- NE 3.3 **Noise Buffers.** Require major stationary noise-generating sources to install noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest level practical as a condition of the approval or renewal of project entitlements.
- NE 3.4 **Construction Equipment.** Require that all construction equipment utilize noise reduction features (i.e., mufflers and engine shrouds) that are at least as effective as those originally installed by the equipment's manufacturer.
- NE 3.5 **Construction Noise.** Limit commercial construction activities adjacent to or within 200 feet of residential

uses to weekdays, between 7:00 a.m. and 6:00 p.m., and limit high-noise-generating construction activities (e.g., grading, demolition, pile driving) near sensitive receptors to weekdays between 9:00 a.m. and 3:00 p.m.

- NE 3.6 **Commercial Truck Idling.** Restrict truck idling near noise sensitive receptors.
- NE 3.7 **Automobile-Oriented Uses.** Require that parking structures, terminals, drive-through restaurants, automobile sales and repair, fueling stations, mini-marts, car washes, and similar automobile-oriented uses be sited and designed to minimize potential noise impacts on adjacent land uses.
- NE 3.8 **Entertainment Uses.** Minimize the generation of excessive noise from entertainment and restaurant/bar establishments into adjacent residential or noise-sensitive uses.
- NE 3.9 **Neighborhood Noise.** Support efforts of the Sheriff's Department, Animal Control, and Code Enforcement to curb nuisance noise from private parties, barking dogs, and illegal firework use.

Program

- NE 3.1.1 **Ensuring Compliance.** Ensure that required noise mitigation measures are enforced as a project is built, and in place and/or fully implemented prior to release of occupancy, including enforcement of the State Building Codes regarding Chapter 35, "Sound Transmission Control," as amended, and "Noise Insulation Standards" (*California Code of Regulations*, Title 24).

NE 4 – Ground-Borne Vibration

In Jurupa Valley, the primary sources of vibration are construction activities, such as demolition, excavation, and pile driving; rail transport, including light and heavy rail, truck idling, and truck transport. In addition, because most hillside areas are solid granite, grading for new construction often includes blasting. All of these sources can be disruptive to vibration-sensitive receptors such as residential uses, concert halls, hospitals, libraries, research operations, schools, and offices. The following policies and programs seek to minimize the adverse effects of vibration on sensitive uses in Jurupa Valley.

Figure 7-11: Construction graders, Inland Empire

Policies

- NE 4.1 **Sensitive Land Uses.** Avoid the placement of sensitive land uses adjacent to or within one-quarter mile of vibration-producing land uses.
- NE 4.2 **Vibration Producing Land Uses.** Avoid the placement of vibration-producing land uses adjacent to or within one-quarter mile of sensitive receptors.
- NE 4.3 **Truck Idling.** Restrict truck idling near sensitive vibration receptors.
- NE 4.4 **Passing Trains.** Prohibit exposure of residential dwellings to perceptible ground vibration from passing trains as perceived at the ground or the second floor. Perceptible motion shall be presumed to be a motion velocity of 0.01 inches per second over a range of 1 to 100 Hz.
- NE 4.5 **Mining Operations.** Require measures to protect properties adjacent to mining or construction sites that will entail blasting as part of the operation when considering land use entitlement applications.

Programs

- NE 4.1.1 **Rail-related Noise.** Minimize the noise impact of passenger (Metrolink) and freight rail service on sensitive land uses by coordinating with rail authorities to effectively manage train noise and by establishing and enforcing noise mitigation measures that apply to rail uses.
- NE 4.1.2 **Quiet Zone Crossings.** Require new development in the vicinity of railroad crossings that are within 1,000 feet of existing residential neighborhoods to design and construct Quiet Zone railroad crossing improvements and seek to qualify for a Quiet Zone designation.

###

DRAFT

8 – COMMUNITY SAFETY, SERVICES, AND FACILITIES ELEMENT

Figure 8-1: Glen Avon Regional Library in Jurupa Valley

A. INTRODUCTION

The Community Safety, Services, and Facilities Element contains goals, policies, and programs to ensure the safety of the community and the delivery of quality services and facilities to meet the City's needs. Public facilities that help deliver these services and utilities, such as water, sewer, and storm drainage/urban runoff collection, are operated and maintained by multiple agencies and community services districts in Jurupa Valley. Jurupa Valley's community services, facilities, and utilities are integral to individual and community well-being and to the City's ability to attract and retain residents and businesses.

The General Plan Advisory Committee (GPAC) addressed community safety, services, and facilities in-depth, as summarized in Appendix 5.0. The Committee acknowledged the important contributions of the many public safety professionals that serve Jurupa Valley citizens and protect the City from natural and man-made hazards. In addition, the Committee urged that public safety services be enhanced and maintained, as expressed in the adopted Community Values Statement:

Public Safety. Support for public safety, law enforcement and emergency medical services are a value that’s widely held by Jurupa Valley residents. We honor and respect the safety professionals who faithfully serve Jurupa Valley. We support strong, collaborative efforts to prevent crime and homelessness, enforce planning and building codes, and to improve the safety of neighborhoods, homes, public facilities, streets, trails, and other transportation facilities. We take proactive measures to cope with and recover from emergencies and natural and man-made disasters.

The Community Safety, Services and Facilities Element is a hybrid element of the General Plan, combining the state-mandated Safety Element with an optional element addressing community services and facilities. The Safety Element overlaps topics covered in the Land Use Element and the Conservation/Open Space Element and addresses the protection of the community from hazards and risks. Community services and facilities have also been included in this element, addressing local resources and services that influence the physical development and the quality of life of Jurupa Valley.

Goals and Policy Sections

1. *Community Safety*
2. *Community Services and Facilities*

B. BACKGROUND

Community Safety

Safety hazards are natural and man-made conditions that must be respected if life and property are to be protected as growth and development occur. As the ravages of wildland fires, floods, dam failures, earthquakes, and other disasters become clearer through the news, public awareness and sound public policy combine to require serious attention to these conditions.

Portions of Jurupa Valley may be subjected to hazards such as flooding, dam inundation, seismic occurrences, and structure and wildland fire. These hazards are located throughout Jurupa Valley and pose varying degrees of risk and danger. Some hazards must be avoided entirely, while the potential impacts of others can be mitigated by special building techniques and other measures. Critical facilities and lifelines are those facilities that must remain operational after a disaster. Critical facilities include schools, hospitals, fire and police stations, emergency operation centers, communication centers, and industrial sites that use or store hazardous materials. Lifelines are utilities or networks that are essential to daily living such as transportation facilities, water and gas lines, electrical power, and communications networks. Critical facilities and lifelines must be sited and designed to reduce or avoid damage and plan for redundant and/or replacement facilities in the event they are compromised.

Figure 8-2: CAL FIRE crew responding to structure fire

Community Services and Facilities

Community services and facilities are essential to maintain Jurupa Valley's quality of life and support existing and future development. Owing to the City's historical development as an unincorporated community in Riverside County, services and facilities are provided by a variety of public and private agencies. To facilitate ongoing coordination between the City and these agencies, regular inter-agency meetings are held to discuss service needs, share information, coordinate programs, and ensure the timely provision of services throughout the City.

This element addresses the provision and maintenance of the following major services and facilities in Jurupa Valley: City governance, police services, fire and emergency medical services, educational facilities, libraries, parks and recreation, social services, water, wastewater, storm water and solid waste disposal. Additional services and facilities provided in Jurupa Valley but not specifically addressed in the General Plan include natural gas, electricity, landscape maintenance, and telecommunication services.

C. COMMUNITY SAFETY, SERVICES, AND FACILITIES GOALS, POLICIES AND PROGRAMS

Goals

CSSF 1 Minimize risks resulting from natural and manmade hazards to its residents and businesses.

CSSF 2 Honor and support our public safety professionals.

Policies and Programs

CSSF 1 – Community Safety

1. Seismic and Geologic Hazards

The State of California requires that the General Plan Safety Element address seismic and geologic hazards and include policies to reduce the potential risk of death, injuries, property damage, and economic and social dislocation.

Seismic Hazards

Seismic hazards are related to earthquakes and earth movement, such as fault rupture, liquefaction, landslides, and rock falls. The Alquist-Priolo Earthquake Fault Zoning Act of 1972 requires the mapping of known surface faults to minimize the direct impact surface fault-rupture would have on structures designed for human habitation. Although Riverside County as a whole is considered seismically active, there are no known seismic faults within Jurupa

Figure 8-3: Hillside neighborhoods in Jurupa Valley

Valley, nor is Jurupa Valley located within a mapped Alquist-Priolo Earthquake Fault Zone. While the potential earthquake risk is considered low, regional faults such as the Rialto-Colton, San Jacinto, and Chino Faults pose earthquake risks to the West Riverside County area, including Jurupa Valley. Moreover, new faults and fault traces may be identified in the future; consequently, new structures designed for human occupancy should be required to be set back from newly identified and potential seismic hazards. *Figure 8-4* below shows the locations of mapped faults in northwestern Riverside County.

Seismic shaking can cause liquefaction, landslides, and rock falls. Liquefaction occurs primarily in saturated, loose, fine- to medium-grained soils in areas with a high groundwater table. Shaking can cause the soils to lose strength and liquefy. Most of Jurupa Valley has a high groundwater table and is considered to have a “High” liquefaction potential. While a general risk of liquefaction potential can be provided based on soil type and groundwater depth, site-specific geotechnical studies are the only practical and reliable way of determining the specific liquefaction potential of a site. *Figure 8-5* below shows the locations of liquefaction susceptibility in Jurupa Valley.

Seismically induced landslides and rock falls could occur in Jurupa Valley in a major earthquake. Landslides and rock falls occur most often on steep, eroded or undercut, or disturbed hillsides. Factors controlling the stability of slopes include: 1) slope height and steepness; 2) engineering characteristics of the earth materials comprising the slope; and 3) the intensity of ground shaking. Field investigation enables identification of slide-prone areas before an earthquake occurs. *Figure 8-6* below contains a map of landslide susceptibility in Jurupa Valley. Typically, areas with steep slopes pose a higher risk of slope instability in an earthquake. Within Jurupa Valley, the Jurupa Mountains are designated as having steep slopes of 30% slope or greater.

Geologic Hazards

Geologic hazards also pose a safety risk in Jurupa Valley and include landslides, rock falls and debris flows, subsidence, expansive and collapsible soils, and wind erosion. Landslides, rock falls, and debris flows are associated with mountainous and hilly areas, and although natural processes, their risks are increased near housing and human activities. The Jurupa Mountains and the Pedley Hills are characterized by moderate to steep rocky slopes and are potentially prone to landslides, rock falls, and debris flows. The City’s building code establishes specific site investigation requirements for hillside development to reduce risks from landslides, rock falls, and debris flows.

DRAFT

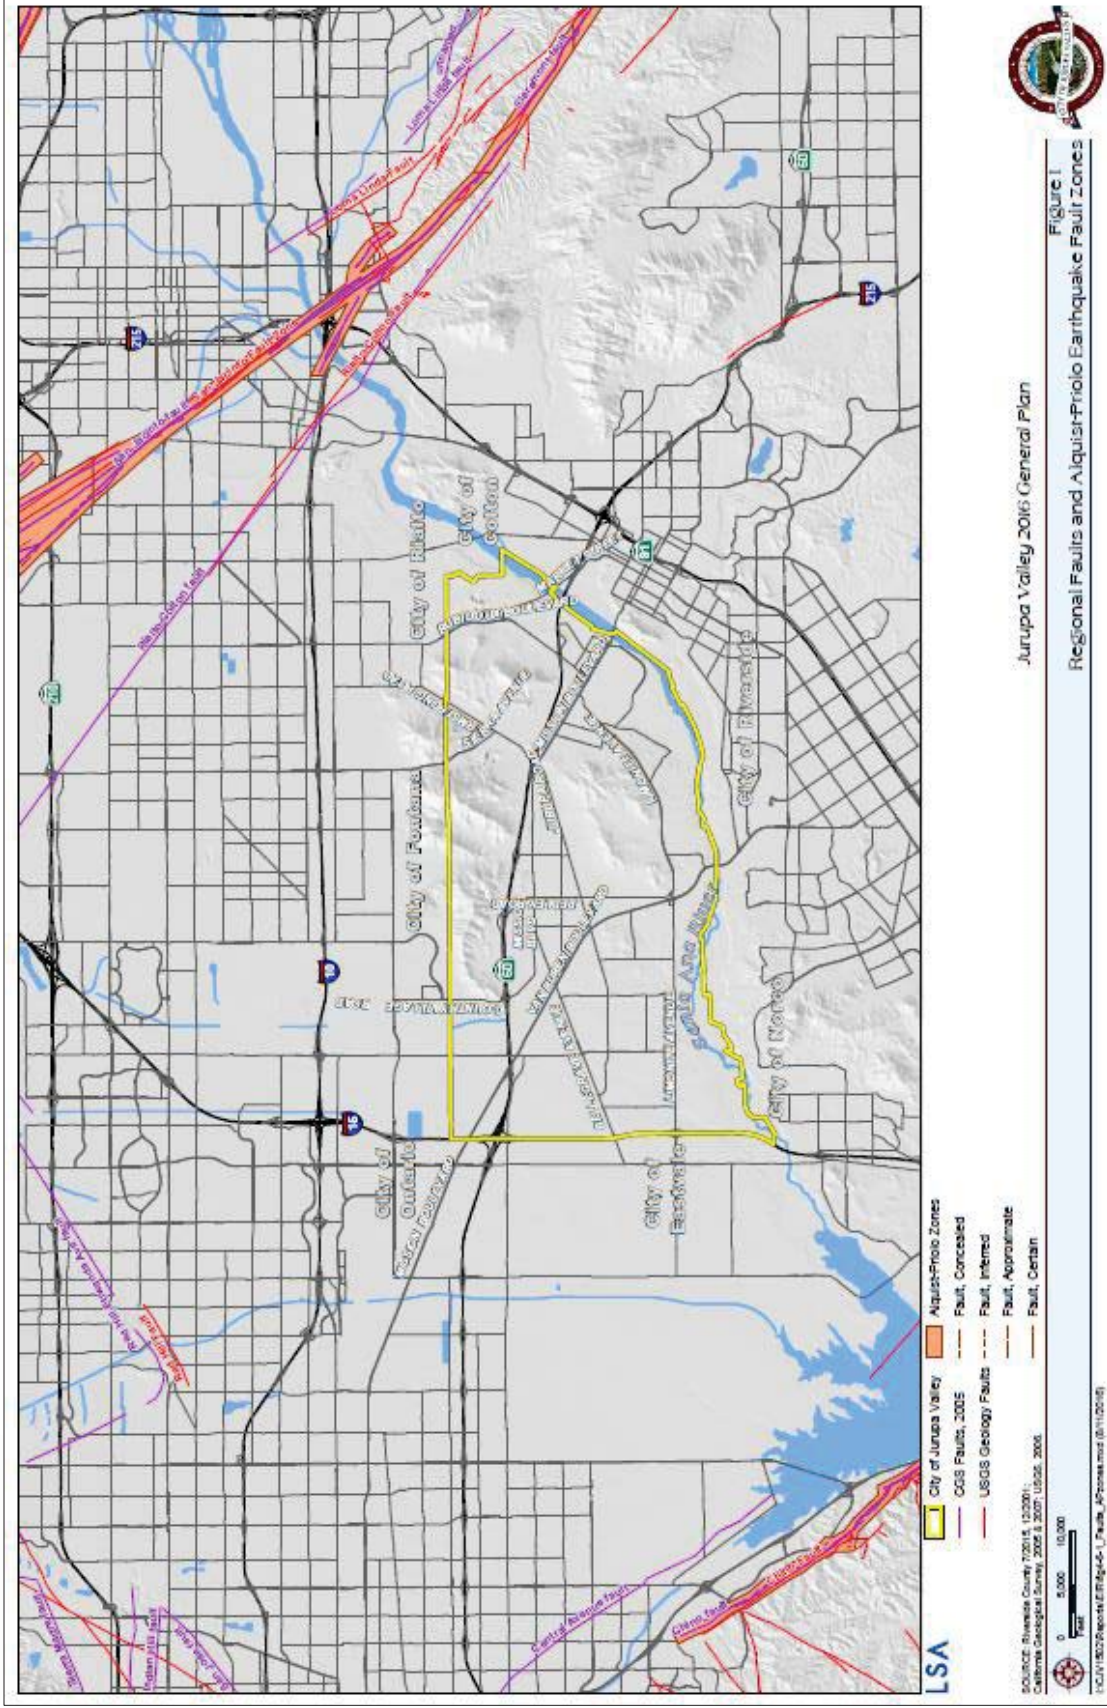

Figure 8-4: Mapped Fault Zones

DRAFT

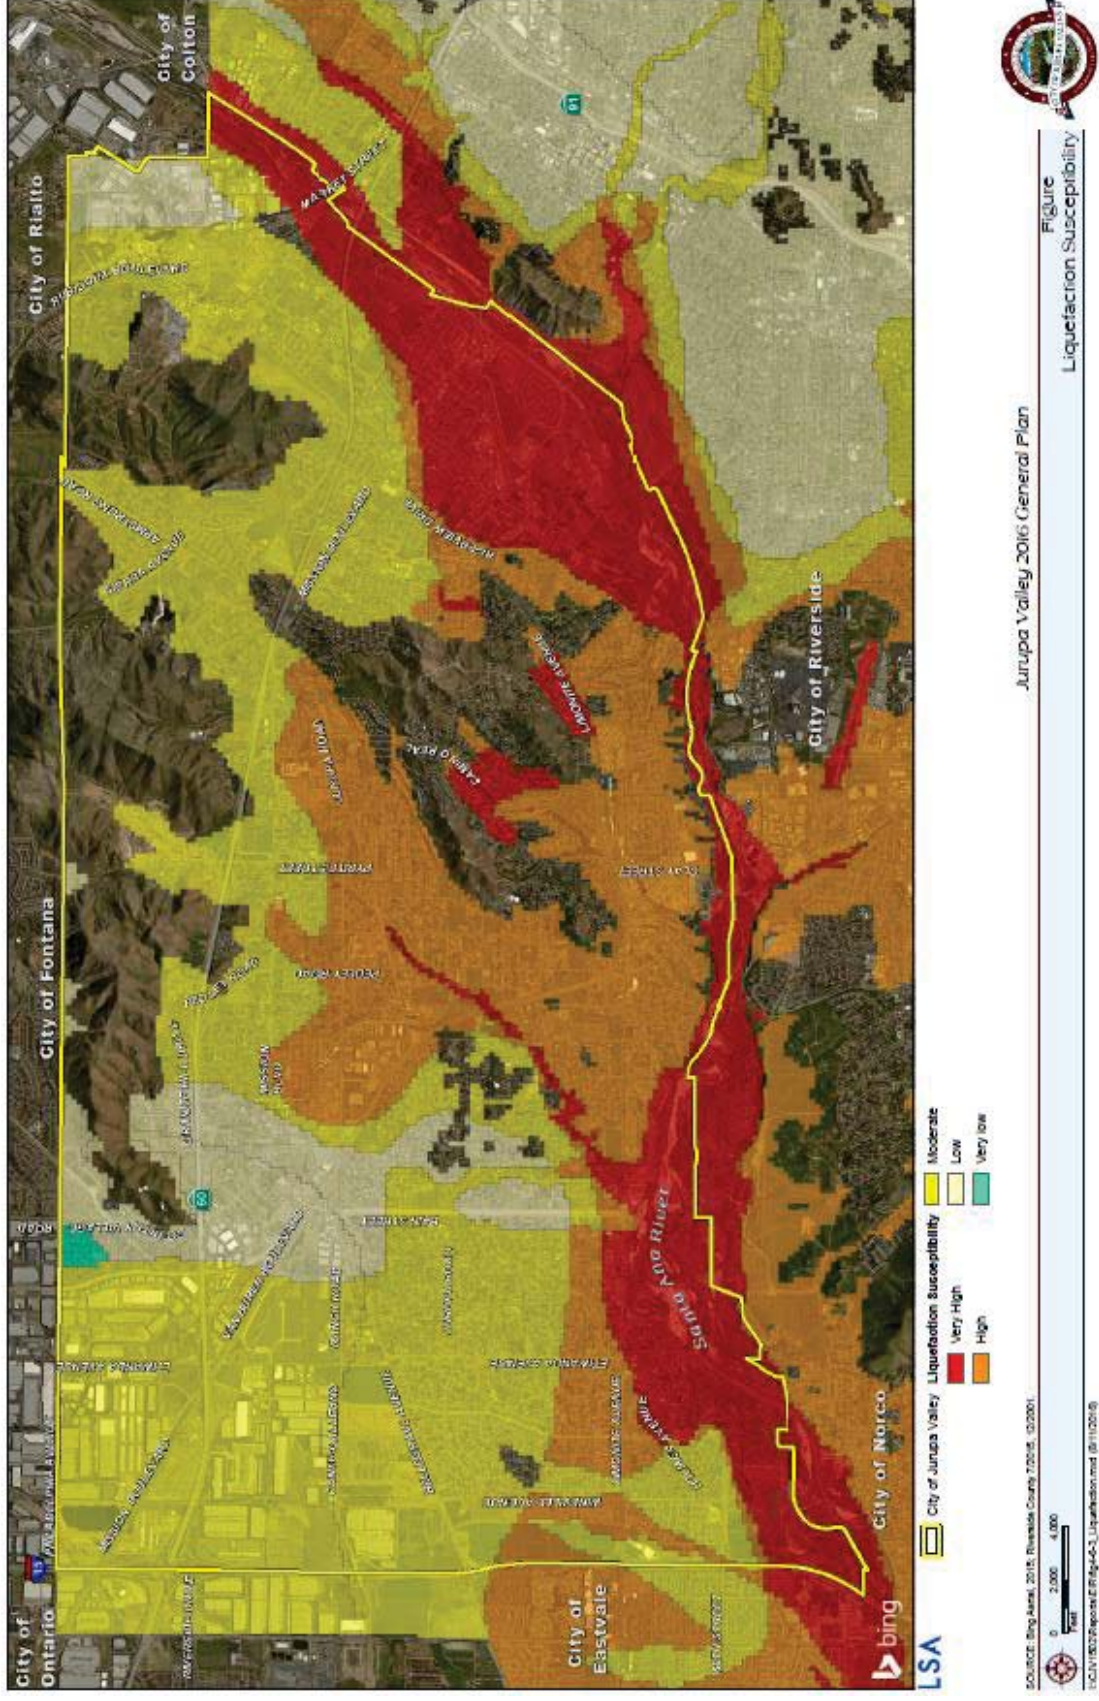

Figure 8-7: Jurupa Mountains, looking northward toward City of Fontana

Subsidence refers to the sudden sinking or gradual downward settling and compaction of soil and other surface material with little or no horizontal motion. This process can be gradual or rapid and can pose significant hazards to property and life. It may be caused by a variety of human and natural activities. In Jurupa Valley, ground subsidence and associated fissuring has resulted from rising and falling ground water tables.

Expansive and collapsible soils are also problematic for development. Expansive soils have a significant amount of clay particles, which can give up water (shrink) or take on water (swell), causing foundations and structures to crack, move, and/or fail. Geotechnical studies, appropriate grading, and construction methods can identify and mitigate adverse effects from expansive and collapsible soils.

Jurupa Valley is also susceptible to wind erosion. Wind erosion generates soil movement as blowing air exerts force against the surface of the ground, releasing soil particles, or dust. Atmospheric dust causes respiratory discomfort, may carry pathogens that cause eye infections and skin disorders, and reduces highway and air traffic visibility. Buildings, fences, roads, crops, trees, and shrubs can also be damaged by abrasive blowing soil.

Policies

CSSF 1.1 Fault Rupture Hazards. When reviewing new development, minimize fault rupture hazards through enforcement of Alquist-Priolo Earthquake Fault Zoning Act provisions and the following requirements:

- a. Require geologic studies or analyses for new, critical structures, such as schools, medical facilities, senior or disabled housing, or other high-risk occupancies located within 0.5 mile of all active or potentially active faults.

- b. Require geologic trenching studies for new developments within all designated Earthquake Fault Studies Zones, unless adequate evidence is presented and accepted by the City Engineer or a Building Official. The City may also require geologic trenching for new development located outside designated fault zones for especially critical or vulnerable structures or lifelines.
- c. Require that critical infrastructure, including roads, bridges, and utilities be designed to resist, without failure, their crossing of a fault, if fault rupture occurs.
- d. Encourage and support efforts by the geologic research community to better define the locations and risks of County faults. Such efforts could include data sharing and database development with regional entities, state and local governments, private organizations, utility agencies, or universities.

CSSF 1.2 Geologic Investigations. Require geological and geotechnical investigations as part of the environmental and development review process. This requirement shall apply to the development of any structure proposed for human occupancy or to unoccupied structures whose damage could cause secondary hazards in areas with potential for earthquake-induced liquefaction, landslides, or settlement.

CSSF 1.3 Structural/Non-Structural Assessment. Require structural and nonstructural assessment and, when necessary, mitigation for other types of potentially hazardous buildings that are undergoing substantial repair or improvements costing more than half of the assessed property value. Potential implementation measures could include:

- a. Use of variances, tax rebates, fee waivers, credits, or public recognition as incentives.
- b. Inventory and structural assessment of potentially hazardous buildings based on screening methods developed by the Federal Emergency Management Agency.
- c. Development of a mandatory retrofit program for hazardous, high occupancy, essential, dependent, or high-risk facilities.
- d. Development of a mandatory program requiring public posting of seismically vulnerable buildings.

CSSF 1.4 Structural Damage. Utilize the latest approaches to minimize damage to structures located in areas

determined to have a high liquefaction potential during seismic events.

- CSSF 1.5 **Hillside Development.** Encourage and, where possible require, mitigation of potential erosion, landslide, and settlement hazards for existing public and private development located on unstable hillside areas, especially slopes with recurring failures where City property or public right-of-way is threatened from slope instability, or where considered appropriate and urgent by the City Engineer, CAL FIRE, or County Sheriff's Department.

