon solvent tanks located at 2400 West Orange Street. This address was no longer associated with any existing building or facility, but corresponded with the northern boundary of the Subject Property, along Orange Street. Review of the Sanborn map for 1950 indicated a property outline for 2400 West Orange Street. Existing permits on file found from the Los Angeles County Department of Public Works (LACDPW) indicated that the tanks were operated by Union Oil Company from 1930 to 1932. It was noted that, if these tanks were ever installed, they likely contained mineral spirits or toluene, not chlorinated solvents, because chlorinated solvents had not been developed at the time of these permits. As Union Oil Company (UNOCAL) was still a viable entity, it was requested that the LARWQCB contact UNOCAL to investigate their former operations.

- July 2005: The LARWQCB approves the Soil Vapor Survey work plan submitted by Equipoise.
- July - October 2005: Equipoise implemented the field activities as outlined in the Soil Vapor Survey work plan.
- November 2005: *Soil Vapor Survey and Soil Matrix Sample Results, 1000 South Fremont, Alhambra, California* report (Equipoise, 2005) was submitted to LARWQCB. The LARWQCB identified six areas of interest on the Site following the review of the Geomatrix report and required that the property owner conduct further investigation at the identified locations (Geomatrix, 2003). Equipoise, on behalf of the property owner, investigated five of these locations in 2005. The one location not investigated was the potential tanks at the former Union Oil facility that was identified by the USEPA described previously.

A total of 59 soil vapor samples were collected from 24 locations. Samples were analyzed for VOCs after collection from depths between 5 and/or 15 feet bgs from three locations, 15 and 25 feet bgs from twenty locations, and 15 to 60 feet bgs at one location. The results of the analyses for the 59 soil vapor samples collected are summarized below:

- PCE was detected in 18 of the 59 soil vapor analytical results.
- TCE was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 1.7 ug/L from a sample from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and this TCE result in this soil vapor probe is attributable to activities associated with the 2215 W. Mission Road property.
- cis-1,2-DCE was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 2.1 ug/L from a sample from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and this cis-1,2-DCE result in this soil vapor probe is attributable to activities associated with the 2215 W. Mission Road property.
- Freon 11 was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 2.1 ug/L.
- Freon 113 was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 1.1 ug/L.
- BTEX components were not detected in any of the 59 soil vapor analytical results.

The summary of the soil vapor detections for PCE is as follows:

- PCE results for 41 out of 59 samples were below the laboratory detection limit of 1.0 ug/L.
- PCE results for 10 out of 59 samples were between 1.0 and 1.4 ug/L.

- PCE results for 2 out of 59 samples that were between 1.4 and 10 ug/L are from samples from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and the PCE results in this soil vapor probe are attributable to activities associated with the 2215 W. Mission Road property.
- The remaining six samples were collected from multiple depths of the nested soil vapor probe SG-21. Soil vapor probe SG-21 was the closest point on the Site to the former soil vapor plume from the adjacent property and the PCE concentrations results in this soil vapor probe are attributable to activities associated with the 2215 W. Mission Road property. The maximum detected PCE concentration from soil vapor probe SG-21 was 33 ug/l at 40 feet.

A total of 10 soil samples were collected from four locations and were analyzed for metals, mercury, TPHcc, PCBs, VOCs, PAHs, and dioxins and furans. Soil samples were collected from depths of 10, 15 and 20 feet bgs from the diesel tank locations and from 5 and 10 feet bgs from the incinerator locations. The results of the analyses for the soil samples collected are summarized as follows: PCE, TCE, -1,2-DCE, Freon 11 and 12, BTEX components, TPH PAHs, PCBs, and dioxins and furans were not detected in the soil analytical results. Heavy metal concentrations (except arsenic) were below both their respective industrial and residential soil PRGs. Arsenic occurrences fall within the range of background concentrations in California soils.

The 2005 Equipoise investigation concluded that all concentrations of constituents in soil and soil vapor detected were below RBSLs or PRGs, with the exception of PCE concentrations in soil vapor probe SG-21 which is the closest point on the Site to the soil vapor plume from the adjacent 2215 W. Mission Road property and the PCE exceedances of the occupational RBSL from the six samples were attributable to 12 activities associated with the 2215 W. Mission Road property. The area near soil vapor probe SG-21 was further investigated as part of the Project Navigator investigation.

- October 2006: The LARWQCB issued a Technical Report Requirement letter to Mr. Dick Denney, counsel for Santa Fe Corporation, for the 1000 South Fremont property. The LARWQCB requires a work plan to perform a soil and soil vapor investigation, implementation of the work plan, and a report documented field activities and that results would be provided to the LARWQCB.
- December 2006: LARWQCB provides comments on *Soil Vapor Survey and Soil Matrix Sample Results* report submitted by Equipoise in November 2005 (Equipoise, 2005) and describes requirements for additional investigative activities.
- January 2007: Equipoise, submits a Response to the LARWQCB December 2006 letter regarding requirements for additional investigative activities. The response letter clarifies that Santa Fe Braun, a successor to the historical owner, will prepare the work plan requested of both parties.
- June 2007: Project Navigator, on behalf of Santa Fe Braun, submits the *Final Supplemental Subsurface Investigation Work Plan, Former C.F. Braun & Co., 1000 South Fremont, Alhambra, California 91803*, to the LARWQCB in response to letter of December 6, 2006. In the letter, the LARWQCB identified three areas of potential concern (APC) to be further investigated: APC-A, APC-B, and APC-C. These areas were oriented north-south and roughly divided the Subject Property into three strips ("A" is the westernmost and "C" is the easternmost) to be used for location purposes. The central "B" strip encompassed the major manufacturing building that previously existed on the historic land use or other activities were identified for soil or soil vapor assessment by the LARWQCB. The LARWQCB stated that although there had been several phases of investigative site characterization of soil matrix and soil vapor profiling undertaken by the current property owners, additional characterization was required to make a determination of environmental impact from past Subject

Property operations. The LARWQCB's specific requirements were to provide additional information in order to determine whether or not soil contamination was present in the subsurface soil, and to determine whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Subject Property. The LARWQCB requested that a shallow soil investigation and an enhanced soil vapor survey be conducted in the APC. Furthermore, the LARWQCB specified the locations for the borings in relation to the APC.

APC-A included the following areas and associated former structures: The drum storage area on the north side of Building B-3; the fuel oil tank near the northwest corner of Building B-3; the sump/clarifier/UST between Buildings B-2 and B-3, the auto shed areas, the location of the 61,500-gallon diesel underground storage tank (UST) southwest of Building A-13; the power generating plant; the machine shop, and the research laboratory.

APC-B includes the following areas and associated former structures: The north end of the former factory building and nearby railroad alignment; the location of the reported former 20,000-gallon solvent tank in the area of 2400 W. Orange Street (the former Union Oil location); the location of the current cooling tower in the northern parking area; the southern portion of the former factory building; and the location of the former south cooling tower.

APC-C includes the following areas and associated former structures: The paint spray booth, machine shop, and the middle paint spray booth and the areas surrounding the southeast corner of the Subject Property near 2215 West Mission Road facility.

The Project Navigator investigation consisted of 30 shallow borings (shallow soil investigation) and four deep (to 100 feet bgs) borings (enhanced soil vapor investigation). Boring location selection was at the direction of the LARWQCB and was based on the LARWQCB's identification of the APC areas, described above, with emphasis on those areas that were not extensively reviewed in the previous investigations.

Shallow Borings: Soil samples were planned for collection at depths of 15 and 50 feet bgs. However, a number of the borings showed refusal at less than the planned total depth. When refusal occurred, samples were collected from the deepest penetration achieved. A total of 67 soil vapor samples were collected from 32 locations. Samples were analyzed after collection from depths between 15 and 50 feet bgs from 28 locations, and 25 and 100 feet bgs from the remaining four locations.

Deep Borings: Vapor sample collection was facilitated by the well construction using dedicated, nested probes. The four 100-ft borings contained nested probes that were sampled at least two weeks after drilling. Samples were withdrawn and analyzed using the same technique as described above for the shallow borings. Analysis of soil vapor samples was performed using a mobile laboratory.

Samples were collected from depths between 15 and 50 feet bgs from 30 locations and from depths between 10 and 100 feet bgs from the remaining four locations. A total of 91 soil samples were collected from 34 locations and analyzed for metals; TPH as Gasoline, Diesel, Crude; PCBs; mercury; VOCs; and SVOCs.

The results of the analyses generally show compounds to be below the laboratory detection limits and are summarized as follows:

- BTEX (benzene, ethylbenzene, o-xylene, p/m-xylene and toluene) was detected in 12 of the 91 soil samples taken from 6 of the 34 soil sampling locations at concentrations between 0.85 and

27 milligrams per kilogram (mg/kg). However, all concentrations were below their respective PRG for both industrial and residential soil as well as soil screening levels for groundwater, where available.

- Hydrocarbons (C7-C36 Total) were detected in 39 of the 91 soil samples taken from 20 of the 34 soil matrix sampling locations at concentrations between 0.0012 and 32 mg/kg. However, all concentrations were below the Board's regulatory requirements (100 mg/kg gasoline and 1,000 mg/kg for diesel). No hydrocarbons were detected at the location of the diesel tank (boring A-5-1) or the solvent tank (borings B-1-2, B-1-3 and B-1-4) investigated in this study.
- Arsenic was detected in 21 of the 91 soil samples taken from 13 of the 34 soil sampling locations at concentrations between 0.813 and 3.73 mg/kg. Twelve of the 20 soil samples had arsenic in concentrations above the industrial soil PRG. However, the arsenic occurrences fall within the range of background concentrations in California soils.
- Heavy metals (barium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, vanadium and zinc), were detected in 23 of the 91 soil samples taken from 14 of the 34 soil matrix sampling locations at concentrations between 0.119 and 96.4 mg/kg; however, all concentrations were below both their respective industrial and residential soil PRG as well as soil screening levels for groundwater, where available.
- Naphthalene was detected in 1 of the 91 soil samples taken from 1 of the 34 soil matrix sampling locations at a concentration of 0.85 mg/kg. However, the concentration was below both the industrial and residential soil PRG as well as soil screening levels for groundwater, where available. Low concentrations of arsenic, heavy metals, hydrocarbons, BTEX and naphthalene were detected in soil samples. In summary, all concentrations were below their respective PRG for both industrial and residential soil and as well as soil screening level for groundwater, where available, with the exception of arsenic.
- PCE, TCE, and cis-1,2- DCE were not detected in any of the soil analytical results.
- March 2008: Project Navigator, on behalf of Santa Fe Braun, submits the *Supplemental Subsurface Investigation Report, 1000 South Fremont, Alhambra, California* (Project Navigator, 2008) to the LARWQCB. The report indicates that the LARWQCB requests for additional investigation have been fulfilled and that VOC contamination is not present in the subsurface soils, and therefore, could not have contributed to the presence of VOCs in groundwater. The report recommends No Further Action at the site and requests that the LARWQCB grant a No Further Requirements letter at its earliest convenience.
- April 2008: Project Navigator, on behalf of Santa Fe Braun, submits the Case Review Form to the LARWQCB. The Case Review Form is the internal LARWQCB document used by the LARWQCB Project Manager as part of the backup documentation for a case closure request.
- June 2015: Equipoise submits the *Soil Closure Work Plan, Soil Vapor Confirmation Sampling, 1000 South Fremont Avenue* to the LARWQCB. The field work is implemented in November 2015 and February 2016. The results of this investigation were previously discussed in the San Gabriel Valley Area 3 NPL site above (Section 4.1.1).

Equipoise summarized the above-mentioned reports by stating that numerous soil and soil vapor investigations were performed at the Subject Property between 1999 and 2007 by Geomatrix, Equipoise

and Project Navigator. According to Equipoise, a total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project Navigator investigations. The results of the soil analyses indicated that all compounds were below Preliminary Remediation Goals (PRGs) and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below Risk-Based Screening Levels (RBSLs) for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and the exception of samples collected in the vicinity of the southeast adjoining 2215 W. Mission Road property. Concentrations of PCE and TCE in shallow soil gas did exceed the industrial RBSL in 18 out of 93 samples for areas of the Subject Property immediately to the west and north of the 2215 W. Mission Road property. The Equipoise investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of soil vapor probe SG-21. Within probe SG-21, concentrations of PCE in shallow soil gas did exceed the industrial RBSL in six samples. However, soil vapor probe SG-21 was the closest point on the Subject Property to the soil vapor plume from the adjacent 2215 W. Mission Road property and Equipoise believed that the PCE exceedances from the six samples were attributable to activities associated with the 2215 W. Mission Road property that had been subsequently addressed by the operation of a soil vapor extraction (SVE) system at that location. In conclusion, Equipoise reported that the Project Navigator investigation found no detections of VOCs in any soil vapor samples and values less than the industrial and residential PRG or within the range of background concentrations for all soil samples. The stated purpose of the Project Navigator investigation was to: *provide additional information in order to determine whether or not soil contamination was present in the subsurface soil and whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Site.* During the Project Navigator investigation detections of other compounds in soil were either below residential/industrial PRGs, or soil levels for groundwater, or were within background for California soils and the soil and enhanced soil vapor investigations resulted in no detection of VOCs. Therefore, the Project Navigator investigation fulfilled the LARWQCB's request for additional investigations, at locations specified by the LARWQCB, and had shown that VOC contamination was not present in the subsurface soils and there was no evidence of any release at the Subject Property.

#### 4.3.9 Other Historical Records and Interviews

According to Mr. Kevin Houser, Senior Property Manager, with The Ratkovich Company, the Subject Property was developed as an industrial facility formerly occupied by C.F. Braun & Co. Manufacturing and Oil Refinery Office Campus and manufacturing shops and parking areas. Mr. Houser has been familiar with the Subject Property for approximately three years. He reported that within the past years, the Subject Property occupants have been limited to office, clean retail, and educational institutions. Light manufacturing or industrial operations are no longer conducted by tenants at the Subject Property. Mr. Houser also stated that he is unaware of any practices in the unaccessed areas (such as use, operations or handling of hazardous materials or medical, or regulated wastes) which would constitute a material threat or release to the environment, or a hazard to human health. He indicated that the Subject Property currently has an Asbestos Operation & Maintenance (O&M) Plan. With regards to the on-site remediation of the Subject Property, Mr. Houser stated that he was not qualified to provide information on this condition of the Subject Property.

EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. Per a telephone interview performed on September 21, 2016, Mr. Blackmer reported that Equipoise has been involved in the remediation and regulatory process of the Subject Property since 2007. Mr. Blackmer reported that the 2016 Soil Closure Risk Evaluation Report indicated Site A (Office

Areas) at the Subject Property was “clean.” Site B (Parking Lot at southeast corner) at the Subject Property had very little contamination due to contamination from the southeast adjacent property. However, Equipoise is expecting to obtain a No Further Action (NFA) letter for this parcel as well, based on the low levels of contamination, proposed future use of Site B as a parking garage, and the ongoing remediation of the southeast adjacent property (2215 W. Mission Road). Mr. Blackmer reported that a determination from the LARWQCB to the NFA request is still pending.

EBI contacted Mr. Curt M. Charmley, Case Manager with the LARWQCB, for information regarding the NFA status of the Subject Property. Mr. Charmley indicated that he is in the process of reviewing the report submitted by Equipoise, in conjunction with the Office of Environmental Health Hazard Assessment (OEHHA). He indicated that, as of September 20, 2016, “I received notification from OEHHA that they conducted review of the Equipoise Report for the Subject Property. He would contact Rick (Professional Geologist with Equipoise) tomorrow (Thursday September 21, 2016) regarding the next steps for the case evaluation closure consideration for the Subject Property.” On September 22, 2016, EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. EBI has not received a response as of to this date.

## 5.0 SUBJECT PROPERTY RECONNAISSANCE

The Subject Property reconnaissance was conducted by Mr. Rafael Encarnacion-Morrison, EBI Senior Engineer and Registered Environmental Assessor, on September 12 and 13, 2016. Mr. Encarnacion-Morrison was accompanied by and interviewed Mr. Kevin Houser, Senior Property Manager, with The Ratkovich Company, during the reconnaissance.

### 5.1 METHODOLOGY AND LIMITING CONDITIONS

The Subject Property reconnaissance consisted of visual and/or physical observations of the Subject Property and improvements, adjoining properties as viewed from the Subject Property boundaries, and the surrounding area based on visual observations made from adjacent public thoroughfares. Building exteriors were observed along the perimeter from the ground, unless described otherwise. Building interiors were observed, as they were made safely accessible, unless described otherwise.

At the time of the survey, the weather was sunny skies and approximately 80° Fahrenheit. During the survey, representative tenant spaces, mechanical spaces, and/or equipment components were observed. There were no significant portions of the Subject Property that were inaccessible or excluded from this survey.

### 5.2 HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS

#### 5.2.1 Hazardous Substances and Petroleum Products (Identified Uses)

Notable hazardous substances or petroleum products in connection with identified uses observed at the Subject Property are described below.

HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS			
General Type of Material	Approximate Quantity / Container / Material	Location	Storage Condition
Cleaning Compounds and Janitorial Supplies	Various sized containers, ranging from aerosol cans to one-gallon pails	Housekeeping and maintenance storage areas	Good: No leaks or spills
HVAC Treatment Compounds	Several 5-gallon and 30-gallon containers of algacide and water treatment chemicals and chlorine power plastic bags	Adjacent areas to cooling tower and chiller units at mechanical rooms and parking garage	Good: No leaks or spills

EBI did not identify evidence of significant leaks, spills, or the improper handling of petroleum or hazardous substances that might impact the environmental condition of the Subject Property.

#### 5.2.2 Hazardous Substances and Petroleum Products (Unidentified Uses)

EBI did not observe evidence of hazardous substance or petroleum products containers at the Subject Property that were not in connection with identified uses.

#### 5.2.3 Unidentified Substances Containers

EBI did not observe evidence of unidentified substances containers at the Subject Property.

### 5.3 WASTE GENERATION, STORAGE, AND DISPOSAL

EBI identified the following waste streams generated at the Subject Property:

<b>WASTE GENERATION, STORAGE, AND DISPOSAL</b>			
<b>Classification</b>	<b>Type of Waste / Generation Process</b>	<b>Type of Storage / Location</b>	<b>Disposal Method / Contractor</b>
<b>Non-regulated Solid Waste</b>	Municipal Solid Waste / Routine Site Operations	Solid Waste Dumpsters in Solid Waste Storage and Management area at the southeast side of the site	Republic
<b>Non-regulated Liquid Waste</b>	Sanitary Sewage / Routine Site Operations	NA (Municipal Sanitary Sewer)	City of Alhambra
	Waste Cooking Grease / - Restaurant Operations	55-gallon grease traps located adjacent to solid waste dumpsters behind the buildings, and grease interceptor system in landscaping areas at the rear of the tenant spaces	Contract waste hauler
<b>Regulated Solid or Liquid Waste</b>	None identified	NA	NA
<b>Biomedical Waste</b>	None identified	NA	NA
<b>Regulated Hazardous Waste</b>	None identified	NA	NA

The on-site restaurants at the retail buildings generate waste cooking grease. The waste cooking grease is stored in waste grease containers located adjacent to the solid waste containers, or is separated from general wastewater in grease oil traps which are cleaned monthly by a private waste company. Management and tenants indicated that permitting and cleaning of the grease interceptor systems is a tenant responsibility. These systems are pumped as needed by off-site contractors. No staining was observed.

No evidence of improper solid waste management or the improper disposal of hazardous substances or petroleum products was observed at the time of reconnaissance.

### 5.4 UNDERGROUND STORAGE TANKS (USTs) & ABOVEGROUND STORAGE TANKS (ASTs)

#### 5.4.1 Existing Storage Tanks

Based upon site reconnaissance, interviews, and a review of state and local records, EBI identified no evidence of existing USTs or ASTs located at the Subject Property, except for the following:

<b>STORAGE TANKS</b>		
(1) 250-gallon AST	Contents:	Diesel
	Location:	Belly tank of emergency generator at rooftop of parking garage B7
	Year Installed:	2006
	Construction Materials:	Double-wall steel tank
	Leak Detection/Prevention:	None identified
	Staining / Releases:	None identified

STORAGE TANKS		
(1) 3,000-gallon AST	Contents:	Diesel
	Location:	Belly tank of back-up generator at north side of BI Building
	Year Installed:	2001
	Construction Materials:	Double-wall steel tank
	Leak Detection/Prevention:	None identified
	Staining / Releases:	None identified
(2) 250-gallon ASTs	Contents:	Diesel
	Location:	Belly tanks of emergency generators at Building A13
	Year Installed:	2000
	Construction Materials:	Double-wall steel tanks
	Leak Detection/Prevention:	None identified
	Staining / Releases:	None identified

The above-mentioned ASTs, associated with emergency and back-up generators, were identified at the Subject Property. All generators and ASTs are reportedly permitted with the Fire Department. EBI inspected the interior of the emergency generators and did not observe staining or other evidence of a release of diesel fuel. Permits are on the generators that are active.

#### 5.4.2 Former Storage Tanks

Based upon site reconnaissance, interviews, and a review of state and local records, EBI identified no evidence of former USTs or ASTs located at the Subject Property, except for the USTs previously discussed in Section 4.3.

### 5.5 OIL-CONTAINING EQUIPMENT AND POLYCHLORINATED BIPHENYLS (PCBs)

Polychlorinated biphenyls (PCBs) are a chemical component of many dielectric fluids, heat transfer fluids, hydraulic fluids, lubricating oils, paints, or coatings manufactured prior to July 2, 1979. Equipment that may potentially contain PCBs includes electrical equipment such as transformers or capacitors or hydraulically operated equipment, such as elevators, compaction equipment, or manufacturing equipment. The manufacture and distribution in commerce of PCBs was banned for use in 1979 by the United States Congress, which enacted the Toxic Substance and Control Act (TSCA). In accordance with *US Code of Federal Regulations Title 40 - Protection of Environment, Chapter 1 - Environmental Protection Agency, Subchapter R - Toxic Substance Control Act (TSCA), Part 761 - Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions*, the owner of a transformer or other PCB-containing equipment is responsible for equipment maintenance and remediation in the event of a leak or release.

Based upon the date of installation or replacement, no potential PCB-containing equipment was identified at the Subject Property. The following oil-containing equipment was identified at the Subject Property:

OIL-CONTAINING EQUIPMENT			
Classification	Type of Equipment	Year Installed / Location	Staining / Releases Identified
<b>Transformers and Fluid-Containing Electrical Equipment</b>	Several pad-mounted Electrical Transformers (Southern California Edison)	Reportedly replaced in 1990s / Generally throughout the property, at rear of buildings, and within an electric sub-station	No

<b>OIL-CONTAINING EQUIPMENT</b>			
<b>Classification</b>	<b>Type of Equipment</b>	<b>Year Installed / Location</b>	<b>Staining / Releases Identified</b>
<b>Hydraulic Equipment</b>	(6) Hydraulic passenger elevators	Reportedly replaced in 1990s / One at parking garage structure, and one at Building A-3, A-11, A-13, and LA Fitness	No
	(2) Solid Waste Compactors	1990 / Solid Waste Storage and Management area at the southeast side of the site	No
<b>Other Oil-containing Equipment</b>	(4) Air Compressor Units	1985 / Basement Mechanical Room	No

EBI observed several pad-mounted electrical transformers located within the landscaped areas, generally behind each building, and at the electric sub-station at the eastern side of the site. The transformers appeared to be in good condition, and no staining or other evidence of a release of dielectric fluid was observed in the vicinity of the transformer units. The transformer units are also owned by the local utility provider, Southern California Edison. The transformers were reportedly replaced in early 1990s, according to the Site Escort, and based upon the date of installation are not considered to be PCB-containing.

## 5.6 ADDITIONAL SITE CONDITIONS

The following is a summary of visual and/or physical observations of the Subject Property on the day of the site visit. Photographs of pertinent Subject Property features are presented in Appendix A.

<b>ADDITIONAL SITE CONDITIONS</b>	
<b>Condition</b>	<b>Identified</b>
Interior Drains, Trenches, or Sumps	<b>Yes</b>
Interior Stains or Corrosion	No
Unusual Odors	No
Interior Pools of Liquid	No
Stained Soil or Pavement	No
Stressed Vegetation	No
Indications of Solid Waste Disposal	No
Exterior Pits, Ponds, or Lagoons	No
Wastewater or Stormwater Discharge/Disposal	<b>Yes</b>
Oil-Water Separators or Clarifiers	No
Septic Systems or Cesspools	No
Wells (Drinking Water Wells, Monitoring Wells, Agricultural/Irrigation Wells, or Process Water Wells)	<b>Yes</b>
Petroleum or Natural Gas Pipelines/Easements	No

Floor drains and sump pumps were observed at mechanical areas in the basement levels of the courtyard buildings. The floor drains and sump pumps reportedly discharge to the municipal sewer system. No staining or other evidence of a release of hazardous substances or petroleum products was observed in the vicinity of the floor drains or sump pumps.

Storm drains were observed in the parking areas, landscaped areas and mechanical rooms throughout the site. The floor drains reportedly discharge to the municipal sewer system. No staining or other

evidence of a release of hazardous substances or petroleum products was observed in the vicinity of the floor drains.

Monitoring wells were observed on the Subject Property and are associated with the assessment and remediation activities conducted as the Subject Property. Once assessment and/or remediation activities are completed on the Subject Property, these monitoring wells should be properly closed in accordance with all applicable guidelines as part regulatory closure activities.

### 6.0 INTERVIEWS

The following persons were interviewed to obtain information regarding recognized environmental conditions in connection with the property. Additionally, a Pre-Survey Questionnaire was forwarded to the designated Subject Property contact. The Pre-Survey Questionnaire has been partially completed and returned to our offices. The information requested in the Pre-Survey Questionnaire is intended to assist in gathering information that may be material to identifying recognized environmental conditions in connection with the Subject Property. The partially completed Pre-Survey Questionnaire and any accompanying documentation is presented in Appendix C.

<b>INTERVIEWS</b>			
<b>Contact / Affiliation</b>	<b>Date of Communication</b>	<b>Years Associated with Subject Property</b>	<b>Telephone No.</b>
Ms. Jessica Poblete, Records Clerk City of Alhambra Building Records Division	09/13/2016	NA	626-570-5034
Ms. Judy Kinslow, Administrative Assistant, City of Alhambra Fire Department	09/13/2016	NA	626-570-5190
Ms. Guadalupe Arreola, Los Angeles County Assessor's Office	09/13/2016	NA	310-236-3771
Ms. Angello Gallardo, FOIA Officer, County of Los Angeles County Department of Environmental Health	09/13/2016	NA	213- 351-7352
Mr. Kevin Houser, Senior Property Manager, The Ratkovich Company	09/12-13/2016	3	626-300-5000
Mr. Richard Blackmer (Rick), Professional Geologist, Equipoise	09/22/2016	9	949-366-0266
Mr. Curt M. Charmley, Case Manager, LARWQCB	09/20/2016	NA	213- 576-6636

Pertinent information from the interviews is presented in applicable sections of this report.

## **7.0 CONSIDERATIONS OUTSIDE THE SCOPE OF ASTM PRACTICE E 1527-13**

The following sections address environmental issues or considerations at the Subject Property that parties may wish to assess in connection with commercial real estate that are outside the scope of ASTM Practice E 1527-13 (non-scope considerations).

### **7.1 ASBESTOS-CONTAINING MATERIAL (ACM)**

Asbestos is a term used to describe a group of six naturally occurring crystalline fiber minerals. Asbestos has excellent thermal stability, a high degree of tensile strength, and has been used extensively in the textile, insulation, and building industries, particularly as a component in fireproofing, decorative coatings, insulation materials, and as reinforcement for plaster binders in building products. Asbestos-containing building materials are generally classified as friable or non-friable. Friable materials are those which can be crumbled, pulverized, or reduced to powder by hand pressure, or by normal use or maintenance can be expected to emit asbestos fibers into the air. Non-friable ACM is a potential concern if it is damaged by maintenance work, demolition, or other activities, at which time it may be considered friable.

EBI conducted a limited visual screening survey for the presence of asbestos-containing material (ACM) at the Subject Property. EBI identified friable suspect ACM in the form of sheetrock/joint compound composite material and 2'x4' white perforated acoustical ceiling tiles and non-friable suspect ACM in the form of vinyl floor tile and associated mastic, sheet vinyl flooring and associated mastic, various construction mastics and caulking, and roofing materials. These materials were observed to be undamaged and in good condition at the time of assessment. Please note that this survey was limited to visual observations of accessible areas and that the scope of work for this assessment did not include the collection and laboratory analysis of bulk samples of suspect ACM. Additional suspect ACM may be present in inaccessible areas, including, but not limited to, roofs, pipe chases behind solid walls and ceilings, concealed floor coverings, the interior of machinery or equipment, or water and sewer systems.

According to Mr. Kevin Houser, there is currently a formal Asbestos Operations and Maintenance (O&M) Plan in place at the Subject Property. A copy of the Asbestos O&M Plan is provided in Appendix C.

It should be noted that the limited visual screening survey conducted under the scope of work for this assessment does not constitute a full asbestos inspection, in which all areas of the buildings would have been thoroughly surveyed and sampled. The possibility exists for ACM to be present in areas of the buildings not accessed or sampled by EBI personnel. Based on the limited scope of this assessment, additional suspect ACM may also present in areas of the buildings that were accessed as part of this assessment.

Due to the continued distribution of a wide variety of asbestos-containing building materials, asbestos may be present in some of the roofing, flooring, wall and ceiling materials, caulking/putties, adhesives, spackling compounds, and insulation materials, as well as other building materials that may be used at the Subject Property. Sampling many of these materials requires techniques that may be destructive to subject facilities, and in the case of roofing material, may void warranties. It is recommended that an asbestos inspection be performed in accordance with all applicable federal, state, and local regulatory requirements prior to renovation, demolition, or other activities that could cause a material disturbance. Any removal or disturbance of ACM or suspect ACM should be performed by properly trained personnel and in compliance with federal, state, and local regulations.

## **7.2 RADON**

Radon is a naturally-occurring, colorless and odorless radioactive gas that is generated primarily in granitic rocks. The United States Surgeon General has published information that radon is a cause of lung cancer. Radon usually enters a building through openings in the foundation, and therefore is a potential health concern to residents of the lowest level of a building with inadequate ventilation.

The EPA Map of Radon Zones indicates that Los Angeles County is located within a Zone 2 radon area. Zone 2 is defined as an area that has a medium to low potential for radon gas, with a predicted average indoor radon screening level between 2.0 and 4.0 picoCuries per liter (pCi/L). The EPA recommended Action Level for radon is 4.0 pCi/L.

Based upon the non-residential nature of the Subject Property and in accordance with the scope of work for this assessment, EBI did not conduct a limited short-term radon screening at the Subject Property.

## **7.3 LEAD-BASED PAINT (LBP)**

Use of lead in household paint was banned by the U.S. Environmental Protection Agency (EPA) effective January 1, 1978. The EPA and the U.S. Department of Housing and Urban Development (HUD) consider lead-based paint as containing a lead concentration equal to or greater than 1.0 milligram per square centimeter (mg/cm<sup>2</sup>) or 0.5% lead by weight, as defined by Title X of the 1992 Housing and Community Development Act.

Based on the non-residential use of the existing building and in accordance with the scope of work of this assessment, a lead-based paint (LBP) survey was not conducted at the Subject Property.

## **7.4 LEAD IN DRINKING WATER**

Lead has historically been used in pipes, solder, and brass fixtures used in water distribution systems and building plumbing systems. In 1986, EPA banned the use of lead at concentrations exceeding 0.2% lead in solder and 8% lead in other plumbing materials. Lead in drinking water results primarily from corrosion of lead containing materials in service lines or from corrosion of lead containing materials in building plumbing systems such as lead solder, brass, bronze, and other lead containing alloys. The EPA Action Level for lead in public drinking water supplies is 0.015 parts per million (ppm) or 0.015 milligrams per liter (mg/L).

Municipal water service is provided to the Subject Property by the City of Alhambra. The City's main source of potable water (80%) comes from ten active wells whose average depth is 790 feet. All the active wells draw water from the Main San Gabriel Basin. An additional source of water (20%) comes from a service connection with the Metropolitan Water District (MWD). The MWD water is surface water treated at the Weymouth Treatment Plant in the City of La Verne and transported via transmission main to the City of Alhambra. The MWD water from the Weymouth Plant is a blend of water from the State Water Project 54% and Colorado River water 46% from the Colorado River, State Water Project (Northern California) and local sources. Based upon review of the utility's 2015 Drinking Water Supply and Water Quality Report, the municipal water supply meets all current criteria established by the Safe Drinking Water Act (SDWA) and local municipal drinking water standards, including those for lead. Based upon the existing municipal water service and in accordance with the scope of work for this assessment, EBI did not conduct lead-in-drinking water sampling at the Subject Property.

## 8.0 FINDINGS AND OPINIONS

EBI has performed this Phase I Environmental Site Assessment of the Subject Property in conformance with the scope and limitations of ASTM Standard E 1527-13. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report. This assessment has identified no evidence of *recognized environmental conditions (RECs)* in connection with the Subject Property, except for the following:

- **San Gabriel Valley Area 3 NPL Site/SLIC Listings:** The San Gabriel Valley Area 3 site is identified on the National Priorities List (NPL), Superfund Enterprise Management System (SEMS), potentially responsible parties (PRP), and California Bond Expenditure (CA BOND EXP. Plan) databases. The San Gabriel Valley Area 3 site is a 19 square-mile area of contaminated groundwater in Los Angeles, California. It is one of four Superfund sites in the 170-square-mile San Gabriel Valley. Area 3 comprises portions of the cities of Alhambra, Rosemead, San Gabriel, San Marino, South Pasadena, and Temple City. Multiple potentially responsible parties (PRPs) contaminated over 30 square miles of groundwater under the Valley with volatile organic compounds (VOCs) and industrial solvents. About 400 facilities in the region have soil contamination. Groundwater in Area 3 is contaminated with VOCs, including trichloroethylene (TCE) and tetrachloroethylene (PCE), at concentrations that exceed 20 times the maximum contaminant levels (MCLs) allowed by federal and State law. Soil also is contaminated with various VOCs. People who inhale vapors from groundwater or soil that contains VOCs could be exposed to hazardous substances. All drinking water served within Area 3 meets federal and State drinking water standards. The key contaminants of potential concern (COPCs) are tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-Dichloroethene (cis-1,2-DCE), 1,2,3-trichloropropane (1,2,3-TCP), carbon tetrachloride, perchlorate, and nitrate.

The USEPA is overseeing the groundwater remediation in the San Gabriel Valley Area 3 NPL site. The Los Angeles Regional Water Quality Control Board (LARWQCB) is primarily overseeing facility specific soil remediation at properties located within the San Gabriel Valley Area 3 NPL site that might have soils impacted with VOCs and might be contributing to the groundwater plume. These properties are considered potentially responsible parties (PRPs) for the San Gabriel Valley Area 3 NPL site contaminated groundwater plume. When a PRP is found, the LARWQCB initiates the following activities at that property: investigation of shallow soil vapor contamination; investigation of deep soil vapor contamination; investigation of groundwater contamination; and/or contaminant source remediation.

The Subject Property and surrounding area are located within the known contaminated groundwater plume (Southwestern Area 3) of the San Gabriel Valley Area 3 NPL site. Groundwater flow in the Subject Property vicinity of the San Gabriel Valley Area 3 NPL site is reported to generally be to the southeast. However, please note that recent groundwater flow data from the southeast adjoining SLIC site shows a localized groundwater flow to the northeast. Multiple former Subject Property occupants, as well as multiple adjoining properties, are being or have been investigated under the California Spills, Leaks, Investigations, and Cleanups (SLIC) Program due to soil and groundwater impacts from VOCs. Six current and former Subject Property addresses are identified on the SLIC database. Thirteen (13) adjoining property addresses are also identified on the SLIC database. All of the Subject Property and adjoining property SLIC listings are reportedly associated with VOC impacts to soil and groundwater.

The six Subject Property SLIC listings include the following:

- The Alhambra (SLIC Site Number T10000001005), 1000 South Fremont Avenue, with a cleanup status of “Open – Site Assessment” as of April 13, 2009.
- A-I Signal Division (SLIC Site Number SL603799147), 635 S. Date Avenue, with a cleanup status of “Open – Inactive” as of January 29, 2015.
- Dickinson Ink Corporation (SLIC Site Number SL603799396), 625 S. Date Avenue, with a cleanup status of “Open – Inactive” as of October 28, 2014.
- The Witteman (SLIC Site Number SL603799518), 705 S. Date Avenue, with a cleanup status of “Completed – Case Closed” as of July 29, 2015.
- Balance Plating (SLIC Site Number SL603799361), 2204 West Orange Street, with a cleanup status of “Open – Inactive” as of October 28, 2014.
- Crown Pattern Works Foundry (SLIC Site Number SL603799394), 815 S. Date Avenue, with a cleanup status of “Open – Inactive” as of October 28, 2014.

With the exception of the database listing for The Alhambra, which specifically indicates that the listing is associated with the San Gabriel Valley Area 3 NPL site, the SLIC listings for the Subject Property each indicate that the listing is associated with VOC impacts to soil and groundwater. As such, it is assumed that these listings are for portions of the Subject Property being investigated by the LARWQCB in connection with the San Gabriel Valley Area 3 NPL site. No additional relevant information is provided in the regulatory database report or in the GeoTracker database for these six listings, with the exception of the listing for The Alhambra. As such, file reviews will need to be performed at the LARWQCB in order to obtain additional information regarding the Subject Property SLIC listings and in order to find out what steps need to be taken in order to obtain regulatory closure for any open listings.

Although 13 adjoining SLIC listings were identified with VOC impacts to soil and/or groundwater, groundwater contamination is already known to extend beneath the Subject Property vicinity due to the larger San Gabriel Valley Area 3 NPL site plume. Although the off-site SLIC listings may have contributed to the groundwater contamination, the extent of impacts to soil and soil vapor at the Subject Property from VOCs is known as further discussed below.

The online GeoTracker database for The Alhambra included a Soil Closure Risk Evaluation, prepared by Equipoise Corporation (Equipoise) and dated May 24, 2016. The scope of the 2016 Soil Closure Risk Evaluation included the entirety of the Subject Property, except for the parcels on the west side of Fremont Avenue. However, the parcels on the west side of Fremont Avenue were historically undeveloped and not expected to have contributed to VOC contamination in the area. The portions of the Subject Property included were divided into two sites (Site A and Site B). Site A includes the majority of the Subject Property minus Site B, which consists of a surface parking lot in the southeast portion of the Subject Property. According to the 2016 Soil Closure Risk Evaluation, the results of several previous field investigations performed at the property lead to a previous request for no further action. LARWQCB staff indicated that additional spatially distributed analytical data was required before they could concur with the results from previous assessments. Therefore, the objective of the 2016 Soil Closure Risk Evaluation was to provide sufficient spatially distributed analytical data characterizing the nature and extent of volatiles in subsurface soil vapor and provide high quality data for regulatory agency decision-making regarding the regulatory closure of the property under proposed future land use development conditions. The investigation activities performed in support of the following risk evaluation focused on soil and soil vapor sampling at both Site A and Site B. This scope of work was conducted to meet requirements for a “No Further Action” letter.

According to Equipoise, numerous soil and soil vapor investigations were performed at the Subject Property between 1999 and 2007 by Geomatrix, Equipoise and Project Navigator. Please note that these previous investigations were not provided to EBI for review. According to Equipoise, a total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project Navigator investigations. The results of the soil analyses indicated that all compounds were below Preliminary Remediation Goals (PRGs) and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below Risk-Based Screening Levels (RBSLs) for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and the exception of samples collected in the vicinity of the southeast adjoining 2215 W. Mission Road property. Concentrations of PCE and TCE in shallow soil gas did exceed the industrial RBSL in 18 out of 93 samples for areas of the Subject Property immediately to the west and north of the 2215 W. Mission Road property. The Equipoise investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of soil vapor probe SG-21. Within probe SG-21, concentrations of PCE in shallow soil gas did exceed the industrial RBSL in six samples. However, soil vapor probe SG-21 was the closest point on the Subject Property to the soil vapor plume from the adjacent 2215 W. Mission Road property and Equipoise believed that the PCE exceedances from the six samples were attributable to activities associated with the 2215 W. Mission Road property that had been subsequently addressed by the operation of a soil vapor extraction (SVE) system at that location. In conclusion, Equipoise reported that the Project Navigator investigation found no detections of VOCs in any soil vapor samples and values less than the industrial and residential PRG or within the range of background concentrations for all soil samples. The stated purpose of the Project Navigator investigation was to: *provide additional information in order to determine whether or not soil contamination was present in the subsurface soil and whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Site.* During the Project Navigator investigation detections of other compounds in soil were either below residential/industrial PRGs, or soil levels for groundwater, or were within background for California soils and the soil and enhanced soil vapor investigations resulted in no detection of VOCs. Therefore, the Project Navigator investigation fulfilled the LARWQCB's request for additional investigations, at locations specified by the LARWQCB, and had shown that VOC contamination was not present in the subsurface soils and there was no evidence of any release at the Subject Property.

The objective of the 2016 Soil Closure Risk Evaluation was to provide sufficient spatially distributed analytical data characterizing the nature and extent of volatiles in subsurface soil vapor and provide high quality data for regulatory agency decision-making regarding the long-term protection of human health and the issuance of a No Further Action letter under proposed future land use development conditions at Site A (Office Areas) and Site B (Parking Areas). The 2016 Soil Closure Risk Evaluation included the collection of soil and soil vapor samples for analysis. Additionally, the results of the soil and soil vapor sample analysis was used to perform a human health risk analysis (HHRA) for the Subject Property.

Thirteen borings were advanced throughout Site A of the Subject Property. Soil sampling activities at Site A were performed on November 20 and 21, 2015 by Equipoise. Soil samples were collected at 5 and 10 feet bgs for chemical analysis at each sample locations proposed in the LARWQCB-approved work plans with the exception of ACP-A-SB-B12, which was limited to a single soil sample at 5 feet bgs because of wet utilities located between 5 and 10 feet. VOCs were not detected above their respective reporting limits in any of the Site A soil samples analyzed during this investigation. After the soil borings were advanced, soil vapor probes were constructed. Sampling of the Site A

soil vapor probes contained a total of 17 VOCs. The primary constituent reported in Site A soil vapor samples was PCE, with the remaining 16 constituents found at low to trace levels.

Two borings were advanced on Site B of the Subject Property. Soil samples were collected for chemical analysis at the two locations proposed in the work plans. VOCs were not detected above their respective reporting limits in any of the Site B soil samples analyzed. Sampling of the Site B soil vapor probes contained a total of nine VOCs. The primary constituent reported in Site A soil vapor samples was PCE, with the remaining eight constituents found at low to trace levels.

The human health risk analysis (HHRA) process consisted of a three-part comparative-analysis in which published California screening levels (DTSC, 2016), default modeled risk screening values (RSVs), and site-specific RSVs were used sequentially to identify and target constituents posing potential future risk in soil vapor at the Subject Property. Based on the results of the HHRA, no significant risks are projected to future site users associated with soil vapors reported in Site A under unrestricted land use conditions. It is recommended that Site A be granted the status of “No Further Action” with regards to soil and soil vapor constituents. However, potential risks were projected to future site users associated with soil vapors reported in Site B under unrestricted land use conditions. Risk management would be necessary to mitigate potential unrestricted land use and subsequent receptor exposure potential. A restricted land use condition was viable and consistent with planned future development of Site B as commercial/industrial. It was recommended that Site B be granted the status of “No Further Action” with regards to soil and soil vapor constituents following the implementation of institutional controls whereby future land use is limited to commercial industrial purposes. Commercial/industrial land use at Site B was consistent with the current zoning, site use, and planned future development. It is EBI’s understanding that Site B will be redeveloped into a parking garage structure.

EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. Per a telephone interview performed on September 21, 2016, Mr. Blackmer reported that Equipoise has been involved in the remediation and regulatory process of the Subject Property since 2007. Mr. Blackmer reported that the 2016 Soil Closure Risk Evaluation Report indicated Site A (Office Areas) at the Subject Property was “clean.” Site B (Parking Lot at southeast corner) at the Subject Property had very little contamination due to contamination from the southeast adjacent property. However, Equipoise is expecting to obtain a No Further Action (NFA) letter for this parcel as well, based on the low levels of contamination, proposed future use of Site B as a parking garage, and the on-going remediation of the southeast adjacent property (2215 W. Mission Road). Mr. Blackmer reported that a determination from the LARWQCB to the NFA request is still pending.

EBI contacted Mr. Curt M. Charmley, Case Manager with the LARWQCB, for information regarding the NFA status of the Subject Property. Mr. Charmley indicated that he is in the process of reviewing the report submitted by Equipoise, in conjunction with the Office of Environmental Health Hazard Assessment (OEHHA). He indicated that, as of September 20, 2016, “I received notification from OEHHA that they conducted review of the Equipoise Report for the Subject Property. He would contact Rick (Professional Geologist with Equipoise) tomorrow (Thursday September 21, 2016) regarding the next steps for the case evaluation closure consideration for the Subject Property.”

According to a Memorandum, dated September 31, 2016 and prepared by the Office of Environmental Health Hazard Assessment (OEHHA), the OEHHA reviewed the Soil Closure Risk Evaluation Report. Following their review, the OEHHA concluded the following:

- Although the OEHHA's RSV estimates differed slightly from Equipoise's estimates, these differences did not change the conclusions.
- The maximum detected PCE concentrations at Site A were less than the RSVs, suggesting that vapor intrusion risk at Site A is de minimis.
- Equipoise recommended that Site B be granted the status of "No Further Action" with regards to soil and soil vapor constituents following the implementation of institutional controls whereby future land use is limited to commercial industrial purposes. The OEHHA reported that they do not make decisions regarding institutional controls. The OEHHA agreed with Equipoise on findings that residential use is not recommended for the Site. However, the OEHHA indicated that, if development of the Site is inconsistent with the land uses identified, or if remediation is not performed in accordance with the remedial scenario proposed in this risk assessment, additional evaluation of potential health risks would be necessary. Please note that, although not stated in the OEHHA letter, it is likely that residential use would be allowed at Site B (Parcel No. 5342-001-024) if a vapor mitigation system is installed for Site B. However, consultation with the LARWQCB and OEHHA would need to occur prior to a land use change to residential.

On September 22, 2016, EBI contacted Mr. Rick Blackmer with Equipoise in order to obtain additional information on the status, conclusion or determination from the LARWQCB with regards to the request of NFA for the Subject Property. EBI has not received a response as of to this date.

The known groundwater contamination beneath the Subject Property and the open case status of the SLIC listing for The Alhambra and four of the five additional listings constitutes a *recognized environmental condition (REC)*.

- **Historical Subject Property Use:** Historical tenants of potential environmental concern include F. Braun & Co. Manufacturing and Oil Refinery Office Campus, machine shops, foundry activities, railroad spurs, unspecified manufacturing facilities, power generation buildings, maintenance shops, and automotive repair shops. Potential environmental concerns associated with these types of occupants include soil, soil-gas, and groundwater impacts. Groundwater at the Subject Property is known to be impacted with VOCs from the San Gabriel Valley Area 3 NPL site. Soil and soil-gas VOC impacts have been assessed at the Subject Property as part of the investigations for the NPL site. These findings were previously discussed above in the San Gabriel Valley Area NPL listing. Numerous soil and soil vapor investigations were performed at the Subject Property between 1999 and 2016 by Geomatrix, Equipoise and Project Navigator. According to Equipoise, between 1999 and 2007, a total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project Navigator investigations. Soil samples were collected from various areas identified as Areas of Concern (near former plating or manufacturing operations, machine shops, spray paint booths, railroad tracks, cooling tower, factories, USTs, sumps, clarifiers, etc.) due to the historic use of the Subject Property and analyzed for metals, mercury, hexavalent chromium, pH, TPHcc (total petroleum hydrocarbons – carbon chain), VOCs, Semi-VOCs (Semi-volatile organic compounds), pesticides, polychlorinated biphenyls (PCBs), polyaromatic hydrocarbons (PAHs), herbicides, perchlorate, and/or dioxins and furans. The results of the soil analyses indicated that all compounds were below Preliminary Remediation Goals (PRGs) and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below Risk-Based Screening Levels (RBSLs) for 195 samples. The Geomatrix investigation concluded that all concentrations of

constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and the exception of samples collected in the vicinity of the southeast adjoining 2215 W. Mission Road property (previously discussed in the San Gabriel Valley Area NPL listing). Based on the results of the numerous previous investigations at the Subject Property, it appears that the historic use of the Subject Property does not represent an environmental concern, with the exception of the SLIC listings that were previously discussed above.

In addition, the following *historic recognized environmental condition (HREC)*, *de minimis condition*, and *condition outside the scope of ASTM Practice E 1527-13* was identified:

- **On-Site Underground Storage Tanks (USTs):** A historic Subject Property occupant, C.F. Braun and Co, 1000 South Fremont Avenue, is identified as a HIST UST, CA FID UST, and SWEEPS UST site. USTs associated with this occupant included one 10,000-gallon gasoline UST installed in 1980, one 3,000-gallon gasoline UST installed in 1968, one 1,500-gallon gasoline UST installed in 1968, and one 61,500-gallon diesel fuel UST installed in 1944. The current status of the USTs is not reported. According to documents provided, the three gasoline USTs were removed from the Subject Property from two separate UST pits in 1998. Soil samples were collected from the excavation pits, as well as from the associated piping and dispenser islands. The soil samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg); benzene, toluene, ethylbenzene, total xylenes (BTEX); methyl tertiary butyl ether (MTBE); and/or lead. Laboratory results indicated that no significant gasoline contamination; however, some MTBE was found. Re-analysis of two samples for MTBE confirmed that no MTBE was present in the soil samples. No further action was recommended. Also in 1998, one 61,500-gallon diesel fuel UST was abandoned-in-place. Soil samples were collected from beneath the UST, adjacent to the fill port and fill piping, and adjacent to the product piping. Soil samples were analyzed for TPH as diesel (TPHd), BTEX, and MTBE. Laboratory results indicated that no diesel fuel contamination. No further action was recommended. As such, these USTs are considered a *historic recognized environmental condition (HREC)*, and no further action is recommended.

A fuel oil tank is depicted on the north side of a former research building located along Fremont Avenue in the 1960 and 1981 fire insurance maps. The former research building has since been demolished and the area redeveloped with a parking garage. Additionally, two solvent USTs were reportedly associated with the former Subject Property address of 2400 West Orange Street, which was located on the northern portion of the Subject Property. Previous reports indicate that permits on file found from the Los Angeles County Department of Public Works (LACDPW) indicated that the tanks were operated by Union Oil Company from 1930 to 1932. Additionally, the reports note that, if these tanks were ever installed, they likely contained mineral spirits or toluene, not chlorinated solvents because chlorinated solvents had not been developed at the time of the permits. The property associated with 2400 West Orange Street was redeveloped with the existing building at some point between 1960 and 1964. Both the tank areas were reportedly investigated as part of the 2007 Supplemental Subsurface Investigation performed by Project Navigator in 2007. No hydrocarbons were detected at the locations of the heating oil or the solvent tanks. Although the information regarding the UST removals was not found, the redevelopment of these areas with the existing improvements would likely have uncovered any remaining USTs. As such, and based on the results of the 2007 Project Navigator investigation, these USTs are considered a *historic recognized environmental condition (HREC)*, and no further action is recommended.

- **On-Site Monitoring Wells:** Monitoring wells were observed on the Subject Property and are associated with the assessment and remediation activities conducted at the Subject Property. Once

assessment and/or remediation activities are completed on the Subject Property, these monitoring wells should be properly closed in accordance with all applicable guidelines as part regulatory closure activities.

- **Asbestos-Containing Materials (ACMs):** EBI conducted a limited visual screening survey for the presence of asbestos-containing material (ACM) at the Subject Property. EBI identified friable suspect ACM in the form of sheetrock/joint compound composite material and 2'x4' white perforated acoustical ceiling tiles and non-friable suspect ACM in the form of vinyl floor tile and associated mastic, sheet vinyl flooring and associated mastic, various construction mastics and caulking, and roofing materials. These materials were observed to be undamaged and in good condition at the time of assessment. Please note that this survey was limited to visual observations of accessible areas and that the scope of work for this assessment did not include the collection and laboratory analysis of bulk samples of suspect ACM. Additional suspect ACM may be present in inaccessible areas, including, but not limited to, roofs, pipe chases behind solid walls and ceilings, concealed floor coverings, the interior of machinery or equipment, or water and sewer systems. According to Mr. Kevin Houser, there is currently a formal Asbestos Operations and Maintenance (O&M) Plan in place at the Subject Property. A copy of the Asbestos O&M Plan is provided in Appendix C. Based on the condition of suspect ACM, these materials do not currently pose a significant environmental threat to the occupants of the Subject Property. Suspect ACM do not present a problem when maintained in good condition. However, additional sampling, removal, and disposal arrangements may be necessary should building construction or renovation activities be conducted. Asbestos is a condition outside the scope of ASTM E 1527-13 and is not considered a recognized environmental condition (REC).

## 9.0 RECOMMENDATIONS

Based upon the findings of this investigation, EBI offers the following recommendations:

- EBI recommends continued cooperation (including, but not limited to, the use of institutional controls on the Subject Property) with the LARWQCB and/or the USEPA until such time as regulatory closure is granted for the San Gabriel Valley Area 3 NPL site and for The Alhambra SLIC site. Additionally, file reviews should be performed on the five additional SLIC listings for the Subject Property in order to verify the details of the SLIC listings are consistent with what has been found with The Alhambra SLIC listing and in order to determine what steps need to be taken in order to obtain regulatory closure for four of the five remaining listings. Estimated Cost for Five File Reviews: \$2,500-\$5,000.
- Once assessment and/or remediation activities are completed on the Subject Property, the on-site monitoring wells should be properly closed in accordance with all applicable guidelines as part regulatory closure activities. Estimated Cost: Action Item
- EBI recommends the continued implementation of the existing Asbestos Operations and Maintenance (O&M) Plan for the Subject Property. This O&M Plan provides the procedures and guidelines that, when used during facility cleaning, maintenance, and general operations, will minimize human exposure to lead and minimize release of lead to the environment. This O&M Plan is a long term management approach. Estimated Cost: Action Item.

## **APPENDIX C**

### **PRE-SURVEY QUESTIONNAIRE AND OTHER RELEVANT DOCUMENTATION**

## ESA AAI USER QUESTIONNAIRE (ASTM E 1527)

Subject Property Name: The Alhambra EBI Project #: TBD

Address: 1000 & [127-113] South Fremont Avenue, Alhambra, Los Angeles County, California 91803

1. Are you aware of any environmental cleanup liens against the Subject Property that are filed or recorded under federal, tribal, state or local law?

Yes  No / Unknown / Not Applicable

If yes, please attach a copy.

2. Are you aware of any Activity and Use Limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

Yes  No / Unknown / Not Applicable

If yes, please attach a copy.

3. As the user of this ESA do you have any specialized knowledge or experience related to the Subject Property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the Subject Property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? Or, do you have documentation (i.e., Phase I ESAs, Phase II subsurface investigations, Tank Removal reports, remedial reports, asbestos sampling and/or abatement reports, lead-based paint sampling and/or abatement reports, etc.) for the Subject Property that may be relevant to the Phase I ESA?

Yes / No / Unknown / Not Applicable

Comments: we have past environmental reports such as Phase I's, Phase II's, ACM O3M, etc.

4. Does the purchase price being paid for this Subject Property reasonably reflect the fair market value of the Subject Property?

Yes / No / Unknown / Not Applicable

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the Subject Property?

Yes  No

Comments: \_\_\_\_\_

ESA AAI USER QUESTIONNAIRE (ASTM E 1527)

5. Are you aware of commonly known or reasonably ascertainable information about the Subject Property that would help the environmental professional to identify conditions indicative of release or threatened releases? For example, as user,

- a. Do you know the past uses of the Subject Property? Yes
- b. Do you know the specific chemicals that are present or once were present at the Subject Property? Presently
- c. Do you know of spills or other chemical releases that have taken place at the Subject Property? Not that I am aware of
- d. Do you know of any environmental cleanups that have taken place at the Subject Property? NO

Comments: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Please attach copies of previous environmental reports prepared for the Subject Property.

6. As the user of this ESA, based on your knowledge and experience related to the Subject Property are there any obvious indicators that point to the presence or likely presence of contamination at the Subject Property?

Yes /  No / Unknown / Not Applicable

Comments: We have an updated SVP under review with RWQCB and OEHAA that is seeking closure.

Please be sure to attach copies of documentation, as available.

Re: Property Condition Report & Environmental Site Assessment Questionnaire for property known as or located at

**THE ALHAMBRA**

---

We have been requested by:	Subject:	EBI Project #:
<b>Holliday Fenoglio Fowler LP</b>	<b>To complete an Engineering and Environmental survey of the above mentioned property.</b>	<b>1116004804</b>

1. Please read these instructions and those on the following page carefully.
2. Please assemble this original questionnaire and one copy of pertinent property documents, and forward all information to the site or the site contact for the Engineer and/or Scientist to use during the site visit. This documentation will be included in our reports.
3. Please fill out this questionnaire to the best of your knowledge and email or fax it back to us within three business days.
4. The Engineer and/or Scientist will contact you directly to schedule the site visit.
5. This information is extremely time sensitive and necessary to provide your lender with accurate and timely reports.
- 6.

Please fill out and sign this questionnaire to the best of your knowledge for the Engineer's/Scientist's site visit. Email to Jonathan Kerry at REResearchGroup@ebiconsulting.com or fax to (781) 425-3623, for our report files, and keep the original to provide to the Engineer or Scientist.

Subject Property Name: The Alhambra EBI Project #: 1116004804

Address: 1000 & 1127-1131 South Fremont Avenue Alhambra CA

Subject Property Owner: The Alhambra Office Community, LLC Purchase Date: TBD

On-Site Property Contact: Karin Houser, Sr. Prop. Mgr. Telephone: (626) 300-5000

Fax: \_\_\_\_\_ Email: Mmdaughney@ratkovich.com

Your Name and title: Megan Malachuk, Development Manager Signature: \_\_\_\_\_ Date: 9/9/16

**PROPERTY CONDITION REPORT PRE-SURVEY QUESTIONNAIRE**

Additional plans and documentation (see page 4) must be forwarded to the site for the Engineer during the survey. For questions not applicable please respond "N/A." Attach additional pages if necessary. This questionnaire and your responses will be included as an exhibit in the Engineer's report. Accurate and full completion is critical to a timely completion of our reports, and timely loan closing.

**LOCAL JURISDICTIONAL INFORMATION**

- 1. What is the property ID #, Lot and Block, or Township/Range ID #? \_\_\_\_\_
- 2. What is the legal Municipality or County that has jurisdiction over the property? \_\_\_\_\_
- 3. What is the assessors file ID number and tax file ID number if available? \_\_\_\_\_

**PROPERTY INFORMATION**

- 4. What is the size of the subject property lot or lots, in acres? \_\_\_\_\_
- 5. How many parking spaces (and HCP parking spaces) are present at the property? \_\_\_\_\_
- 1. How many buildings comprise the subject property? \_\_\_\_\_
  - a. If the property is a mall or large retail center, please confirm and list ownership of each building. \_\_\_\_\_
- 1. What is the gross and net rentable square footage of the building(s)? \_\_\_\_\_
- 2. What is the date of construction of the building(s)? When was the building(s) first occupied? \_\_\_\_\_
- 3. How many tenant spaces or apartments are at the Subject Property? \_\_\_\_\_
  - a. If the property is apartments, please provide a unit and type count by bedroom and square feet \_\_\_\_\_
- 1. Please list, to the best of your knowledge, any deficiencies or problems with the site, parking area, amenities or utilities. \_\_\_\_\_
- 2. Please list, to the best of your knowledge, any structural, water infiltration, mold, roof, plumbing, HVAC, Fire Alarm or electrical deficiencies or problems. \_\_\_\_\_
- 3. During the last five years, have any major capital improvements been made to the site or building(s)? If so, please explain, with the approximate cost. \_\_\_\_\_
- 4. \_\_\_\_\_

*See Reports Sent Via Email*

Property Condition Report & Environmental Site Assessment Pre-Survey Questionnaire

Does the property have	Y or N	Does the property have	Y or N
Polybutylene piping		Compressed wood or composite board siding	
Galvanized steel water lines		EIFS exterior finishes	
ABS sanitary lines		Fire Retardant Treated plywood	
Aluminum branch wiring		Cadet/Encore electric heaters installed 1982-99	
Omega (Central or CSC) brand sprinkler heads		GE or Hotpoint dishwashers installed 1983-89	

5. Please list any deficiencies noted during any Building, Fire or Health Department inspections in the last three years. \_\_\_\_\_
6. When were the fire alarm systems and/or sprinkler system (if any) last tested? \_\_\_\_\_
7. Please list the following utility providers:
 

Electricity: _____	
Water: _____	Storm Drainage: _____
Sanitary Sewer: _____	Natural Gas or Oil: _____
Trash Hauler: _____	and, Frequency of Pick-ups: _____
8. If you are performing or planning any repairs or replacement work to the property that will exceed an aggregate cost of \$2,000 please explain, with the approximate cost. \_\_\_\_\_
9. Please list the responsible party for tenant improvements and maintenance of major systems (if applicable). \_\_\_\_\_

18. Please attach a brief history of the property. This information helps us properly assess, evaluate and understand your property, and will assist in the financial analysis. The information should include:

- The date of approvals and construction, the contractor who built the property
- History of major capital improvements, repairs, additions or modifications
- History of fires or violations
- A list of any ongoing maintenance issues
- Tenant history, approximate turnover rate

**DOCUMENT AND INFORMATION CHECKLIST**

Please provide the following information (as much as possible in electronic format) so the Engineer or Scientist can proceed with the survey of the property. Asterisk (\*) items are critical to report completion. The documents will become exhibits in the Consultant's report.