Programs

- CSSF 1.1.1 **Hazard Mitigation.** Mitigate potential seismic hazards through adoption and strict enforcement of current building codes, which will be amended as necessary when local deficiencies are identified.
- CSSF 1.1.2 **Liaison Program.** Develop a liaison program with all water purveyors to prevent water extraction-induced subsidence.

2. Flood Hazards and Inundation

As identified by the GPAC, the Santa Ana River is tremendous asset to the City, providing open space, environmental, recreational, and visual amenities. It also presents the potential for flood hazards and inundation. Throughout the years, flooding events on the Santa Ana River have resulted in the loss of livestock, infrastructure, property, and even lives. To manage and minimize the risk of flooding, the Riverside County Flood Control and Water Conservation District was formed in 1945 to reduce the risks and damage due to flooding in western Riverside County. The District's responsibilities include the maintenance and construction of flood control structures and facilities, and regulating development in and near floodplains. Despite major improvements in flood management methods and planning, portions of Jurupa Valley are still at risk of flooding during major events. It continues to be in the City's best interest to regulate and monitor development in floodplain and flood prone areas. Waterways and drainage facilities existing in 2017 are shown in *Figure 8-9*.

The Federal Emergency Management Agency (FEMA) prepares Flood Insurance Rate Maps, or FIRM maps, to graphically show areas prone to flooding during 100-year and 500-year frequency floods. *Figure 8-9* identifies the flood prone portions of Jurupa Valley based on FIRM maps and flood district data, and *Figure 8-10* (page [8-13](#)) shows the FIRM map for Jurupa Valley.

Figure 8-8: Van Buren Bridge collapse during the 1969 Santa Ana River flood (Riverside County Flood Control and Water Conservation District)

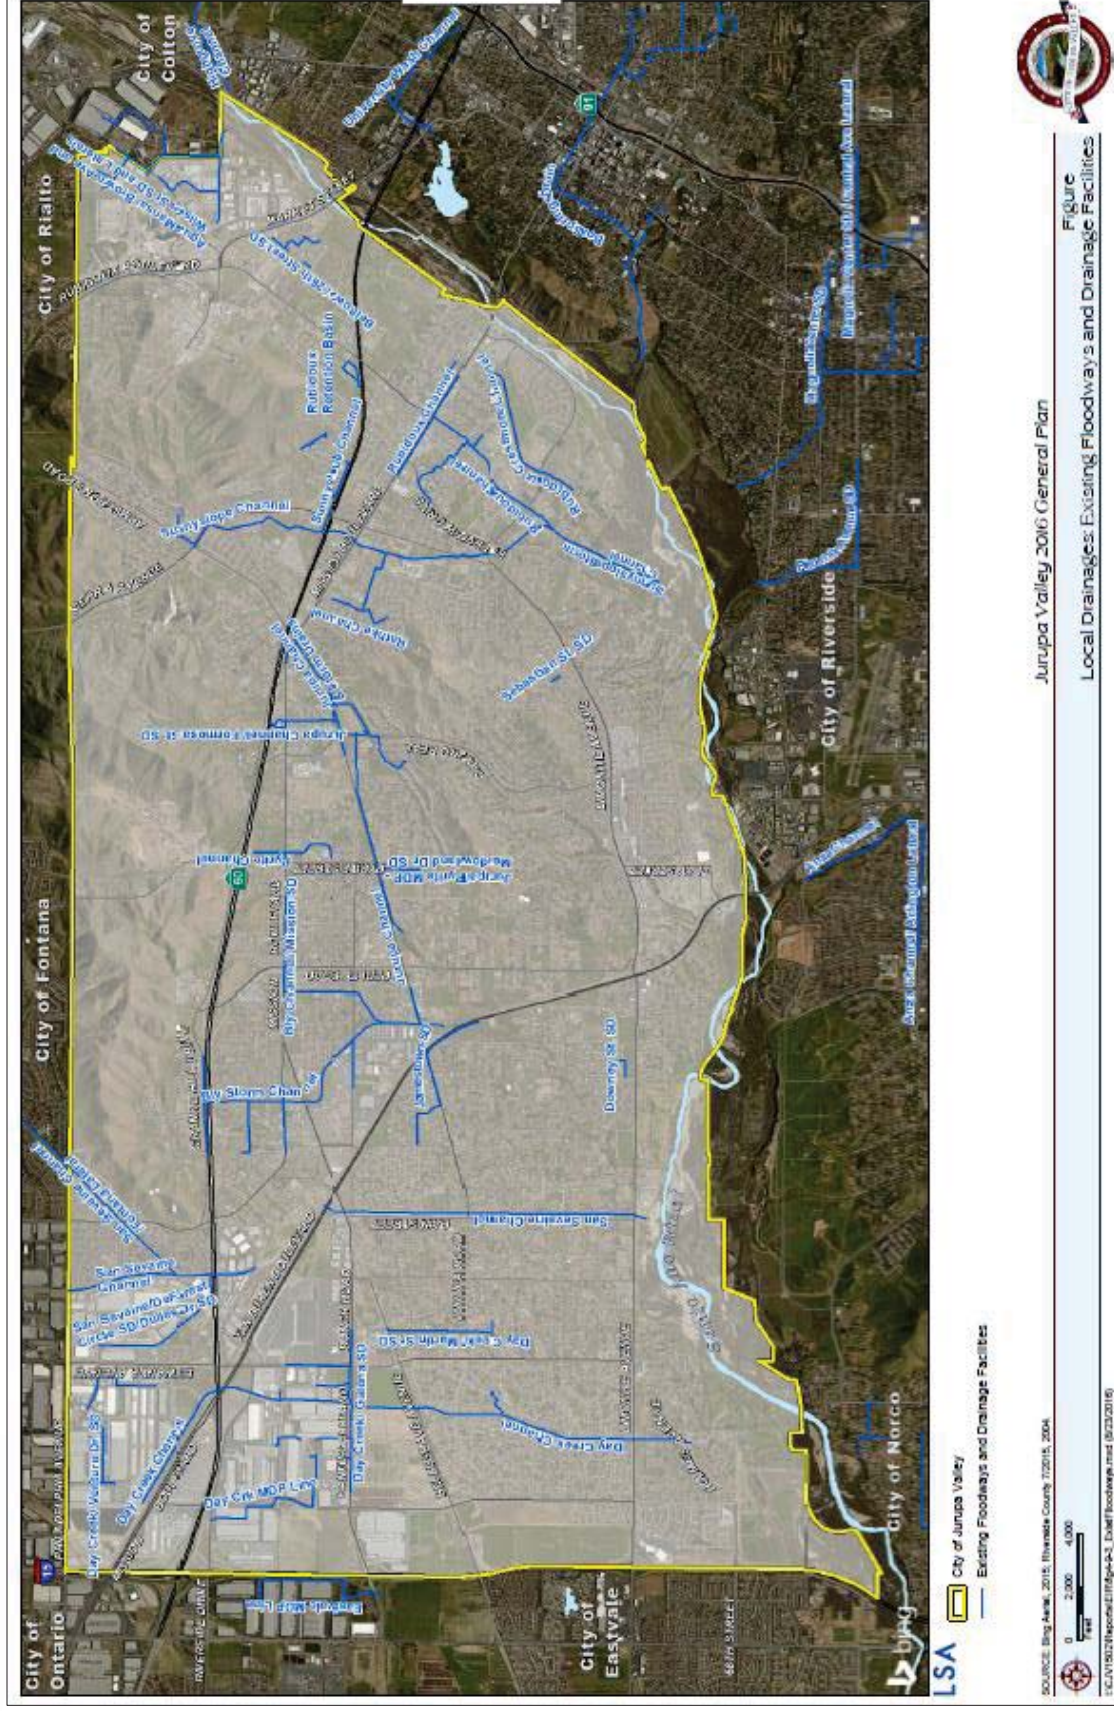

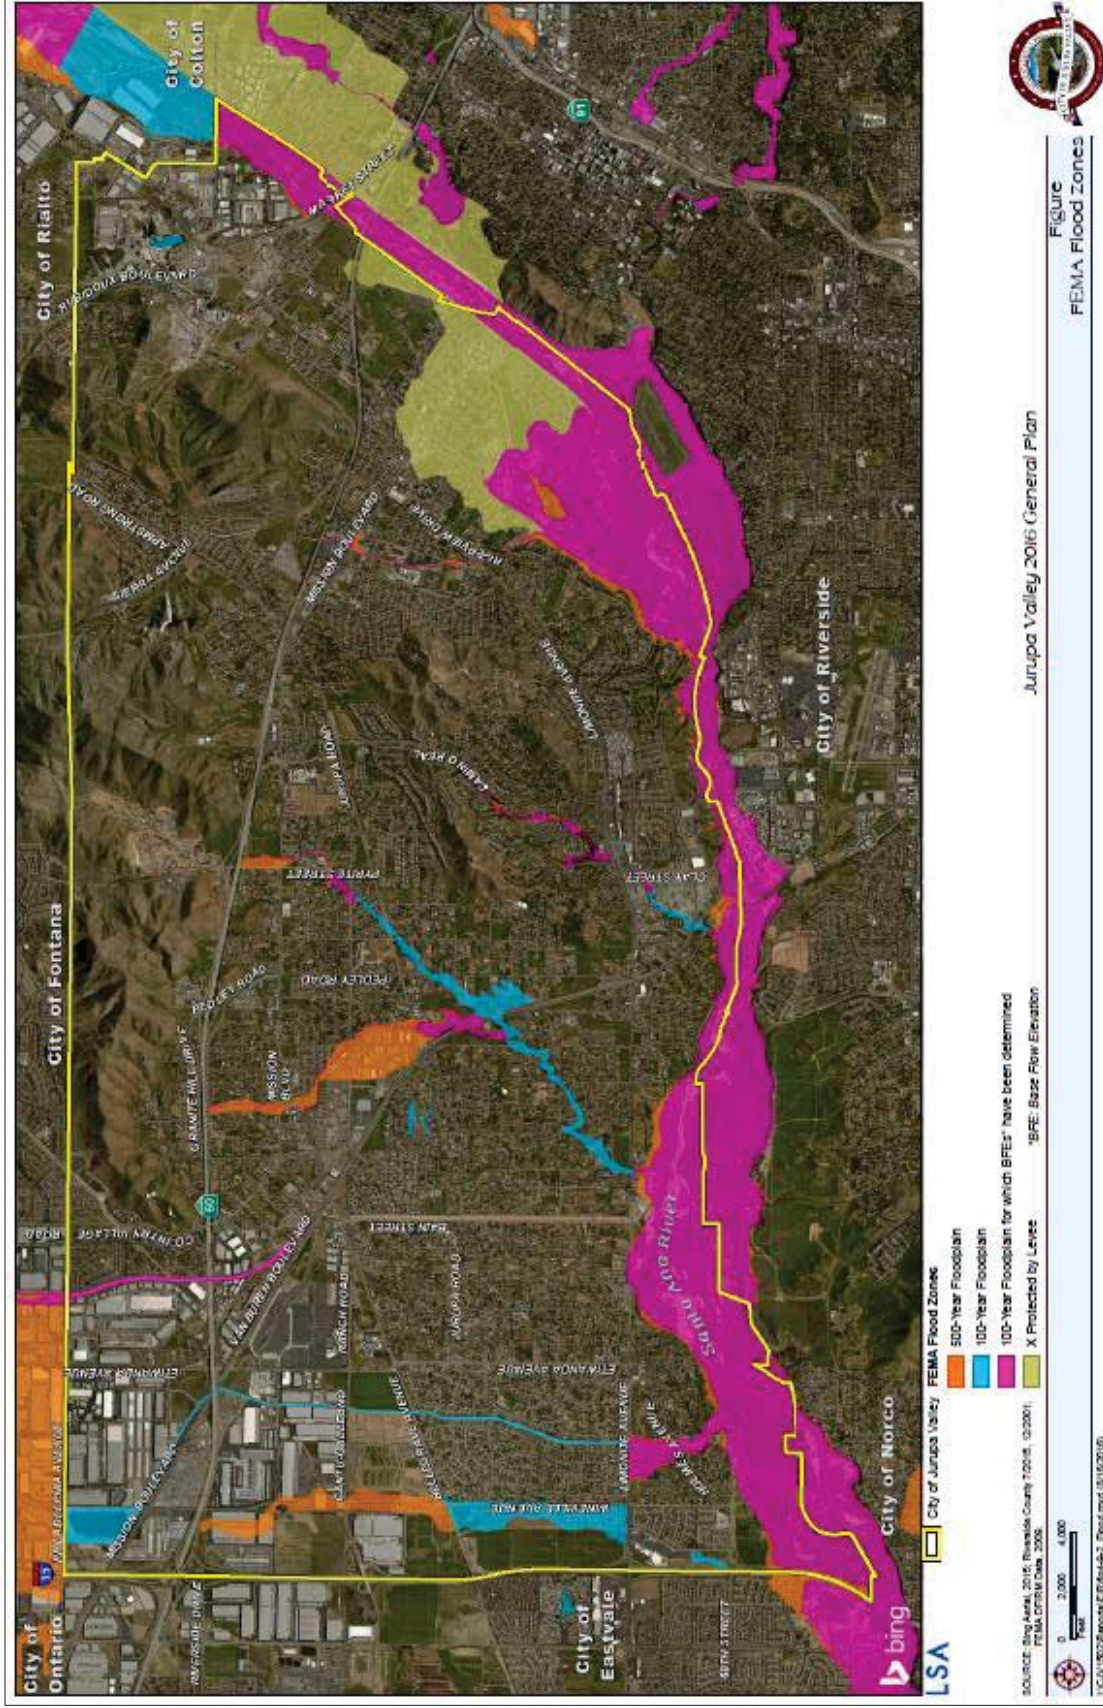

Figure 8-9: Existing Floodways and Drainage Facilities in Jurupa Valley

DRAFT

Community Safety, Services, and Facilities

In addition to the Santa Ana River, the Riverside Basin (northeast of the Interstate 15/SR 60 interchange), and those areas bordering the Etiwanda Flood Control Channel, Pyrite Channel, and the Riverside Canal, are part of the 100-year floodplain. Most of these areas are also where a substantial amount of development exists or is intended to occur. Many techniques may be used to address the danger of flooding, such as preventing or limiting development in floodplains, reducing urban runoff, maintaining floodways, using special building techniques, elevating foundations and structures, and enforcing building setbacks.

One effective technique for maintaining floodways and reducing flood hazards is controlling the spread of *Arundo donax* (giant cane). Giant cane is a highly invasive, non-native aquatic plant that grows in the Santa Ana River and other local drainage courses. The plant is hazardous from a flooding perspective because it grows quickly, clogs channels, and increases flood risks. Left unchecked, the plant can easily take over riparian areas, excluding native plants and damaging natural habitat. However, the Santa Ana Watershed Project Authority (SAWPA), the County of Riverside, and other agencies have been working to eliminate giant cane from the Santa Ana River Watershed and restore natural habitat.

Policies

CSSF 1.6 Flood Risk. In reviewing new construction and substantial improvements within the 100-year floodplain, the City shall disapprove projects that cannot minimize the flood risks to acceptable levels in areas mapped by FEMA or as determined by site-specific hydrologic studies for areas not mapped by FEMA. The City shall:

- a. Prohibit the construction, location, or substantial improvement of structures in areas designated as floodways, except upon approval of a plan that provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood; and
- b. Prohibit the filling or grading of land for nonagricultural purposes and for non-authorized flood control purposes in areas designated as floodways, except upon approval of a plan, which provides that the proposed development will not result in any significant increase in flood levels during the occurrence of a 100-year flood discharge.

- CSSF 1.7 **Floodway Alteration.** Require that any alterations of the floodway utilize naturalized edge treatments as outlined in the Conservation and Open Space Element (Policies 3.16 and 3.17).
- CSSF 1.8 **Building Codes.** Enforce provisions of the Building Code in conjunction with the following guidelines:
- a. Critical facilities shall not be permitted in floodplains unless the project design ensures that there are at least two routes for emergency ingress and egress, and minimizes the potential for debris or flooding to block emergency routes.
 - b. Development using, storing, or otherwise involved with substantial quantities of on-site hazardous materials shall not be permitted unless all standards for evaluation, anchoring, and flood-proofing have been satisfied; and hazardous materials are stored in watertight containers, not capable of floating, to the extent required by state and federal laws and regulations.
 - c. Specific flood-proofing measures that may be required include, but are not limited to: use of paints, membranes, or mortar to reduce water seepage through walls; installation of water tight doors, bulkheads, and shutters; installation of flood water pumps in structures; and proper modification and protection of all electrical equipment, circuits, and appliances so that the risk of electrocution or fire is eliminated. Fully enclosed areas that are below finished floors shall require openings to equalize the forces on both sides of walls.
- CSSF 1.9 **Permanent Structures.** Prohibit construction of permanent structures for human housing or employment to the extent necessary to convey floodwaters without property damage or risk to public safety. Agricultural, recreational, or other similar, non-habitation uses are allowable if flood control and groundwater recharge functions are maintained.
- CSSF 1.10 **Floodway Alteration.** Prohibit alteration of floodways and channelization unless alternative methods of flood control are not technically feasible or unless alternative methods are already utilized to the maximum extent practicable. The intent is to balance the need for protection with prudent land use solutions, recreation needs, and habitat preservation requirements, and as

applicable to provide incentives for natural watercourse preservation. Preservation incentives may include density transfer programs as may be adopted.

- CSSF 1.11 **Modification of Water Courses.** Prohibit substantial modification to water courses, unless modification does not increase erosion or adjacent sedimentation, or increase water velocities, so as to be detrimental to adjacent property, nor adversely affect adjacent wetlands or riparian habitat.
- CSSF 1.12 **Flood Control Improvements.** Direct flood-control improvement measures toward the protection of existing and planned development.
- CSSF 1.13 **Environmental Protection.** Ensure that any substantial modification to a watercourse is accomplished in the least environmentally damaging manner possible to maintain adequate wildlife corridors and linkages and maximize groundwater recharge
- CSSF 1.14 **Ability to Withstand Flooding.** Require development within the floodplain to be capable of withstanding flooding and to minimize use of fill. Compatible uses shall not, however, obstruct flows or adversely affect upstream or downstream properties with increased velocities, flood heights, erosion backwater effects, or concentrations of flows.
- CSSF 1.15 **Regional Storm Drain System.** All proposed development projects shall address and mitigate any adverse impacts on the carrying capacity of local and regional storm drain systems.
- CSSF 1.16 **Neighboring Jurisdictions.** Encourage neighboring jurisdictions to require development occurring adjacent to the City to consider the impact of flooding and flood control measures on properties within the City.
- CSSF 1.17 **Hazardous Materials Storage.** Require that facilities storing substantial quantities of hazardous materials within designated 100- or 500-year flood zones be adequately flood-proofed and that hazardous materials containers be anchored and secured to prevent flotation and contamination.
- CSSF 1.18 **Lifeline Facilities.** Require that all lifeline and dependent care facilities, such as convalescent homes, group housing, police stations, fire stations, and emergency operation centers in designated flood zones be flood-proofed and to maintain and rehearse inundation response plans.

- CSSF 1.19 **Open Space Tools.** Utilize various means of land acquisition tools and land use measures, such as density credit for open space and dedication of floodplain areas to the Riverside Conservation Agency, to create open space zoning in designated flood zones that are likely to be developed or redeveloped with uses that are more intensive.
- CSSF 1.20 **Risk Assessment.** Continue to assess and upgrade inundation risk and protection in the City.
- CSSF 1.21 **Flood Hazard Zones.** Encourage periodic reevaluation of the 500-year, 100-year and 10-year flood hazard zones by state, federal, county, and other sources and use such studies to improve existing protection, review flood protection standards for new development and redevelopment, and update emergency response plans.
- CS 1.22 **Specific Plans.** Encourage the use of specific plans to allow increased densities in certain areas of a proposed development and to transfer density to locate residential, commercial, industrial, and public facility uses outside of natural hazard areas; and to direct appropriate uses to these areas, such as open space, passive recreational uses, or other uses compatible with these hazards.

Programs

- CSSF 1.1.3 **Property Acquisition.** As resources allow, acquire property in high-risk flood zones and designate the land as open space for public use or wildlife habitat.
- CSSF 1.1.4 **Giant Cane.** Encourage and, as resources allow, support the efforts of SAWPA, the County of Riverside, and other agencies to remove giant cane from the Santa Ana River corridor and restore native riparian habitat.

3. Fire Hazards

Due to the rural and somewhat mountainous nature of the City, and some of the flora, such as oak woodlands and chaparral habitat, the foothill areas and mountainsides are subject to a risk of fire hazards. The lush riparian vegetation of the Santa Ana River also poses conditions conducive to wildfires, and giant cane, where present in the watershed, is even more combustible than native species. The highest danger of wildfires can be found in the most rugged terrain where, fortunately, development intensity is relatively low. Methods to address this hazard include such techniques as not building in high-risk areas, creating setbacks that buffer development from hazard areas, maintaining brush clearance to

Figure 8-11: CAL FIRE strike crew fighting a wildland fire

reduce potential fuel, establishing low fuel landscaping, and applying special building techniques. In still other cases, safety-oriented organizations, such as the California Fire Safe Council, can provide assistance in educating the public and promoting practices that contribute to improved public safety.

As stated in the State of California's General Plan Guidelines, "California's increasing population and expansion of development into previously undeveloped areas is creating more 'wildland-urban interface' issues with a corresponding increased risk of loss to human life, natural resources, and economic assets associated with wildland fires." To address this issue, the state passed Senate Bill 1241 to require that General Plan Safety Elements address the fire severity risks in State Responsibility Areas (SRAs) and Local Responsibility Areas (LRAs). As shown in *Figure 8-12*, Jurupa Valley contains several areas within Very High and High fire severity zones that are located in an SRA. SRAs are those areas of the state in which the responsibility of preventing and suppressing fires is primarily that of the Department of Forestry and Fire Protection, also known as CAL FIRE.

Policies

CSSF 1.23 Fire Prevention. Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:

- a. All proposed construction shall meet minimum standards for fire safety as defined in the City Building or Fire Codes, or by City zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.
- b. In addition to the fire safety provisions of the Uniform Building Code and the Uniform Fire Codes, apply additional standards for high risk, high occupancy hospital and health care facilities, dependent care, emergency operation centers, and other essential or "lifeline" facilities, per county or state standards. These shall include assurance that structural and nonstructural architectural elements of the building will not:
 - impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor
 - hinder evacuation from fire, including potential blockage of stairways or fire doors.

- c. Proposed development in Hazardous Fire areas shall provide secondary public access, unless determined unnecessary by CAL FIRE or City Building Official.
- CSSF 1.24 **Adjacent Natural Vegetation.** Development that adjoins large areas of native vegetation will require fuel modification with drought tolerant landscaping that blends with the natural vegetation to the greatest extent possible.
- CSSF 1.25 **Wildfire Hazards.** Encourage and, as resources allow, support CAL FIRE and other agency efforts to reduce wildfire hazards and improve fire-fighting capacity to successfully respond to multiple fires.
- CSSF 1.26 **Gas Shutoff.** Require automatic natural gas shutoff earthquake sensors in high-occupancy industrial and commercial facilities and encourage their installation in all residences.
- CSSF 1.27 **Coordination.** During preparation and implementation of the City's capital improvement programs, encourage coordination between CAL FIRE and Community Services Districts providing water services in Jurupa Valley to improve firefighting infrastructure, by proposing or requiring, when appropriate:
 - a. Replacement and/or relocation of old cast-iron pipelines and inadequate water mains when street improvements are planned;
 - b. Assessment of impact fees as a condition of development; and
 - c. Redundant emergency distribution pipelines in areas of potential ground failure or where determined to be necessary.
- CSSF 1.28 **Fire Protection Master Plan.** Continue to utilize the Riverside County Fire Protection Master Plan and Jurupa Emergency Response Plan as the base documents to implement the goals and objectives of the Community Safety Element.
- CSSF 1.29 **Water Resources.** Encourage and, as resources allow, support efforts to utilize existing water bodies, tanks, and water wells in the City for emergency fire suppression water sources.
- CSSF 1.30 **Brush Clearance.** Utilize ongoing brush-clearance fire inspections to educate homeowners on fire prevention tips.

Programs

CSSF 1.1.5 **Fire Safety Planning.** Conduct and implement long-range fire safety planning, including updating building, fire, subdivision, and municipal code standards, improved infrastructure, and improved mutual aid agreements with the private and public sectors.

CSSF 1.1.6 **Fire Response Agreements.** Review inter-jurisdictional fire response agreements, and improve firefighting resources as recommended in the County Fire Protection Master Plan, to keep pace with development and to ensure that:

- a. Fire reporting and response times do not exceed those listed in the County Fire Protection Master Plan identified for each of the development densities described;
- b. Fire flow requirements (water for fire protection) are consistent with Insurance Service Office (ISO) recommendations; and
- c. The planned deployment and height of aerial ladders and other specialized equipment and apparatus are sufficient for the intensity of development anticipated.

4. Hazardous Materials

Hazardous materials are those substances that have the potential to cause harm to humans, animals, or the environment, by themselves or through interaction with other factors (Institute of Hazardous Materials Management). In Jurupa Valley, hazardous materials include petroleum products, solvents, pesticides, and other substances used in or generated by commercial, industrial, agricultural, or residential activities. State and federal laws govern the storage, transport, and disposal of hazardous materials.

Contaminated sites are another source of hazardous materials in Jurupa Valley. The Stringfellow Remediation Site near SR 60 and Pyrite Street is perhaps the most well-known contaminated site in the region. The former hazardous waste disposal site leached toxins into the environment and has been undergoing remediation through the federal Superfund process. In addition to contaminating the surface and soil, the site leaked toxins into Pyrite Creek and the groundwater basin, which traveled in a southwest-trending "plume" to the community of Glen Avon and other areas. The remediation effort includes monitoring and remediation of groundwater supplies.

Policies

- CSSF 1.31 **Federal/State Laws.** Comply with federal and state laws regarding the management of hazardous waste and materials.
- CSSF 1.32 **Hazardous Waste Storage/Disposal.** Identify, assess, and mitigate safety hazards from the storage, use, and disposal of hazardous materials through the development review process.
- CSSF 1.33 **Hazardous Waste Collection.** Encourage and, as resources allow, support household hazardous waste collection activities.
- CSSF 1.34 **Stringfellow Remediation Site.** Encourage and support state and federal efforts to complete the clean-up of the Stringfellow Remediation Site and related groundwater and soil contamination.
- CSSF 1.35 **Information Dissemination.** Disseminate information to the public on the storage, use, and disposal of hazardous materials.

5. Disaster Preparedness

The Federal Emergency Management Agency (FEMA) defines disaster preparedness as “a continuous cycle of planning, organizing, training, equipping, exercising, evaluating, and taking corrective action in an effort to ensure effective coordination during incident response.” Disaster preparedness is important to Jurupa Valley to establish the most effective and efficient ways to address hazards and minimize the effects of hazards on life and property, reduce the potential for disasters, and recover from the effects of disasters as quickly as possible.

Hazard Mitigation Plans exist at the federal, state, regional, and local level. The California Disaster Mitigation Act of 2000 requires state, local, and tribal governments to prepare Hazard Mitigation Plans that address actions and strategies to mitigate hazards, risks, and vulnerabilities. The City of Jurupa Valley has adopted a Local Hazard Mitigation Plan (LHMP) and participates in the County of Riverside Multi-Jurisdictional Local Hazard Mitigation Plan (MHFP). The plans set goals to mitigate potential risks from natural and man-made hazards, identify vulnerabilities, provide recommendations for actions, evaluate resources, and identify future mitigation planning and maintenance of existing plan.

The City also has an Emergency Operations Plan (EOP) that addresses how the City will respond to emergency situations ranging from minor incidents to large-scale disasters. The plan

addresses four primary phases of emergency operation including Preparedness, Response, Recovery, and Mitigation. The plan discusses the activation and management of the City's Emergency Operations Center (EOC), which may be set up during an emergency to manage the event and coordinate with other EOCs such as the Riverside County EOC. The EOC also coordinates the sharing of resources under the California Mutual Aid Agreement.

The City also participates in the County of Riverside's HAZUS Program, which is a standardized methodology for earthquake loss estimation based on geographic information systems (GIS). HAZUS, which stands for Hazards – United States, is designed for use by state, regional, and local governments in planning for earthquake loss mitigation, emergency preparedness, response, and recovery.

Policies

CSSF 1.36 Multi-Hazard Functional Plan. Strengthen the Multi-Hazard Functional Plan and maintain mutual aid agreements with federal, state, local agencies and the private sector to assist in:

- a. clearance of debris in the event of widespread slope failures, collapsed buildings or structures, or other circumstances that could result in blocking emergency access or regress;
- b. heavy search and rescue;
- c. fire suppression;
- d. hazardous materials response;
- e. temporary shelter;
- f. geologic and engineering needs;
- g. traffic and crowd control; and
- h. building inspection.

CSSF 1.37 Hazardous Waste Handling. Require businesses, utilities, and industrial facilities that handle hazardous materials to:

- a. install automatic fire and hazardous materials detection, reporting, and shut-off devices; and
- b. install an alternative communication system in the event power is out or telephone service is saturated following an earthquake.

- CSSF 1.38 **Self-Sufficiency.** Use incentives and disincentives to persuade private businesses, consortiums, and neighborhoods to be self-sufficient in an emergency by:
- a. maintaining a fire control plan, including an on-site firefighting capability and volunteer fire response teams to respond to and extinguish small fires; and
 - b. identifying medical personnel, employees, or local residents who are capable and certified in first aid and CPR.

- CSSF 1.39 **Critical Facilities.** Ensure that critical facilities such as City Hall, Sheriff's Substations, City Fire Stations, electrical substations, community services district offices, and water and sewer facilities are subject to the following design considerations:

- a. Require that special development standards, designs, and construction practices be implemented to reduce risk of compromise in a disaster to acceptable levels for capital improvements, utility projects, and development projects involving critical facilities, large-scale residential development, and major commercial or industrial development. Special standards should be applied through conditional use permits and the subdivision review process and, where appropriate, impact fees should be assessed to finance required actions.
- b. Require mitigation measures to reduce potential damage caused by ground failure for sites determined to have potential for liquefaction. Such measures shall apply to critical facilities, utilities, and large commercial and industrial projects as a condition of project approval.
- c. Require that planned lifeline utilities, as a condition of project approval, be designed, located, structurally upgraded, and fit with safety shutoff valves; be designed for easy maintenance, and have redundant back-up lines where unstable slopes, earth cracks, active faults, or areas of liquefaction cannot be avoided.
- d. Review proposed uses of fault setback areas closely to ensure that City infrastructure (roads, utilities, sanitary and storm sewers) are not unduly placed at risk by the developer. Insurance, bonding, or compensation plans should be used to compensate the City for the potential costs of repair.

- CSSF 1.40 **Strengthen Utilities/Lifelines.** Encourage the strengthening of planned and existing utilities and lifelines, the retrofit and rehabilitation of structurally unsound utility structures and public facilities, and the relocation of certain critical facilities where appropriate.
- CSSF 1.41 **Alternative Facilities.** Encourage alternatives that improve site safety for the protection of critical facilities, including property acquisition for open space, change in building use or occupancy, or other appropriate measures that can reduce risks posed by hazards.
- CSSF 1.42 **Critical Facilities in Inundation Areas.** Discourage development of critical facilities that are proposed in dam failure inundation areas, and apply hazardous materials safety guidelines within such zones.
- CSSF 1.43 **Santa Ana River Levees.** Ensure that the City's emergency preparedness plans include response protocols for the breaching of the Santa Ana River levees.
- CSSF 1.44 **Rebuilding After Disaster.** Allow rebuilding after a disaster consistent with the General Plan allowing exceptions on a case-by-case basis for previously non-conforming uses and structures when such an action would be consistent with public safety goals and in the City's best interests.

Programs

- CSSF 1.1.7 **Post-Disaster Recovery.** Develop plans for short-term and long-term post-disaster recovery.
- CSSF 1.1.8 **Safeguard Infrastructure.** Coordinate with the Public Utilities Commission (PUC) and/or utilize the Capital Improvement Program, to strengthen, relocate, or take other appropriate measures to safeguard high-voltage lines, water, sewer, natural gas and petroleum pipelines, and trunk electrical and telephone conduits that:
- extend through areas of high liquefaction potential;
 - cross active faults; or
 - traverse earth cracks or landslides.

CSSF 1.1.9 Earthquake Drills. Conduct City earthquake drills and, where appropriate:

- a. Develop internal scenarios for City emergency response, including emergency drills; and
- b. Test back-up power generators in public facilities and other critical facilities taking part in emergency drills.

CSSF 1.1.10 Information Dissemination. Improve management and emergency dissemination of information using portable computers with geographic information systems and disaster-resistant Internet access, to obtain:

- a. Hazardous Materials Disclosure Business Plans regarding the location and types of hazardous materials;
- b. Real-time information on seismic, geologic, or flood hazards; and
- c. The locations of high-occupancy, immobile populations, potentially hazardous building structures, utilities, and other lifelines.

CSSF 2 – Provide a high level of community services and facilities to serve the existing and future needs of Jurupa Valley

1. General

Figure 8-13: Jurupa Valley City Hall

Jurupa Valley’s community services and facilities are a source of pride for the community and directly affect public health and safety, quality of life, land values, economic and environmental sustainability, and fiscal health. Due to the City’s recent history as an unincorporated area, community services and facilities are provided by a number of public and private agencies and service districts. Because of this, close coordination is needed to ensure that existing and future needs of the City are met.

Programs

CSSF 2.1 Provide Facilities and Services. Work with community services agencies and districts on the planning and provision of adequate community facilities and services.

CSSF 2.2 Concurrency with Development. Ensure the provision of sufficient public facilities and services prior to, or concurrently with, new development.

- CSSF 2.3 **Facility Design.** Work with service agencies to ensure that new public facilities are well designed, energy efficient and compatible with adjacent land uses.
- CSSF 2.4 **Fair Share.** Ensure that new development pays its fair share of public facilities and service costs.
- CSSF 2.5 **Joint Use.** Promote the joint use of public facilities to meet multiple needs of the community.

2. City Governance

After the incorporation of Jurupa Valley on July 1, 2011, the City began operating out of a small commercial storefront building in the De Anza Marketplace. City Council meetings were initially held at the Jurupa Valley Unified School District Education Center. However, in 2012, the City Council began meeting at the vacant Sam's Western Wear, a vintage, western-themed building located at 8930 Limonite Avenue in the Pedley community. Soon thereafter, the City began converting Sam's Western Wear into City Hall with offices, public counters, meeting rooms, and enhanced Council chambers. City staff and consultants moved into the new City Hall in early 2015, and a grand opening was held to celebrate the important milestone in February of 2015.

The City prides itself on providing quality municipal services in a cost effective manner. The City is responsible for police (including crime and traffic), fire suppression and prevention, street construction, maintenance and repair, building and grading permits and inspections, code enforcement, zoning and planning, water quality management, business registrations, and finance. The City of Jurupa Valley provides these services at City Hall through the following departments: City Manager, City Attorney, Finance, City Clerk, Engineering, Public Works, Building and Safety, Code Enforcement, Planning, and Economic Development. The City provides for police services through the Riverside County Sheriff's Department, and fire services are provided by the Riverside County Fire Department and the Rubidoux Community Services District. In addition, the City Council and the Planning Commission operate from City Hall and conduct their meetings in the Council chambers. Regular City Council meetings are held on the first and third Thursdays of the month, and Planning Commission meetings are held on the second and fourth Wednesdays of the month.

Policies

- CSSF 2.6 **Municipal Services.** Continue to consolidate municipal services at City Hall to meet the needs of Jurupa Valley citizens.

Program

CSSF 2.1.1 Evaluate Municipal Services. Allocate municipal resources to evaluate the need, cost, and feasibility of the City assuming responsibility for providing facilities or services currently provided by other agencies.

3. Police Services

One of the primary benefits of the City's incorporation in 2011 was to achieve enhanced police services. The Riverside County Sheriff's Department provides police services in Jurupa Valley and throughout much of Riverside County. The department is the second largest Sheriff's Office in California and includes ten stations, five correctional facilities and other facilities. Sheriff services are provided to Jurupa Valley through a contract with the City from the Jurupa Valley Sheriff's station located at 7477 Mission Boulevard. The station also serves the cities of Norco, Eastvale, and several unincorporated areas of the County and is led by a commander who serves as the Police Chief for the area.

As of 2017, the Jurupa Valley Sheriff's Station responds to approximately 35,000 total calls per year. Calls are broken down by priority level. Priority 1 calls are urgent calls that involve a threat to human life or property and have the potential for serious injury. Priority 2 calls involve circumstances that are urgent but not life threatening. Priority 3 and Priority 4 calls involve non-urgent nor life threatening issues. The Department's 2015 response times for Priority 1 and Priority 2 calls within the service area of the Jurupa Valley Sheriff's Station are shown in *Table 8.1*.

Table 8.1: 2015 Police Response Times, Jurupa Valley Sheriff's Station

| Type of Emergency Call | 2015 Response Times |
|------------------------|---------------------|
| Priority 1 | 7.57 minutes |
| Priority 2 | 21.31 minutes |

Source: Captain Jason Horton, Riverside County Sheriff's Department, 2/17/16

Graffiti. The Sheriff's Department and the JCSD regularly patrol the City for graffiti to enable quick eradication and limit its proliferation. In addition, residents in Jurupa Valley are encouraged to report graffiti vandalism. The City contracts with the JCSD and the Riverside County Economic Development Agency to paint out graffiti in the City. The Sheriff's Department also actively pursues conviction of graffiti vandals in accordance with local and state laws.

Homelessness. As of January 2015, there were estimated to be 170 homeless individuals living within the City limits with 20 homeless encampments identified. A number of the encampments are

located within the Santa Ana River as well as on public and private property along SR 60 and in other areas of the City. Homelessness is associated with a number of negative issues, including crime, blight, trash, unsanitary conditions, and illegal fires. In 2014, the Sheriff's Department created a Homeless Outreach Team to identify homeless individuals, reduce the homeless population, and coordinate the delivery of resources to the homeless. The Sheriff's Department coordinates homeless outreach with a number of additional agencies including, but not limited to, the City of Jurupa Valley, the Riverside County Department of Social Services, the Probation Department, the Department of Veteran's Affairs, and the Riverside County Flood Control and Water Conservation District.

Residential Noise Complaints. Every weekend, the Sheriff's Department receives numerous complaints about noise resulting from loud parties that keep residents awake at night. Residents have expressed concerns about loud parties with amplified music that last well into the night and early morning hours and disturb the peace. The Sheriff's Department maintains a two-deputy noise unit that specifically deals with residential noise complaints and enforces the City's Noise Ordinance.

Community-Oriented Policing. The Jurupa Valley Sheriff's Department actively engages in Community-Oriented Policing, which brings together law enforcement professionals with the community in a variety of outreach efforts to reduce crime. In addition, the Department assists the City incorporate Crime Prevention through Environmental Design, or CPTED, techniques in new development. CPTED is a concept supported by law enforcement officers, city planners, designers, and other professionals to design the physical environment in ways that discourage criminal activity and increase safety. The concept is based on three principles: natural surveillance, territoriality, and access control. When incorporated into development projects, these principles serve to eliminate hiding places and enhance visibility so that law-abiding people can easily watch over the physical environment and discourage criminal activities. For example, one effective design strategy to deter crime is to design buildings and sites to maximize visibility of public areas and avoid designs that create hidden entries or site areas that are difficult to monitor or secure.

Policies

CSSF 2.7 Community Safety. Coordinate with the Riverside County Sheriff's Department on an ongoing basis to ensure the continued safety of the City.

- CSSF 2.8 **Criminal Activity.** Support efforts to develop innovative methods to reduce criminal activity and increase safety in the community.
- CSSF 2.9 **Graffiti.** Support efforts of the Sheriff’s Department, the JCSD, and the Riverside County Economic Development Agency to identify and remove graffiti and prosecute graffiti vandals.
- CSSF 2.10 **Homelessness.** Support efforts to reduce the homeless population and provide outreach services to the homeless.
- CSSF 2.11 **Residential Noise Complaints.** Discourage loud parties with amplified music in residential neighborhoods and support the Sheriff Department’s efforts to do the same.
- CSSF 2.12 **CPTED.** Incorporate CPTED principles in the design of new development to encourage natural surveillance and reduce crime.

Programs

- CSSF 2.1.2 **Planning Applications.** Route new Planning applications to the Sheriff’s Department to increase public safety and maintain close coordination with the Sheriff’s Department and law enforcement programs.

4. Fire and Emergency Medical Services

The Riverside County Fire Department, in cooperation with the California Department of Forestry and Fire Protection (CAL FIRE), provides full service municipal and wildland fire protection, emergency medical response, technical rescue services, and response to hazardous materials discharges in Jurupa Valley. The Department operates 97 fire stations throughout the County of Riverside with four of those located in Jurupa Valley, as shown in *Table 8.2*.

Table 8.2: Jurupa Valley Fire Stations

| Station Number | Name/Location | Address |
|----------------|------------------------|------------------------|
| 16 | Pedley Fire Station | 9270 Limonite Avenue |
| 17 | Glen Avon Station | 10400 San Sevaine Way |
| 18 | West Riverside Station | 7545 Mission Boulevard |
| 38 | Rubidoux Station | 5721 Mission Boulevard |

In 2015, the Department responded to 9,161 calls for service with the majority for emergency medical assistance (73%), traffic collisions (10%), and false alarms (8%) (Riverside County Fire Department 2015 Annual Report).

Policies

- CSSF 2.13 **Fire Safety Techniques.** Incorporate fire-safety techniques in new development
- CSSF 2.14 **Fire Department Review.** Involve the Fire Department in the review of development applications in fire prone areas.
- CSSF 2.15 **Coordination.** Coordinate with the Fire Marshal on fire prevention throughout the community.
- CSSF 2.16 **Adequate Facilities.** Work with the Fire Department to ensure the provision of adequate fire stations, personnel, and equipment to meet the City's needs over time.
- CSSF 2.17 **Public Education.** Support efforts to educate the public about fire safety and prevention.

5. Educational Facilities

A well-educated population is essential to maintain and enhance the City's overall quality of life and economic vitality. Educated citizens are more likely to participate in youth programs, community-based volunteer organizations, and civic affairs. In a very real sense, these citizens form the foundation of what it means to be a "community." Local schools strengthen and support the City's social fabric and are leaders in maintaining an educated and informed citizenry.

Two school districts provide public educational services in Jurupa Valley. They are the Jurupa Unified School District (JUSD) and the Corona-Norco Unified School District (CNUSD). JUSD serves most of Jurupa Valley as well as a small portion of Eastvale west of I-15. The District's Benita B. Roberts Education Center is located at 4850 Pedley Road. Named after a former JUSD Superintendent, the Center contains district offices and the Board of Education meeting room. The District operates 16 elementary schools, 3 middle schools, and 3 high schools in Jurupa Valley. Total student enrollment as of 2015 was 19,465.

CNUSD serves students living in the southwestern area of Jurupa Valley, as well as students living in the cities of Corona, Norco, and Eastvale, and portions of unincorporated Riverside County. The CNUSD Education Center is located in the City of Norco. The District operates one school in the City of Jurupa Valley: VanderMolen Fundamental Elementary School located at 6744 Carnelian Street. Older students living in this area attend River Heights Intermediate School and Roosevelt High School, both of which are located in Eastvale. Students may also request a transfer to other schools.

During the General Plan preparation process, the GPAC identified several issues related to schools. Community members pointed out

Figure 8-14: Jurupa Valley High School

that schools should ideally be community centers and serve as focal points where the community comes together for education, recreation, and other activities. The GPAC also identified the need to modernize and remodel several additional schools within JUSD and to provide a community college, occupational training institute, or similar facility. In addition, as most students walk, bike, or are driven to schools, community members identified the need to ensure the safety of travel routes to schools.

There are currently no institutions of higher education in Jurupa Valley. The closest facilities within Riverside County are Norco College, Riverside City College, and the University of California, Riverside. The GPAC stated a strong desire to build a satellite college campus and/or trade school in Jurupa Valley, and to provide other venues offering adult education.

Policies

- CSSF 2.18 **Coordination with School Districts.** Coordinate with JUSD and CNUSD in planning for the current and future needs of Jurupa Valley students.
- CSSF 2.19 **Modernization.** Encourage efforts of JUSD to modernize and renovate schools within the district.
- CSSF 2.20 **Safe Routes to School.** Work with the school districts to ensure the safety of travel routes to and from schools.
- CSSF 2.21 **Schools as Neighborhood Centers.** Develop new schools, as needed, that also serve as neighborhood centers and that are pedestrian- and bicyclist-friendly.
- CSSF 2.22 **Joint Use.** Encourage school districts to allow joint use of schools for after-school sports, classes, childcare, or other uses to maximize the community value of these important public investments.
- CSSF 2.23 **Review of Development Proposals.** Involve the school districts in the review of large residential development proposals to ensure that adequate schools are provided without affecting existing facilities.
- CSSF 2.24 **Higher Education.** Encourage institutions of higher education, and other adult education providers, to locate facilities and programs in Jurupa Valley.
- CSSF 2.25 **Vocational and Trade Schools.** Encourage and accommodate to the greatest extent possible the development and location of vocational and trade schools to broaden the local pool of skilled and technical workers.

Program

CSSF 2.1.4 **Incentivize Advanced Educational Opportunities.**

Review the Zoning Ordinance to identify potential zones, locations, development incentives, and requirements for advanced educational and occupational training schools and similar facilities. Make this information available to potential applicants, real estate and development professionals, marketing and construction firms, and local school districts.

6. Libraries

Libraries are sources of lifelong learning and enrichment. Jurupa Valley's public libraries provide free access to collections of books and media in a wide range of subjects, titles and formats. In so doing, they provide the community with universal access to resources that are integral for education, leisure, personal growth, health, skill building, and vocational training. As community centers, libraries can also foster social interaction, community involvement, and lifelong learning for residents of all ages.

The Riverside County Library System provides library services in Jurupa Valley and throughout Riverside County. Overall, the Library System operates 35 libraries and 2 bookmobiles. Library facilities in Jurupa Valley include the Glen Avon Library located at 9244 Galena Street and the Rubidoux Library located at 5840 Mission Boulevard. The GPAC stressed the importance of Jurupa Valley's libraries and their desire to provide additional libraries in underserved areas of the City such as the western quadrant of the City. They also expressed a desire to develop libraries as focal points of the community with good access to pedestrian and bicycle routes, and public transit.

Figure 8-15: School Library, Jurupa Valley

Policies

CSSF 2.26 **Provide Adequate Facilities.** Work with the Riverside County Library System to provide adequate facilities and services for the current and future population of Jurupa Valley and to promote and use the libraries for community meetings and events.

CSSF 2.27 **New Libraries.** Encourage the development of new libraries in underserved areas of the city.

CSSF 2.28 **Libraries as Community Centers.** Design new library facilities as community centers with access to pedestrian and bicycle routes as well as public transit.

CSSF 2.29 **Educational Programming.** Encourage the County of Riverside to provide reading and literacy programs and

other educational programs at the local library branch or via other means for those who cannot visit library facilities.

CSSF 2.30 **Funding.** Encourage County of Riverside efforts to provide adequate funding for improvements to local library facilities and programs through county, state, and federal funding, private and corporate donations, or other resources.

CSSF 2.31 **Technology.** Encourage the adoption of technological advances that can provide improved access to library resources.

7. Parks and Recreation

Figure 8-16: "The Cove" Waterpark, Jurupa Valley

Parks, sports fields, trails, recreation facilities, special events, and programs are at the core of Jurupa Valley's quality of life and provide residents with a healthy alternative to the built environment. Jurupa Valley's active and passive parks, recreational facilities, and programs reflect the City's our local culture and unique history, and benefit residents and local businesses by promoting health and wellness, nurturing the City's agricultural/equestrian heritage, and fostering community interaction and pride. Recreational facilities help define who we are as a community and serve as gathering spaces for celebration, sport, and relaxation. In describing the Community's values, the GPAC emphasized the importance of recreation in residents' lives:

***Active Outdoor Life.** Many Jurupa Valley residents were drawn here because of the City's unique outdoor setting and the recreation opportunities it offers. Our parks and recreation facilities are essential to maintain and improve our health and quality of life. We place high value on our public parks, sports fields, pedestrian and equestrian trails and support facilities, golf courses, outdoor use areas, historic sites and nature centers, campgrounds, and airport and joint use school facilities.*

In Jurupa Valley, parks and recreation facilities and programs are provided primarily by the Jurupa Area Recreation and Park District (JARPD). Similar facilities and programs are provided by the Jurupa Community Services District in the western edge of the City and the Riverside County Regional Parks and Open Space District. Additional playground and sports field areas are made available to the public through joint use agreements with the Jurupa Unified School District.

Figure 8-17: Jurupa Area Recreation and Parks District ("JARPD") Parks

The JARPD offers a diverse range of parks, playgrounds, greenbelts, trails, and recreation facilities. *Figure 8-18* shows the locations of Jurupa Valley area parks managed by multiple agencies. JARPD owns and maintains over 125 acres of parkland, 173 acres of undeveloped parks and open space, and about 23 acres of trails, Citywide. *Figure 8-19* (page [8-37](#)) summarizes the JARPD's recreation facilities and acreages.

The Riverside County Regional Park and Open Space District operates several important recreation facilities in Jurupa Valley that are available to all residents. These are:

- A. **Jurupa Area Recreation and Park District Parks.** Formed in 1984, the Jurupa Area Recreation and Park District (JARPD) provides parks and recreational facilities for Jurupa Valley. The District offices are located at 4810 Pedley Road and offers a wide variety of year-round recreational programs and opportunities at 10 facilities throughout the Jurupa area.
- B. **The Louis Robidoux Nature Center.** The Center is located at 5370 Riverview, in the heart of the Community of Rubidoux area, about 2 miles southeast of Limonite Avenue. Named after a Frenchman born in St. Louis, Missouri in 1796, the Louis Robidoux Nature Center provides educational programs and tours for the public and school groups on a variety of natural history topics, including Native American history, native plants and animals, astronomy, the environment, and local history.

DRAFT

△ Undeveloped

△ Temporarily Closed

★ Splash Pad Open Memorial Day weekend through Labor Day

Figure 8-19: List of JARPD Facilities and Parks

C. **Rancho Jurupa Regional Sports Park.** Located at 5249 Crestmore Road, the Rancho Jurupa Regional Sports Park provides 32 acres of well-maintained, natural, and synthetic turf fields. It comprises four large marked and lighted synthetic turf fields, two large natural turf fields, plus nine smaller natural turf fields, with a plaza with picnic shelters, restrooms, a snack bar, and two playgrounds. The Park provides individual, team, and group play facilities year around.

D. **Rancho Jurupa Park and Campground.** Located at 4800 Crestmore Road, Rancho Jurupa Park and Campground is a 200-acre regional park and serves as a popular destination for local campers and anglers as well as out-of-town visitors. The Park offers 140 camping sites, 5 cabins, and two 3-acre lakes. Rancho Jurupa Park offers many amenities, including a “splash pad” for water play, rock climbing, picnic areas, children’s playgrounds, miniature golf and a disc golf course, and fishing.

E. **Historic Crestmore Manor.** The historic Crestmore Manor, located at 4600 Crestmore Road, is a 10,830-square-foot colonial-style mansion built in the mid-1950s by W.W. “Tiny” Naylor, a restaurateur, and the state’s second-leading thoroughbred horse breeder of the time. The Manor, a California Historical Landmark, is owned by the Riverside County Regional Park and Open-Space District and is available for community, group, or individual events, such as meetings, festivals, shows, weddings, receptions, parties, and other special events, and can accommodate up to 400 guests.