A. Plans	B. Municipal Documents	C. Additional Information
<ul style="list-style-type: none"> <li>▪ ALTA Survey or Site Plan*</li> <li>▪ Architectural Building Plans* - plans, elevations, wall section, foundation, HVAC &amp; elec. schedules</li> <li>▪ Reduced scale Site and Building Plans</li> <li>▪ <b><i>Extremely critical for properties in Seismically active zones 3 and 4* STRUCTURAL PLANS – Seismic Assessments are required for these properties. Structural drawings must be provided at the time of the site visit. If no drawings are provided, the report will be delayed and the Seismic Assessment may be overly conservative.</i></b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Certificate of Occupancy*</li> <li>▪ Building Permit*</li> <li>▪ Façade inspection compliance*</li> <li>▪ Copy of tax cards</li> <li>▪ Copy of violations</li> </ul> <p><b>B.1 NYC Projects</b></p> <ul style="list-style-type: none"> <li>▪ Department of Building Violations*</li> <li>▪ Environmental Control Board Violations*</li> <li>▪ Local Law 11 Façade Reports*</li> </ul>	<ul style="list-style-type: none"> <li>▪ Capital expense report for 1 to 3 years*</li> <li>▪ Tenant Rent Roll*</li> <li>▪ Roof warranty</li> <li>▪ History of recent improvements</li> <li>▪ Schedule of Floor Area Measurements                             <ul style="list-style-type: none"> <li>- Gross and Rentable Square Feet</li> </ul> </li> <li>▪ Previous Due Diligence or Building Component Reports, <u>including, but not limited to, façade*, roof*, mechanical*, electrical, elevator, sprinkler, fire alarm or life safety equipment, or pavement.</u></li> <li>▪ Copy of most Recent Appraisal</li> </ul>

**EBI ACCESS REQUIREMENTS**

At the time of the site visit the Consultant is required to gain access to all areas of the property. This includes:

- All building roofs, unless pitched asphalt shingles. This may require you to obtain and provide a ladder.
- All building perimeters

**Property Condition Report & Environmental Site Assessment Pre-Survey Questionnaire**

---

- All site amenities
- All building interiors, including as applicable, common areas, lobbies, a representative sampling of offices, retail spaces, manufacturing or assembly areas, or apartments, community rooms, exercise rooms, pool areas, storage rooms, attics and basements, garages.
- All mechanical, electric, sprinkler, HVAC, utility, service, elevator, storage and equipment rooms

**ENVIRONMENTAL SITE ASSESSMENT PRE-SURVEY QUESTIONNAIRE**

*See Attached Previous Phase I ESA*

1. Describe the current uses of the property noting tenant names and oil/chemical usage. \_\_\_\_\_
2. Describe the past uses of the property noting tenant names and oil/chemical usage. \_\_\_\_\_
3. (Y) (N) Has a previous environmental site assessment report been prepared for the property? If yes, for what reason? Can EBI have a copy? \_\_\_\_\_
4. (Y) (N) Has a subsurface investigation (Phase II) ever been conducted on the property, including soil sampling, groundwater sampling, or installation of groundwater monitoring wells? If yes, for what reason? What were the results? Can EBI have a copy of the report? Are there any groundwater monitoring wells currently located on the property? \_\_\_\_\_
5. (Y) (N) Has contamination been identified at the Subject Property? Describe the nature of the contamination (i.e., source, media impacted, location, sampling, cleanup activities, regulatory status, etc.). Can EBI have copies of related documentation? \_\_\_\_\_
6. (Y) (N) Has a spill or surficial release occurred at the Subject Property? Describe the nature of the spill/surficial release (i.e., source, location, response/cleanup actions, regulatory status, etc.). Can EBI have copies of related documentation? \_\_\_\_\_
7. (Y) (N) Is the Subject Property listed with the USEPA and/or the state environmental regulatory agency as a contaminated site? If yes, please describe. Can EBI have copies of related documentation? \_\_\_\_\_
8. (Y) (N) Has there ever been previous sampling for Asbestos, Lead-Based Paint, Lead in Water, or Radon? If yes, please describe. Can EBI have copies of related documentation? \_\_\_\_\_
9. (Y) (N) Has there been any Asbestos or Lead-Based Paint abatement or Radon mitigation conducted at the Subject Property? Are there Asbestos and/or Lead-Based Paint Operations and Maintenance Plans for the Subject Property? If yes, please describe. Can EBI have copies of related documentation? \_\_\_\_\_
10. (Y) (N) Any known environmental liens, deed restrictions, or use limitations for the Property? If yes, please describe. Can EBI have copies of related documentation? \_\_\_\_\_
11. (Y) (N) Any permitted or regulated activities (Hazardous waste generator, air) on the Property? If yes, please describe. \_\_\_\_\_
12. (Y) (N) Are there any transformers or other electrical equipment, which may contain PCBs? If yes, please describe. Where are they? Who owns the transformer(s)? Who services them? \_\_\_\_\_
13. (Y) (N) Has an industrial or manufacturing operation, gas station, motor repair facility, commercial printing facility, dry cleaners, photo-developing laboratory, junk yard, landfill or waste, treatment, storage, disposal processing or recycling facility ever been located at or adjacent to the property? If yes, please describe. \_\_\_\_\_
14. (Y) (N) Are there any discarded drums, barrels or containers, construction debris, damaged or discarded automobile or industrial batteries, or pesticides, paints or other chemicals in individual containers or drums of greater than five gallons or fifty gallons in aggregate located on the property? If yes, please describe. \_\_\_\_\_
15. (Y) (N) Have there ever been any waste storage or treatment lagoons, pits, ponds, or surface impoundments on the property? If yes, please describe. \_\_\_\_\_
16. (Y) (N) Does the property have floor drains not discharging to a sewer? Septic System? If yes, please describe. \_\_\_\_\_
17. (Y) (N) Are there currently aboveground or underground storage tanks at the property? If yes, complete table.

Type of Tank	Size	Content	Installation Date	Spill/Leak Detection? Y or N
Above or Underground	gal			
Above or Underground	gal			
Above or Underground	gal			
Above or Underground	gal			

Property Condition Report & Environmental Site Assessment Pre-Survey Questionnaire

18. Are you aware of any information to indicate that the Subject Property was sold for substantially below its fair market value? If so, please provide an explanation: \_\_\_\_\_

19. Additional comments and/or pertinent information relevant to this Phase I ESA: \_\_\_\_\_

**DOCUMENT AND INFORMATION CHECKLIST**

Please provide the following information (as much as possible in electronic format) so the Engineer or Scientist can proceed with the survey of the property. Asterisk (\*) items are critical to report completion. The documents will become exhibits in the Consultant's report.

### **INTRODUCTION**

Representatives of SFIC Properties, Inc. (SFIC) contracted with PIC and Moine Bros. to remove three (3) underground gasoline storage tanks from their property (see Figures 1 and 2; Site Location and Site Sketch Maps). Tank removal operations were completed on Wednesday, July 29, 1998. Upon excavation, one 10,000 gallon fiberglass unleaded gasoline, one 3,000 gallon steel premium unleaded gasoline and one 1,500 gallon steel, leaded gasoline tanks were uncovered and removed from two separate tank pits (see Figure 2B; Site Sketch Map-Detail). In accordance with tank removal permit #218747 (see Appendix D) issued by the Los Angeles County Department of Public Works, six (6) soil samples (1A, 1B, 2A, 2B, 3A and 3B) were recovered from beneath the three gasoline tanks. In addition, two (2) soil samples (D1 and D2) were recovered from beneath the dispenser island and six (6) soil samples (P1, P2, P3, P4, SB1 and SB2) were recovered from under product piping associated with the these three tanks. The fourteen (14) recovered soil samples were chemically analyzed to document subsurface soil conditions. All soil samples measured nondetectable or background concentrations of petroleum (gasoline) contaminants indicating a lack of historic leakage of stored products. All activities were conducted under the direct supervision of PIC registered geologist, J. Tim Hersch.

PIC Environmental Services (PIC) was contracted (in-house Job # E2001.7) to provide a geologist onsite to: 1) conduct a visual inspection of lithology; 2) recover the specified soil samples; 3) oversee subsequent laboratory testing of the soil samples; and 4) prepare this

geologic report of tank removal operations. This report documents the field procedures and test results for 14 soil samples recovered during the removal and laboratory evaluation of this tank pit site.

### PROCEDURES

Tank removal operations were completed on Wednesday, July 29, 1998 (see Figure 2B: Site Sketch Map-Detail). A backhoe was used to remove soil from above and beside the tanks. The tanks were triple rinsed and cleaned prior to removal (see Rinseate Manifest in Appendix C). After Lower Explosion Levels (LEL) were measured below 10%, Alhambra Fire Inspector, Mr. Ken H. Toh, allowed removal operations to continue. The tanks were loaded onto trucks and transported off the site (see Appendix C: Tank Disposal Verification). The following data were provided by field observation or by the permit application.

SIZE	MFG	YEAR	CONTENTS	U.L. NO.	SAMPLE
10000 gal.	N/A	N/A	Unl. Gasoline	N/A	3A, 3B
3000 gal.	N/A	N/A	Unl. premium Gasoline	N/A	2A, 2B
1500 gal.	N/A	N/A	leaded Gasoline	N/A	1A, 1B

To facilitate transport and visual inspection for structural integrity, the sides and bottoms of the tanks were scraped to remove excess soil. None of the tanks exhibited any obvious holes or

cracks. There was no significant field evidence (visual or olfactory) of gasoline soil contamination in the tank pits. Tank removal operations were conducted under direction of Los Angeles County Department of Public Works, Waste Control Management Engineering inspector, Sergio Arvayo. Once the tanks had been removed from the tank pits, PIC environmental geologist, Hamid Khorzani, recovered six (6) soil samples (1A, 1B, 2A, 2B, 3A, 3B) at a depth of four feet below tank bottom (12 to 16 feet below grade). In addition, two (2) soil samples (D1 and D2) were recovered from beneath the dispenser island (two dispenser pumps), and six (6) soil samples (P1, P2, P3, P4, SB1 and SB2) were recovered from under product piping areas. Four of the piping samples (P1-P4) were recovered via hand auger and two piping samples (SB1 and SB2) were recovered using a Geoprobe System® hydraulic probing rig (see Figure 2B; Site Sketch Map-Detail).

#### SOIL SAMPLING PROCEDURES

Six soil samples were recovered from under the three removed tanks via backhoe bucket. Six hand augered soil samples were recovered under product piping and dispenser locations. Two soil samples (SB1 and SB2) were recovered via Geoprobe using a stainless steel barrel sampler lined with ¼ inch PETG liners. All 14 samples were sealed with tape, placed on ice, and transported to a state-certified laboratory for quantitative analyses of targeted gasoline contaminants (see Appendix A: Chain of Custody Record). Borings were backfilled with bentonite hole plug and surface locations were patched with cement.

---

## GEOLOGY

A visual inspection of the stratigraphy exposed along the sides and bottom of the tank pits revealed that the predominant soil type from surface to a depth of 15 feet is brown, fine to coarse grained, massive, sand to sandy gravel with intermittent lenses of silty clay. The tank pits were originally backfilled with this same native soil.

The elevation of the subject site is approximately 460 feet above sea level. The surrounding topography slopes to the south-southeast (see Figure 1). The subject property is located in the northern portion of the Central Los Angeles Groundwater Basin. Water bearing strata within the basin consist of Pleistocene to Recent fluvial, alluvial, and marine terrace deposits. The shallowest regional aquifer occurs within the Lakewood Formation. This formation contains two principal water bearing zones; the Exposition and Gardena aquifers. South of Los Angeles, these aquifers are separated by an undifferentiated aquiclude of varying thickness and are overlain by Recent alluvial sediments which may contain shallower "perched" aquifers. Regional groundwater flow mimics surface topography in a southerly direction. The regional groundwater contour map (Figure 3) published by Los Angeles County does not provide coverage under the site. LACFCD groundwater monitoring well No. #2891C, located approximately 2 miles east of the subject site, was determined to have a groundwater depth of 227.7 feet below surface on November 1, 1993. An historical high water level in this well was determined to be 156.3 feet below surface in December of 1950. In house PIC drilling data

from nearby properties indicate that the first occurrence of groundwater exceeds a depth of 40 feet under the subject property.

### TESTING AND RESULTS

All fourteen (14) soil samples recovered from the three gasoline tank locations were transported upon recovery to Advanced Technology Laboratories (Signal Hill) for specified quantitative testing of total petroleum hydrocarbons (TPH) via modified EPA method 8015 (gasoline) and for volatile aromatics (B/T/E/X and MTBE) via EPA method 8020. Additionally, twelve (12) of the recovered soil samples were also analyzed for organic lead by EPA Title 22 protocol. Finally two samples (P2 and D2) were reanalyzed for MTBE via EPA method 8260 to confirm a lack of MTBE. Laboratory results of the fourteen soil samples are summarized below on Table I and included in Appendix B.

TABLE I

SAMPLE I.D.	EPA 8015	EPA 8020				EPA 8020/8260	Organic Lead
	TPH gas (ppm)	B (ppb)	T (ppb)	E (ppb)	X (ppb)	MTBE (ppb)	(ppm)

BTEX and MTBE results expressed as ug/kg = ppbillion

---

**CONCLUSIONS AND RECOMMENDATIONS:**

Based on laboratory results and field observations of tank removal operations at the subject site, the following conclusions and recommendations are offered:

- 1) Laboratory results indicate that no significant petroleum (gasoline) soil contamination exists under the removed tanks, dispensers or product piping.
- 2) Reanalysis of two samples for MTBE confirms that no MTBE is present in any of the samples.
- 3) PIC recommends regulatory closure of this tank pit site with no further action required.

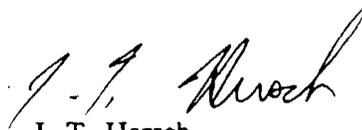

This report is proprietary and confidential, to be delivered to, and intended for the exclusive use of, the above named client and appropriate regulatory agencies only. PIC Environmental Services assumes no responsibility nor liability for the reliance herein or use hereof by anyone other than the above named client or appropriate regulatory agencies. In addition, all of the lab work cited in this report was prepared under the supervision of Edgar Caballero of Advanced Technology Laboratories (Signal Hill) who is solely responsible for the contents and conclusions of the laboratory data.

UNDERGROUND STORAGE TANK

RECEIVED

CLOSURE INFORMATION

MAY 26 1998

This application is for authorization to temporarily or permanently close an underground storage tank (UST) pursuant to Los Angeles County Code, Title 11, Division 4, and California Code of Regulations, Title 23, Division 3, Chapter 16. This application may also be used for product piping removal associated with an existing or removed UST.

This application will not be approved unless a valid Hazardous Material Underground Storage Permit (HMUSP) or Unified Program Permit (Unified Permit) application is on file with the Department of Public Works (DPW). HMUSP registration fees may be waived, if the DPW finds that the subject USTs': a. Have been continuously empty and out of service since January 1, 1984; b. The owner or operator was never informed by DPW or any other agency of need to properly close USTs.

USTs closed on site by removal or cleaning and filling with an inert solid material prior to January 1, 1984, need not comply with current closure requirements, however, leaks from such USTs must be reported and cleaned up.

This application must be accompanied by a State Water Resources Control Board UST permit application Form A for each site and Form B for each UST to be removed or closed.

- 5. All work shall be carried out in full compliance with all applicable Federal, State and local laws, ordinances, rules and regulations.
- 6. All fees due to DPW and/or the certified Unified Program Agency (CUPA) for the operation and/or maintenance of the facility subject to closure through the date of closure shall be paid.
- 7. All inspections notification(s) shall be made as directed by the attached conditions of this approval.

Within 30 days of the date of closure the applicant shall furnish the DPW a closure report describing all work done, results of any required sampling, disposition of any contaminated soils or materials found and all other requirement made part of the closure application.

In all cases, closure permits expire 180 days from the date of issue. It is the responsibility of the owner to make sure that the final report that contains the required information is submitted to the DPW within one month from the sampling date or 180 days from the date of the permit issuance, whichever is earlier. The total number of tanks listed on the HMUSP or Unified Permit and the yearly annual permit maintenance billing will remain unchanged until the closure report is received by the DPW. Only one copy of the closure report need be submitted unless otherwise directed.

- 10. All closure applications are site specific and may be subject to additional sampling and site characterization requirements as necessary to protect the public health and safety, underground and surface water supplies, and may include requirement requested by Federal, State or other regulatory agencies.

DATE

Los Angeles County Fire Department, Fire Prevention Division, other applicable parts. -- Inspection Guide #6, Part D and Supplement #A.

1. All tank removals shall be carried out as indicated in the Los Angeles County Fire Department, Fire Prevention Division, other applicable parts. -- Inspection Guide #6, Part D and Supplement #A.
2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.
3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.
4. If an appointment has been arranged with a County Engineer Inspector to inspect the removal of a tank, the Inspector will only visit at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the Inspector has to return to the site.
5. After inspection, tanks shall be transported to a legal disposal point.
6. If the tank has stored materials other than motor fuel, fuel oil or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.
7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.
2. Owners/operators shall demonstrate part site integrity as follows:
  - a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.b. below.
  - b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.
  - c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.
  - d. Soil samples shall be taken at depths of 6, 10, 20, 30 and 40 feet below grade level.
  - e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.
  - f. Soil samples shall be capped immediately with teflon or aluminum.
  - g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.
  - h. A report containing the results of the above analysis shall be submitted to the County Engineer.
3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."
4. A report shall be submitted to the County Engineer containing

CONDITIONS -- UNDERGROUND STORAGE TANKS

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer - Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.
2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:
  - a. Removal of tank shall require a three (3) business day advance notification.
  - b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.
3. Consult current fee schedule for costs.
4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any of all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.
5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.
6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards" State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.
7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.
8. Decontamination shall require the following, as a minimum:
  - a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.
  - b. The personnel shall be sufficiently skilled to safely carry out such operation.
  - c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.
  - d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.
2. Temporary closures shall not exceed 90 days.

## NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 1166 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective August 6, 1988.

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

- Notify the SCAQMD Executive Officer by telephone at (909) 396-3886 24 hours prior to tank excavation. 1166(e)(1)(A)
- Monitor the excavated material during the excavation for VOC contamination. 1166(e)(1)(B)
- When VOC contamination is detected:
  - \* Cease excavation
  - \* Cover the contaminated soil until implementation of approved mitigation measures. 1166(e)(1)(C)
  - \* Notify the SCAQMD Executive Officer at (909) 396-3886 within 24 hours of detection of VOC contaminated soil. 1166(e)(2)(A)
- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(e)(3)

### Exemptions

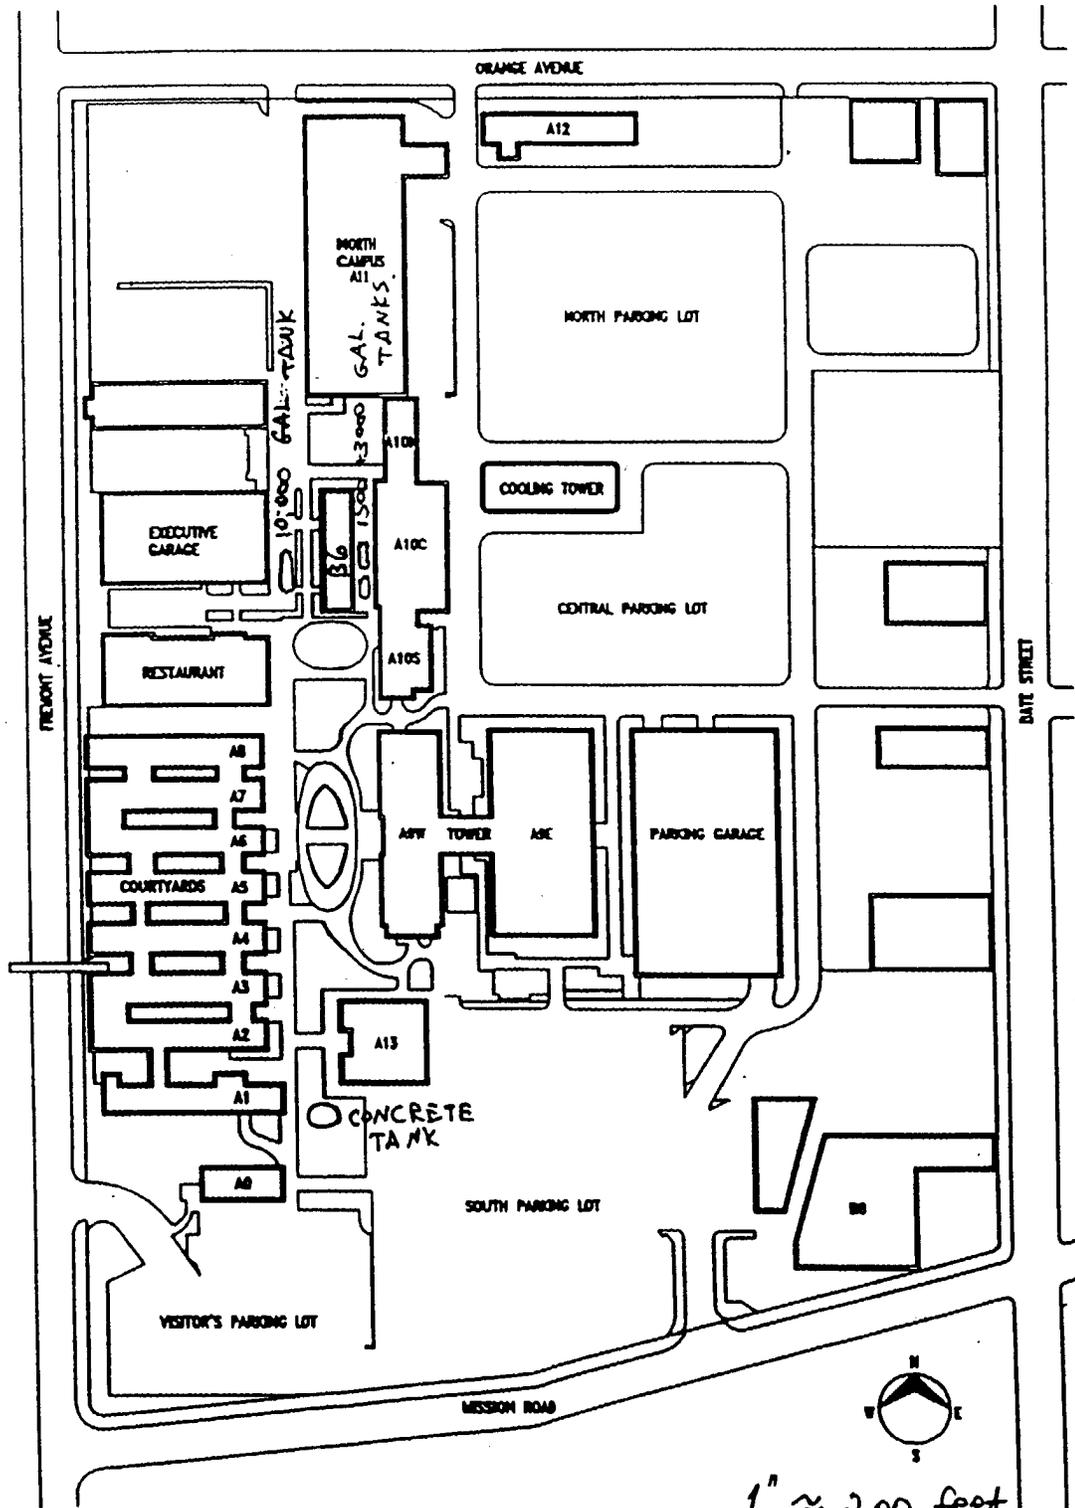

- Treatment of less than one (1) cubic yard of contaminated soil. 1166(d)(1)(A)
- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(d)(1)(B), (F)
- Removal of soil for sampling purposes pursuant to EPA methods. 1166(d)(1)(C)
- Accidental spillage of five (5) gallons or less of VOC. 1166(d)(1)(E)
- Documentation of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(d)(1)(D)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE  
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (909) 396-3886

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.
2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
<u>1A&amp;1B</u>	<u>2-4 ft</u>	<u>TPH(G)</u>	<u>8015(M)</u>
<u>2A&amp;2B</u>	<u>below tank invert</u>	<u>BTEX, MTBE</u>	<u>8020</u>

Re: Site Proposals, etc.  
1000 South Fremont Ave  
Alhambra, CA

This letter certifies that product piping under  
Building 86 (Vehicle Service Building) will  
be abandoned in place due to potential  
damage to the structure if removal were  
attempted. Soil sampling every 20 feet  
will be conducted as required.

Tim Hesch  
CA Registered Geologist  
No 4082

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.
4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.
5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.
6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determination; d) The method of analysis; e) Signature of chemist certifying results.
7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.
8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.
9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

ATTENTION CONTRACTOR

NOTIFICATION/PERMIT REQUIREMENTS

This Closure Authorization is issued subject to compliance with all applicable laws and regulations relating to the performance work including, but not limited to, business license requirements, Building Codes, Fire Codes, Air Quality regulations, Health and Safety Codes, Water Codes, and Transportation regulations.

Pursuant to Los Angeles County Code, Section 11.78.045, and the Conditions and Limitations of the attached Hazardous Materials Underground Storage Closure Authorization, you are required to complete ALL of the agency notifications indicated below within the time period specified prior to commencement of work on this closure.

COUNTY OF LOS ANGELES DEPARTMENT OF PUBLIC WORKS  
WASTE MANAGEMENT DIVISION

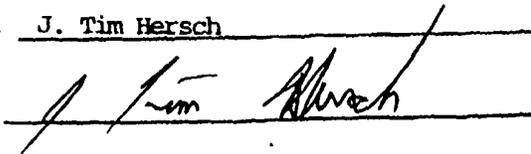

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the County of Los Angeles Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, California 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.
3. Description of methods for obtaining, handling, and transporting samples.
4. Time and date samples were obtained.
5. Soil sampling certification (including but not limited to soils classification, boring logs, sample procedures, sample locations, initiating chain-of-custody, and groundwater location) for UST closure shall be certified by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils. The certification must clearly state that all work was performed under the supervision of the person signing.
6. Chain-of-custody documentation initiated by person obtaining sample through person at CAL/EPA Department of Toxic Substance Control certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction, and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil and tank rinseate.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils.

**UNDERGROUND TANKS PROGRAM - GROUNDWATER MONITORING  
THOMPSON PROPERTY  
5592 SOUTH SEPULVEDA BOULEVARD, CULVER CITY (I-7060)**

We have reviewed all the information contained in our file for the above referenced site. Based on our review, groundwater beneath the site is contaminated with petroleum hydrocarbons from underground tank leaks. You are requested to comply with the following requirements:

1. All groundwater monitoring wells should be monitored quarterly. The quarterly report containing groundwater monitoring data must be submitted by the fifteenth day following the end of the quarter as shown in the following schedule, with your next report due April 15th:

<u>Report Period</u>	<u>Report Due Date</u>
January-March	April 15th
April-June	July 15th
July-September	October 15th
October-December	January 15th

The groundwater samples must be analyzed by EPA Method 8015 Modified for Gasoline, EPA Method 8020 or 8260 for BTXE, including methyl tertiary butyl ether (MTBE). If MTBE is detected it must be quantified using EPA Method 8260.

*EPA 8260 is the only reliable, quantitative method.*

2. All work must be in accordance with the Los Angeles County Department of Public Works "Guidelines for Report Submittals - Revised June 1993" and Title 23, California Code of Regulations, Division 3, Chapter 16, Underground Storage Tank Regulations.
3. All work must be performed under the responsible charge of a registered geologist or civil engineer. A statement is required in the report that the licensed professional in responsible charge actually supervise or personally conduct all work associated with the project, as defined in the Professional Engineers Act or the Registered Geologist Act of California Code of Regulations.

Greetings:

Re: MTBE Testing  
SFIC Properties, Inc.  
1000 South Fremont Avenue  
Alhambra, CA 91803

This letter and attachments document our conversation on April 29, 1999 concerning laboratory test results for MTBE at the referenced property. As you recall, PIC Environmental Services (PIC) conducted soil testing, on behalf of SFIC Properties, Inc. (SFIC) during removal operations of underground fuel tanks in 1998. PIC submitted a "Tank Removal Geologic Report" dated August 24, 1998 concerning three gasoline tanks formerly located adjacent to SFIC's Vehicle Service Building. Soil testing protocols followed by PIC conformed to permit requirements established by the Los Angeles County Dept. of Public Works (LACDPW). A copy of the LACDPW Soil Testing Protocols is attached documenting the requirement to "screen" analyzed samples for MTBE using EPA method 8020. Accordingly, PIC analyzed a total of 14 soil samples for gasoline contaminants including MTBE by EPA method 8020 (see attached results). Three of these analyzed samples indicated the potential presence of MTBE. All three measured concentrations were very low ranging from 39 to 91 parts per billion. The state drinking water guideline for MTBE is 35 ppb. Following state protocols (see discussion below) the two samples (D2 and P2) measuring the highest apparent concentrations of MTBE were reanalyzed by EPA method 8260. Both samples measured Nondetectable (ND) MTBE concentrations by EPA method 8260 (see attached results). The EPA 8260 results verify that the EPA 8020 measurements are "false positives."

Also attached is a memorandum dated April, 1996 by the Los Angeles Region of the Regional Water Quality Control Board (RWQCB) concerning testing methods for MTBE. This RWQCB memorandum documents that both methods 8020 and 8260 are approved for "screening" samples for the presence of MTBE. Since 1996, virtually all regulatory agencies have recognized that EPA method 8260 is the only reliable method to "quantify" the concentration of MTBE in an analyzed sample. Attached is

RWQCB correspondence dated February 19, 1997 which outlines current testing protocols concerning MTBE. Both the RWQCB and LACDPW, like most regulatory agencies, agree that quantification of MTBE in a sample is reliably accomplished by EPA method 8260 and is not reliably accomplished by EPA method 8020. That is, method EPA 8020, although approved for "screening" samples, is not approved for the "quantification" of MTBE and routinely measures "false positives."

PIC concludes that there is no evidence of MTBE soil contamination under or near the removed tanks formerly located adjacent to the Vehicle Service Building. Please advise if you have additional questions.

Respectfully submitted,

J. Tim Hersch  
California Registered Geologist #4082  
President

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.
2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
<u>1A&amp;1B</u>	<u>2-4 ft</u>	<u>TPH(G)</u>	<u>8015(M)</u>
<u>2A&amp;2B</u>	<u>below tank invert</u>	<u>BTEX, MTBE</u>	<u>8020</u>

### **INTRODUCTION**

Representatives of SFIC Properties, Inc. (SFIC) contracted with PIC and Moine Bros. to abandon (close) in place one underground 61,500 gallon concrete diesel/fuel oil tank at their property (see Figures 1 and 2; Site Location and Site Sketch Maps). In accordance with tank removal Permit #218746 (see Appendix D) issued by the Los Angeles County Department of Public Works, four (4) soil samples (1A, 1B, 1C and 1D) were recovered from beneath the concrete tank and eleven (11) soil samples (B1-B11) were recovered from under the associated product and fill piping. The recovered soil samples were chemically analyzed to document subsurface soil conditions. None of the analyzed samples measured elevated concentrations of petroleum contaminants. PIC concludes no historic leakage of stored products occurred from this tank or associated piping. All activities were conducted under the direct supervision of PIC registered geologist, J. Tim Hersch.

PIC Environmental Services (PIC) was contracted (in-house Job # E2001.7) to provide a geologist onsite to: 1) conduct a visual inspection of lithology; 2) recover specified soil samples; 3) oversee subsequent laboratory testing of the soil samples; and 4) prepare this geologic report of tank abandonment/closure operations. This report documents the field procedures and test results for the soil samples recovered during abandonment/closure operations of this tank location.

---

## PROCEDURES

On Monday July 27, 1998, PIC Environmental Geologist, Hamid Khorzani, conducted soil sampling operations along product and fill piping associated with the 61,500 gallon concrete diesel/fuel oil tank. After conducting utility clearance, coring operations were conducted using a Geoprobe System® hydraulic probing rig. Under the direction of PIC Environmental Geologist, Hamid Khorzani, eleven (11) borings (B1-B11) were penetrated/cored and sampled using the Geoprobe System® hydraulic percussion hammer/probing machine with a 1.125" ID and 1.375" OD large bore sampler sleeves. Borings B1 and B3 were cored adjacent to the fill port and fill piping to 5 feet below surface. Borings B4-B11 were cored adjacent to product piping north of the tank to a maximum of 10 feet below surface (see Figure 2A for boring locations). The probe sleeves and probe rods were decontaminated with a liquinox detergent solution, then rinsed with water between boring locations to minimize potential cross contamination. The Geoprobe System® does not generate drill cuttings; therefore, no drums were required to store potentially contaminated soil from drill cuttings. No groundwater was encountered in any of the borings.

Triple rinsing and liquids disposal operations inside the concrete tank were completed on Monday, July 27, 1998 (see Figure 2A: Site Sketch Map-Detail). A copy of the rinseate disposal manifest is included in Appendix C. Once the concrete tank was washed and rinsed,

the bottom of the concrete tank was cored at four locations to facilitate soil sampling. On July 28, 1998, PIC environmental geologist, Hamid Khorzani, recovered four (4) soil samples (1A, 1B, 1C and 1D) at a depth of two feet below tank bottom (about 20 feet) via hand auger assembly. On July 30, 1998, Mr. Khorzani returned to the site to recover a duplicate soil sample (DB1) at the same location as 1B due to a laboratory error.

In addition, on July 29, 1998, four 20 feet deep vadose monitoring wells located around the perimeter of the 61,500 gallon concrete tank were abandoned via a Geoprobe System® pressure grout pump. Moine Bros. removed product piping from a utility tunnel north of the tank extending to the boiler room. Finally, the 61,500 gallon concrete tank and associated piping were filled with cement slurry and closed in place in early August, 1998 (see Appendix C).

#### **SOIL SAMPLING PROCEDURES**

Four hand augered soil samples (1A, 1B, 1C, and 1D) and one duplicate soil sample (DB1) were collected under the tank in glass jars, sealed with teflon lined lids, placed on ice and transported under chain of custody protocol to a state certified laboratory for quantitative analyses (see Appendix A: Chain of Custody).

Eleven boring samples (B1-B11) were recovered under product and fill piping using a stainless steel barrel sampler lined with 3/8 inch PETG liners. The soil sampling equipment was washed and decontaminated between sample recovery using a liquinox detergent solution. The sampling equipment was then rinsed in tap water and dried with paper towels. Each sample was covered

---

with teflon lining at both ends, secured with plastic caps, sealed with tape, placed on ice, and transported to a state-certified laboratory for quantitative analyses of targeted petroleum (diesel) contaminants (see Appendix A: Chain of Custody Record). Borings were backfilled with bentonite hole plug material to surface.

## GEOLOGY

A visual inspection of the stratigraphy exposed by boring activities revealed that the predominant soil type from surface to a depth of 10 feet is brown, fine to coarse grained, massive, sand to sandy gravel with intermittent lenses of silty clay.

The elevation of the subject site is approximately 460 feet above sea level. Surrounding topography slopes to the south-southeast (see Figure 1). The subject property is located in the northern portion of the Central Los Angeles Groundwater Basin. Water bearing strata within the basin consist of Pleistocene to Recent fluvial, alluvial, and marine terrace deposits. The shallowest regional aquifer occurs within the Lakewood Formation. This formation contains two principal water bearing zones; the Exposition and Gardena aquifers. South of Los Angeles, these aquifers are separated by an undifferentiated aquiclude of varying thickness and are overlain by Recent alluvial sediments which may contain shallower "perched" aquifers. Regional groundwater flow mimics surface topography in a southerly direction. The regional groundwater contour map (Figure 3) published by Los Angeles County does not provide

coverage under the site. LACFCD groundwater monitoring well No. #2891C, located approximately 2 miles east of the subject site, was determined to have a groundwater depth of 227.7 feet below surface on November 1, 1993. An historical high water level in this well was determined to be 156.3 feet below surface in December of 1950. In house PIC drilling data from nearby properties indicate that the first occurrence of groundwater exceeds a depth of 40 feet under the subject property.

### TESTING AND RESULTS

All sixteen soil samples recovered from concrete tank area between July 27-30, 1998 were transported upon recovery to Advanced Technology Laboratories (Signal Hill) for quantitative testing of total petroleum hydrocarbons (TPH) via modified EPA method 8015 (diesel) and volatile aromatics (B/T/E/X) and MTBE via EPA method 8020 (see Appendix B: Laboratory Results). Laboratory results are summarized below in Table I and attached as Appendix B.

TABLE I

SAMPLE I.D.	EPA 8015	EPA 8020				
	TPH Diesel (ppm)	B (ppb)	T (ppb)	E (ppb)	X (ppb)	MTBE (ppb)
1A	ND	ND	ND	ND	ND	ND
1B	-	ND	ND	ND	ND	ND
DB1	ND	-	-	-	-	-

SAMPLE I.D.	EPA 8015	EPA 8020				
	TPH Diesel (ppm)	B (ppb)	T (ppb)	E (ppb)	X (ppb)	MTBE (ppb)
1C	ND	ND	ND	ND	ND	ND
1D	ND	ND	ND	ND	ND	ND
B1	ND	ND	19	ND	31	ND
B2	ND	ND	ND	ND	ND	ND
B3	ND	ND	ND	ND	ND	ND
B4	ND	ND	ND	ND	ND	ND
B5	ND	ND	ND	ND	ND	ND
B6	ND	ND	ND	ND	ND	ND
B7	ND	ND	ND	ND	21	ND
B8	ND	ND	ND	ND	ND	ND
B9	ND	ND	ND	ND	ND	ND
B10	ND	ND	13	ND	21	ND
B11	ND	ND	ND	ND	ND	ND
Drinking Water MCL	None	1	100	680	1750	35

Note: ND = Nondetectable

- = Not Analyzed

TPH results expressed as mg/kg = ppmillion

BTEX and MTBE results expressed as ug/kg = ppbillion

---

## CONCLUSIONS AND RECOMMENDATIONS

Based on the laboratory analyses and field observations of tank closure operations at the subject site, the following conclusions and recommendations are offered:

- 1) All laboratory results confirm there is no petroleum hydrocarbon soil contamination (as diesel) under the concrete tank or associated piping.
- 2) Consistent with permit requirements, the 61,500 gallon concrete diesel/fuel oil tank has been filled with cement slurry and closed in place.
- 3) PIC recommends regulatory closure of this tank with no further action required.

This report is proprietary and confidential, to be delivered to, and intended for the exclusive use of, the above named client and appropriate regulatory agencies only. PIC Environmental Services assumes no responsibility nor liability for the reliance herein or use hereof by anyone other than the above named client or appropriate regulatory agencies. In addition, all of the lab work cited in this report was prepared under the supervision of Edgar Caballero of Advanced Technology Laboratories (Signal Hill) who is responsible for the contents and conclusions of the laboratory data.

UNDERGROUND STORAGE TANK

CLOSURE INFORMATION

RECEIVED

MAY 26 1998

DEPARTMENT OF PUBLIC WORKS  
ENVIRONMENTAL PROGRAMS DIVISION

- 1. This application is for authorization to temporarily or permanently close an underground storage tank (UST) pursuant to Los Angeles County Code, Title 11, Division 4, and California Code of Regulations, Title 23, Division 3, Chapter 16. This application may also be used for product piping removal associated with an existing or removed UST.
- 2. This application will not be approved unless a valid Hazardous Material Underground Storage Permit (HMUSP) or Unified Program Permit (Unified Permit) application is on file with the Department of Public Works (DPW). HMUSP registration fees may be waived, if the DPW finds that the subject USTs': a. Have been continuously empty and out of service since January 1, 1984; b. The owner or operator was never informed by DPW or any other agency of need to properly close USTs.

USTs closed on site by removal or cleaning and filling with an inert solid material prior to January 1, 1984, need not comply with current closure requirements, however, leaks from such USTs must be reported and cleaned up.

This application must be accompanied by a State Water Resources Control Board UST permit application Form A for each site and Form B for each UST to be removed or closed.

- 5. All work shall be carried out in full compliance with all applicable Federal, State and local laws, ordinances, rules and regulations.
- 6. All fees due to DPW and/or the certified Unified Program Agency (CUPA) for the operation and/or maintenance of the facility subject to closure through the date of closure shall be paid.
- 7. All inspections notification(s) shall be made as directed by the attached conditions of this approval.
- 8. Within 30 days of the date of closure the applicant shall furnish the DPW a closure report describing all work done, results of any required sampling, disposition of any contaminated soils or materials found and all other requirement made part of the closure application.

In all cases, closure permits expire 180 days from the date of issue. It is the responsibility of the owner to make sure that the final report that contains the required information is submitted to the DPW within one month from the sampling date or 180 days from the date of the permit issuance, whichever is earlier. The total number of tanks listed on the HMUSP or Unified Permit and the yearly annual permit maintenance billing will remain unchanged until the closure report is received by the DPW. Only one copy of the closure report need be submitted unless otherwise directed.

- 10. All closure applications are site specific and may be subject to additional sampling and site characterization requirements as necessary to protect the public health and safety, underground and surface water supplies, and may include requirements requested by Federal, State or other regulatory agencies.

UNDERGROUND STORAGE TANKS

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer - Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.
2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:
  - a. Removal of tank shall require a three (3) business day advance notification.
  - b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.
3. Consult current fee schedule for costs.
4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.
5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.
6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards" State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.
7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.
8. Decontamination shall require the following, as a minimum:
  - a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.
  - b. The personnel shall be sufficiently skilled to safely carry out such operation.
  - c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.
  - d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks, Part A and any other applicable Parts."

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part B and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.
3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.
4. If an appointment has been arranged with a County Engineer Inspector to inspect the removal of a tank, the Inspector will only visit at the site a reasonable amount of time (approximately one hour) after arriving for the removal to witness. Another closure fee may be charged if the Inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.
6. If the tank has stored materials other than motor fuel, fuel oil or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS B below.
7. The site shall be backfilled and recompact to a relative compaction of 90%.

CONDITIONS D -- PERMANENT

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.
2. Owners/operators shall demonstrate part site integrity as follows:
  - a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 3.b. below.
  - b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.
  - c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.
  - d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.
  - e. A Shelby Tube or a Modified California sampler shall be utilized for taking all soil samples.
  - f. Soil samples shall be capped immediately with teflon or aluminum.
  - g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.
  - h. A report containing the results of the above analysis shall be submitted to the County Engineer.
3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."
4. A report shall be submitted to the County Engineer containing

Re: Justification Statement for  
Closure in Place  
Underground Concrete Diesel Tank  
SFIC Properties, Inc.  
1000 South Fremont Ave  
Alhambra, CA 91803

PIC Environmental Services (PIC) has been contracted by SFIC Properties, Inc. to close/abandon one 61,500 gallon concrete underground diesel/fuel oil storage tank at the referenced location. A Site Sketch Map is attached to illustrate referenced facilities. This 61,500 gallon concrete tank was installed underground in 1944 by C.F. Braun and Co. to store diesel/fuel oil. Fuel was used primarily to power steam boilers located northeast of the tank. The tank has a diameter of about 28 feet and the bottom is located over 20 feet below surface. Although the tank was last used in about 1976, four vadose monitoring wells were constructed in 1988 as required by California underground tank regulations. Over the years a large number of facilities (buildings, and utilities), have been installed in close proximity to the tank and above most of the underground piping assembly. Particularly noteworthy are the close proximity of building A13 northeast of the tank, an emergency electrical generating system east of the tank and adjacent to the fill piping, a large fountain adjacent to and southeast of the tank, and underground utility tunnels adjacent to the tank on the western boundary. Finally, numerous utility "feeder" lines cross above the product piping which extends northerly from the tank. Because of the large size, significant depth, difficulty of removing the tank, and unacceptable risk of damaging adjacent facilities, PIC recommends closure in place. Proposed closure procedures are outlined below:

1. Access to the tank, fill piping and product piping will be accomplished. A 36" diameter manway exists at the top of the tank.
2. The tank and piping will be cleaned, triple rinsed and pumped dry as required under Manifest Conditions.

3. After cleaning the tank, concrete at the tank bottom will be cut at four locations to recover soil samples from a depth of about two feet directly under the tank. Recovered samples will be analyzed for diesel contaminants. Recall that perimeter borings around the outside of the tank in 1988 documented a lack of soil contamination laterally.
4. Soil sampling will be accomplished every 20 feet along the buried fill and product piping at a depth of about five feet below surface. Recovered samples will be analyzed for diesel contaminants.
5. Product piping located in the utility tunnel west of the boiler room will be cut and removed.
6. Assuming all soil test results document a lack of contamination, the concrete tank and buried piping will be filled to surface with a cement slurry mixture to formalize closure in place.
7. A tank closure report signed by a California registered geologist will document all procedures and test results.

Respectfully submitted,

J. Tim Hersch  
California Registered Geologist #4082  
President

FAX: (213) 266-7600

April, 1996

**MONITORING REQUIREMENTS FOR METHYL TERTIARY BUTYL ETHER  
(MTBE) AT ALL LEAKING UNDERGROUND TANK SITES**

MTBE is a major component of gasoline that is now being detected in drinking water wells throughout California. The threat to human health from MTBE is being evaluated at this time by the United States Environmental Protection Agency (U.S.EPA), and the California Department of Health Services has advised that all drinking water wells should be tested for MTBE, especially if they are located near leaking underground storage tank sites.

We are therefore requiring that MTBE be included in the analysis of all soil and groundwater samples collected at all leaking underground gasoline tank sites, in addition to the analyses already being performed. The MTBE results should be included with the other analytical results in the assessment report, or the groundwater monitoring report for that sampling period. Separate reporting of MTBE is not necessary.

The commercial analytical laboratories have indicated that MTBE can be identified and quantified using U.S.EPA Method 8020 and/or U.S.EPA Method 8260. U.S.EPA Method 8020 is the same method that is routinely used to analyze for aromatic hydrocarbons (benzene, toluene, ethylbenzene, and xylenes).

both methods approved

We will evaluate the need for additional MTBE monitoring on a case-by-case basis based on our review of the analytical test results we receive.

The analytical data will provide a better understanding of the extent of MTBE contamination and will help assess the risk to public health and the environment so that effective and appropriate remedial measures can be developed and implemented.

If you have any questions concerning this new requirement, please contact the project engineer for your case, or call Al Novak, the supervisor of the Underground Tank Program Support Unit, at (213) 266-7551.

Interim guideline  
for MTBE in  
water =  
35 ppb.

Revised 07/02.

## NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 66 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective August 6, 1988.

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

- Notify the SCAQMD Executive Officer by telephone at (909) 396-3886 24 hours prior to tank excavation. 1166(c)(1)(A)
- Monitor the excavated material during the excavation for VOC contamination. 1166(c)(1)(B)
- When VOC contamination is detected:
  - \* Cease excavation
  - \* Cover the contaminated soil until implementation of approved mitigation measures. 1166(c)(1)(C)
  - \* Notify the SCAQMD Executive Officer at (909) 396-3886 within 24 hours of detection of VOC contaminated soil. 1166(c)(2)(A)
- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(c)(3)

### Exemptions

- Treatment of less than one (1) cubic yard of contaminated soil. 1166(d)(1)(A)
- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(d)(1)(B), (F)
- Removal of soil for sampling purposes pursuant to EPA methods 1166(d)(1)(C)
- Accidental spillage of five (5) gallons or less of VOC. 1166(d)(1)(D)
- Documentation of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(d)(1)(E)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE  
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (909) 396-3886

UST1/NOTCLOSE

REVISED 08/20/

CLOSURE PERMIT SUPPLEMENT  
 HAZARDOUS MATERIALS UNDERGROUND STORAGE  
 LOS ANGELES COUNTY  
 DEPARTMENT OF PUBLIC WORKS  
 WASTE MANAGEMENT DIVISION  
 900 S. FREMONT AVENUE  
 ALHAMBRA, CA 91803

Closure Permit  
 No. 218746 B  
 File No.  
 I- 94129219

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.
2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
IA & IB } IC & ID }	2-4 ft	TPH (D)	8015 (M)
	below tank invert	BTEX, MTBE	8020
1 Sample	24 ft every	"	"
	20ft	"	"
	under piping		
Note:	All the requirements for Fire Department for closure in-place must be satisfied.		

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.
4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.
5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.
6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determination; d) The method of analysis; e) Signature of chemist certifying results.
7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.
8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.
9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

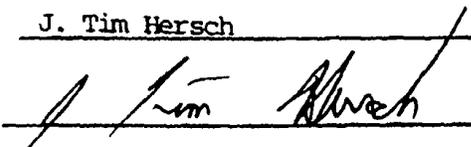

COUNTY OF LOS ANGELES DEPARTMENT OF PUBLIC WORKS  
WASTE MANAGEMENT DIVISION

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the County of Los Angeles Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, California 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.
3. Description of methods for obtaining, handling, and transporting samples.
4. Time and date samples were obtained.
5. Soil sampling certification (including but not limited to soils classification, boring logs, sample procedures, sample locations, initiating chain-of-custody, and groundwater location) for UST closure shall be certified by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils. The certification must clearly state that all work was performed under the supervision of the person signing.
6. Chain-of-custody documentation initiated by person obtaining sample through person at CAL/EPA Department of Toxic Substance Control certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction, and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil and tank rinseate.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils.

## 1.0 INTRODUCTION

The purpose of this Operations and Maintenance Program (O&M) is to limit exposure to airborne asbestos fibers for all employees, tenants, contractors, and visitors to the commercial complex located at 1000 S. Fremont Ave., Alhambra, California and owned by Campus 100 Fremont, LLC. The accepted level of airborne fibers for re-occupancy is determined by the Federal and CAL/OSHA Permissible Exposure Limit (PEL) of 0.1 f/cc and the former EPA-AHERA PCM re-occupancy clearance level of 0.01 f/cc. To attain these levels and maintain them over the life of the site facilities, it is important that Operation and Maintenance Program procedures be strictly followed by the site owner's employees, tenants and contractors. Employees, tenants and contractors working in areas which contain asbestos-containing materials (ACM) must be carefully selected, informed, and held accountable to the Operations & Maintenance Procedures described in this manual. Since 1973, asbestos-containing building materials have been gradually phased out by legislation prohibiting their use. Because the subject site contains ACM, the following guidelines are to be followed:

- Any thermal system insulation or surfacing material will be considered a Presumed Asbestos Containing Material (PACM) until certified by competent testing under the EPA/AHERA bulk sampling protocol to be non-ACM.
- No tenant, employee, contractor or visitor is to either enter controlled areas containing ACM, nor are they to disturb ACM or PACM without first notifying the Asbestos Program Manager (APM) and obtaining appropriate approval.
- All areas with ACM or PACM will be visually monitored periodically to assess the material's condition with respect to its potential for fiber release and its potential for disturbance.
- Any friable ACM that is "significantly damaged" and/or has a potential for personnel exposure will be repaired or removed immediately. All other ACM will be routinely inspected per the O & M re-inspection schedule.
- Any work being performed in an area containing ACM or PACM must be done in accordance with the Operations and Maintenance Program for the 1000 S. Fremont complex. The program specifies requirements which must be met for all asbestos-related work.
- Air quality in the subject buildings will be monitored semi-annually for airborne asbestos fiber concentrations.

The primary intent of the O&M is to decrease potential exposure to airborne asbestos fibers for all tenants, employees, contractors and visitors to the 1000 S. Fremont complex by controlling access to asbestos-containing materials.

## 1.1 OBJECTIVES

According to the EPA document dated July 1990, "Managing Asbestos In Place: A Building Owner's Guide to Operations and Maintenance Programs for Asbestos-Containing Materials", the O&M should include the following elements:

- An inventory of all asbestos-containing material in the building.
- Periodic examinations of all asbestos-containing materials to detect deterioration.
- Written procedures for handling asbestos materials during asbestos-related work.
- Written procedures for asbestos disposal.
- Written procedures for dealing with asbestos-related emergencies.
- Training of an Asbestos Project Manager (APM), Facilities Coordinator (FC) and all maintenance and custodial employees who may accidentally damage asbestos-containing materials.
- Notification to tenants employees, and contractors.
- Controls for activities that may disturb ACM.
- Work practices to avoid or minimize fiber release during activities affecting ACM.
- Record keeping to document O&M activities.
- Worker protection consisting of medical and respiratory protection programs, as applicable.

## ***Section 2***

BLASLAND, BOUCK & LEE, INC.  
*engineers & scientists*

## 2.0 ADMINISTRATIVE ORGANIZATION

The key to implementing a comprehensive Operations & Maintenance Program is the program participant's. Based on this premise, the following roles and responsibilities have been established as summarized below:

The **Asbestos Program Manager (APM)** is responsible for the policies and procedures outlined in the O&M Program, and in such capacity coordinates work activities, maintains and distributes all documentation and interacts with the environmental consultant.

The **Facilities Coordinator (FC)** ensures that his/her staff receives the required training, coordinates work activities with the APM and assists in the documentation of all the ACM and PACM locations and the condition of the ACM and PACM.

Per ASHARA (See Glossary) and Cal-OSHA (see Glossary) it is required that an individual who disturbs asbestos have received EPA/AHERA training, or an equivalent. This may apply to the APM, Facilities Coordinator, maintenance and custodial employees, contractor personnel and Industrial Hygienist. Pursuant to Campus 1000 Fremont LLC's policy for the site, the minimum training required of all employees who may disturb ACM is the EPA's 16 hour Operations and Maintenance course (see AHERA Appendix X). Respirator fit testing and medical clearance is also required for these personnel. In addition, a "competent person" must be designated for all work sites covered under the OSHA standard.

### 2.1 Outline of Responsibilities

The APM is responsible for:

- The overall implementation and documentation of the O&M Program.
- Consulting with experts and state, local and federal regulatory agencies annually regarding any changes in technologies and regulations regarding ACM.
- Requesting consultation with experts when the solution of an ACM-related problem lies outside the scope of this O&M or beyond the training and/or expertise of employees.
- All asbestos-related communications, including notifying employees and others as appropriate, of the location of ACM and policy regarding ACM.
- Ensuring that all asbestos-related work complies with applicable EPA, Cal/OSHA, federal, state and local regulations.

- Determining work practices to be followed by approving **Job Request Forms** and completing and forwarding **Maintenance Authorization Work Forms** and **Evaluation of Work Forms**, in conjunction with the Facilities Coordinator.
- Visiting the work site whenever work which will affect ACM is initiated and periodically thereafter to verify that maintenance is being performed according to the requirements of this Operations & Maintenance Program. The APM's observations should be appropriately recorded.
- Ensuring that any deviation from appropriate work practices is corrected immediately. A copy of the APM's written evaluation should be placed in a permanent file.
- Ensuring that any outside contractor, or Industrial Hygienist (IH) who may or will come in contact with ACM in the course of his/her work has received appropriate training to perform asbestos-related work and has received a medical examination and respirator fit testing as required by OSHA.
- Arranging with a qualified Environmental Consultant to perform periodic air monitoring and O&M audits.
- Maintaining a record of all known ACM and PACM remaining within the structure and all work related to ACM and PACM.
- Maintaining all training records (and medical records if appropriate) of employees exposed to ACM for a period of 30 years after their last day of employment, per the requirements of 29 CFR 1910.20.
- Making a copy of this O&M and related reports available to all employees, tenants or contractors who could reasonably be expected to come in contact with ACM in the performance of their duties.
- Ensuring that all maintenance employees receive appropriate training per Cal/OSHA regulations.

- Maintaining all documents and records in accordance with this program; conducting semi-annual air monitoring; performing an annual inspection of ACM; and a semi-annual internal audit of documentation, equipment and procedures.
- Advising outside contractors in writing of the existence and locations of ACM in the building and of the precautions necessary to protect building occupants and themselves.
- Ensuring that the outside abatement contractors provide documentation of proper disposal of all removed ACM.

The Facilities Coordinator is responsible for:

- Ensuring that all maintenance employees receive appropriate training per Cal/OSHA.
- Determining prior to any work if the possibility exists that ACM may be disturbed by reviewing Job Request Forms in conjunction with the APM. If ACM is to be disturbed, the FC, in conjunction with the APM will process the completed Maintenance Work Authorization Form and Evaluation of Work Form.
- Arranging with the APM for asbestos-related work by an outside contractor.
- Helping to ensure that no non-qualified employee performs any work which might disturb ACM.
- Documenting changes in the condition of the ACM, through periodic scheduled re-inspections.

## ***Section 3***

---

BLASLAND, BOUCK & LEE, INC.  
*engineers & scientists*

### **3.0 CONTRACTOR/SUBCONTRACTOR CRITERIA**

An outside contractor is anyone who is not an employee of Campus 1000 Fremont LLC who performs maintenance or construction work within the facility. Outside contractors must comply with the conditions set forth in the O&M Program and must review the Contractor Notification Letter and this document before beginning work. (See Appendix IV Sample Notification Letters)

3.1 The asbestos abatement contractors shall be duly licensed in the State of California in accordance with the provisions of Chapter 9 of Division 3 of the Business and Professions Code, as amended. The prime contractor on asbestos abatement projects shall hold a license from the Contractors State License board with an "ASB" Asbestos Certification.

Contractors shall be registered with the Department of Industrial Relations, Division of Occupational Safety and Health (Cal/OSHA) in accordance with the provisions of Section 6501.5 of the California Labor Code.

Contractors are to be advised in writing that they must meet the requirements of this standard and all applicable governmental regulations.

As part of the selection process the contractors shall submit documentation of successful completion of asbestos work involving at least three jobs of similar scope and duration. Documentation shall include:

- Entity for which the work was done.
- Type, quantity, cost and duration (scheduled and actual) of the work.
- Name of the entity representative responsible for performance inspections.
- Results of all air monitoring, including lab sheets.
- Results of all inspections by other agencies (e.g. EPA, AQMD, Cal/OSHA), subject to verification.

3.2 Contractors shall submit a statement, signed by an officer of the company, containing the following information:

- AIA standard contractor pre-qualification form, notarized.
- A record of all citations issued by Federal, State or local regulatory agencies relating to asbestos abatement or other activity. Include projects, dates and resolutions.
- A list of penalties incurred through noncompliance with asbestos abatement project specifications, including liquidated damages, overruns in scheduled time limitations and resolutions.
- Situations in which an asbestos-related contract has been terminated including projects, dates and reasons for terminations.
- Listing of all asbestos-related legal proceedings/claims in which the contractors (or employees scheduled to participate in this project) has participated or is currently involved. Include descriptions of role, issue and resolutions to date.

Written procedures must be obtained from the contractor, reviewed and approved by the APM and the environmental consultant engaged by Campus 1000 Fremont, LLC prior to beginning work.

## 4.0 HEALTH ASPECTS OF ASBESTOS

### How does exposure to asbestos occur?

Asbestos, which may be crumbled by hand pressure, is called friable asbestos. Friable asbestos-containing material is found in sprayed-on insulation and other products and is hazardous because dangerous fibers are easily released into the air by impact and deterioration.

Some asbestos is bound with other materials in products such as roofing shingles or vinyl-asbestos floor tiles. In these products fiber release is much more difficult. However, fibers in bound asbestos may be released when the material is cut, drilled, scraped or sanded, or when it is badly deteriorated.

Exposure to asbestos occurs when asbestos fibers are released into the air and are inhaled by the worker. Asbestos fibers are of various sizes. The smaller fibers can remain in the air for long periods of time. These fibers are so small that they are invisible. Some of the larger fibers may lodge in the nose, but the smaller ones travel through the upper airways and become embedded in the lungs. The body has no efficient mechanism for removing such fibers.

### How will asbestos affect my health?

Exposure to asbestos may cause several types of serious disease.

#### **Asbestosis**

When asbestos fibers become lodged in the lungs, the lung tissues are irritated, and the small air tubes and sacs of the lung become inflamed. As the inflammation heals, permanent scar tissue (called fibrosis) remains. The scarring will cause shortness of breath which grows worse over time, even after exposure ceases. Eventually, it may be impossible for the victim to inhale enough air. Heart failure may result.

What we know about the relationship of asbestos exposure to incidence of asbestosis has been learned from studies of people who were heavily exposed. Asbestosis is usually found as a result of heavy exposure over a long period of time.