F. **The Cove Waterpark.** Located at 4310 Camino Real, The Cove is operated by the County of Riverside Park and Open-Space District and was developed in partnership with the Economic Development Agency and the Jurupa Unified School District. Also called the Jurupa Aquatic Center, the facility consists of 7.5 acres with a waterpark and a competition sports pool. The Caribbean-themed waterpark consists of children’s activity pool and splash playground, river rafting, a water slide, a wave machine for surfing, a multi-purpose room, restrooms and lockers, a picnic area, and concessions.

In cooperation with community services districts, the County of Riverside, the Jurupa Unified School District, and other agencies, the City helps meet the diverse recreation needs of existing and new residents by requiring the dedication and improvement of new parks and recreation facilities as a condition of new development. The City also promotes recreation and healthy exercise by providing equestrian, bicycle, and walking paths within the public right of way and by requiring new residential neighborhoods to include

pedestrian and equestrian paths, where appropriate. In California, local governments play a critical role in the effort to set aside parkland and open space for recreational purposes. Under the California State Quimby Act (*California Government Code §66477*), local governments can adopt ordinances requiring developers to set aside land, donate conservation easements, or pay fees for park improvements. Generally, the parkland dedication standard is 5 acres of parkland per 1,000 new residents. The Jurupa Area Recreation and Park District uses a standard parkland dedication requirement 5 acres per 1,000 new residents. Frequently, developers choose to pay fees “in lieu” of actually providing parkland. The fees are set by the local agency and are equivalent to the value of the parkland dedication required. Special districts must work with cities to receive parkland dedications or in-lieu fees inasmuch as only cities and counties have the authority to tie such requirements to new development project entitlements.

As a young city, Jurupa Valley faces special challenges in meeting existing parks and recreation needs. Residents in some communities, such as Pedley, Mira Loma, and Glen Avon, are largely built out but remain underserved in terms of neighborhood-oriented park and recreation facilities. In addition, park administration and maintenance through multiple agencies can pose difficulties in meeting growing and/or changing park and recreation needs. In its new role as a city, Jurupa Valley seeks to play a more direct role in ensuring that residents’ park and recreation needs are met and in adopting the goals and standards to help improve and expand residents’ access to parks, playgrounds, trails, recreation facilities, and open space.

Policies

- CSSF 2.32 **Evaluation of User Needs.** Encourage park and recreation service providers to evaluate user feedback, track facility use, and utilize projections to understand park and recreation facility needs and plan for future acquisition and development.
- CSSF 2.33 **Park and Recreation Facilities Maintenance.** Encourage park and recreation service providers to maintain parks, trails, and other recreation facilities in good condition and strive to meet Council-adopted community parks and recreation goals.
- CSSF 2.34 **Joint Use Agreements.** Maintain and improve joint-use recreational agreements with school districts and public agencies and seek new opportunities for joint recreational uses.

- CSSF 2.35 **Universal Access.** Encourage responsible agencies to provide, where feasible, inclusive recreation facilities that meet or exceed accepted standards for universal access for all persons and abilities, and encourage others to do likewise.
- CSSF 2.36 **Users.** Encourage responsible agencies to provide parks and recreation facilities and programs that meet the needs of all residents, regardless of income levels, ages, and abilities, and encourage others to do likewise.
- CSSF 2.37 **Historic Sites.** Celebrate historic sites with recreational learning opportunities in parks and recreation facilities.
- CSSF 2.38 **Natural Environment.** Protect and, where possible, utilize parks, trails, and open spaces for learning opportunities and passive recreation in conjunction with our environmental goals.
- CSSF 2.39 **Street Closures/Public Spaces.** Support temporary and, where safe and appropriate, long-term street closures to create or expand public spaces and to accommodate street fairs, farmers' markets, art shows, and other special community events.
- CSSF 2.40 **Equestrian Heritage.** Work with community groups to encourage, promote, and as resources allow, help support projects that celebrate the City's equestrian heritage, such as trails, staging areas, hitching posts, corrals, exercise areas, and performance arena.

Program

- CSSF 2.1.5 **Master Plan.** In cooperation with JARPD, County of Riverside, JCSD, and other responsible agencies, prepare and adopt a Joint Recreational Opportunities and Open Space Master Plan that identifies priorities for park expansion, acquisition, improvement, and funding. The Plan will be adopted within 2 years of General Plan adoption and updated at least every 10 years.

8. Social Services

Riverside County provides a variety of public assistance programs in Jurupa Valley. The County's Department of Public Social Services (DPSS) operates several offices in the region including an office in Jurupa Valley located at 5961 Mission Boulevard. The Jurupa Valley office offers a number of programs to assist City residents become self-sufficient. Services include the California Work Opportunity and Responsibility to Kids program, or CalWORKS, which provides temporary financial assistance to eligible families with minor children who have lost or had a reduction in their income. Other

services include Medi-Cal, which provides no-cost or low-cost health care coverage for eligible participants, and CalFresh/SNAP, which provides healthy food for needy families. Riverside County also has other services and facilities located in Jurupa Valley, including the Youth Center and Fleet Services in Rubidoux, and the Transportation Facility in Glen Avon.

Policies

CSSF 2.42 **Social Services.** Support Riverside County to assist Jurupa Valley residents with social services and other programs.

9. Water

Jurupa Valley is fortunate that it does not rely on imported water to provide its domestic needs. Instead, it relies on local groundwater from the Chino and Riverside Groundwater Basins. Three agencies provide water to the City of Jurupa Valley. They are the Jurupa Community Services District, the Rubidoux Community Services District, and the Santa Ana River Water Company. These agencies rely on groundwater supplies for both “potable” and “non-potable” water. Potable water is that which is drinkable and fit for human consumption. Non-potable water contains chemicals or other contaminants that make the water unhealthy for humans and animals, but that with proper treatment, may be used for irrigation, manufacturing, and other purposes. Imported water is used by other agencies to recharge local groundwater supplies.

Although local groundwater supplies are forecast to meet Jurupa Valley’s water needs for the foreseeable future, ongoing drought conditions in California have severely impacted water supplies and the ability of water purveyors to meet various water demands. In response, water purveyors throughout California, including Jurupa Valley’s local community services districts, have implemented emergency water conservation regulations to eliminate or reduce water-wasting practices and to conserve precious water resources on an on-going basis.

Figure 8-20: Water desalter plant, Jurupa Valley (Press-Enterprise)

Policies

CSSF 2.43 **Grey Water Systems.** Facilitate the utilization of grey water systems.

CSSF 2.44 **Drought-Tolerant Landscaping.** Require the use of drought-tolerant landscaping in all new development.

CSSF 2.45 **Reclaimed Water.** Encourage the development and use of reclaimed water for landscape irrigation and other uses.

- CSSF 2.46 **Public Education.** Support public education efforts to promote water conservation throughout the community.
- CSSF 2.47 **Water Storage.** Encourage local water purveyors to expand local domestic water storage and recycling capabilities.
- CSSF 2.48 **Public Education/Outreach.** Continue providing education and community outreach on water conservation options and methods.
- CSSF 2.49 **Water Conservation Ordinance.** Implement and enforce the City's Landscape Water Conservation ordinance.
- CSSF 2.50 **Water Conservation.** Make use of state-of-the-art water conservation technology in all City facilities and landscaping, and require new developments to include drought-tolerant landscaping and water-saving systems and fixtures.

Programs

- CSSF 2.1.6 **Urban Water Management Plan.** Work with local water purveyors to prepare a unified Urban Water Management Plan for Jurupa Valley and to ensure that the Plan is updated as needed.
- CSSF 2.1.7 **Alternative Water Resources.** Explore the feasibility of desalinization and other regional projects as additional sources of local water.

10. Wastewater

Figure 8-21: Water Treatment Facility, Rubidoux Community Services District

The Jurupa Community Services District and the Rubidoux Community Services District provide wastewater service to most of Jurupa Valley. However, some areas in the City, particularly in Old Mira Loma and Sky Country, still rely on private septic systems. The community services districts collect and distribute wastewater through a system of pipes, mains, lift stations, force mains, and pump stations. Wastewater is transported to two nearby municipal wastewater treatment plants. The Riverside Water Quality Control Plant is located in, and operated by, the City of Riverside. The Western Riverside County Regional Wastewater Authority (WRCRWA) operates the Western Riverside County Regional Wastewater Treatment Plant, which is located in the City of Corona. As of 2017, both treatment plants were undergoing expansion projects to serve future population growth.

The two treatment plants treat the majority of wastewater to very clean tertiary levels, which can then be discharged into the Santa

Ana River. In addition, some of the wastewater is treated to recycled, or reclaimed, levels for irrigation purposes. The use of reclaimed water for irrigation has several environmental benefits including reducing the demand for potable (drinkable) water for landscaping, reducing the amount of groundwater withdrawal, and increasing the quality of groundwater supplies by reducing outflow.

Salty water produced through groundwater extraction and through commercial and industrial processes is transported to the Santa Ana Watershed Project Authority's (SAWPA) Inland Empire Brine Line, which runs through Jurupa Valley. The Brine Line helps to maintain the water quality of the Santa Ana River Watershed by reducing the salt content of water that percolates into the groundwater basin.

Policies

- CSSF 2.51 **Adequate Wastewater Conveyance.** Work with the Jurupa Community Services District and the Rubidoux Community Services District to ensure sufficient wastewater conveyance and pumping capacity to meet the existing and future needs of the City.
- CSSF 2.52 **Septic Systems.** Work with the Jurupa Community Services District to convert areas of the City relying on septic systems to municipal wastewater service.
- CSSF 2.53 **Recycled Water.** Encourage the continued production and expansion of recycled water for irrigation and other purposes.
- CSSF 2.54 **Wastewater Treatment Capacity.** Encourage efforts of the City of Riverside and the Western Riverside County Regional Wastewater Authority (WRCRWA) to provide adequate wastewater treatment capacity to serve the existing and future needs of the City.
- CSSF 2.55 **Fair-Share Costs.** Require new development to contribute fair-share costs for the provision of wastewater infrastructure and treatment.
- CSSF 2.56 **Brine Line.** Support the continued maintenance and use of the Inland Empire Brine Line to transport salty wastewater to the ocean and maintain the quality of the Santa Ana River Watershed.

Figure 8-22: Flood levee along Santa Ana River in Jurupa Valley

11. Storm Water

The Riverside County Flood Control and Water Conservation District serves as the regional flood management agency for western Riverside County. It was formed in 1945 largely in response to the devastating floods of 1938, which destroyed most of the bridges across the Santa Ana River including the Van Buren Bridge. The District provides flood protection including the identification of flood hazards, the regulation of floodplains, watercourse and drainage planning, and the design, construction, and maintenance of flood control facilities. The District operates a series of storm drains and channels throughout Jurupa Valley that collect runoff water and ultimately direct it to the Santa Ana River. As shown in **Error! Reference source not found.**, a levee was built along portions of the Santa Ana River to prevent reoccurrence of catastrophic flooding.

As runoff enters the storm drain system, it collects trash, debris, and pollutants, which ultimately make their way to the Santa Ana River. The Flood Control and Water Conservation District, Jurupa Valley, and other permittees along the Santa Ana River are regulated by the Environmental Protection Agency's (EPA) National Pollutant Discharge Elimination System (NPDES) as well as a Municipal Separate Storm Sewer System (MS4) Permit issued by the Santa Ana Regional Water Quality Control Board. These regulations require the agencies to implement storm water management techniques to reduce the amount of pollutants entering the storm water system.

During preparation of the General Plan, the GPAC addressed issues of flooding and storm water. The GPAC generally agreed that storm water facilities in Jurupa Valley are adequate, except in some areas where flooding occurs, such as Old Mira Loma. In addition, a recurring theme among GPAC members was the desire to utilize property along flood control channels and creeks for walking, bicycling, and potentially even equestrian travel. These facilities crisscross the community and offer unimpeded routes to the Santa Ana River. While flood control, pollution prevention, and safety are paramount with these facilities, the potential for additional community use should be explored.

Policies

CSSF 2.57 Adequate Facilities. Work with the Riverside County Flood Control and Water Conservation District to develop and maintain adequate flood control facilities to reduce the potential for flooding and protect the quality of the Santa Ana River and other natural drainage courses.

CSSF 2.58 **New Development.** Require new development to implement on-site measures to clean and contain storm water runoff.

CSSF 2.59 **Public Education.** Support public education and other efforts to inform the community about the hazards of runoff pollution.

Program

CSSF 2.1.8 **Multi-Modal Trails.** Develop a multi-agency program with the Riverside County Flood Control and Water Conservation District, the Jurupa Area Recreation and Park District, and the City for the use of flood control channels and associated maintenance and accessways for pedestrian, bicycle, and equestrian trails.

12. Solid Waste Disposal

Waste and recycling disposal in Jurupa Valley is provided by private companies. Residential, commercial, and industrial subscription services are provided as well as specialized services such as dumpsters, construction containers, and neighborhood clean-up events. Trash from Jurupa Valley is transported to the Agua Mansa Transfer Station and Material Recovery Facility at 1830 Agua Mansa Road. From there, recyclable materials are transferred to third-party providers, and waste materials are transported to various landfills in Riverside County. Community members may drop off waste, recycling, and bulk items at the Agua Mansa Station. Residents may also request collection of hazardous household wastes such as petroleum products, garden chemicals, and paint up to one time per year.

The semi-rural nature of many areas of the City has attracted individuals and businesses to dispose of unwanted items or construction materials along local roadways and vacant lots. This practice creates a blight and must be prevented to maintain the quality of life desired by those who live and work in the community. In addition to strict enforcement of anti-dumping regulations, a program is needed to facilitate the proper means of disposing of solid waste. Such a program could include free pick up on certain days several times per year or establishing small local disposal stations in key locations in the community.

Figure 8-23: Residential waste and recycle bins

Policies

CSSF 2.60 **Solid Waste Services.** Work with private disposal companies to ensure the continued provision of adequate solid waste and recycling services in Jurupa

Valley, including the availability of adequate landfill capacity to meet the City's future needs.

- CSSF 2.61 **Waste Reduction.** Encourage the diversion of waste from landfills through reduction, reuse, and recycling efforts.
- CSSF 2.62 **Waste Management.** Encourage new development to employ construction waste management techniques to divert construction materials and debris away from landfills.
- CSSF 2.63 **Public Education.** Encourage and, as resources allow, support public education efforts to inform the public about waste reduction, reuse, and recycling.
- CSSF 2.64 **Neighborhood Clean-Up Efforts.** Sponsor and/or participate in neighborhood clean-up efforts.
- CSSF 2.65 **Commercial Recycling.** Expand mandatory recycling for commercial customers consistent with state requirements.
- CSSF 2.66 **Rubberized Asphalt.** Consider using rubberized asphalt and recycled aggregate for City street projects, as appropriate.
- CSSF 2.67 **Waste Diversion.** Achieve at least the minimum construction and demolition waste diversion requirement of 75%.
- CSSF 2.67 **Litter and Recycling Containers.** Place public litter and recycling containers at key locations in the public right of way, as resources allow. Encourage other responsible agencies and service districts to do likewise.
- CSSF 2.68 **Illegal Dumping.** Strictly enforce the laws and ordinances against illegal dumping along streets and highways or vacant private property, and establish convenient alternatives for local residents and businesses.

###

9 – ENVIRONMENTAL JUSTICE ELEMENT

Figure 9-1: Ensuring a community that is a healthy place for all residents is the goal of the Environmental Justice Element

A. INTRODUCTION

Environmental Justice is a concept that seeks to minimize and equalize the effects of environmental hazards among all people regardless of race, ethnicity, or income level. In Jurupa Valley, the issue of Environmental Justice has gained momentum partly as a result of litigation challenging the approval of industrial development by the County of Riverside prior to the City's incorporation near a low-income residential neighborhood. This Element seeks to address environmental justice through a set of comprehensive goals, policies, and programs aimed at increasing the influence of target populations in the public decision-making process and reducing their exposure to environmental hazards. The Element will be used by the Jurupa Valley City Council and the Planning Commission, other boards, commissions and agencies, developers, and the public in planning for the physical development of the City.

The Environmental Justice Element is an optional element of the General Plan. As outlined in the California General Plan Guidelines, environmental justice is a subject that should be addressed in the General Plan either through integration into the seven mandatory elements of the plan, or as an optional element. The City has elected to emphasize the importance of ensuring environmental equity for disadvantaged persons in Jurupa Valley through adoption of a separate Environmental Justice Element. The Element was adopted in advance of the City's first General Plan and was awarded the California Chapter of the American Planning Association's 2015 Advancing Diversity and Social Change in Honor of Paul Davidoff

Award of Merit. In bestowing this prestigious award to the City, the organization acknowledged Jurupa Valley’s commitment to ensuring the inclusion of all persons in the public decision-making process. The importance of environmental justice to Jurupa Valley residents is reflected in the City’s Community Values Statement:

Environmental Justice. *We value the health, well-being, safety, and livability of all our communities and strive to distribute public benefits and resources equitably. We endeavor to enhance underserved communities so that all residents can thrive and share in a high quality of life.*

Primary Goal

Ensure environmental equity for all persons, regardless of race, color, national origin, or income, and establish and maintain an open and inclusionary public decision-making process.

Policy and Program Sections

1. *Meaningful Public Input and Capacity Building*
2. *Land Use and the Environment*
3. *Mobility and Active Living*
4. *Healthy and Affordable Housing*

B. BACKGROUND

Environmental Justice Defined

The *California Government Code* (§65040.12) defines Environmental Justice as “The fair treatment and meaningful participation of people of all races, culture, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.” Environmental justice policies and laws have been established to ensure that all people, regardless of race, color, national origin, or income, have equal protection from environmental hazards where they live, work and play. Furthermore, all people should have the equal ability to participate in, and influence, the decision-making process regarding environmental regulations.

Figure 9-2: Jurupa Valley's setting and location provide challenges and opportunities as the community strives to ensure environmental justice for its residents.

Figure 9-3: The Environmental Justice Element includes policies that promote environmental equity.

CCAIEJ and the Mira Loma Settlement

The Center for Community Action and Environmental Justice (CCAIEJ) is an environmental health and justice organization that has been working in the San Bernardino-Riverside County region for over three decades. CCAIEJ focuses on land use, air quality, and respiratory health in the low-income communities of color in the City of Jurupa Valley and the Westside area of San Bernardino. In 2011, the CCAIEJ filed a lawsuit against the County of Riverside, the City of Jurupa Valley, and others challenging approval of the 1.1-million-square-foot Mira Loma Industrial/Warehouse Project. The lawsuit contended that the project violated the California Environmental Quality Act (CEQA) by failing to mitigate its environmental effects on Mira Loma Village, a single-family residential neighborhood.

A settlement was reached and the City and project applicant agreed to implement a variety of mitigation measures, including instituting an air quality monitoring program, installing air filtration systems in nearby homes, and conducting hearings to consider adoption of a restricted truck route. In addition, the settlement called for the preparation and consideration of an Environmental Justice Element of the General Plan. By creating a standalone element that addresses environmental justice, the City has established policies to promote a healthier community for all.

Land Use and Transportation

The arrangement of land use and transportation can affect the healthfulness of an area because it affects exposure to environmental hazards, accessibility to daily needs, and the ability to be physically active. Existing land uses in Jurupa Valley include residential, commercial, industrial, agricultural, and open space uses. The City includes nine distinct communities ranging from the community of Rubidoux, the largest and most densely developed area with a variety of land uses, to Mira Loma, which is predominantly industrial north of Bellegrave Avenue, with large lot semi-rural residential development south of Bellegrave Avenue. In general, historic land use patterns led to the development of well-balanced communities with a separation of incompatible uses. However, some environmental justice issues have also been created, such as the proximity of residential development to freeways and industrial uses as outlined below.

Figure 9-4: The proximity of major air pollution sources such as Interstate 15 poses health risks to many Jurupa Valley residents.

The 2017 General Plan Land Use Element outlines the land use plan for the City. The Plan includes 22 land use designations and 11 land use overlays and was developed based on sound planning practices such as preserving rural and equestrian uses and open space, concentrating employment uses along major transportation

corridors, and the creation of Village Centers. The Jurupa Valley Zoning Map and Ordinance contain detailed development regulations to implement the policies in the Land Use Element.

The City's circulation system, and its network of highways, streets, trails, and sidewalks, influences the environmental health of an area, and is further described in the 2017 General Plan Mobility Element. Inadequate circulation can make it difficult for residents to access daily needs that influence their health, such as grocery stores and healthcare facilities. Likewise, the lack of transportation choices and reliance on the automobile mean that alternative modes of transportation are harder to use, which can contribute to the lack of physical activity.

Environmental Justice Communities

As outlined by CalEnviroScreen¹, environmental justice communities are those areas of a city "that have higher pollution burdens and vulnerabilities than other areas, and therefore are most in need of assistance." Environmental justice communities can be defined both by characteristics of the population and the pollution burden they bear. Characteristics of the population include the number of people most vulnerable to pollution, i.e. "sensitive receptors" (children, pregnant women, the sick, and the elderly), and their socioeconomic status, such as poverty level and unemployment status. Social factors that may also contribute to increased environmental vulnerabilities include a lack of access to fresh food, a lack of park and recreation opportunities, as well as an overabundance of liquor stores and fast food facilities.

Pollution burden is measured by the presence of direct environmental threats (i.e., proximity to a toxic cleanup site) as well as exposure to other toxics such as air and water pollution. A number of resources are available to help identify environmental justice communities, such as CalEnviroScreen and the Environmental Justice Screening Model (EJSM). Using multiple environmental "indicators," these resources scientifically determine what areas of the City face disproportionate environmental burdens. The City Planning Department maintains a current map of environmental justice communities in Jurupa Valley. By identifying these areas, the City can work to mitigate existing adverse conditions and ensure that new development does not affect vulnerable populations.

¹ State of California, Office of Environmental Health Hazard Assessment (OEHHA), Draft California Community Environmental Health Screening Tool 2.0 (CalEnviroScreen 2.0), April 2014.

Demographics

The City of Jurupa Valley is a majority-minority area, meaning that Non-Hispanic Whites make up less than 50% of the population. Sixty-six percent of its residents are Hispanic or Latino, 4% are African American, 3% are Asian, and 2% are American Indian/Alaska Native, Hawaiian, and Pacific Islander, two or more races, or some other race (see *Table 2.1*).

There are 26,874 total housing units in the City (2015) with the majority (77%) being single-family, detached homes. The average number of persons per household is 3.86, and most working residents are employed in the transportation and warehousing, retail trade, manufacturing, education, or construction industries. Jurupa Valley residents have a lower per capita and household income than the County of Riverside and the State of California, as shown in *Table 2.2*. Approximately 16% of Jurupa Valley residents live below the poverty level. For more information on Jurupa Valley's demographics and housing, refer to the 2017 General Plan Housing Element.

Table 9.1: Jurupa Valley Racial and Ethnic Population – 2013

| | Number | Percent |
|-------------------------------|--------|---------|
| African American | 3,890 | 4.0% |
| Asian | 2,723 | 2.8% |
| American Indian/Alaska Native | 194 | 0.2% |
| Hawaiian and Pacific Islander | 97 | 0.1% |
| Some Other Races | 194 | 0.2% |
| Two or More Races | 1,264 | 1.3% |
| Hispanic (can be of any race) | 62,182 | 66.0% |
| Total | 97,246 | 100% |

Air Quality

As outlined in the 2017 General Plan Air Quality Element, the Inland Empire, including the City of Jurupa Valley, has some of the worst air pollution in the State, primarily due to land use patterns, weather systems, and topography. Prior to the 1970s, the area was a major agricultural center. Agricultural uses declined over time as

land was converted to residential, industrial, and commercial development. The concentration of many highways and railroads has made the Inland Empire a major shipping hub, and many manufacturing companies have located their distribution facilities in the area. Trucks and rail lines accessing these facilities generate increased levels of diesel emissions. In addition, the prevailing wind pattern of sea breezes from throughout Southern California blowing east brings emissions from cars, trucks, ports, construction equipment, power plants, and refineries, which are blocked by the San Bernardino Mountains and tend to concentrate over the Inland Empire. This issue is further compounded as the pollution mixes with oxygen in the presence of sunlight to form ozone.

Discriminating State Tax Allocation Policies

The City of Jurupa Valley was incorporated in 2011 after a group of unincorporated communities came together to form a city to assert their right to govern themselves and preserve their lifestyle. They sought meaningful opportunities to participate in the governmental actions that would mitigate land use impacts in this predominantly low-income, minority area. However, at the same time the City was incorporating, the State was modifying the tax allocation formulas to divert motor vehicle license fees away from cities. This had a disproportional impact on new cities like Jurupa Valley, which relied more heavily on motor vehicle license fees than established cities with other sources of revenue. Faced with an anticipated budgetary shortfall, the City began the disincorporation process while still working with State legislators to restore needed funding. The City is pursuing alternate funding strategies to maintain and fund cityhood and is no longer considering disincorporation. However, the diversion of funding has threatened to deny this low-income minority community of what other cities take for granted—the right to govern themselves, take control of land use decisions, and implement the principles of environmental justice.

Figure 9-5: The Inland Empire's topography, concentration of industrial and distribution facilities, and transportation networks often contribute to poor air quality.

C. KEY FINDINGS AND RECOMMENDATIONS

Environmental Justice Issue Areas

The manner in which the City of Jurupa Valley has developed over time presents some key environmental justice issues, as outlined below.

New Residential Development Adjacent to Freeways

Two major freeways run through or border the City of Jurupa Valley. The I-15 freeway is adjacent to approximately 200 acres of land

between 68th Street and Bellegrave Avenue that is zoned for residential use. Other residentially zoned vacant land exists adjacent to SR 60, including the 200-acre Emerald Meadow site in Rubidoux. Motor vehicle emissions along freeways and other high traffic roads generate carbon monoxide, nitrogen oxides, particulate matter, and hydrocarbons that react in sunlight to form ozone. According to the California Air Resources Board (ARB), living close to freeways and other high traffic roads can increase the incidence of respiratory diseases and other adverse health effects. In addition, a 2002 University of Southern California Children's Health Study found that Mira Loma children had the weakest lung capacity and the slowest lung growth of all children studied in Southern California due to diesel exhaust. This element provides policies to reduce the exposure of residents to traffic-related pollution.