The disease is much less likely to occur if proper precautions are taken. There is no cure for asbestosis.

## Lung Cancer

Lung cancer is five times more common in people exposed to asbestos than in individuals who have not been exposed. Early symptoms are coughing, chest pains and coughing up blood. Smoking greatly increases the risk of developing lung cancer from asbestos exposure. A person heavily exposed to asbestos has a 30 to 90 times higher risk of developing lung cancer if that person is a smoker. As with asbestosis, proper precautions can help to reduce the risk of contracting asbestos-related lung cancer. There is usually no cure for this disease, but if the cancer is detected early it may be surgically treated.

## Mesothelioma

Mesothelioma is an extremely deadly form of cancer that is almost always caused by asbestos exposure. It is truly an "asbestos cancer." Mesothelioma may result from relatively light exposure to asbestos. This cancer involves the lining of the chest and abdomen. Early symptoms are shortness of breath, or chest or abdominal pain.

Mesothelioma would be expected to occur in only one out of 10,000 non-asbestos-exposed people, but one study found that 10 out of 124 deaths of asbestos-insulation workers were caused by mesothelioma. There is no cure for mesothelioma.

## Other Cancers

Asbestos exposure is also thought to result in cancers of the esophagus, stomach, colon, rectum, and gastroenterological tract. These diseases are probably due to swallowing some of the longer asbestos fibers that are caught in the upper airways and are carried to the throat in mucus.

### How great is the risk of developing these diseases?

The answer probably depends on the extent of exposure. Workers in the construction, renovation, and demolition trades who encounter asbestos on the job are among the higher risk groups.

The amount of asbestos to which you are exposed and the length of time and number of times you are exposed seem to influence the likelihood of developing asbestos-related disease. The greater the total exposure, the greater the chance that you will become ill. However, many experts believe that there is no definite safe exposure level. Some workers who had done shipyard work with asbestos for only a few weeks during World War II developed asbestos-related disease in the 1960's. **The best way to protect your health or the health of your employees is to limit exposure as much as possible.**

Usually disease will not manifest itself for 15 to 40 years. That means that workers exposed today will not know for a considerable time whether they are disease victims.

Are there medical tests to determine whether asbestos exposure has caused harm?

Anyone frequently exposed to asbestos on the job should have regular medical checkups. The worker should tell his/her work history to the doctor. A medical exam should be provided that includes a complete medical history, a chest X-ray, a lung function test and a stool sample.

## 5.0 BACKGROUND MATERIAL ABOUT ASBESTOS

“Asbestos” is the generic name applied to a group of six fibrous silicate minerals which occur naturally in the in the earth’s crust. Within the definition of asbestos are included two mineralogical classifications: Serpentine and Amphibole.

Each of these classifications is sub-divided into specific mineralogical species. Some of these species are “non-fibrous” and therefore are not “asbestos”. Other species are “fibrous” and therefore are included in the definition. The corresponding asbestos and non-asbestos species can be chemically identical to each other. However, in the asbestos form, the molecules arrange themselves in very long, thin fibers which are flexible and very strong. The non-asbestos species form plates or other shapes rather than fibers. Unfortunately, sometimes the non-asbestos “plates” break into long thin needles which resemble asbestos but actually are not asbestos.

Generally, asbestos fibers are long, thin, strong, fireproof, flexible and resistant to the action of many chemicals. Chrysotile asbestos, by far the most common type, is usually white or off-white, with long wavy fibers. In some mines, the fibers are exceedingly long and flexible, making this Chrysotile excellent for weaving into fire and heat resistant cloth. Shorter Chrysotile fibers were more apt to be used as binders and strengtheners in plastics, cement or insulation, chrysotile has been chiefly mined in the USSR, Canada, the United States and Southern Africa. By far the largest western producer has been Canada, with dozen or more commercial mines at various times. In the United States, Chrysotile has been (and is still, in some cases) mined at various times. In the United States, Chrysotile has been mined commercially in three states, deposits of Chrysotile have been found in thirty of the fifty states. Serpentine rock, the general class of rock of which Chrysotile is a specific example, is so common in California that it has been adopted as the state rock.

Amosite’s real name is fibrous cummingtonite-grunerite. AMOSA, from which the name amosite is derived, is a trade acronym for Asbestos Mines of South Africa. Amosite is usually brown or tan, with much straighter and stouter fibers than Chrysotile. Amosite was the second most commonly used type of asbestos, comprising approximately 5% of the asbestos placed in buildings and factories.

Crocidolite is a fairly rare form of asbestos, unique because of its very obvious blue color. Crocidolite fibers appear long and straight, much like Amosite.

The remaining three asbestos types were not extensively used in commercial products in this country. It is most unusual to find them in a building or product.

Asbestos can be mined in open pit or sub-surface mining operations. The rock containing the veins of asbestos is broken up and transferred to the mill, where physical action is used to separate the bundles of asbestos from the adjoining rock. The fiber bundles are then further processed and packaged for shipment to manufacturing plants.

Asbestos fibers have been used in two to three thousand different applications in our industrialized society. The most common uses of asbestos have been:

Thermal and acoustic insulation

Fireproofing

Textiles

Asbestos-concrete

Plastic products (vinyl floor tiles)

Paper products

Gaskets, packaging materials

Roofing felts, papers

Electrical insulation

Joint, sealer compounds

## **6.0 SUMMARY OF ASBESTOS-CONTAINING MATERIALS**

The site at 1000 South Fremont consists of 39 buildings and 1 utility tunnel. Identified asbestos-containing materials at the site consist of floor tile mastic, ceiling tile mastic, wallboard/joint compound, pipe insulation, spray-applied fireproofing, fire doors, cement asbestos board, roofing materials and other miscellaneous materials. The following charts summarize the identified asbestos containing materials, their locations, estimated quantities, friability, and the accessibility of each material.

## 7.0 O&M AUDIT/AIR MONITORING

An audit of the O&M program should be performed annually (at a minimum) by the Industrial Hygiene Consultant. The audit will ensure that the O&M is being properly utilized, that the results are properly entered within the O&M records and that the accuracy of reports is verified for the current condition of the asbestos-containing material within the buildings. In order to obtain an overview of the airborne fiber levels within the building, area air monitoring will be performed. Due to the size of the site, air monitoring within the commercial complex will be performed on a semi-annual schedule. The air-monitoring schedule is found in Appendix VIII. There are five basic areas of the program which must be audited:

7.1 Documentation Review - review of the following records to ensure that they are updated:

- Semi-Annual Air Monitoring Reports
- Annual Inspection forms
- Employee/Tenant notifications
- Contractor notification of ACM
- Hazardous Waste Shipment Records
- Employee records (training, certification, respirator fit test & medical)
- Annual re-training of personnel
- New employee training
- Asbestos control personnel list
- Diagrams of abated/encapsulated areas
- Public agency notifications

7.2 Physical Inspection - This entails a walk through of the property by appropriately trained personnel in order to complete a separate risk assessment for ACM. The assessment will be compared to previous assessments in order to note changes and recommend future actions. The forms for completing the physical inspection are to be stored in this manual.

7.3 Equipment Inspection - The equipment reserved for asbestos-related work should be reviewed in light of the following:

- Repair/Replacement
- Adequate quantity to meet needs
- Stored properly, sealed and in a locked area
- Clean and free of all ACM debris
- Reorder cycle and procedure

7.4 Employee Review - This is conducted in order to ascertain that training is effective and retained by the maintenance and custodial employees to ensure that they have a comprehensive understanding of how ACM is to be handled at in accordance with Campus 1000 Fremont, LLC's policy at the 1000 S. Fremont, Alhambra commercial complex.

7.5 Semi-Annual Air Sampling Protocol

**AIR SAMPLING PROTOCOL**

Purpose: To gain an overall view of the various buildings' fiber levels, (asbestos fibers, primarily), and which incidental factors (air currents, vibration, outside contamination), affect them.

Methodology:

- A. Pick up sources of contamination, (possible and probable), such as:
  - 1. Outdoor air intake -- make up air (both HVAC)
  - 2. Return air (HVAC) or outside air (ambient) entering the building
  - 3. Pedestrian and traffic entry points
- B. Pick up sources of vibration, erosion and abrasion, such as:
  - 1. Equipment/fan rooms
  - 2. Air duct discharge (from fans)
- C. Random sampling within the various occupied and unoccupied areas above and below the ceiling to get an idea of the overall concentration of airborne fiber levels.
- D. New sample locations should be established during future semi-annual monitoring to eventually sample all areas of the asbestos-containing buildings and tunnels in the complex. Changing sample locations provides comparative data to more accurately determine possible sources of elevated fiber levels and to determine remedial parameters, if necessary. The cycle should be repeated every two years.

## ***Section 8***

## 8.0 COMMUNICATIONS POLICY AND PROCEDURES

The purpose of the communications policy and procedures is to provide a forthright and timely information program, including proper notification and periodic updates on the status of the ACM in the commercial complex located at 1000 S. Fremont in Alhambra.

Because owners have more control of the overall outcome of an asbestos management plan when they develop and implement a pro-active (as opposed to re-active) communications policy, communications should be considered an integral part of this asbestos management plan.

In accordance with Division 20 of the California Health and Safety Code, Chapter 10.4 Section 25915-24 (California AB 3713 and AB 1564) asbestos data must be made available to the complex's employees and tenants. Notifications must be made to the employees within 15 days of first receiving information on the asbestos in the building. If there is updated information, the employees must be notified within 15 days of the end of the quarter in which the updated information was received. Components of the notifications include a summary of bulk sampling results, a summary of air sampling results and the locations within the building where the asbestos-containing materials are found. The basic components of the asbestos communications plan are:

- Asbestos Policy or Position Statement - This will outline the steps and procedures planned to mitigate the potential asbestos hazard.
- Designation of a Spokesperson(s) - The APM is to identify the recipients of the asbestos communications: on-site employees, subcontractors, maintenance or construction employees, etc.
- Techniques: Fact Sheet, Notification Letter, Briefings -The APM will select a method to establish the most efficient, clear and concise communications program
- Ongoing Communications - Depending upon the level of inquiries and responses from employees and tenants, a variety of communication techniques can be examined to select the best method of controlling the "grapevine" and maintaining open lines of communication.

Media Relations - Although not expected, if news media people call, the APM must be prepared to refer the media to the corporate office. This manual contains the required general information (i.e., policy statement, etc.) for tenant communication. Specific information will come from Campus 1000 Fremont, LLC should the media become involved.

*engineers & scientists*

## **9.0 WORKER PROTECTION**

### **9.1 Worker Training Program**

Training requirements for all employees of Campus 1000 Fremont, LLC participating in the O&M program shall be (at a minimum) the 2-hour Awareness course developed by EPA for maintenance and custodial workers who conduct activities in proximity to ACM or PACM but do not disturb ACM (AHERA - Appendix X). In addition to the elements contained in AHERA, this training should include:

1. Methods of recognizing asbestos, including presumed asbestos containing materials (PACM);
2. The health effects associated with asbestos exposure;
3. The relationship between smoking and asbestos in causing lung cancer;
4. The nature of operations that could result in exposure to asbestos, the importance of necessary protective controls to minimize exposure including as applicable, engineering controls, work practices, respirators, housekeeping procedures, hygiene facilities, protective clothing, decontamination procedures, emergency procedures, and waste disposal procedures, and any necessary instruction in the use of these controls and procedures and the contents of "Managing Asbestos in Place" (EPA 20T-2003, July 1990) ("the Green Book") or its equivalent in content;
5. The purpose, proper use, fitting instructions, and limitations of respirators as required by 29 CFR 1910.134;
6. The appropriate work practices for performing the asbestos job;
7. Medical surveillance program requirements;
8. The contents of the Federal OSHA construction asbestos standard (CFR1926.1101); and CAL/OSHA (Title 8CCR, 1529.asbestos) including appendices.
9. The names, addresses and phone numbers of public health organizations which provide information, materials and/or conduct programs concerning smoking cessation;
10. The requirements for posting signs and affixing labels and the meaning of the required legends for such signs and labels.

## 9.2 MEDICAL SURVEILLANCE

An employer is required by Cal/OSHA to institute a medical surveillance program for all employees who, for a combined total of 30 days per year, are engaged in Class I, II or III work, or may reasonably be expected to be exposed to asbestos at or above the Permissible Exposure Limit or excursion limit, and for employees who are required to wear negative pressure respirators. A medical examination is to be provided to all such employees prior to assignment to an area where negative pressure respirators are worn, within ten working days following the thirtieth day of exposure at or above the PEL, and at least annually thereafter.

The medical surveillance requirements state that the employer will provide at no cost to the employee a medical examination by a licensed physician. The medical exam will include, but not be limited to, the following components:

- A medical and work history;
- A complete physical examination with emphasis on the respiratory system, the cardiovascular system and the gastrointestinal system;
- Completion of the Initial Medical Questionnaire;
- A chest x-ray according to the Table below;
- Pulmonary function tests to include forced vital capacity (FVC) and forced expiratory volume at 1 second (FEV 1); and
- Any additional tests deemed appropriate or necessary by the examining physician interpreting the chest x-ray.

At the conclusion of the examination, a physician's written opinion will be obtained by the employer. This opinion shall include the elements specified in the OSHA construction asbestos standard.

### **FREQUENCY OF CHEST X-RAYS**

<b>Years Since First Exposure</b>	<b>Age of Employee</b>	
	<b>Less than 40</b>	<b>40 and older</b>
0-10	Every 3 Years	Annually
10+	Annually	Annually

\*Oblique x-rays need only be performed every 3 years.

In addition to the above initial exam, the employer will provide periodic medical examinations at least annually. The scope of this examination shall conform with the protocol for initial examinations except a specified Periodic Medical Questionnaire shall be administered to the employees instead of the Initial Medical Questionnaire.

### 9.3 PERSONAL AIR MONITORING AND EXPOSURE ASSESSMENTS

PLEASE NOTE: The following section applies only to workers who perform work which disturbs ACM or PACM:

It is the responsibility of the APM and the FC to fully comprehend and apply to all asbestos operations at the 1000 S. Fremont complex, the requirements of 8 CCR 1529 (f) (1). This requirement is excerpted below for emphasis.

#### General Monitoring Criteria

- Employers are required to perform monitoring and exposure assessments to determine accurately the airborne concentration of asbestos to which employees may be exposed. This practice helps allow the selection of adequate respiratory protection that, along with proper work practice and engineering controls, helps to ensure that no employee is exposed to airborne concentrations of asbestos fibers in excess of the Permissible Exposure Limit, (PEL) of 0.1 f/cc as determined by breathing zone air samples that are representative of the 8-hour TWA (Time Weighted Average) and 30-minute short-term exposures of each employee as analyzed by Phase Contrast Microscopy (PCM). Representative 8-hour TWA employee exposure shall be determined on the basis of one or more samples representing full-shift exposure for employees in each work area. Representative 30-minute short-term employee exposures shall be determined on the basis of one or more samples representing 30-minute exposures associated with operations that are most likely to produce exposures above the excursion limit for employees in each work area.

#### Initial Exposure Assessment

- A “competent person” must conduct an exposure assessment immediately before or at the start of the work to ascertain exposures expected during that work.
- The assessment must be completed in time to comply with requirements which are triggered by exposure data or the lack of “negative exposure assessment,” and to provide information necessary to assure that all control systems planned are appropriate for the operation and will work properly.
- The initial exposure assessment shall be based, if feasible, on the results of employee exposure monitoring, per the requirements of Cal/OSHA.

- Additionally, assess by considering all observations, information or calculations which indicate employee exposure to asbestos, including any previous monitoring in the workplace, or of the operations of the employer which indicate the levels of airborne asbestos likely to be encountered on the job. However, the assessment may conclude that exposures are likely to be consistently below the PEL only as a conclusion of a “negative exposure assessment” conducted pursuant to Cal/OSHA requirements (see summary below).
- Negative Exposure Assessment: For any one specific asbestos job performed by appropriately trained employees, the employer may demonstrate that employee exposures will be below the PELs by data which conform to the following:
  - ⇒ Objective data demonstrating that the product or material containing asbestos or the work involving it cannot release fibers in concentrations exceeding the TWA and excursion limit under those work conditions having the greatest potential for releasing asbestos; or
  - ⇒ Where the employer has monitored prior asbestos jobs for the PEL and the excursion limit within 12 months of the current or projected job, the monitoring and analysis were performed in compliance with the asbestos standard then in effect; and the data were obtained during work operations “closely resembling” the processes, type of material, control methods, work practices, and environmental conditions used and prevailing in the employer’s current operations, the operations were conducted by employees whose training and experience are no more extensive than that of employees performing the current job, and these data show that under the conditions prevailing and which will prevail in the current workplace there is a high degree of certainty that employee exposures will not exceed the TWA and excursion limit; or
  - ⇒ The results of initial exposure monitoring of the current job made from breathing zone air samples that are representative of the 8-hour TWA and 30-minute short-term exposures of each employee covering operations which are most likely during the performance of the entire asbestos job to result in exposures over the PELs.

### Periodic Monitoring

- The employer shall conduct periodic monitoring of all work where the exposures are expected to exceed a PEL, at intervals sufficient to document the validity of the exposure prediction.

### Termination of Monitoring

- If the periodic monitoring reveals that employee exposures, as indicated by statistically reliable measurement, are below the PEL and excursion limit the employer may discontinue monitoring for those employees whose exposures are represented by such monitoring.

## ***Section 10***

BLASLAND, BOUCK & LEE, INC.  
*engineers & scientists*

## 10.0 RISK ASSESSMENT

The degree of risk presented by ACM depends on its likelihood of releasing asbestos fibers into the air. This likelihood can be assessed by evaluating the material's condition and location.

Factors for assessing fiber release potential are listed below:

### Condition

- Current condition of ACM
- Evidence of deterioration or delamination from the underlying surface (substrate)
- Evidence of physical damage (e.g., presence of debris)
- Evidence of water damage

### Potential for Disturbance

- Potential for future disturbance, damage or erosion of ACM
- Proximity of air plenum or direct airstream
- Visibility, accessibility (to building occupants, maintenance personnel, repairmen, plumbers, electricians, installers, etc.), and degree of activity (air movement, vibrations, movement of building)
- Change in building or tunnel use

The first set of factors focuses on the current condition of ACM. If water or physical damage, deterioration, or delamination of the material is evident, then fiber release has occurred, is occurring, or is likely to occur. The appearance of the material and the presence of broken or crumbled material on horizontal surfaces indicate fiber releases.

Factors under the second heading reflect potential fiber release due to disturbance or erosion. Visible, highly accessible materials in areas frequently used or needing periodic maintenance are most vulnerable to physical damage. Also in this category are materials subject to intense human activities - for example, materials near a gymnasium or in buildings near an airport or highway. ACM in an air plenum or near a forced airstream (e.g. air from a heating vent) is likely to suffer surface erosion. In addition, fibers released into an airstream may be transported to other parts of the building, possibly exposing more people. Any planned changes in building use should also be considered when assessing potential fiber release.

## Assessment Process

The assessment factors discussed previously are used to decide if additional asbestos control is needed and, if so, when and by what method. Although the process is similar for each of the three types of ACM, the details are specific to each type and are discussed separately below.

When further action is necessary, its timing must be carefully considered. If the ACM is currently in good condition, but the potential for future fiber release is high, scheduling of asbestos abatement can take advantage of other building plans. For example, renovation work, which requires precautions to control fiber release, provides an opportunity to remove, encapsulate, or enclose ACM.

There are no set rules to determine the timing of asbestos abatement. Material in poor condition should be dealt with first. Materials that are in better condition or have a low potential for disturbance or erosion have a lower priority.

### 10.1 Thermal System Insulation Such As Pipe and Boiler Insulation

Pipe and boiler insulation typically creates a more localized fiber release problem than surfacing material. The insulated pipes, boilers, ducts, and other equipment are frequently confined to equipment rooms or placed within walls or behind ceilings. Even accessible insulation is localized to the piece of insulated equipment. Thus, the potential for disturbance, damage, or erosion is lower than for surfacing materials; frequent inspection can spot any new disturbance and the damage can be repaired quickly. The condition of the ACM determines the need for further action.

Damaged insulation should be repaired or replaced as soon as possible. Major renovation, such as installation of a new boiler, is a good time to consider replacing pipe and boiler insulation with non-asbestos material.

Removal is appropriate where the insulation is extensively damaged or deteriorated. It involves cutting and stripping the insulation from pipes (or other equipment) and substituting non-asbestos material. Plaster around elbows, valves, and flanges should also be replaced with non-asbestos materials. Removal of pipe and boiler insulation requires many of the same precautions and worker protection measures for removal as surfacing materials.

Repair may be considered where the insulation has minor damage. Repair involves patching the damaged insulation or covering it with a new jacket.

## 10.2 Surfacing Materials Sprayed-on and Troweled-on Such as Fireproofing

Use the factors described above to determine the current condition of the ACM and the potential for future disturbance, damage or erosion. Surfacing material in good condition may need no further action if potential for future disturbance, damage, or erosion is low. The material must be inspected regularly to assure that it remains in good condition. Further action is needed if the material is damaged or in poor condition, or if there is high potential for future disturbance or erosion.

## 10.3 Miscellaneous Materials Such As Floor Coverings and Other Types of ACM

Other asbestos-containing materials include vinyl asbestos floor tiles, acoustic tile mastic, transite panels and vents, drywall systems and various textile products such as some wall coverings. Use the factors described above to determine the current condition of the ACM and the potential for future disturbance, damage or erosion. The material must be inspected regularly to assure that it remains in good condition. Further action is needed if the material is damaged or in poor condition, or if there is high potential for future disturbance or erosion.

# ***Section 11***

---

BLASLAND, BOUCK & LEE, INC.  
*engineers & scientists*

## 11.0 RECORD KEEPING

Documentation should be created (and retained) for the following:

- Bulk sampling and analysis of ACM (actual or presumed), and their locations;
- Semi-Annual building air sampling;
- All bulk and air sampling records should include the locations, dates, analytical methods used, number, duration, and results from the samples taken;
- Abatement job files, including location drawings for abated areas, asbestos notifications, the identity of the contractor(s) and consultants who were involved, close-out documentation and all other records relating to asbestos work at the 1000 S. Fremont commercial complex.
- Reports of all emergency incidents, including any serious employee exposures;
- Results of annual ACM re-inspections, and O&M Program audit;
- Medical Surveillance Records;
- Employee Training Certifications;
- Hazardous Waste Log and Shipment Records;
- Hazardous Waste Records/Waste Origin-Waste Disposal Forms/Landfill Receipts for disposal of asbestos-containing material;
- Employee Exposure Monitoring Results;
- All correspondence regarding ACM;
- All correspondence with any federal, state or local agencies regarding asbestos;
- Any tenant-related inquiries or correspondence relating to ACM;
- All other documents and records relating to asbestos.

## ***Section 12***

---

BLASLAND, BOUCK & LEE, INC.  
*engineers & scientists*

## 12.0 CONTROL MEASURES

### 12.1 CONTROL STRATEGY

The identification and evaluation of ACM provides the basis for the control strategy.

- Identified ACM found to be in poor condition is to be removed. Highest priority is to be given to those areas where employee exposure risk is the greatest.
- ACM in fair condition is to be either removed or repaired.
- ACM in good and/or repaired condition is to be periodically inspected as part of the facility's Asbestos Operations and Maintenance Program until removed.
- Asbestos removal operations outside the scope of this O&M should be planned for, designed and performed by Cal/OSHA Certified Asbestos Consultant and a Licensed Asbestos Abatement Contractor, in conjunction with the APM and FC.

In general, the Operations & Maintenance Control Measures have been designed to manage the ACM until all of the material can eventually be removed from the building. This is accomplished by utilizing the following safety guidelines:

- Signage - Two types of signage shall be utilized for notification of the presence of, or work affecting ACM:

Asbestos warning sign - to be posted in, or outside (as appropriate), routine maintenance areas, such as Telephone Closets, Mechanical Rooms, Electrical Closets, etc., where ACM could be contacted:

CAUTION  
ASBESTOS  
CANCER AND LUNG DISEASE HAZARD  
DO NOT DISTURB WITHOUT  
PROPER TRAINING AND EQUIPMENT

CONTACT THE ASBESTOS PROGRAM MANAGER IN \_\_\_\_\_  
BEFORE PERFORMING ANY WORK

Sign for restricted asbestos work areas - to be posted outside work areas where asbestos materials are being disturbed for maintenance, repair or removal activities.

DANGER  
ASBESTOS  
CANCER AND LUNG DISEASE HAZARD  
AUTHORIZED PERSONNEL ONLY  
KEEP OUT  
RESPIRATORS AND PROTECTIVE CLOTHING  
ARE REQUIRED IN THIS AREA

CONTACT THE ASBESTOS PROGRAM MANAGER IN \_\_\_\_\_  
IF ACCESS IS REQUIRED

- No tenant, contractor or visitor will enter areas other than offices, meeting rooms, corridors, stairways, parking areas, restrooms or retail spaces known or suspected to contain ACM, without first obtaining proper authorization from the APM. This includes, but is not limited to, storage areas, custodial areas, mechanical equipment rooms, piping chases, duct chases and areas above drop ceilings.
- No tenant, contractor or visitor will disturb ACM or PACM in any area without first obtaining authorization from the APM.
- Any work performed by an outside contractor where an asbestos fiber release is possible or expected will be monitored by independent industrial hygienists experienced in air monitoring and project management. The air monitoring will be of sufficient volume to accurately show concentrations are maintained equal to or below 0.01 f/cc for large scale abatement; and of sufficient number of samples to prove the integrity of the containment. The PCM air volume shall be a minimum of 2,400 liters/sample to allow transmission electron microscopy (TEM) evaluation (of samples >0.01 f/cc) to determine the exact airborne asbestos fiber count, if required.
- The Building Maintenance staff is trained to recognize ACM, ascertain its condition with relation to potential health risk, and provide limited emergency response actions to contain and abate a small accidental asbestos fiber release.

- All planned operations where ACM could or will be disturbed shall be performed as set forth in the ensuing work practices. (See Section 13.0)

## 12.2 WORK PERMIT SYSTEM

Forms are found in Appendix II. Prior to any maintenance work being performed in areas where ACM is present, or may be disturbed, a **Job Request Form** is to be completed and submitted to the APM. The APM will then:

Review written records, building plans and specifications to determine whether ACM is present in the proposed work area. If ACM is present, but it is not anticipated that the material will be contacted, the Asbestos Program Manager should note the presence of the ACM on the **Maintenance Work Authorization Form** and provide additional instruction on the importance of not disturbing the ACM.

If ACM is both present and may be contacted, the APM should visit the site and determine what work practices should be established to minimize the release of asbestos fibers during the work.

This determination should be recorded on the **Maintenance Work Authorization Form**, which is then sent to the Facilities Coordinator to authorize the work.

A copy of both the request and the authorization forms should be permanently filed.

The APM, working with the FC, should ensure appropriate work practices and protective equipment are utilized for the job. Any deviation from standard work practices should be reported to the FC and APM, and remedied immediately.

The **Evaluation of Work Form** should be filled out upon inspection of the job site and filed in the permanent file.

## 12.3 EMERGENCY PROCEDURES

In the event of accidental damage to ACM due to water leaks, improper maintenance, fire, etc., maintenance personnel for 1000 S. Fremont shall:

1. If feasible, stop the cause of the contamination (renovation work, coring, jack-hammering, water leak, etc.)
2. Simultaneously to Item 1, inform the APM and the Consultant, who will determine if the services of an outside contractor are needed to perform clean-up, repair or removal.

3. The APM shall select an appropriate Work Practice for clean up and provide appropriate worker protection (respirators; Tyvek coveralls, etc.) for site maintenance personnel.
4. Maintenance staff shall shut down the HVAC system (if applicable) and if possible, seal all vents.
5. The area shall be isolated from other areas in the building and only approved, properly protected staff and/or contractor abatement personnel should be allowed to enter the area. As required, airtight seals should be constructed around doors, windows and other penetrations to the isolated area.
6. The Consultant may conduct air monitoring inside and outside the contaminated area to evaluate the airborne fiber concentration. The air handling system in the affected area will remain off until airborne fiber concentrations are determined. Based on these results, a determination will be made by the APM, management, and Campus 1000 Fremont, LLC as to the procedure for emergency abatement and clean-up of the area. Until the contaminated area has been checked and air monitoring indicates that the airborne fiber concentration is at or below a level acceptable to the Building Owner, no employee or tenant will enter the area. Only properly trained and protected (respiratory protection, protective clothing, including head covering, etc.) personnel will be allowed to enter the area in the interim.
7. APM will notify management and Campus 1000 Fremont, LLC for further action.

## **APPENDIX IV**

### **SAMPLE NOTIFICATION LETTERS**

Following are several examples of letters which might be adapted for notification of tenants, contractors and employees of the commercial complex located at 1000 S. Fremont, Alhambra regarding the presence of asbestos and of the existence of and requirements related to the Asbestos O&M Program:

Date  
Tenant

Re: Asbestos Notification

Dear Tenant:

California law requires building owners to notify employees regarding the presence of materials containing asbestos in their building. This letter is to inform you about asbestos-containing materials (ACM) in the commercial complex located at 1000 S. Fremont, Alhambra, California.

Various surveys and inspections of the complex have been conducted by environmental consultants in order to determine the presence of ACM. Suspect materials were sampled and analyzed for asbestos content.

Several materials, including but not limited to flooring materials and associated mastics; roofing materials; drywall, joint compound and tape; ceiling tile mastics; thermal system insulation and fire doors tested positive for asbestos. As asbestos-containing materials, they should not be disturbed (damaged, i.e., such as scraped, removed, gouged, altered, cut, abraded, etc.) in order to prevent a release of asbestos fibers. Approval of the Asbestos Program Manager, (name), must be obtained prior to performing any work in the vicinity of these materials.

The company provides periodic air monitoring to determine the level of fibers, if any, in the air in the complex. The air monitoring results are available for your review, along with asbestos survey and bulk sampling data in the Property Manager's office during working hours.

The U.S. EPA has found that as long as asbestos-containing materials remain undisturbed and fibers are not released, exposure is unlikely and occupants should not be subject to asbestos-related health hazards. It is imperative that all necessary safety precautions be taken to ensure that the ACM in the complex are not disturbed. A formal Asbestos Operations and Management (O&M) Plan has been developed for this complex. It includes requirements for education and training for the maintenance staff, the establishment and enforcement of special cleaning and maintenance procedures to avoid any disturbance or damage to the ACM, routine inspection and monitoring of the ACM, and periodic air monitoring to ensure that fiber levels are below state and federal health action standards.

Your assistance in avoiding any disturbance of ACM in the complex is requested. The Property Manager must authorize any repair or renovation work done in the complex in order to ensure that ACM will not be disturbed. If ACM will be disturbed, the Property Manager will ensure that all measures necessary to protect health and safety and to comply with the law are taken. During any period when work is being done in areas containing ACM, the areas will be closed to all but those workers involved in the project. Please observe posted signs and comply with all instructions regarding access to the area.

Please contact the undersigned if you have any questions regarding this letter.

Sincerely,

**ACKNOWLEDGMENT OF RECEIPT**

I ACKNOWLEDGE THAT I HAVE RECEIVED AND READ THE ABOVE INFORMATION AND WILL INFORM MY EMPLOYEES OF SAME.

SIGNED: \_\_\_\_\_ DATE: \_\_\_\_\_

TITLE: \_\_\_\_\_

## EXAMPLE

MEMO TO: All Personnel

FROM: Property Management

RE: Notification of Asbestos Report

DATE: \_\_\_\_\_

All employees working in the commercial complex located at 1000 S. Fremont, Alhambra, California, are advised that Asbestos-Containing Materials (ACM) are present in the complex. It is important for employees to follow proper work practices to minimize the potential for disturbing ACM. Avoid touching asbestos materials. Do not drill holes, or otherwise disturb ACM. If you find ACM that has been damaged, report it to your supervisor. Do not disturb damaged asbestos material or asbestos debris. Only persons authorized and properly trained should perform any work which may disturb asbestos materials. Asbestos-containing materials pose no threat to your health unless asbestos fibers become airborne due to material aging, deterioration, or as the result of some damage. Asbestos conditions may vary, and the ACM identified in the subject property were generally in good condition, enclosed, encapsulated or of a type not likely to release fibers unless disturbed. Specific locations in the complex where ACM have been found are noted in documentation in the Property Manager's office. These materials are not to be disturbed.

Additional information is available in the Operations & Maintenance Program, located in the Property Manager's office. Become familiar with ACM locations in your area. Any employee may review the asbestos survey report or results of bulk sampling or air monitoring conducted in this complex. All asbestos-related data will be available during normal business hours at the Property Manager's office.

If you have any questions, contact the Property Manager for additional information.

**EXAMPLE**

To: Contractors

From:

Date: \_\_\_\_\_

All contractors whose personnel may engage in construction, demolition, renovation, installation, repair or related work in this complex are hereby notified that construction materials containing the hazardous, cancer-causing material known as asbestos were used in the construction of this complex and may be encountered on the job.

Specific types of material containing asbestos in the complex include, but are not limited to flooring materials and associated mastics; roofing materials; drywall, joint compound and tape; ceiling tile mastics; thermal system insulation and firedoors. Disturbance of these materials may cause a release of asbestos fibers. Approval of the Asbestos Program Manager must be obtained prior to performing any work in the vicinity of these materials.

You are hereby warned of the existence of this potential hazard, and are advised to take all necessary measures and precautions to prevent harmful exposure to your personnel as well as to Ratkovich personnel, the building maintenance staff, tenants, and the public and also to comply with all government regulations applicable to such potential exposure.

I HAVE READ AND HEREBY CERTIFY THAT I HAVE INFORMED ALL PERSONNEL WORKING ON THIS PROJECT OF THE ABOVE.

By: \_\_\_\_\_ For: \_\_\_\_\_  
Name Company

\_\_\_\_\_  
Signature

\_\_\_\_\_  
Date

## EXAMPLE

Date:

Dear:

As part of the asbestos management plan for the commercial complex located at 1000 S. Fremont, Alhambra, California, the ongoing Operations & Maintenance Program delineates methods used to ensure the safety of asbestos-related work performed in the complex.

One aspect of the plan calls for air monitoring to be performed in and around asbestos-related work areas. Identified asbestos-containing materials have been include flooring materials and associated mastics; roofing materials; drywall, joint compound and tape; ceiling tile mastics; thermal system insulation and firedoors found throughout the complex. Current law (Division 20 of the California Health and Safety Code, Chapter 10.4, Section 25915-24) requires us to notify you as to the availability of these air monitoring results. The air monitoring readings, as well as other information regarding asbestos (of which you have been previously notified), are available in the Property Manager's office during normal business hours.

For your information, all air monitoring results to date have been well within federal, state and local health standards. Please note, approval of the Asbestos Program Manager must be obtained prior to performing work in the vicinity of asbestos-containing materials.

Sincerely,

## EXAMPLE

To: All Tenants

From:

Date \_\_\_\_\_

In November 1986, the voters of California passed Proposition 65, a bill concerning exposure to certain chemicals which requires building owners to notify tenants of the presence of such chemicals.

In compliance with the requirements of Proposition 65, you are hereby advised that materials containing asbestos were used in the construction of this complex. Specifically, flooring materials and associated mastics; roofing materials; drywall, joint compound and tape; ceiling tile mastics; thermal system insulation and firedoors throughout the complex proved to contain asbestos. Disturbance of these materials may cause a release of asbestos fibers. Approval of the Asbestos Program Manager must be obtained prior to performing any work in the vicinity of these materials. Asbestos is a carcinogenic substance; exposure to asbestos fibers may be hazardous.

Notwithstanding the existence of such materials in the complex, air quality studies show that the level of airborne asbestos fibers in the complex is well below the permissible exposure levels in applicable federal guidelines.

We will continue to monitor the air in the complex (as we have done in the past) to keep abreast of any changes in air quality within the complex.

Please contact the Property Manager should you desire more information regarding this letter.

**APPENDIX V**

**LIST OF RECOMMENDED  
EQUIPMENT/VENDORS**

## **Operations And Maintenance Equipment, Tools And Materials List**

The following lists include the abatement equipment, tools and materials required for maintenance personnel to perform the O&M activities. This type of work must only be done by trained, competent personnel. It may be helpful to maintain an "O&M cart", containing the most commonly use equipment and supplies.

### Equipment & Tools List

- Wet/dry HEPA vacuum cleaners with attachments, including hose, floor sweep, and squeegee.
- Approved ladders, labeled for "Asbestos Use Only", easily cleaned of debris (Any good quality fiberglass or wooden carpenter's ladder).
- Approved rolling scaffolds.
- Asbestos mini-enclosures, such as a "Kontrol Kube".
- Mops and buckets for wet mopping of ACM debris.
- Hand pump garden sprayers - 1 1/2 - 2 1/2 gallon (Hudson or equivalent).
- Personal air monitoring pumps (low volume), cassettes and calibration equipment.
- Waterproof flashlights
- Razor Knives (retractable blade)
- Scrapers (large and small)
- Nylon bristle brushes
- Screw drivers
- Hand-powered drill
- Wire cutters/tin snips
- Pliers
- Utility knives
- Extension cords and adapters
- Temporary work lights
- Bone Saws

### Safety equipment

- Eye protection/Safety Glasses
- Hard hats
- Lockout tags
- Ground fault circuit interrupters (GFCIs)\*
- Half-face negative pressure respirators (such as North #7700 or 3M #7300).
- Rubber boots and gloves.
- Disposable suits with hood and boots (Dupont Tyvek)

## Abatement Materials List

- Spare HEPA filter and pre-filter cartridges for HEPA-vacuum cleaners.
- Spare respirator cartridges.
- Clean-and-wipe towelettes.
- Polyethylene clear plastic film, 4.0 mil or 6.0 mil, 20 x 100 foot (Visqueen, ACTI-POLY or equivalent).
- Polyethylene black plastic film, 6.0 mil, 20 x 100 foot (Visqueen, ACTI-POLY).
- Asbestos disposal bags with proper asbestos warning labels, per Cal/OSHA regulations.
- Barrier tape.
- Tape (2" poly and 3" duct).
- Spare mop heads.
- Spray glue (3M #77, or Act-Tak, or equivalent).
- Clean rags and sponges.
- Shaving cream
- Encapsulant, penetrating (Better Work Encapsulant 7500) or equivalent.
- Encapsulant, bridging (Better Work Encapsulant 5000) or equivalent.
- Wetting agent for asbestos (Asbestos Wet Surfactant Concentrate) or equivalent.
- Floor mastic remover.
- Non-ACM replacement insulation.(Pipe/Boiler)
- Non-ACM replacement flooring(VST/VFT).
- Non-ACM surfacing patching material.

\*GFCIs should be used on any electrical equipment or tools used in O&M work where water might be in use or present in the work area.

When not in use, this equipment shall be thoroughly decontaminated and stored in a locked, secure area with access limited to personnel trained in the proper use of the above equipment.

## **VENDOR LIST**

**APPENDIX VI**

**RESPIRATORY PROTECTION PROGRAM**

# **RESPIRATORY PROTECTION PROGRAM**

## **1.0 POLICY STATEMENT AND INTRODUCTION**

Campus 1000 Fremont LLC may determine that while performing regular duties (e.g. routine repairs or remodeling work) some of their employees could encounter workplace conditions where airborne concentrations of contaminants may well exceed healthful levels. Campus 1000 Fremont LLC would then be required to implement a respiratory protection program to provide for the health and safety of its employees. This document would constitute Campus 1000 Fremont LLC's written respiratory protection program pursuant to 8 CCR 1531 and 5144 which mandates that the employer shall institute a respiratory program in accordance with 8 CCR 5144(f)(1).

### **1.1 Purpose**

This policy establishes standardized operating procedures required for an effective respiratory protection program which adequately protects employees exposed to breathing hazards that may exceed permissible exposure limits, short-term exposure limits, ceiling limits, and excursion limits. Respiratory protection equipment is not a permanent solution to the problem, but rather serves as a readily available interim measure while more permanent solutions by engineering controls can be utilized.

### **1.2 Scope**

In order to assure adequate protection for employees and to meet the requirements of 8 CCR 1531 and 5144(f)(1), Written Respiratory Protection Program, both the company and the employee must comply with this program. In addition to establishing standard operating procedures for proper selection, use and maintenance of respirators, this policy also establishes and sets forth responsibilities for supervisory and senior industrial hygiene personnel for administration of the program as well as important employee and consulting physician responsibilities.

The use of respirators may not always be required. In some situations respirators may be in use where employee exposures do not represent a health hazard. Whether by employee choice or management suggestion, an employee may wear a respirator to make a nuisance condition more comfortable. In such situations, where a health hazard has not been established, the use of respirators is not mandatory and need not be enforced. In other situations, however, the use of respirators will be required and then the use of respirators will be effectively enforced.

In any case, if respirators are used regardless of whether it is voluntary or mandatory, the same requirements for proper training, use, maintenance and storage as established in this program shall be followed.

## 2.0 GENERAL PROGRAM ADMINISTRATION

### 2.1 Responsibilities where respirators are used.

#### 2.1.1 Supervision

- A. The supervisor has first line responsibility to adopt, initiate, maintain, and enforce the requirements of this program.
- B. To be knowledgeable of the potential health hazards associated with the known air contaminants present in their projects.
- C. Be familiar with methods of engineering, administrative, and work practice controls currently used elsewhere in industry to deal with similar problem situations.
- D. Make the appropriate arrangements with the Administrative Coordinator to ensure that the employees are sent to the consulting physician to determine if they are medically fit to wear respiratory protection.
- E. Must assure that respirator wearers receive instruction (training) from the Senior Industrial Hygienist on the proper use, maintenance, care, and selection regarding those particular devices to be used.
- F. Establish a procedure to assure that respiratory protection devices are thoroughly cleaned, disinfected, inspected for serviceability and that any necessary repair work is accomplished.

#### 2.1.2 Senior Industrial Hygienist responsibilities

- A. Provide necessary program coordination and guidance for the company and provide supervisor(s) with advice and technical assistance needed for effective program implementation and operation.
- B. Make studies of operating conditions where it is suspected that employees are exposed to possible breathing hazards and/or determine if breathing hazards exist and make appropriate recommendations for respirator selection and use, and additionally make further recommendations for engineering controls, work practice controls, or administrative controls as needed.

- C. Make such inspections and observations as necessary to assess program effectiveness.
- D. Give initial instructions to respirator wearers on the proper use, maintenance, care and selection of the respirator.

#### 2.1.3. Consulting Physician responsibilities

Upon hire and annually thereafter, each employee will be evaluated by a licensed physician, knowledgeable in performing spirometry, to determine if the employee is physically able to perform the assigned work when using respiratory protection equipment.

#### 2.1.4. Employee Responsibility

- A. Use the respirator when required and do so in accordance with the instructions and training received.
- B. Report any malfunction of the respirator to the supervisor. If a malfunction is detected in an area immediately hazardous to life and health (IDLH), it is imperative the employee immediately vacate that area.
- C. Inspect respirators prior to and after each use for defects or malfunctions. Also, employees shall clean and properly store or return the respirator in accordance with the instructions received.
- D. Guard against loss or damage to company provided respiratory protection devices. Loss or damage to employee-owned devices are the responsibility of the employee.
- E. Check for proper facepiece fit and pressure test the respirator before wearing.
- F. Use only properly approved respirators.
- G. Be aware of the limitations and/or special work precautions associated with the specific respirator.
- H. Understand that excessive facial hair, which interferes with respirator facepiece seal, causes leakage and will not be permitted where respirators are required.

## 2.2 Program Enforcement

It must be understood that the best and most acceptable enforcement of this program would be to achieve total employee acceptance without the necessity of disciplinary action. Realistically, however, this may not always be possible. It is important, therefore, that a procedure be developed to handle anticipated problems with employee acceptance of his/her responsibilities as listed in Section 2.1.4 of this policy.

The enforcement procedure shall take the form of the established progressive disciplinary practice as described in the g/ja Injury and Illness Prevention Program (I2P2). Actions taken shall be recorded and maintained with the supervisor and a copy forwarded to "Responsible Person".

## 2.3 Program Interpretation

Any questions regarding interpretation, or meaning of any portion of this program shall be forwarded or communicated to the Senior Industrial Hygienist. A written record of any conclusions shall be added to this manual as supplementary information of changes.

## 2.4 Program Evaluation, Review and Revision

A procedure shall be established to incorporate recurring evaluation, review, and revision of this program to assure the provisions remain current and accurately reflect the program in actual practice.

## 3.0 STANDARD OPERATING PROCEDURES

### 3.1 Determination of Breathing Hazards and the Necessity for use of Respiratory Protection Devices.

3.1.1 Routine Operations: An industrial hygiene survey and evaluation shall be the method used for determining the necessity for required respirator use by exposed employees.

3.1.2 Non-Routine Operations: Where industrial hygiene data is not available, apply the two (2) elements described below to a given situation.

A. Has any previous injury or illness occurred to employees under similar circumstances? If so, provision of appropriate standby respiratory protection devices may be established.

- B. Consider chemical and physical characteristics of raw materials, intermediate products, and by-products of the given operation and applying agents the provision of standby respiratory protective devices may be established. Designated use may be prescribed for certain jobs such as emergency work or for rescue activity or both. Appropriate hazard data can be obtained by screening completed Material Safety Data Sheets.

Personnel authorized to establish the availability, prescribed uses and locations for standby respiratory protection devices shall include MOFO, the Senior Industrial Hygienist, and the Principals.

### 3.2 Selection of Respirators

- 3.2.1 Only respiratory protection equipment approved by the National Institute for Occupational Safety and Health (NIOSH) and the Mine Safety and Health administration (MSHA) shall be used. Selection shall be made according to the guidance of American National Standard Practices for Respiratory Protection: Z88.2-1969 and Z88.2-1980. The correct respirator shall be specified for each job.
- 3.2.2 Actual determination of specific respiratory protection equipment for specific jobs or areas will be made by the Senior Industrial Hygienist. Some factors to be considered are:
  - A. Industrial hygiene survey data.
  - B. The nature of the hazardous operation or process.
  - C. The type of air contaminant, including its physical properties, chemical properties, physiological effects on the body, and its concentration.
  - D. The period of time for which respiratory protection must be provided.
  - E. The location of the hazard area with respect to a source of uncontaminated respirable air.
  - F. The state of health of the personnel involved.
  - G. The functional and physical characteristics of respiratory protection equipment.

3.2.3 When specific respirator approval is made, appropriate limitations and work activity precaution information shall be related to supervisors where they shall in turn advise respirator wearers accordingly and make appropriate work procedure adjustments if necessary.

### 3.3 Issuance of Respirators

3.3.1 Management reserves the right to determine if a respirator is needed.

3.3.2 Air sampling data will be taken and shall be the determining factor in the case of a disagreement between the company and the employee on whether a respirator is needed.

3.3.3 Employees will be required to wear breathing zone sampling apparatus for periods of time when air sampling studies are being carried out. These studies will be done from time to time to ascertain whether a respirator is or is not necessary.

### 3.4 Training

Required prior to issuance of respiratory protection equipment.

3.4.1 In the selection, use, care, limitations, and cleaning and sanitation.

3.4.2 Employee training shall be conducted by the Senior Industrial Hygienist or a person who is knowledgeable of the applications and uses of respirators and the hazards associated with various air contaminants and oxygen deficiency.

The subject material, teaching methods, and types of respirators emphasized shall be oriented to the needs of the group taking the training.

3.4.3 In all cases the minimum information to be covered in training sessions for employees using respirators shall be as follows:

- A. An explanation of the need for a respirator including a discussion of the airborne contaminants for which respirator is to be utilized.
- B. The operating principle of the respirator including its basic construction, the limitations of the respirator, and why it was chosen for a particular application.

It should be especially noted that particulate filter respirators are of no value as protection against organic vapors, injurious gases, or lack of oxygen. Chemical cartridge respirators shall not be used where gas mask respirators shall not be used where gas masks are required or where atmosphere supporting or self-contained breathing units are necessary.

- C. The reasons for using the respirator shall include a discussion of the status of engineering control efforts at present and any plan for the future which might alleviate the need for the required use of respiratory protection. This discussion will include information of the problems faced in developing and/or introducing engineering controls if that is the case.
- D. The proper use and maintenance of the respirator including the application of various cartridges for air-purifying respirators will be reviewed if applicable to the needs of the group.
- E. As a part of the users maintenance responsibilities for simple air-purifying respirators, the employee will be taught how to check the respirator in the following fashion:
  - 1. Check inhalation and exhalation valves to see that they seat properly and are not out of shape.
  - 2. The body of the facepiece shall be inspected to see that it is in proper shape and has not been hardened by various air contaminants and that its inner surface is clean. Methods available to the user shall be demonstrated.
  - 3. If the respirator contains gaskets these must be shown to the user and shall be notified where replacement parts can be obtained.
  - 4. The specific filter or cartridge intended for use shall be shown to the employee, explained in detail, and shown how it can be assembled with the respirator.
- F. Since facial sizes vary within the work population, it may be impossible to fit all persons with a single style facepiece. It is necessary, therefore, to individually fit each person with several face-pieces to obtain the best fitting device. Two or three different respirator models should be available which can be tried out and the wearer must be aware of which respirator style provided the proper fit.

- G. Facepiece Fitting – Each wearer shall be tested to insure that he/she can obtain a good fit with the respirator he/she is issued. In some cases a number of respirator model(s) must be tried before an acceptable fit is obtained.

For all cartridges, filters, and/or combination cartridge/filter assemblies the simple fitting test described below are adequate (for contaminants not significantly more toxic than lead or for asbestos exposures).

1. Negative Pressure Test

The inlet opening of the air-purifying element is covered with the hand(s) and the user gently inhales so that the face-piece collapses slightly. The breath is held for ten (10) seconds and if the facepiece remains in its slightly collapsed condition the tightness of the respirator is satisfactory.

2. Positive Pressure Test

The exhalation valve is blocked off and the user exhales gently so that a slight positive pressure is built up in the facepiece. Again, if no outward leakage of air is noted at the facial area, the facepiece is satisfactory. (In some cases it is extremely difficult to use this test since the exhalation valve cover must be removed.)

3. A more critical fitting test will be used for respirators. The facepiece is equipped with a HEPA filter. In this procedure the wearer is exposed to an irritating aerosol generated by a smoke tube. The testes bathes the seal area in the smoke. If leakage does occur it is easily recognized by the wearer. This procedure can be used for all particulate type hazards as well as fit testing for supplied-air respirator and self-contained breathing apparatus. **(See Appendix A – Fit Testing Protocols)**
4. An isoamyl acetate test (banana oil) is used exclusively for chemical cartridge respirators equipped with an organic vapor cartridge. The face fit is checked by pouring a few drops of isoamyl acetate on a piece of cotton and passing it over the periphery of the facepiece. If facial seal leakage is noted, the wearer will become aware of the sweet odor of the isoamyl acetate. **(See Appendix B – Fit Testing Protocols)**

5. Quantitative fit testing shall be performed if exposure levels exceed ten (10) times the PEL and/or the Excursion Limit for Asbestos. An outside vendor shall be used for this level of testing.
- H. Training records shall be kept with the Senior Industrial Hygienist and Senior Project Manager. Original copies of these records shall be forwarded to the Administrative Coordinator.
- I. When new types of respirators are to be introduced complete training including fitting, pressure testing and qualitative fit testing are to be repeated. This shall be performed by the Senior Industrial Hygienist.
- J. Training sessions shall include explanatory information, demonstration, and employee participation exercises on proper cleaning and sanitation, inspection and maintenance.
- K. Any emergency or special instructions.

### 3.5 Respirator Maintenance

3.5.1 Particulate and chemical cartridge respirators (General Procedures). Conventional air purifying respirators in daily use shall be individually assigned to employees solely for their own use. Respirators issued to employees shall be labeled with an identification marking unique to the assignee.

#### A. Daily use

Employees routinely using respirators shall:

1. Perform a pre-operation inspection including a facepiece seal test before entering the area where the respirator is to be worn. The inspection shall include:
  - a. Check for tightness of connections and the condition of the facepiece.
  - b. Check of the headbands.
  - c. Check of the valves.
  - d. Check of the connecting tubes and canisters (if applicable).
  - e. Rubber or elastomer parts shall be checked for pliability and deterioration.

2. Before the end of the shift (after use) a post operation inspection is to be performed to verify the respirator is still functioning properly. Prior to leaving the work area the employee must clean the respirator, replace new cartridges (if necessary) and place the respirator in a clean container (such as a large plastic bag). This storage area must be protected against dust, sunlight, heat extreme cold, excessive moisture or damaging chemicals.

## B. Monthly Respirator Cleaning and Inspection

Monthly cleaning of the respirator shall be performed by each employee assigned a respirator. The cleaning shall be accomplished by using a bactericidal agent, following rinsing in clean, warm water, and air drying. The use of prepackaged cleaning wipes is not to be used for this purpose, they are to be used as the daily sanitation method only. As part of the monthly cleaning, the respirator shall be checked for torn or misplaced parts, proper form of the facepiece, serviceability of headbands and valve seating.

Rubber or elastomer parts shall be inspected for pliability and signs of deterioration. Any questions related to the adequacy of the respirator shall be directed to the Senior Industrial Hygienist. The procedure to be followed can be found in Appendix F. This procedure shall be periodically checked by the Senior Project Manager and/or the Senior Industrial Hygienist for compliance.

Respirators kept for emergency use shall be inspected before and after each use, at least monthly to assure that they are in satisfactory working condition.

A record shall be kept of inspection dates and findings for respirators maintained for emergency use.

An adequate monthly cleaning and inspection procedure shall include:

1. Remove filters, cartridges, canisters, headbands, and disassemble the major respirator parts.
2. Wash all respirator parts (except cartridges, filters, canisters, and elastic headbands) in cleaner-disinfectant solution at about 120 degrees F. Use a hand brush to facilitate removal of dirt.
3. Completely rinse in clean, warm water.

4. Dry respirator (prefer air drying) in a clean area.
5. Inspect all respirator valves, headstraps and other parts and replace with new parts if defective.
6. Reassemble the respirator and insert new filters, cartridges, or canisters and check for tightness.
7. Disinfect all facial contact areas by spraying the respirator with an approved type disinfectant.
8. Place the respirator in a new plastic bag and seal it for storage.

#### C. Repair of Respirators

1. Repair and replacement of respirator parts shall be done only by experienced persons with parts designed for the respirators.
2. No attempt shall be made to replace components or to make adjustments or repair beyond the manufacturer's recommendations.
3. Reducing or admission valves or regulators shall be returned to the manufacturer or a trained technician for adjustment or repair (Applies to supplied-air and self-contained breathing apparatus respirators)

#### 3.5.2 Gas Masks, Supplied-Air Respirators, and Self-Contained Breathing Apparatus

Devices of this type, if needed, will be located at strategic locations. Their issue will be generally based on advanced determination of potential breathing hazard and will be generally designated by the Senior Industrial Hygienist. At present, only the Senior Industrial Hygienist is adequately trained and knowledgeable in the use of these type of devices.

Where use is not routine, this equipment will be cleaned and inspected after each use. This shall be performed by the Senior Industrial Hygienist or his/her designee (if suitably qualified) and documented.

Emergency Standby equipment (if utilized) such as supplied-air respirators and self-contained breathing apparatus generally for use in non-routine situations will be inspected monthly. This inspection (if the equipment is utilized) shall be performed by the Senior Industrial Hygienist.

### 3.5.3 Respirator Storage

Respirators shall be stored in a clean dry area under conditions of continuous moderate temperature. Exposure in storage to heat, sunlight, extreme cold, excessive moisture (as in not being properly dried after cleaning) or damaging chemicals shall not be permitted. Respirators shall be packed or stored so that the facepiece and exhalation valve will not be impaired by the elastomer setting in an abnormal position. They shall not be placed or stored in such places as lockers or tool boxes unless they are in carrying cartons.

Respirators placed at stations and work areas for emergency use (if utilized) shall be stored in compartments built for that purpose, be quickly accessible at all times, and be clearly marked.

### 3.5.4 Inventory

- A. An inventory procedure will be established to assure that adequate stock levels are maintained for respirators and replacement parts.
- B. All components of air purifying devices such as filters, cartridges, and canisters are to be inspected for damage or defect prior to initial issue to employees.
- C. To be eligible to receive a replacement respirator that is employer provided, the employee must turn in previously issued respirator(s).

### 3.5.5 Toxic Atmospheres

- A. During normal operations (except asbestos and lead abatement) toxic atmospheres may not be present as long as established engineering controls and work practice procedures are being followed.
- B. In emergency situations where an atmosphere exists in which the wearer of the respirator could be overcome by a toxic or oxygen-deficient atmosphere, the following procedure shall be followed:
  - 1. Contact the Senior Industrial Hygienist immediately. The potential situation may present a Confined Space Hazard!
  - 2. Never enter a dangerous or unknown atmosphere without first obtaining the proper protective equipment and permission to enter from the Senior Industrial Hygienist.

3. Never enter a dangerous or unknown atmosphere without at least one additional person present. This person must remain in the safe atmosphere.
4. Communications (voice, visual, or signal line) must be maintained between both individuals or all present.
5. The persons remaining in the safe atmosphere must have the proper rescue equipment to enable them to aid the person(s) in the dangerous or unknown atmosphere if problems are encountered.

### 3.6 Surveillance

In order to maintain an effective respiratory protection program, control and feedback on how the program is functioning is necessary. In this manner, improvements can be made and deficiencies eliminated.

#### 3.6.1 Medical Surveillance

- A. Prior to an employee being issued a respirator for required use, that employee shall be examined by the consulting physician (especially for substance specific regulated health standards) to ensure that he/she is physically capable of wearing the respirator under working conditions to which he/she is to be assigned.
- B. A licensed physician shall determine what health and physical conditions are pertinent.
- C. In situations where an employee routinely uses a respirator for protection against a toxic contaminant, that employee's medical status shall be reviewed annually (especially for substance specific regulated health standards) to insure that he/she can continue to use the respirator effectively and to biologically assess if the employee's health has been impaired due to exposure to toxic contaminants.

#### 3.6.2 Respirator Practice at the Workplace

The Senior Industrial Hygienist and/or the Senior Project Manager shall hold monthly inspections where respirators are in use. A written report shall be made noting employees failing to use the devices correctly. This report shall be given to MOFO for potential disciplinary action. This report will be included in the evaluation of the program effectiveness.

### 3.6.3 Industrial Hygiene Surveillance

Industrial hygiene surveys of air contaminants shall be made in areas where respirator use is required. Survey data and related employee exposure information will permit evaluations determining whether or not breathing hazards or nuisance conditions are present. Surveys also will be made where practicable to evaluate effectiveness of engineering controls, work practice controls, and administrative controls.

### 3.6.4 Wearer Acceptance

1. Comfort.
2. Ability to breathe without objectionable effort.
3. Adequate visibility under all conditions.
4. Provisions for wearer prescription glasses.
5. Ability to perform all tasks without undue interference.
6. Confidence in the facepiece fit.

## 4.0 MANAGEMENT APPROVAL

\_\_\_\_\_  
Manager of Field Operations

\_\_\_\_\_  
Corporate Vice President

\_\_\_\_\_  
President

## **APPENDIX A**

# **QUALITATIVE FIT TEST PROTOCOL**

### III. Irritant Fume Protocol

#### A. Respirator selection.

Respirators shall be selected as described in section 1B above, except that each respirator shall be equipped with a high-efficiency cartridge.

#### B. Fit test.

1. The test subject shall be allowed to smell a weak concentration of the irritant smoke to familiarize the subject with the characteristic odor.
2. The test subject shall properly don the respirator selected as above, and wear it for at least 10 minutes before starting the fit test.
3. The test conductor shall review this protocol with the test subject before testing.
4. The test subject shall perform the conventional positive pressure and negative pressure fit checks (see ANSI A88.2 1980). Failure of either check shall be cause to select an alternate respirator.
5. Break both ends of a ventilation smoke tube containing stannic oxychloride, such as the MSA part #5645, or equivalent. Attach a short length of tubing to one end of the smoke tube. Attach the other end of the smoke tube to a low pressure air pump set to deliver 200 milliliters per minute.
6. Advise the test subject that the smoke can be irritating to the eyes and instruct the subject to keep the eyes closed while the test is performed.
7. The test conductor shall direct the stream of irritant smoke from the tube towards the faceal area of the test subject. The person conducting the test shall begin with the tube at least 12 inches from the facepiece and gradually move to within one inch, moving around the whole perimeter of the mask.
8. The test subject shall be instructed to do the following exercises while the respirator is being challenged by the smoke. Each exercise shall be performed for one minute.
  - i. Breathe normally.
  - ii. Breathe deeply. Be certain breaths are *deep and regular*.

- iii. Turn head all the way from one side to the other. Be certain movement is complete. Inhale on each side. Do not bump the respirator against the shoulders.
- iv. Nod head up-and-down. Be certain motions are complete and made every second. Inhale when head is in the full up position (looking toward the ceiling). Do not bump the respirator against the chest.
- v. Talking. Talk aloud and slowly for several minutes. The following paragraph is called the Rainbow Passage. Repeating it after the test conductor (keeping eyes closed) will result in a wide range of facial movements, and thus be useful to satisfy this requirement. Alternative passages which serve the same purpose may also be used.