Mira Loma Village

Figure 9-6: The Mira Loma Village neighborhood is surrounded by industrial land.

Mira Loma Village is a 101-unit single-family residential neighborhood located on the east side of Etiwanda Avenue, near the junction of SR 60 and I-15 and a rail line. As outlined above, the area was the subject of a legal settlement associated with new industrial facilities approved by the County of Riverside in the area. The neighborhood comprises mostly low-income, Hispanic residents and is located close to existing and planned warehousing and distribution facilities. Numerous diesel trucks travel in and through the area to access the warehousing and distribution center, which generates diesel emissions in the area. Diesel emissions generate gases and fine particulate matter that have been proven to have serious health risks, particularly in the young.

Other Industrial Zoned Land Adjacent to Residential Neighborhoods

Numerous other properties are zoned for industrial uses in close proximity to existing residential neighborhoods. In particular, the large area north of the SR 60 freeway and east of Rubidoux Boulevard in Belltown, and a large area south of Jurupa Road and easterly of Van Buren Boulevard have industrially and residentially zoned land in close proximity. Other sites that could impact residential neighborhoods include approximately 60 acres on the west side of Clay Street, south of Limonite, the old Belltown Borrow Pit between 24th and 26th streets northwest of Hall Avenue, and various sites in the Glen Avon community. This element provides goals, policies, and programs to reduce the exposure of residents to diesel emissions from industrial development.

Stringfellow Remediation Site

Located in Pyrite Canyon in north-central Jurupa Valley, the Stringfellow Remediation Site includes toxic property that is undergoing long-term remediation. The site was originally a rock quarry that was converted to a toxic waste dump in 1956. During its 16 years of operation, more than 34 million gallons of caustics, metals, solvents, and pesticide residue were dumped into the unlined pits at Stringfellow. Throughout the years, the pollutants leached into the groundwater and overflowed into Pyrite Creek thereby contaminating soil, groundwater, and surface water. The site was designated a Superfund clean-up site in 1983 and has been undergoing clean up and remediation since then. As of 2017, the California Department of Toxic Substances Control is constructing a new, larger treatment facility that will remain in operation until the site is fully remediated.

Figure 9-7: Ongoing remediation of the Stringfellow Acid Pits has helped reduce the impacts of prior ground and water contamination.

D. ENVIRONMENTAL JUSTICE GOALS, POLICIES, AND PROGRAMS

Goals

To be a City that supports and achieves environmental justice by ensuring:

- EJ 1 An open and transparent public process that improves the quality of life relative to a cleaner and healthier environment.
- EJ 2 Meaningful participation in the public process by all members of the community.
- EJ 3 A reduction in disproportionate environmental burdens affecting low-income and minority populations.
- EJ 4 Increased mobility and accessibility for all residents.
- EJ 5 Healthy and affordable housing opportunities for all segments of the community.

Figure 9-8: Public engagement activities can go far beyond traditional meetings to include festivals, cultural fairs and community-specific events.

Policies and Programs

EJ 1 – Meaningful Public Input and Capacity Building

Disadvantaged members of the community often do not have a meaningful voice in decisions that affect their environment. The causes of this are many, including cultural and language barriers, the lack of information, inadequate training, lack of exposure to the decision-making process, and officials who are not informed about issues of concern for those members of the community. The Environmental Protection Agency (EPA) identifies community capacity building as efforts to engage disadvantaged populations to help them better identify and meet the needs of their areas. It includes building on existing skills, providing education on issues and processes, and helping disadvantaged persons communicate effectively in the public realm. At the individual level, capacity building focuses on the development of conditions that allow individual participants to build and enhance existing knowledge and skills and engage in public processes. At the City level, capacity building refers to ensuring the municipal organization is responsive and accountable to all stakeholders and that officials are informed about issues of concern for those neighborhoods.

Policies

- EJ 1.1 **Public Participation.** Ensure that affected residents have the opportunity to participate in decisions that affect their health.
- EJ 1.2 **Facilitate Community Involvement.** Facilitate the involvement of residents, businesses, and organizations in all aspects of the planning process.
- EJ 1.3 **Culturally Appropriate Approaches.** Utilize culturally appropriate approaches to public participation and involvement.
- EJ 1.4 **Public Meetings.** Schedule public meetings on key issues affecting the public at times and locations most convenient to community members.
- EJ 1.5 **Communication Techniques.** Utilize a variety of communication techniques and social media tools to convey information to the public.
- EJ 1.6 **Translation Services.** Provide translation and interpretation services at public meetings on issues affecting populations whose primary language is not English. Translation time should not be taken from the person's time limit for comments.

- EJ 1.7 **Public Awareness.** Support efforts to raise the public's awareness of the importance of a healthy environment and physical activity.
- EJ 1.8 **Education.** Educate decision makers and the public on the principles of environmental justice.
- EJ 1.9 **Tribal Consultation.** Consult with Native American Tribes early in the process on issues that could affect culturally significant areas.
- EJ 1.10 **Agency Collaboration.** Collaborate with and among public agencies to leverage resources, avoid duplication of effort, and enhance the effectiveness of public participation.
- EJ 1.11 **Environmental Screening.** Identify those areas of the City most vulnerable to environmental hazards through CalEnviroScreen, the Environmental Justice Screening Model (EJSM), or other model.

Program

- EJ 1.1.1 **Alternative Funding Strategies.** Pursue alternate funding strategies to maintain the financial stability of Jurupa Valley so as to enable the City to implement the principles of environmental justice described in this Element.

EJ 2 – Land Use and the Environment

This section addresses environmental hazards, as well as land use planning to ensure that disadvantaged or minority communities are not adversely affected by new development where they live, work, and play. Additionally, policies that address how to improve or retrofit existing hazards are included. In addition to air emissions from commercial and industrial development, the resultant commercial truck trips from such development can also generate traffic, noise, odors, light and glare, which can adversely affect residential populations.

Policies

Figure 9-9: Participatory events and workshops are useful to help educate and share ideas on environmental justice in the community.

Figure 9-10: Providing adequate vegetative buffers between residential properties and features such as rail lines can mitigate negative visual and environmental conditions.

- EJ 2.1 **Separation of Land Uses.** Require that proposals for new sensitive land uses are located adequate distances from freeways and major roadways based on an analysis of physical and meteorological conditions at the project site.
- EJ 2.2 **Sensitive Land Use Buffers.** Require that proposals for new sensitive land uses incorporate adequate setbacks, barriers, landscaping, or other measures as necessary to minimize air quality impacts.
- EJ 2.3 **School Buffers.** Provide adequate buffers between schools and industrial facilities and transportation corridors.
- EJ 2.4 **Stationary Source Emissions.** Require, wherever possible, existing sources of stationary emissions near sensitive land uses to relocate and/or incorporate measures to minimize emissions.
- EJ 2.5 **Residential Buffers.** Require that zoning regulations provide adequate separation and buffering of residential and industrial uses.
- EJ 2.6 **Mitigate Air Quality.** Identify resources for the existing sensitive receptors experiencing adverse air quality issues to incorporate measures to improve air quality such as separation/setbacks, landscaping, barriers, ventilation systems, air filters/cleaners, and other measures.
- EJ 2.7 **Latest Technologies.** Give preference in approving commercial and industrial development to those projects that incorporate the latest technologies to reduce diesel emissions.
- EJ 2.8 **Separation of Uses.** Build new sensitive land uses with sufficient buffering from industrial facilities and uses that pose a significant hazard to human health and safety. The California ARB recommends that sensitive land uses be located at least 1,000 feet from hazardous industrial facilities.
- EJ 2.9 **Access to Decision-making Process.** Ensure that low income and minority populations have equal access and influence in the land use decision-making process through such methods as bilingual notices, posting bilingual notices at development sites, and conducting public information meetings with interpreters.
- EJ 2.10 **Information Dissemination.** Ensure that low-income and minority populations understand the potential for adverse pollution, noise, odor, vibration, and lighting and

glare when new commercial and industrial developments are proposed.

- EJ 2.11 **Toxic Emissions.** Ensure that low-income and minority populations understand the effect of projects that may use or generate toxic materials or emissions.
- EJ 2.12 **Public Outreach.** Initiate outreach efforts as early as possible in the decision-making process before significant resources have been invested in a particular outcome.
- EJ 2.13 **Healthy Needs Assessment.** Consider the health needs of projects with sensitive receptors through a healthy needs assessment, the Healthy Development Measurement Tool (HDMT), or other tool.
- EJ 2.14 **Truck Idling.** Seek the necessary funding and resources to enforce the statewide idling limit of five minutes for heavy-duty diesel vehicles with a Gross Vehicle Weight Rating (GVWR) of 10,000 pounds or more.
- EJ 2.15 **Noise Reduction.** Request that transportation agencies incorporate noise reduction technologies when planning facilities near homes and other sensitive receptors.
- EJ 2.16 **Noise Mitigation.** Support traffic and highway techniques and technologies that reduce noise impacts of vehicular traffic through traffic calming, noise barriers, pavement design, and other measures.
- EJ 2.17 **Brownfield Sites.** Promote the remediation and reuse of contaminated brownfield sites within the City, with priority given to those near environmental justice populations.
- EJ 2.18 **Energy Efficiency.** Support programs to promote the use of energy efficiency products and renewable energy systems.
- EJ 2.19 **Green Building Techniques.** Encourage public and private development to incorporate green building techniques, such as construction waste management practices, optimization of energy efficiency measures, and avoidance of toxic chemicals.
- EJ 2.20 **Vehicle Fleet.** Monitor and maintain City facilities and the City's vehicle fleet to maximize energy efficiency and reduce emissions.

Programs

- EJ 2.1.1 **Truck Routes.** Designate truck routes to avoid residential areas including low-income and minority neighborhoods.
- EJ 2.1.2 **Training.** Provide staff and City officials training on the principles and methods of comprehensive public

Figure 9-11: Recreation is a core component of a healthy, active lifestyle for area youth.

participation. Guidelines for how to conduct staff/official training are contained in the Cal/EPA Environmental Justice Advisory Committee Recommendations.

EJ 3 – Mobility and Active Living

Mobility is a critical issue in bringing equity to disadvantaged persons and communities. These communities often lack access to needed resources, such as schools, health clinics, and healthy food outlets. Disadvantaged communities are more likely to rely on public transportation than their more affluent neighbors are, but are often located in areas with limited transit service. Increased mobility options will provide critical links and opportunities for active living. For more information on mobility options and community-wide access facilities for all persons, refer to the 2016 General Plan Mobility Element.

Policies

- EJ 3.1 **Location of Housing.** Locate medium- and high-density housing near jobs, transit, shopping, schools, and other needed facilities.
- EJ 3.2 **Access.** Increase access to shopping, jobs, and healthcare facilities for low-income and minority populations.
- EJ 3.3 **Balanced Transportation.** Balance walking, bicycling, and transit use with automobile use.
- EJ 3.4 **Facilities and Services.** Plan for the equitable distribution of public facilities and services, prioritizing new facilities in traditionally underserved areas.
- EJ 3.5 **Transit Routes.** Encourage transit providers to establish and maintain routes to jobs, shopping, schools, parks, and healthcare facilities that are convenient to low-income and minority populations.
- EJ 3.6 **Traffic Calming.** Implement traffic calming measures such as pop-outs and road narrowing to slow down traffic, and improve pedestrian and bicycle safety.
- EJ 3.7 **Walking and Bicycling.** Explore measures to encourage walking and bicycling in the City as part of daily physical activities.
- EJ 3.8 **Alternative Modes of Transportation.** Promote the use of alternative modes of transportation.
- EJ 3.9 **Shuttle Systems.** Support public and/or private shuttle systems to transport residents to grocery stores and other sources of healthy food.

Figure 9-12: Amenities such as the bike trail along the Santa Ana River encourage healthy activity and alternative transportation modes.

- EJ 3.10 **Safe Routes to School.** Work with local school districts to ensure that all schools have safe and walkable routes to school.
- EJ 3.11 **Bicycle Facilities.** Require new commercial and industrial development to provide bicycle facilities on-site.
- EJ 3.12 **Healthy Living.** Support the efforts of Healthy Jurupa Valley and others to promote active living and healthy choices.
- EJ 3.13 **Joint Use.** Work with local school districts to provide the joint use of school properties for neighborhood parks and recreation centers.
- EJ 3.14 **Open Space Access.** Increase access to urban parks, green space, and natural environments for traditionally underserved communities.
- EJ 3.15 **Public Parks.** Provide a variety of active and passive parks and recreational activities accessible to all residents of Jurupa Valley.
- EJ 3.16 **Private Recreational Facilities.** Encourage the private and non-profit sectors to provide recreational opportunities in the City.
- EJ 3.17 **Emergency Preparedness.** Ensure that emergency preparedness and disaster response programs serve all parts of the City.

Figure 9-13: Community gardens can engage, educate, and nourish neighborhoods.

EJ 4 – Healthy and Affordable Housing

A major emphasis of environmental justice is ensuring that people have a healthy home environment. According to the National Human Activity Pattern Survey, Americans spend 70% of the time in their homes. Low-income and minority populations are disproportionately affected by home health hazards, as their limited incomes reduce housing choices and their options for maintenance and repairs. Housing-related environmental hazards include exposure to indoor air pollution, lead-based paint, asbestos, mold, and mildew. These toxins can cause developmental delays, asthma, allergies, and other health risks. Ensuring that all residents have access to healthy homes is an important way to achieve environmental justice. For more information on housing choice and affordability, refer to the 2017 General Plan Housing Element.

Figure 9-14: Affordable housing projects are particularly beneficial to families who face challenges in finding safe and desirable places to live.

Policies

- EJ 4.1 **Affordable Housing.** Ensure that proposed new affordable housing projects meet the same standards of health and safety as conventional market rate housing.
- EJ 4.2 **Air Pollution.** Require new housing proposals in areas subject to unhealthful air quality to incorporate setbacks, barriers, landscaping, ventilation systems, or other measures to ensure that air pollution does not affect the residents.
- EJ 4.3 **Housing Rehabilitation.** Promote efforts to repair, improve, and rehabilitate substandard housing.
- EJ 4.4 **Contaminants.** Support the efforts of responsible public agencies to develop and implement programs to remediate lead-based paint and other contaminants in residential structures.
- EJ 4.5 **Applicant Responsibilities.** Require applicants of residential remodel and rehabilitation projects to remediate lead-based paint, mold and mildew, and any other structural hazards.
- EJ 4.6 **Code Enforcement.** Prioritize enforcement activities of residential structures with known health hazards.
- EJ 4.7 **Affordable Housing Incentives.** Incentivize affordable housing through permit streamlining and financial incentives.
- EJ 4.8 **Homeownership.** Support programs to provide rental and homeownership assistance to low-income persons.
- EJ 4.9 **Community/Private Gardens.** Ensure that regulations allow community and private gardens where residents can grow healthy fruits and vegetables.

###

DRAFT

10 – HEALTHY COMMUNITIES ELEMENT

Figure 10-1: Second tee, Jurupa Hills Country Club

A. INTRODUCTION

The Healthy Communities Element establishes goals and policies to help improve quality of life and foster healthy behavior and lifestyles, translating the General Plan vision for a robust Jurupa Valley into reality. The General Plan Advisory Committee (GPAC) placed a strong emphasis on opportunities for residents to improve their physical and mental well-being while meeting daily needs, as stated in the adopted Community Values Statement:

Healthy Communities. *We have a comprehensive view of health. We enhance existing opportunities for healthy living and create new ones by helping residents to make the healthy choice the easy choice. The health and well-being of all individuals, families, neighborhoods, and businesses is our shared value and concern. We take positive steps to maintain a clean, visually attractive City, to improve Jurupa Valley's physical, social, and environmental health, and to share and teach these values to achieve and sustain a healthy, clean, and safe environment for current and future generations.*

Our immediate environment—including physical, social, and cultural factors—directly affects human health and well-being. Convenient access to healthy foods, recreation, and medical services is essential for a healthy population. Appropriate land use and design policies can promote strong neighborhoods that, in turn, help create safe, harmonious communities.

The Healthy Communities Element is an optional section of the General Plan. It emphasizes the City's commitment to improving and maintaining the health of our community. In addressing community design, access, and overall health, the element works

closely with the Land Use, Mobility, and Environmental Justice Elements of the General Plan, as well as other elements.

Primary Goal

To be a City that, through its public policies and municipal actions, promotes and maintains a health-giving quality of life, where fresh food options, health care services and recreational opportunities are readily available to all residents.

Goals and Policy Sections

1. *Overall Health*
2. *Access to Healthy Foods and Nutrition*
3. *Health Care Facilities and Services*
4. *Land Use and Mobility*
5. *Social Interaction and Community Participation*
6. *Urban Forestry*

B. BACKGROUND

According to the Centers for Disease Control (CDC)², evidence increasingly shows that built environments influence chronic, or ongoing, diseases as well as infectious diseases. Infectious diseases may receive the most publicity, but the real and continually growing threat to community health is chronic disease. Diseases and poor health conditions reduce the productivity and quality of life of Jurupa Valley residents throughout their daily routines. Daily routines are those encounters in homes, neighborhoods, and

²Centers for Disease Control and Prevention—Division of Community Health. A Practitioner’s Guide for Advancing Health Equity. Community Strategies for Preventing Chronic Disease. Atlanta, GA: US Department of Health and Human Services, 2013.

Figure 10-2: Community health fair

streets that surround and connect residents to their jobs, retail outlets, daily activities, and each other. Being physically inactive, eating poorly, breathing poor quality air, and having stress or depression may not immediately result in poor health; but data shows that over a number of years, these risks are associated with the leading causes of death and illness in our communities.

According to the CDC, the current leading causes of death are: 1) heart disease, 2) cancer, and 3) stroke, with heart disease strongly linked to lifestyle and individual behavior. It is of particular concern that Riverside County ranks 53rd out of 58 California counties, indicating a much higher than normal incidence of heart disease³. Other illnesses like diabetes, asthma, and lung disease are also related to the direct and indirect effects of built environments that discourage physical activity, promote unhealthy eating habits, and increase exposure to environmental toxins in the air, water, and soil.

According to the County of Riverside Department of Public Health (DOPH), Jurupa Valley residents have a higher rate of chronic diseases, such as cardiovascular disease, obesity, and diabetes, than the national average. Studies show that on average, Jurupa Valley residents are less active than their Riverside County neighbors. Due to its inland location and the prevalence of warehousing, shipping, and industrial uses near housing, Jurupa Valley residents have concerns about the potential health effects of poor air quality. In December of 2013, Healthy Jurupa Valley (HJV) was formally established as part of the National Healthy Cities movement to improve the health and quality of life of the City's residents. HJV is a collaborative effort between the City of Jurupa

³County of Riverside Department of Public Health (DOPH) 2014 Annual Report.

Figure 10-3: Equestrians on the Santa Ana River Trail

Valley and Reach Out, a nonprofit agency working to improve the quality of life for area residents. Since its inception, HJV and community leaders have worked to raise awareness of health issues, increase access to healthy foods, and promote healthy living.

As part of its effort to promote healthy living, the City of Jurupa Valley is collaborating with the Jurupa Area Recreation and Park District (JARPD) to create an integrated, multi-purpose trails network to encourage walking, jogging, horseback riding, and off-road bicycle use. Pedestrian and bicycle paths are addressed in the Mobility Element and in the City's Bicycle and Pedestrian Master Plan. In addition, DOPH has sponsored various classes and community workshops countywide, and provided information on important topics such as obesity, physical activity levels, access to healthy foods, inequities in parkland and facilities, vehicle crash data, and pedestrian injuries. HJV is also working on creating walking corridors and programs throughout Jurupa Valley, including Safe Routes to School programs to improve safety and walkability around local schools.

C. HEALTHY COMMUNITIES GOALS, POLICIES, AND PROGRAMS

The Healthy Communities Element addresses Jurupa Valley's key health issues and challenges with a commitment to help citizens preserve and enhance their health and make positive lifestyle choices. Key topics are Overall Health; Access to Healthy Foods and Nutrition; Health Care Facilities and Services; Land Use and Mobility; Social Interaction and Community Participation; and, Urban Forestry. Special emphasis is placed on those residents who may be especially vulnerable to public health risks, such as children, the elderly, the disabled, and the poor.

Goals

To be a City that:

- HC 1 Fosters physical activity, social interaction, and access to healthy food and medical care.
- HC 2 Is known for its healthy lifestyle and commitment to preserving and improving residents' quality of life.
- HC 3 Has readily accessible high quality, fresh foods, and convenient health services.
- HC 4 Allows residents to easily choose to engage in healthy activities and lifestyles, and where health and wellness considerations help guide City decision-making.

- HC 5 Supports sustainable, health-supporting land uses and activities, such as farmers' markets, food cooperatives, fruit trees in public places, and residential vegetable gardens.

Policies and Programs

HC 1 – Overall Health

Policies

- HC 1.1 **Land Use Decisions.** Give priority to the overall health and well-being of residents in City land use decisions and City actions, particularly in terms of their effects on the most vulnerable populations, such as children, persons living at or below poverty level, disabled persons, and seniors.
- HC 1.2 **Public Information.** Promote an understanding of the connections between the built environment and the ongoing health challenges in Jurupa Valley and encourage other agencies to do likewise.
- HC 1.3 **Volunteer Efforts.** Encourage the efforts of Healthy Jurupa Valley and other volunteers, agencies, and organizations working to improve the overall health of City residents.

Programs

- HC 1.1.1 **Health Events.** Sponsor special City health events, Mayor's Walks, and similar activities to raise resident awareness of health programs and to promote healthy neighborhood activities, such as cleanup days and bike rodeos.
- HC 1.1.2 **Public Health Information.** Collaborate with local health providers to provide public health information, programs and events at local community centers, parks, food markets, and other public places.

HC 2 – Access to Healthy Foods and Nutrition

Good health requires a state of physical, mental, and social well-being. It is widely documented that a healthy lifestyle includes the need for a varied, healthy diet. According to the Riverside County DOPH, poor diets for many Jurupa Valley residents increase risks for several major chronic health issues. It is estimated that 80% of teens, 50% of adults, and 50% of children do not eat the daily-recommended five fruits and vegetables. The GPAC identified access to healthy foods as an issue of primary importance and expressed a desire for more full-service grocery stores in the City. In addition, the committee pointed out that the majority of the

Figure 10-4: Garden to table – part of a healthy diet

City's restaurants are fast-food outlets with limited healthy food options. The GPAC stressed the need for farmers' markets, more and diverse food options, and a greater variety of full-service restaurants with healthy food options.

Studies have shown that communities without access to sources of fresh, healthy, and affordable food have higher obesity rates⁴. Low-income and underserved communities often have less access to stores that sell healthy foods, especially high-quality fruits and vegetables. In addition to retail markets, farm and garden-scale urban agriculture provides excellent opportunities and benefits for public health, including encouraging residents to produce and purchase fresh products and engage in healthy activities. This type of urban agriculture also helps create safe, healthy, and green environments and can include the reuse of otherwise vacant or underutilized land.

Policies

- HC 2.1 **More Grocery Store Options.** Encourage the development of additional full-service grocery stores, especially in underserved areas.
- HC 2.2 **Farmers' Markets.** Attract farmers' markets offering fresh food options to operate in the City on a regular basis.
- HC 2.3 **Food Cooperatives.** Encourage the development and maintenance of community food cooperatives and community gardens.
- HC 2.4 **Restaurant Options.** Encourage full-service restaurants offering a variety of healthy food choices to locate within the City.
- HC 2.5 **Education Programs.** Encourage school and adult education programs that provide opportunities to learn about healthy eating, cooking, gardening, composting, and selling locally grown produce.
- HC 2.6 **Healthy Food Choices.** Encourage the availability of healthy food choices in local schools, public buildings, facilities, and parks and at City-sponsored events.

Programs

- HC 2.1.1 **Zoning for Local Food Outlets.** Encourage the development of healthy food outlets, small neighborhood markets, farmers' markets, and food cooperatives in

⁴Liese AD, Weis KE, Pluto D, Smith E, Lawson A. Food store types, availability, and cost of foods in a rural environment. *Journal of American Dietetic Association*, 2007.

residential zones by adopting flexible zoning standards to allow such uses where appropriate.

- HC 2.1.2 **Community Gardens.** Identify and inventory potential community garden/urban farm sites on existing parks, utility easements and rights of way, and prioritize site use as community gardens in appropriate locations.
- HC 2.1.3 **Grant Funding.** Seek grant funding and innovative public-private partnerships, where feasible, to increase residents' access to healthy foods and opportunities for physical activity, especially in underserved areas.

HC 3 – Health Care Facilities and Services

Access to affordable health care is important to the overall health of the community. It enables health care professionals to reach underserved residents, educate patients about healthy living, prevent disease by identifying early warning signs, and address illnesses at earlier, more treatable, stages. The lack of medical facilities in a community can cause residents to travel long distances for needed health care, or not to access it at all. The GPAC identified the lack of health care facilities as a critical issue and cited the need for a full-service hospital and urgent care facilities, as well as medical offices and other facilities.

Figure 10-5: Community garden

Policies

- HC 3.1 **Accessible Health Care.** Encourage the development of a wide range of accessible health care facilities and services, including mental health facilities, to meet the diverse needs of the City.
- HC 3.2 **Public Transit.** Encourage public transit agencies to locate routes near health care facilities.
- HC 3.3 **Health Fairs.** Promote local health service providers' participation in community-wide health fairs and similar events.
- HC 3.4 **Health Care Services.** Encourage and, as resources allow, participate with nonprofit health organizations to provide no- or low-cost health care services on a regular basis, as resources allow.

Figure 10-6: Urgent care center, Jurupa Valley

HC 4 – Land Use and Mobility

The overall design of a city includes an arrangement of land uses that provide for the basic needs of individuals, including food, shelter, and safety. Jurupa Valley is diverse; it has nine distinct communities that differ in terms of character, density, uses, and scale. There are also large areas of open space that include significant natural resources and recreational opportunities. As the City continues to grow, it is important to maintain open space and create land use patterns that contribute to a healthy environment, as described below.

1. Land Use Planning

Land use is discussed in detail in the Land Use Element. The Healthy Communities Element addresses land use as it relates to community health. The arrangement and design of land uses, together with transportation systems, can have a positive or negative effect on health outcomes. For example, separating residential land uses from retail commercial and services without having a variety of transportation options increases residents' dependence on the use of private automobiles. This, in turn, reduces residents' ability to incorporate physical activity into daily activities and can have negative health outcomes. In addition, increasing reliance on the private automobile contributes to pollution, which can also adversely affect individual and community-wide health and quality of life.

Planning for healthy communities involves designing neighborhoods so that residents can shop, run errands, recreate, and get to work by walking, biking, riding a horse, or taking public transit. This can be accomplished in a variety of ways, such as providing a diversity of housing options, ensuring that goods, services, and public and private recreational facilities are available near housing, and providing safe and accessible pedestrian, equestrian, and bicycle paths between land uses. In this manner, residents are more likely to walk, bike, or ride to where they need to go, which in turn increases their level of physical activity and overall health. These concepts make the healthy choice the easy choice.

Policies

- HC 4.1 **Housing Location.** Locate housing near shopping, services, and recreational facilities to allow residents to access daily needs and services by walking, riding a bike or a horse, or using public transit.
- HC 4.2 **Housing Variety.** Provide for a range of housing options to accommodate a full range of income levels and household types.

- HC 4.3 **Higher Density Housing.** Encourage higher density residential development near existing and proposed high-use transit centers and major transit corridors.
- HC 4.4 **Compact Development Patterns.** Promote increased physical activity, reduced driving, and increased walking, cycling, and public transit use by requiring, where appropriate, the development of compact development patterns that are pedestrian- and bicycle-friendly.
- HC 4.5 **Neighborhoods.** Support healthy aging in place and childhood development by promoting safe streets to accommodate a wide range of housing types and affordability within neighborhoods.
- HC 4.6 **Connectivity.** Interconnect neighborhoods with safe, well designed, and regularly maintained walking, equestrian, and/or biking trails and sidewalks, where appropriate, consistent with the City's Bicycle and Pedestrian Master Plan.
- HC 4.7 **Neighborhood-Serving Development.** Locate compact, neighborhood-serving development that provides healthy foods or essential services within walking or biking distance from residential neighborhoods, schools, and parks.
- HC 4.8 **Trails.** Encourage use of public trails and work with civic organizations, community groups, youth groups, homeowner associations, regional and state agencies and nonprofit organizations to improve, expand, and maintain the trail network.
- HC 4.9 **Streetscape Amenities.** Require new development to include streetscape amenities such as sidewalks that are separated from the roadway by landscaping and parkways with street trees, trails, hitching posts (where appropriate), pedestrian waiting shelters, and other features that enhance safety, walkability, neighborhood appeal, and help commercial neighborhoods stay clean, safe and attractive.

Programs

- HC 4.1.1 **Neighborhood Markets.** Amend the Zoning Ordinance to allow small, neighborhood-serving markets within easy walking and biking distance from most residential areas, and encourage such markets to include fruits, vegetables, and other healthy foods.
- HC 4.1.2 **Bicycle and Pedestrian Master Plan.** Implement the Bicycle and Pedestrian Master Plan and allocate a portion of the annual City budget, as resources allow, to

Figure 10-7: Granite Hills Elementary School garden project

complete bike and sidewalk projects that infill public sidewalk gaps and provide connectivity.

HC 4.1.3 **Community Gardens.** Amend the Zoning Ordinance to allow the development of community gardens throughout the City.

HC 4.1.4 **Compatible Agriculture.** Amend the Zoning Ordinance to allow compatible agriculture uses in Residential, Commercial, and Public zones.

2. Traffic Calming

A critical component of designing healthy and walkable neighborhoods is ensuring that local travel routes are safe and enjoyable to pedestrians, bicyclists, equestrians, and transit riders. By their very nature, most sidewalks and trails in Jurupa Valley are located along public roads that can carry heavy traffic volumes, particularly at peak periods. The Mobility Element addresses the co-location and design of transportation facilities. This element focuses on how to “calm” traffic in these areas to make the experience safer and more enjoyable. Traffic calming relates to identifying unsafe conditions and implementing measures to slow down vehicles and increase safety and accessibility for all modes of transportation. Potential measures include reducing speed limits, restriping roads, narrowing road widths, and installing rumble bars or heavily textured paving. To help achieve traffic calming, the City intends to implement these policies and programs:

Policies

HC 4.10 **Municipal Actions.** Place a high priority on land use decisions and municipal actions that reduce or avoid traffic safety issues and promote traffic calming.

Programs

HC 4.1.5 **Risk Reduction.** Pursue grants and other funding for projects that reduce the risk of pedestrian/vehicle collisions and equestrian/vehicle interactions, particularly in areas where there are frequent incidents.

HC 4.1.6 **Traffic Calming.** Implement traffic calming and traffic-slowing measures on roads with a high level of pedestrian and non-motorized vehicle activity.

HC 4.1.7 **Safety Features.** Incorporate non-motorized safety features within road improvement projects, as resources allow.

HC 4.1.8 **Equestrian Crossings.** Provide special accommodations for equestrians at crossings where trails and roads intersect.

3. Safe Routes to Schools

Jurupa Valley values the health of all its residents, but particularly of its children. One way to promote healthy living is to encourage children to walk or bike to school. However, in many communities, roads, schools, and neighborhoods have developed in ways that make it difficult, unsafe, or impossible for children to get to school by foot or bicycle. Safe Routes to School initiatives bring together residents, schools, and local governments to make it safe, fun, and convenient to walk and bike to school. Safe Routes to School programs look at conditions around schools and develop programs to improve safety and accessibility. Programs may include physical improvements, such as installing traffic lights and crosswalks, as well as educational programs to inform students and drivers how to travel safely around schools.

Policies

- HC 4.11 **City Decisions and Actions.** Place a high priority on land use decisions and municipal actions that reduce or avoid traffic safety issues and that promote traffic calming.
- HC 4.12 **Development Approvals.** Consult with local school districts to determine the routes to schools that will serve new development, and ensure the routes are free of hazards or unsafe conditions when approving new residential development.
- HC 4.13 **Coordination with School Districts.** Work with local school districts to ensure the safety of all walking and biking routes to schools within the City.
- HC 4.14 **School Safety.** Encourage local school districts to educate parents and students about pedestrian and bicycle safety in and around schools.
- HC 4.15 **Development Features.** Require new residential development to include design features, such as sidewalks, decorative crosswalks, and bulbouts, bike paths and bike racks, to promote walking and biking to schools.
- HC 4.16 **Community Events.** Help sponsor and support active transportation events, such as Walk and Bike to School Days, to raise awareness of safe walking and biking practices.

4. Recreational Opportunities

The Jurupa Valley General Plan includes goals and policies to preserve the rural equestrian lifestyle that is an integral part of the City's character and appeal. The plan includes a multi-use trails network, including parks as destination points that promote recreation and physical activity throughout the City, incorporating special attention to the equestrian community and areas within the Equestrian Lifestyle Protection Overlay. With the prevalence of obesity on the rise, incorporating physical activity into daily routines helps reduce the health risks from obesity and other leading chronic diseases.

Providing recreational facilities to serve residents throughout their lives requires a range of facilities for all ages and abilities. A range of recreational centers, daycare centers, senior centers, schools, and other facilities is needed to support the overall well-being of residents. Community facilities and schools support physical activity, civic life, and social connections for residents of all ages and interests, and facilitate improved health on a community-wide level.

Policies

- HC 4.17 **Recreational Access.** Ensure that residents of all ages, abilities, and income levels have access to convenient and safe opportunities for recreation and physical activities.
- HC 4.18 **Parks.** Encourage the expansion of existing parks with needed facilities and amenities, and encourage the construction of new parks and open spaces located near homes and offices in collaboration with the special districts that provide recreation and parks.
- HC 4.19 **Recreation Centers.** Encourage the development of recreational centers to provide activities and services for all phases of life (e.g., children, families, and senior citizens) in collaboration with the special districts that provide recreation and parks.
- HC 4.20 **Concurrent Park Development.** Require that development of parks, trails, and open space facilities occur concurrently with new development consistent with City and outside agency requirements and, when feasible, that they are located near other community facilities such as schools, senior centers, and recreation centers.
- HC 4.21 **Multi-Use Features.** Incorporate design features into the multi-use trail and park network that reflect the unique equestrian characteristics of the community.

- HC 4.22 **Safety Features.** Address actual and perceived safety concerns that create barriers to physical activity by requiring adequate lighting, street visibility, and defensible space.
- HC 4.23 **Easements.** Coordinate with public entities to allow easements to be used as parks and trails.
- HC 4.24 **Regional Trails.** Ensure that regional trail plans are implemented at the development plan and Specific Plan level.
- HC 4.25 **Joint Use.** Encourage collaboration with schools and other agencies to optimize resources and public facilities through joint use agreements.

HC 5 – Social Interaction and Community Participation

A complete, healthy community involves the creation of “a sense of place”—features, events, and qualities that make a place unique and memorable. One important ingredient of sense of place is the establishment of gathering places for residents to meet, learn, and socialize. Communities that have cultural activities, the arts, social networking, civic engagement, personal recreation, and other activities that create social bonds between individuals and groups are healthier and provide a higher quality of life for all residents. Studies show that community involvement and social connectedness improve cardiovascular and mental health and can speed recovery from illnesses⁵. As articulated by the GPAC, Jurupa Valley seeks to attract clubs, arts, cultural and educational facilities, and services to produce a thriving social, cultural, and artistic environment that supports social interaction and participation for residents of all abilities and ages.

Figure 10-8: Multi-use urban trail

Policies

- HC 5.1 **Community Centers.** Support the development of public and private neighborhood centers with social, artistic, cultural, and educational facilities and services.
- HC 5.2 **New Development.** Encourage new development to incorporate social, artistic, cultural, and educational facilities, and services into the project design, where appropriate.

⁵Centers for Disease Control and Prevention. *Healthy places: social capital* [online]. Nov 16, 2009.

Figure 10-9: Public Art in Jurupa Valley
(Courtesy of Christine Chavez, artist)

HC 5.3 **Community Partnerships.** Facilitate partnerships among local groups and organizations that promote civic and cultural programs, promote community identity, and enhance neighborhood pride.

HC 5.4 **Public Art.** Encourage the creation of public art throughout the City, and preserve and increase access to cultural resources.

HC 6 – Urban Forestry

A prevalent theme throughout GPAC meetings was urban forestry and the value of trees. Urban forestry refers to planning for, and managing, trees in the urban environment. GPAC members addressed the desire to maintain existing trees, replace trees when lost, and plant more trees to enhance the aesthetic quality and healthfulness of the City. Trees contribute to the health of a community by improving air and water quality, reducing temperatures, providing shade and habitat, and reducing erosion and runoff. Trees also provide aesthetic beauty and have calming qualities. Planting and maintaining trees helps a city become more sustainable and reduces the negative effects of development on the environment.

When discussing trees, it is important to consider the availability and consumption of water. As a semi-arid area with limited rainfall and frequent periods of drought, Jurupa Valley needs to manage its water resources carefully. In general, native trees and other drought-resistant plants that require less water should be prioritized over those that consume greater amounts. After a growing-in period, many trees need minimal watering while greatly contributing to the quality and character of the City.

Policies

HC 6.1 **Urban Forest/Trees.** Support best practices in the planting and maintenance of trees in the public realm to improve air quality and reduce “heat island” effects due to reflected heat from hardscape and urban uses.

HC 6.2 **Low Water Requirements.** Prioritize and strategically plant trees in the public right of way that have low water requirements and are well adapted to the City's semi-arid climate, especially California native species.

HC 6.3 **Landscape Improvements.** Strive to incorporate existing mature trees and native vegetation into existing and new development, particularly expansive parking lots.

HC 6.4 **Historically Significant Trees.** Require that historically significant trees be preserved, wherever possible.

- HC 6.5 **Trees on Public Land.** Prohibit private citizens from removing or severely trimming trees that are located in public rights of way, parks, athletic fields, and other public land that is adjacent to private property.
- HC 6.6 **Partnerships.** Partner with federal, state, regional, and local governmental agencies, community nonprofits, and civic and youth groups to plant and maintain trees within the City.

Programs

- HC 6.1.1 **Street Tree Master Plan.** Prepare a Street Tree Master Plan to address tree preservation, planting, and maintenance.
- HC 6.1.2 **Pilot “Edible Landscape” Program.** Establish a pilot Community Living Gardens program in cooperation with volunteer groups and other agencies; identify viable community garden sites, and consider the feasibility of planting fruit trees in local parks, parkways, and on publicly controlled parties.

Figure 10-10: Canopy street trees

###

DRAFT

11– ECONOMIC SUSTAINABILITY ELEMENT

A. INTRODUCTION

The Economic Sustainability Element sets goals and policies to guide decisions that affect the local economy and the City’s fiscal health. It also expands upon Land Use Element goals and policies by addressing how to grow and sustain the local economy. The element’s main purpose is to enhance and preserve our prosperity and quality of life, consistent with the City’s Community Values Statement:

Economic and Fiscal Health. We support high quality economic growth and development that is environmentally sustainable and that fosters housing, living wage jobs, retail goods and services, public facilities and services, environmental benefits, destination tourism, and medical and educational facilities. We seek ways to be good stewards of our local assets, to make wise land use and fiscal decisions, to conduct open and accessible government, and to preserve and enhance the City’s prosperity and quality of life.

Primary Goal

Build and maintain a thriving local economy to expand employment and business opportunities, provide needed products and services, increase median income and property values, and help achieve the City of Jurupa Valley’s General Plan goals and preserve and enhance Jurupa Valley’s quality of life.

Goal and Policy Sections

1. *Economic Development and Fiscal Sustainability*
2. *Industrial Base*
3. *Retail Commercial Base*
4. *Tourism Base*
5. *Workforce Development*
6. *Special Economic Opportunity Areas*

B. BACKGROUND

The City of Jurupa Valley recognizes the importance of a sustainable economy to the City's overall health. Despite initial economic challenges, the young city has established itself as a financially sound and well-managed municipality. It has begun the important tasks of improving its services and infrastructure, strengthening its economy, and ensuring a safe, healthy, and prosperous future for its residents. Continued determination, patience and ongoing attention are needed to ensure the long-term financial stability of this "Community of Communities." From a fledgling City to a stable municipality, Jurupa Valley is poised to establish itself as an anchor in the economic health of the Inland Empire.

Setting

The City was incorporated in 2011 after a group of unincorporated communities came together to assert their right to govern themselves, improve the local economy, and preserve the area's "equestrian lifestyle." However, at the same time the City was incorporating, the State of California was modifying the tax allocation formulas to divert vehicle license fee revenue away from cities. This had an especially adverse impact on new cities like Jurupa Valley, which relied more heavily on motor vehicle license fees than established cities with other sources of revenue.

Concurrently, the state eliminated redevelopment as a tool to build tax base and counteract the effects of blight.

With a population of almost 100,000 in 2017, the City is faced with many challenging tasks that come with cityhood, including: providing police services, repairing roads that have not been maintained for decades, and coping with numerous issues that threaten the semi-rural lifestyle and that prompted incorporation. Graffiti, illegal dumping, property maintenance, and noise complaints are just a few of the ongoing needs to be met. The elimination of a significant portion of the City's tax base by the state has made it challenging to provide basic services to a largely underserved minority citizenry.

In 2015, California Senate Bill 107 was approved, which provided one-time funding to the County of Riverside in exchange for the County retiring approximately \$22 million in first year service costs to the City. By relieving the City's outstanding debt, this action enabled the City to plan for its future. Additional long-term funding is needed, however, to ensure the future financial viability of Jurupa Valley, and the City is continuing to work with its legislators to restore vehicle license fees and explore other revenue sources.

Jurupa Valley's location near the I-15, I-10, I-215, and SR 60 freeways makes it regionally accessible and ideally suited for industrial and commercial development. Businesses have easy access to the local and regional employee and customer base. However, the economy of Jurupa Valley has struggled. Warehousing and logistics have dominated the industrial base, providing low-wage jobs and scant property or sales tax revenues. Likewise, retail commercial development has been limited in terms of distribution and diversity, forcing residents to travel outside the City for needed goods and services. Most employed residents must also travel outside the City to access regional employment opportunities. Jurupa Valley needs a comprehensive economic strategy to identify how to expand its industrial and commercial base that, in turn, will benefit City residents, property owners, and businesses.

Figure 11-2: Jurupa Valley Food Fest

Socio-Economic Profile

Jurupa Valley has a large blue collar population with most employees working in the transportation, warehousing, and retail trade and manufacturing services. Unemployment rates vary widely within the City, with some communities having higher levels of unemployment (e.g., Rubidoux, Glen Avon) than county and state averages and some areas having lower levels (e.g., Pedley). The City is a net exporter of jobs, with more residents working outside the City than non-residents working inside the City. Within the next 25 years, the number of jobs within the City is projected to grow at a faster rate than the number of households (US Census Bureau Center for Economic Studies (2011); US Census Bureau (2010); ESRI (2014); Southern California Association of Governments (2010), Dun & Bradstreet, Inc. (2014)).

Housing

While tax base development focuses on commerce, including retail, dining, entertainment, services, and industrial, it is interactive with the housing market. The quality and diversity of residential neighborhoods create the basis for the local job market. To attract higher paying jobs to Jurupa Valley, residential neighborhoods that meet the needs and preferences of skilled and professional labor must be available in the community. This leads to increasing median income and, in turn, attracts the diversity of commercial and industrial development that benefits the entire community and builds tax base for the City government.

GPAC Findings and Recommendations

Members of the General Plan Advisory Committee (GPAC) discussed Jurupa Valley's economic assets, issues, and needs and identified what Committee members considered the City's main economic assets. These included: its location near freeways and job centers, existing retail centers (e.g., Vernola Marketplace), recreational amenities (e.g., golf courses, parks) and open spaces (e.g., Santa Ana River), a large supply of vacant, developable land and buildings, the historic Flabob Airport, and the City's role as a warehousing and transportation hub. The Committee considered Jurupa Valley's main economic challenges to be lack of retail shopping opportunities, lack of high paying jobs (skilled and professional), lack of hotels and visitor attractions, and urban blight, including trash, graffiti, and lack of maintenance of roads and building facades in some areas.

In discussing the City's economic needs and opportunities, the GPAC members agreed that several types of businesses or activities should be encouraged, including high-tech industries, such as

bioengineering and medical, medical centers or a hospital, and technical schools and a community college campus. Committee members also discussed “opportunity sites” that presented special development or redevelopment opportunities. The sites and possible uses discussed included: vacant land along the I-15 and SR 60 freeway corridors (hotels, restaurants, and visitor-serving uses), Emerald Meadows (shopping and mixed use), the City Hall area, Pedley near SR 60, Mission and Rubidoux Boulevards, the Riverside Cement Plant property, and the Clay Street area.

Economic Analysis

An economic analysis and implementation plan prepared by Kosmont Companies in 2015 included key socio-economic findings, market analyses, and economic development strategies. The analyses identified economic “voids,” or commercial sectors and uses in Jurupa Valley that were not meeting local demand or needs. A partial list of voids in national retailers is shown in *Figure 11-3*. The complete list is included in *Appendix 15.0*.

| National Retailer Voids (within City Limits) | | | | |

Figure 11-3: National retailer voids in Jurupa Valley (partial list)

Potential voids included clothing/apparel, casual and other restaurants, sporting goods, office supply, fitness, drug stores, dollar stores, wholesale, and others, including a listing of specific national retailers that were not represented in Jurupa Valley. Other key findings included:

- Jurupa Valley's economy is driven by a younger, largely Hispanic, and blue collar local population with strong incomes;
- City employment is concentrated within transportation, warehousing, retail trade, and manufacturing services;
- The City performs below average relative to neighboring jurisdictions in terms of taxable retail sales and capture of resident and non-resident spending (i.e., retail "leakage");
- Higher performing retail categories include grocery, electronics and appliances, and miscellaneous retail sales, while lower performing retail categories include apparel, restaurants and bars, and sporting goods.

Based on these and other findings, Kosmont recommended that the City explore the use of alternative economic tools to retain and attract businesses that meet local demand, improve the tax base, and create a potential for public-private cooperation.

C. ECONOMIC SUSTAINABILITY ELEMENT GOALS, POLICIES, AND PROGRAMS

The health and stability of Jurupa Valley's overall economy is of vital importance to the City. Key issues include Economic Development and Fiscal Stability; the Industrial Base; the Retail Commercial Base; the Tourism Base; Workforce Development; and Special Opportunities. Policies and programs for each of these topic areas are outlined below, following overall economic sustainability goals.

Goals

- ES 1 Be a stable municipal government with adequate financial resources to serve the needs of the City's residents, businesses, and property owners.
- ES 2 Achieve a sustainable industrial base that supports skilled and professional employment and contributes to the local economy, capitalizes on the City's unique attributes, and has a positive effect on residents' quality of life and environmental quality.
- ES 3 Be a City with a diversity of commercial enterprises that meet local needs.

- ES 4 Provide a wide range of visitor-serving uses, such as hotels, motels, restaurants, RV parking, commercial recreation, and other uses that appeal to tourists as well as residents.
- ES 5 Be a City with a well-trained workforce with diverse opportunities for living wage jobs.
- ES 6 Attract high quality, economically sustainable commercial, professional, and industrial uses that are well suited to the City, particularly in the Special Economic Opportunity Areas.
- ES 7 Make land use decisions that result in sustainable increases in median income and property values.
- ES 8 Be a City whose citizens have pride in their community and that is well maintained and free of blight from conditions such as poorly maintained roads, graffiti, homeless encampments, and illegal dumping.

Policies and Programs

EC 1 – Economic Development and Fiscal Sustainability

The financial health of Jurupa Valley, under threat upon the City's incorporation, has become stronger and gained stability under local governance; however, the ongoing need for fiscal stability continues to be a major economic driver. Economic development enhances Jurupa Valley's quality of life by providing local goods and services, expanding employment and business opportunities, and improving the local tax base. As important components of economic development, the community expects municipal facilities and services to maintain and enhance Jurupa Valley's quality of life and spur further investment. The community also recognizes that providing these facilities and services is costly and often requires tradeoffs among competing and changing needs and priorities.

Sustainable economic growth refers to growth that is both economically prosperous and environmentally friendly. Economic growth refers to the capacity of the economy to produce goods and services and can be measured in a variety of ways. Sustainable economic growth is that which improves the overall economy while minimizing adverse social and environmental effects.

Figure 11-4: New housing under construction near Vernola Marketplace

Policies

- ES 1.1 **Funding Reinstatement.** Continue to pursue the reinstatement of funding due to the loss of vehicle license fees (VLF) to ensure the ongoing economic stability of the City and achieve parity with other cities,

including the possibility of additional property taxes passed through to the City in-lieu of VLF.

- ES 1.2 **Economic Development Strategy.** Seek out selective development opportunities that will bring private capital investment into the community, provide skilled and professional labor, and increase median income and property values. Ensure that land use, capital improvement, and fiscal management decisions are consistent with the City's Economic Development Strategy, are guided by the General Plan, and emphasize mid- and long-term development of the local economy, rather than focus on short-term goals or individual projects.
- ES 1.3 **Balanced Budget.** Seek to adopt a balanced City budget, annually.
- ES 1.4 **Fair Share.** Ensure that new development pays its fair share of facilities and infrastructure costs.
- ES 1.5 **Allocation of Public Resources.** Allocate municipal budget resources based on an adopted Economic Development Strategy.
- ES 1.6 **Staff Resources.** Budget for adequate staffing to implement the adopted Economic Development Strategy, as resources allow.
- ES 1.7 **Long-Term Benefits.** Consider long-term Community benefits, not just short-term returns, in our decision-making processes.
- ES 1.8 **Evaluation of Progress.** Annually evaluate City progress in achieving the Economic Development Strategy. This evaluation will guide decisions to maintain or modify the allocation of resources for economic development.
- ES 1.9 **Business Competitiveness.** Assign high priority to City initiatives, investments, and the allocation of municipal resources that address the needs and challenges of conducting business in Jurupa Valley, and improve the City's attractiveness for new business and industry to locate here.
- ES 1.10 **Existing Businesses.** Assign high priority to initiatives, investments, and the allocation of municipal resources that help existing businesses remain and prosper in Jurupa Valley.

Programs

- ES 1.1.1 **Economic Development Strategy.** Prepare and adopt an Economic Development Strategy to achieve the goals of

this General Plan and to capitalize on economic development opportunities.

- ES 1.1.2 **Cost of Services Study/Impact Fees.** Conduct a cost of municipal services study and, if warranted, consider establishing impact fees to defray costs of maintaining and improving municipal services and facilities.
- ES 1.1.3 **Regional Economic Influence.** Build Jurupa Valley's role as a regional economic leader through active participation in local and regional business forums, regional economic and transportation planning, and business recruitment activities, as resources allow.

EC 2 – Industrial Base

Jurupa Valley and the entire Inland Empire area is one of the fastest growing logistics hubs in California. Logistics refers to the flow of goods between producers and consumers. It includes warehousing, materials handling, and transportation. In addition, while such uses can be part of a robust local economy, they have some drawbacks. They can result in large areas with over concentrations of warehousing and truck parking, relatively low job and local revenue generation, and related traffic, air quality and paving impacts. As part of its industrial sector, the City also seeks to encourage clean industry, job-rich manufacturing businesses, and research and development parks to achieve long-term and sustainable economic health. In addition, the City encourages point-of-sale fulfillment centers to locate in Jurupa Valley to provide retail options for residents and visitors and improve the local tax base. It is the City's intent to continue to accommodate logistics uses in appropriate areas—primarily in the Mira Loma Warehouse and Distribution Center area—while expanding the industrial base in a manner that promotes economic sustainability and that benefits the City and its residents.