#### Rainbow Passage

When the sunlight strikes raindrops in the air, they act like a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch, with its path high above, and its two ends apparently beyond the horizon. There is, according to legend, a boiling pot of gold at one end. People look, but no one ever finds it. When a man looks for something beyond his reach, his friends say he is looking for the pot of gold at the end of the rainbow.

- vi. Jogging in Place.
  - vii. Breathe normally.
9. The test subject shall indicate to the test conductor if the irritant smoke is detected. If smoke is detected, the test conductor shall stop the test. In this case, the tested respirator is rejected and another respirator shall be selected.
  10. Each test subject passing the smoke test (i.e., without detecting the smoke) shall be given a sensitivity check of smoke from the same tube to determine if the test subject reacts to the smoke. Failure to evoke a response shall void the fit test.
  11. Steps B4, B9, B10 of this fit test protocol shall be performed in a location with exhaust ventilation sufficient to prevent general contamination of the testing area by the test agents.
  12. At least two facepieces shall be selected by the irritant fume test protocol. The test subject shall be given the opportunity to wear them for one week to choose the one which is more comfortable to wear.

13. Respirators successfully tested by the protocol may be used in contaminated atmospheres up to ten times the PEL of asbestos.
14. The test shall not be conducted if there is any hair growth between the skin and the facepiece sealing surface.
15. If hair growth or apparel interfere with a satisfactory fit, then they shall be altered or removed so as to eliminate interference and allow a satisfactory fit. If a satisfactory fit is still not attained, the test subject must use a positive pressure respirator such as powered air-purifying respirators, supplied-air respirator, or self-contained breathing apparatus.
16. If a test subject exhibits difficulty in breathing during the tests, she or he shall be referred to a physician trained in respirator diseases or pulmonary medicine to determine whether the test subject can wear a respirator while performing her or his duties.
17. Qualitative fit testing shall be repeated at least every six months.
18. In addition, because the sealing of the respirator may be affected, qualitative fit testing shall be repeated immediately when the test subject has a:
  - (1) Weight change of 20 pounds or more.
  - (2) Significant facial scarring in the area of the facepiece seal.
  - (3) Significant dental changes: i.e., multiple extractions without prosthesis, or acquiring dentures.
  - (4) Reconstructive or cosmetic surgery, or
  - (5) Any other condition that may interfere with facepiece sealing.

C. Recordkeeping.

A summary of all test results shall be maintained in each office for 3 years. The summary shall include:

- (1) Name of test subject.
- (2) Date of testing.
- (3) Name of test conductor.
- (4) Respirators selected (indicate manufacturer, model, size and approval number).
- (5) Testing agent

**APPENDIX B**

**QUANTITATIVE FIT TEST PROTOCOL**

## QUANTITATIVE FIT TEST PROCEDURES

### 1. General

- a. The method applies to the negative-pressure non-powered air purifying respirators only.
- b. The employer shall assign one individual who shall assume the full responsibility for implementing the respirator quantitative fit test program.

### 2. Definition

- a. "Quantitative Fit Test" means the measurement of the effectiveness of a respirator seal in excluding the ambient atmosphere. The test is performed by dividing the measured concentration of the challenge agent in a test chamber by the measured concentration of the challenge agent inside the respirator facepiece when the normal air purifying element has been replaced by a n essentially perfect purifying element.
- b. "Challenge Agent" means the air contaminant introduced into a test chamber so that its concentration inside and outside the respirator may be compared.
- c. "Test Subject" means the person wearing the respirator for quantitative fit testing.
- d. "Normal Standing Position" means standing erect and straight with arms down along the sides and looking straight ahead.
- e. "Fit Factor" means the ratio of challenge agent concentration outside with respect to the inside of a respirator inlet covering (facepiece or enclosure)

### 3. Apparatus

- a. Instrumentation. Corn oil, sodium chloride or other appropriate aerosol generation, dilution and measurement systems shall be used for quantitative fit test.
- b. Test chamber. The test chamber shall be large enough to permit all test subjects to freely perform all required exercises without distributing the challenge agent concentration or the measurement apparatus. The test chamber shall be equipped and constructed so that the challenge agent is effectively isolated from the ambient air, yet uniform in concentration throughout the chamber.

- c. When testing air-purifying respirators, the normal filter or cartridge element shall be replaced with a high-efficiency particulate filter supplied by the same manufacturer.
- d. The sampling instrument shall be selected so that a strip chart record may be made of the test showing the rise and fall of challenge agent concentration with each inspiration and expiration at fit factors of at least 2,000.
- e. The combination of substitute air-purifying elements (if any), challenge agent, and challenge agent concentration in the test chamber shall be such that the test subject is not exposed in excess of PEL to the challenge agent at any time during the testing process.
- f. The sampling port on the test specimen respirator shall be placed and constructed so that there is no detectable leak around the port, a free air flow is allowed into the sampling line at all times and so there is no interference with the fit or performance of the respirator.
- g. The test chamber and test set-up shall permit the person administering the test to observe one test subject inside the chamber during the test.
- h. The equipment generating the challenge atmosphere shall maintain the concentration of challenge agent constant within a 10 percent variation for the duration of the test.
- i. The time lag (interval between an event and its being recorded on the strip chart) of the instrumentation may not exceed 2 seconds.
- j. The tubing for the test chamber atmosphere and for the respirator sampling port shall be the same diameter, length and material. It shall be kept as short as possible. The smallest diameter tubing recommended by the manufacturer shall be used.
- k. The exhaust flow from the test chamber shall pass through a high-efficiency filter before release to the room.
- l. When sodium chloride aerosol is used, the relative humidity inside the test chamber shall not exceed 50 percent.

4. Procedural requirements.

- a. The fitting of half-mask respirators should be started with those having multiple sizes and a variety of interchangeable cartridges and canisters such as the MSA Comfo 11M, North M, Survivair M, A-O M or Scott-M. Use either of the tests outlined below to assure that the face piece is properly adjusted.
  - (1) Positive pressure test. With the exhaust port(s) blocked, the negative pressure of slight inhalation should remain constant for several seconds.
  - (2) Negative pressure test. With the intake port(s) blocked, the negative pressure of slight inhalation should remain constant for several seconds.
- b. After a facepiece is adjusted the test subject shall wear the facepiece for at least 5 minutes before conducting a qualitative test by using either of the methods described below and using the exercise regime described in 5.a., b., c., d. and e.
  - (1) Isoamyl acetate test. When using organic vapor cartridges, the test subject who can smell the odor should be unable to detect the odor isoamyl acetate squirted into the air near the most vulnerable portions of the facepiece seal. In a location which is separated from the test area, the test subject shall be instructed to close her/his eyes during the test period. A combination cartridge or canister with organic vapor high-efficiency filters shall be used when available for the particular mask being tested. The test subject shall be given all opportunity to smell the odor of isoamyl acetate before the test is conducted.
  - (2) Irritant fume test. When using high-efficiency filters, the test subject should be unable to detect the odor of irritant fume (stannic chloride or titanium tetrachloride ventilation smoke tubes) squirted into the air near the most vulnerable portions of the facepiece seal. The test subject shall be instructed to close her/his eyes during the test period.
- c. The test subject may enter the quantitative testing chamber only if she or he has obtained a satisfactory fit as stated in 4.b. of this Appendix.
- d. Before the subject enters the test chamber, a reasonably stable challenge agent concentration shall be measured in the test chamber.
- e. Immediately after the subject enters the test chamber, the challenge agent concentration inside the respirator shall be measured to ensure that the peak penetration does not exceed 5% for a half-mask and 1 percent for a full facepiece.

- f. A stable challenge agent concentration shall be obtained prior to the actual start of testing.
  - (1) Respirator restraining straps may not overtightened for testing. The straps shall be adjusted by the wearer to give a reasonably comfortable fit typical of normal use.
- 5. Exercise Regime. Prior to entering the test chamber, the test subject shall be given complete instructions as to her/his part in the test procedures. The test subject shall perform the following exercises, in the order given, for each independent test.
  - a. Normal Breathing (NB). In the normal standing position, without talking the subject shall breathe normal for at least one minute.
  - b. Deep Breathing (DB). In the normal standing position, the subject shall do deep breathing for at least one minute pausing so as not to hyperventilate.
  - c. Turning head side to side (SS). Standing in place the subject shall slowly turn his/her head from side between extreme positions to each side. The head shall be held at each extreme position for at least 5 seconds. Perform at least three complete cycles.
  - d. Moving head up and down (UD). Standing in place, the subject shall slowly move his/her head up and down between the extreme position straight up and the extreme position straight down. The head shall be held at each extreme position for at least 5 seconds.
  - e. Reading (R). The test subject (keeping eyes closed) shall repeat after the test conductor the "rainbow passage" at the end of this section. The subject shall talk slowly and aloud so as to be heard clearly by the test conductor or monitor.
  - f. Grimace. (G). The test subject shall grimace, smile, frown and generally contort the face using the facial muscles. Continue for at least 15 seconds.
  - g. Bend over and touch toes (B). The test subject shall bend at the waist and touch toes and return to upright position. Repeat for at least 30 seconds.
  - h. Jogging in place (J). The test subject shall perform jog in place for at least 30 seconds.
  - i. Normal Breathing (NB). Same as exercise a.

## Rainbow Passage

When the sunlight strikes raindrops in the air, they act like a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch, with its path high above, and its two ends apparently beyond the horizon. There is, according to legend, a boiling pot of gold at one end. People look, but no one ever finds it. When a man looks for something beyond his reach, his friends say he is looking for the pot of gold at the end of the rainbow.

6. The test shall be terminated whenever any single peak penetration exceeds 5 percent for half-masks and 1 percent for full facepieces. The test subject may be refitted and retested. If two of the three required tests are terminated, the fit shall be deemed inadequate.
7. Calculation of Fit Factors.
  - a. The fit factor determined by the quantitative fit test equals the average concentration inside the respirator.
  - b. The average test chamber concentration is the arithmetic average of the test chamber concentration at the beginning of and the end of the test.
  - c. The average peak concentration of the challenge agent inside the respirator shall be the arithmetic average of peak concentrations for each of the nine exercises of the test which are computed as the arithmetic average of the peak concentrations found for each breath during the exercise.
  - d. The average peak concentration for an exercise may be determined graphically if there is not a great variation in the peak concentrations during a single exercise.
8. Interpretation of Test Results. The fit factor measured by quantitative fit testing shall be the lowest of the three protection factors resulting from three protection factors resulting from three independent tests.

9. Other Requirements.

- a. The test subject shall not be permitted to wear a half-mask or full facepiece mask if the minimum fit factor of 100 or 1,000 respectively, cannot be obtained. If hair growth or apparel interfere with a satisfactory fit, then they shall be altered or removed so as to eliminate interference and allow a satisfactory fit. If a satisfactory fit is still not attained, the test subject must use a positive-pressure respirator such as powered air-purifying respirators, supplied air respirator, or self-contained breathing apparatus.
- b. The test shall not be conducted if there is any hair growth between the skin and the facepiece sealing surface.
- c. If a test subject exhibits difficulty in breathing during the tests, she or he shall be referred to a physician trained in respirator diseases or pulmonary medicine to determine whether the test subject can wear a respirator while performing her or his duties.
- d. The test subject shall be given the opportunity to wear the assigned respirator for one week. If the respirator does not provide a satisfactory fit during actual use, the test subject may request another QNFT which shall be performed immediately.
- e. A respirator fit factor card shall be issued to the test subject with the following information:
  - (1) Name
  - (2) Date of fit test.
  - (3) Protection factors obtained through each manufacturer, model and approval number of respirator tested.
  - (4) Name and signature of the person that conducted the test.
- f. Filters used for qualitative or quantitative fit testing shall be replaced weekly, whenever increased breathing resistance is encountered, or when the test agent has altered the integrity of the filter media. Organic vapor cartridges/canisters shall be replaced daily or sooner if there is any indication of breakthrough by the test agent.

10. In addition, because the sealing of the respirator may be affected, quantitative fit testing shall be repeated immediately when the test subject has a:
  - (1) Weight change of 20 pounds or more.
  - (2) Significant facial scarring in the area of the facepiece sealing.
  - (3) Significant dental changes; i.e. multiple extractions without prosthesis or acquiring dentures.
  - (4) Reconstructive or cosmetic surgery.
  - (5) Any other condition that may interfere with facepiece sealing.
  
11. Recordkeeping. A summary of all test results shall be maintained for 3 years. The summary shall include:
  - (1) Name of test subject
  - (2) Date of testing.
  - (3) Name of the test conductor
  - (4) Fit factors obtained from every respirator tested (indicate manufacturer, model, size and approval number.

**APPENDIX C**

**RESPIRATORY PROGRAM EVALUATION  
CHECKLIST**

## RESPIRATORY PROTECTION PROGRAM CHECKLIST

### I. Program Administration

- \_\_\_\_\_ 1. Is there a written policy which acknowledges employer responsibility for providing a safe and healthful workplace, and assigns program responsibility, accountability, and authority?
- \_\_\_\_\_ 2. Is program responsibility vested in one individual who is knowledgeable and who can coordinate all aspects of the program at the job site?
- \_\_\_\_\_ 3. Can feasible engineering controls or work practice controls eliminate the need for respirators?
- \_\_\_\_\_ 4. Are these written procedures/statements covering the various aspects of the respirator program, including:
- \_\_\_\_\_ designation of an administrator?
  - \_\_\_\_\_ respirator selection?
  - \_\_\_\_\_ purchase of approved equipment?
  - \_\_\_\_\_ medical aspects of respirator use?
  - \_\_\_\_\_ issuance of equipment?
  - \_\_\_\_\_ fitting?
  - \_\_\_\_\_ training?
  - \_\_\_\_\_ maintenance, storage, and repair?
  - \_\_\_\_\_ inspection?
  - \_\_\_\_\_ use under special conditions?
  - \_\_\_\_\_ work area surveillance?

### II. Equipment Selection

- \_\_\_\_\_ 5. Are work area conditions and worker exposures properly surveyed?
- \_\_\_\_\_ 6. Are respirators selected on the basis of hazards to which the worker is exposed?
- \_\_\_\_\_ 7. Are selections made by individuals knowledgeable of proper selection procedures?
- \_\_\_\_\_ 8. Are only approved respirators purchased and used: do they provide adequate protection for the specific hazards and concentrations of contaminant?

- \_\_\_\_\_ 9. Has medical evaluation of the prospective user been made to determine physical and physiological ability to wear the selected respiratory protective equipment?
10. Where practical, have respirators been issued to the users for their exclusive use, and are there records covering issuance?

### **III. Respiratory Protective Fitting**

- \_\_\_\_\_ 11. Are the users given the opportunity to try on several respirators to determine whether the respirator they will subsequently be wearing is the best fitting one?
- \_\_\_\_\_ 12. Is the fit tested at appropriate intervals?
- \_\_\_\_\_ 13. Are those users who require corrective lenses properly fitted?
- \_\_\_\_\_ 14. Are users prohibited from wearing contacted lenses when using respirators?
- \_\_\_\_\_ 15. Is the facepiece-to-face seal tested in a test atmosphere?
16. Are workers prohibited from entering contaminated work areas when they have facial hair or other characteristics which prohibit the use of tight-fitting facepieces?

### **IV. Respirators in the work area**

17. Are respirators being worn correctly (i.e., head covering over respirator straps, top straps worn over the crown of the head)?
- \_\_\_\_\_ 18. Are workers keeping respirators on all the time while in the work area?
19. Are workers wearing respirators into the shower without disturbing the face seal (asbestos exposures)?

### **V. Cleaning, Disinfecting, and Storage**

20. Are respirators cleaned and disinfected after each use when different people use the same device, or as frequently as necessary for devices issued to individual users?
- \_\_\_\_\_ 21. Are proper methods of cleaning and disinfecting used?

22. Are respirators stored in a manner so as to protect them from dust, sunlight, heat, moisture, excessive cold, or damaging chemicals?
23. Are respirators stored properly in a storage facility so as to prevent them from deforming?
24. Is storage in lockers and tool boxes permitted only if the respirator is in a carrying case or carton?

#### **VI. Inspection and Repair**

- \_\_\_\_\_ 25. Are respirators inspected before and after each use and during cleaning?
- \_\_\_\_\_ 26. Are qualified individuals/users instructed in inspection techniques?
27. Is respiratory protective equipment designated as "emergency use" inspected at least monthly (in addition to after each use)?
- \_\_\_\_\_ 28. Is a record kept of the inspection of "emergency use" equipment?
29. Are replacement parts used in repair of those of the manufacturer of the respirator?
30. Are repairs made by manufacturers or manufacturer-trained individuals?

#### **VII. Special Use Conditions and Training**

- \_\_\_\_\_ 31. Is a procedure developed for respiratory protective equipment in use in IDLH atmospheres?
- \_\_\_\_\_ 32. Is a procedure developed for equipment use for entry into confined spaces?
- \_\_\_\_\_ 33. Are users trained in proper respirator use, cleaning, and inspection?
- \_\_\_\_\_ 34. Are users trained in the basis for selection of respirators?
35. Are users evaluated, using competency-based evaluation, before and after training?

**APPENDIX IX**  
**GLOSSARY OF TERMS**

## **GLOSSARY OF TERMS**

**Actinolite** - one of six naturally occurring asbestos minerals. It is not normally used commercially.

**Addenda** - changes made to working drawings and specifications for a building before the work is bid.

**AHERA** - Asbestos Hazard Emergency Response Act.

**Algorithm** - a formal numerical procedure for assessing suspect material; results are given a numerical score.

**Amosite** - (brown asbestos) an asbestiform mineral of the amphibole group. It is the second most commonly used form of asbestos in the United States.

**Amphibole** - one of the two major groups of minerals from which the asbestiform minerals are derived - distinguished by their chain-like crystal structure and chemical composition. Amosite and Crocidolite are examples of amphibole minerals.

**Anthophyllite** - one of six naturally occurring asbestos minerals. It is of limited commercial value.

**As-built drawings** - drawings and specifications which reflect the way a building was actually constructed.

**Asbestos** - a generic name given to a number of naturally occurring hydrated mineral silicates that possess unique crystalline structure, are incombustible in air, and are separable into fibers. Asbestos includes the asbestiform varieties of chrysotile (serpentine), crocidolite (riebeckite), amosite (cummingtonite grunerite), anthophyllite, actinolite, and tremolite.

**Asbestos-Containing Material - (ACM)** - asbestos or any material containing more than one percent (1%) asbestos by weight, including particulate asbestos material.

**Asbestos Abatement Project** - any demolition, renovation, repair, construction or maintenance activity of any public or private facility that involves the repair, enclosure, encapsulation, removal, salvage, handling or disposal of any material with the potential of released in asbestos fibers from asbestos-containing a material into the air. Emergency fire fighting is not an asbestos abatement project.

**Asbestos bodies** - coated asbestos fibers often seen in the lungs of asbestos-exposure victims.

**Asbestos-containing material (ACM)** - any material or product which contains more than 1 percent asbestos (AHERA definition)

**Asbestosis** - a scarring of the lungs caused by exposure to asbestos. Continued exposure may lead to degeneration of lung function and death.

**Asbestos Waste Shipment Record** - the shipment document required to be originated and signed by the asbestos waste generator; used to track and substantiate the disposition of asbestos-containing material.

**ASHARA (Asbestos School Hazard Abatement Reauthorization Act)** - re-authorizes AHERA (Asbestos Hazard Emergency Response Act). Although AHERA was directed only at schools, ASHARA policies are directed at public and commercial buildings as well. "Public and Commercial" buildings include all buildings other than schools and apartment buildings of fewer than 4 units. The EPA interprets this term to exclude single-family homes.

**Breeching** - a duct which transports combustion gases from a boiler or heater to a chimney or stack. Also called a flue.

**Bulk samples** - samples of bulk material, in the case of asbestos, suspect material.

**Chain-of-custody** - formal procedures for tracking samples and insuring their integrity.

**Change order** - a change to construction documents after a contract for construction has been signed.

**Chrysotile** - (white asbestos) a serpentine consisting of alternate sheets of magnesia and silica. Chrysotile is the most abundant and widely used type of asbestos.

**Competent person** - one who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, as specified in 29 CFR 1926.32 (f), and (for FIC) who is trained as an AHERA "Contractor/Supervisor".

**Damaged or significantly damaged thermal system insulation** - thermal system insulation on pipes, boilers, tanks, ducts and other thermal insulation equipment in which the insulation has lost its structural integrity, or its covering, in whole or in part, is crushed, water-stained, gouged, punctured, missing, or not intact such that it is not able to contain fibers. Damage may be further illustrated by occasional punctures, gouges, or other signs of physical injury to ACM; occasional water damage on the protective coverings/jackets; or exposed ACM ends or joints. Asbestos debris, originating from the ACM in question may also indicate damage (AHERA definition).

**Dose-response effect** - the relationship between the amount of pollutant a person is exposed to (dose) and the increased risk of disease (effect). Usually the greater the dose the greater the effect.

**Electrical systems** - the system of wires, lights, power generation equipment, and related facilities to produce, convey, and utilize electrical power in a building.

**Encapsulation** - the use of an agent to seal the surface (bridging encapsulant) or penetrate the bulk (penetrating encapsulant) of ACM.

**Enclosure** - a resilient structure, built (or sprayed) around ACM designed to prevent disturbance and contain released fibers.

**Environmental consultant** - one who performs environmental assessments and can recommend and, in some cases perform, compliance, oversight and remediation services based on industrial hygiene principles and regulatory health and safety-related requirements.

**Epidemiology** - the study of causes, occurrence and distribution of disease throughout a population.

**Fireproofing** - spray or trowel-applied fire resistant materials.

**Friable** - material that can be crumbled or reduced to powder by human hand pressure.

**Functional spaces** - Spatially distinct units within a building which contain identifiable populations of building occupants.

**Heating, ventilation and air conditioning (HVAC) system** - the system of pipes, ducts, and equipment (air conditioners, chillers, heaters, boilers, pumps, fans) used to heat cool, move, and filter air in a building.

**High efficiency particulate air (or absolute), (HEPA) filter** - a type of filter which is 99.97% efficient when challenged with particles 0.3 micrometers in diameter.

**Homogeneous areas** - an area which appears similar throughout in terms of color, texture, and date of material application.

**Industrial hygienist** - one who specializes in the measurement and control of workplace health and safety issues including the design and implementation of those mandated by legal requirements.

**Latency period** - the time between first exposure to a disease-causing agent and the appearance of the disease.

**Lung cancer** - a malignant growth of tissue in the lungs. Specifically of the bronchi covering.

**Mesothelioma** - a rare cancer of the lining around the lungs (pleura) or the abdomen (peritoneum).

**MSHA** - Mine Safety and Health Administration.

**Miscellaneous ACM** - interior building material on structural components, structural members or fixtures, such as floor and ceiling tiles, which does not include surfacing material or thermal insulation.

**Negative pressure respirators** - respirators which function by the wearer breathing in air through a filter.

**Negative pressure respirator check** - a form of qualitative fit testing in which the wearer covers the filters of a negative pressure, air-purifying respirator to check for leaks around the face seal.

**NIOSH** - National Institute of Occupational Safety and Health.

**Permissible Exposure Level (PEL)** - a level of airborne fibers specified by OSHA as an occupational exposure standard for asbestos. It is 0.1 fibers per cubic centimeter of air, 8-hour time-weighted average, as measured by phase contrast microscopy.

**Phase Contrast Microscopy (PCM)** - a method of analyzing air samples for fibers using a light microscope.

**Physical assessment** - assessing suspect material to determine the current condition of the material and the potential for future disturbance.

**Plenum** - a horizontal space designed to transport air in a building. Plenums are commonly the space between a dropped ceiling and the floor above.

**Plumbing system** - the system of pipes, valves, fittings and related components designed to convey liquid or gas fluids throughout a building. Some piping may also be part of the HVAC system.

**Polarized Light Microscopy (PLM)** - a method of analyzing bulk samples for asbestos in which the sample is illuminated with polarized light (light which vibrates in only one plane) and viewed under a light microscope.

**Positive pressure respirators** - respirators which function by blowing air or providing pressurized air to the wearer.

**Positive pressure respirator check** - a form of qualitative fit testing in which the wearer covers the exhalation valve of a negative pressure, air-purifying respirator and exhales to check for leaks around the face seal.

**Presumed Asbestos Containing Material - (PACM)** - Any thermal system insulation or surfacing material is considered a Presumed Asbestos Containing Material (PACM) until certified by competent testing under the EPA/AHERA bulk sampling protocol to be non-ACM.

**Protection factor (PF)** - a number which reflects the degree of protection provided by a respirator. It is calculated by dividing the concentration of contaminant outside the mask by the concentration inside the mask.

**Qualitative fit testing** - a program for collecting and analyzing additional samples of suspect material to check on the reliability of procedures.

**Quantitative fit testing** - testing the fit of a respirator by calculating concentrations of contaminants inside and outside the mask. This requires the use of instruments.

**Rales** - crackling sounds in the lower half of the lung, symptomatic of progressing asbestosis.

**Regulated areas** - areas where fiber levels can exceed OSHA's permissible exposure limit.

**Respiration** - the exchange of gases in the lungs.

**Respiratory-protection Program** -a set of procedures and equipment required by OSHA for employees to wear respirators if fibers levels could exceed the PEL.

**Respiratory tract** - the organs of the body which convey air to the blood, allow exchange of gases, and remove carbon dioxide.

**Serpentine** - one of the two major groups of mineral from which the asbestiform mineral are derived -- distinguished by their tubular structure and chemical composition. Chrysotile is a serpentine mineral.

**Shop drawings** - detailed drawings of selected items used in the construction of a building.

**Significantly damaged friable surfacing material** - friable surfacing ACM in a functional space where damage is extensive and severe.

**Specification** - a written set of standards, procedures, and materials for the construction of a building.

**Surfacing material** - material in a building that is sprayed-on, troweled-on, or otherwise applied to surfaces, such as acoustical plaster on ceilings and fireproofing materials on structural members.

**Synergistic** - the combination of two effects which is greater than the sum of the two independent effects.

**Thermal System Insulation** - means material applied to pipes, fittings, boilers, breeching, tanks, ducts or other interior structural components to prevent heat loss or gain, or water condensation, or for other purposes.

**Transite** - a trade name for asbestos cement wallboard and pipe.

**Transmission Electron Microscopy (TEM)** - a method of analyzing air samples for asbestos fibers using a transmission electron microscopy and possibly associated instruments for further identifying asbestos.

**Tremolite** - one of six naturally occurring asbestos minerals. Tremolite has few commercial uses.

**Working drawings** - a set of drawings which reflect the intended construction and appearance of the building. Also known as building plans.

*engineers & scientists*

**APPENDIX X**  
**REGULATIONS**

## 12.3 GOVERNMENT REGULATIONS

This section lists those standards established by government regulations applicable to asbestos management and abatement in commercial buildings.

These standards include regulations of US EPA, Fed OSHA, Cal/OSHA, California Department of Health Services, and the South Coast Air Quality Management District.

Federal, state and local regulatory agencies have created standards to be followed when working with asbestos. Following is a brief synopsis of some of the relevant regulations.

### 40 CFR 61 Subpart M, US EPA National Emission Standard for Asbestos

In 40 CFR 61 Subpart M, U.S. EPA establishes standards for emission of asbestos fibers to the environment from a demolition or renovation project. The standards include notification requirements, procedures for emission control, and waste disposal procedures.

### Title 8, California Code of Regulations, Section 1529, Cal/OSHA Construction Industry Safety Orders for Asbestos

In Section 1529, Cal/OSHA establishes standards for asbestos in the construction workplace. The standard addresses permissible exposure limits, work methods and practices, waste disposal, personal protective equipment including respiratory protection, monitoring, record keeping, warning signs and labels, medical surveillance, reporting notification requirements, and employee information and training.

### Title 8, California Code of Regulations, Section 5208, Cal/OSHA General Industry Safety Order for Asbestos

In Section 5208, Cal/OSHA establishes standards for asbestos in the workplace. The standard considers permissible exposure limits, work methods and practices, waste disposal personal protective equipment including respiratory protection, monitoring, record keeping, warning signs and labels, medical surveillance, reporting requirements, and employee information and training.

Title 8 California Code of Regulations, Section 341, Cal/OSHA Registration for Asbestos Related Work

In Section 341, Cal/OSHA establishes registration requirements for contractors who perform asbestos-related work, greater than 100 square feet, requirements for notifying Cal/OSHA of impending asbestos-related work, and posting of warning signs.

Regulation X, South Coast Air Quality Management District's (SCAQMD) Emission Standards for Hazardous Air Pollutants

SCAQMD, which is the local air pollution regulatory agency, also enforces 40 CFR 61 Subpart M (National Emission Standards for Asbestos). In Regulation X, SCAQMD adopts 40 CFR 61 Subpart M in toto.

Rule 1403, South Coast Air Quality Management District's (SCAQMD) Emission Standards For Hazardous Air Pollutants

This is intended to limit asbestos emissions from demolition or renovation activities and the associated disturbance of asbestos-containing material, as well as the storage and disposal of asbestos-containing waste material generated or handled by these activities. The general requirements for demolition or renovation operators include District notification, techniques for asbestos-containing material, clean-up procedures, and waste storage and disposal requirements. All operators are required to keep records and use appropriate labeling and public warning signs. Rule 1403 incorporates many of the requirements of 40 CFR 763, the Asbestos Hazard Emergency Response Act (AHERA).

Title 22 California Code of Regulations, Chapter 3, Sections 12101 - 12103, the California Safe Drinking Water and Toxic Enforcement Act of 1986 (enacted as Proposition 65)

Proposition 65 establish asbestos standards of 100 fibers per day inhaled and 140 million fibers per day ingested as significant risk levels. It does indicate that asbestos is known by the State of California to be a carcinogen and prohibits a business from knowingly exposing anyone to detectable amounts of such chemicals without first giving "clear and reasonable warning". In addition to the warning requirement, the statute contains a prohibition against discharge into water or land where asbestos can pass into a source of drinking water.

California Business and Professions Code, Section 7058.5 (AB 2999)

This requires a contractor to be certified for asbestos related work by the Contractor's State License Board before performing asbestos abatement.

California Business and Professions Code, Chapter 1003, Section 7030.6 (AB 2999)

This requires that an asbestos abatement contractor be registered with Cal/OSHA.

California Health and Safety Code, Section 25915 et. seq.

This requires that an owner or employer notify building employees (including those of a contractor) of the presence of asbestos-containing materials within a facility, its location, potential health risk, and precautions required to minimize exposure.

Amendments (AB 1940)

Supplemental notice is required within a 90-day period if new asbestos-related information is required. The 90-day period starts when the notice is first provided, and runs continually thereafter.

California Health and Safety Code, Section 25359.7 (SB 245)

This requires that any owner of nonresidential real property must disclose the presence of hazardous substances prior to the sale, lease or rental to a buyer of that property. Additionally, a lessee is required to notify the owner of the presence of any hazardous substance.

California Health and Safety Code, Chapter 948 (AB 1564)

This requires that the AB 3713 notifications include a summary of inspection results and that all existing asbestos survey and monitoring data be placed in the building or another building which is leased or also owned by the owner, located on the same property as the building, and accessible and convenient to the employer.

California Health and Safety Code, Section 19827.5 (AB 2791)

This prohibits the issuance of a demolition permit as to any building or other structure except upon the receipt from the permit applicant of a copy of each written asbestos notification regarding the building that has been required to be submitted to the U.S. Environmental Protection Agency.

Business and Professions Code, Section 10084.1 (AB 983)

This requires the Department of Real Estate to seek the advice and assistance of the Department of Health Services to develop a booklet on common environmental hazards that effect real property. It requires the Department of Health Services to publish and distribute the booklet to the public for a fee.

California Labor Code Chapter 599 (AB 1545)

This authorizes the Division of Occupational Health and Safety in the Department of Industrial Relations to impose civil penalties upon employers pursuant to specified provisions. It would increase, as specified, the amount of civil penalties which may be assessed.

Health and Safety Code, Chapter 789 (AB 1639)

Asbestos-related work not described in a bid or original contract requires a separate written contract. A contractor who discovers materials believed to be asbestos must stop work in that particular area and notify the owner or owner's representative in writing. Work may continue in areas unaffected by the hazard. A non-certified asbestos contractor may bid on a job involving asbestos removal as long as the removal is performed by a registered, licensed asbestos contractor.

Business and Professions Code, Chapter 1255 (SB 732)

This bill establishes a certification process for asbestos consultants and site surveillance technicians. These consultants or technicians are prohibited from having a financial interest in any asbestos abatement contractor hired on the same project. It is illegal for a building owner to contract with uncertified personnel.

Anthony v. Blech, 760 Fed. Supplement 832 (C.D. Cal. 1991)

A tenant in a commercial building cannot sue the owner under the Comprehensive Environmental Response, Compensating and Liability Act (CERCLA) for the cost of removal of asbestos in the building

Fed/OSHA Construction Asbestos Standard 29 CFR 1926.1101

CFR Part 763 Friable Asbestos-Containing Materials in Schools; Identification and Notification (1982) - AHERA; PL 98-377 Asbestos School Hazard Abatement Act (1984), Reauthorization (1990) (ASHARA), Requires AHERA accreditation for all work done after 11/28/92; 40 CFR Part 763 Friable Asbestos-Containing Materials in Schools; Final Rule and Model Accreditation Plan - AHERA 1987.

AHERA defines certification requirements for asbestos-related work; bulk sampling protocol; and clearance air monitoring levels. It defines a hazard ranking of ACM, based on potential for disturbance and condition. AHERA was originally designed to identify, and abate as required, ACM in school facilities. ASHARA extends AHERA standards for training, inspection and certain procedures to commercial properties.

**APPENDIX D**  
**PROFESSIONAL QUALIFICATIONS**

### **Summary of Experience**

Ms. Perkins is a Senior Scientist at EBI Consulting with over 15 years of experience in the environmental consulting industry. Ms. Perkins specializes in phase I environmental site assessments (ESAS), subsurface investigations and remediation activities, national environmental policy act (NEPA) assessments, limited compliance audits. She also completes radon, lead, asbestos, moisture intrusion, and mold sampling assessments.

### **Relevant Project Experience**

Ms. Perkins has performed, managed, and provided review/technical guidance for phase I ESAS on hundreds of properties throughout the United States in conformance with ASTM and/or specific lender or equity requirements. These properties have included multi-family residential, commercial, mining, light industrial, heavy industrial and manufacturing facilities, undeveloped and agricultural tracts, and telecommunication facilities. She has performed limited compliance audits as part of phase I ESAS on industrial and manufacturing properties. Duties included site observations, permit review, interviews, and local, state, and federal regulation review. Ms. Perkins has performed limited asbestos, lead-based paint, mold and moisture intrusion, and radon sampling assessments in conjunction with phase I ESAS. Additionally, Ms. Perkins has prepared sampling reports and operations & maintenance programs, as well as performed oversight for abatement activities.

Ms. Perkins has conducted subsurface investigation and remediation activities on various properties and prepared reports for various clients and state regulatory agencies. Specific duties included the development and implementation of site health and safety plans, the advancement and sampling of soil borings, the installation and development of groundwater monitoring wells, groundwater sampling, groundwater monitoring well abandonment, enhanced fluid recovery oversight, vapor intrusion sampling, and hazardous material/waste characterization and disposal.

### **Education**

B. A. Biology, North Central College, Naperville, Illinois, 2000

### **Professional Registrations/Certifications**

40-Hour OSHA HazMat/HazWaste Site Worker

AHERA Certified Building Inspector

Colorado Certified Asbestos Building Inspector Certificate #13063

## EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

### TARGET PROPERTY INFORMATION

#### ADDRESS

1000 & 1127-1131 SOUTH FREMONT AVENUE  
ALHAMBRA, CA 91803

#### COORDINATES

Latitude (North): 34.0820270 - 34° 4' 55.29"  
Longitude (West): 118.1500290 - 118° 9' 0.10"  
Universal Transverse Mercator: Zone 11  
UTM X (Meters): 393894.4  
UTM Y (Meters): 3771653.0  
Elevation: 466 ft. above sea level

# EXECUTIVE SUMMARY

## SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

## STANDARD ENVIRONMENTAL RECORDS

### ***Federal NPL site list***

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
<b><i>SAN GABRIEL VALLEY (</i></b>	<b><i>MAIN ST &amp; GAFIELD AV</i></b>	<b><i>0 - 1/8 (0.000 mi.)</i></b>	<b><i>0</i></b>	<b><i>31</i></b>

### ***Federal CERCLIS list***

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/07/2016 has revealed that there are 2 SEMS sites within approximately 0.5 miles of the target property.

## EXECUTIVE SUMMARY

### ***Federal CERCLIS NFRAP site list***

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

### ***Federal RCRA CORRACTS facilities list***

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/27/2016 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

### ***Federal RCRA non-CORRACTS TSD facilities list***

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 06/21/2016 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

## EXECUTIVE SUMMARY

### ***Federal RCRA generators list***

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/21/2016 has revealed that there are 4 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/21/2016 has revealed that there are 24 RCRA-SQG sites within approximately 0.25 miles of the target property.

### **State- and tribal - equivalent CERCLIS**

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 05/02/2016 has revealed that there are 11 ENVIROSTOR sites within approximately 1 mile of the target property.

### **State and tribal registered storage tank lists**

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 4 UST sites within approximately 0.25 miles of the target property.

## EXECUTIVE SUMMARY

### **Other Ascertainable Records**

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/21/2016 has revealed that there are 4 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

### EDR HIGH RISK HISTORICAL RECORDS

#### **EDR Exclusive Records**

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

<u>Lower Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
SO CAL GAS/ALHAMBRA	FRONT ST. AND EDITH	E 1/2 - 1 (0.677 mi.)	BC299	496

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk

## EXECUTIVE SUMMARY

Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 5 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Substance: TRICHLOROETHYLENE (TCE)  
CAS #: 79-01-6  
Pathway: GROUND WATER PATHWAY  
Scoring: 4

Summary Details:

Conditions at listing September 1983): San Gabriel Valley Area 3) is a ground water plume that runs along the axis of the west fork of the Alhambra Creek in the San Gabriel ground water basin in Alhambra, Los Angeles County, California. The plume is about 2 miles long and 1 mile wide. Ground water is contaminated with trichloroethylene (TCE) and perchloroethylene (PCE), according to analyses by State agencies and local water companies. Many public wells in the area exceed the EPA Suggested No Adverse Response Levels (SNARL) for TCE and PCE. Approximately 100,000 people are affected. Cities and public water companies in the area have tested to ensure that their water supplies contain less than 5 parts per billion (ppb) of TCE, a level considered safe for human consumption. When alternative methods of reducing the TCE level below 5 ppb are not effective, wells are removed from service. Status June 1984): A supplemental sampling program of contaminated wells will begin soon to get a snapshot view of the degree of contamination. The State Department of Health Services and EPA are preparing to initiate a remedial investigation/ feasibility study to determine the aerial and vertical extent of contamination and to develop alternatives for treatment and management of the problem. EPA continues its investigation to identify sources of the contamination. This site, along with the three other San Gabriel Valley sites, was added to the NPL in May 1984 because it involves a serious problem that required taking immediate remedial action.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History:

**Actual:**  
**465 ft.**

The property was operated by Nardon Manufacturing Company, a metal manufacturing company. from 1969 to 1984 (Plant No. 1 was apparently located at 2125-2215 West Mission Road). Nardon apparently also operated at 2121 West Mission Road, and stored degreaser solvents in subsurface tanks which were removed in 1985.

Registry ID: 110002899418

**Environmental Interest/Information System**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 Secondary Waste: Not reported  
 Secondary Waste Type: Not reported  
 Design Flow: 0  
 Baseline Flow: 0  
 Reclamation: No reclamation requirements associated with this facility.  
 POTW: The facility is not a POTW.  
 Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.  
 Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

 POTW: Not reported  
 Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.  
 Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Registry ID: 110002882337

**Environmental Interest/Information System**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

**FINDS:**

Registry ID: 110002644087

**Environmental Interest/Information System**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

**Environmental Interest/Information System**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

**FINDS:**

Registry ID: 110000478420

**Environmental Interest/Information System**

**AIR EMISSIONS CLASSIFICATION UNKNOWN**

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region

**WDS:**

Facility ID: 4 19I000247  
Facility Type: Other - Does not fall into the category of Municipal/Domestic, Industrial, Agricultural or Solid Waste (Class I, II or III)  
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.  
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board  
Subregion: 4  
Facility Telephone: 8185760480  
Facility Contact: Jerry Pearring Sr.  
Agency Name: PEMACO METAL PROCESSING CORP.  
Agency Address: Not reported  
Agency City,St,Zip: 0  
Agency Contact: Not reported  
Agency Telephone: Not reported  
Agency Type: Private  
SIC Code: 3471  
SIC Code 2: Not reported  
Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.  
Primary Waste: STORMS  
Waste Type2: Not reported  
Waste2: Stormwater Runoff  
Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Secondary Waste: Not reported  
Secondary Waste Type: Not reported  
Design Flow: 0  
Baseline Flow: 0  
Reclamation: No reclamation requirements associated with this facility.  
POTW: The facility is not a POTW.  
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.  
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Lead Agency Case Number: Not reported  
Latitude: 34.0826999264695  
Longitude: -118.156111273819  
Case Type: Cleanup Program Site  
Case Worker: CH  
Local Agency: Not reported  
RB Case Number: 115.0179  
File Location: Regional Board  
Potential Media Affected: Aquifer used for drinking water supply  
Potential Contaminants of Concern: 1,1,1-Trichloroethane (TCA), Tetrachloroethylene (PCE), Trichloroethylene (TCE)  
Site History: The property at this address has been used for ironwork since at least 1986. The Regional Board issued a Chemical Use Questionnaire to the business owner and it was never returned. The Regional Board also requested information from the property owner in 2001 and none was supplied.

Actual:  
450 ft.

CARBON CHAIN LENGTHS RANGING FROM ONE TO, AND INCLUDING FIVE, WITH VARYING AMOUNTS AND POSITIONS OF CHLORINE SUBSTITUTION. (THIS LISTING DOES NOT INCLUDE WASTEWATERS, WASTEWATER TREATMENT SLUDGE, SPENT CATALYSTS, AND WASTES LISTED IN SECTIONS 261.31. OR 261.32)

- . Waste code: F025
- . Waste name: CONDENSED LIGHT ENDS, SPENT FILTERS AND FILTER AIDS, AND SPENT DESICCANT WASTES FROM THE PRODUCTION OF CERTAIN CHLORINATED ALIPHATIC HYDROCARBONS BY FREE RADICAL CATALYZED PROCESSES. THESE CHLORINATED ALIPHATIC HYDROCARBONS ARE THOSE HAVING CARBON CHAIN LENGTHS RANGING FROM ONE TO, AND INCLUDING FIVE, WITH VARYING AMOUNTS AND POSITIONS OF CHLORINE SUBSTITUTION.
  
- . Waste code: F034
- . Waste name: WASTEWATERS, PROCESS RESIDUALS, PRESERVATIVE DRIPPAGE, AND SPENT FORMULATIONS FROM WOOD PRESERVING PROCESSES GENERATED AT PLANTS THAT USE CREOSOTE FORMULATIONS. THIS LISTING DOES NOT INCLUDE K001 BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATER FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL.
  
- . Waste code: F035
- . Waste name: WASTEWATERS, PROCESS RESIDUALS, PRESERVATIVE DRIPPAGE, AND SPENT FORMULATIONS FROM WOOD PRESERVING PROCESSES GENERATED AT PLANTS THAT USE INORGANIC PRESERVATIVES CONTAINING ARSENIC OR CHROMIUM. THIS LISTING DOES NOT INCLUDE K001 BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATER FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL.
  
- . Waste code: F037
- . Waste name: PETROLEUM REFINERY PRIMARY OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE GENERATED FROM THE GRAVITATIONAL SEPARATION OF OIL/WATER/SOLIDS DURING THE STORAGE OR TREATMENT OF PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH SLUDGES INCLUDE, BUT ARE NOT LIMITED TO, THOSE GENERATED IN OIL/WATER/SOLIDS SEPARATORS; TANKS AND IMPOUNDMENTS; DITCHES AND OTHER CONVEYANCES; SUMPS; AND STORM WATER UNITS RECEIVING DRY WEATHER FLOW. SLUDGES GENERATED IN STORM WATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.
  
- . Waste code: F038
- . Waste name: PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND F037, K048, AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.

**Corrective Action Summary:**

Event date: 01/01/1990  
Event: CA029ST

Event date: 06/01/1991  
Event: RFA Completed, Assessment was an RFA.

Event date: 07/23/1992  
Event: Stabilization Measures Evaluation, This facility is not amenable to stabilization activity at the present time for reasons other than 1- it appears to be technically infeasible or inappropriate (NF) or 2- there is a lack of technical information (IN). Reasons for this conclusion may be the status of closure at the facility, the degree of risk, timing considerations, the status of corrective action work at the facility, or other administrative considerations.

Event date: 08/27/1992  
Event: CA Prioritization, Facility or area was assigned a low corrective action priority.

Event date: 05/22/2006  
Event: RFI Approved

Event date: 01/03/2007  
Event: Corrective Action Process Terminated, No Further Action

Event date: 01/03/2007  
Event: Corrective Action Process Terminated, Remedial Activities Completed

Event date: 07/14/2010  
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and

reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 07/14/2010  
Event: Migration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 07/14/2010  
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. SIC Code 2: Not reported

Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Primary Waste: STORMS

Waste Type2: Not reported

Waste2: Stormwater Runoff

Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Secondary Waste: Not reported

Secondary Waste Type: Not reported

Design Flow: 0

Baseline Flow: 0

Reclamation: No reclamation requirements associated with this facility.

POTW: The facility is not a POTW.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Background Info: The site was the location of a pole treating facility from 1922 until 1957. Since 1957 the 32.55 acre property was used by Southern California Edison Company as a salvage center for metals recycling, storage of new and used electrical transformers, employee training facilities, and maintenance of fleet vehicles. A Preliminary Endangerment Assessment (PEA) conducted in 1999, determined that past uses of the site have resulted in the contamination of onsite soils with various metals, volatiles, polycyclic aromatic hydrocarbons, polychlorinated biphenyls, and pentachlorophenol. Soil contamination has not impacted groundwater therefore the main threat is from direct contact. To expedite cleanup efforts the site was divided into three Areas of Concern (AOC). Currently AOC-2 where the former pole treatment area was located is undergoing remediation. The selected remedy for AOC-2 is In Situ Thermal Desorption The other AOC's still require further investigation.

Comments Date: 01311995  
Comments: Need to verify RCRA Lead.  
Comments Date: 02012003  
Comments: In Situ Thermal Desorption system begins operating.

Description:	A customer had a hole in their fuel tank and gasoline leaked on the pavement. A small amount spilled into a catch basin and will be recovered.

**FINDS:**

Registry ID: 110012240379

**Environmental Interest/Information System**

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

POTW: Not reported

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Completed Area Name: PROJECT WIDE  
Completed Sub Area Name: Not reported  
Completed Document Type: \* Remedial Action Completion or Implementation  
Completed Date: 02/11/1998  
Comments: RMDL -- THE FINAL REMEDIAL ACTION REPORTS FOR THE SITE DESCRIBED IN  
DETAIL THE EXCAVATION AND REMOVAL ACTIVITIES THAT OCCURRED AT EACH  
RESIDENTIAL LOT. THE REPORT ALSO PRESENTED THE RESULTS OF THE  
CONFIRMATION SAMPLING AND THE STATISTICAL ANALYSIS CONDUCTED FOR EACH  
SITE SHOWING THAT THE ESTABLISHED CLEANUP VALUE WAS ACHIEVED.

Completed Area Name: PROJECT WIDE  
Completed Sub Area Name: Not reported  
Completed Document Type: \* Remedial or Removal Design  
Completed Date: 07/14/1997  
Comments: DES/SOIL -- Approved the Engineering Design Report for the Alhambra  
MGP Site. The Design provides technical specifications for the  
excavation and removal of contaminated soil at the site.

Completed Area Name: PROJECT WIDE  
Completed Sub Area Name: Not reported  
Completed Document Type: Remedial Action Plan  
Completed Date: 05/30/1997  
Comments: RAP -- The Remedial Action Plan was approved for the project. The  
project will involve the relocation of affected residents and the  
excavation and removal of contaminated soil. All impacted residential  
properties will be returned to a safe use. It is anticipated that the  
project will begin on July 1 and take roughly 6 months to complete.  
ALLOC -- The allocation of liability was completed in con- junction  
with approval of the RAP. The allocation of liability apportioned 82%  
to the Gas Company and 18% to orphan share. The allocation of  
liability was mailed to the Gas Company, and affected community and  
the public. CEQA -- The negative declaration for the Alhambra MGP was  
finalized in conjunction with approval of the remedial action plan.

Completed Area Name: PROJECT WIDE  
Completed Sub Area Name: Not reported  
Completed Document Type: Remedial Investigation / Feasibility Study  
Completed Date: 08/23/1996  
Comments: RI/FS -- The Department approved the RI/FS for the Alhambra  
Manufactured Gas Plant Site. The RI/FS identified wide- spread PAH  
and lead contamination in the surface and subsurface soils. The RI/FS  
characterized the lateral and vertical extent of the PAH and lead  
contamination at the site.

Background Info: A 2.4 acre former, early 1900's, manufactured gas plant site that was shut down in 1913. The site is currently occupied by 19 single family residences and one duplex. At this time no conclusions can be drawn about potential risks present at the site. Actions are currently being planned and scheduled.

**FINDS:**

Registry ID: 110002139061

**Environmental Interest/Information System**

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include;

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Number of Days to Update:** Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

## STANDARD ENVIRONMENTAL RECORDS

### ***Federal NPL site list***

#### **NPL: National Priority List**

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: N/A

#### **Proposed NPL: Proposed National Priority List Sites**

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: N/A
Date Made Active in Reports: 04/15/2016	Last EDR Contact: 07/07/2016
Number of Days to Update: 10	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

#### **NPL LIENS: Federal Superfund Liens**

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

## ***Federal Delisted NPL site list***

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: N/A
Date Made Active in Reports: 04/15/2016	Last EDR Contact: 07/07/2016
Number of Days to Update: 10	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

## ***Federal CERCLIS list***

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/13/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 01/06/2016	Telephone: 703-603-8704
Date Made Active in Reports: 05/20/2016	Last EDR Contact: 07/06/2016
Number of Days to Update: 135	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: 800-424-9346
Date Made Active in Reports: 04/15/2016	Last EDR Contact: 07/22/2016
Number of Days to Update: 10	Next Scheduled EDR Contact: 10/31/2016
	Data Release Frequency: Quarterly

## ***Federal CERCLIS NFRAP site list***

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: 800-424-9346
Date Made Active in Reports: 04/15/2016	Last EDR Contact: 07/22/2016
Number of Days to Update: 10	Next Scheduled EDR Contact: 10/31/2016
	Data Release Frequency: Quarterly

## ***Federal RCRA CORRACTS facilities list***

CORRACTS: Corrective Action Report

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 06/27/2016	Source: EPA
Date Data Arrived at EDR: 06/30/2016	Telephone: 800-424-9346
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 10/10/2016
	Data Release Frequency: Quarterly

## ***Federal RCRA non-CORRACTS TSD facilities list***

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: (415) 495-8895
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

## ***Federal RCRA generators list***

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: (415) 495-8895
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

## RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: (415) 495-8895
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

## RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: (415) 495-8895
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 10/17/2016

## ***Federal institutional controls / engineering controls registries***

### LUCIS: Land Use Control Information System

LUCIS contains records of land use control information pertaining to the former Navy Base Realignment and Closure properties.

Date of Government Version: 05/28/2015	Source: Department of the Navy
Date Data Arrived at EDR: 05/29/2015	Telephone: 843-820-7326
Date Made Active in Reports: 06/11/2015	Last EDR Contact: 08/12/2016
Number of Days to Update: 13	Next Scheduled EDR Contact: 11/28/2016
	Data Release Frequency: Varies

### US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 05/09/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/01/2016	Telephone: 703-603-0695
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 08/31/2016
Number of Days to Update: 93	Next Scheduled EDR Contact: 12/12/2016
	Data Release Frequency: Varies

### US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 05/09/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/01/2016	Telephone: 703-603-0695
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 08/31/2016
Number of Days to Update: 93	Next Scheduled EDR Contact: 12/12/2016
	Data Release Frequency: Varies

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

## ***Federal ERNS list***

ERNS: Emergency Response Notification System

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 03/28/2016

Date Data Arrived at EDR: 03/30/2016

Date Made Active in Reports: 05/20/2016

Last EDR Contact: 08/02/2016

Next Scheduled EDR Contact: 11/14/2016

Data Release Frequency: Quarterly

## ***State- and tribal - equivalent CERCLIS***

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Date of Government Version: 05/02/2016

Date Data Arrived at EDR: 05/04/2016

Data Release Frequency: Varies

## **ADDITIONAL ENVIRONMENTAL RECORDS**

### ***Local Brownfield lists***

#### **US BROWNFIELDS: A Listing of Brownfields Sites**

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

## US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

### DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Date of Government Version: 06/06/2016	Source: DTSC and SWRCB

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

### EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

Date of Government Version: 08/30/2013	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/21/2014	Telephone: 617-520-3000
Date Made Active in Reports: 06/17/2014	Last EDR Contact: 08/08/2016
Number of Days to Update: 88	Next Scheduled EDR Contact: 11/21/2016
	Data Release Frequency: Quarterly

### 2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

Date of Government Version: 04/22/2013	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/03/2015	Telephone: 703-308-4044

### SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/2009	Source: EPA
Date Data Arrived at EDR: 12/10/2010	Telephone: 202-564-4203

Number of Days to Update: 77	Next Scheduled EDR Contact: 11/07/2016
	Data Release Frequency: Annually

# GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

## ROD: Records Of Decision

Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 11/25/2013	Source: EPA
Date Data Arrived at EDR: 12/12/2013	Telephone: 703-416-0223
Date Made Active in Reports: 02/24/2014	Last EDR Contact: 06/07/2016
Number of Days to Update: 74	Next Scheduled EDR Contact: 09/19/2016
	Data Release Frequency: Annually

## RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Government Version: 05/01/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 05/26/2016	Telephone: 202-564-8600
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 07/25/2016
Number of Days to Update: 99	Next Scheduled EDR Contact: 11/07/2016
	Data Release Frequency: Varies

## RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995	Source: EPA
Date Data Arrived at EDR: 07/03/1995	Telephone: 202-564-4104

## HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/01/2007	Telephone: 202-564-2501
Date Made Active in Reports: 04/10/2007	Last EDR Contact: 12/17/2007
Number of Days to Update: 40	Next Scheduled EDR Contact: 03/17/2008

## UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

## US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

## HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

Date of Government Version: 12/31/2014	Source: California Environmental Protection Agency

## EDR HIGH RISK HISTORICAL RECORDS

### *EDR Exclusive Records*

#### EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

#### EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Data Release Frequency: Varies

## OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

### CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013  
Date Data Arrived at EDR: 08/19/2013  
Date Made Active in Reports: 10/03/2013

**Sensitive Receptors:** There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

## AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

## Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

## Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

## Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

## Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

## Daycare Centers: Licensed Facilities

## **GEOCHECK<sup>®</sup> - PHYSICAL SETTING SOURCE ADDENDUM**

### **TARGET PROPERTY ADDRESS**

THE ALHAMBRA  
1000 & 1127-1131 SOUTH FREMONT AVENUE  
ALHAMBRA, CA 91803

### **TARGET PROPERTY COORDINATES**

Latitude (North):	34.082027 - 34° 4' 55.30"
Longitude (West):	118.150029 - 118° 9' 0.10"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	393894.4
UTM Y (Meters):	3771653.0
Elevation:	466 ft. above sea level

### **USGS TOPOGRAPHIC MAP**

Target Property Map:	5630795 LOS ANGELES, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

## GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

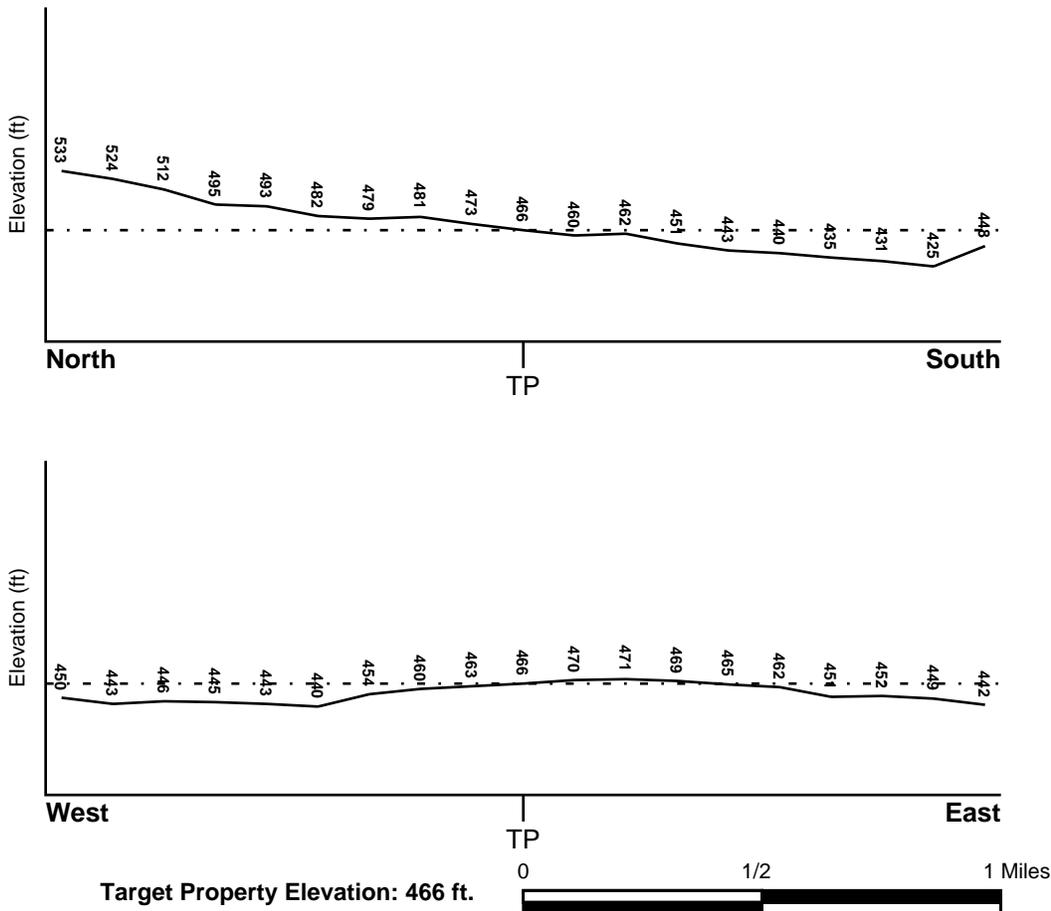

## TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

## TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

## SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

## **HYDROLOGIC INFORMATION**

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

## **FEMA FLOOD ZONE**

<u>Target Property County</u> LOS ANGELES, CA	<u>FEMA Flood Electronic Data</u> YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property:	06037C - FEMA DFIRM Flood data
Additional Panels in search area:	Not Reported

## **NATIONAL WETLAND INVENTORY**

<u>NWI Quad at Target Property</u> LOS ANGELES	<u>NWI Electronic Data Coverage</u> YES - refer to the Overview Map and Detail Map
---	---

## **HYDROGEOLOGIC INFORMATION**

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

### **Site-Specific Hydrogeological Data\*:**

Search Radius:	1.25 miles
Status:	Not found

## **AQUIFLOW®**

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
1	1/2 - 1 Mile SW	NE

For additional site information, refer to Physical Setting Source Map Findings.

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

### GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

### GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

#### ROCK STRATIGRAPHIC UNIT

Era: Cenozoic  
System: Tertiary  
Series: Miocene  
Code: Tm (decoded above as Era, System & Series)

#### GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

### DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

## GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

### OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: sandy loam  
 gravelly - sandy loam  
 silt loam  
 clay  
 fine sand  
 gravelly - sand  
 sand  
 fine sandy loam

Surficial Soil Types: sandy loam  
 gravelly - sandy loam  
 silt loam  
 clay  
 fine sand  
 gravelly - sand  
 sand  
 fine sandy loam

Shallow Soil Types: fine sandy loam  
 gravelly - loam  
 sandy clay  
 sandy clay loam  
 clay  
 silty clay  
 sand

Deeper Soil Types: gravelly - sandy loam  
 sandy loam  
 very gravelly - sandy loam  
 stratified  
 very fine sandy loam  
 weathered bedrock  
 sand  
 gravelly - fine sandy loam  
 silty clay loam  
 clay loam

# GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

## LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

## HYDROGEOLOGIC INFORMATION

### AQUIFLOW<sup>R</sup> Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

## GEOLOGIC INFORMATION

### Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

### STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

### SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

## LOCAL / REGIONAL WATER AGENCY RECORDS

### FEDERAL WATER WELLS

#### PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

#### PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

#### USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

### STATE RECORDS

#### Water Well Database

Source: Department of Water Resources

Telephone: 916-651-9648

#### California Drinking Water Quality Database

Source: Department of Public Health

Telephone: 916-324-2319

The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

## OTHER STATE DATABASE INFORMATION

#### California Oil and Gas Well Locations

Source: Department of Conservation

Telephone: 916-323-1779

Oil and Gas well locations in the state.

### RADON

#### State Database: CA Radon

Source: Department of Health Services

Telephone: 916-324-2208

Radon Database for California

#### Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

#### EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

### **Disclaimer - Copyright and Trademark Notice**

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

## EXECUTIVE SUMMARY

### DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2013. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

### RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

## 1.0 INTRODUCTION

On behalf of the Alhambra Office Community LLC, Equipoise Corporation (Equipoise) submits this *Soil Closure Work Plan, Soil Vapor Confirmation Sampling* (Soil Vapor Work Plan) for activities to be performed at 1000 South Fremont Avenue, Alhambra, California (the Site) (Plate 1). This document provides a work plan to collect soil vapor samples and perform a screening risk evaluation on the subsequent soil vapor results with the objective of obtaining a “No Further Requirements” letter for the Site.

Numerous soil and soil vapor investigations were performed at the Site between 1999 and 2007. Three of these investigations stand out because of the extensive nature of the scope of work of the investigation: Geomatrix Consultants, Inc. (Geomatrix) in 2002/2003; Equipoise in 2005; and Project Navigator, LTD (Project Navigator) in 2007. The Geomatrix investigation was performed site-wide as part of a property transfer. The Equipoise investigation was performed at locations of interest identified by the California Regional Water Quality Control Board – Los Angeles Region (LARWQCB). The Project Navigator investigation further investigated specific locations identified by the LARWQCB and the United States Environmental Protection Agency (USEPA). Plate 2 illustrates the facility building footprints and the site layout from 200 through 2007 when these investigations were conducted.

Please note that the discussion below regarding the results of the above combined investigations make reference to preliminary remediation goals (PRGs), risk based screening levels (RBSLs), and other nomenclature that is not readily used in 2015 but was pertinent regulatory screening criteria at the time of the submittals of the reports. These references are included to provide a more complete context of the logic used in data evaluation at the time of the preparation of the Geomatrix, Equipoise, and Project Navigator reports and the basis for the subsequent conclusions of the investigations.

A total of 138 soil samples and 219 soil vapor samples were collected during the Geomatrix, Equipoise and Project Navigator investigations. The results of the soil analyses indicated that all compounds were below PRGs and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below RBSLs for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California soils and local soils sampled in the vicinity of the Site. Concentrations of tetrachloroethene (PCE) and trichloroethene (TCE) in shallow soil vapor did exceed the industrial RBSL in 18 out of 93 samples for areas of the Site to the west and north of the 2215 W. Mission Road property and these sample results are attributable to activities associated with the 2215 W. Mission Road property and have been addressed by operation of a soil vapor extraction (SVE) system at that location. The Equipoise investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of soil vapor probe SG-21. Concentrations of PCE in shallow soil gas did exceed the industrial RBSL in 6 sample depths in the nested soil vapor probe SG-21. However, soil vapor probe SG-21 is the closest point on the Site to the soil vapor plume from the joining 2215 W. Mission Road property and Equipoise concluded that the PCE exceedances from the 6 samples

were attributable to activities associated with the 2215 W. Mission Road property and have been addressed by operation of a SVE system at that location<sup>1</sup>.

The Project Navigator investigation concluded that all concentrations of constituents detected were below applicable RBSLs, PRGs, and/or background concentrations for the 67 soil vapor and 91 soil samples. In total, 138 soil and 195 soil vapor samples taken from the above-mentioned investigations, indicated that no samples had any constituents above PRGs and/or background for soil and the remaining 24 soil vapor samples had constituents above RBSLs, but were all related to the adjacent 2215 W. Mission Road property.

---

<sup>1</sup> The property at 2215 West Mission Road received a *No Further Requirements for Soils Only* letter from the LARWQCB on August 8, 2013.

## 2.0 BACKGROUND – PREVIOUS SOIL AND SOIL VAPOR INVESTIGATIONS

This section provides a brief summary of the background information available for the soil and soil vapor investigation activities that have been performed at the Site. More details of the soil and soil vapor investigation discussed below are provided in the referenced technical reports.

The three major investigations identified previously are summarized in the following sections. Please note that the discussion below regarding the results of past investigations make reference to preliminary remediation goals (PRGs), risk based screening levels (RBSLs), and other nomenclature that is not readily used in 2015 but was pertinent regulatory screening criteria at the time of the submittals of the reports. These references are included to provide a more complete context of the logic used in data evaluation and the basis for the subsequent conclusions of the investigations.

### 2.1 HISTORY OF INVESTIGATIONS

May 1999	Law Crandall performs <i>Phase I Environmental Site Assessment for 1000 South Fremont Avenue and 2601 West Mission Road</i> for Santa Fe (U.S. Holdings) (Law Crandall, 1999).
July 1999	Blasland, Bouck, and Lee (BBL) performed site investigation activities to support the prospective purchase of the property (BBL, 1999a). The investigation included the following tasks: review of available agency records, figures, maps, drawings, and reports associated with previous/current environmental conditions regarding the subject property and adjacent properties; a site reconnaissance to further identify potential areas of environmental concern; a subsurface soil investigation based on the findings of the document review and site walk over; and a building material survey including sampling for asbestos containing material (ACM), lead-based paint and other building materials of environmental concern.
November 1999	BBL completes soil investigation in the former manufacturing area (BBL, 1999b). Six soil sampling locations were drilled and 24 soil samples were collected at depths of 3, 5, 10 and 15 feet below ground surface (bgs). Soil samples were analyzed for CAM 17 Metals using USEPA Test Method 6010 and results were within anticipated background concentrations for all metals.
December 2000	BBL performs <i>Phase I Environmental Site Assessment for 1000 South Fremont Avenue</i> (BBL, 2000).
February 2003	USEPA sends letter “Request for Information – Area 3 Operable Unit – San Gabriel Valley Superfund Sites, East Los Angeles County, California” dated February 10, 2003.
March 2003	Geomatrix (on behalf of iStar Financial, Inc. the lender on the property at the time) performs <i>Phase II Environmental Site Assessment for The</i>

*Alhambra Campus, 1000 and 1101 South Fremont Avenue and 2215 and 2601 West Mission Road* (Geomatrix, 2003). Conclusions from these activities indicated the following:

- 1) With the exception of the samples collected in the vicinity of the Charter property (2215 W. Mission Road), the concentrations of constituents detected during Geomatrix's assessment were all below regulatory screening levels used at the time of the assessment (RBSLs and PRGs), except for arsenic, which was within the range of background concentrations for California soils.
- 2) Concentrations of PCE in shallow soil gas exceed the industrial RBSL for PCE areas of the Alhambra Campus to the west and north of the Charter property.
- 3) Constituents including petroleum hydrocarbons (PHCs) and volatile organic compounds (VOCs) were detected at several locations across the site. The majority of the detections were low and below regulatory screening levels.

April 2003

Submittal of response to USEPA letter "Request for Information – Area 3 Operable Unit – San Gabriel Valley Superfund Sites, East Los Angeles County, California" dated February 10, 2003.

April 2005

California Regional Water Quality Control Board – Los Angeles Region requires preparation of a "Soil Vapor Survey Work Plan, 1000 South Fremont, Alhambra, California" for the seven areas identified within the letter dated April 8, 2005. The locations of interest identified by the LARWQCB are:

1. 1101 South Fremont Avenue;
2. Northeast portion of 1000 South Fremont;
3. Former Sump/Clarifier and Gas Fractionation/Distillation Unit;
4. Southwest Corner – Adjacent Areas to 2215 West Mission Road;
5. Incinerator Locations;
6. 61,500 Gallon Diesel Tank; and
7. 20,000 Gallon Solvent Tanks.

May 2005

A Soil Vapor Survey Workplan responsive to the following locations is submitted to LARWQCB by Equipoise on behalf of the property owner:

- Northeast portion of 1000 South Fremont;
- Former Sump/Clarifier and Gas Fractionation/Distillation Unit;
- Southwest Corner – Adjacent Areas to 2215 West Mission Road;
- Incinerator Locations;
- 61,500 Gallon Diesel Tank;

Regarding 1101 South Fremont: The LARWQCB was informed that this property was owned by a different entity.

Regarding the 20,000 Gallon Solvent Tank: The LARWQCB required sampling be performed at the reported locations of the two 20,000 gallon solvent tanks located at 2400 West Orange Street. This address no longer is associated with any existing building or facility, but

corresponds with the Site's northern boundary along Orange Street. Review of the Sanborn map for 1950 indicated a property outline for 2400 West Orange Street. Existing permits on file found from the Los Angeles County Department of Public Works (LACDPW) indicate that the tanks were operated by Union Oil Company from 1930 to 1932. Note: If these tanks were ever installed, they likely contained mineral spirits or toluene, not chlorinated solvents because chlorinated solvents had not been developed at the time of these permits.

As Union Oil Company (UNOCAL) is still a viable entity, it was requested that the LARWQCB contact UNOCAL to investigate their former operations.

- July 2005 LARWQCB approves Soil Vapor Survey Workplan submitted by Equipoise.
- July - October 2005 Equipoise implemented the field activities as outlined in the Soil Vapor Survey Workplan.
- November 2005 *Soil Vapor Survey and Soil Matrix Sample Results, 1000 South Fremont, Alhambra, California* report (Equipoise, 2005) is submitted to LARWQCB. The report shows that with the exception of results from soil vapor probe SG-21, the maximum detected concentrations of PCE and TCE are 8.8 and 1.7 microgram per liter (ug/L), respectively. Soil vapor probe SG-21 is the closest survey point on 1000 S. Fremont Avenue to the soil vapor plume from the adjacent property (2215 W. Mission Road) and results at this location are attributable to that property. Based on these results, additional soil vapor survey activities were not recommended.
- October 2006 LARWQCB issues a Technical Report Requirement letter to Mr. Dick Denney, counsel for Santa Fe Corporation, for the 1000 South Fremont property. The LARWQCB requires a work plan to perform a soil and soil vapor investigation, implementation of the work plan, and a report documented field activities and that results are provided to the LARWQCB.
- December 2006 LARWQCB provides comments on *Soil Vapor Survey and Soil Matrix Sample Results* report submitted by Equipoise in November 2005 (Equipoise, 2005) and describes requirements for additional investigative activities.
- January 2007 Equipoise, submits a Response to the LARWQCB December 2006 letter regarding requirements for additional investigative activities. The response letter clarifies that Santa Fe Braun, a successor to the historical owner, will prepare the work plan requested of both parties.
- June 2007 Project Navigator, on behalf of Santa Fe Braun, submits the *Final Supplemental Subsurface Investigation Work Plan, Former C.F. Braun & Co., 1000 South Fremont, Alhambra, California 91803*, to the LARWQCB in response to letter of October 2006.

March 2008

Project Navigator, on behalf of Santa Fe Braun, submits the *Supplemental Subsurface Investigation Report, 1000 South Fremont, Alhambra, California* (Project Navigator 2007) to the LARWQCB. The report indicates that the LARWQCB requests for additional investigation have been fulfilled and that VOC contamination is not present in the subsurface soils, and therefore, could not have contributed to the presence of VOCs in groundwater. The report recommends No Further Action at the site and requests that the LARWQCB grant a No Further Action letter at its earliest convenience.

April 2008

Project Navigator, on behalf of Santa Fe Braun, submits the Case Review Form to the LARWQCB. The Case Review Form is the internal LARWQCB document used by the LARWQCB Project Manager as part of the backup documentation for a case closure request.

## 2.2 RESULTS OF GEOMATRIX INVESTIGATION - 2002 AND 2003

Geomatrix conducted soil vapor and soil investigations at fifteen locations on-site and off-site. The results of those investigations were summarized by Geomatrix and are excerpted in tables provided in Appendix A. The tables are organized by the 15 areas identified in the Geomatrix report. Plate 3 shows the locations and analytes detected. The table below shows the number of borings and the results of the analysis of the samples collected in comparison to the applicable PRGs, RBSLs and/or background concentrations.

<b>Geomatrix Investigation</b>	<b>Total Samples Collected</b>	<b>Samples Above PRGs, RBSLs, and/or Background from on-site sources at Time of the Geomatrix 2003 Report<sup>2</sup></b>
Soil	37	0
Soil Vapor	93	7

### 2.2.1 Soil Analytical Results

A total of 37 soil samples were collected from 17 locations (Plate 3) and analyzed using a combination of the following USEPA Test Methods:

- USEPA Test Method 6010B: Metals
- USEPA Test Method 7471: Mercury
- USEPA Test Method 7199: Hexavalent Chromium
- USEPA Test Method 9045C: pH
- USEPA Test Method 8015B: TPHcc (Total Petroleum Hydrocarbons – carbon chain)
- USEPA Test Method 8260B: VOCs

---

<sup>2</sup> Please note that the discussion of this investigation references PRGs, RBSLs, and other nomenclature that is not readily used in 2015 but was pertinent regulatory screening criteria at the time of the submittals of the reports. These references are included to provide a more complete context of the logic used in data evaluation and the basis for the subsequent conclusions of the investigations.

- USEPA Test Method 8270C: Semi-VOCs (Semi-volatile organic compounds)
- USEPA Test Method 8081A: Pesticides
- USEPA Test Method 8082: Polychlorinated Biphenyls (PCBs)
- USEPA Test Method 8151A: Herbicides
- USEPA Test Method 314.0: Perchlorate
- GC/MS Isotope Dilution: Dioxins

Soil samples were collected from depths ranging from 1.5 to 20 feet bgs<sup>3</sup>. The table below shows the number of soil samples, the number of detections, and that none of the analyses from of the results of the soil samples were above regulatory limits.

<b>Compound</b>	<b>Total Samples</b>	<b>Samples with Detection</b>	<b>Samples Greater Than Regulatory Limits at Time of the Geomatrix 2003 Report</b>
Arsenic	17	17	No
Heavy Metals	17	17	No
TPHcc	14	9	No
VOCs	26	0	No
PCE	26	3	No
TCE	26	0	No
Xylene	26	1	No
SVOCs	9	0	No
Pesticides	19	0	No
PCBs	19	0	No
Herbicides	6	0	No
Perchlorate	6	1	No
Dioxins	6	0	No

The results of the analyses for the soil samples collected are summarized below:

- Arsenic occurrences fall within the range of background concentrations in California soils.
- Heavy metal concentrations (except arsenic) were below both their respective industrial and residential soil PRG.
- TPH hydrocarbon distribution components were below regulatory limits for diesel range hydrocarbons where depth to water is greater than 150 feet bgs.
- PCE results detected in the soil analytical results were below residential RBSL values.
- TCE was not detected in the soil analytical results.
- Xylene results detected in the soil analytical results were below residential RBSL values.
- SVOCs were not detected in the soil analytical results
- Pesticides were not detected in the soil analytical results
- PCBs were not detected in the soil analytical results
- Perchlorate result detected in the soil analytical results was below residential RBSL values
- Dioxins were not detected in the soil analytical results

---

<sup>3</sup> Details of soil sample collection depth: 15 samples from depth 1 to 4 feet bgs; 19 samples from depths 5 to 8 feet bgs; 8 samples from depths 9 to 14 feet bgs; 12 samples from depths 14 to 18 feet bgs; and 13 samples from 19 to 20 feet bgs.

The Geomatrix investigation concluded that all concentrations of constituents detected in soil samples were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations.

## 2.2.2 Soil Vapor Analytical Results

A total of 93 soil vapor samples (including duplicates) were collected from 43 locations (Plate 3). Samples were analyzed, using USEPA Method 8260B, after collection from depths between:

- 5 and 9 or 11 feet bgs from two locations,
- 15 and 25 feet bgs from 43 locations, and
- 3.5 feet bgs at one location.

The table below shows the number of borings and the results of the analysis of the soil vapor samples collected in terms of residential RBSLs.

<b>Compound</b>	<b>Total Samples</b>	<b>Samples with Detection</b>	<b>Samples Greater than Regulatory Limits at the Time of the Geomatrix 2003 Report</b>
PCE	93	25	23
TCE	93	16	6
1,1-DCE (1,1-dichloroethene)	93	5	5
Freon 12	93	6	0
Freon 113	93	8	0
Toluene	93	24	0
Ethylbenzene	93	1	0
Xylene	93	4	0

The results of the analyses for the soil vapor samples collected are summarized below:

- Six of the soil vapor PCE analytical results (with a maximum concentration of 14 ug/L) above the RBSL are from sample locations SG-9, SG-10, and SG-39 which were located near the former machine shop in the parking lot north of the 2215 W. Mission Road property.
- The remaining 17 of the 23 soil vapor PCE analytical results above the RBSL are from sample locations SG-2 through SG-8, SG-37, and SG-38 which are immediately north or west of the 2215 W. Mission Road property and these concentrations are attributable to the 2215 W. Mission Road property.
- The 6 soil vapor TCE analytical results above the RBSL are from sample locations SG-2 through SG-8, SG-37, and SG-38 which are immediately north or west of the 2215 W. Mission Road property and these concentrations are attributable to the 2215 W. Mission Road property.
- Two of the soil vapor 1,1-DCE analytical results (with a maximum concentration of 1.1 ug/L) above the RBSL are from sample locations SG-9 and SG-10 which were located near the former machine shop in the parking lot north of the 2215 W. Mission Road property. An additional sample result (with a maximum concentration of 1.1 ug/L) was at sample location SG-18 which was located near the former paint spraying area in the northeast corner of the property.
- Both of the remaining soil vapor 1,1-DCE analytical results above the RBSL, are from sample location SG-38 which is immediately north of the 2215 W. Mission Road property and these concentrations are attributable to the 2215 W. Mission Road property.

Concentrations of PCE and/or 1,1-DCE in soil vapor exceeded the residential RBSL in 7 out of 93 samples for areas of the Site not attributed to the 2215 W. Mission Road property. An additional 17 locations where concentrations of PCE, TCE, and/or 1,1-DCE in soil vapor exceed the residential RBSL are immediately west and north of the 2215 W. Mission Road property and have been attributed to the 2215 W. Mission Road property.

Please note that the locations identified above (north and west of the 2215 W. Mission Road property, the former machine shop, and the former paint spraying area) where PCE, TCE, and 1,1-DCE were detected above the RBSL were further investigated as part of the 2005 Equipoise investigation and the 2007 Project Navigator investigation. In addition, it should be noted that the 2002/2003 Geomatrix Investigation was performed prior to implementation of remediation activities at the 2215 W. Mission Road property. In July 2003, an extensive SVE remediation program was implemented using multiple wells with multiple extraction zones. The SVE system operated at the 2215 W. Mission Road site for approximately 42 months between July 2003 and December 2006. The SVE remediation system operations dramatically reduced the VOC concentrations in soil vapor probes. Details of the remediation system activities are presented in numerous reports submitted to the LARWQCB for the 2215 W. Mission Road site (Equipoise 2005, 2006, 2007).

## 2.3 RESULTS OF EQUIPOISE INVESTIGATION - 2005

The LARWQCB identified six areas of interest on the Site following the review of the Geomatrix report and required that the property owner conduct further investigation at the identified locations. Equipoise, on behalf of the property owner, investigated five of these locations in 2005. The one location not investigated was the potential tanks at the former Union Oil facility that was identified by the USEPA described previously. The table below shows the number of borings and the results of the analysis of the samples collected in terms of PRGs, RBSLs and/or background concentrations, as applicable.

<b>Equipoise Investigation</b>	<b>Total Samples Collected</b>	<b>Samples Above PRGs, RBSLs, and/or Background from on-site sources at the Time of the Equipoise 2005 Report<sup>4</sup></b>
Soil	10	0
Soil Vapor	59	0

The following sections present the results of the analysis of the soil and soil vapor samples.

### 2.3.1 Soil Vapor Analytical Results

A total of 59 soil vapor samples were collected from 24 locations (Plate 4). Samples were analyzed, using USEPA Method 8260B, after collection from depths between:

---

<sup>4</sup> Please note that the discussion of this investigation reference PRGs, RBSLs, and other nomenclature that is not readily used in 2015 but was pertinent regulatory screening criteria at the time of the submittals of the reports. These references are included to provide a more complete context of the logic used in data evaluation and the basis for the subsequent conclusions of the investigations.

- 5 and/or 15 feet bgs from three locations,
- 15 and 25 feet bgs from twenty locations, and
- 15 to 60 feet bgs at one location.

The table below shows the number of borings and the results of the analysis of the soil vapor samples collected in terms of RBSLs.

<b>Compound</b>	<b>Total Samples</b>	<b>Sample with Detections</b>	<b>Samples Greater Than Regulatory Limits at the Time of the Equipoise 2005 Report</b>
PCE	59	18	6
TCE	59	1	No
cis-1,2-DCE (cis-1,2-dichloroethene)	59	1	No
Freon 11	59	1	No
Freon 113	59	1	No
BTEX (benzene, toluene, ethylbenzene, xylene)	59	0	No

The results of the analyses for the 59 soil vapor samples collected are summarized below:

- PCE was detected in 18 of the 59 soil vapor analytical results.
- TCE was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 1.7 ug/L from a sample from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and this TCE result in this soil vapor probe is attributable to activities associated with the 2215 W. Mission Road property.
- cis-1,2-DCE was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 2.1 ug/L from a sample from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and this cis-1,2-DCE result in this soil vapor probe is attributable to activities associated with the 2215 W. Mission Road property.
- Freon 11 was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 2.1 ug/L.
- Freon 113 was detected in 1 of the 59 soil vapor analytical results with a maximum concentration of 1.1 ug/L.
- BTEX components were not detected in any of the 59 soil vapor analytical results.

The summary of the soil vapor detections for PCE is as follows:

- PCE results for 41 out of 59 samples were below the laboratory detection limit of 1.0 ug/L.
- PCE results for 10 out of 59 samples were between 1.0 and 1.4 ug/L.
- PCE results for 2 out of 59 samples that were between 1.4 and 10 ug/L are from samples from soil vapor probe SG-22. Soil vapor probe SG-22 is immediately north of the 2215 W. Mission Road property and the PCE results in this soil vapor probe are attributable to activities associated with the 2215 W. Mission Road property.
- The remaining 6 samples were collected from multiple depths of the nested soil vapor probe SG-21. Soil vapor probe SG-21 was the closest point on the Site to the former soil vapor plume from the adjacent property and the PCE concentrations results in this soil vapor probe are attributable to activities associated with the 2215 W. Mission Road property. The maximum detected PCE concentration from soil vapor probe SG-21 was 33 ug/l at 40 feet.

### 2.3.2 Soil Analytical Results

A total of 10 soil samples were collected from 4 locations (Plate 4) and, depending on each specific located, were analyzed using the USEPA Test Methods below:

- USEPA Test Method 6010B: Metals
- USEPA Test Method 7471: Mercury
- USEPA Test Method 8015B: TPHcc (Hydrocarbon Distribution)
- USEPA Test Method 8082: PCBs
- USEPA Test Method 8260B: VOCs
- USEPA Test Method 8310: PAHs
- USEPA Test Method 8290: Dioxins and Furans

Soil samples were collected from depths of 10, 15 and 20 feet bgs from the diesel tank locations and from 5 and 10 feet bgs from the incinerator locations. The table below shows the number of soil samples, those with detections, and results of the analyses, which indicated that none of the soil samples were above regulatory limits.

<b>Compound</b>	<b>Total Samples</b>	<b>Samples with Detections</b>	<b>Samples Greater Than Regulatory Limits at the Time of the Equipoise 2005 Report</b>
BTEX	10	0	No
TPHcc	6	0	No
Arsenic	4	3	No
Heavy Metals	4	4	No
PCE	10	0	No
TCE	10	0	No
cis-1,2-DCE	10	0	No

The results of the analyses for the soil samples collected are summarized below:

- PCE was not detected in the soil analytical results.
- TCE was not detected in the soil analytical results.
- cis-1,2-DCE was not detected in the soil analytical results.
- Freon 11 and 113 were not detected in the soil analytical results.
- BTEX components were not detected in the soil analytical results.
- TPH components were not detected in the soil analytical results.
- PAHs were not detected in the soil analytical results
- PCBs were not detected in the soil analytical results
- Dioxins and furans were not detected in the soil analytical results
- Heavy metal concentrations (except arsenic) were below both their respective industrial and residential soil PRG
- Arsenic occurrences fall within the range of background concentrations in California soils

The 2005 Equipoise investigation concluded that all concentrations of constituents in soil and soil vapor detected were below RBSLs or PRGs, with the exception of PCE concentrations in soil vapor probe SG-21 which is the closest point on the Site to the soil vapor plume from the adjacent 2215 W. Mission Road property and the PCE exceedances of the occupational RBSL from the 6 samples were attributable to

activities associated with the 2215 W. Mission Road property. The area near soil vapor probe SG-21 was further investigated as part of the Project Navigator investigation.

## **2.4 RESULTS OF PROJECT NAVIGATOR INVESTIGATION - 2007**

In a December 6, 2006 letter, the LARWQCB identified three areas of potential concern (APC) to be further investigated (Plate 5):

- APC-A,
- APC-B, and
- APC-C.

These areas are oriented north-south and roughly divide the Site into three strips (“A” is the westernmost and “C” is the easternmost) to be used for location purposes. The central “B” strip encompasses the major manufacturing building that previously existed on the historic land use or other activities were identified for soil or soil vapor assessment by the LARWQCB. The LARWQCB stated that although there had been several phases of investigative site characterization of soil matrix and soil vapor profiling undertaken by the current property owners, additional characterization was required to make a determination of environmental impact from past Site operations. The LARWQCB’s specific requirements were to:

- Provide additional information in order to determine whether or not soil contamination was present in the subsurface soil, and
- Whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Site. The LARWQCB requested that a shallow soil investigation and an enhanced soil vapor survey be conducted in the APC. Furthermore, the LARWQCB specified the locations for the borings in relation to the APC.

APC-A included the following areas and associated former structures:

- The drum storage area on the north side of Building B-3,
- The fuel oil tank near the northwest corner of Building B-3,
- The sump/clarifier/UST between Buildings B-2 and B-3,
- The auto shed areas,
- The location of the 61,500-gallon diesel underground storage tank (UST) southwest of Building A-13,
- The power generating plant,
- The machine shop, and
- The research laboratory.

APC-B includes the following areas and associated former structures:

- The north end of the former factory building and nearby railroad alignment,
- The location of the reported former 20,000- gallon solvent tank in the area of 2400 W. Orange Street (the former Union Oil location),
- The location of the current cooling tower in the northern parking area,
- The southern portion of the former factory building, and
- The location of the former south cooling tower.

APC-C includes the following areas and associated former structures:

- The paint spray booth, machine shop, and the middle paint spray booth, and
- Areas surrounding the southeast corner of the Site near 2215 West Mission Road facility.

### **2.4.1 Scope of Work**

The Project Navigator investigation consisted of 30 shallow borings (shallow soil investigation) and four deep (to 100 feet bgs) borings (enhanced soil vapor investigation). Boring location selection was at the direction of the LARWQCB and was based on the LARWQCB's identification of the APC areas, described above, with emphasis on those areas that were not extensively reviewed in the previous investigations. Activities during the Project Navigator investigation included drilling, sampling and analysis of soil matrix and soil vapor as described in the following subsections.

**Shallow Borings:** Soil samples were planned for collection at depths of 15 and 50 feet bgs. However, a number of the borings showed refusal at less than the planned total depth. When refusal occurred, samples were collected from the deepest penetration achieved. A total of 67 soil vapor samples were collected from 32 locations (Plate 5). Samples were analyzed, using USEPA Test Method 8260B, after collection from depths between:

- 15 and 50 feet bgs from 28 locations, and
- 25 and 100 feet bgs from the remaining four locations.

**Deep Borings:** Vapor sample collection was facilitated by the well construction using dedicated, nested probes. The four 100-ft borings contained nested probes that were sampled at least two weeks after drilling. Samples were withdrawn and analyzed using the same technique as described above for the shallow borings. Analysis of soil vapor samples was performed using a mobile laboratory.

A total of 91 soil samples were collected from thirty-four locations (Plate 5) and analyzed using the USEPA Test Methods below:

- USEPA Test Method 6010B: Metals
- USEPA Test Method 8015B: TPH as Gasoline, Diesel, Crude
- USEPA Test Method 8082: PCBs
- USEPA Test Method 7471: Mercury
- USEPA Test Method 8260B: VOCs
- USEPA Test Method 8270C: SVOCs

Samples were collected from depths between 15 and 50 feet bgs from 30 locations and from depths between 10 and 100 feet bgs from the remaining four locations. Soil matrix samples were analyzed using USEPA Test Method 8015B (M).

### **2.4.2 Analytical Results**

The following sections present the results of the analysis of the soil and soil vapor samples.

<b>Project Navigator Investigation</b>	<b>Total Samples Collected</b>	<b>Samples Above RBSLs at the Time of the Project Navigator 2008 Report<sup>5</sup></b>
Soil Vapor	67	0
Soil	91	0

Soil vapor samples were analyzed for VOCs, BTEX and/or TPH. The table below shows the number of borings and the results of the analysis of the samples collected in terms of RBSLs. The results of the analyses, presented in Appendix A, showed that all compounds were below the laboratory detection limits for the 67 samples taken and summarized in the table below.

<b>Compound</b>	<b>Total Samples</b>	<b>Samples with Detections</b>	<b>Samples Greater Than Regulatory Limits at the Time of the Project Navigator 2008 Report</b>
PCE	67	0	No
TCE	67	0	No
cis-1,2-DCE	67	0	No
BTEX	67	0	No
All other compounds	67	0	No

Soil samples were analyzed for a wide range of compounds. The table below shows the number of samples, those with detections, and results of the analyses, which indicated that none of the samples were above regulatory limits.

<b>Compound</b>	<b>Total Samples</b>	<b>Samples with Detections</b>	<b>Samples Greater Than Regulatory Limits at the Time of the Project Navigator 2008 Report</b>
BTEX	91	12	No
TPH	91	39	No
Arsenic	91	21	No
Heavy Metals	91	23	No
Naphthalene	91	1	No
PCE	91	0	No
TCE	91	0	No
cis-1,2-DCE	91	0	No

The results of the analyses (see Appendix A) generally show compounds to be below the laboratory detection limits and are summarized as follows:

- BTEX (benzene, ethylbenzene, o-xylene, p/m-xylene and toluene) was detected in 12 of the 91 soil samples taken from 6 of the 34 soil sampling locations at concentrations between 0.85 and 27 milligrams per kilogram (mg/kg). However, all concentrations were below their respective PRG

---

<sup>5</sup> Please note that the discussion of this investigation references PRGs, RBSLs, and other nomenclature that is not readily used in 2015 but was pertinent regulatory screening criteria at the time of the submittals of the reports. These references are included to provide a more complete context of the logic used in data evaluation and the basis for the subsequent conclusions of the investigations.

for both industrial and residential soil as well as soil screening levels for groundwater, where available

- Hydrocarbons (C7-C36 Total) were detected in 39 of the 91 soil samples taken from 20 of the 34 soil matrix sampling locations at concentrations between 0.0012 and 32 mg/kg. However, all concentrations were below the Board's regulatory requirements (100 mg/kg gasoline and 1,000 mg/kg for diesel). No hydrocarbons were detected at the location of the diesel tank (boring A-5-1) or the solvent tank (borings B-1-2, B-1-3 and B-1-4) investigated in this study.
- Arsenic was detected in 21 of the 91 soil samples taken from 13 of the 34 soil sampling locations at concentrations between 0.813 and 3.73 mg/kg. Twelve of the 20 soil samples had arsenic in concentrations above the industrial soil PRG. However, the arsenic occurrences fall within the range of background concentrations in California soils<sup>6</sup>.
- Heavy metals (barium, total chromium, cobalt, copper, lead, mercury, molybdenum, nickel, vanadium and zinc), were detected in 23 of the 91 soil samples taken from 14 of the 34 soil matrix sampling locations at concentrations between 0.119 and 96.4 mg/kg; however, all concentrations were below both their respective industrial and residential soil PRG as well as soil screening levels for groundwater, where available.
- Naphthalene was detected in 1 of the 91 soil samples taken from 1 of the 34 soil matrix sampling locations at a concentration of 0.85 mg/kg. However, the concentration was below both the industrial and residential soil PRG as well as soil screening levels for groundwater, where available. Low concentrations of arsenic, heavy metals, hydrocarbons, BTEX and naphthalene were detected in soil samples. In summary, all concentrations were below their respective PRG for both industrial and residential soil and as well as soil screening level for groundwater, where available, with the exception of arsenic.
- PCE was not detected in any of the soil analytical results.
- TCE was not detected in any of the soil analytical results.
- cis-1,2- DCE was not detected in any of the soil analytical results.

## 2.5 COMBINED INVESTIGATION CONCLUSIONS AND RECOMMENDATIONS

### 2.5.1 Conclusions

A total of 138 soil samples and 219 soil vapor samples were taken during the Geomatrix, Equipoise and Project Navigator investigations. The results of the soil analyses indicated that all compounds were below PRGs and/or background for all 138 soil samples, and soil vapor analyses indicated all compounds were below RBSLs for 195 samples. The Geomatrix investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs, with the exception of arsenic, which was within the range of background concentrations for California Soils, and those samples collected in the vicinity of the 2215 W. Mission Road property. Concentrations of PCE and TCE in shallow soil gas did exceed the industrial RBSL in 18 out of 93 samples for areas of the Site to the west and north of the 2215 W. Mission Road property. The Equipoise investigation concluded that all concentrations of constituents

---

<sup>6</sup> The assertion that the detected arsenic concentration results at the Site are naturally occurring background conditions is further supported by a technical paper prepared by California Department of Toxic Substances Control (DTSC) risk assessment professionals in 2005 titled, *Determination of a Southern California Regional Background Arsenic Concentration in Soil*. Results of this paper suggest that in Southern California, six (6) milligrams per kilogram (mg/kg) is a conservative screening number for evaluating arsenic as a chemical of concern.

detected were below RBSLs or PRGs, with the exception of soil vapor probe SG-21. Within probe SG-21, concentrations of PCE in shallow soil gas did exceed the industrial RBSL in 6 samples. However, soil vapor probe SG-21 is the closest point on the Alhambra Site to the soil vapor plume from the adjacent 2215 W. Mission Road property and Equipoise believes that the PCE exceedances from the 6 samples are attributable to activities associated with the 2215 W. Mission Road property and have been addressed by operation of an existing SVE system at that location. Plate 6 indicates sample locations for the Geomatrix, Equipoise, and Project Navigator investigations where soil vapor concentrations were detected greater than the PRGs or RBSL.

The Project Navigator investigation concluded that all concentrations of constituents detected were below RBSLs or PRGs and/or within background concentrations for the 67 soil vapor and 91 soil samples. In total, 138 soil and 195 soil vapor samples taken from the 3 above-mentioned investigations, indicated that no samples had any constituents above PRGs and/or background for soil and the remaining 24 soil vapor samples had constituents above RBSLs, but were all related to the adjacent 2215 W. Mission Road property.

<b>Geomatrix Investigation – 2002/2003</b>	<b>Total Samples Collected</b>	<b>Samples Above RBSLs at the Time of the Project Navigator 2008 Report</b>
Soil Vapor	93	7
Soil	37	0

<b>Equipoise Investigation - 2005</b>	<b>Total Samples Collected</b>	<b>Samples Above RBSLs at the Time of the Project Navigator 2008 Report</b>
Soil Vapor	59	0
Soil	10	0

<b>Project Navigator Investigation - 2007</b>	<b>Total Samples Collected</b>	<b>Samples Above RBSLs at the Time of the Project Navigator 2008 Report</b>
Soil Vapor	67	0
Soil	91	0

### 2.5.2 Recommendation

The Project Navigator investigation found no detections of VOCs in any soil vapor samples and values less than the industrial and residential PRG or within the range of background concentrations for all soil samples.

The stated purpose of the Project Navigator investigation was to: *provide additional information in order to determine whether or not soil contamination was present in the subsurface soil and whether or not a release of VOCs occurred that posed a threat to the groundwater quality beneath the Site.*

During the Project Navigator investigation:

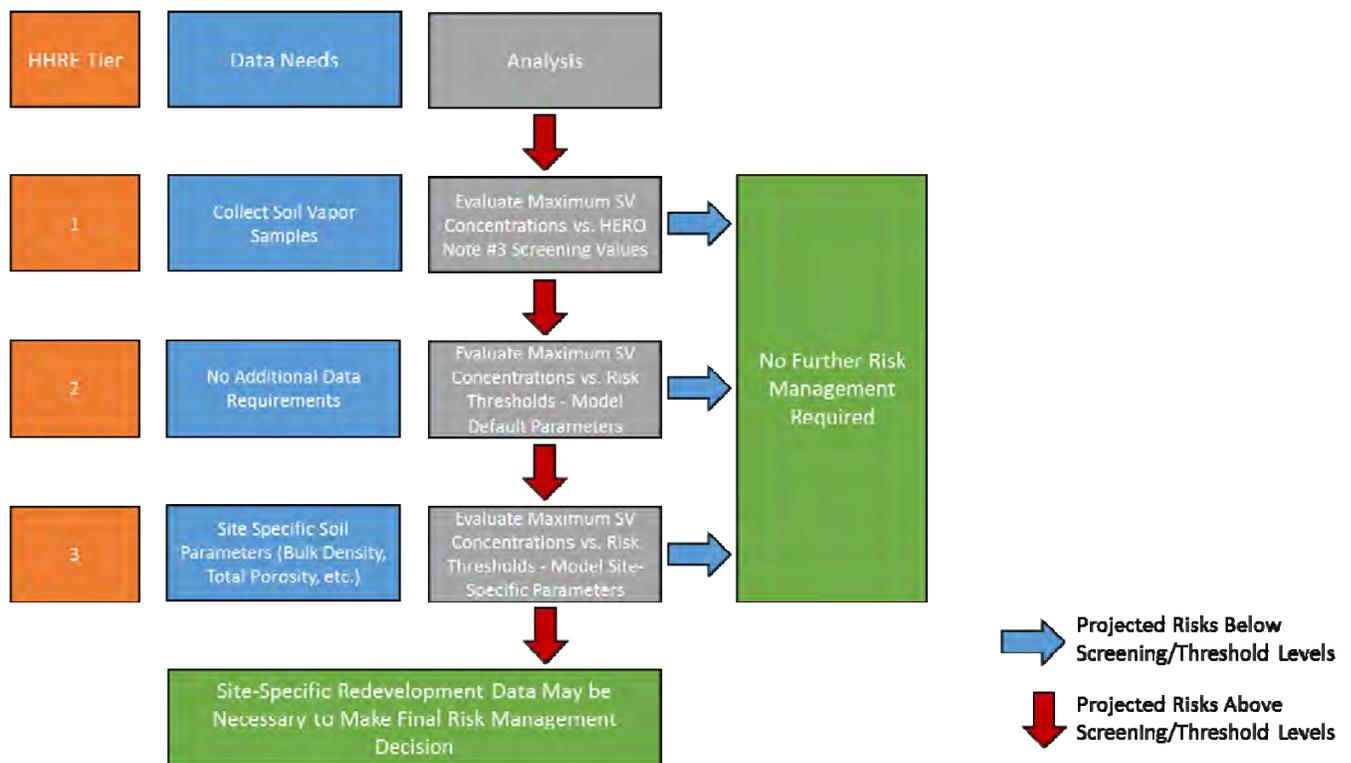

- Detections of other compounds in soil were either below residential/industrial PRGs, or soil levels for groundwater, or were within background for California soils.
- The soil and enhanced soil vapor investigations resulted in no detection of VOCs.

Therefore, the Project Navigator investigation:

1. Fulfilled the LARWQCB's request for additional investigations, at locations specified by the LARWQCB, and
2. Has shown that VOC contamination is not present in the subsurface soils and there is no evidence of any release at the Site.

### 3.0 HUMAN HEALTH RISK EVALUATION APPROACH

The objective of the soil vapor sampling proposed in this work plan will be to obtain and analyze soil vapor samples to allow a technically defensible position regarding the nature and extent of chemicals of potential concern in subsurface soil vapor and provide high quality data for regulatory agency decision-making regarding the long-term protection of human health. Equipoise anticipates that a multi-tier human health risk evaluation (HHRE) for the assessment of potential human health risks associated with the migration of soil vapors to indoor air at the subject Site would be beneficial. It is proposed that the structure of this multi-tiered HHRE progress from conservative regulatory screening criteria to site-specific modeling as necessary to isolate risk driving components, if any. The following flow chart summarizes the proposed multi-tier risk evaluation process.

The first tier of the analysis consists of a comparison of the maximum detected soil vapor concentrations in the 5 and 10 foot samples of each constituent for the proposed sample event to the corresponding chemical-specific Department of Toxic Substances Control (DTSC) Office of Human and Ecological Risk (HERO) Human Health Risk Assessment (HHRA) Note #3 recommended screening value for soil vapor intrusion risk screening (Cal/EPA, 2014). The soil vapor HERO Note#3 values represent concentrations in soil vapor that the Cal/EPA considers to be below thresholds of concern for risks to human health for specific land use conditions. The HERO Note #3 values are conservatively used to qualitatively screen sites for potential human health concerns associated with potential soil and/or soil vapor contamination.

Should reported constituent concentrations exceed the conservative HERO Note #3 screening values, a second tier of analysis will be conducted based on the modeling of potential indoor air risks associated with measured soil vapor concentrations for the Site using the Johnson and Ettinger Vapor Intrusion Model as maintained by Cal/EPA under assumed default soil and unrestricted land use exposure parameters. Projected human health risks will be compared to typical regulatory risk management levels for carcinogenic risk ( $1 \times 10^{-6}$ ) and noncarcinogenic hazard (1) under unrestricted land use conditions.

In the event default vapor intrusion modeling conditions applied in the second tier of this assessment project risk greater than typical regulatory thresholds, risks exceeding  $1 \times 10^{-6}$  and/or hazard greater than 1, a third tier of analysis will be conducted incorporating site-specific soil conditions. Due to the regulatory recommend vapor intrusion model's sensitivity to soil properties in projecting vapor migration potential; site-specific soil parameters including total soil porosity, water-filled porosity, and dry bulk density will be collected to use in the vapor intrusion modeling effort, as necessary<sup>7</sup>. The average of each soil parameter value for each soil interval depth sampled (5 and 10 feet bgs) will be used in the modeling of potential vapor intrusion.

---

<sup>7</sup> The site-specific soil parameters will be collected as part of field program, but these specific samples will only be analyzed if the second tier assessment results project a risk greater than typical regulatory thresholds as described within this paragraph.

## 4.0 SOIL VAPOR SAMPLING WORKPLAN

The objective of the soil vapor sampling will be to obtain and analyze soil vapor samples to allow a technically defensible position regarding the nature and extent of chemicals of potential concern in subsurface soil vapor and provide high quality data for regulatory agency decision-making. Soil vapor sampling will be conducted in accordance with the procedures and methodologies documented in the *Advisory – Active Soil Gas Investigations, Department of Toxic Substance Control, April 12*, which will subsequently be referred to as the 2012 *Draft Advisory* (presented in Appendix B).

### 4.1 RATIONALE FOR SOIL VAPOR SAMPLE LOCATIONS

In a December 6, 2006 letter, the LARWQCB divided the Site into three areas to be further investigated and the Project Navigator investigation was based on that approach. This additional soil vapor investigation will also be based on that approach. The areas are oriented north-south and roughly divide the Site into three strips (“APC-A” is the westernmost and “APC-C” is the easternmost) to be used for location purposes. The central “APC-B” strip encompasses the major manufacturing building that previously existed on the historic land use or other activities were identified for soil or soil vapor assessment by the LARWQCB.

The proposed soil vapor probes will be installed in APC-B and APC-C at locations identified on Plate 7 to supplement the results of the previous investigations and further characterize the location of the historical manufacturing building. The rationale for the soil vapor probe locations is as follows:

- APC-B: Five soil vapor locations will be installed in a north-south alignment within the footprint of the major manufacturing building. As previous investigation activities have not detected VOCs within this footprint, these samples will be roughly evenly spaced in a north-south alignment with three sample locations north of the existing building and two sample locations south of the existing building. The locations selected are within existing parking lot areas to minimize disturbance to operations at the Site and minimize access restrictions.
- APC-C: Four soil vapor locations will be installed in a north-south alignment within this area. Three of the soil vapor probes will be located to the north and west of the 2215 W. Mission Road property, with one soil vapor probe location to the north of 2215 W. Mission Road property, one soil vapor probe location to the west of the 2215 W. Mission Road property, and one soil vapor probe location near former sample probe location SG-21. property. The fourth soil vapor probe will be located in the northeastern corner to supplemental previous investigations at that location.

### 4.2 FIELD INVESTIGATION ACTIVITIES

The scope of work for the field investigation will consist of the following activities.

#### 4.2.1 Site Safety Plan Update

Prior to commencing field activities, Equipoise will update the Facility-wide health and safety plan (HASP) to identify potential chemical or physical hazards associated with the proposed field work that were not included in the previously prepared HASP. The HASP provides guidelines for use of personal protective equipment based on Facility-specific and work-specific conditions, location and direction to

the nearest emergency care facility, and contingency plans. The plan was prepared in accordance with United States Department of Labor Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response (HAZWOPER) Standard (29 Code of Federal Regulation [CFR] 1910.120) and State of California Department of Industrial Regulations, Title 8 California Code of Regulations (CCR) Section 5192.

The HASP will be on-site during field activities and Site workers will be required to review and sign copies of the employee acknowledgement and field health and safety meeting forms. Prior to the start of fieldwork each day, Equipoise field personnel will conduct a tailgate safety meeting to discuss key features of the plan with all Site workers.

#### **4.2.2 Mark and Clear Sampling Locations**

Prior to commencement of drilling activities, subsurface sampling locations will be marked in the field and Underground Services Alert (USA) will be notified. USA will contact utility owners of record within the Site vicinity and notify them of our intention to conduct subsurface investigations near underground utilities. Utility owners of record will be expected to mark the locations of their utilities on the ground surface throughout the area designated for investigation. To ensure proper sampling locations are selected and minimize the potential of encountering subsurface utilities, pipelines, and structures the following steps will be taken:

- a) Review appropriate maps, plans, or other documentation to assess the locations of subsurface features and obstructions at each location.
- b) Visually check each boring location to ensure that there are no impedances to access by the sampling equipment.
- c) Equipoise may subcontract a private utility locating company to conduct a utility clearance of each proposed boring location. Adjustments to borehole locations will be made, as required, to avoid identified utilities.
- d) Equipoise will notify Underground Service Alert (USA) at least 48 hours prior to drilling to mark known substructure locations and utilities within easements and/or the public right-of-way.

#### **4.2.3 Boring Advancement and Sampling**

Soil, soil vapor, and groundwater sample locations will be advanced, as possible, utilizing a truck- or track-mounted direct push drill rig. If refusal is encountered during drilling, borings may be completed using a small diameter hollow stem auger. During boring advancement, soil will be collected for observation and soil logging via 48-inch-length macro-core sampler lined with acetate sleeves. The macro-core is opened by removing the piston-stop by means of extension rods inserted into the probe rods. The sampler is then pushed approximately 48 inches. The rods and sampler will then be retrieved, the sampler disassembled, and the acetate sleeve removed for soil sample collection, identification and logging.

During advancement of soil borings, soil samples will be collected every 5 feet for lithologic logging purposes and for chemical and physical analysis as discussed below. Soil samples will be collected for chemical analysis at 9 soil vapor probe locations from two vertical depths (18 total samples) at 5 feet bgs

and 10 feet bgs. Soil samples will be collected for physical parameters at both depths at three soil vapor probe shown on Plate 7 where the sample is representative of the lithology of the vertical profile (6 total samples). Once the soil borings are advanced to their total depth, soil vapor probes will be installed in the boring, as described below.

Upon retrieval, the soil in the acetate sleeve will be logged by the on-site scientist in accordance with the Unified Soil Classification System (USCS), screened for the presence of VOCs using a handheld photoionization detector (PID) and recorded on the field boring logs. Approximately 6-inches of the acetate sleeve containing soil from the sampling interval will be cut, capped with Teflon sheets, sealed with plastic end caps, labeled with pertinent information, and placed in a cooler maintained at approximately 4°C. Soil samples will then be transferred, under chain-of-custody procedures, to Calscience for analysis. Soil samples submitted to Calscience will be analyzed for VOCs using USEPA Test Method 8260B.

Additional soil samples will be collected for testing of physical parameters. The additional soil samples will be labeled, placed in a separate ice-chilled cooler, and transferred under chain-of-custody procedures to PTS Laboratories for analysis of California Environmental Protection Agency (Cal/EPA) Department of Toxic Substance Control (DTSC) Vapor Transport Package (Johnson-Ettinger) physical parameters, that includes air permeability, porosity (total and water filled), volumetric air and water, moisture content, intrinsic permeability/hydraulic conductivity, grain density, dry bulk density, total organic carbon (toc), and soil classification. Physical properties sample depth and frequency may be modified based on actual field conditions (i.e., significant changes in lithology).

#### **4.2.4 Soil Vapor Probe Installation**

Soil vapor monitoring locations are proposed at nine locations as shown on Plate 7. Conditions encountered in the field may dictate that one or more boring location be adjusted. The need and rationale for adjusting a boring will be recorded and included in the documentation report. Once the static depth to groundwater has been established for each soil vapor sampling location, borings will be drilled for soil sampling and installation of soil vapor probes.

Soil vapor probes will be installed using either direct push methods or hollow-stem auger methods depending on technical practicality and cost.

After a soil boring is advanced to its total depth, soil vapor probes will be installed as shown in Plate 8), and in accordance with the DTSC Advisory for Active Soil Gas Investigation (DTSC, 2012) and the DTSC Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (DTSC, 2011). Each vapor probe will consist of a stainless steel implant (0.5-inch outer diameter by 1.75-inch long), including a 1-inch long 50 micron filter, attached to ¼-inch outer diameter Teflon, Nylaflo, or Polyetheretherketone (PEEK) tubing. The soil vapor probe and tubing will be fastened to a 1-inch diameter poly vinyl chloride (PVC) pipe. The PVC pipe will be placed at the bottom of the soil boring, and the deepest probe will be tied to the pipe so that the screen is placed exactly three inches above the bottom of the borehole. Fine-grained sand will be placed in the annulus extending 3-inches above and 3-inches below the tip of the soil vapor probe. Approximately one foot of dry, granular bentonite will be placed above the filter pack. The remaining annulus between the deep and shallow probes will be grouted with granular bentonite and hydrated in place to form a tight seal around the tube and prevent drawing air from the surface. The process will then be repeated for the 10-foot bgs and 5-foot bgs probes. At the time of installation, each probe will be labeled with the probe description and total depth. Each probe will be

completed with a three way valve, which will be left in the closed position to prevent infiltration of water/moisture and ambient air. Probes will be completed as semi-permanent monitoring points to allow for future re-sampling as needed, and each probe location will be completed at the surface with a 5-inch diameter traffic-rated well box with a concrete surface seal.

#### **4.2.5 Soil Vapor Sampling**

Soil vapor probes installed following direct-push drilled methods will be allowed to equilibrate for a minimum of two hours prior to sampling. If hollow-stem auger drilling methods are utilized for boring advancement, soil vapor probes will be allowed to equilibrate for a minimum of 48 hours prior to sampling (DTSC, 2012). Soil vapor sampling in non-paved areas will not be conducted within five days following a significant rain event (i.e., ½-inch or greater) due to possible effects on the subsurface vapor regime.

##### **Shut-In Test**

Prior to initiating sampling, a shut-in test will be conducted on the sampling train to check for leaks in the above ground fittings. Pressure gauges are added to the sampling train prior to the shut-in test. The in-line pressure gauges will be calibrated to indicate a vacuum change of 0.5 inches of water (inH<sub>2</sub>O). The shut-in test will be conducted by closing all valves on the sampling train, and applying a measured vacuum of about 100 inH<sub>2</sub>O to the sample train. The vacuum gauges will be observed for a period of sixty seconds. If the vacuum on the gauges does not noticeably dissipate during the sixty seconds the sample train will be considered “air-tight” (DTSC, 2012).

##### **Purging and Sampling**

Based on previous soil vapor investigations conducted at the Site, it is anticipated that three purge volumes will be evacuated from each probe prior to sample collection. Each purge volume includes the calculated internal volume of tubing, the estimated pore space of the sand pack around the probe tip, and the void space of the dry bentonite in the annular space. The purge rates during sample purging and collection will be kept at approximately 100 to 200 milliliters per minute (mL/min), and vacuum pressure should be less than 100 inches of water. If a high vacuum condition is present due to low permeability soil and a vacuum of greater than 100 inches of water is observed, alternative methods will be used for soil vapor sample collection (DTSC, 2012).

A modified purging and sampling procedure can be used for low flow vapor probes, per Appendix D of the Soil Gas Sampling in Low Permeability Soil (DTSC, 2012). Once the maximum vacuum pressure is exceeded and it is determined that a flow rate of 100 mL/min is not sustainable, the probe valve will be closed allowing the pressure inside the formation to come to equilibrium. When the vacuum is fully dissipated, the probe valve will be reopened, and another aliquot of sample collected. This procedure will be repeated until the soil gas probe is purged and sampled. In this manner, probes can be appropriately purged and enough sample volume can be collected for analysis. If this procedure is used, the rate of vacuum dissipation will be monitored with a dedicated vacuum gauge. The sampling crew may proceed with other nearby activities during the pressure rebound cycle. Additional pressure gauges, fittings, and a flow meter will be needed to implement this procedure in the field. Prior to purging and sampling, the sampling system will be shut-in tested to ensure that vacuum rebound is attributable to subsurface processes and not system leakage. Likewise, leak check compounds will be used during the entire sampling process to confirm the integrity of the sample (DTSC, 2012).

During purging and sampling, a leak check will be conducted using a liquid tracer (either 1,1-difluoroethane or isopropyl alcohol) to evaluate whether an adequate seal is established at the soil vapor probe interface with the ground surface. A leak test will be conducted at every vapor probe, each time a sample is collected to ensure the sample is not being diluted by ambient air.

### **Sample Collection and Handling**

Once purging is completed, samples will be collected into passivated stainless steel canisters (Summa canisters). Each Summa canister will be fitted by the laboratory with a vacuum gauge. The Summa canister vacuum will be recorded by the laboratory prior to shipment, by the field personnel upon receipt, and again prior to sample collection to verify the integrity of the canister (should be between 28 and 30 inches of mercury [inHg] vacuum). To ensure that samples are collected at flow rates less than 200 mL/min, an in-line flow controller will be installed at the inlet to the Summa canister. The Summa canister will then be connected to the soil vapor well and opened. The sample start time will be recorded by the on-site personnel. When the vacuum gauge on the Summa canister reads approximately five (5) inHg vacuum, it will be closed, the final vacuum recorded, and then disconnected from the sample train. The Summa canister will then be labeled with pertinent information on the supplied sample label, including the sample identification, time, and final vacuum. Samples will be transported, under chain-of-custody procedures, to Calscience for analysis of VOCs using USEPA Test Method TO-15.

#### **4.2.6 Sample Nomenclature**

After the sample containers are filled and preserved as required, they will be labeled. Sample labels will include the following information:

- Site/client name and location;
- Project number;
- Boring/probe identification number;
- Sample number;
- Date and time of sample collection;
- Analytical parameters;
- Any preservatives added to sample; and
- Initials of sampling personnel.

Unique identifiers will be utilized for each sample and sample location. Each sample will be identified to include the boring number, the type of sample collected (soil or soil vapor), and the interval from which the sample was collected. In addition, the laboratory will assign its own unique laboratory identification numbers for each sample analyzed. The project protocol for naming individual samples is as follows:

- Soil vapor sample locations will include the Site identification along with the soil vapor (SV) probe location number. For example soil vapor samples collected from boring “B2” in the APC-B Area will be designated “APC-B-SV-B2”, respectively.
- The sample interval will be incorporated in the sample name. For example, a soil sample collected from boring location “APC-B-SB-B2” at a depth of 10 feet bgs will be designated “APC-B -SB-B2-10” and a soil vapor sample where the probe is installed to a depth of 10 feet will be designated “APC-B -SV-B2-10”.

#### **4.2.7 Sample Location Survey**

Upon completion of drilling activities, soil and soil vapor locations will be surveyed for latitude, longitude, and elevation (X, Y, and Z) using a hand-held global positioning system (GPS) capable of sub-meter accuracy. After collection of the data, it will be downloaded to a workstation and post-processed using differential correction to a known fixed point to provide the most accurate data.

#### **4.2.8 Quality Assurance/Quality Control**

QA/QC procedures will be conducted in accordance with applicable professional standards, state and federal requirements, regulations, and guidelines, as well as specific project goals and requirements. The QA objectives are to assure that sampling, field and laboratory data measurements, field and laboratory chain-of-custody procedures, laboratory analyses, and reporting activities result in data that are precise, accurate, representative, complete, comparable, and technically and legally defensible. QA is the overall goal, while QC represents the specific steps and procedures to be followed during the course of investigation activities to achieve QA. The data generated from soil vapor sampling activities will not be considered invalid if the QA/QC criteria are not fully achieved, but variances will trigger the appropriate QA/QC measures needed to evaluate and correct these activities as, and if, necessary.

Field and analytical QA/QC procedures are generally quantitative and qualitative. Typically quantitative procedures involve the analysis of QC samples. Quantitative procedures provide a measure of precision, accuracy and completeness. Qualitative procedures involve standardization of sample collection and analysis methodologies. Qualitative procedures provide a subjective measure of representativeness and allow for comparability of data from different samples and comparability of data with time.

Non-dedicated equipment used for monitoring and sampling will be properly assembled, cleaned, and calibrated (if necessary) prior to arriving at the Site. As required, field analytical equipment will be calibrated in accordance with manufacturer's specifications prior to use. A new pair of disposable Nitrile gloves will be donned by field personnel during each field task.

For soil samples, a carbon-free, deionized water sample provided by the laboratory and labeled "trip blank" will be provided by the laboratory. For soil vapor samples, a certified-clean Summa canister filled by the laboratory with "high purity air" and labeled as "trip blank" will be provided by the laboratory. A trip blank of the appropriate media will accompany the samples during all stages of shipment, storage and analysis. The trip blanks will be utilized to evaluate whether artificial introduction or cross-contamination of analytes into the investigation samples during transportation and sample handling processes has occurred. One trip blank will accompany each sample delivery group from the field to the laboratory during each sampling event. Trip blanks will be analyzed for VOCs and reported alongside the samples analyzed from the sample delivery group.

If anomalies or nonconformancies are discovered, the QA/QC Officer will instruct the laboratory to review the submitted data and the methods used to obtain the data. If appropriate, the field data and narrative records pertaining to the samples in question will also be reviewed. Data that meet the quality assurance objectives of this project will be considered usable.

#### **4.2.9 Field Documentation**

Field data will be recorded on daily field work forms. Daily activities will be described in chronological order and will include times key personnel are on-site, meteorological conditions, a summary of drilling and

sampling activities, significant contacts with agency personnel, deficiencies noted during field measurements, levels of personal protective equipment donned, if borings/sample locations are altered with the rationale/justification will be documented and problems or unusual occurrences. Quantitative data, such as field PID readings and groundwater purging and sampling will be entered on field forms such as boring logs and groundwater sampling field data sheets. The entry for each day's activities will be dated and identified at the top of each page.

Preprinted forms will be used to record data that are collected repeatedly, including the following:

- Boring Logs and well completion diagrams;
- Sample Labels;
- Soil vapor purging and sampling logs; and
- Chain-of-custody records.

#### **4.2.10 Decontamination Procedures**

Non-dedicated equipment will be decontaminated after each use. Large drilling equipment will be decontaminated using a high-pressure steam cleaner. Smaller equipment will be decontaminated using a three-stage wash consisting of a non-phosphate detergent and potable water wash followed by potable and distilled water rinses. Decontamination fluids will be placed into properly labeled, Department of Transportation (DOT)-compliant 55-gallon drums pending disposal.

#### **4.2.11 Management and Disposal of Investigation-Derived Wastes**

Investigation-derived waste (IDW) generated during field activities, including soil cuttings and decontamination fluids will be placed into separate, appropriately labeled, DOT-compliant, 55-gallon drums, and stored at a secure location on-site. Drums will be stored on-site for a period of no more than 90 days, pending review of the analytical data to evaluate disposal options. Drums will subsequently be transported and disposed of off-site by a licensed waste-hauler at an appropriate waste receiving facility, under proper manifest.