Figure 11-5: Logistics building, Jurupa Valley

Policies

- ES 2.1 **Industrial Expansion.** Expand and diversify the City's industrial base by encouraging clean industry, including job-rich manufacturing and assembly uses, research and development, and point-of-sale fulfillment centers.
- ES 2.2 **Job Growth.** Encourage industrial uses that provide well-paying skilled and professional jobs.
- ES 2.3 **City Investments.** Assign a high priority to City initiatives, investments, and the allocation of City resources that benefit the ongoing quality of life for all, including employees, rather than focusing solely on

reducing initial industrial or commercial development costs.

- ES 2.4 **Jobs-Housing Balance.** Assign high priority to City initiatives, investments, Council decisions, and the allocation of City resources, and development approvals that improve the jobs/housing ratio by expanding local job opportunities for residents and housing opportunities for employees.

Program

- ES 2.1.1 **Industrial Development Profiles.** Prepare development profiles for specific industrial opportunity sites, including information on site attributes, allowed land use and development standards, relevant County or City approvals, and potential development incentives.

EC 3 – Retail Commercial Base

Figure 11-6: New office/business park space, Jurupa Valley

Retail vacancy within the City is below the Inland Empire average, while lease rates are above the average. Average retail sales per capita are lower for the City (approximately \$5,500) than the County (approximately \$9,400). Higher performing sales categories include grocery, sporting goods, office supplies, drug stores, and other retail uses. Lower performing retail categories include apparel, general merchandise, restaurants and bars, building materials, and automotive dealerships/supply. During public workshops, many residents commented on the need for more choice in full-service grocery shopping, specialty retail, and quality, full-service restaurants. The GPAC recommended that the City diversify its commercial base by attracting high-quality retail shopping opportunities, such as a Target, Albertson's or Vons markets, and Olive Garden Restaurant.

Overall, retail sales in Jurupa Valley are lower than average household spending potential and household income, suggesting that the City is "leaking" resident retail purchases to other jurisdictions. However, some retail categories, such as general merchandise, supply, and food and beverage stores have higher than projected household spending per average income, resulting in an inflow of retail sales. Potential retail voids include clothing/apparel, casual and other restaurants, sporting goods, office supplies, fitness, drug stores, dollar stores, office supplies, wholesale, and others.

Policies

- ES 3.1 **Business Retention.** Support programs and activities that help retain high quality businesses that provide

- needed goods, services, and/or jobs for the community or regions.
- ES 3.2 **New Business Attraction.** Attract new commercial enterprises that balance and diversify the commercial base and provide needed goods and services. These could include the introduction of new commercial and institutional sectors such as medical, educational, and visitor-serving uses.
- ES 3.3 **Opportunity Areas.** Actively promote development in the Opportunity Areas that achieves General Plan goals and is consistent with Community Values.
- ES 3.4 **Unique Commercial Districts.** Recognize and enhance the unique visual qualities of commercial areas in the different communities of the City through development approvals and infrastructure improvements, as resources allow.
- ES 3.5 **Local Businesses.** Encourage and support local business associations, particularly along principal commercial corridors and in village centers.
- ES 3.6 **Residential Uses in Commercial Centers.** Consider the addition of residential development to underutilized community commercial shopping centers.
- ES 3.7 **Mixed Uses.** Promote mixed-use commercial and residential development adjacent to the Metrolink Station.
- ES 3.8 **Nodal Development.** Promote the development of focused commercial development at key nodes along commercial corridors.
- ES 3.9 **Home Businesses.** Continue to permit home enterprise and home occupation activities in appropriate areas of the City.
- ES 3.10 **Business-Friendly City Processes.** Ensure that the City development review and permit process is fair, efficient, and business-friendly.
- ES 3.11 **Gateway Improvements.** Enhance major gateways along I-15, SR 60, Van Buren Boulevard, Mission Boulevard, and other important corridors to create attractive entrances into the City, as resources allow, through the City's land use and capital improvement program.

Figure 11-7: 2016 Dedication of the Clay Street Grade Separation Project (from left: Gary Thompson, City Manager; Frank Johnston, Council Member; Verne Lauritzen, Council Member; Laura Roughton, Mayor; Riverside County Supervisor John Tavaglione; Patricia Romo, Riverside County Transportation Department; Ann Mayer, Executive Director, Riverside County Transportation Commission; Juan C. Perez, Riverside County Transportation Department)

- ES 3.12 **Rubidoux, Pedley, and Glen Avon Village Centers.** Ensure that City initiatives, investments, and development approvals for the historic Village Centers in Rubidoux, Pedley, and Glen Avon contribute to the vision of these areas as multi-modal, mixed-use retail, residential and entertainment centers. These areas shall promote high-quality pedestrian experiences and preserve and enhance their visual character (can refer to the Land Use Element for descriptions of each Village Center's visual character and assets).
- ES 3.13 **Mission Boulevard.** Require that City initiatives, investments, and development approvals for Mission Boulevard contribute to the vision of the corridor as a mixed-use commercial corridor that serves a wide range of commercial needs of Jurupa Valley residents and visitors.
- ES 3.14 **Other Commercial Districts.** Ensure that City initiatives, investments, and development approvals for commercial districts other than those described above contribute to the vision of these areas as primarily serving the day-to-day retail shopping, services, and dining needs of residents of adjacent and nearby neighborhoods.

Programs

- ES 3.1.1 **Business Retention Strategy.** Adopt a Business Retention and Expansion (BRE) Program to address outreach strategies, business improvement and marketing in village centers, feasibility of business improvement districts, and potential business incentives.
- ES 3.1.2 **Branding and Business Attraction.** Prepare and adopt an Economic Development Strategy, including: 1) branding and business attraction strategy to establish a unified identity for Jurupa Valley based on its unique character, quality of life, and business attributes, and 2) a communications program to publicize the Jurupa Valley brand for residents, visitors, and potential visitors.
- ES 3.1.3 **Commercial Corridors.** Work with property owners along the principal commercial corridors, including Mission Boulevard, Rubidoux Boulevard, Limonite Avenue, and Jurupa Road to explore General Plan and zoning strategies to consolidate commercial uses into vibrant nodes and allow residential development along the corridors.
- ES 3.1.4 **Business Visitation Program.** Establish and operate a City business visitation program to improve communication and understanding of business needs, opportunities, and issues.
- ES 3.1.5 **Mayor's Business Awards Program.** Consider initiating an annual Mayor's Business Award to recognize Jurupa Valley's outstanding business citizens and businesses.

EC 4 – Tourism Base

As outlined previously, Jurupa Valley's location in the region adjacent to a number of major freeways and a convenient stop on the route to several major vacation destinations makes Jurupa Valley a logical tourist spot, primarily for business, overnight, and short-term stays. The City desires to tap into this potential economic sector and market itself to travelers desiring an interesting destination or just passing through the area in need of a place to eat or stay.

Figure 11-8: Fishing Lake, Rancho Jurupa County Park and Campground

Policies

- ES 4.1 **Regional Location.** Capitalize on Jurupa Valley's regional location to attract tourism.
- ES 4.2 **Visitor and Business Travel Lodging.** Encourage the development of quality hotels, inns, recreational vehicle campgrounds, and other high quality lodging facilities catering to Jurupa Valley visitors and business travelers.
- ES 4.3 **Golf Courses.** Promote the City's golf courses as a major attraction within the community.
- ES 4.4 **Flabob Airport.** Support the revitalization and continued improvement of Flabob Airport as a cultural destination as well as a municipal airport.
- ES 4.5 **Cultural and Recreational Assets.** Promote the City's cultural and recreational assets to the traveling public.
- ES 4.6 **Cultural Facilities.** Attract arts and cultural facilities such as theaters and museums to locate in Jurupa Valley.
- ES 4.7 **Community Festivals and Special Events.** Encourage trade fairs, festivals, concerts, equestrian events, and other special events to be held in Jurupa Valley.

Program

- ES 4.1.1 **Commercial Recreation and Visitor Attraction Plan.** Prepare and adopt a commercial recreation and visitor attraction plan in cooperation with the Chamber of Commerce and other interested parties, which identifies the City's recreational, equestrian, cultural and tourism assets, potential resources and funding sources, potential land use and zoning incentives, target uses, businesses and/or attractions, and marketing strategies.

EC 5 – Workforce Development

Economic studies indicate that a significant portion of Jurupa Valley's workforce is low skilled and low paid, partly as a result of the prevalence of low education levels, low-paying jobs, and low-cost housing in the region. Workforce development is an economic development strategy to develop a supply of trained employees that in turn can help attract quality industrial and commercial jobs to the area. This in turn has the beneficial effect of keeping young people in the community and raising the standard of living for Jurupa Valley residents.

Policies

- ES 5.1 **Employee Commuting.** Reduce the number of Jurupa Valley residents who commute to other areas for work by expanding and diversifying the City's job base.
- ES 5.2 **Job Training.** Encourage school districts, trade schools, learning centers, colleges, and universities to offer programs to develop and maintain a well-trained workforce, such as evening and weekend programs at local schools.
- ES 5.3 **Emerging Industry Training.** Support programs that address skills gaps in growing and emerging industries, such as hospitality industries and high tech.
- ES 5.4 **Regional Collaboration.** Collaborate with public and private entities to develop a regional technology plan to address current and future industrial technology needs.
- ES 5.5 **Promote Living Wage Jobs.** Promote the development of quality jobs for local residents, especially those with living wages and career ladders.
- ES 5.6 **Internships.** Encourage local businesses to offer internships and apprenticeships to local students.
- ES 5.7 **Diverse Job Opportunities.** Help promote job opportunities for people of all income levels, including low-income residents.
- ES 5.8 **Entrepreneurship Programs.** Support programs to train minority entrepreneurs on how to establish and maintain successful businesses.

Programs

- ES 5.1.1 **Business Incubator.** Explore opportunities to collaborate with a business "incubator" in Jurupa Valley, such as a research and technology development campus, a regional occupation center, or a technology training institute.

ES 6 – Special Economic Opportunity Areas

To promote economic sustainability and diversity, the City has identified six opportunity areas in the City as shown on *Figure 11-9*. These are areas where private commercial and industrial development could have a moderate to high economic impact based on fiscal revenue and job creation forecasts. The City is actively collaborating with property owners in these areas to attract potential developers. The six areas are discussed below:

DRAFT

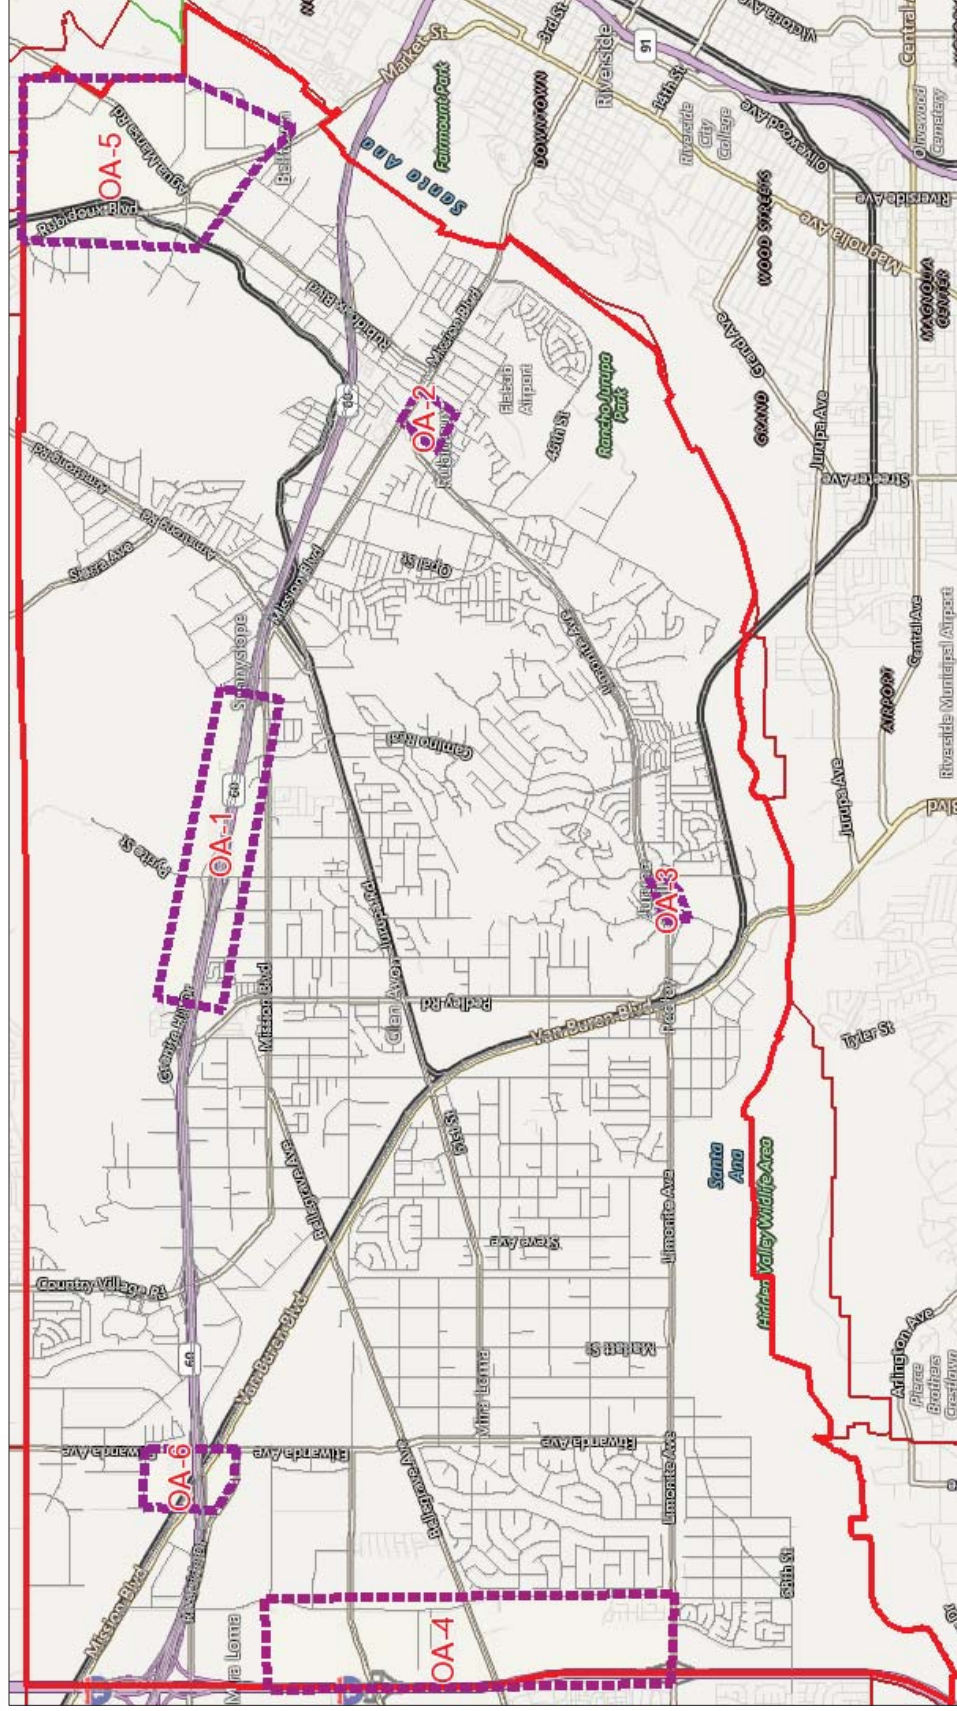

Figure 11-9: Economic Opportunity Areas

- OA-1) SR 60 Freeway Commercial Opportunity Area: The SR 60 Freeway Commercial area includes four areas immediately south of the SR 60 Freeway with excellent freeway access and visibility. These areas are considered to have a high potential economic impact based on fiscal revenue and job creation forecasts. Potential uses could include retail, commercial, residential, tourist-commercial (e.g., hotel, RV park) and recreational development as well as other freeway-oriented uses.
- OA-2) Mission Street District Retail Opportunity Area: This area includes two sites located on the south side of Mission Boulevard near Riverview Drive as shown on *Figure 11-9*. These areas are also considered to have a high potential fiscal revenue generation and job creation. These sites are considered suitable for neighborhood retail and commercial development, particularly because they are situated in an underserved retail trade area.
- OA-3) Suburban Retail/Medical Opportunity Area: Three sites have been identified for potential suburban retail and/or medical office development, including the old Albertson's grocery store site south of Limonite Avenue at Clay Street.
- OA-4) I-15 Freeway Commercial Opportunity Area: Two sites, comprising more than 300 acres, have been identified along the I-15 Corridor, on either side of Bellegrave Avenue. Owing to their excellent visibility from I-15, the sites are suitable for myriad uses, including industrial, commercial, business park, tourist-commercial (e.g., hotel, conference facility), retail, and entertainment uses. These areas are considered to have a high potential for fiscal revenue generation and job creation.
- OA-5) Northeast Industrial Opportunity Area: Various sites in northeastern Jurupa Valley have been identified for industrial and commercial uses. These include the approximately 250-acre Riverside Cement Company site. These areas are considered to have a low potential for fiscal revenue generation but a medium potential for job creation.
- OA-6) Space Center Industrial Opportunity Area: Approximately 50 acres located at the northeast corner of SR 60 and Etiwanda have been identified as an industrial development opportunity site as identified on *Figure 11-9*. This site is considered to have a medium potential for fiscal revenue generation and job creation.

Policies

- ES 6.1 **Opportunity Areas.** Ensure that City economic initiatives, budgeting, and land use actions for designated Opportunity Areas are consistent with the 2017 General Plan Land Use Element's vision of these areas in terms of balancing the commercial/industrial base, attracting economically and environmentally sustainable development and meeting residents' needs.
- ES 6.2 **Address Voids.** Ensure that City initiatives, budgeting, and capital improvement programs give high priority to attracting high quality retail and industrial businesses that fill identified economic "voids" with businesses with growth potential in the Jurupa Valley trade area.
- ES 6.3 **Infrastructure.** Ensure that City initiatives, budgeting, and capital improvement programs give a high priority to improving the economic attractiveness and development feasibility of designated Opportunity Areas, consistent with the City's vision for these areas, and encourage community service districts and other responsible agencies to do likewise.

Programs

- ES 6.1.1 **Fulfillment Center and Logistics.** Give a high priority to attracting a new point-of-sale fulfillment center and logistics industrial projects based on low market vacancies and growth in those sectors.
- ES 6.1.2 **Economic Development Strategy.** Ensure that the City's Economic Development Strategy includes specific implementation measures to address the Kosmont findings and recommendations, and include a monitoring and evaluation program to evaluate the effectiveness of City economic development actions.

###

12 – GLOSSARY

A

A-Weighted Sound Level: The sound level obtained by using an A-weighting filter for a sound level meter. All sound levels referred to in the policies are in A-weighted decibels (abbreviated “dBA”). A-weighting de-emphasizes the very low and very high frequencies (itches) of sound in a manner similar to the human ear. Most community noise standards use A-weighting, as it provides a high degree of correlation with human annoyance and health effects.

Accessory Structure: A structure that is clearly subordinate or incidental and directly related to the primary structure.

Acoustical Engineer: An engineer specializing in the measurement and physical properties of sound. In environmental review, the acoustical engineer measures noise impacts of proposed projects and designs measures to reduce those impacts.

Acreage, Gross: The land area that exists prior to any dedication of land for public use, health, or safety purposes.

Acreage, Net: The portion of a site on which one can actually build, and is the land area that remaining after dedication of ultimate rights-of-way for:

- Public streets
- Drainage facilities
- Public parks and other open space developed to meet minimum standards required by City ordinance
- Utilities

Acre-Foot: The volume of water that would cover 1 acre to a depth of 1 foot. An acre-foot is about the amount of water used each year in and around the home by two average California families, or about 326,000 gallons.

Active Recreation: Active recreation means recreation facilities typical of urban parks, including play fields (such as soccer or softball), school fields, community centers, tennis courts, picnic areas (group and individual), golf courses and golf-related facilities, recreation resorts, and similar facilities.

Active Trail Corridor: A pedestrian or bicycle trail that typically is (1) used for commuting purposes (provides direct access from school or work and residences), (2) located in an urban area, (3) paved with an all-weather surface, and (4) utilized by a significant segment of the City population.

Active Transportation: Non-motorized transportation modes, such as bicycling and walking that are integrated with public transportation.

Adaptive Reuse: Refers to the process of reusing an old site or building for a purpose other than that for which it was built or designed. Typically used in reference to historic buildings being remodeled

Figure 12-1: Jurupa Mountains Discovery Center

and/or restored in compliance with the Secretary of the Interior's Standards for Preservation or other applicable historic preservation standards.

Affordable Housing: Housing that meets the rental or sales price standards as established by the County of Riverside following State affordability standards. Such housing is made available for very low, low- and moderate-income persons or households, and subject to deed restrictions or other instruments that ensure the housing remains affordable for a predetermined period. In general, housing is considered "affordable" if its monthly rent or mortgage payment (including principal, interest, property tax and insurance) does not exceed 30% to 35% of a household's gross income.

Affordability, Housing: The ratio of housing costs to household income.

Agriculture: The use of land for the production of food or fiber, or both, including (1) the growing of crops, or (2) the grazing of animals on naturally prime pasture or improved pasture land, or both (1) and (2).

Agricultural Land: Is generally open land where there has been a history of agricultural cultivation or keeping of livestock, which remains generally open, and if located within the City limits, is a specific land use designation in the General Plan Land Use Element.

Alquist-Priolo Earthquake Fault Zone: A regulatory zone, delineated by the State Geologist, within which site-specific geologic studies are required to identify and avoid fault rupture hazards prior to subdivision of land and/or construction of most structures for human occupancy.

Alternative Fueling Stations: A station that offers alternative fuels to petroleum-based fuel. Alternative fuels can include but are not limited to biodiesel, compressed natural gas, ethanol, electric charging, hydrogen, liquefied natural gas, and propane. "Blends" that include a combination of petroleum and non-petroleum fuels are considered alternatives for purposes of this definition.

Ambient Noise: The composite of noise from all sources. The ambient noise level constitutes the normal or existing level of background noise at a given location.

Automobile Related Uses: Uses related to retail or wholesale sales of automobiles, recreational vehicles and boats, automotive repair services, automobile-oriented retail businesses (e.g., auto parts, tires, etc.), and fueling stations.

Alternative Forms of Transportation: Transportation modes other than single-occupant vehicles, including buses, bicycles, car and vanpools, and walking.

Annexation: The extension of the City limits, to increase the area which is subject to City laws and, sometimes, eligible for City utilities and services. Annexations are acted on by the Local Agency Formation Commission, according to procedures and standards in State law.

Arterial Street: A major road connecting different areas of the City with each other and with highways. Driveway access is usually limited. (See also the Mobility Element).

Assisted Housing: Assisted housing units, including multifamily or single-family, whose construction, financing, sales prices, or rents have been subsidized by Federal, State, or local housing programs, and may include dwelling units developed pursuant to local inclusionary housing and density bonus programs.

Average Daily Traffic (ADT): ADT is the total number of vehicles that use a particular street through the day (24 hours).

Average Vehicle Ridership (AVR): AVR is a number derived by dividing the number of people in a geographic area or at a specific site by the number of cars that they drive to that location. For example, if 100 people work at a site and they all drive a car to work, then AVR = 1.0 (100 people divided by 100 cars). If 100 people work at a site but only 50 drive cars and the rest use alternative forms of transportation, then AVR = 2.0 (100 people divided by 50 cars).

B

Balanced Roadway: A roadway designed or operated in a manner that meets transportation needs for different types of users, such as bicyclists, pedestrians, public transit users, and motorists.

Below Market Rate (BMR) Housing: Below market rate housing refers to housing unit(s) that are sold or rented at prices less than the fair market value or prevailing market rent, typically due to the use of public or private subsidies that make the units affordable for very low, low, or moderate income households (depending on the program).

Bicycle-Friendly: Describes policies and practices, which may help some people feel more comfortable about traveling by bicycle with other traffic. The level of bicycle-friendliness of an environment can be influenced by many factors resulting from transportation planning and infrastructure design decisions.

Bikeways: A term that encompasses “bicycle lanes,” “bicycle paths,” and “bicycle routes.” Bikeways are further described as Class 1, Class 2 or Class 3 facilities, as described below:

Bicycle Path (Class 1 facility): A special pathway facility for the exclusive use of bicycles, which is separated from motor vehicle facilities by space or a physical barrier. A bicycle path may be located on a portion of a street or highway right-of-way or in a special right-of-way not related to a motor vehicle facility. It may be grade separated or have street crossings at designated locations. It is identified with “Bike Route” signs and may have pavement markings.

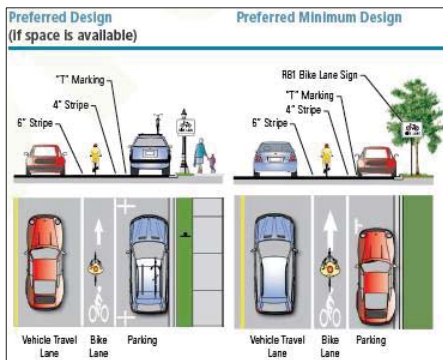

Figure 12-2: Typical Class II Bicycle Path design (Complete Streets Manual, City of Los Angeles)

Bicycle Lane (Class 2 facility): A lane on the paved area of a road for preferential use by bicycles. It is usually located along the edge of the paved area or between the parking lane and the first motor vehicle travel lane. It is identified by “Bike Lane” or “Bike Route” guide signing, special lane lines, and other pavement markings. Bicycles have exclusive use of a bicycle lane for longitudinal travel, but must share the facility with motor vehicles and pedestrians crossing it.

Bicycle Route (Class 3 facility): A Street identified as a bicycle facility by “Bike Route” guide signing only. There are no special lane markings, except for optional Shared Lane Markings or “sharrows.” Bicycle traffic shares the roadway with motor vehicles.

Billboards: Billboards are signs visible from and adjacent to highways and major street corridors that are made available for lease or rent.

Boarding/Rooming House: A dwelling or part of a dwelling where lodging is furnished for compensation to more than three persons living independently from each other. Meals may also be included. Does not include fraternities, sororities, convents, or monasteries.

Buffer or Buffering: An area established between potentially conflicting land uses, such as agricultural and residential uses, which, depending on the potential impact, may utilize landscaping, earth berms, structural barriers, setbacks or roads. Also may refer to the process of providing separation between land uses and reducing or preventing adverse impacts between land uses, such as noise, vibration, lighting and glare, odor, and privacy, etc.

Building: Buildings are any structures used or intended for sheltering or supporting any use or occupancy.

Building Intensity: Building intensity is a measure of the amount of floor space in relation to site area. It is expressed as the ratio of gross building floor area to site area (Figure 12-3). For example, where a ratio of 1.0 is allowed, building floor area can equal site area. In this example, a one-story building could cover the entire site (except any required setbacks), a two-story building could cover one-half the site, or a three-story building could cover one-third of the site. (See also “density.”)

Figure 12-3: Diagram showing Floor Area Ratio (City of Austin, Texas)

Build-out: That level of urban development characterized by full occupancy of all developable sites within the City's Limits, in accordance with the General Plan; the maximum level of development anticipated by the General Plan. Build-out does not assume that each parcel is developed with the maximum floor area or dwelling units possible under zoning regulations.

Business Incubator: An organization designed to accelerate the growth and success of entrepreneurial companies through an array of business support resources and services that could include physical space, capital, coaching, common services, and networking connections. Business incubation programs are often sponsored by private companies or municipal entities and public institutions, such as colleges and universities. Their goal is to help create and grow young businesses by providing them with necessary support and financial and technical services.

Business Park: Business Park is a master-planned, campus-like setting for research-and-development or light-manufacturing uses.

C

California Environmental Quality Act (CEQA): Legislation and corresponding procedural components established in 1970 by the State of California to require environmental review for projects anticipated to result in adverse impacts to the environment.

Candidate Species: Candidate species are animal or plant species that the U.S. Fish and Wildlife Service (USFWS) or California Department of Fish and Wildlife are considering for listing as endangered or threatened species.

Capital Improvement Plan (CIP): Is part of the City's budget that describes how money will be spent on the construction, maintenance, or replacement of buildings, streets, sewer and water mains and other publicly owned facilities. The program, generally reviewed annually for conformance to and consistency with the General Plan.

Carbon Dioxide (CO₂): An odorless, colorless gas formed during respiration, the combustion of fuels, and certain industrial activities, among other processes. CO₂ is the most abundant greenhouse gas, with primary sources from transportation and electrical power generation.

Carbon Monoxide (CO): An odorless, colorless gas formed by the incomplete combustion of fuels; majority of southern California CO emissions come from motor vehicles.

Chlorofluorocarbon (CFC): An ozone-depleting greenhouse gas previously used as a propellant and a refrigerant.

City Limits: The legal boundaries of the geographical area subject to the jurisdiction of the City of Jurupa Valley's government. For example, development applications for properties located within the City limits must be reviewed by the City.

Figure 12-4: Cluster Development Layout to Preserve Open Space (City of Durango, Colorado)

Clustering: Clustering means grouping allowed development on a small area of the site, with the remainder of the property protected as agriculture or open space. See the City's Land Use Element for clustering densities.

CNPS: Means the California Native Plant Society.

Collector Street: Is a street serving a neighborhood or subarea of the City, which "collects" traffic from local streets and connects it with higher volume arterial streets. Collectors typically have only two motor vehicle traffic lanes. See also the Circulation Element.

Commercial Truck: A vehicle weighting more than 10,000 pounds, with three or more axles and used for commercial or industrial purposes.

Community Development Block Grant (CDBG): A grant program administered by the U.S. Department of Housing and Urban Development (HUD) on a formula basis for entitlement communities and urban counties and by the State Department of Housing and Community Development (HCD) for non-entitled jurisdictions. CDBG funds are used by cities and counties for land purchase, housing rehabilitation and community development, public services and facilities, economic development, and other purposes that primarily benefit persons or households with income less than 80% of County median income.

Community Noise Equivalent Level (CNEL): Community noise equivalent level, abbreviated "CNEL", is the equivalent energy (or energy average) sound level during a 24-hour day, obtained by adding approximately five decibels to sound levels from 7:00 p.m. to 10:00 p.m. and ten decibels to sound levels between 10:00 p.m. and 7:00 a.m. to account for greater human sensitivity to noise during those periods.

Community Value: Important and lasting beliefs or ideals shared by the residents of a community about what is good or bad, and desirable or undesirable. Values have major influence on a person's or a group's behavior and attitude and serve as broad guidelines in all situations. Some common values are justice, equality, pursuit of liberty and quality of life, civic responsibility and involvement.

Compatible: Capable of existing together without conflict or ill effects.

Complete Streets: Streets that comfortably accommodate all users, with particular emphasis on pedestrians, bicyclists, and public

transportation, as well as people of all ages and physical abilities. The Complete Streets Act of 2008 requires circulation elements to incorporate multimodal transportation into the General Plan.

Conditional Use Permit: The discretionary and conditional review of an activity or function or operation on a site or in a building or facility.

Conservation: The management of natural resources to prevent waste, destruction, or neglect.

Cultural Resources: Includes historic, archaeological, and paleontological resources, as well as human remains.

Cumulative Impact: As used in CEQA, the total environmental impact resulting from the accumulated impacts of individual projects or programs over time.

Conservation, Energy: Means the use of less energy in any form than would otherwise occur. It may be accomplished by greater efficiency (i.e., more miles per gallon), or reduced activity (i.e., going to a nearby park instead of a distant park).

Conservation Plan: Conservation Plan is a document prepared by the City or a City designated representative which specifies the care and management of specific open space sites or areas, in compliance with the General Plan. This plan outlines resources existing on the site, resource preservation, allowed recreational uses, and other similar programs.

Covenants, Conditions, and Restrictions (CC&Rs): Restrictions or requirements that are placed on a property and its use by a property owner, usually as a condition of subdivision approval. CC&Rs are deed restrictions that “run with the land” and are legally binding.

Creek: Creek is a waterway or portion of a waterway so designated on the Conservation and Open Space Element "Creek Map," or other source as defined in the Conservation and Open Space Element; creek includes a natural watercourse or altered natural watercourse where water flows in a definite channel, with a bed and banks. Drainage ditches, concrete swales, underground culverts, and storm drains are not considered creeks.

Creek Corridor: Creek corridor is that area of the creek between physical top of bank on one side of the creek and physical top of bank on the other side of the creek, or the area between the outer edge of the riparian vegetation on one side of the creek to the outer edge of the riparian vegetation on the other side of the creek (whichever is greater).

Figure 12-5: Typical creek corridor and setbacks (City of San Luis Obispo, California)

Creek Maintenance: Creek maintenance means work within a creek corridor that involves the trimming of vegetation, the use of herbicides or pesticides, removing debris or trash, removing vegetation necessary to maintain flood control, or similar maintenance activities. Projects that involve creek alterations should not be considered creek maintenance.

Creek Restoration: Creek restoration is the process of restoring a creek to a more natural condition. Restoration includes planting native riparian vegetation, removing wildlife barriers, providing fish ladders, removing debris and trash, removing invasive non-native creek species, grading and changes to the creek associated with creek restoration work, and other similar activities. Creek restoration is not considered development.

Creek Setback: Creek setback means the minimum distance that development must be located from a creek's physical top of bank or the outer edge of the riparian vegetation (whichever results in a greater setback), as provided in the Conservation and Open Space Element. An adequate creek setback should allow for future natural changes that may occur within the creek corridor and allow adequate space for storm design capacity.

Cultural Resources: Consist of any prehistoric or historic district, site, building, landscape, structure, or object included in or eligible for local, State, or National historic designation, including artifacts, records, and material remains related to such a property or resource. Cultural resources represent the full range of prehistory and history by indigenous cultures and historic American settlement in Jurupa Valley, including traditional cultural properties. Cultural resources also include the remains of historic settlement and development activities of Euro-Americans, Asians, and other non-Native cultural activities during the past 200 years.

Cut-Through Traffic: The term for vehicle trips on a particular residential local or collector street by motorists who do not live in the neighborhood and are passing through it to some other destination.

D

Dark Skies: Refers to efforts to preserve and protect the nighttime environment and our heritage of dark skies through environmentally responsible outdoor lighting to prevent light pollution due to excessive or inappropriate outdoor lighting. Common forms of light pollution include glare, sky glow, excessively strong lighting and glare from outdoor lighting, which is unshielded and publicly visible.

Day/Night Average Sound Level (Ldn): Day/night average sound level, abbreviated "Ldn," is the equivalent energy (or energy average) sound level during a 24-hour day, obtained by adding ten decibels to sound levels between 10:00 p.m. and 7:00 a.m. The Ldn is generally computed for annual average conditions.

Decibel (dB): The unit of measurement for loudness based on a logarithmic scale.

Decibel "A-Weighted" (dBA): The "A-weighted" scale for measuring sound in decibels, which weighs or reduces the effects of low and high frequencies in order to simulate human hearing. Every increase of 10 dBA doubles the perceived loudness even though the noise is actually ten times more intense.

Density: Density describes how many things of a certain kind occupy an area of land. Density is often expressed as the number of residents, dwellings, or employees per acre.

Density Bonus: An increase in the allowed base density applied to a residential development project, as allowed by State law. The increase allows the development of more dwellings than a property's zoning would otherwise allow, and is usually in exchange for the provision or preservation of affordable housing or housing amenity.

Density, Residential (du/acre): The number of permanent residential dwelling units (du) per acre of land. Densities specified in the General Plan are expressed in dwelling units per gross acre or per net acre (du/acre). (See "Acres, Gross" and "Acres, Net")

Development Fees: Direct charges or dedications collected on a one-time basis for a service provided or as a condition of approval being granted by the local government. The purpose of the fee or exaction must directly relate to the need created by the development. In addition, its amount must be proportional to the cost of the service or improvement. Fees can be broken down into two major classes: 1) service charges such as permit fees covering the cost of processing development plans, connection or standby fees for installing utilities, or application fees for reviewing and considering development proposals; and 2) "impact" fees levied on new development to cover the cost of infrastructure or facilities necessitated by development.

Development Project: A project that involves grading, demolition, construction, remodeling, subdivision, new signs or other land improvement, land division or other action for which City discretionary planning approvals or building permits are required.

Development Review: The comprehensive evaluation of a development and its impact on neighboring properties and the community as a whole, in terms of land use compatibility, site planning and design, architecture, landscaping, lighting and signs, in accordance with a set of adopted policies, guidelines and standards.

Dwelling Unit (du): A building or portion of a building containing one or more rooms, designed to be used by one household for living or sleeping purposes, and having a separate bathroom and only one kitchen or kitchenette.

Development: Development means the erection of structures (including agricultural buildings and accessory structures such as decks and spas), the associated grading, vegetation removal, and

paving associated with structures, the subdivision of land, mining, excavation, and drilling operations. Where creeks, wetlands, unique resources, sensitive habitat, and historical resources occur on-site or may be affected, development also includes agricultural uses (such as tilling the soil, grazing, agricultural grading, and similar uses) as well as grading (greater than 50 cubic yards), paving, and vegetation removal (the removal of a tree or riparian vegetation such that a major portion of a creek bank is exposed) whether such activities are associated with a structure or independent of a structure. Enhancement or restoration of a natural resource is not considered development.

Director: Refers to the Director of the City's Planning Department, or another staff person authorized by the Director to act on his or her behalf.

Dormitory: A building used as a group quarters for students, as an accessory use for a college, university, boarding school, or other similar institutional use.

E

Ecotone: An ecotone is a transition area between two or more natural habitats (or plant communities), such as the area along and between a riparian habitat and Oak woodland or Chaparral habitats. Ecotones are typically diverse and support a greater variety of species than the bordering habitats. Ecotones may appear on the ground as a gradual blending of the two plant communities across a broad area, or it may appear as a sharp boundary line.

Elderly or Senior Housing: Housing designed to meet the needs of and enforceably restricted to occupancy by persons 62 years of age and older or, if more than 150 units, persons 55 years of age and older.

Endangered Species, California: A native species or sub-species of a bird, mammal, fish, amphibian, reptile, or plant, which is in serious danger of becoming extinct throughout all or a significant portion of its range, due to one or more factors, including loss in habitat, change in habitat, over-exploitation, predation, competition, or disease. The State Department of Fish and Wildlife determine the status.

Endangered Species, Federal: A species that is in danger of extinction throughout all, or a significant portion, of its range. The U.S. Fish and Wildlife Service and the Department of the Interior determine the status.

Environmental Impact Report (EIR): A report required pursuant to the California Environmental Quality Act (CEQA) that assesses all the environmental characteristics of an area, determines what effects or impacts will result if the area is altered or disturbed by a proposed action, and identifies alternatives or other measures to avoid or reduce those impacts. (See "California Environmental Quality Act")

Environmentally Sensitive Habitat Areas (ESHAs): Any area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which could be easily disturbed or degraded by human activities and developments.

Energy: Energy means the capacity to change the characteristics of a material, most often its location, or temperature. In the realm of daily life, energy is never really used up, only changed from a more useful state to a less useful state, with all forms eventually dissipating as heat.

Enforceably Restricted: Refers to housing that is deemed affordable under county or state standards and that is subject to deed restrictions, affordable housing agreements or other mechanisms to ensure the housing remains affordable for a prescribed period.

Environmental Justice: Refers to the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of planning, land use and environmental policies, standards and regulations.

Equivalent Sound Level (Leq): Equivalent sound level, abbreviated “Leq,” is the constant or single-sound level containing the same total energy as a time-varying sound, over a certain time. For example, if 64 dB is measured for 10 minutes, 68 dB is measured for 20 minutes, and 73 dB is measured for 30 minutes, the 1-hour Leq is about 71 dB. The Leq is typically computed over 1-, 8-, or 24-hour sample periods.

Expansion Area: Expansion areas are places that the City has decided will be appropriate for annexation and urban development, as further described in the General Plan Land Use Element text and map. Expansion areas are generally next to and extending beyond the City limits at the time the plan was adopted.

F

Façade: A building “face” or exterior wall of a building, usually, but not always, the front wall, including all openings and architectural ornamentation, facing a street or public way. The word comes from the French language, literally meaning “frontage” or “face.” The facade is often the most important part of a building from an architectural design standpoint, as it sets the tone for the rest of the building.

Fair Market Rent: The rent, including utility allowances, determined by the United States Department of Housing and Urban Development (“HUD”) for purposes of administering the Section 8 Housing Choice Voucher Program.

Fault: A fracture or zone of closely associated fractures along which rocks on one side have been displaced with respect to those on the other side. A fault zone is a zone of related faults, which commonly

Figure 12-6: Craftsman building façade features (City of San Luis Obispo, California)

are braided, but which may be branching. A fault trace is the line formed by the intersection of a fault and the earth's surface.

Flood, 100-year: In any given year, a flood that has a 1% likelihood of occurring, and is recognized as a standard for acceptable risk.

Floodplain: The relatively level land area on either side of the banks of a stream regularly subject to flooding.

Flood Prone: Flood Prone means subject to a general and temporary condition of partial or complete inundation of normally dry land from: (1) overflow of inland waters, and/or (2) the unusual and rapid accumulation of runoff of surface waters from any source. Flood prone areas are areas within the 100- and 500-year flood plain (zones A and B on FEMA maps), but also include areas in which standing water may accumulate after a relatively short rain or flood due to other sources of water such as runoff from nearby land uses caused by inadequate local drainage facilities.

Floor Area Ratio (FAR): A unit of measurement to describe the "intensity" of a non-residential land use. A building's total gross floor area, in square units, divided by the building's site area, in the same square units, equals "FAR." For example, a 60,000 square foot building on a 120,000 square-foot parcel would have a floor area ratio of 0.50. The higher the number, the higher the level of development intensity. In calculating F.A.R., floor area shall mean the conditioned floor area (as defined by Title 24 of the *California Code of Regulations*) of the building and excluding parking garages and basements. (see Figure 12-3)

Form-Based Codes: A method of regulating development to achieve specific urban form. Form-based codes use clear, graphic-based standards to address the relationship between building facades and the public realm, the form, mass and scale of buildings in relation to one another and the aesthetic character of buildings, urban spaces, streets, and blocks.

G

Gateway: Gateways are locations of visual or geographic importance, typically on or near major street entry points. They are intended to be aesthetically pleasing, memorable, and understandable places signifying arrival or change. Gateways are typically located in high visibility areas, close to major transportation facilities that, due to their visual prominence, shape the aesthetic character of their surroundings.

General Plan: A document containing goals, policies and implementation actions or programs regarding a city's long-term development, in the form of maps and accompanying text. The General Plan is a legal document required of each local agency by the State of California Government Code §65301 and adopted by the legislative body (City Council) by resolution. In California, the General Plan has seven mandatory elements (Circulation or Mobility, Conservation, Housing, Land Use, Noise, Open Space, and Public Safety) and may include any number of optional elements a city deems important.

General Plan Amendment (GPA): A modification made to the General Plan after adoption.

Geographic Information Systems (GIS): GIS is a combination of computer-based approaches, programs, methodologies, and technologies to gather, store, manipulate, analyze, present, and interpret spatial information and data.

Goal: A goal is an adopted statement that describes long-term intent. It is intended as an ideal end-state related to the public health, safety, or general welfare. A goal is a general expression of community hopes and aspirations and, therefore, is typically abstract in nature. Consequently, goal achievement is not precisely measurable or time-constrained.

Granny Flat: See **Secondary Residential Unit**.

Greenbelt: A Greenbelt is essentially undeveloped land beyond a city's limits or urban reserve line. Greenbelts typically include a city's viewshed and may consist of private and public property composed of 1) open space area that is preserved to define the limit to urban growth, 2) open space area utilized to protect natural resources, 3) agricultural lands and associated agricultural uses, and 4) rural lands and recreation. A greenbelt functions to preclude adjacent urban communities from merging by maintaining urban growth in designated urban areas.

Greenhouse Effect: A term used to describe the warming of the earth's atmosphere due to accumulated carbon dioxide and other gases in

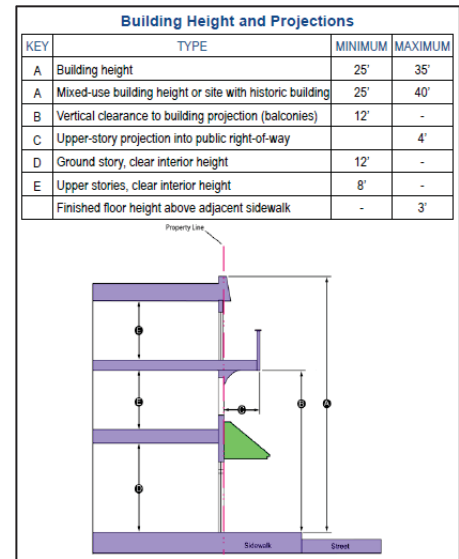

Figure 12-7: Example of form-based code (City of San Luis Obispo, California)

the upper atmosphere. These gases absorb energy radiated from the earth's surface, "trapping" it in the same manner as glass in a greenhouse traps heat.

Greenhouse Gas (GHG): A balance of naturally occurring gases in the atmosphere determines the earth's climate by trapping solar heat through a phenomenon known as the greenhouse effect. GHGs, including carbon dioxide, methane, nitrous oxide, chlorofluorocarbons, and water vapor, keep solar radiation from exiting our atmosphere. In a process very similar to the windows on a greenhouse, GHGs trap so much heat that the temperature within the earth's atmosphere is rising. GHGs are emitted through both natural processes and human activities. Emissions from human activities, such as electricity production, motor vehicle use, or agriculture, contributes to the concentration of GHG in the atmosphere and are believed to be the cause of a gradual warming of the earth's climate.

Groundwater: Water that exists beneath the earth's surface, typically found between saturated soils and rock, and is used to supply wells and springs.

H

Figure 12-8: Wildlife Habitat Buffer and Ecotone areas along the Santa Ana River

Habitat: The physical locations or types of environments in which an organism or biological population lives or occurs.

Habitat Buffer: Habitat buffer is an area around a sensitive habitat or unique resource that protects the resource from development or associated impacts of development. A habitat buffer should 1) be located between sensitive habitat or unique resources and proposed, existing, or potential development; 2) be a sufficient width and size to protect the species most sensitive to development disturbances and to compensate for project impacts, and 3) be designed to complement the habitat value associated with the sensitive habitat or unique resource and to protect such resource(s).

Hazards: Hazards include landslides and soil creep, flooding, potentially active or active earthquake faults, liquefaction areas, wildland fires, and dangers associated with locating too near to an airport.

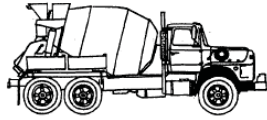

Hazardous Material: Any material that because of its quantity, concentration, or physical or chemical characteristics poses a significant present or potential hazard to human health and safety or the environment if released into the work-place or environment.

Hazardous Waste: Waste that requires special handling to avoid illness or injury to persons or damage to property.

Heat Island Effect: The heat island effect is a temperature phenomenon in which heat-absorbing buildings and paving, especially non-reflective surfaces of dark colors, release heat absorbed from sunlight into the surrounding atmosphere. The resulting effect is an increase in outdoor air temperature of 2 to 8

degrees Fahrenheit in a specific area, or “island.” Increases in local air temperature caused by the heat island effect generally occur in urban areas and centers where many buildings with dark roofs and asphalt paving are concentrated in a small area. Some ways to combat the heat island effect include installing green roofs, using light-colored roofing, and paving materials that do not absorb heat, and planting trees and vegetation.

Heavy Trucks, Truck Tractors: Heavy Trucks and Heavy Truck Tractors as used in the 2016 General Plan are defined as generally shown in *Figure 12-9*.

| | |
|---|---|
| HEAVY TRUCKS—20,001 lbs. to 45,000 lbs. GVW Many trucks other than light trucks will fall into this category. The manufacturer usually refers to these trucks as “2½ tons to 4½ tons” and in some cases up to “5 tons.” Although many of the 2½-ton trucks will have a gross registered weight 20,000 lbs. or less, the GVW given by the manufacturer must still be used. | |
| Concrete forms being brought to job site by building contractor; vehicle principally parked at the job location for most of the working day. Business use class is <i>Service</i> . |  |
| Delivery of furniture to retail customers by store. Business use class is <i>Retail</i> . |  |
| EXTRA HEAVY TRUCKS—over 45,000 lbs. GVW There are no separate business use classifications for vehicles falling into this weight category. All trucks in this category carry the same class and factor. Many trucks falling into this category will be the very large dump trucks and the larger mix-in-transit trucks. Vehicles in this weight range will have a nominal rating of 4½ tons and above. | |
| Mix-in-transit truck |  |

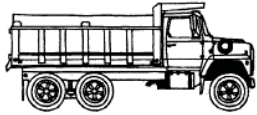

| | |
|---|---|
| Dump truck |  |
| HEAVY TRUCK TRACTORS—up to 45,000 lbs. GCW Tractors in this weight category are the smaller tractors and trucks equipped with a fifth wheel for hauling semi-trailers or mobile homes (known as toters). Strange as it may seem, this category includes those pickups that are equipped to pull semi-trailers used for the transportation of auto, fiberglass boats, etc., commonly referred to as hot shots. | |
| Tractor hauling mobile homes |  |
| Note 1: Very few tractors of this size exist. They are limited to tractors used for hauling very light loads. Note 2: When classifying tractors, please take care not to confuse GVW with GCW. GVW is given on tractors for registration purposes only and will always be less than the needed GCW. | |
| EXTRA HEAVY TRUCK TRACTORS—over 45,000 lbs. GCW The majority of tractors fall into this category. It does not matter if the tractor is single rear axle or dual rear axle. If the GCW is over 45,000 lbs., it is classified under this category. | |
|  |  |

Figure 12-9: Heavy Trucks and Heavy Truck Tractors (MAIPF)

Historic Property: Land or buildings that have been determined by the State, County, or City to have archaeological, historical, or architectural significance.

Historical Resources: Historical resources are places, buildings, or objects that represent periods in history and that meet local, State, or federal criteria for historic designation.

Hydrofluorocarbon (HFC): A gaseous compound that has been used as an ozone-safe replacement for CFCs, but that acts as a potent greenhouse gas.

Household: Refers to person or group of persons living in one dwelling unit.

Housing or “Dwelling” Unit: A building, a modular home, a mobile home, a cooperative, or any other residential use considered real property under State law and constructed upon a permanent foundation, with provisions for sleeping, cooking, and sanitation, and with permanent connections to utilities.

I

Impervious Surface: Surface through which water cannot penetrate, such as a roof, road, sidewalk, or paved parking lot. The amount of impervious surface increases with development and establishes the need for drainage facilities to carry the increased runoff.

Implementation Measure: Actions, procedures, programs, or techniques that are used to achieve goals and/or carry out policies.

Income, Above Moderate: A household whose income exceeds 120% of the Riverside County median income.

Income, Extremely Low: “Extremely Low Income Household” shall mean persons and families whose household income does not exceed the qualifying limits for Extremely Low Income Households as established and amended from time to time in California Health & Safety Code §50106, as such limits are published annually by the California Department of Housing and Community Development.

Income, Low: “Low Income Household” shall mean persons and families whose household income does not exceed the qualifying limits for lower income families as established and amended from time to time pursuant to Section 8 of the United States Housing Act of 1937, as such limits are published annually by the California Department of Housing and Community Development, pursuant to Section 50079.5 of the California