## 5.0 REPORTING

At the conclusion of the field investigation a Soil Vapor Assessment Report will be prepared to describe the scope, methodologies, and findings of the “snap-shot” assessment completed at the Site and include a summary of previous site assessment activities. At a minimum the Soil Vapor Assessment Report will include:

- A description of the investigation, including investigative methods and procedures;
- A summary of the investigation results;
- A discussion of key decision points encountered and resolved during the course of the investigation;
- A discussion of any deviations from the scope of work;
- Facility and Site plates showing soil vapor probe locations;
- Tables summarizing sampling parameters, analytical data, remediation results, and other parameters as appropriate;
- Analytical laboratory data sheets and QA/QC information
- Human health risk evaluation calculations and discussion of results
- An assessment of the Quality Assurance/Quality Control (QA/QC) program effectiveness;
- Conclusions and recommendations; and
- Signature and stamp of appropriate California registered professional.

The final report will document the soil and soil vapor analytical data, boring logs, well construction schematics, and plates will be submitted electronically to the State Water Resources Control Board's GeoTracker geographic information system.

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

### FOREWORD

In a coordinated effort, the Department of Toxic Substances Control, the Los Angeles Regional Water Quality Control Board, and the San Francisco Regional Water Quality Control Board have jointly developed the *Advisory – Active Soil Gas Investigations*. This document attempts to ensure that high quality data used for regulatory decision making are collected during active soil gas investigations using consistent methodologies. The document was reviewed by other government organizations and the regulated community. Their comments were considered and the Advisory changed in response to those comments. The Advisory also addresses recent developments in the field of soil gas collection. As additional information and experience are obtained, this Advisory may be modified as appropriate.

The information in the Advisory should not be considered as regulations. Mention of trade names or commercial products does not constitute the agency endorsement or recommendation.

If you have any questions or comments regarding this document, please contact Theodore Johnson of DTSC at via email at [tjohnson@dtsc.ca.gov](mailto:tjohnson@dtsc.ca.gov).

## ACKNOWLEDGMENTS

Preparation of this Advisory was achieved through the efforts of the following individuals at the California Environmental Protection Agency:

Rafat Abbasi	Department of Toxic Substances Control
Elizabeth Allen	San Francisco Bay Regional Water Quality Control Board <sup>1</sup>
Bill Bosan	Department of Toxic Substances Control
Phil Chandler	Department of Toxic Substances Control
Craig Christmann	Department of Toxic Substances Control
Dan Gallagher	Department of Toxic Substances Control
Joe Hwong	Department of Toxic Substances Control
Theo Johnson	Department of Toxic Substances Control
Dot Lofstrom	Department of Toxic Substances Control
Lynn Nakashima	Department of Toxic Substances Control
Yue Rong	Los Angeles Regional Water Quality Control Board
Thizar Williams	Los Angeles Regional Water Quality Control Board
Peter Wong	Department of Toxic Substances Control <sup>2</sup>

Also, David Berry, Ken Chiang, Rebecca Chou, Bryan Eya, Jeffrey Hu, and Christine Papagni provided invaluable assistance in the revision of this document. The California Environmental Protection Agency thanks them for their efforts.

This document was developed jointly under the direction of Debbie Raphael, Director, Department of Toxic Substances Control, Samuel Unger, Executive Officer, Los Angeles Regional Water Quality Control Board, and Bruce Wolfe, Executive Officer, San Francisco Regional Water Quality Control Board. Without their support, completion of this document would not have been possible.

The committee would like to acknowledge the contribution from soil gas practitioners that provided extensive and valuable comments, improving the overall quality of this document. More than 440 public comments on the Draft Advisory were received. Every comment was considered and the Advisory was changed in response to those comments. The Advisory was also revised to address recent developments in the field of soil gas collection. The Soil Gas Workgroup thanks all contributors for their efforts which improved the Advisory through their thoughtful observations.

---

## **1.0 INTRODUCTION**

The Advisory – Active Soil Gas Investigations (ASGI or Advisory) provides technically defensible and consistent approaches for collecting and analyzing soil gas samples. The Advisory is not a regulation. It does not impose any requirements or obligations on the regulated community. Rather, it provides a technical framework and reference for addressing soil gas sample collection and analysis. It is not intended to determine the need for soil gas samples, but rather to serve as a guide once a decision has been made to collect soil gas samples. Other technically equivalent procedures may exist. This Advisory is not intended to exclude alternative approaches or methodologies. The Advisory is a compilation of available information, knowledge, experience and best practices regarding soil gas sampling. The mention of trade names or commercial products in this Advisory is for illustrative purposes only, and does not constitute an endorsement or exclusive recommendation by the contributing government agencies.

Active soil gas sampling and analysis refers to the methods utilized to collect vapor phase data at sites potentially affected by volatile organic compounds (VOCs), chlorinated solvents, petroleum hydrocarbons, methane, hydrogen sulfide and semi-volatile organic compounds (SVOCs). The data obtained from a soil gas investigation can be used to identify the source and spatial distribution of contamination at a site or to estimate contaminant indoor air concentrations for risk assessment purposes. For guidance on evaluating the risk associated with vapor intrusion to indoor air, including sub-slab sampling, consult the DTSC Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (October 2011), hereafter referred to as the Vapor Intrusion Guidance.

Within the subsurface, contaminants may exist in the following phases:

- 1) Solid phase by adsorbing onto the organic fraction of soil;
- 2) Aqueous phase by dissolving in groundwater and pore water;
- 3) Non-aqueous phase liquid (NAPL); and/or
- 4) Gaseous phase, by accumulating in the interstitial space of soil particulates as soil gas.

Thus, soil matrix and groundwater sampling and analysis should be considered for site characterization in addition to soil gas sampling to ensure that all potential phases of VOCs are evaluated and their associated exposure pathways. Soil gas sampling is practical and preferred for many geologic materials, and, with care, can be successful in fine-grained soils.

This document supersedes the 2003 *Advisory – Active Soil Gas Investigations* (Cal/EPA, 2003) and 1997 LARWQCB *Interim Guidance for Active Soil Gas Investigations* (CRWQCB, 1997). It is the opinion of Cal/EPA that active soil gas investigations should be performed in accordance with this document. However, as noted above, other technically equivalent procedures may exist, and this Advisory is not intended to exclude alternative approaches or methodologies.

## **2.0 INITIAL PROJECT PLANNING AND WORKPLAN DEVELOPMENT**

### **2.1 STUDY PURPOSE AND DATA QUALITY OBJECTIVES**

A soil gas investigation may be undertaken for a number of different reasons and a single investigation may have multiple objectives. The data quality objectives (DQOs) for each investigation will vary according to the overall goals of each specific investigation. Examples of different purposes for performing a soil gas investigation are provided below:

- Determining if discharges of contaminants have occurred which may impact indoor air, outdoor air and groundwater, such as leaks at aboveground storage tanks (AST), underground storage tanks (USTs) or other underground pollution sources;
- Determining the spatial patterns and extent of vapor phase soil contamination,
- Designing and monitoring the performance of a soil vapor extraction system;
- Mapping soil vapor plumes to select buildings for indoor air monitoring;
- Creating a stand-alone data set for performing a vapor intrusion risk assessment using either generic attenuation factors or a mathematical model to estimate indoor air concentrations from soil gas data;
- Remedy performance monitoring; and
- Providing data for no-further-action determinations at impacted sites.

The DQO process is a systematic planning tool based on the scientific method for establishing criteria for data quality and for developing data collection procedures. By using the DQO process to plan environmental data collection efforts, the effectiveness, efficiency and defensibility of decisions can be improved. DQOs should be established before an investigation is started. Example input parameters to the DQOs include past, current and future land uses, regulatory action levels for contaminated media, laboratory method reporting limits, and the appropriate sample collection method. The expected output is the most resource-effective design for the study. Information concerning DQOs is provided in USEPA (1994a, 1994b, 2000a). A critical step in developing site-specific DQOs is the generation of a conceptual site model (CSM), discussed below in Section 2.3.2.

### **2.2 TECHNICAL DOCUMENTS**

Each soil gas investigation should have two technical documents: a workplan that describes the investigation in detail, and a report that describes the results of the investigation and the analysis of data. The workplan should incorporate the CSM and DQOs as a framework for the planned investigation. The CSM should be updated during the investigation as data gaps are addressed.

### **2.3 WORKPLAN**

A workplan should be prepared and submitted to the regulating agency for review and approval according to the agreed upon schedule. Any variations or deviations from this Advisory should be specified in the workplan. The soil gas workplan may be incorporated as part of a comprehensive site investigation workplan or as a stand-alone

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

document, depending on site-specific circumstances. The workplan should include a CSM, sampling and analysis plan (SAP), and DQOs. The decision making criteria for step-out sampling should be included in the workplan.

The workplan should have contingences to address unexpected field conditions, such as larger than anticipated contaminant plumes, low flow or no flow conditions, and resampling when anomalous data are obtained. Anomalous data are defined as data which are inconsistent with the CSM. Additional points may be required to resolve anomalies.

The regulating agency should be informed of any problems, unforeseen site conditions or deviations from the approved workplan. If modifications to the approved workplan are going to be implemented, the regulating agency should be notified and provided an opportunity to review the changes prior to implementation. Changes made without prior agency approval should be clearly documented in subsequent reports, including justification for these changes.

The project proponent should notify the regulating agency 10 working days prior to implementation of field activities. All necessary permits and utility clearances should be obtained prior to conducting any investigations described in this Advisory.

### **2.1.1 Elements of the Workplan**

Specific information that the regulating agencies will expect to see in a workplan include the following:

- 1) Site background;
- 2) CSM;
- 3) A SAP that contains the number, location and depth of sampling points and the rationale for this decision;
- 4) A statement of the investigation objectives relative to the site-specific DQOs;
- 5) A statement as to whether permanent or temporary soil gas wells are to be installed. See DTSC (2011) for guidance concerning the need for the installation of permanent soil gas wells;
- 6) A statement as to whether a mobile and/or stationary laboratory will be used, and the rationale for making this decision;
- 7) A schematic diagram of the well design;
- 8) A schematic diagram of the sampling train;
- 9) A geological cross-section of the site showing the major lithologic units and zones for vapor monitoring;

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

- 10) Procedures for soil gas sample collection and the analytical methods to be used along with their laboratory detection limits;
- 11) Contaminant analyte list;
- 12) Considerations for sampling frequency pursuant to the DQOs established for each site;
- 13) Procedures to properly decommission soil gas wells to effectively prevent cross-contamination in the subsurface;
- 14) A project-specific quality assurance project plan (QAPP) for the project if no existing approved QAPP is applicable;
- 15) Procedures for handling and disposing of investigation-derived waste in accordance with federal, state and local agency requirements; and
- 16) A site-specific Health and Safety Plan.

### 2.1.2 Conceptual Site Model

A CSM is an integral part of all site investigations. The purpose of a CSM is to provide a conceptual understanding of the potential for exposure to hazardous contaminants at a site based on:

- Sources of contamination;
- Release mechanisms;
- Transport media;
- Exposure pathways; and
- Potential receptors.

The CSM also aids in the justification for the number, location and frequency of samples. The CSM should consist of descriptive text and diagrammatic or schematic figures relating the sources of contamination to receptors and the environment. The CSM organizes and communicates information about the site characteristics and provides all interested parties with an understanding of the potential for exposure to chemicals of potential concern (COPCs) at a site. Additional resources regarding CSMs include: (1) DTSC, 2011; (2) ITRC, 2007; (3) DTSC, 1994; (4) USEPA, 1988; (5) USEPA, 1989; and (6) USEPA, 1994.

The basic components of a CSM are:

- 1) Type of contaminants, including VOCs, currently or previously stored or handled at the site, to develop a site-specific target analyte list;
- 2) Known concentrations of COPCs in media such as soil gas, soil and groundwater;
- 3) Identification of the primary and secondary sources of COPCs;
- 4) Location, depth, and phase(s) of COPCs;

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

- 5) Primary release mechanism;
- 6) Exposure media such as surface soil, drinking water and air;
- 7) Potential human and ecological receptors and groundwater; and
- 8) Unique site features.

The CSM is a dynamic and iterative tool, and is updated as new information becomes available. Therefore, it should be reviewed after each stage of investigation and revised as appropriate.

The following information should be considered to identify contaminant sources, potential release mechanism(s) and pathway(s) for vapor migration:

- Soil types;
- Subsurface geology;
- Hydrogeology (local and regional), including depth to groundwater and groundwater flow direction;
- Subsurface heterogeneity;
- Preferential pathways, such as fractures, sand lenses, and utility corridors;
- Groundwater quality data;
- Regional groundwater flow direction;
- Well records;
- Boring logs;
- Building construction details; and
- Surficial features of the area, such as ground cover and surface water bodies.

A CSM should be supported by contaminant plume maps and geological cross sections. The narrative description should clearly describe known site conditions and state what assumptions were made to generate the CSM.

### **2.1.3 Sampling and Analysis Plan**

The SAP should specify all procedures and techniques used for soil gas sample collection, shipment, analytical procedures and chain of custody documentation. Field personnel should follow the SAP while collecting and analyzing soil gas samples.

The SAP should identify proposed sampling points, known or inferred extent of contamination, potential or known areas of concern and pertinent features such as existing or former sumps, trenches, utility corridors, drains, sewer lines, clarifiers, septic systems, piping, ASTs, USTs and waste management units. Generally, the SAP should contain:

- Sampling objectives;
- Sample location and frequency;
- Pre-sampling activities;
- Sample equipment and collection procedures;
- Sample handling and analyses;
- Chain of custody control and records management;
- Analytical procedures;

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

- Field instrument and laboratory detection limits;
- Field and laboratory quality assurance/quality control (QA/QC); and
- Evaluation of data quality.

The SAP should also contain a quality assurance project plan describing the policy, organization, activities and protocols necessary to achieve the data quality objectives dictated by the intended use of the data. The QAPP should include the following applicable information:

- Project description, management/organization and responsibilities;
- Quality assurance objectives;
- Sampling, calibration and analytical procedures;
- Data acquisition, reduction, validation and reporting;
- Documentation;
- Internal quality control;
- Performance and systems audits;
- Preventative maintenance;
- Data assessment procedures;
- Corrective actions; and
- Quality assurance reports.

Project tasks and time lines, including dates anticipated for initiating and completing sampling activities should also be included in the SAP.

### **2.4 SOIL GAS INVESTIGATION REPORTS**

A soil gas investigation report should be submitted to the regulating agency at the conclusion of the investigation. Electronic data files should be submitted in accordance with the electronic data format requirements of the oversight agency.

Reports should include the following information:

- Description of field operations (including purge testing and leak check compounds);
- Analytical methods used;
- Analytical results;
- Analysis and revision of the CSM based on data obtained from the soil gas investigation;
- Deviations from the approved workplan;
- Data inconsistencies;
- Data gaps identified based on the revised CSM; and
- Conclusions and recommendations.

Additionally, the following tables and diagrams should be included in the Report:

- 1) Site plan and sample location maps;

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

- 2) Plume maps and geologic cross sections with isoconcentration contours displaying the limits of contamination. Data from previous investigations may be included provided the data are presented in a way that distinguishes them from the current investigation;
- 3) Boring logs;
- 4) Construction and as-built diagrams for soil gas wells;
- 5) Summary tables for analytical data;
- 6) Legible copies of field and laboratory notes or logs;
- 7) All analytical results and QA/QC information including tables and explanation of procedures, results, corrective actions and effect on the data;
- 8) All raw data including chromatograms and calibration data if specifically requested by the regulating agency; and
- 9) Electronic data deliverables submitted in the format specified by the regulating agency.

All engineering or geologic work should be performed or supervised by a California Registered Professional in accordance with the Business and Professions Code, chapters 7 and 12.5, and the California Code of Regulations, title 16, chapters 5 and 29.

### 3.0 SOIL GAS INVESTIGATION DESIGN

The number, location and depth of soil gas samples should be based on the CSM and the project-specific DQOs, as well as the following general guidelines.

#### 3.1 LOCATION, SPACING AND DEPTH

Subsurface contamination should be delineated three-dimensionally. Vertical soil gas delineation is achieved by collecting soil gas samples at varying depths in a single location, or by using closely spaced soil gas wells installed at varying depths.

##### 3.1.1 Lithology

Locations and depths for soil gas monitoring wells should be based on site-specific lithologic information. If on-site lithologic information is not available prior to conducting the soil gas investigation, one or more continuously cored boring(s) should be installed at the first location to the proposed greatest depth of the soil gas investigation. If the soil gas data are to be used for human health risk assessment, geotechnical data may be needed. Geotechnical information needed for vapor intrusion risk assessment purposes can be found in DTSC's Vapor Intrusion Guidance (DTSC, 2011).

Lithologic logs should be prepared for all borings, including soil matrix and geotechnical borings. Information gathered from the continuously cored borings may include lithologic descriptions, geotechnical data and contaminant data. Information collected from borings should be used to update the CSM. All boring logs generated during the soil gas survey should be provided to the regulating agency.

##### 3.1.2 Sample Spacing

Sample spacing may be based on historical site use or known or potential release sources. Initial spacing can be grid-based such as samples spaced on a 50- by 50-foot grid. Alternatively, initial sampling can be based on historical or suspected site use. When areas of contamination are identified, a more focused grid spacing or biased sampling approach may be employed. Use a close interval grid or radial or step-out sampling pattern such as 10- to 20-foot grid pattern and multi-level sampling at 5-, 10-, 15-feet vertically to delineate identified contaminant areas. If historical information for the area is unknown, a screening grid pattern, such as 100- by 100-foot may be used.

##### 3.1.3 Sample Depth

All available information such as boring logs and field instrument readings from soil cuttings or cores should be used to select the correct depths to collect soil gas samples. Probes should be installed at depths with elevated vapor readings and/or slightly above fine-grained soils. If vertical characterization to groundwater is needed, the deepest soil gas sample should be collected near the top of the capillary fringe. Soil gas wells or probes<sup>3</sup> should not be installed within or below the capillary fringe. Nested soil gas wells

---

<sup>3</sup> The term "soil gas monitoring well", "soil gas well", "soil vapor well", and "soil vapor probe" are considered equivalent and used interchangeably within the Advisory.

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

may be installed in the annular space of groundwater monitoring wells to serve as a dual-purpose well if both vapor and groundwater monitoring are required.

Soil gas sample depths should be chosen to minimize the effects of changes in barometric pressure and temperature, breakthrough of ambient air from the surface, and to ensure that representative samples are collected. Soil gas samples collected at less than 5 feet below ground surface (bgs) may be subject to barometric pressure effects and prone to breakthrough of ambient air through the soil column. Consideration should be given to source location, types of chemicals of concern and the lithology encountered. Variation of sample depths and the need for deeper sample locations should be evaluated based on site-specific characteristics and DQOs.

When evaluating vapor intrusion, sampling soil gas immediately adjacent to a building's foundation may be a viable option if the samples are collected near the contaminant source. Soil gas samples collected immediately above the source of contamination are more likely to be representative of what may be in contact with the building's foundation (Hers et al., 2006 and DiGiulio and Cody, 2006). Likewise, the numerical modeling conducted by Abreu and Johnson (2005) and Abreu and others (2006) also suggests this relationship. Hence, risk estimates may be biased low if quantified with shallow soil gas measurements (five feet below grade) using the Johnson and Ettinger (1991) model. Accordingly, collecting soil gas samples near contaminant sources is recommended for vapor intrusion modeling. Vertical soil gas sampling should be conducted to determine the source of subsurface contamination. Ideally, numerous vertical profiles of soil gas should be developed at the site to accurately locate subsurface sources. Once located, soil gas collection can be targeted at these depths site-wide. Typically, contaminant sources are adjacent to the areas of highest subsurface concentration.

### **3.2 INSTALLATION PROCEDURES**

Soil gas well installation procedures are described below. Soil gas well construction should ensure a good seal between the formation and sampling assembly, and minimize ambient air breakthrough. Additional standards may be required by local oversight agencies.

#### **3.2.1 Installation Methods and Design**

Soil gas wells may be installed using a variety of drilling methods such as direct push, hollow stem auger or hand auger. Certain drilling methods that significantly disrupt soil gas equilibrium, such as air rotary and roto-sonic, may be employed if longer equilibration times are used prior to sampling. The mud rotary drilling method is not acceptable for soil gas probe emplacement under any circumstances. Following is a step-by-step guide to soil gas well (probe) installation after the borehole has been drilled:

- 1) Install a sand pack to minimize disruption of airflow to the sampling tip. A tremie pipe should be used for soil gas wells deeper than 15 feet to avoid bridging or segregation during placement of the sand pack and bentonite seal. The sand

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

pack should be a minimum of six inches thick. Place the probe tip midway in the sand pack, as shown on Figure 1;

- 2) Emplace at least six inches of dry granular bentonite on top of each sand pack, as shown on Figure 1. Following the dry bentonite, fill the borehole to the surface with hydrated bentonite. The bentonite should be hydrated in a container at the surface and then slowly poured into the borehole. The purpose of the dry granular bentonite between the sand pack and the hydrated bentonite is to prevent hydrated bentonite from infiltrating the sand pack. Follow a similar procedure for deep well construction with multiple probe depths, in that one foot of dry granular bentonite should be emplaced on top of the sand pack encasing each probe, followed by hydrated bentonite. The hydrated bentonite should continue until the next sand pack, as shown on Figure 1. A cement/bentonite mixture may also be used above the dry bentonite layer to seal the borehole annulus, consistent with California Department of Water Resources Bulletin 74-90 (California Well Standards) (DWR 1991). Dry and hydrated bentonite layer thicknesses may be adjusted based on probe use (such as sub-slab probes).
- 3) A down-hole rod should be used to support the well tubing in the borehole. The support rod ensures that the probe tip is placed at the proper depth. The support rod should be constructed to avoid possible cross contamination or ambient air intrusion. Alternative probe support designs with accompanying descriptions may be proposed in the project workplan. Justification should be included in the project workplan if the project proponent chooses not to use probe support for deep soil gas wells.

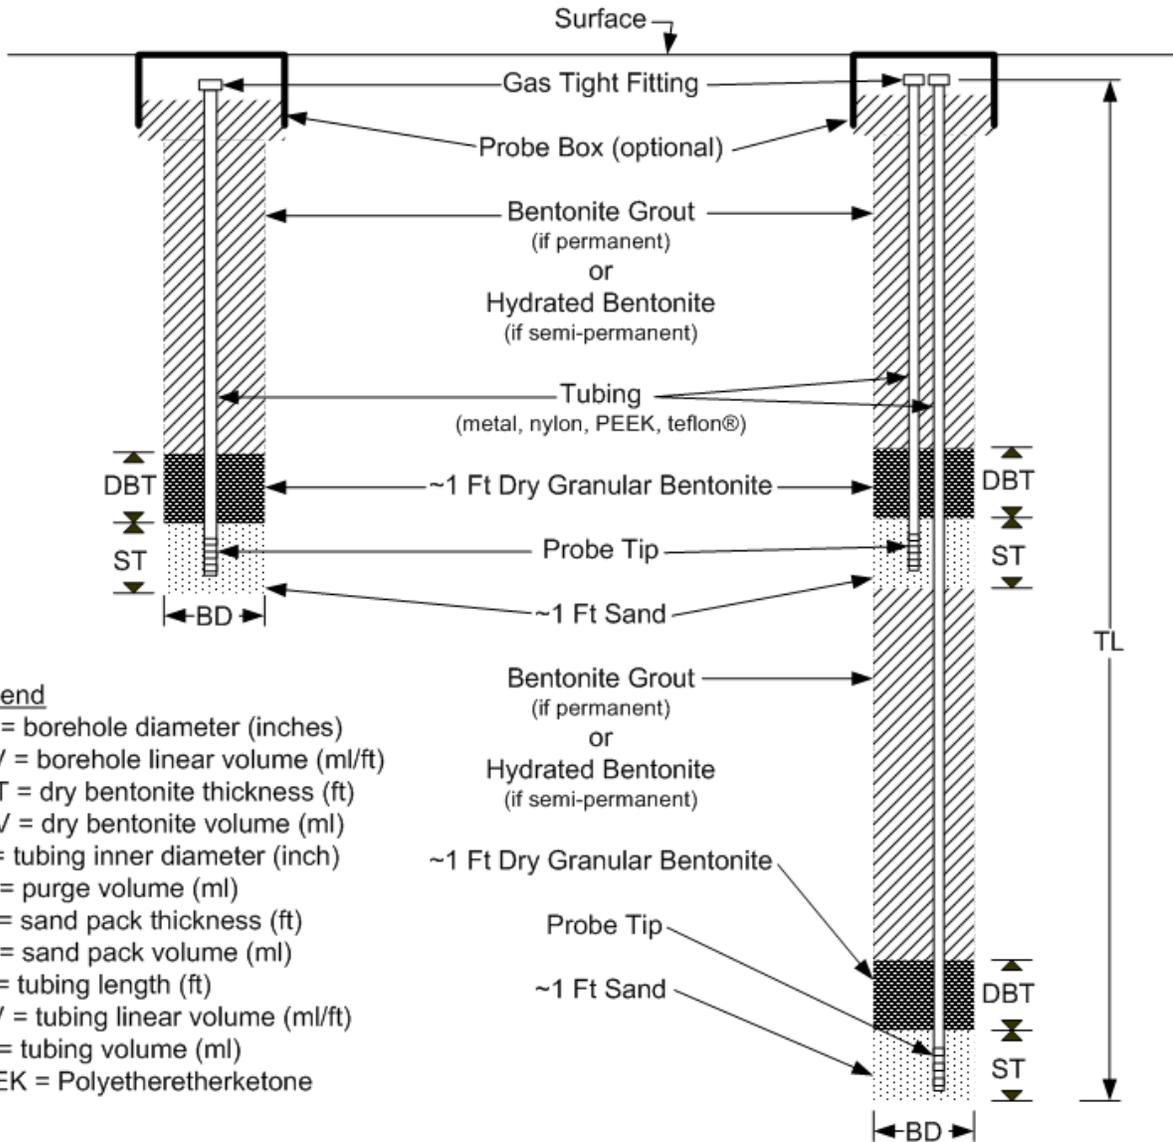

### 3.2.2 Temporary and Permanent Wells

Permanent or temporary soil gas wells may be used for collecting samples. Permanent sampling points are installed so that repeated sampling can be conducted, as necessary, to evaluate seasonal or temporal variations. Temporary sampling points are typically used for one or two sampling events and then decommissioned in accordance with Section 3.4 of this Advisory.

**ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

Figure 1

Typical Single and Nested Soil Gas Probe Design & Purge Volume Calculation

(1)  $TV = TL \times TLV =$                   

X 6 if tubing ID = 3/16" = \_\_\_\_\_ ml  
 X 16 if tubing ID = 5/16" = \_\_\_\_\_ ml  
 X \_\_\_ if tubing ID = \_\_\_" = \_\_\_\_\_ ml

(2)  $DBV = DBT \times BLV =$                   

X 350 if BD = 2 1/8" = \_\_\_\_\_ ml  
 X 820 if BD = 3 1/4" = \_\_\_\_\_ ml  
 X \_\_\_ if BD = \_\_\_" = \_\_\_\_\_ ml

(3)  $SV = ST \times BLV =$                   

X 280 if BD = 2 1/8" = \_\_\_\_\_ ml  
 X 660 if BD = 3 1/4" = \_\_\_\_\_ ml  
 X \_\_\_ if BD = \_\_\_" = \_\_\_\_\_ ml

Note: porosity of 50% used for dry bentonite and 40% used for #3 sand pack to calculate BLV.

1  $PV = (1)TV + (2)DBV + (3)SV =$                    ml

### 3.2.3 Sampling Tubing

To minimize purge volume, use small diameter (1/8 to 1/4 inch) sampling tubing from the vapor probe tip to the ground surface, made of material which will not react or interact with site contaminants. The probe tip, probe and probe connectors should all have the same diameter to provide a good seal between the formation and the sampling assembly. The following steps will help ensure a good-quality soil gas sample.

- 1) Clean, dry tubing should be used at all times. If any moisture or unknown material is present in the tubing prior to insertion, decontaminate or replace the tubing;
- 2) The bottom-end of the tubing should be attached to a soil gas probe tip. Downhole equipment (probe screens, tie wires, etc.) or drive heads should be free of cutting oils and other contaminants;
- 3) Metal tubes should not be used to collect hydrogen sulfide samples. Nylaflo<sup>®</sup>, polyetheretherketone (PEEK), and Teflon<sup>®</sup> are recommended for soil vapor sampling. Low-density polyethylene (L-D PE) should not be used due to decreased performance relative to other tubing types in both off-gassing of VOCs inherent in the tubing structure (contribution to background) and for decreased contaminant recovery (reactivity). Reduced recovery of naphthalene was observed when using Nylaflo<sup>®</sup> tubing with small sample sizes. For additional information, see Appendix B;
- 4) Prior to sampling, an assembled soil gas probe, tip and tubing should be blank tested at a frequency of one analysis per new batch of tubing or material used.

### 3.2.4 Drive Point Method

Post-run tubing (PRT) and drive point methods<sup>4</sup> used to create temporary soil gas wells may be used to rapidly acquire soil gas samples when carefully installed. Contractors should ensure that installation includes regularly checking and cleaning of the PRT tip threads and its seat and changing the O-rings on a daily basis. Contractors should use stiff tubing to couple the PRT tip to the connective hose and use 1/4 inch outer diameter, thick-wall tubing to ensure sufficient torque is available to screw the tip tightly into the seat. If the O-ring is not seated properly into the drill rod, ambient air from inside the rod could enter into the sampling system, introducing ambient air into the soil gas sample. The integrity of the seal of the O-ring cannot be readily evaluated with a leak check compound.

Representative soil gas samples may be difficult to obtain with PRT and drive point methods in certain lithologies. Drive point probes may be deflected by consolidated lithologies and strata containing cobbles or boulders, which can create gaps between

---

<sup>4</sup> Drive point methods may be appropriate for certain site conditions or circumstances depending on DQOs. The use of post-run tubing should be discussed with the regulating agency prior to inclusion in the workplan.

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

the outer wall of the drive rod and the subsurface that are difficult to observe and equally difficult to seal. A hydrated bentonite plug at ground surface does not stop communication along the annular space. Samples collected under these circumstances will potentially draw soil gas primarily from the most permeable layer above the probe tip which may introduce a significant bias. Moreover, this condition is difficult to identify by a leak check compound applied at or near ground surface. Collecting representative soil gas samples in these conditions may require alternative sampling methods such as passive soil gas sampling or the installation of permanent sampling wells.

### **3.3 SOIL GAS WELL COMPLETION**

Soil gas wells should be secured, capped and completed to prevent infiltration of water or ambient air into the subsurface, and to prevent accidental damage or vandalism. Mark the tubing at the surface to identify the probe location and depth. For surface completions, the following components may be installed:

- Gas-tight valve or fitting for capping the sampling tube;
- Utility vault or meter box with ventilation holes and lock;
- Surface seal; and
- Guard posts.

### **3.4 DECOMMISSIONING**

When sample collection ceases at a vapor well, properly remove or decommission wells with concurrence from the regulating agency. The decommissioning process should prevent the well and associated borehole from becoming a conduit for the preferential migration of contamination. The decommissioning procedures within the California Well Standards (Bulletin 74-90) should be followed along with any local requirements.

When decommissioning vapor wells with tubing, the following decommissioning steps should be followed:

- 1) Squeeze sealant, such as grout, cement or silicone caulk, into the exposed tubing until the entire tubing is filled with material;
- 2) Cut the well tubing as far below grade as possible;
- 3) Fill the open hole with hydrated bentonite to within one foot of the surface grade;
- 4) Fill the last foot of the hole with compacted native material; and,
- 5) Restore pavement and vegetation to original conditions, if needed.

When overdrilling vapor wells with ridged casing, a casing guide should be used to prevent the drill bit from drifting during the decommissioning. A casing guide will allow the drill bit to remain aligned on the top of the well casing, allowing for effective removal of the well material. Once the well material is removed, the borehole should be filled with bentonite grout. If vapor wells penetrate clay units, consideration should be given to overdrilling rather than abandonment in place in order to prevent preferential contaminant migration.

### **3.5 DECONTAMINATION**

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

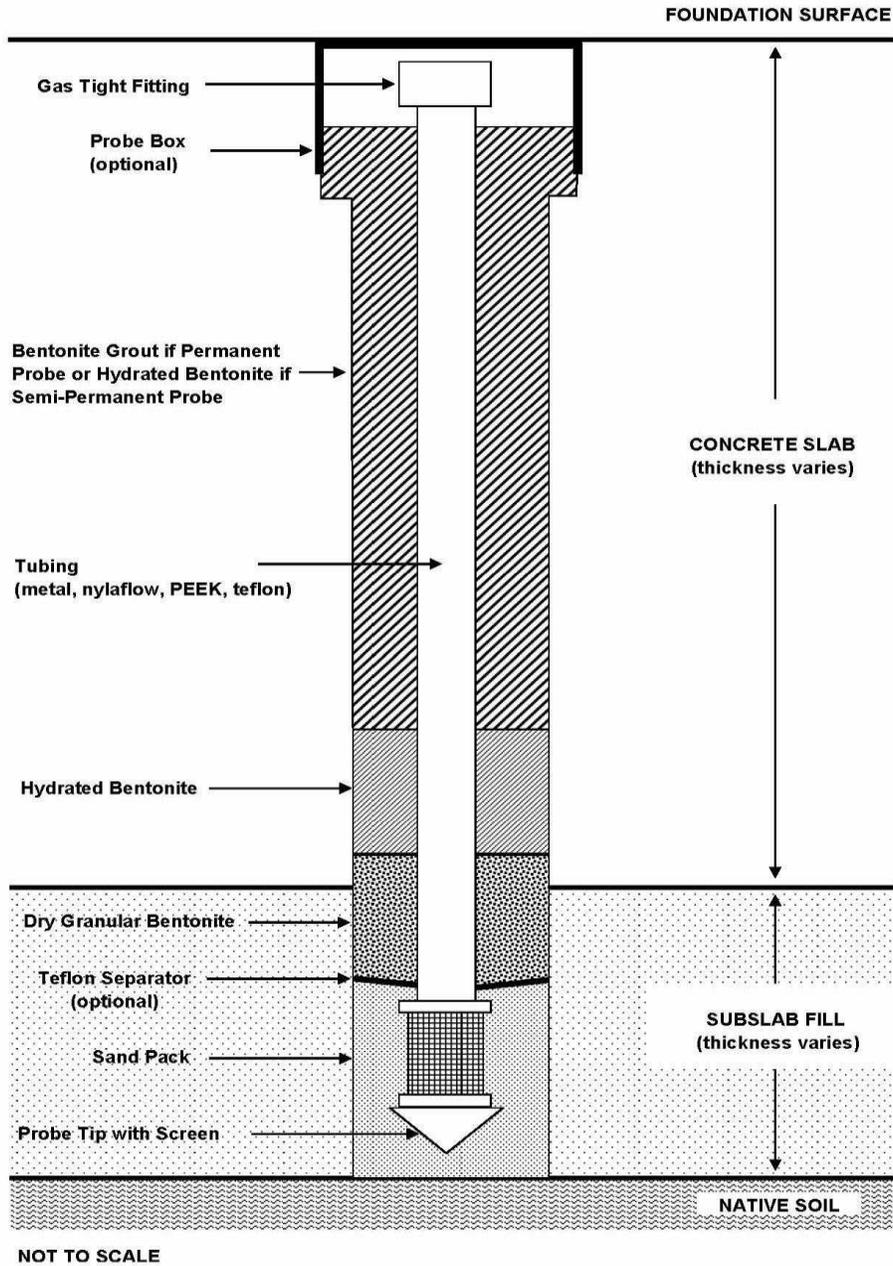

Decontaminate all reusable equipment to prevent cross contamination. Tubing is not reusable and should not be decontaminated. Instead, use new or unused sampling tubing for each probe location.

Decontamination may consist of steam cleaning or a three-stage decontamination process consisting of a wash with a non-phosphate detergent, a rinse with tap water and a final rinse with distilled water. Collect one equipment blank at the beginning of sampling and at least one each day after decontamination. Equipment should be air-dried before reuse.

### **3.6 SUB-SLAB INVESTIGATION METHODS**

The procedures for collecting sub-slab soil gas samples are the same as for collecting subsurface soil gas samples except that small sampling canisters should be used to minimize ambient air breakthrough into samples. USEPA (2006) recommends that the sampling canisters should be one liter or less. Methods for installing sub-slab vapor probes can be found in the DTSC Vapor Intrusion Guidance (DTSC, 2011, Appendix G). A typical sub-slab probe design is included in this document as Figure 2. The probe tubing should extend to the bottom of the foundation slab to effectively bypass any cracks within the slabs at the probe location. It is critical to seal off the probe to ambient air to obtain high quality data.

FIGURE 2  
Sub-Slab Vapor Probe Typical Diagram

## 4.0 SOIL GAS SAMPLE COLLECTION

### 4.1 EQUILIBRATION TIME

Subsurface conditions are disturbed during drilling and probe placement. To allow for the subsurface to equilibrate back to representative conditions, the following equilibration times are recommended before proceeding with soil gas sampling:

- 1) For soil gas wells installed with the direct push method, do not conduct the purge volume test, leak test and soil gas sampling for at least two hours following vapor probe installation;
- 2) For soil gas wells installed with hollow stem or hand auger drilling methods, do not conduct the purge volume test, leak test and soil gas sampling for at least 48 hours after soil gas probe installation;
- 3) For soil gas wells installed with a combination of hand auger drilling or hollow stem auger and direct push methods, do not conduct the purge volume test, leak test and soil gas sampling for at least two hours following vapor probe installation provided that at least five feet of the borehole was drilled by direct push technology. The five feet of direct push borehole should be drilled after the completion of hand augering or hollow stem augering. The well screen should be located below this five-foot interval. If the well screen is located above the five-foot interval, do not conduct the purge volume test, leak test and soil gas sampling for at least 48 hours after soil gas probe installation; and
- 4) For soil gas wells installed with the rotosonic or air rotary method, do not conduct the purge volume test, leak test, and soil gas sampling until it can be empirically demonstrated that the subsurface equilibrium time is sufficient to collect representative samples. Due to site-specific conditions, the re-establishment of equilibrium could vary from a few days to a few weeks.

**Note:** The best option to verify that equilibrium has re-established is to collect time-series data. Soil gas samples, along with oxygen and carbon dioxide measurements, should be collected shortly after installation, and then at a frequency that will demonstrate the time needed to attain representative samples. A field instrument may be used to analyze the soil gas samples to evaluate representativeness. Assuming similar lithology, one monitoring point could serve as a surrogate for all others when installing multiple sampling probes. For differing lithologies, see Additional Purge Volume Tests section below.

Soil gas well installation method and equilibration time should be recorded in the field log book or field form.

### 4.2 SOIL GAS ASSEMBLY TESTS

Complete shut-in, leak, and purge volume tests before collecting soil gas samples after the soil gas well has equilibrated.

### **4.2.1 Shut-In Test**

Prior to purging or sampling, a shut-in test should be conducted to check for leaks in the above-ground sampling system. To conduct a shut-in test, assemble the above-ground valves, lines and fittings downstream from the top of the probe. Evacuate the system to a minimum measured vacuum of about 100 inches of water using a purge pump. The test is conducted while the sampling canister, if used, is attached with its valve in the closed position. Observe the vacuum gauge connected to the system with a “T”-fitting for at least one minute or longer. If there is any observable loss of vacuum, the fittings are adjusted until the vacuum in the sample train does not noticeably dissipate. After the shut-in test is validated, the sampling train should not be altered. The vacuum gauge should be calibrated and sensitive enough to indicate a water pressure change of 0.5 inches. A shut-in test is not a replacement for a leak test.

### **4.2.2 Leak Test**

A leak test is used to evaluate whether ambient air is introduced into the soil gas sample during the collection process. Atmospheric leakage occurs in three ways:

- 1) Advection through voids in the probe packing material and along the borehole sidewall;
- 2) Advection directly through the soil column; and
- 3) Through the fittings in the sampling train at the surface (Banikowski et al, 2009).

A leak test should be conducted at every soil gas well each time a soil gas sample is collected to evaluate the integrity of the sample. Introducing ambient air may result in an underestimation of actual site contaminant concentrations or, alternatively, may introduce external contaminants into samples from ambient air.

The two types of leak check compounds available for use when soil gas sampling are liquid compounds and gaseous compounds. Both types have their advantages and disadvantages, and practitioners should select a leak check compound based on their project's DQOs. See Appendix C for quantitative leak testing.

#### **4.2.2.1 LEAK CHECK COMPOUNDS (LIQUID)**

Liquid tracer compounds, such as hexane, pentane, difluoroethane and isopropanol, can be used to evaluate sample integrity. Other compounds not listed here may also be appropriate. Typically, liquid tracer compounds are applied to towels or clean rags and placed around all connections in the sampling train in order to evaluate potential leaks of ambient air into the sampling train. The liquid tracer should not be directly sprayed or poured onto a fitting, but rather applied to a cloth which should be placed near the connection. Towels or rags with the liquid tracer should also be placed on the ground adjacent to the probe to evaluate soil column and probe construction breakthrough. The leak check compound selected should not be a suspected site-specific contaminant. Seal integrity is confirmed by analyzing the soil gas sample for the tracer compound. Alternatively, each connection can be individually checked by placing the tracer cloth in a plastic bag and then using the bag to enclose individual connections. Instruments can

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

be used in the field to evaluate whether leakage is occurring rather than waiting for the mobile or stationary laboratory results. Liquid leak check compounds should be included in the laboratory analyte list. The laboratory reports should quantify and annotate all detections of the leak check compound at the reporting limit of the target analytes. If the concentration of the leak check compound is greater than or equal to 10 times the reporting limit for the target analyte(s), then corrective action is necessary as discussed below.

### 4.2.2.2 LEAK CHECK COMPOUNDS (GASEOUS)

Gaseous tracer compounds, such as helium and sulfur hexafluoride, can be used along with a shroud or tent placed over the sampling equipment. Other compounds not listed here may also be appropriate. Procedures for conducting a quantitative leak test are described in Appendix C. An ambient air leak up to 5 percent is acceptable if quantitative tracer testing is performed by shrouding.

### 4.2.2.3 LEAK CHECK CONSIDERATIONS

A soil gas well should be decommissioned if the leak cannot be corrected. Replacement soil gas wells should be installed at least five feet from the location where the original soil gas well was decommissioned due to a confirmed leak. The leak check compound concentrations detected in the soil gas samples should be included in the laboratory report and the ambient air breakthrough should be discussed in the site characterization report.

The intent of the leak check compound is to enhance the integrity of the soil gas sample by demonstrating that minimal or no ambient air breakthrough during sampling is occurring. Although it is preferable not to have any tracer gas breakthrough, minor amounts of breakthrough may be acceptable if the breakthrough is appropriate for the site's DQOs. Detecting leak check compounds indicate potential field problems. Some potential sources of leaks in sampling trains are poor quality fittings, stripped, over tightened, dirty or worn threads, and excessive sampling train connections. Regardless of the cause of the leak, a data adjustment factor based upon the concentration of the leak check compound to compensate for the inability to collect representative samples is inappropriate.

Note that if a passivated stainless steel canister is used to collect a sample that is later analyzed at a stationary laboratory and there is a significant leak, it will typically not be identified until after demobilization of the field crew. Therefore, field screening prior to laboratory analysis is recommended.

Commercially available leak check compounds, both liquid and gaseous, may contain unanticipated impurities. Therefore, laboratories should analyze the leak check compound to aid in the interpretation of the data.

When designing a field study, the tracer compound should be carefully selected. The following items should be considered when choosing a tracer compound.

- Excessive concentrations of the tracer can elevate analytical detection limits;

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

- Tracer compounds can cause interference with target analytes;
- Field detectors may produce biased results in the presence of water vapor or other compounds;
- The tracer compound may be naturally occurring;
- Field detectors may not be routinely calibrated; and
- Pressurized canisters of tracer gas may be dangerous to transport.

### 4.2.3 Purge Volume Test

The purpose of a purge volume test is to ensure that stagnant air is removed from the sampling system and to ensure that samples are representative of subsurface conditions. The purge volume test should be completed after the shut-in and leak test. The test well should be located near the contaminant source zone and in a lithologic unit where soil gas concentrations are anticipated to be elevated. The purge volume test is conducted by collecting and analyzing a sample for target compounds after removing one, three and 10 purge volumes. The purge volume test samples should be analyzed with the same analytical method as the constituents of concern.

One purge volume includes the following volumes:

- The internal volume of tubing;
- The void space of the sand pack around the probe tip; and
- The void space of the dry bentonite in the annular space.

For permanent probes subject to frequent sampling, the purge volume can be reduced to one tubing volume if sufficient time, typically two weeks, has transpired between sampling events to allow the filter pack to come into equilibrium with the surrounding soil and the probe has remained sealed to ambient air. Sample containers are not included in the purge volume calculation except when non-evacuated glass bulbs are used. In those instances, the volume of the non-evacuated glass bulbs should be added to the purge volume to account for mixing and dilution of gasses inside the glass bulb.

Conduct the purge test at the same flow rate and applied vacuum as will be used to collect the soil gas samples. If the pump is battery-operated, the batteries should be checked before and during the operation to insure that a proper charge is maintained. As batteries lose charge the flow rate is lowered, effectively changing the purge rate. Select the appropriate purge volume based on the highest concentration of the compound(s) of concern detected during the purge volume test.

To avoid extensive purging for soil gas samples collected at less than five feet bgs, a default of three purge volumes should be extracted prior to sampling. If VOCs are not detected in any of the step purge tests, a default of three purge volumes should be used.

Include the purge test data in the report to support the purge volume selection. The data set should include the purge volume test as well as the flow rate, vacuum exerted on the formation, and duration of each purge step. Additionally, dependent on the objectives of the characterization activities, collecting pneumatic data during the purge

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

volume testing may be warranted to determine the air permeability of the subsurface (see Appendix D for more information).

### 4.2.4 Additional Purge Volume Tests

Additional purge volume tests may be warranted by site-specific situations. Under the following conditions, additional purge volume tests should be conducted:

- A previously unknown lithology is encountered;
- Variable flow conditions are unexpectedly encountered; or
- If the default purge volume of three is used and a VOC of concern not previously detected is subsequently detected.

If a new purge volume is selected, then 10 percent of the previously completed soil gas wells should be re-sampled using the new purge volume. Re-sampling may be necessary for all previously sampled soil gas wells depending on results of the re-sample. The soil gas investigation may then be continued with the revised purge volume in the remaining areas.

### 4.3 PURGE/SAMPLE FLOW RATE AND APPLIED VACUUM

Flow rates between 100 to 200 milliliters per minute (mL/min) and vacuums less than 100 inches of water should be maintained during purging and sampling to minimize stripping (partitioning of vapors from pore water to soil gas), to prevent ambient air from diluting the soil gas samples, and to reduce variability between contractors. Maintaining these flow rates and vacuums will increase the likelihood that representative samples will be collected. A flow rate greater than 200 mL/min may be used when purging times are excessive, such as for deep wells with larger-diameter tubing. However, a vacuum of 100 inches of water or less must be maintained during sampling whenever a higher flow rate is used. The pressure gauge used to measure vacuum should be calibrated and in good working order.

A vacuum gauge should be used between the soil gas sample tubing and the soil gas purging device to verify that 100 inches of water or less is maintained during sampling. Gas-tight syringes may also be used to qualitatively determine if a high vacuum soil condition is present. If a high vacuum condition is present due to low permeability soil, the sampling technician can feel the suction while the plunger on the syringe is being withdrawn. If low permeability conditions are encountered where 100 inches of water is exceeded, the well can be sampled using the techniques in Appendix D (Soil Gas Sampling in Low Permeability Soil).

#### 4.3.1 Vacuum Pump

When a vacuum pump is used, collect samples on the intake side to prevent potential contamination from the internal parts of the pump. To collect the sample in a polymer gas sampling bag, a lung box<sup>5</sup> is required. Record the vacuum readings and

---

<sup>5</sup> A lung box is a small airtight chamber into which the polymer gas sampling bag is placed. The connective tubing to the bag protrudes out a hole in the chamber. The sealed chamber is evacuated by a pump, causing the bag to

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

corresponding flow rates on field data sheets for each sample. If the pump is battery-operated, the batteries should be checked before and during the operation to ensure that a proper charge is maintained. As batteries lose charge the flow rate is lowered, effectively changing the purge rate.

## 5.0 SAMPLE HANDLING AND TRANSPORT

### 5.1 SAMPLE CONTAINERS

Collect samples in gas-tight containers and handle in a manner that will prevent photodegradation of the target analytes. Sample containers should not compromise the integrity of the samples.

#### 5.1.1 Syringes

Syringes should be checked for leaks before each use by closing the exit valve and attempting to force ambient air through the needle. Gas-tight glass syringes with Teflon<sup>®</sup> seals are preferred. Glass syringes should be leak tested periodically to verify integrity with age.

Plastic syringes should not be used because of the potential interaction with some target analytes.

#### 5.1.2 Passivated Stainless Steel Canisters

Passivated stainless steel canisters need a flow regulator and vacuum gauge when sampling soil gas. If the canister is not fitted with a permanent vacuum gauge, a field vacuum gauge should be attached between the flow regulator and the canister inlet during sampling. To prevent stripping, connections should be initially hand-tightened. To verify the integrity of the seal on the steel canisters during transit, pressure readings should be collected during the canister's journey. The stationary laboratory should record the pressure when the canisters leave the laboratory and record it again on receipt of the canisters. Likewise, the field crew should record the pressure upon start and completion of the sampling. Typically, canisters are returned to the stationary laboratory with a slight vacuum (two to four inches of mercury). These pressure measurements should be included in the laboratory's analytical report as a mechanism to verify the integrity of the sample.

Pressure measurements should be collected using a calibrated pressure gauge, using the same gauge at the laboratory and in the field. Field crews should only rely on canister-dedicated pressure gauges if the gauges are calibrated and working properly. Canister-dedicated gauges tend to be inaccurate due to overuse.

#### 5.1.3 Polymer Gas Sampling Bags or Glass Bulbs

Samples in polymer gas sampling bags or glass bulbs should be analyzed within six hours after collection. Appendix B discusses the merits of collecting samples in polymer gas sampling bags.

Surrogates do not need to be added to polymer gas sampling bags because surrogate recovery levels cannot be precisely calculated since the volume of soil gas collected in a polymer gas sampling bag cannot be measured precisely. Thus, adding surrogates to polymer gas sampling bags is unnecessary.

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

Samples collected in glass bulbs should have surrogates added within 15 minutes of collection and the samples analyzed within six hours after collection.

### **5.1.4 Sorbent Tubes**

Sorbent tubes are used with USEPA (1999) Compendium Method TO-17 (Method TO-17). Method TO-17 describes:

- Sorbent tube sampling procedures;
- Sorbent tube selection;
- Tube conditioning;
- Sampling apparatus;
- Sampling rates;
- Sample collection preparation;
- Flow rates; and
- Other sampling procedures.

Method TO-17 is used for VOCs and SVOCs including naphthalene (See Appendix E for additional details on collecting and analyzing for naphthalene in soil gas).

### **5.1.5 Alternate Sample Containers**

Non-traditional sample containers are available for collecting soil gas samples. MiniCans, smaller versions of the passivated stainless steel canister, may be useful in many field applications. Evacuated glass bottles (e.g., Bottle Vac®) may also be used but their holding time should be limited to 48-hours. The use of non-traditional size or types of containers should be discussed in the workplan.

## **5.2 FIELD CONDITIONS**

The regulating agency may request raw data at any time during the investigation. Hard copies of the complete raw laboratory data, including handwritten field and laboratory notes, should be provided to the regulating agency staff upon request. Adjustments or modifications to the sampling program may be required by the regulating agency to accommodate changes mandated by evaluation of the data set or unforeseen site conditions. Field conditions, such as rainfall, irrigation, low permeability lithology or drilling conditions may affect the ability to collect soil gas samples.

### **5.2.1 Rainfall and Barometric Pressure (See Appendix G)**

Rainfall decreases the air-filled porosity of the shallow soil, thereby limiting diffusional transport of volatile contaminants. Also, soil gas contaminants may partition into the clean infiltrating rainwater, both of which may potentially bias soil gas sampling results. Hence, soil gas sampling should not occur during a significant rain event and should only occur after five days without a significant rain event. A significant rain event is defined as 1/2 inch or greater of rainfall during a 24-hour period. The waiting period is based upon soil drainage curves. Appendix G provides additional information. Irrigation or watering of soil should stop at least five days prior to the soil gas sampling event. Likewise, areas subject to soil gas sampling should be free of standing or ponded water

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

for at least five days prior to sampling. Do not perform soil gas sampling in swales or depressions where water might have accumulated. However, soil gas sampling after rainfall can proceed where infiltration has not occurred, such as under buildings or beneath high-integrity pavement.

Barometric pressure fluctuations associated with the passage of frontal systems can introduce atmospheric air into the shallow vadose zone. Therefore, soil gas sampling should be delayed until frontal systems have passed the area.

### **5.2.2 Wet Conditions**

If no flow or low flow conditions are encountered where water is drawn into the sampling system due to wet soils caused by rain or irrigation, cease soil gas sampling and wait five days for the soils to drain.

### **5.2.3 Soil Gas Sampling in Low-Permeability Soil**

Soil gas sampling in silt and clay-rich soils is feasible by following the sampling protocols described in Appendix D. Low flow or no flow conditions correspond to conditions where the minimum flow rate of 100 mL/min cannot be sustained at the maximum applied vacuum of 100 inches of water. High quality data can be produced by implementing the following field practices:

- Good annular seals;
- Careful monitoring of flow rate and vacuum during purging; and
- Use of tracer gas for leak-testing.

If the soil gas permeability is too low to allow sustainable purging at appreciable flow rates without applying excessive vacuum, follow the protocols described in Appendix D by using an alternative sample collection method or re-drilling and constructing a soil gas well in a non-traditional manner.

If low flow or no flow conditions are encountered, a new soil gas well in a coarser lithology at a different depth or lateral location may be installed. The following should be considered if low-flow conditions persist:

- 1) Evaluate site lithologic logs and adjust sample depth and location;
- 2) Collect new continuous soil core samples;
- 3) Use alternate low-flow sampling methods (see Appendix D);
- 4) Use passive soil gas methods (see Appendix A); and
- 5) Collect soil matrix VOC samples using 5035/8260 (DTSC, 2004).

If moisture or unknown material is observed in the sample container, cease soil gas sampling until the cause of the problem is determined and corrected. Moisture detected in either the sampling train or the sample container may indicate saturated conditions in the subsurface. Vapor phase compounds may partition into the dissolved phase, affecting the recovery of target analytes and causing analytical results to be biased low.

### **5.2.4 Drilling Refusal**

If refusal occurs during drilling, soil gas samples should be collected as follows:

- 1) Install a replacement borehole at least five feet laterally from the original boring location. If refusal still occurs after three tries, collect a soil gas sample at the depth of refusal or use an alternate drilling method; and
- 2) If refusal occurs at depths less than five feet, collect the soil gas sample following the precautions in Appendix D. Sealing off the probe to ambient air is critical to obtaining high quality data.

## **5.3 SAMPLE CONTAINER HANDLING**

Sample handling procedures cited in the analytical methods should be followed. However, since most methods are not designed for soil gas, additional safeguards should be implemented to maintain the integrity of the samples. If samples need to be shipped to a stationary laboratory, then follow the container-specific handling procedures below.

### **5.3.1 Syringes and Glass Bulbs**

Samples in syringes and glass bulbs should be analyzed as soon as possible after collection in a mobile laboratory and should never be transported. Samples in syringes and glass bulbs should be kept in a cool dark location at all times, protected from exposure to light, until the samples are analyzed. A cooler without ice works well for syringe and glass bulb sample storage.

Do not subject syringe and glass bulb samples to extreme temperatures. Heat can cause compound degradation and leakage from the syringe or glass bulb. Cold can cause moisture condensation, which can affect the recovery of target analytes. If condensation is observed, the sample should be discarded and a new sample should be collected.

### **5.3.2 Sorbent Tubes**

Samples collected in sorbent tubes may be shipped for analysis at a stationary laboratory. Samples tubes should be capped with Swagelok<sup>®</sup>-type caps and combined Teflon (PTFE) ferrules, rewrapped in aluminum foil, and placed in the storage container immediately after sampling.

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

Sorbent tubes should be stored at 4°C or less and analyzed within 30 days after collection. For compounds likely to undergo chemical degradation, such as bis-chloromethyl ether and sulfur or nitrogen-containing volatiles, analysis should be done within one week (USEPA, 1999; Compendium Method TO-17, Section 10.10).

Samples collected on tubes containing multiple sorbent beds should be analyzed as soon as possible after collection unless it can be verified that storage will not affect analyte recovery (USEPA, 1999; Compendium Method TO-17, Section 10.10).

### **5.3.3 Polymer Gas Sampling Bags**

These procedures should be followed when transporting samples in polymer gas sampling bags:

- 1) Do not expose soil gas samples in polymer gas sampling bags to light or extreme temperatures. Photodegradation of target analytes is possible with light exposure. Heat can cause expansion of the bag and possibly result in leakage. Cold can cause moisture condensation in the bags;
- 2) Do not ship polymer gas sampling bags by air because changes in ambient pressure can adversely affect the integrity of the bags. Increases in pressure may collapse the bag and decreases in pressure may expand the bag. These changes in pressures, coupled with possible flaws in the bag, may cause sample loss; and
- 3) Do not ship polymer gas sampling bags by vehicle where changes in elevation, such as over mountain passes, will result in ambient pressure changes.

### **5.3.4 Passivated Stainless Steel Canisters**

Samples collected in passivated stainless steel canisters may be shipped for analysis at a stationary laboratory. Passivated stainless steel canisters have minimal problems associated with their handling. Therefore, no additional precautions or safeguards are needed.

## **5.4 SAMPLE CONTAINER CLEANLINESS AND DECONTAMINATION**

New containers should be shown to be free of contaminants by providing data from either the supplier or the analytical laboratory. After each use, reusable sample containers should be decontaminated as follows:

- 1) Glass syringes and bulbs may be decontaminated by disassembling and heating them. Some components of the syringes and glass bulbs, such as the syringe barrel and bulb stopcock, cannot be heated and should be decontaminated by other methods such as rinsing with methanol and/or expunging with nitrogen or clean air. If a syringe is reused, it should be blank tested, and tested for adsorptive losses via spike testing;

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

- 2) Passivated stainless steel canisters should be decontaminated as specified in USEPA Method TO-15, either batch or individually certified, according to project DQOs;
- 3) Polymer gas sampling bags should not be reused; and
- 4) Equipment blanks should be analyzed to verify and evaluate the effectiveness of decontamination procedures for recycled or reused containers, except for certified containers. At a minimum, one equipment blank should be run per 20 sample containers cleaned, or at least one per day.

### **5.5 CHAIN OF CUSTODY RECORDS**

The chain of custody documents the identity and integrity of the sample from the time of collection through receipt at the laboratory.

A chain of custody form should be completed in the field and include any relevant problems encountered during sample collection. The starting and ending pressures for passivated stainless steel canisters should be recorded on the chain of custody form. USEPA provides a complete description of chain of custody protocols and records management (USEPA, 1998, 2000b). To avoid loss or damage, the chain of custody forms should be placed into a sealable bag and attached to the inside of the shipping container.

## 6.0 ANALYSIS OF SOIL GAS SAMPLES

The sections below summarize analytical methods, QA/QC, holding times, reporting and laboratory certification. Additional details are provided in Appendices F and H.

### 6.1 TARGET COMPOUNDS

Target compounds are chemicals believed to be present, used, or released at the site. Common target compounds are listed below. Compounds may be added or excluded from the list below based on site history and DQOs. A vapor intrusion-specific list can be found in DTSC's Vapor Intrusion Guidance (DTSC, 2011).

#### 6.1.1 Common Organic Compounds

##### Halogenated

- 1) Bromochloromethane
- 2) Bromodichloromethane
- 3) Bromomethane
- 4) Carbon tetrachloride
- 5) Chloroethane
- 6) Chloroform
- 7) 1,1-Dichloroethane
- 8) 1,2-Dichloroethane
- 9) 1,1-Dichloroethylene
- 10) cis-1,2-Dichloroethylene
- 11) trans-1,2-Dichloroethylene
- 12) Dichlorodifluoromethane (Freon 12)
- 13) Dichloromethane (Methylene chloride)
- 14) Tetrachloroethylene
- 15) 1,1,1,2-Tetrachloroethane
- 16) 1,1,2,2-Tetrachloroethane
- 17) 1,1,1-Trichloroethane
- 18) 1,1,2-Trichloroethane
- 19) Trichloroethylene (TCE)
- 20) Trichlorofluoromethane (Freon 11)
- 21) 1,1,2-Trichloro-1,2,2-trifluoroethane (Freon 113)
- 22) Vinyl chloride

##### Aromatics and Oxygenates

- 23) Benzene
- 24) n-Butylbenzene
- 25) sec-Butylbenzene
- 26) tert-Butylbenzene
- 27) 1,4-Dichlorobenzene
- 28) Di-isopropyl ether (DIPE)
- 29) Ethylbenzene
- 30) Ethyl tertiary butyl ether

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

- 31) Isopropylbenzene
- 32) p-Isopropyltoluene
- 33) Methyl tertiary butyl ether (MTBE)
- 34) Naphthalene
- 35) n-Propylbenzene
- 36) Tertiary amyl methyl ether
- 37) Tertiary butyl alcohol
- 38) Toluene
- 39) 1,2,4-Trichlorobenzene
- 40) 1,2,4-Trimethylbenzene
- 41) 1,3,5-Trimethylbenzene
- 42) Xylenes

### Others

- 43) Acetone
- 44) Carbon disulfide
- 45) 2-Hexanone
- 46) Styrene
- 47) Methyl ethyl ketone
- 48) Methyl isobutyl ketone
- 49) Ethylene dibromide

## 6.2 REPORTING LIMITS FOR TARGET COMPOUNDS

Reporting limits (RLs) should be based on the DQOs of the investigation. Corresponding analytical methods should be selected to achieve RLs that are below regulatory or risk-based screening levels. The RLs for the leak check compound should be reported at the RL of the target analytes.

When RLs are elevated due to sample dilution, the laboratory should provide a written explanation of why the project-specific RLs were not achieved. In some instances, sample dilution is necessary because of high concentrations of non-target compounds (background). It may be necessary to collect new samples for reanalysis to achieve appropriate RLs pursuant to the project's DQOs. A higher RL as a result of sample dilution is acceptable for the compound(s) whose concentration in an undiluted sample exceeds the upper level of an initial calibration range. Non-detected results for all target compounds shall be reported at the lowest dilution(s) concentration or no dilution concentration.

## 6.3 QUALITY ASSURANCE/QUALITY CONTROL

This section primarily focuses on field laboratory QA/QC and not stationary laboratory QA/QC. For a detailed discussion on stationary laboratory QA/QC, refer to Appendix F.

Laboratories should comply with the project QAPP, USEPA Methods, and the criteria in this Advisory. The analytical data should be consistent with the DQOs established for the project.

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

The regulating agency may inspect the field and/or stationary laboratory QA/QC procedures. Copies of the QA/QC plan and laboratory calibration data should be presented upon request.

All calibration and QA/QC standards, traceable to a source, should be documented by the laboratory. Continuing calibration and QC standards should be from a second source or a different lot from the same supplier. Vapor phase standards should be used to calibrate laboratory instruments.

The following items should be included when using USEPA Methods:

- Initial calibration;
- Daily calibration/continuing calibration;
- Laboratory control spike;
- Internal standards;
- Surrogates;
- Method blank; and
- Field blank.

All surrogate recovery data should comply with laboratory-derived control limits. Control limits should be listed in the laboratory reports for reference.

Surrogate recovery limits should be approximately 70 percent to 130 percent (30 percent deviation). The laboratory-derived recovery limits may be wider or narrower than the 30 percent figure depending on sample introduction technique and compound used. If a compound-specific recovery limit is not selected, an explanation should be provided to justify the recovery limit used. See Appendix F for surrogate introduction techniques.

### 6.3.1 Sample Blanks

- Method Blanks: Method blanks should be used to verify the effectiveness of decontamination procedures in the laboratory, and to detect any possible interference from ambient air;
- Trip Blanks for Off-site Shipments: Trip blanks should be included in the shipping containers when collecting USEPA TO-17 samples;
- Material Blanks: Prior to soil gas sampling, an assembled soil gas probe, tip and tubing should be blank tested at a frequency of one analysis per new batch of tubing or material used; and
- Equipment Blanks: Equipment blanks should be collected from decontaminated equipment before reuse at a frequency specified in the workplan. One equipment blank should be collected and analyzed for each batch of 20 samples, or at least one per day, whichever is more often.

### **6.3.2 Field Duplicate/Replicate Samples**

Duplicate samples are collected simultaneously, whereas replicate samples are collected sequentially. At least one duplicate/replicate sample should be collected and analyzed per 20 samples or per batch, whichever is more often.

Duplicate/replicate samples should be collected from contaminated areas at a frequency based on the project DQOs. The workplan should state the duplicate/replicate collection frequency.

Duplicate/replicate samples should be collected in separate sample containers at the same location and depth. Replicate samples can be collected immediately after the original sample, or a duplicate sample can be collected simultaneously by use of a T-splitter at the point of collection to divide the sample stream into two separate sample containers.

The field replicate mentioned in this section should not be confused with the laboratory replicate (see Table 2 in Section 6.5, and the QA/QC Section of Appendix F).

When comparing the results from field duplicate/replicate samples, a wider allowance should be given for the differences (e.g., 50 percent Relative Percent Difference [RPD]) because of the inherent variability associated with soil gas samples. The specific guideline for the RPD should be based on DQOs and be specified in the QAPP.

### **6.3.3 Laboratory Control Samples**

Laboratory Control Samples (LCS) are optional as described in Appendix F.

### **6.3.4 Split Samples**

The regulating agency may request split samples be collected and analyzed by a separate laboratory.

## 6.4 HOLDING TIMES

Holding times for soil gas samples should be specified in the workplan. All soil gas samples should be analyzed pursuant to container-specific holding times, as follows:

**TABLE 1**  
**Soil Gas Sample Holding Time**

Container	Holding Time	Comments
Glass syringes	30 minutes	
Polymer gas sampling bags	6 hours	
Glass bulbs	24 hours	Must have surrogate added within 15 minutes of collection
Passivated stainless steel canisters	30 days	
Sorbent Tubes	30 days	Sulfur and nitrogen compounds and bis-chloromethyl ether should be analyzed with one week.
Hydrogen sulfide	See Section 7.1	

Note that for passivated stainless steel canisters, storage pressure and humidity in a canister are also important factors that determine analyte recovery. Additionally, mercaptans, dimethyl acetal and bis-[chloromomethyl] ether at low concentrations are not suitable for collection in passivated canisters pursuant to a study by Brymer and others (1996).

## 6.5 ANALYTICAL METHODS

There are no approved USEPA methods specifically designed to analyze soil gas samples. Consequently, modified versions of existing USEPA methods were adopted.

Numerous modifications of USEPA methods are being used for soil gas analysis. Each modification has advantages and disadvantages. Soil gas analysis should be performed in accordance with the protocols noted in the respective USEPA method(s) concurrently with the specific recommended practices for soil gas samples outlined in Table 2. Methods/Parameters not included in Table 2 should be followed as stated in the original USEPA method.

For a more detailed discussion on the various types of modifications and other applications, consult Appendix F.

**TABLE 2**  
**Preferred Analytical Methods and Modifications\***

Method/ Parameter	GC/MS Methods			GC Methods	COMMENTS
	Modified USEPA 8260	Modified USEPA TO-15	Modified USEPA TO-17	Modified USEPA 8015 and Modified USEPA 8021	
<b>Applicability/Analytes</b>	Most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	Most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	Most VOCs: approximate concentrations should be known prior to sampling.	Limited number of VOCs: gasoline/TPH most VOCs: confirmation sampling for naphthalene should be performed by USEPA TO-17.	See Appendix F of this guidance for discussion.
<b>Sample Introduction Technique</b>	Modified Purge-and-trap (USEPA 5030).	Samples collected in passivated canisters: VOCs are concentrated on sorbent trap.	Samples pulled through sorbent pack, thermally desorbed into GC.	Modified purge-and-trap (USEPA 5030).	See Appendix F of this guidance for discussion.
<b>Sample Size</b>	Purge-and-trap: 5 to 250 mL (cc) (See Appendix F for discussion).	To be determined by sample delivery technique and sample concentration; typically 1 to 6 liters.	To be determined by a combination of factors: sorbent selected, tube length, humidity, temperature; 50 to 250 ml of sample suggested.	Purge-and-trap: 5 to 250 mL (cc) (See Appendix F for discussion).	See Appendix F of this guidance for discussion.  Dilution may be needed if high concentration is suspected.
<b>Method Validation <sup>(1)</sup></b>	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	As per Section 8.4 of USEPA 8000B.	
<b>Initial Calibration</b>	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria. Preloaded certified standard tubes may be used for calibration.	Minimum of 5 levels, lowest at reporting level. Use method acceptance criteria.	Vapor-phase standards are preferred. Liquid standards may be used for USEPA Methods 8260, 8015, 8021 and TO-17 provided calibration curve is validated. See Appendix F of this guidance.
<b>Continuing Calibration</b>	Mid-level calibration standard run every 12 hours. Use method acceptance criteria.	Mid-level calibration standard run every 24 hours. Use method acceptance criteria.	Mid-level calibration standard every 10 sample batch (Section 12 of USEPA TO-17).	Mid-level calibration standard run every 12 hours. Use method acceptance criteria.	
<b>Calibration Validation</b>	At minimum, vapor-phase validation check standard <sup>(2)</sup> analyzed and evaluated for each new calibration curve (% difference ≤ 20%).	Not Applicable.	No vapor-phase standard validation needed for liquid standards.	At minimum, vapor-phase validation check standard <sup>(2)</sup> analyzed and evaluated for each new calibration curve (% difference ≤ 20%).	Validation not needed if calibration curve is prepared with vapor-phase standards.

**TABLE 2 (continued)  
Preferred Analytical Methods and Modifications\***

Method/ Parameter	GC/MS Methods			GC Methods	COMMENTS
	Modified USEPA 8260	Modified USEPA TO-15	Modified USEPA TO-17	Modified USEPA 8015 and Modified USEPA 8021	
<b>End of Run Calibration Check</b>	Optional.	Optional.	Optional.	Mid-level calibration standard run for each 20 sample batch or at end of run, whichever is more often.	See Appendix F of this guidance for discussion.
<b>Surrogates</b>	Surrogates needed for glass bulbs but not for syringes or polymer sampling bags.	Optional.	Optional.	<b>8015:</b> To be determined by lab. <sup>(3)</sup> <b>8021:</b> Surrogates needed for glass bulbs but not for syringes or polymer sampling bags.	Recovery acceptance limits to be determined by lab. Default=70-130%.
<b>Internal Standards</b>	As per Section 5.10 of USEPA 8260.	As per Section 9.2.2.3 of USEPA TO-15.	As per Sections 6.12.2 and 9.4 of USEPA TO-17.	<b>8015:</b> To be determined by lab. <sup>(3)</sup> <b>8021:</b> As per Section 5.9 of USEPA 8021.	
<b>Accuracy/Precision Matrix Spike/Matrix Spike Duplicate</b>	See Appendix F of this guidance.	Optional.	Optional.	See Appendix F of this guidance.	See Appendix F of this guidance for discussion. Recovery acceptance limits to be determined by lab. Default=70-130% and %RPD=25%.
<b>Duplicates</b>	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	One per 20 samples or batch, whichever is more often.	See Appendix F of this guidance for discussion. %RPD=25%.

<sup>(1)</sup> Initial, one-time demonstration of ability to generate acceptable accuracy and precision. Procedure may need to be repeated if changes in instrument, methodology or personnel occur. USEPA Method 8000B (Determinative Chromatographic Separations), Revision 2, December 1996 (SW-846 Manual).

<sup>(2)</sup> Mid-level NIST (National Institute of Standard and Technology) traceable (where available or equivalent) vapor-phase standard.

<sup>(3)</sup> No internal standards and surrogates were suggested by the method. The compounds are to be selected by the laboratory analyst and they must be similar in analytical behavior to the compounds of interest. The analyst needs to demonstrate the internal standards are not affected by method or matrix interferences.

<sup>(4)</sup> There is no limit on the number of samples per batch for Reporting Limit Verification. If the RL is set at the lowest calibration point, then this verification is not needed.

## **6.6 SOIL GAS SAMPLE ANALYSIS AND LABORATORY REPORTING**

### **6.6.1 Analytical Methods**

At sites that are not fully characterized, soil gas samples should be analyzed using only USEPA modified analytical methods 8260B, TO-15, TO-17, or equivalent. At well-characterized sites, alternative methods may be used for monitoring contamination where VOCs are known to be present and confirmed based on previous gas chromatograph/ mass spectrometer (GC/MS) analyses. Non-specific portable organic vapor analyzers and/or GC-based hand-held detectors can provide useful information for selecting samples for laboratory analysis and verifying the integrity of collected samples. However, these instruments are not acceptable substitutes for compound-specific analysis due to a lack of QA/QC protocols. The various available VOC analytical methods are discussed in detail in Appendix F. Additional discussion is provided in Appendix E specific to soil gas containing naphthalene.

If new VOC(s) are detected by a non-GC/MS method during routine monitoring, then at least 10 percent of the samples for each newly identified VOC should be confirmed by a GC/MS method. Thereafter, routine monitoring can resume with the non-GC/MS method, including the newly identified analyte(s).

### **6.6.2 Contaminant Reporting**

Laboratory reports should contain the analytical results for all identified quantifiable contaminants, along with all tentatively identified compounds (TICs) with an estimated concentration. The site's QAPP should specify that TICs will be identified and reported.

### **6.6.3 Leak Check Compounds**

Liquid and gaseous leak check compounds should be included in the laboratory analyte list. The laboratory reports should quantify and annotate all detections of the leak check compound the target analyte reporting limits. For additional information on leak check compounds, refer to Section 4.2.

### **6.6.4 Auto Samplers**

Using an autosampler with modified USEPA Method 8260B/C for soil gas analysis is not reliable. Sample loss may occur from the vials during the sample transfer and sample run. In addition, the vials may sit in the autosampler for an extended period of time which may compromise the sample through leakage at the vial seal (See Appendix F, GC/MS Methods Section for additional information).

## 7.0 METHANE AND HYDROGEN SULFIDE SAMPLING PROGRAMS

### 7.1 METHANE

There are several analytical methods appropriate for methane, including:

- USEPA Methods 8015B modified;
- TO-3, 3C;
- ASTM Method D1945; or
- ASTM Method D1946.

Methane may also be measured with a hand held gas emissions monitor or analyzer. The RLs for methane analysis should be determined by project-specific DQOs.

#### 7.1.1 Methane Field Collection

The following procedures should be followed when collecting samples for methane analysis:

- Methane should be collected in gas-tight sample containers such as passivated stainless steel canisters or polymer gas sampling bags.
- Fixed and biogenic gases such as oxygen, carbon dioxide, methane and ethylene should be analyzed to determine whether methanogenesis is occurring. The RL for oxygen and carbon dioxide should be one percent or less.
- Prior to sampling, tubing or probe pressure should be recorded in the field logs and reported along with the methane concentration to determine if the area is pressurized.

#### 7.1.2 Methane Laboratory Analysis

GC calibration curves for analytes such as methane should be recorded and reported. Hand-held instruments should be calibrated in accordance with the manufacturer's specifications. At least 10 percent of all positive detections with concentrations more than 5,000 parts per million by volume (ppmv) should be confirmed by another hand-held instrument (either different unit or a different brand) or by a GC method when a hand-held instrument is used.

### 7.2 HYDROGEN SULFIDE

Hydrogen sulfide may be analyzed using:

- South Coast Air Quality Management District Method 307-91;
- ASTM D5504;
- USEPA Method 16;
- Draeger™ tubes; or
- Other equivalent methods.

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

Hand held multi-gas monitors equipped with a hydrogen sulfide sensor may also be used. The RL should be equal to or less than 0.5 ppmv, be at least one microgram per liter or sensitive enough to allow for a modeled ambient air concentration at the soil surface.

### 7.2.1 Sample Containers

The following sample containers are recommended for hydrogen sulfide:

- Black polymer gas sampling bags fitted with polypropylene valves or equivalent. Clear polymer gas sampling bags can be used, stored and/or transported provided they are protected from light;
- 100 mL gas-tight glass syringe or gas-tight glass bulb fitted with an inert valve and wrapped in aluminum foil; and
- Passivated stainless steel canister. Note that recovery of hydrogen sulfide in passivated stainless steel canisters will deteriorate naturally with time with repeated hydrogen sulfide sampling.

### 7.2.2 Hydrogen Sulfide Field Collection

Hydrogen sulfide samples should be analyzed by a hand-held instrument within 30 minutes of collection to minimize sample degradation from reaction with the container surfaces. If a hand-held instrument is not used, hydrogen sulfide samples should be analyzed as follows:

- 1) Within 30 minutes of collection using GC procedures;
- 2) Within 24 hours of collection if duplicate samples are collected and analyzed; or
- 3) Within 24 hours of collection in polymer gas sampling bag using ASTM D5504 with no surrogate addition needed.

### 7.2.3 Precautions Particular to Hydrogen Sulfide

- 1) Contact with oxygen and moisture should be avoided because hydrogen sulfide is extremely unstable;
- 2) Due to the high reactivity of hydrogen sulfide gas, avoid contact of hydrogen sulfide samples with metallic or other active surfaces during sample collection, storage, and analysis;
- 3) Ensure GC components do not react with the sample. Typically, glass-lined injection ports, thick-film capillary columns and silcosteel<sup>®</sup> lined tubing are used to avoid loss of hydrogen sulfide during analysis;
- 4) Exposure of samples to light should be minimized to prevent photodegradation; and

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

- 5) USEPA Method 16 should be used with caution because it is a source-testing method which has limitations, including non-linear detector response, high reporting limits and susceptibility to hydrocarbon interference.

## **8.0 LABORATORY CERTIFICATION**

The California Department of Public Health, Environmental Laboratory Accreditation Program (ELAP), offers certification for soil gas analysis. Laboratories utilizing USEPA Methods 8015B, 8021B, 8260B, TO-15 and TO-17 for analyses of soil gas samples should obtain ELAP certifications for these methods. Accreditation under National Environmental Laboratory Accreditation Program (NELAP) for USEPA Methods TO-13A, TO-15 and TO-17 for ambient air testing is acceptable as certification for soil gas testing.

As of the date of this document, the development of a laboratory certification program for soil gas is in progress in California. Once a certification program is available by the California Department of Public Health, laboratories should apply to be certified. Further information concerning laboratory certification is provided in Appendix F.

Any laboratory analyzing soil gas samples may be subject to inspection by regulatory agency staff.

## **APPENDIX A      PASSIVE SOIL GAS METHOD**

Passive soil gas sampling consists of burying an adsorbent material into the subsurface soil and subsequently retrieving and measuring organic vapors passively amassed onto the adsorbent material. Unlike active soil gas sampling, passive soil gas sampling does not force soil gas into the sampling vessel through pumping or vacuum. Instead, as the vapors disperse from a subsurface contaminant source, the sorbent acts as a sink for the VOCs and SVOCs found in soil gas.

Passive soil gas methods provide a quantified mass value for the adsorbent material and a semi-quantitative soil gas result. In contrast to active soil gas samples, which yield concentration data in micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) or micrograms per liter ( $\mu\text{g}/\text{L}$ ), passive soil gas samples do not generate contaminant concentration data. For this reason, passive soil gas sampling and analysis is not applicable as a stand-alone method for determination of human exposure.

Potential uses of the passive soil gas method are as follows:

- 1) To delineate contaminant plumes, contaminant sources, and hot spots;
- 2) To identify potential preferential pathways where sewer and utility corridors provide vapor migration pathways into and around buildings. Passive methods can also identify preferential pathways resulting from lithologic variability;
- 3) To collect soil gas in areas where active soil gas samples are difficult to obtain. These areas include low-permeability lithology, high-moisture soils and shallow groundwater conditions. When the depth to groundwater is within five feet of the surface, the capillary fringe may prevent sample collection by active soil gas methods due to the high soil moisture content; and
- 4) To evaluate whether a release has occurred. Active soil gas data should be collected following the detection of subsurface contamination by the passive method.

**Advantages of the passive soil gas methods are:**

- 1) Provides a time-integrated measurement, which reduces uncertainty due to temporal variations;
- 2) Detects compounds with low vapor pressures not easily captured by active methods, such as naphthalene (see Appendix E);
- 3) Maintains subsurface equilibrium during sampling since there is no forced movement of soil gas into the sampling vessel with passive methods; and
- 4) Simple to design, install, and retrieve.

## **Passive Sampling Procedures**

Analytical procedures, deployment depths, and sampling durations will depend on the manufacturer's recommended procedures. Some samplers currently available can be installed at any depth, and at the same sampling density as the active method.

Typically, passive samplers are deployed in hand-drilled boreholes that are three to five feet deep and one-inch in diameter. The sampler is lowered into the borehole with a string and the surface is covered to prevent the introduction of ambient air. Deployment duration is usually 10 to 14 days. The samplers are retrieved by pulling the device from the borehole with its string. Analysis of the absorbent material is conducted by Methods 8260, 8270 or TO-17. Sample preparation prior to analysis can be very simple and may involve cutting the tip off the bottom of the sampler and transferring an exposed sorbent material to a thermal desorption tube.

Replicate samples, if collected, are retained for approximately two weeks after initial analysis. Two trip blanks should be collected and analyzed for passive soil gas sampling. One trip blank should accompany the passive samplers to the field and then be analyzed. The second trip blank should accompany the samples from the field to the laboratory.

## APPENDIX B POLYMER GAS SAMPLING BAGS AND TUBING TYPES

### Polymer Gas Sampling Bags

Polymer gas sampling bags require similar quality assurance/quality control as other sample containers, specifically container blanks, laboratory control samples and trip blanks. Additional information on quality assurance requirements is presented in Appendix F.

Polymer gas sampling bags should not be reused because contaminants may adhere to the surface of the bag. Also, the bags themselves may off-gas various organic compounds. Manufacture specifications of the bag material should be checked to verify site-specific COCs are compatible.

Relative humidity inside polymer gas sampling bags may affect recovery of polar compounds. Additionally, water may permeate into and out of polymer gas sampling bags during storage.

Advantages are:

- Inexpensive;
- Disposable;
- Easily handled and transported; and
- Recommended for reduced sulfur compounds such as hydrogen sulfide and the fixed gases such as O<sub>2</sub>, N<sub>2</sub>, CH<sub>4</sub>, etc.

Disadvantages are:

- Potential bag material off gassing (toluene and ketones);
- Adsorption of some VOCs;
- Sample loss (mostly via hose valve assembly);
- Limited holding time;
- Vulnerable to puncture;
- Should not be used when moisture content of soil gas is high (condensation);
- Highly polar compounds adhere to the inner surface of the bag; and
- Low molecular weight compounds may permeate the bag.

### Tubing Types

Nylaflo®, polyetheretherketone (PEEK), and Teflon® are recommended tubing materials for soil vapor sampling. Low-density polyethylene (L-D PE) should not be used due to decreased performance relative to other tubing types in both off-gassing of VOCs inherent in the tubing structure (contribution to background) and for decreased recovery (reactivity). Reduced recovery of naphthalene has been observed when using Nylaflo® tubing with small sample sizes.

**Justification**

Nyloflo<sup>®</sup>, PEEK, Teflon<sup>®</sup>, and L-D PE were evaluated for contribution to background. Of the four tubing types, L-D PE exhibited the highest frequency of VOCs and hydrocarbons in background samples and the poorest recovery for target analytes. Some off-gassing of toluene, and to a lesser extent, benzene, propylbenzene and methanol, were noted with the Nyloflo<sup>®</sup> tubing.

The following table summarizes the results of several studies:

**TABLE B-1  
Tubing Type Study Results**

Tubing Type	Study		
	Ouellette (2004)	Hayes and others (2006)	Nicholson and others (2007)
L-D PE	Sorption of hexane and pentane	Sorption of numerous compounds	N/A
Tygon	Sorption of hexane and pentane	N/A	N/A
Nyloflo <sup>®</sup>	Acceptable	Sorption of naphthalene	Sorption of aromatics
Teflon <sup>®</sup>	Acceptable	Acceptable	N/A
Vinyl	Sorption of hexane and pentane	N/A	N/A
PEEK	N/A	Acceptable	N/A

## APPENDIX C      QUANTITATIVE LEAK TESTING USING A TRACER GAS

### Background

High quality soil gas data collection is driven by project-specific data quality objectives (DQOs) and can be enhanced by using a shroud and a gaseous tracer compound. This method of leak detection ensures that soil gas wells are properly constructed and the sample train components do not leak. Gaseous leak check compounds differ from liquid leak check compounds in that liquid leak check compounds can interfere with target analytes. Soil gas samples containing liquid tracers frequently require extensive sample dilution resulting in elevated reporting limits. These elevated reporting limits may not meet project DQOs. Most gaseous tracer compounds do not affect target analyte measurements nor does their detection require sample dilution. Also, gaseous leak tracer compounds allow a quantitative determination of a leak either in the sampling train or from ambient air intrusion down the borehole.

### Shroud Design

The shroud should be designed to contain the entire sampling train and the soil gas well annulus. The size of the shroud depends on the sampling equipment used but should be designed to minimize the shroud volume and gaseous leak tracer compound used. It is easier to maintain initial gaseous leak tracer compound concentrations within the shroud if the shroud volume is kept small, the number of holes in the shroud is kept minimal, and the shroud has good contact with the ground surface. The sampling train should be constructed of material that does not react with the sample analytes and will not off gas or adsorb volatile compounds. The sampling equipment should be clean and shut-in tested prior to use.

Shrouds should be designed for ease of use during purging and sampling, minimizing disturbance of the shroud. The gaseous leak tracer compound concentration inside the shroud should be monitored frequently to verify initial concentrations (See Figure C-1). Shroud design should also take into account the need for duplicate or multi-depth sampling.

Tracer compound detectors provide measurements of tracer gas concentrations inside the shroud and in the purge stream. Several types of detectors are available for field use including hand held, diffusion cell type (inside shroud), and flow through detectors for measuring the purge stream. Alternatively, an external lung box/polymer gas sampling bag setup may be used to quantify tracer compound breakthrough prior to sampling. Detection of tracer compounds prior to sampling enables the samplers to correct the source of the leak(s) or relocate well(s) before taking a compromised soil gas sample.

Soil gas probes installed with good seals throughout the borehole annulus and the use of compression fittings provide assurance against ambient air leaks.

## **Field Use**

A detailed illustrated Standard Operating Procedure should be submitted to the regulating agency for review prior to sampling. Field personnel should be familiar with the procedures and practices necessary to successfully collect soil gas samples using this equipment. If the shroud and sampling train will be reused, all components should be cleaned and shut-in tested prior to reuse.

USEPA Method TO-15 requires sample trains be tested by passing both spiked and clean dry air through the sampling trains to validate performance characteristics.

## **Purging and Sampling**

The tracer compound concentration around the sample train and above the well annulus should be maintained at a minimum concentration. The shroud should be infused with the tracer compound at least five minutes prior to sample collection to allow the tracer compound time to equilibrate (See Figure C-2).

All methods of tracer compound detection should be capable of measuring the tracer compound in air to an accuracy and precision of 0.1 percent. Shroud concentrations should be two orders of magnitude higher than the reporting limit of the laboratory analytical method or the field meter used to analyze the sample. Tracer compound concentrations inside the shroud should be carefully monitored and maintained to correct variations in tracer compound concentration due to wind and uniformity of the ground surface. Additional tracer compound should be added to the shroud incrementally to maintain the desired concentration. Field personnel should record the measured tracer compound concentration in the shroud periodically during the sampling event.

The calculation of a leak is based on the ratio of tracer compound concentration in the shroud to that in the sample, assuming that the tracer compound is continuously infused during sampling. The tracer compound in the shroud should be kept within  $\pm 10\%$  of its target value, and if not achieved then its lowest measured value should be used for calculation purposes.

The soil gas probe and sampling train assembly can be field screened for leaks by drawing purge gas through the well and then through the tracer compound detector while the shroud is in position and filled with the initial tracer compound concentration. Detecting a significant leak in the probe or sampling train at the time of sampling provides the opportunity for the field crew to correct the leak early in the sampling process, thereby ensuring the samples analyzed by the laboratory meet the project-specific DQOs.

If the concentration of the tracer compound in the purge sample is greater than or equal to five percent of the tracer compound concentration in the shroud, corrective action is necessary to either remedy the leak or relocate the probe prior to collecting a soil gas

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

sample. Regardless of the cause of the leak, a data “adjustment factor” based upon the concentration of the leak check compound to compensate for the inability to collect representative samples is inappropriate.

FIGURE C-1

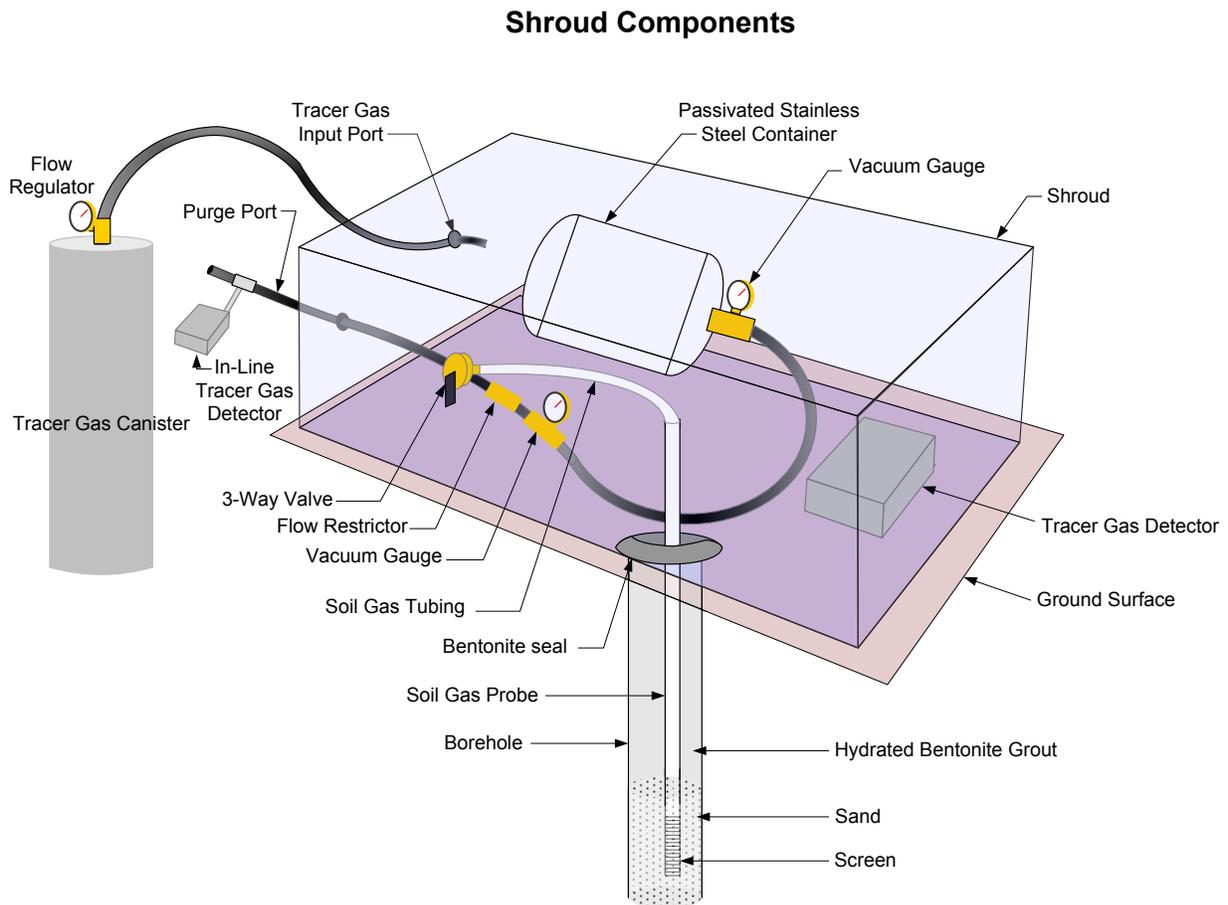

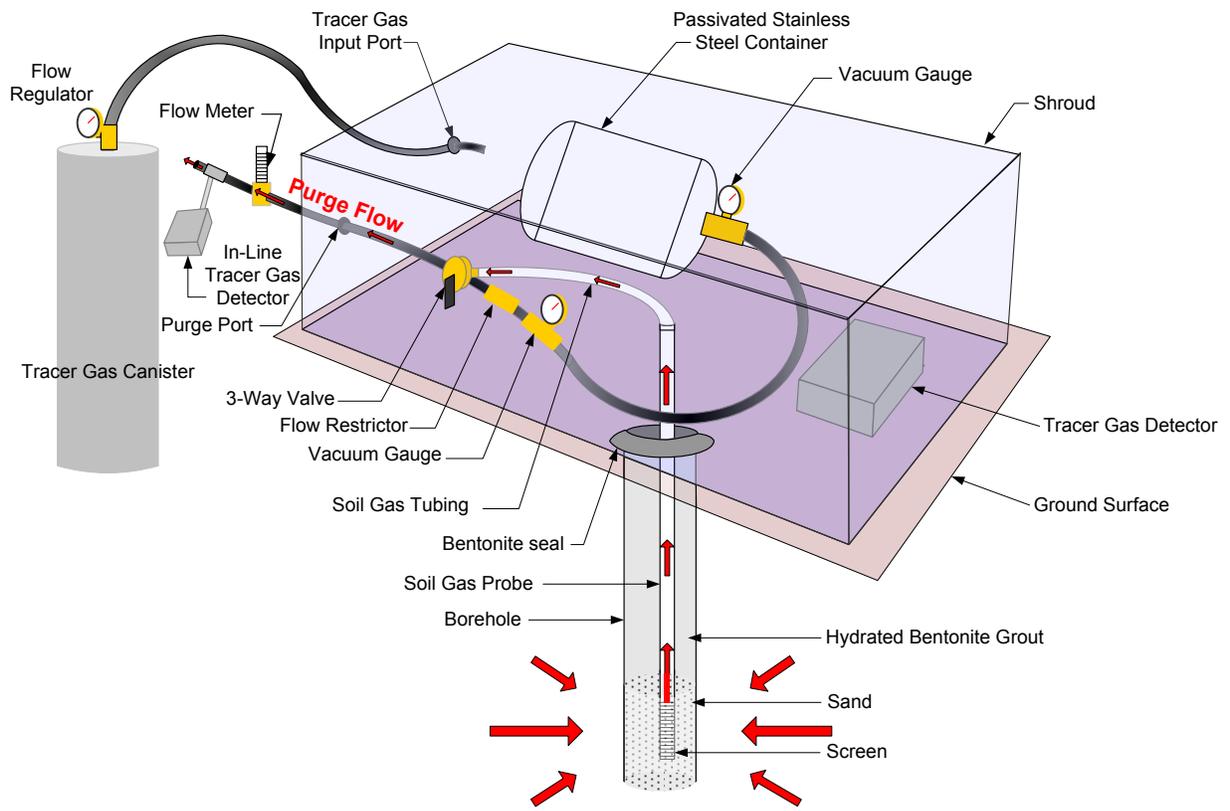

FIGURE C-2

Shroud Components – Purge Conditions

**APPENDIX D SOIL GAS SAMPLING IN LOW PERMEABILITY SOIL**

Representative soil gas samples can be collected from low permeability soil by utilizing specialized field procedures in addition to the protocols described in the main text of this Advisory. Hence, the procedures described in this Appendix do not replace the recommended procedures in the main text but rather supplement the procedures.

When low flow, high vacuum conditions are encountered during soil gas sample collection, two options are available for field technicians. Sampling can continue at the probe with an alternative sample collection method or the probe can be re-drilled and constructed in a non-traditional manner. Typically, low flow conditions are defined as the inability to maintain an appreciable flow rate (100 mL/min or greater) without applying excessive vacuum (any vacuum greater than about 100 inches of water). In the field, the determination of low flow, high vacuum conditions can be done quantitatively or qualitatively. The probe in question should be subject to applied vacuum for three minutes prior to rendering a decision about flow conditions.

In low permeability soil, it is helpful to initially perform passive soil gas sampling to determine whether active soil gas samples are required at low permeability sites. The passive soil gas samples are used to screen areas for contamination with follow-up active soil gas sampling for risk assessment. Passive soil gas sampling is described in Appendix A.

**ALTERNATIVE SAMPLING METHOD**

A modified purging and sampling procedure can be used for low flow vapor probes. In a study conducted by McAlary and others (2009), several nested soil gas probes were installed in low-flow conditions, as defined above. About a third of a liter of soil gas was collected from each soil gas probe under an applied vacuum of 100 inches of water before the flow diminished to a negligible amount. Once this vacuum threshold was obtained and it was determined that a flow rate of 100 mL/min was not sustainable, the probe valve was closed to allow the vacuum to dissipate and to allow soil gas to slowly enter the sand pack and tubing from the surrounding soils. When the vacuum dissipated, the probe valve was reopened, and another aliquot of sample was collected. This procedure was repeated until the soil gas probe was adequately purged and sampled. In this manner, probes can be appropriately purged and enough sample volume can be collected for analysis.

If this procedure is used, the rate of vacuum dissipation should be monitored with a dedicated vacuum gauge. The sampling crew may proceed with other nearby activities during the pressure rebound cycle. Additional pressure gauges, fittings, and a flow meter will be needed to implement this procedure in the field. Prior to purging and sampling, the sampling system should be shut-in tested to ensure that vacuum rebound is attributable to subsurface processes and not system leakage. Likewise, leak check compounds should be used during the entire sampling process to confirm the integrity of the sample.

## **REINSTALLATION METHOD**

This approach requires the reinstallation of a vapor probe with a sand pack larger than traditional size. A large sand pack assures the availability of subsurface air for sampling. For this method, the sand pack should have an interstitial void volume of approximately 3 liters, which implies the use of approximately 10 liters of sand for the sand pack. To accommodate this large volume of sand, both the length and the radius of the sand pack must be larger than sand packs typically installed with direct push technology. Approximately ten liters of sand equates to a sand pack length of two feet for a six-inch borehole and a sand pack length of four feet for a four-inch borehole. A study by Neznal and Neznal (2005) indicates that measured radon concentrations in soil gas are not dependent on the subsurface well geometry when the soil is homogeneous and of low permeability.

When using this method, the following should be considered:

- The length of the sand pack should not be longer than the zone of interest;
- The vapor probe tip should be located in the center of the sand pack;
- The top of the sand pack should be at least five feet below surface grade;
- Excessively long sand packs (greater than five feet) should be avoided;
- The diameter of the vapor probe should be small to reduce purge volumes (less than or equal to ¼-inch); and
- The bentonite above the sand pack should be fully hydrated to ensure a high integrity annular seal.

The vapor probe should only be sampled after the sand pack has reached equilibrium with the native material. The establishment of equilibrium can be expected to take approximately two weeks. Purge volume testing should be conducted on the probe to determine optimal purging with one purge volume equating to one tubing volume. Probe tubing size should be selected so that the purge volume does not exceed 200 milliliters. Purging 200 milliliters should not induce any significant vacuum in the probe given the void volume in the sand pack. Excessive vacuum during sample collection can be avoided if the sample collection vessel is small. To avoid excessive vacuum, sample size should be no more than one liter. Vacuum within the vapor probe should be measured to ensure that 100 inches of water is not exceeded during the purging and sampling.

## **AIR PERMEABILITY TESTING**

Air permeability is determined by measuring the gas pressure in a vapor probe as a metered flow of air is passed through the probe. These in-situ tests should only be conducted after soil gas sampling due to potential disruption of subsurface conditions by the movement of air. In-situ testing should continue until steady-state conditions occur. The occurrence of steady-state conditions is defined as less than a 130 Pascal pressure change within 30 minutes. The air permeability is calculated using the data obtained during steady-state conditions. The method also requires the measurement of the soil gas air temperature along with ambient air pressure. See DTSC'S Vapor Intrusion

## APPENDIX E NAPHTHALENE SOIL GAS COLLECTION

Soil gas sampling for naphthalene is more complex than traditional soil gas sampling procedures. Naphthalene analysis by USEPA Method TO-15 presents several challenges, such as contaminant carryover and variability in recovery (Hayes et al., 2005). Likewise, naphthalene readily sorbs onto traditional soil gas sample tubing such as polyethylene and nylaflo (Hayes et al., 2006). USEPA Method TO-15 defines target analytes as having vapor pressures greater than 0.1 millimeter (mm) of mercury (Hg) at standard conditions, and is suitable for organic compounds with carbon content ranging from C3 to C10. However, naphthalene with vapor pressure of 0.087 mm Hg falls just below this threshold and hence is not listed as an analyte for TO-15. USEPA Method TO-17 allows greater flexibility in targeting lower vapor pressure compounds, and hydrophobic sorbents can trap organic compounds ranging from C7 to C20. Nonetheless, naphthalene samples can be analyzed by both USEPA Methods TO-15 and TO-17 provided the appropriate protocols described below are followed. Table E1 is a comparison of the two methods, and can be used to assist practitioners in the selection process in conjunction with the project's data quality objectives (DQOs).

To collect a naphthalene sample, the entire sampling system should be composed of Teflon<sup>®</sup>, polyetheretherketones (PEEK) or other tubing types with demonstrated inertness (Hayes et al., 2006). Using proper materials in the sampling system will ensure that soil gas samples are representative of subsurface conditions. Soil gas sampling workplans should describe how the field investigation will meet all the recommendations within this appendix as well as those noted in the USEPA TO methods. Both passive and active soil gas samples may need to be collected in order to provide multiple lines of evidence to evaluate vapor intrusion exposure to naphthalene.

### Naphthalene Sample Collection by TO-15 (USEPA, 1999a)

Many stationary laboratories are capable of obtaining naphthalene data of acceptable quality using TO-15. If TO-15 is used for naphthalene sampling, then the laboratory conducting the analysis should utilize certain procedures, as follows:

- 1) **Naphthalene Recovery:** Naphthalene may condense onto the interior surface of sampling canisters. Therefore, storage stability tests with prepared naphthalene vapor standards should be performed for the duration of expected holding times. These storage stability tests should be conducted in the laboratory using certified clean canisters. Acceptable recovery of naphthalene should be demonstrated using a gas standard at a concentration of  $32 \mu\text{g}/\text{m}^3$  or less prepared in a passivated canister of the same make and approximate age as those used for sampling. The recovery testing information should be provided in the laboratory reports.
- 2) **Naphthalene Carryover:** Laboratory blanks should be used to check for instrument carryover. The blank should be run after the introduction of the highest naphthalene standard used to generate the instrument's calibration curve. Likewise, blanks should be run after the analysis of soil gas samples with

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

high naphthalene concentrations. Any instrument carryover of naphthalene from the blank sample should be substantially lower than the reporting limit to assure that the analyses are not compromised. The laboratory blank information should be provided in the laboratory reports.

- 3) **Canister Cleanliness:** Canisters used for naphthalene analysis should be certified clean before and after use, and the certification sheets provided in the laboratory reports. The canisters can be either batched or individually certified dependent upon the project's data quality objectives.
- 4) **Canister Age:** Laboratories should consider utilizing newer canisters for naphthalene sample collection. In older canisters, the passivated interior surface degrades over time, allowing greater surface area for the sorption of naphthalene. The age of the sampling canisters should be provided in the laboratory reports.
- 5) **Matrix Spikes (MS) and Matrix Spike Duplicates (MSD):** As stated in Table 2 in the Advisory and repeated in Appendix F, MS and MSD are impractical and not required when using TO-15.

If TO-15 is used for naphthalene sampling, TO-17 should be used to confirm TO-15 sampling results at a frequency of five to ten percent of the field samples. The number of confirmatory samples should be a function of the data quality objectives for the site. Confirmation sampling is especially prudent when using data for risk assessment purposes or when verifying cleanup objectives.

### Naphthalene Sample Collection by TO-17

Soil gas samples for analysis by TO-17 are collected in sampling tubes packed with an appropriate sorbent material. USEPA (1999b) contains lists of chemicals amenable to TO-17 analysis along with guidelines for sorbent selection. For naphthalene, the sorbent material is usually Tenax<sup>®</sup> GR or Tenax<sup>®</sup> TA, but others may be appropriate. Practitioners should reference Table I in the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (USEPA 1999b). The air flow rate through the tubes is monitored during sample collection and a vacuum of less than 100 inches of water should be maintained during sampling. Shut-in tests should be conducted and leak check compounds should be used to evaluate sample integrity.

Items to consider when soil gas sampling pursuant to TO-17 are as follows:

- 1) **Practitioner's Unfamiliarity:** Practitioner's unfamiliarity with sampling by TO-17 may lead to field errors, potentially reducing the integrity of the sampling data.
- 2) **Perceived Limitations with Sorbent Tubes:** Other concerns and perceived limitations with use of the sorbent tube include lack of repeat analysis for samples collected by TO-17, breakthrough of target analytes during sampling and potential mass spectrometer overload from high concentration samples. To

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

address these concerns, practitioners should consider pre-screening all soil gas samples subject to TO-17 procedures. By estimating the anticipated concentration range of the sample prior to sorbent tube sampling, practitioners can determine optimal sampling durations to avoid breakthrough and provide notification to the stationary laboratory about possible instrumentation overload. Field equipment capable of measuring in the microgram per cubic meter range may be warranted.

- 3) **Breakthrough Volumes:** The sampling air volume is calculated from the anticipated subsurface concentration, sampling tube sorption capacity and sorbent tube temperature. Equations for breakthrough are typically provided by either the sorbent tube manufacturer or the analytical laboratory. Calculations for breakthrough should include an adequate safety factor to ensure that breakthrough does not transpire during sampling. If breakthrough volumes cannot be determined due to unknown conditions, sorbent tubes should be arranged in series and all tubes should be submitted to the laboratory for analysis.
- 4) **Pump Placement:** The sorbent tube should be upstream of the sampling pump.
- 5) **Sample Collection Flow Rate:** Flow rates for sample collection are typically less than 50 milliliters per minute, and the flow rate should not vary by more than 10 percent during sample collection.
- 6) **Sorbent Tube Orientation:** Tube orientation is usually annotated on the tube by the sorbent manufacturer or laboratory. For thermal desorption methods, the sorbent tube must be oriented during sample collection in the direction indicated on the tube. Multiple tubes may be placed in series in the sampling train if analytes other than naphthalene are required or if duplicate samples are necessary.
- 7) **Field Documentation:** Data sheets should be completed in the field and submitted to the analytical laboratory. The sheets should contain the sampling flow rates and sampling volumes required to quantify contaminant concentrations. These field data sheets should be included within the characterization report.
- 8) **Leak Check Compounds:** Leak test compounds should be used to verify sample integrity when sampling pursuant to TO-17, but it should be noted that most sorbent tubes will not retain many typical leak check compounds. For example, compounds smaller than C7 are not captured by Tenax® GR or Tenax® TA. In these situations, practitioners cannot depend upon the analysis of sampling tube for quantification of the leak check compound. Instead, additional sampling and analytical procedures may be warranted. Leakage can be readily measured and quantified on-site with a field meter, or by a stationary laboratory after the soil gas sample is collected. If a leak test compound with a carbon range of greater than C7 is used, the additional mass absorbed onto the sorbent tube may elevate the reporting limit or even overload the mass

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

spectrometer upon analysis. Additionally, a shut-in test of the above-ground apparatus downstream from the probe should be performed prior to sampling.

- 9) **Collection Tube Composition:** Sorbent tubes composed of metal should be used due to potential photochemical reactions. However, if only glass sampling tubes are available, the tubes should be wrapped entirely in aluminum foil during and after sample collection to avoid photodegradation.
- 10) **Duplicate Samples:** Duplicate sorbent tube samples should be collected at a predetermined frequency, usually at a rate of 10 percent of the number of samples.
- 11) **Trip Blanks:** Each shipping cooler should contain a trip blank. The trip blank should be a sealed tube filled with the same sorbent used during the field procedures.

### Other Analytical Methods for Naphthalene Sample Collection

- 1) **Method 8260:** Due to the potential for low data quality when collecting and analyzing naphthalene soil gas samples pursuant to Method 8260, sample results should not be used for risk assessment purposes. Similar to the concerns about naphthalene analysis by TO-15, Method 8260 presents issues concerning contaminant carryover, variability in recovery and sorption to sampling equipment, such as plastic and glass syringes, glass bulbs and Tedlar bags.
- 2) **TO-13A:** Naphthalene analysis by TO-13A is not recommended. While TO-13A procedures are similar to TO-17 in many respects, two fundamental differences exist. First, the sorbent material within the sampling tubes for TO-13A is composed of polyurethane foam, typically PUF® and XAD-2®. Second, the sorbent material is removed by solvent (soxhlet) extraction prior to introduction into the gas chromatography/mass spectrometry instrumentation rather than by thermal desorption as in TO-17. Both PUF® and XAD-2® are known to have marginal collection efficiency for vapor phase naphthalene. Additionally, there is a potential for substantial losses of naphthalene due to its tendency to sublime and its relatively high vapor pressure during TO-13A soxhlet extraction and evaporative concentration (Fortune et al., 2010).

**TABLE E-1  
Comparison of Methodologies**

Issues	TO-15	TO-17
Application to naphthalene	Naphthalene is not a listed constituent due to its low vapor pressure.	Method specifically designed for constituents with low vapor pressure.
Familiarity with method	Method is commonly used.	Method is not widely used. Some laboratories may not have the necessary analytical equipment.
Sample collection	Canisters are expensive, expensive to clean, and bulky to transport. Only one sampling canister is needed per sample if numerous constituents warrant analysis. Sample remains stored as a gas until analysis.	Sorbent tubes are inexpensive as compared to canisters, and are small and easy to transport. Numerous sampling tubes may be needed if numerous constituents warrant analysis. Samples are no longer in the gas phase once collected, and hence, less likely to interact or react until analysis.
Sample analysis	The GC/MS analysis is the same for both methods. The difference is how the sample is introduced into the GC.	The GC/MS analysis is the same for both methods. The difference is how the sample is introduced into the GC.
Sample recovery	Naphthalene may sorb into the interior surface of the sampling canister, biasing the sampling results.	Naphthalene readily desorbs from the sampling tube material.
Sampling rate	Canister sampling rate is controlled by a regulator which is pre-calibrated and usually provided by the laboratory.	Sampling rate is controlled by a purge pump in the field. Hence, the field crew is responsible for maintaining the flow rate and for determining the sample volume.
Subsurface concentration	Highly concentrated samples can be handled, but canisters need to be cleaned thoroughly afterward.	Constituent breakthrough can occur without realization, compromising the integrity of the sample.
Capacity for multiple runs	Multiple analyses can be performed on the canister air if needed.	Typically, only one analytical run is possible on a sorbent tube. Samples cannot be diluted in most cases.
Detection limits	Typically greater than 10 µg/m <sup>3</sup> for naphthalene.	Typically less than 10 µg/m <sup>3</sup> for naphthalene.
Water management	Both methods are effective in removing water. Sorbent trap in the concentrator allows for the passage of some water, and then a dry gas purge is performed prior to thermal desorption in the GS/MS.	Both methods are effective in removing water. Uses a combination of hydrophobic sorbents, and then a dry gas purge is performed prior to thermal desorption in the GS/MS.
QA/QC	Analytical QA/QC is same for both methods.	Analytical QA/QC is same for both methods. Relatively extensive QA/QC on the sorbent tubes before and during sampling.

**APPENDIX F SOIL GAS ANALYTICAL METHOD REVIEW**

**SOIL GAS ANALYSIS METHODS**

There are two methods generally used in California for soil gas analysis. One is Gas Chromatography with Mass Spectrometer (GC/MS), which is able to confirm the identity of compounds. The second is GC with a single specific detector such as a Flame Ionization Detector (FID), Electron Capture Detector (ECD), Photoionization Detector (PID) or a series of these detectors. The GC/MS technique is preferred because of its specific compound identification ability.

There are no approved USEPA methods specifically designed to analyze volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in soil gas samples. Consequently, modified versions of existing USEPA methods are used to analyze soil gas samples.

The modifications made to accommodate soil gas samples include the sample introduction technique and the calibration approach. It is important for consultants, regulators and other stakeholders to evaluate the technique(s) being employed before work begins on a site. All of the modifications have advantages and disadvantages with some working better for certain compounds than others. Project data quality objectives should be the deciding factor on which technique is the best to use for each phase of work on a particular site. If possible, the parties involved should perform preliminary performance tests or trial runs using a selected number of techniques and determine the best method to use on the site.

**PERFORMANCE-BASED MEASUREMENT SYSTEM**

This appendix summarizes some common methods used to analyze soil vapor samples. Laboratories are not restricted to the methods described in this document. Modifications and other adjustments may be needed to accommodate matrix, background, or other analytical issues. These modified methods can be used provided they have been validated and it can be demonstrated that the modified methods are capable of meeting the project data quality objectives and established performance criteria. Innovations and creativity are encouraged.

Methods that do not follow the specifics of published written methods (such as USEPA Method TO-15) but have been validated and can be demonstrated to be effective are considered to be “performance-based measurement system” (PBMS) with stipulations.

USEPA published the PBMS in 1997. The intent of PBMS was to allow the regulated community to select any suitable analytical method for regulatory compliance, to improve data quality and to encourage development of better analytical techniques. PBMS conveys what needs to be accomplished, but does not prescriptively describe how to do it. PBMS are defined as a set of processes where the data needs of a program or project are specified, and serve as the criteria for selecting appropriate methods to meet data or project objectives.

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

Since there are no analytical methods specifically designed to analyze soil gas samples, laboratories may develop and implement PBMS for soil gas samples. PBMS can be used for soil gas samples provided the criteria stated above are met, specifically that:

- The process can be validated;
- It can be demonstrated that the process can meet project data quality objectives; and
- It can be demonstrated that the process can meet the specified method performance criteria.

Laboratories may independently validate their PBMS. All validation documentation, such as raw data, should be kept on file and available for review by parties that may have vested interests in a particular project.

The regulating agency should review all PBMS in detail before accepting the proposed modification. Data from projects where the proposed PBM will be used should be compared side-by-side with an existing method. The proposed PBMS should be scrutinized to make sure they are not simply short-cut methods disguised as performance-based measurement systems.

Project consultants and contractors should provide the necessary documentation to support the use of any proposed PBMS for a project. Documentation should substantiate that the proposed method is capable of meeting the project data quality objectives and meet performance criteria.

Laboratory results from a PBM should reference the method used as “Performance-Based” followed by the base method. For example, if the PBM is based on USEPA Method TO-15, then the method should be referenced as “Performance-Based USEPA Method TO-15.” In the report narrative, a short description of the modification and/or adjustment made to the established method should also be included.

## **HISTORICAL AND LATEST VERSIONS OF ANALYTICAL METHODS**

Multiple versions of USEPA methods exist. Analytical methods are revised in order to add more analytes, update instrumentation and clarify requirements and recommendations. Most revisions do not involve substantial changes to the method technique. In general, laboratories should use the latest method revision in their work. However, before using a new revision, laboratories should carefully review and compare their existing method with the new revision to verify that there are no significant changes that can affect data quality and the data quality objectives of their clients. Likewise, laboratories using older revisions of methods, for historical or consistency reasons, should confirm that the older method version will serve the intended purpose. Laboratories should clearly indicate the exact revision of the method used in their laboratory reports to their clients.

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

Letter suffixes to a method such as “A”, “B”, etc. are used to identify the revision status of the method. The first version of a method (revision “0” [zero]) does not have a letter suffix.

Occasionally a revision or method may be declared obsolete by the USEPA and should therefore no longer be used by laboratories. For the current status of USEPA methods, refer to the Status Tables for SW-846, Third Edition.

Table F-1 displays the various versions of USEPA methods referenced in this advisory modified for soil gas testing:

**TABLE F-1  
USEPA Soil Gas Testing Methods**

USEPA Method	Description	Revisions (Date)	Comments
8015	Nonhalogenated Organics by Gas Chromatography	0 (September 1986) A (July 1992) B (December 1996) C (February 2007) D (June 2003)	Revision D is the latest revision in spite of the later date for revision C. Revision C was introduced in 2000 as a draft update, but not finalized until 2007.
8021	Aromatic and Halogenated Volatiles by Gas Chromatography Using Photoionization and/or Electrolytic Conductivity Detectors	0 (July 1992) A (September 1994) B (December 1996)	Replaced methods 8010 and 8020.
8260	Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)	0 (July 1992) A (September 1994) B (December 1996) C (August 2006)	
TO-13A	Polycyclic Aromatic Hydrocarbons (PAHs) in Ambient Air Using Gas Chromatography/Mass Spectrometry (GC/MS)	First Edition (TO-13) (March 1989) Second Edition (January 1999)	“Edition” refers to the Compendium of Methods for the Determination of Toxic Organic Compound in Ambient Air, and not the revision of the method.
TO-15	Volatile Organic Compounds (VOCs) in Air Collected in Specially-Prepared Canisters and Analyzed By Gas Chromatography/Mass Spectrometry (GC/MS)	Second Edition (January 1999)	Method TO-15 was a new method added to the Second Edition of the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air. TO-15 is based on Method TO-14A.
TO-17	Volatile Organic Compounds (VOCs) in Ambient Air Using Active Sampling Onto Sorbent Tubes	Second Edition (January 1999)	Method TO-17 was a new method added to the Second Edition of the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air. It is an update of Methods TO-1 and TO-2 from the first compendium (1989).

## MODIFIED GC/MS METHODS

### USEPA Method 8260

USEPA Method 8260 (Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)) is designed to determine the concentration of VOCs in a variety of solid and liquid matrices (USEPA, 2000). There are two modifications made to this analytical method for soil gas sampling. In the first modification, a volume of soil gas sample is injected into the sparge vessel (sparger) containing water. Helium gas is then used to purge the VOCs out of the sparger and onto a sorbent trap. VOCs in the sorbent trap are thermally desorbed into the GC column for separation and analysis. This is equivalent to USEPA Method 5030 (Purge-and-Trap for Aqueous Samples). In the second modification, a small volume of the soil gas sample is directly injected into the GC.

Laboratories employing a modification of USEPA Method 8260 to analyze soil gas samples should adhere to all the analytical requirements of the original method including purge time, calibration and Quality Assurance/Quality Control (QA/QC). Modifications for soil gas samples are outlined in the following sections.

#### **a) Sample Introduction**

The original USEPA Method 8260 outlines five specific methods for sample introduction, none of which were designed for soil gas. Therefore, modifications of the introduction step are needed for soil gas samples. DTSC contacted several stationary and mobile laboratories that use Method 8260 for soil gas, and determined that soil gas samples are usually introduced by either purge-and-trap or direct injection, as described above. Each sample introduction technique has its own advantages and disadvantages. The advantages and disadvantages are summarized in Table F-2.

**TABLE F-2**  
**Advantages and Disadvantages of 8260 Sample Introduction Techniques for Soil Gas**

Sample Introduction Technique	Advantages	Disadvantages	Comments
<p>A volume of soil gas sample is injected into a purge-and-trap sparger containing water. Analytes are purged out of sparger into the sorbent trap using helium gas. Analytes in the trap are thermally desorbed into the GC column for separation.</p>	<ul style="list-style-type: none"> <li>• Larger volumes of soil gas sample may be forced into water to achieve lower reporting limits with limitations.</li> <li>• Surrogates, internal standards and spikes are added into the sparger before sample introduction and purging.</li> <li>• Soil gas volumes can be changed by using a smaller syringe or concentrated soil gas samples can be diluted in glass bulb before injecting into sparger.</li> </ul>	<ul style="list-style-type: none"> <li>• Analytes are forced into a water matrix and purged out into trap before entering into GC column. Loss of target analytes possible.</li> <li>• Depending on the type of sample container/vessel in which the sample is collected, sample may need to be transferred before injection into sparger –potential sample loss in transfer process.</li> <li>• Low recovery of polar/water soluble compounds.</li> <li>• Calibration curve not matrix-matched if liquid standards are used.</li> </ul>	<ul style="list-style-type: none"> <li>• Not recommended for polar/water soluble compounds.</li> <li>• Surrogates (liquid-phased) are used, but introduced separately into sparger. Does not actually provide true QA/QC information on soil gas.</li> <li>• Ideal for higher concentration samples.</li> <li>• Not recommended for low level (low concentration) samples.</li> <li>• Not recommended for oxygenates and chlorinated compounds due to poor purging efficiency.</li> </ul>
<p>Direct injection of soil gas sample into GC column for separation.</p>	<ul style="list-style-type: none"> <li>• Technique is quick with limited sample handling.</li> <li>• Holding time not an issue, provided samples are injected immediately after collection.</li> <li>• No transfer of analytes from one phase to another (i.e., gas to liquid to gas).</li> <li>• Can handle high level (concentrated) samples.</li> </ul>	<ul style="list-style-type: none"> <li>• Limited sample size; threshold limit on how much sample can be injected into GC column may result in elevated reporting limits</li> <li>• Elevated reporting limits may not meet the DQOs for risk assessment purposes.</li> <li>• Calibration not matrix-matched.</li> </ul>	<ul style="list-style-type: none"> <li>• Recommended for screening purposes (qualitative data) and routine monitoring of limited number of known compounds.</li> <li>• Calibration standards prepared by expansion of liquid standards in vials/bulb may not be amenable to all compounds.</li> </ul>

**b) Calibration for 8260**

Analytical laboratories should use vapor-phase standards to calibrate their instruments when employing USEPA Method 8260B/C for soil gas analysis. Vapor-phase standards used for ambient air testing are readily available and can be used for soil gas analyses. Many laboratories use liquid-phase standards to prepare the calibration curve, for logistical and economic reasons, rather than using a vapor-

phase standard. This is problematic because the vapor pressure, solubility, and other properties of a compound may be different in a liquid-phase standard than in a vapor-phase standard, especially when it is subjected to being forced into an aqueous phase in the sparger and then forced out into a gaseous phase again during the purge. Therefore, the calibration curve should be matrix-matched by using a vapor-phase standard.

Some laboratories are essentially using a headspace technique modification that attempts to matrix-match a liquid-phase calibration standard to soil gas samples. The technique entails injecting the liquid standard into an empty volatile organic analysis (VOA) vial through the septum or into glass bulbs and allowing the standard to vaporize and equilibrate before taking an aliquot of the vapor and injecting it into the gas chromatograph. This technique may not be amenable to all VOCs since it is dependent on the vapor pressures of the target analytes and how well each compound will vaporize in the vial or bulb. The few laboratories that use this technique are analyzing a limited number of analytes. Laboratories using this approach should standardize their temperature range, time for equilibration, and other practices in preparing the calibration standards. Furthermore, laboratories using this technique should validate and verify the accuracy of their vaporized standards by comparing their calibration with vapor-phase standards (see next section).

### **c) Calibration Validation for 8260**

Calibration curves are validated by analyzing a mid-level National Institute of Standard and Technology (NIST) traceable vapor-phase validation check standard on a routine basis. The vapor-phase validation check standard, or equivalent, should be analyzed and evaluated every time a calibration curve is generated. Routinely, a vapor-phase check standard should be analyzed with each analytical batch to verify the validity of the liquid calibration curve. In addition, the vapor-phase validation check standard should include all the target analytes in the calibration curve. Because the purging characteristic of each compound is different, laboratories should establish their own acceptance criteria for each compound for the validation. The acceptance criteria should be based on experimental and/or historical data. This validation procedure is recommended, regardless of the sample introduction technique being used, to provide technically sound and defensible data.

For laboratories that calibrate their analytical system using the headspace technique, validation of the calibration curve should be conducted by injecting an aliquot of a vapor-phase NIST traceable or equivalent standard at a volume equal in concentration to the mid-point of the calibration curve to validate and to verify the accuracy of their standard preparation technique. The volume needs to be calculated based on the volume of the vaporized standard injected and the concentration of the standard. The frequency of the validation, percent differences of validation check and reportable data should be the same as for liquid standards.

If vapor-phase standards are used to prepare the calibration curve with USEPA Method 8260B, the validation referenced above is not necessary. However,

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

analytical laboratories should verify the accuracy of their vapor-phase standards periodically by comparing them to a secondary standard either from another source or to a different lot of standards from the same supplier.

### **d) Sample Volume for 8260**

The sample volume is determined by the sample introduction technique in conjunction with the project reporting limits. If lower reporting limits are desired, then a larger volume of sample should be injected. The volume for the direct injection technique is limited since only a very small volume can be injected onto the GC, whereas a larger volume can be used with the sparger technique. Sample volumes of five to 250 milliliters (mL) are typically used, although some laboratories use up to 500 mL of sample.

Larger volume samples are introduced in aliquots into a sparger filled with water by forcing the water directly through the trap. The contact time with the water is minimal. More water-soluble compounds such as ketones and methyl tertiary butyl ether will preferentially stay in the water phase until purged out.

Laboratories should validate their injection technique by injecting aliquots of vapor-phase standards into the sparger and evaluating the recovery levels. The recommended recovery range is 70 to 130 percent for most compounds.

### **e) Purge Time for 8260**

USEPA Method 8260B specifies a purge time of 11 minutes. Laboratories should not deviate from this specification as the method is optimized for the recovery of all target analytes. If modifications are required, they should be documented and validated with vapor-phased standards.

### **f) Autosamplers for 8260**

Using an autosampler with modified USEPA Method 8260B/C is not reliable. The soil gas sample is transferred for analysis from a soil gas collection vessel such as a syringe to another secondary container such as a VOA vial, resulting in sample loss. This technique is not capable of handling variable volumes of soil gas sample, especially larger sample volumes needed to adjust for the desired site-specific compound RLs. Furthermore, gases and the more water-soluble compounds have questionable recoveries.

### **g) Screening**

When using a GC/MS, laboratories should screen samples before analysis with a GC/FID to avoid saturation of the mass spectrometer. This will also provide information on the proper dilution(s) needed for quantification.

**h) Applicability of 8260**

Modified Method 8260B works well for soil gas samples with VOC concentrations greater than 0.1  $\mu\text{g/L}$  or 100  $\mu\text{g/m}^3$  and for most compounds.

**i) Other Modifications**

The project proponent should propose method modifications to the regulatory agencies prior to implementation, leaving an adequate time for regulatory review and comment. Standard operating procedures (SOP) for the modified sample preparation and analysis should be provided. The laboratory using the modification must validate the procedures before implementation and provide the data and report for review. Refer to the Performance-Based Measurement System Section above.

**USEPA Method TO-15**

Although TO-15 (USEPA, 1999) was designed for collecting and analyzing VOCs in ambient air samples, this method can successfully be used for soil gas analysis. A known volume of sample is collected into a passivated stainless steel canister, then concentrated onto a solid sorbent trap in the laboratory and refocused on a second trap before being thermally desorbed onto the GC column for separation.

There are two techniques for introducing whole air samples by TO-15 from the canister into the gas chromatograph. These are the multisorbent pack method and a cold trap method. The multisorbent pack method uses different types of solid sorbent traps with different retentive properties selectively concentrating VOCs depending on the analytes. The cold trap method concentrates VOCs by condensing them on a cold surface.

TO-15 was designed for ambient air where the analyte concentrations have a narrow concentration range. In contrast, soil gas samples have a wide range of concentrations. Therefore, soil gas samples should be pre-screened before analysis. Pre-screening provides for adjusting the operating parameters such as dilution and recalibration to avoid overloading the instrument and/or creating problems such as carryovers.

Of all the USEPA methods, Method TO-15 is best suited for soil gas analysis since it is designed for gas samples. Laboratories employing TO-15 to analyze soil gas samples should adhere to all the basic requirements of the method including calibration and QA/QC protocols.

Advantages and disadvantages of TO-15 modifications are described in Table 3. Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method.

**TABLE F-3**  
**Advantages and Disadvantages of Modifications to TO-15**

Modification	Advantages	Disadvantages	Comments
Samples collected in polymer gas sampling bags	<ul style="list-style-type: none"> <li>• Lower Cost;</li> <li>• Easily transported</li> <li>• Selected compounds have been shown to be stable.<sup>1</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Potential background issues (bag off-gas);</li> <li>• Adsorption of some compounds;</li> <li>• Bags do not conform to TO-15 protocol; and</li> <li>• Limited holding time (6 hours).</li> </ul>	
Samples injected into instrument by filling injection loop with syringe	<ul style="list-style-type: none"> <li>• Good for highly concentrated samples.</li> </ul>	<ul style="list-style-type: none"> <li>• Limited volume can be analyzed (0.5 – 5 cc); and</li> <li>• Not suited for low concentration samples.</li> </ul>	<ul style="list-style-type: none"> <li>• May only be used for highly concentrated samples.</li> </ul>

Samples have to be transferred for analysis (e.g., canister to syringe or polymer gas sampling bag).</li> </ul>	<ul style="list-style-type: none"> <li>• Considered to be an automated gas chromatograph under Section 1.6 of method.</li> </ul>

<sup>1</sup> Hartman (2006)

<sup>2</sup> DTSC Environmental Chemistry Laboratory should be consulted.

**a) Quality Assurance/Quality Control for TO-15**

The QA/QC requirements for Method TO-15 differ from USEPA Method 8260B/C. The calibration curve and tuning need to be checked every 24 hours for Method TO-15 compared to every 12 hours for Method 8260B/C. There are no requirements to verify the calibration curve with a second-source standard, to analyze matrix spike/matrix spike duplicate samples (MS/MSD), to run laboratory control samples (LCS) or to use surrogates for Method TO-15.

**b) Use of Autosamplers for TO-15**

Samples in passivated stainless steel canisters may be analyzed without any further sample transfer if the canisters are directly connected to an autosampler. Additional blank samples should be included in the sample sequence to evaluate possible carryover of highly contaminated samples.

Samples in polymer gas sampling bags may also be analyzed with an autosampler provided the sample container is connected in such a way to ensure there is no leakage. A vacuum pump is needed to pull the sample into the instrument. Additional blank samples should be included in the sample sequence to evaluate possible carryover of highly contaminated samples.

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

Polymer gas sampling bags are sometimes used for dilution of highly concentrated samples from canisters. The bags used for dilutions should be new and thoroughly cleaned.

### **c) Canister Certification for TO-15**

Although canister certification may not be appropriate for all projects, certifying canisters as clean canisters decreases the level of uncertainty associated with the prior use of the canister. Certified canisters are leak tested and documented to be clean and free of any contaminants. The project DQOs dictate the certification level and certification frequency. The certification level is determined by the reporting limits. The certification frequency refers to the number or percent of canisters requiring certification. Canisters should be certified with the same data acquisition mode as the sample analysis.

Soil gas samples collected in canisters may be shipped since they are under vacuum. The Department of Transportation (DOT) in title 49 Code of Federal Regulations, Parts 100-185, requires that canister pressure must not exceed 400 pound-force per square inch gauge (psig). Consult with the federal code of regulations and the shipping agent on specific regulations pertaining to shipping and transporting various materials.

## **USEPA Method TO-17**

Method TO-17 (USEPA, 1999) is primarily a sampling method coupled with the analytical approach used in USEPA Method TO-15. In TO-17, a known volume of soil gas is pulled through a sorbent tube to collect the VOCs followed by VOC desorption onto the GC column for separation and analysis by the mass spectrometer. Other detectors or combinations of detectors, such as the ECD/FID in series, can be used with this method provided that the criteria specified in Section 14 of the method are met.

Like TO-15, TO-17 was designed for collecting and analyzing VOCs in ambient air samples, but can successfully be used for soil gas sampling and analysis.

Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method.

### **a) Conditioning and Calibration for TO-17**

Freshly packed or new sorbent tubes must be conditioned before use. Conditioning entails heating the tubes at specific temperatures with a set gas flow rate (See Table 2 of method). Tubes can be reused for multiple thermal desorption cycles until the safe sampling volume validation procedures fails (USEPA, 1999, Method TO-17, Section 13.1.2).

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

For calibration, either vapor-phase or liquid standards can be used. Liquid standards are directly injected into the sorbent tubes for calibration. No calibration validation with gas-phase standards is needed if liquid standards are used.

According to USEPA 1999, “Sample tubes awaiting analysis on an automated desorption system must be completely sealed before thermal desorption to prevent ingress of VOC contaminants from the laboratory air and to prevent losses of weakly retained analytes from the tube.” (Method TO-17, Section 8.2.1.2)

### **b) Advantages and Disadvantages**

The TO-17 method has some advantages over Methods TO-15 and 8260. One advantage is the ability to collect and concentrate a larger volume of sample, resulting in lower reporting limits because the entire volume of VOCs trapped on the sorbent tube is desorbed completely as a single aliquot of sample. In comparison, for TO-15, only a smaller sub-sample is usually analyzed at a time, resulting in elevated reporting limits. Another advantage of Method TO-17 is that this method can be used on low vapor pressure compounds such as naphthalene. Finally, the collection apparatus and sample tubes for Method TO-17 are compact and easily transportable.

However, there are disadvantages in using a sorbent tube as required by TO-17. Some of the primary disadvantages include:

- The inability to repeat an analysis on the same sample;
- Potential MS overload due to desorption of concentrated sample; and
- Column breakthrough.

The unfamiliarity of practitioners in handling and collecting soil gas samples onto sorbent tubes is another potential disadvantage, since in the United States, soil gas samples are mostly collected in canisters and syringes rather than onto sorbent tubes. Sorbent tubes, however, are used widely in Europe.

With Method TO-15, additional analysis on the same sample can be easily performed by withdrawing another sample aliquot from the sample canister. With Method TO-17, once all the compounds are desorbed from the sorbent tube the sample is completely used. Repeating a sample analysis is possible only if multiple (duplicate) sorbent tubes are collected. Multiple sorbent tubes can be collected concurrently if several sorbent tubes are manifolded in parallel during sampling. Moreover, recent advances in thermal desorption (TD) technology have made it possible to split sample into fractions for repeat runs from the same sorbent tube.

For quantification, the volume of air passing through the cartridge must be measured and documented. Moisture can be a problem with sorbent cartridges, but it can be managed by using alternative sorbents, sample splitting or dry purging (USEPA, 1999, Method TO-17, Section 7.2). The use of in-line water traps is not recommended since the traps may absorb target analytes. Other issues with TO-17

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

include interferences from sorbent artifacts (USEPA, 1999, Method TO-17, Section 7.1). There is no single universal sorbent that can be used for all possible VOCs. The choice of sorbent depends on the target VOCs. However, multi-bed (sorbent) tubes are also available that can be used to sample for a wide range of target compounds.

Method TO-17 should not be used to analyze highly concentrated soil gas samples. Highly concentrated soil gas samples will saturate the MS if completely desorbed into the GC. Therefore, the approximate concentration of VOCs or SVOCs should be predetermined by field screening specific soil gas sampling locations using another analytical method such as USEPA 5035/8260 or USEPA 5030/8260, prior to deployment.

### **USEPA Method TO-13A**

Although TO-13A (USEPA, 1999) was designed for collecting and analyzing PAHs in ambient air, this method can successfully be used for soil gas sampling and analysis.

Samples are collected/adsorbed onto a combination of filter and sorbent cartridges followed by solvent extraction, cleanup (if needed) and concentration before analysis by GC/MS. Since a soil gas sample is treated in the same manner as an ambient air sample, there should be no modification needed to analyze soil gas samples with this method. The following need to be evaluated prior to sampling:

- Volume needed to meet the required reporting limits; and
- Sampling flow rate relative to the capacity of the sampling tube.

### **Scan vs. SIM Mode**

Scan and Selected Ion Monitoring (SIM) are two data acquisition modes with GC/MS methods. The most common mode is the Scan mode in which the detector scans from high to low across a range of masses continuously. In scan mode, compound identification is made by comparing the samples mass spectrum against a spectral library. In SIM mode, only a few selected ion fragments or masses are monitored. Because the detector concentrates its time only on selected masses, the sensitivity is maximized. Due to the increase in sensitivity, lower reporting limits are possible.

Although SIM can provide lower reporting limits, its utility is limited and should only be used for a site that is completely characterized. It should never be used for initial site characterization because the instrument is set to monitor only the selected target compounds. SIM may be used to overcome some background problems in soil and water matrices. However, there are inherent matrix effects with soil gas samples; therefore, SIM is not always the best choice to use with soil gas samples.

## **MODIFIED GC METHODS**

Two primary GC methods associated with soil gas analysis are USEPA Methods 8015 and 8021. GC methods may be used for routine monitoring when the contaminants and their approximate concentrations are known. The GC method should not be used for initial characterization. When new, unknown compounds are detected, these should be confirmed by analysis with a GC/MS method. On a routine basis, at least 10 percent of positive results from GC analysis should be confirmed by analysis with a GC/MS method.

Various versions of each method exist in the SW-846 manual (USEPA 2000). Laboratories should use the most updated versions of the method and state in their analytical reports which version of the method was used.

### **USEPA Method 8015 (8015, 8015A, 8015B, 8015C and 8015D)**

USEPA Method 8015 (Non-halogenated Organics by Gas Chromatography) is used to determine the concentration of volatile and semi-volatile nonhalogenated organic compounds, triethylamine and petroleum hydrocarbons (C5-C32) (USEPA 2000). Samples are introduced into the GC by one of the following methods:

- Purge-and-trap;
- Equilibrium headspace;
- Direct injection;
- Injection of azeotropic distillation concentrate;
- Injection of vacuum distillation concentrate; and
- Injection of solvent extraction concentrate.

A FID is used with all modifications of Method 8015. In order to apply this method to soil gas samples, the same types of modifications described for Method 8260B/C should be used. Samples are either injected into a purge-and-trap sparger filled with water and purged or directly injected into the GC.

### **USEPA Method 8021 (8021, 8021A and 8021B)**

USEPA Method 8021B (Aromatic and Halogenated Volatiles by Gas Chromatography Using Photoionization and/or Electrolytic Conductivity Detectors) is used to determine the concentration of halogenated and aromatic volatile organic compounds (USEPA 2000). Samples are introduced into the GC by one of the following methods:

- Direct injection;
- Purge-and-trap;
- Headspace; and
- Injection of vacuum distillation concentrate.

Both a PID and a Hall electrolytic conductivity detector (HECD) are used with Method 8021 in either series or as a single detector. In order to apply Method 8021 to soil gas

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

samples, the same types of modifications described for Method 8260B/C should be used.

### **QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)**

QA/QC requirements for soil gas testing should be outlined in the project-specific Quality Assurance Project Plan (QAPP) or the specific modified USEPA Method being employed. Soil gas analytical laboratories should comply with those QA/QC requirements and add additional checks as needed.

#### **QA/QC for Soil Gas Testing**

The following are the QA/QC protocols that should be included with soil gas testing. Most of these QA/QC protocols are required with USEPA methods as well as laboratory certification (see later):

##### **a) Daily Tune**

For GC/MS methods, laboratories should conduct the daily tune as specified in the respective method. The instrument must meet the tuning criteria before sample analysis.

##### **b) Initial Calibration**

The calibration curve should consist of a minimum of five points. The maximum percent relative standard deviation (%RSD) for each target compound should not exceed 30 percent. For USEPA Methods TO-15 and TO-17, two compounds are allowed up to 40 percent RSD.

##### **c) Daily Calibration (Continuing Calibration)**

The calibration curve for each compound of interest should be verified with each analytical batch, or once every 12 hours (24 hours for TO-15 and TO-17). Verification is conducted by analyzing the mid-point calibration standard. The results from the mid-point standard should be within 20 percent (30 percent for TO-15 and TO-17) of the initial calibration in order to assume the calibration curve is valid.

##### **d) End of Run Calibration Check**

A mid-level calibration standard should be run for each 20-sample batch or at the end of the run, whichever is more often. Verification is conducted by analyzing the mid-point calibration standard. The results from the mid-point standard should be within 20 percent of the initial calibration in order to ensure the calibration curve is still valid at the end of the batch run and the instrument sensitivity has not deteriorated. For USEPA 8260B/C, TO-15 and TO-17 methods, there is no requirement for this analysis. The instrument is monitored by internal standards which are added to every sample. The need for an end-of-the-run calibration check for GC/MS methods is at the discretion of the parties involved in the project and

should be based on DQOs. For those methods where there is no internal standard monitoring, the end of run calibration check may be needed to evaluate the instrument.

### **e) Method Blanks**

Method blanks are used to evaluate contamination from the analytical process. This is a sample prepared by the analytical laboratory using an analyte-free matrix and carried through the entire sample preparation and analytical procedure. The analyte-free matrix for soil gas is humidified laboratory grade ultra-pure air or ultra-pure nitrogen.

### **f) Container Blanks**

If sampling containers are reused or recycled then at least one decontaminated sample container per 20 samples or per batch, whichever is more often, should be analyzed as a container blank sample to verify the effectiveness of the decontamination procedures. Other components such as fittings and valves of the sampling stream that are subject to carryover/contamination should also be monitored. Note: This was previously referred to as the “Method Blank” in the 2003 Advisory – Active Soil Gas Investigations).

### **g) Trip Blanks**

Trip blanks consist of humidified laboratory-grade ultra-pure air. Trip blanks evaluate whether shipping and handling procedures are introducing contaminants into the samples, and if cross-contamination in the form of VOC migration has occurred between the collected VOC samples. Trip blanks are only required if samples are collected in polymer gas sampling bags or sorbent tubes for TO-17 analysis. A minimum of one trip blank per shipping container should be collected and analyzed for target compounds whenever VOC samples are shipped offsite for analysis. The trip blank containers and media should be the same as the site samples. USEPA Method TO-15 does not have specific trip blank requirements. Therefore, trip blanks are not needed if samples are collected in passivated stainless steel canisters.

### **h) Duplicate Samples**

Duplicate sample analysis evaluates the reproducibility (precision) of the sampling process. At least one duplicate sample per 20 samples or per batch, whichever is more often, should be collected and analyzed. Duplicate samples should be collected in separate containers at the same location and depth. A duplicate sample can be collected by using a T-splitter at the point of collection to divide the sample stream into two separate sample containers.

### **i) Replicate Samples**

Replicate sample analysis evaluates the reproducibility (precision) of the laboratory’s analytical ability and is used to estimate sample variability. At least one replicate

sample per 20 samples or per batch, whichever is more often, should be reanalyzed by the laboratory to assess analytical precision.

**j) Matrix Spike/Matrix Spike Duplicates (MS/MSD)**

The requirement for MS/MSD with modified USEPA Method 8260B/C is discretionary. Although MS/MSD samples are required with the USEPA 8000 series methods, there is no practical approach to apply this requirement to soil gas samples. For true MS/MSD samples, spike compounds must be added to the sample during the collection process. With soil gas samples, this is not technically feasible. The addition of a spike into the sparger with modified USEPA Method 8260B/C does not duplicate the actual condition of the sample as it is collected, processed and analyzed.

There is also no requirement for MS/MSD with USEPA Method TO-15 as the analysis of MS/MSD with TO-15 is impractical. Spike compounds are added at the same time that the sample is transferred into the concentrator. Because this does not truly assess the impact of the matrix on the recovery of the target compounds, the need for MS/MSD with Method TO-15 is at the discretion of the parties involved in the project and should be based on the data quality objectives.

**k) Laboratory Control Sample (LCS)**

LCS is a sample made with an aliquot of a clean (control) matrix similar to the sample matrix spiked with compounds that are representative of the target analytes and is used to document laboratory performance. For soil gas analysis, this QA/QC sample is not necessary since the “clean” matrix is humidified laboratory grade ultra-pure air. When prepared as such, this is equivalent to the daily calibration (continuing calibration) sample. It would be redundant to analyze this QA/QC sample; therefore, LCS samples are optional depending on the requirement of the project QAPP. Methods TO-13, TO-15 and TO-17 do not have any requirements for LCS sample analysis.

**l) Surrogates**

The use of surrogates in soil gas analysis is dependent on the method and container used. USEPA Method 8260B/C requires surrogates whereas Method TO-15 does not. Introducing surrogates into soil gas samples can present some logistical challenges, depending on the type of container being used to collect the sample. Surrogates are designed to monitor recoveries of target analytes. Therefore, they should be introduced at the point of sample collection in order to fully assess the recovery process.

For most laboratories that use modified USEPA Method 8260B/C, the surrogates are usually added to the water in the sparger either before or after the soil gas sample has been forced into the water. Vapor-phase surrogates (which are available for air analysis) can be theoretically added into soil gas sample aliquot in a gas-tight syringe just before injecting into the sparger. However, few if any laboratories are

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

using this practice for various reasons.

For laboratories using USEPA Method TO-15 the surrogates are added to the sample loop at the same time the soil gas sample is being loaded onto the concentrator. In both instances the surrogates are added after the sample has already been collected. There is a gap between when the sample is collected and when the sample is analyzed where there are no surrogates to monitor the process.

Commercially prepared surrogates or standards should be used. Preparing vapor internal standards or surrogates with liquid standards in either polymer gas sampling bags or glass bulbs is not recommended because of the inherent difficulty in preparing the surrogates or standards. Some laboratories add vapor surrogates immediately after sampling to samples collected in glass bulbs. The vapor surrogates are actually liquid surrogates injected into a glass bulb and allowed to expand. Aliquots of the vapor surrogates are injected into the glass bulb with the soil gas sample. The internal standards or surrogates should be completely vaporized before aliquots are taken. Droplets of liquid standards or surrogates can adhere to the internal surface of the bags or bulbs. Due to variations with where and when the surrogates are added to the soil gas samples, laboratories are advised to note in their final analytical reports the exact step in the process where the surrogates (if used) are added so the results can be evaluated accordingly.

### **m) Reporting Limit Verification**

The RL is the limit of quantification reported by the analyzing laboratory. The RL should not be lower than the lowest calibration point. The RL should be validated periodically (recommended with each batch of samples) by spiking a blank sample at the RL level. There is no limit on the number of samples per batch for RL verification. If the RL is set at the lowest calibration point then verification is not needed.

### **n) Acceptance Limits**

Based on laboratory performance, laboratories should establish their own acceptance limits for their QA/QC parameters. QA/QC parameters include percent recoveries for surrogates, matrix spikes, laboratory control samples and percent relative difference for duplicates. The limits should be evaluated and updated periodically. For guidance on establishing acceptance limits consult USEPA Method 8000B (December 1996), Section 8.0 of SW-846 (USEPA 2000).

**o) Standard Operating Procedures**

Laboratories should have detailed written Standard Operating Procedures (SOP) for their soil gas sampling and testing procedures. Copies of the SOP should be available in the laboratory for review and reference. The SOP should be reviewed on an annual basis and updated as needed. Field procedures, including sampling procedures, can be written as a separate SOP from the laboratory analytical procedures.

**DATA REVIEW**

All soil gas data should be reviewed in detail to ensure all QA/QC parameters are within specified control limits.

Soil gas data should be reviewed and evaluated as described in the most current version of DTSC's *"Guidance for the Evaluation of Subsurface Vapor Intrusion to Indoor Air"*.

**DETECTION LIMITS VERSUS REPORTING LIMITS**

A detection limit is defined as the *"the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, and is determined from analysis of a sample in a given matrix type containing the analyte"* (SW-846, Chapter One, Quality Control, Revision 1, July 1992). A RL is defined as the lowest concentration of an analyte that can be detected in a sample by the given analytical procedure taking into account sample matrix, interferences, dilution factor and the lowest point of the calibration curve. Laboratories should use the RL in their analytical reports since it is a more reliable indicator of the limit of detection.

**Reporting Limits**

Reporting limits should be selected prior to choosing analytical methods and be based on project DQOs. Sampling protocols, analytical method(s) used, list of target compounds, and other DQOs should be considered when selecting project RLs. For risk assessments, the reporting limits should be lower than the California Human Health Screening Levels (CHHSLs) for soil gas. For compounds that are not on the CHHSL listing, the analytical method should be selected to achieve the reporting limits for risk-based decision making.

Table F-4 delineates the reporting limits of the common soil gas analytical techniques for select analytical methods. The ranges in this table are based on a survey of analytical laboratories conducted by the Soil Gas Advisory Workgroup. For the reporting limits of other methods/techniques, consult with the analytical laboratory.

**TABLE F-4  
Reporting Limits**

Analytical Method/Technique	Reporting Limit Range*	Comments
Modified USEPA 8260B/C: Direct injection of soil gas into sparger with water.	20 – 5000 $\mu\text{g}/\text{m}^3$ (most compounds at 1000 $\mu\text{g}/\text{m}^3$ or lower)	Sample size dependent. Most samples are 5-250 cc (mL).
Modified USEPA 8260B/C: Direct injection of soil gas into GC column.	100 – 1000 $\mu\text{g}/\text{m}^3$	
Modified USEPA TO-15 (Conventional GC/MS system).	Scan Mode: 0.7 – 200 $\mu\text{g}/\text{m}^3$ SIM Mode: 0.004 – 0.20 $\mu\text{g}/\text{m}^3$	
Modified USEPA TO-15 (Using portable GC/MS system (e.g., Hapsite®)).	4 – 100 $\mu\text{g}/\text{m}^3$	

**Reporting Units**

Analytical laboratories should report soil gas results in  $\mu\text{g}/\text{m}^3$  rather than  $\mu\text{g}/\text{L}$  or parts per billion by volume (ppbv). Although 1,000  $\mu\text{g}/\text{m}^3$  is equivalent to one  $\mu\text{g}/\text{L}$ , neither can be converted to ppbv by simply moving the decimal point. The ppbv conversion is a function of the molecular weight of the compound in question, as shown in the example below. Environmental practitioners should verify that soil gas sample results are calculated correctly and reported in the proper units.

Example: benzene in air/soil gas with molecular weight=78.11 is converted as follows:

$$1.0 \mu\text{g} / \text{L Benzene} = 1000 \mu\text{g} / \text{m}^3 \text{ Benzene} = 315 \text{ ppbv Benzene}^*$$

$$*\text{ppbv} = [(\mu\text{g}/\text{L}) \times (\text{RT})] \times 1000 / (\text{MW}) \times \text{P} \quad \text{or} \quad \text{ppbv} = [(\mu\text{g}/\text{m}^3) \times (\text{RT})] / (\text{MW}) \times \text{P}$$

where:

$$\begin{aligned} \mu\text{g}/\text{L} &= 1.0 \\ \mu\text{g}/\text{m}^3 &= 1000 \\ \text{R} &= 0.0825 \text{ L-atm}/\text{mole}\cdot\text{K} \text{ (Ideal Gas Law Constant)} \\ \text{T} &= 298^\circ\text{K} \text{ (Standard Temperature)} \\ 1000 &= \text{Conversion of } 1 \text{ m}^3 = 1000 \text{ L} \\ \text{MW} &= 78.11 \text{ (Molecular Weight of Benzene)} \\ \text{P} &= 1 \text{ atm (Standard Pressure)} \end{aligned}$$

Laboratories using TO methods generally report results in ppbv, and may continue to do so, but should also provide the conversion to  $\mu\text{g}/\text{m}^3$ .

## **VARIABILITY AND COMPARING RESULTS**

Variability in soil gas results comes from differences in the laboratory instruments, sample introduction techniques, and the analyst's skill, experience and practices, as well as variability in field sample collection methods and in sample containers. Finally, there is also a variation in the sample matrix. A replicate sample collected immediately after the original sample may not be the same due to spatial and temporal differences.

To evaluate the comparability of results from two different methods, calculate the Relative Percent Difference (RPD) of the results. The RPD is calculated with the formula:

$$\text{RPD} = 100 \times (C_1 - C_2) / [(C_1 + C_2) / 2]$$

where:  $C_1$  = Result from the first method  
 $C_2$  = Result from the second method

In instances where soil gas results from the same source analyzed by two different methods differ by more than 50 percent RPD, the results should be validated. Validation involves reviewing the sampling procedures, collection containers, sample introduction technique and QA/QC data. Any differences should be evaluated and explained. All QA/QC results should be reviewed to make sure the parameters are within the established control limits and the calculations checked. The final analytical results from modified 8260B/C should be reported and calculated as  $\mu\text{g}/\text{m}^3$  or  $\mu\text{g}/\text{L}$  (see section above on reporting units).

Some compounds are better analyzed by one method than the other due to their physical nature. Some compounds have a better recovery if a liquid standard is used whereas, the vapor phase standard will purge poorly. Highly volatile VOCs are recovered well with modified 8260B/C compared to TO-15. Resampling and reanalyzing samples may be necessary if the recovery discrepancies cannot be explained after validation.

## **METHOD REFERENCES IN ANALYTICAL REPORTS**

The analytical method used to test soil gas samples and any modifications to the analytical method should be described in the laboratory reports. Refer to the Performance-Based Measurement Systems Section above for information on referencing PBMS.

## **LABORATORY CERTIFICATION**

All laboratories performing soil gas testing should be certified. According to the California Health and Safety Code Section 25356.1.5(e), exposure assessments shall include development of reasonable maximum estimates or exposure to VOCs that may enter existing or future structures on a site. Section 25358.4 requires that analysis of any material, that is required to show compliance with Chapter 6.8 of the Health and

## **ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS**

Safety Code, shall be performed by a laboratory accredited by the Department of Public Health pursuant to Article 3 of Chapter 4 of Part 1 of Division 101.

Soil gas testing laboratories can obtain certification from the California Department of Public Health's Environmental Laboratory Accreditation Program (ELAP) for all analytical methods they are using for soil gas testing. Certification ensures that the laboratories have the requisite facilities, equipment and personnel to perform the testing, and have demonstrated competence and compliance with the methods being certified.

In addition, certification entails the validation of the analytical method as well as periodic checks with performance evaluation or blind samples (where available) to assess laboratory continued competence with the method.

Soil gas certification for USEPA Methods 8015, 8021, 8260, TO-13A, TO-15 and TO-17 is available from ELAP.

National Environmental Laboratory Accreditation Program (NELAP) accreditation for USEPA Methods TO-13A, TO-15 and TO-17 should be accepted in lieu of California ELAP certification for soil gas testing.

Laboratories that have either certification from ELAP or NELAP for USEPA Methods 8015, 8021 or 8260B for either soil or water matrices should obtain separate certification from ELAP for soil gas work with those methods.

ELAP will provide certification for PBMS as warranted. PBMS may be new techniques using available equipment, an entirely new method with novel techniques and equipment, or modifications of known published methods. PBMS must meet the criteria below:

- The process can be validated;
- It can be demonstrated that the process can meet project data quality objectives; and
- It can be demonstrated that the process can meet the specified method performance criteria.

## APPENDIX G      BAROMETRIC PRESSURE, RAINFALL, AND SOIL DRAINAGE

### BAROMETRIC PRESSURE FLUCTUATIONS

#### Soil Gas

Massmann and Farrier (1992) evaluated the significance of barometric pressure fluctuations on the transport of atmospheric gas into the vadose zone. They examined situations in which barometric fluctuations will yield a significant effect on the vadose zone. Model calculations showed that fresh air may migrate several meters into a highly permeable subsurface during large barometric pressure cycles and the depth of penetration increases as the thickness and permeability of the vadose zone increases. Massmann and Farrier (1992) thus suggested that the concentration of volatile contaminants may be lower when barometric pressures are high and that soil gas measurements will show the largest fluctuations during times of rapidly rising or falling barometric pressures. During these large barometric pressure changes, as indicated by Figure 8 of their paper, soil gas at 1.5 meters (5 feet) may be diluted with atmospheric air by 30 to 50 percent.

#### Surface Flux

Clements and Wilkening (1974) demonstrated empirically that atmospheric pressure changes of one to two percent associated with the passage of frontal systems will produce changes in the flux of radon from the subsurface by 20 to 60 percent. The actual magnitude of the change in the radon flux depends upon the rate of change of the barometric pressure and its duration. The effect of pressure changes on VOC concentrations in soil gas is expected to be similar.

### RAINFALL EVENTS

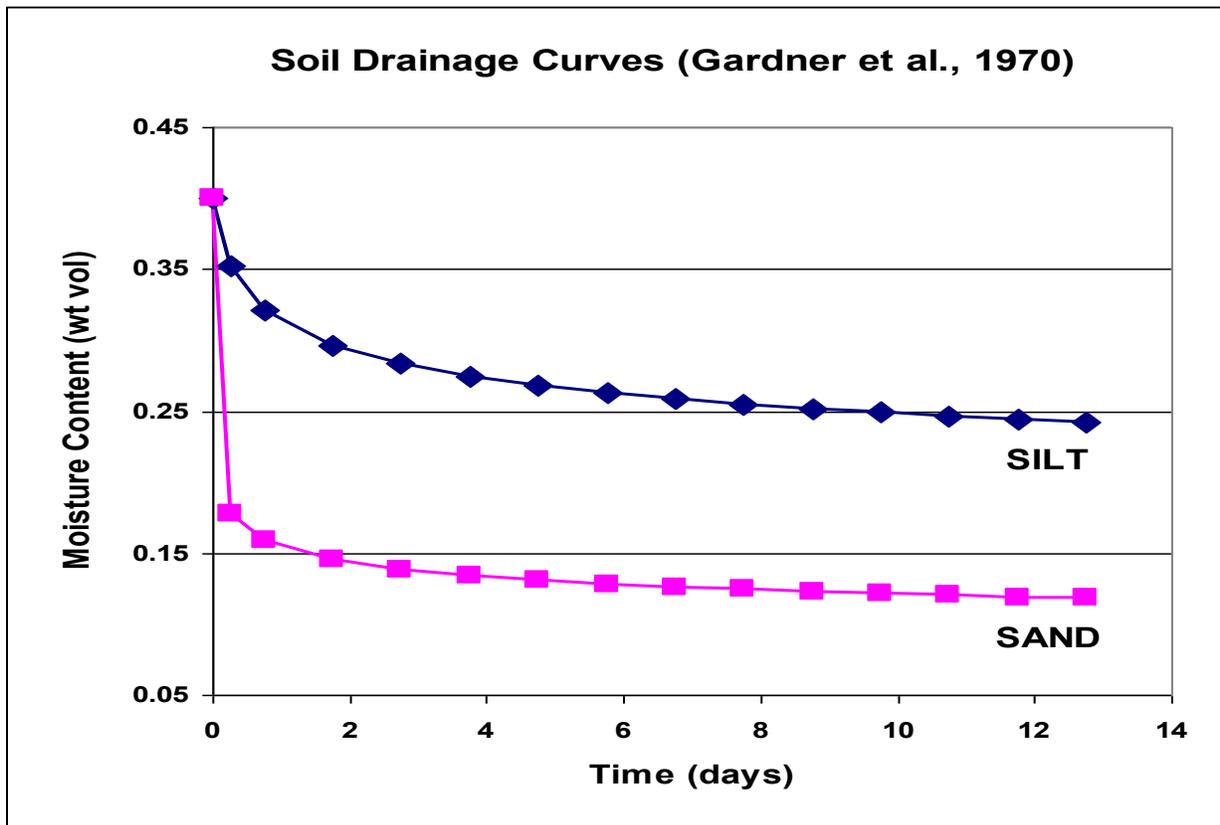

#### Surface flux

Kienbusch and Ranum (1986) evaluated the effects of rainfall on the collection of flux chamber measurements on open ground. In tests at a simulated landfill, water was added to dry soil cells to simulate rainfall. Trace precipitation (0.01 inches) had no effect on measured emission fluxes from the ground. Heavier rainfall (0.4 inches), however, did have an effect. The emission flux was decreased by 90 to 95 percent and the reduction in emissions lasted for over eight days. These results are consistent with other field observations (Radian Corporation, 1984; Eklund, 1992).

**Soil Drainage**

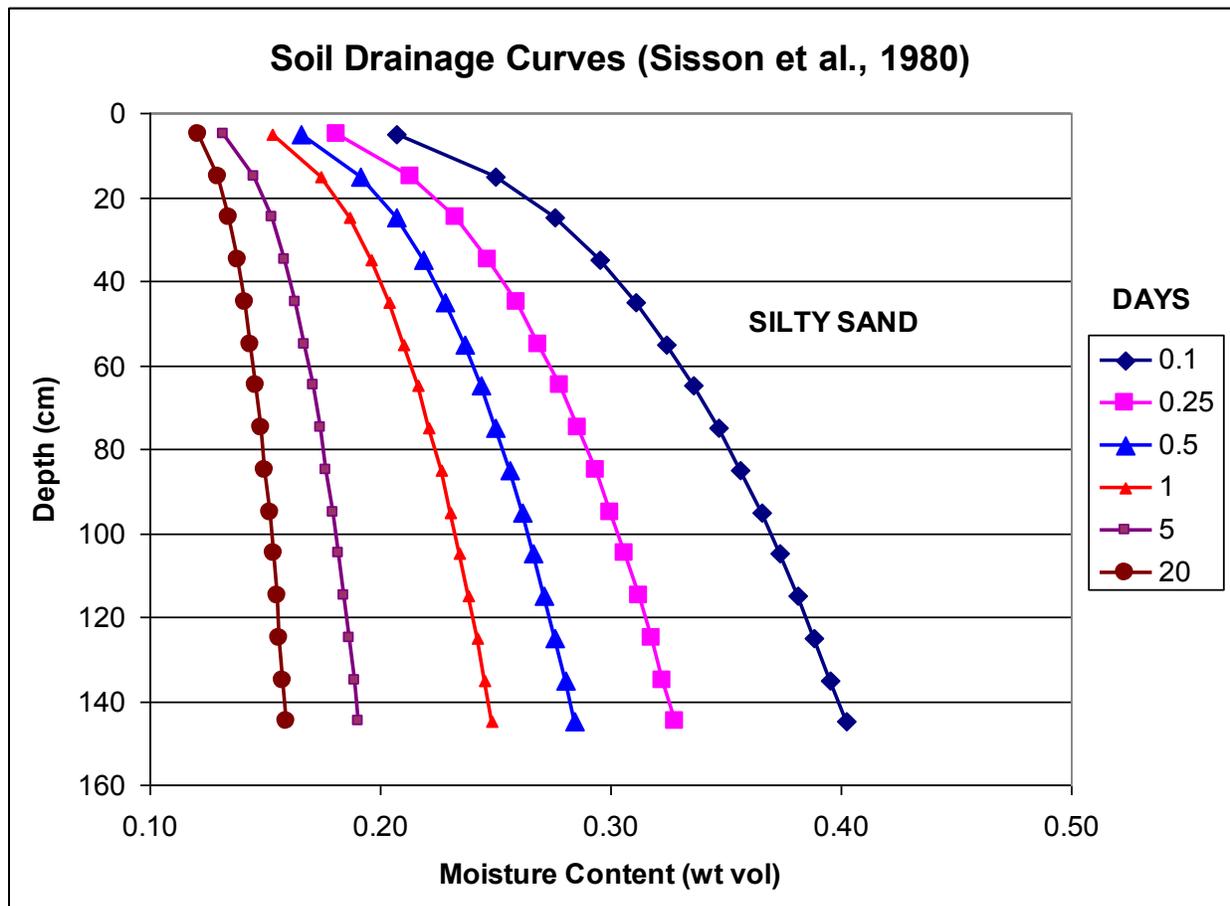

Gardner and others (1970) derived approximate solutions for unsaturated flow following irrigation. Their solutions can be used to evaluate the impact of rainfall on subsurface moisture conditions. The drainage of soil by gravity following infiltration of one centimeter of water for two soil types, sand and silt, is shown in Figure G-1. The initial unsaturated hydraulic conductivity within the infiltration zone for the silt and sand was assumed to be one centimeter per day and 1000 centimeters per day, respectively. An instantaneous infiltration of one centimeter was used in the evaluation. The figure demonstrates that drainage to approximately asymptotic moisture conditions occurred within about five days for these two soil types.

**FIGURE G-1**

Likewise, Sisson and others (1980) derived a one-dimensional unsaturated flow equation to evaluate water movement in the vadose zone. Soil drainage curves from Sisson and others (1980) where a unit gradient was assumed are shown in Figure G-2. The figure denotes a silty sand scenario where the initial unsaturated hydraulic conductivity was assumed to be 100 centimeters per day. The model assumed that the vadose was saturated to 0.40 and allowed to drain. Moisture profiles are shown for five different time intervals. The figure demonstrates that drainage to near ambient moisture conditions of 0.10 occurred within about five days, agreeing with the approximations by Gardner and others (1970).

**APPENDIX H      REPORTING FORMAT AND PARAMETERS**

**RECORDKEEPING IN THE MOBILE LABORATORY**

The following records concerning calibration standards and QA/QC should be maintained as hard copies in the mobile laboratory:

- a) Date of calibration standard receipt;
- b) Name of calibration supplier;
- c) Calibration lot number;
- d) Date of preparation for intermediate standards (dilution from the stock or concentrated solution from supplier);
- e) Calibration ID number or other identification data;
- f) Name of technician who performed the dilution;
- g) Volume of concentrated solution taken for dilution;
- h) Final volume after dilution;
- i) Calculated concentration after dilution;
- j) The latest and current initial calibration data for each instrument used; and
- k) The currently-used laboratory standard operating procedures.

**REPORTING OF SOIL GAS SAMPLE RESULTS AND QA/QC DATA**

- 1) Report all sample test results for all compounds in the analyte list and QA/QC data. Compounds may be listed by retention time or in alphabetical order. Report any unidentified or tentatively identified peaks. Submit all data in electronic format and raw data, including the chromatograms for samples and standards, as requested.
- 2) Report the following for all calibration standards, QA/QC standards, and soil gas samples:
  - a) Site name;
  - b) Laboratory name;
  - c) Date of analysis;
  - d) Initials of analyst;
  - e) Instrument identification;
  - f) Injection amount;
  - g) Injection time;
  - h) Concentrations of each analysis;
  - i) Laboratory quality control limits;
  - j) Calculated results; and
  - k) Notes or explanation of any outliers

## ADVISORY – ACTIVE SOIL GAS INVESTIGATIONS

- 3) Provide additional information, as specified, for different types of analyses. Tabulate and present in a clear legible format all information according to the following grouping:

**a) Initial calibration**

- i) Source of standard (STD Lot ID No.);
- ii) Detector;
- iii) Retention time (RT);
- iv) Standard mass or concentration;
- v) Peak area;
- vi) Response factor (RF);
- vii) Average response factor ( $RF_{Ave}$ );
- viii) Standard deviation ( $SD_{n-1}$ ) of RF;
- ix) Percent relative standard deviation (% RSD); and
- x) Acceptable range of %RSD (ACC RGE).

**b) Daily calibration check sample and Laboratory Control Sample (LCS)**

- i) Source of standard;
- ii) Detector;
- iii) Retention time (RT);
- iv) Standard mass or concentration;
- v) Peak area;
- vi) Response factor (RF);
- vii) Percent difference between RF and  $RF_{Ave}$  from initial calibration (% DIFF); and
- viii) Acceptable range of %DIFF (ACC RGE).

**c) Soil Gas Sample**

- i) Sample identification;
- ii) Sampling depth;
- iii) Purge volume;
- iv) Vacuum pressure;
- v) Sampling date and time;
- vi) Injection date and time;
- vii) Injection amount;
- viii) Dilution factor (or concentration factor if trap is used);
- ix) Detector;
- x) Retention time (RT);
- xi) Peak area;
- xii) Concentration in either  $\mu\text{g/L}$  or  $\mu\text{g/m}^3$ . Specific reporting units should be specified in the QAPP;
- xiii) Total number of peaks found by each detector;
- xiv) Unidentified peaks and/or other analytical remarks;
- xv) Surrogate results; and
- xvi) Control limits.

## MEMORANDUM

**TO:** Curt Charmley, P.G.,  
Engineering Geologist  
Regional Water Quality Control Board  
320 West 4<sup>th</sup> Street, Suite 200  
Los Angeles, CA 90013

**FROM:** James C. Carlisle, D.V.M., M.Sc.,  
Staff Toxicologist  
Air, Community, and Environmental Research Branch

**DATE:** September 21, 2016

**SUBJECT:** SOIL CLOSURE RISK EVALUATION, 1000 SOUTH FREMONT  
AVENUE, ALHAMBRA, CALIFORNIA  
SWRCB #R4-15-072 OEHHA #880417-00

### Document reviewed and scope of review

- Soil Closure Risk Evaluation, 1000 South Fremont Avenue, Alhambra, California, by Equipoise, dated May 24, 2016.
- OEHHA's review focused primarily on the current (11/21/15) sampling effort; previous studies were not reviewed in detail.

### Site characterization

- The soil vapor sampling followed a RWQCB-approved work-plan.
- Soil characteristics are based on on-site soil samples.

### Chemicals of potential concern (COPCs)

- COPCs are based on VOCs detected in soil gas. PCE is the dominant COPC.
- Table 4: For the record, OEHHA does not recommend one-at-a-time screening of VOCs, since this ignores additivity. However, in this case, adding in the other carcinogens would not significantly change the risk estimate or the conclusions.

### Conceptual site model

- Equipoise evaluated the potential for inhalation of VOCs in indoor air by residents and workers via the vapor intrusion pathway at each of six buildings based on indoor air VOC modeling.

California Environmental Protection Agency

Sacramento: (916) 324-7572 Oakland: (510) 622-3200

[www.oehha.ca.gov](http://www.oehha.ca.gov)

- Their approach utilized tiered risk screening values (RSVs) calculated for  $1 \times 10^{-6}$  residential risk and for  $1 \times 10^{-5}$  workplace risk.

#### Vapor intrusion Site A (office areas)

- Equipoise's 5-foot and 10-foot residential RSV estimates (9500 and 16,000  $\mu\text{g}/\text{m}^3$ , respectively) are based on a ceiling height of 366 m, unusually high for a residence
- OEHHA estimated 5- and 10-foot residential RSVs of 6640 and 7830  $\mu\text{g}/\text{m}^3$ , respectively, using a standard residential ceiling height of 244 cm.
- Either way, the maximum detected PCE concentrations are less than the RSVs.

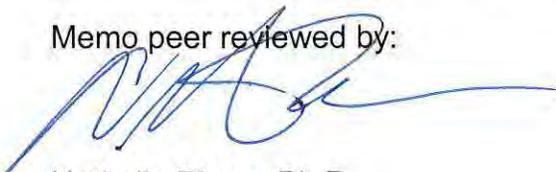

#### Vapor intrusion Site B (parking lot)

- Likewise, Equipoise's 5-foot and 10-foot residential RSV estimates of 745 and 1050  $\mu\text{g}/\text{m}^3$ , respectively, are based on a ceiling height of 366 cm.
- OEHHA estimated 5-foot and 10-foot residential RSVs of 493 and 788  $\mu\text{g}/\text{m}^3$ , respectively, using a standard residential ceiling height of 244 cm.
- OEHHA estimated commercial risks of approximately 50% of Equipoise's estimates at both depths. The maximum detected PCE concentrations exceed both Equipoise's and OEHHA's RSVs

#### Conclusions

- Although OEHHA's RSV estimates differ slightly from Equipoise's estimates, these differences do not change the conclusions.
- The maximum detected PCE concentrations at Site A are less than the RSVs, suggesting that vapor intrusion risk at Site A is *de minimus*.
- Equipoise recommends that Site B be granted the status of "No Further Action" with regards to soil and soil vapor constituents following the implementation of institutional controls whereby future land use is limited to commercial industrial purposes.
  - OEHHA does not make decisions regarding institutional controls.
  - OEHHA agrees with Equipoise on findings that residential use is not recommended for the Site.
  - If development of the Site is inconsistent with the land uses identified, or if remediation is not performed in accordance with the remedial scenario proposed in this risk assessment, additional evaluation of potential health risks will be necessary.

Staff Toxicologist

## **APPENDIX H**

### **TERMINOLOGY**

## TERMINOLOGY

The following provides definitions and descriptions of certain terms that may be used in this report. Italics indicate terms that are defined by ASTM Standard Practice E 1527-13. The Standard Practice should be referenced for further detail related definitions or additional explanation regarding the meaning of terms.

**Recognized environmental condition (REC):** The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: 1) due to any release to the environment, 2) under conditions indicative of a release to the environment; or 3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

**De minimis conditions:** Conditions that generally do not present threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions or controlled recognized conditions.

**Historical recognized environmental condition(s) (HREC):** A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted residential use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a recognized environmental condition at the time of the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time of the Phase I ESA, the condition shall be included in the conclusions section of the report as a recognized environmental condition,

**Controlled recognized environmental condition(s) (CREC):** A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by the regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). A condition considered by the environmental professional to be a controlled recognized condition shall be listed in the findings section of the Phase I Environmental Site Assessment report, and as a recognized environmental condition in the conclusions section of the Phase I Environmental Site Assessment report. NOTE: A condition identified as a controlled recognized environmental condition does not imply that the environmental professional has evaluated or confirmed the adequacy, implementation, or continued effectiveness of the required control that has been, or is intended to be, implemented.

**Material threat:** A physically observable or obvious threat which is reasonably likely to lead to a release that, in the opinion of the environmental professional, is threatening and might result in impact to public health or the environment. An example might include an aboveground storage tank that contains a hazardous substance and which shows evidence of damage such that it may cause or contribute to tank integrity failure with a release of contents to the environment.

**Material impact to public health or environment:** A substantial risk of harm to public health or the environment resulting from the presence or likely presence of an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. An example might include a release of a hazardous substance in concentrations exceeding applicable governmental agency standards under conditions that could reasonably and foreseeably result in substantial exposure to humans or

substantial damage to natural resources. The risk of that exposure or damage would represent a material impact to public health or environment.

**General risk of enforcement action:** The likelihood that an environmental condition would be subject to enforcement action if brought to the attention of appropriate governmental agencies. If the circumstances suggest an enforcement action would be more likely than not, then the condition is considered a general risk of enforcement action.

**Data failure:** A failure to achieve the historical research objectives, even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. Data failure is one type of data gap.

**Data gap:** A lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to site reconnaissance (for example, an inability to conduct the site visit), and interviews (for example, an inability to interview the key site manager, regulatory officials, etc.).

### **QUALIFICATIONS**

## **ELLIOT R. HARO**

Principal Scientist

Mr. Haro is the founding principal of Haro Environmental, Inc. With over 14 years of experience in the environmental field, Mr. Haro has directed, managed and performed environmental site assessments and remediation activities. Mr. Haro's project management experience includes proposal and cost estimate preparation for site assessments and remediation projects, design of soil and groundwater remediation systems, in-house staff and subcontractor coordination, technical report preparation, and permit acquisition. Mr. Haro has managed and performed numerous Phase I and Phase II Environmental Site Assessments (ESAs) as well as site investigation and remediation field activities including air, soil, groundwater, and surface water sampling, groundwater monitoring well installations, and remediation system operations and maintenance. He has prepared various environmental reports including site assessment reports, feasibility studies, remedial/corrective action plans, remedial work plans and health-based risk evaluations. Mr. Haro is familiar with the regulatory process and has consulted with both local and regional agencies on Client's behalf for work plan approvals and modifications. Mr. Haro's technical expertise includes evaluation, design and implementation of innovative in-situ groundwater treatment technologies including enhanced bioremediation and in-situ chemical oxidation.

**PROJECT DESCRIPTIONS**

**Retail Service Station Portfolio, Various Locations, CA**

- |   |  |  |
|---|--|--|
| <ul style="list-style-type: none"> <li>• Groundwater Monitoring and Sampling Management</li> <li>• In-Situ Bioremediation</li> <li>• Permitting</li> <li>• Regulatory Agency Negotiations</li> <li>• Quarterly Reporting</li> </ul> | <ul style="list-style-type: none"> <li>• Target compounds: Hydrocarbons and MTBE</li> <li>• Interim Remedial Action Plans</li> <li>• Remedial and Corrective Action Plans</li> </ul> | <ul style="list-style-type: none"> <li>• Health and Safety</li> <li>• Remediation System Design</li> <li>• Multiphase and Dual Phase Extraction Systems</li> </ul> |
|---|--|--|

Managed project activities for monitoring and cleanup of multiple gas station facilities throughout Northern, Central and Southern California. Evaluated in-situ and ex-situ treatment options for source zone reduction and off-site containment of contaminants. Performed and managed operations and maintenance activities on remediation systems and prepared quarterly remediation reports. Prepared quarterly groundwater monitoring reports for agency submittal and approval. Prepared corrective actions plans and remedial action plans for implementation of mobile high vacuum dual phase extraction, multi-phase extraction, and dual-phase extraction systems. Designed and permitted innovative groundwater remediation approaches including enhanced aerobic bioremediation using ORC®. Negotiated with overseeing agencies for acceptance of proposed remedial actions.

**Phase I Environmental Site Assessment, Remediation Engineering Evaluation, & Indoor Air Quality Assessment, Former Aircraft Manufacturing Facility, Playa Vista, CA**

- |  |  |   |
|--|--|---|
| <ul style="list-style-type: none"> <li>• Phase I ESA</li> <li>• Remediation System Performance Evaluation</li> </ul> | <ul style="list-style-type: none"> <li>• Historic Chlorinated VOC and Hydrocarbon Use</li> </ul> | <ul style="list-style-type: none"> <li>• 550,000 Square Feet of Building Space</li> </ul> |
|--|--|---|

Performed a Phase I ESA for an approximately 38-acre site developed with 8 historic structures totaling approximately 550,000 square feet. Historic aircraft manufacturing resulted in chlorinated VOCs and petroleum hydrocarbon impacts to soil and groundwater. Identified recognized environmental conditions (RECs) at 11 source areas. Consulted client on extent of environmental liabilities and potential

environmental costs. Evaluated the performance of the on-site dual-phase extraction system targeting identified source areas. Developed potential life-cycle costs for the existing remediation system, and costs for remediation of metals contaminated soil. Performed an indoor air survey to assess potential impacts from the historic aircraft manufacturing operations on indoor air quality. Indoor air study results were compared to published regulatory thresholds and calculated site-specific health risks.

**Soil and Groundwater Remediation of Chlorinated Solvents using Chemical Oxidation, Former Aerospace Manufacturing Facility, Newbury Park, CA**

- Groundwater Monitoring and Sampling Management
- In-Situ Chemical Oxidation using Potassium Permanganate
- Injection and Monitoring Well Installations
- Quarterly WDR Reporting
- Target compounds: Chlorinated VOCs
- Health and Safety Plan Preparation
- Lead Agency Negotiations

Managed in-situ chemical oxidation injections for remediation of soil and groundwater impacted with the chlorinated solvents TCE and PCE. Negotiated with the lead agency (LARWQCB) for revised Waste Discharge Requirements (WDR) and amendments to the original work plan. Developed and implemented a site-specific health and safety plan to protect the health and safety of workers and the environment from accidental exposure to the chemical oxidant. Oversaw the installation of 35 injection wells and 14 dual-nested monitoring wells, and the injection of approximately 12,000 pounds of potassium permanganate. Conducted performance evaluation sampling per WDR requirements, and prepared and submitted quarterly WDR monitoring reports to the regulatory agency.

**Soil and Groundwater Remediation of Chlorinated Solvents, Soil Source Zone Removal and In-Situ Bioremediation, Former Industrial Facility, Los Angeles, CA.**

- Groundwater Monitoring and Sampling Management
- Large Diameter Auger Excavation
- Enhanced Anaerobic Bioremediation
- Soil Vapor Survey
- Injection and Monitoring Well Installations
- Quarterly WDR Reporting
- Target compounds: Chlorinated VOCs
- Health and Safety Plan Preparation
- Lead Agency Negotiations

Managed soil and groundwater investigation and remediation activities for a site with soil and perched groundwater water zone with chlorinated hydrocarbons present. A Remedial Action Plan (RAP) was developed and approved by the LARWQCB to remediate soil and groundwater at the site. Because site constraints precluded the use of conventional excavation approaches without extensive shoring requirements, soil remediation activities included the design and implementation of source area soil removal using large diameter augers. Groundwater remediation activities included acquisition of a Waste Discharge Requirement (WDR) permit from the LARWQCB for injection of HRC® into the perched zone, injection design, and implementation of an Enhanced Anaerobic Biodegradation approach to stimulate by injecting HRC®.

**RCRA Facility Closure, Former Hazardous Waste Handling Facility, Wilmington, CA**

- Lead Agency: DTSC
- RCRA Hazardous Waste Permit Closure
- Port of Los Angeles Permitting
- Health and Safety Plan Preparation
- DTSC Approval of Work Plan Updates and Modifications

Managed work plan modification/updating and permitting for a closure of a RCRA hazardous waste permit under DTSC oversight. This former hazardous waste handling facility was the subject of an enforcement action by the lead regulatory agency and resulted in the conviction of the former operator. The chemicals associated with the facility included VOCs and petroleum hydrocarbons. Negotiated with DTSC for work plan modification resulting in a reduction of \$70,000 in the sampling costs.

**Feasibility Study, Former Aerospace Testing Facility, CA**

- Chlorinated VOCs
- Emergent Compounds  
1,4-dioxane and NDMA
- In-Situ and Ex-Situ Treatment Options
- Conforming to Lead Agency Requirements

Provided technical assistance for preparation of a feasibility study for remediation of a 2,800-acre former test site facility being closed after 50 years of storied operations. The feasibility study in part addressed the emergent chemicals 1,4-dioxane and N-nitrosodimethylamine (NDMA). These chemicals are somewhat recalcitrant in the environment and are the subject of research at many DOD-sponsored projects. Evaluated innovative remedial alternatives including enhanced aerobic bioremediation and in-situ chemical oxidation. Prepared a bench-scale work plan and reported the findings evaluating sodium persulfate and propane to reduce NDMA concentrations in groundwater.

**Former Oil Field Sumps Assessment and Remediation, Santa Maria Valley, CA**

- Sump Assessment and Remediation
- Remediation construction
- Target compounds: Metals, volatile and semi-volatile organics, hydrocarbons,
- Soil Excavation
- Health and Safety Plan Preparation

Project manager for sump assessment and remediation activities for multiple land leases within the Santa Maria Valley. Former oil field features were identified by reviewing historic maps and aerial photographs. The lateral and vertical limits of identified features were assessed in the field using direct push technology. Non-hazardous sump material was excavated and transported to a local landfill for reuse. Confirmation samples were collected and based on the results, closure reports were prepared and submitted to the lead oversight agency (County Santa Barbara Fire Prevention Division).

**Operations and Maintenance, Ex-situ Bioremediation, San Luis Obispo, CA**

- Groundwater monitoring well installation
- Groundwater sampling
- Remediation construction
- Vapor extraction system O&M
- Soil Excavation
- Field safety coordinator

**Feasibility Study and Remedial Action Plan, Thousand Oaks, CA**

- Project Coordinator
- Oversee field activities
- Permitting
- Conducted dual phase extraction events
- Managed and performed O & M

**Site Investigations, Multiple Clients**

- Oversee well installation
- Oversee boring installation
- Remediation construction
- Perform Monitoring and Optimization.
- Soil and Soil Vapor Sampling
- Risk Analysis
- Managed Subcontractors
- Construction
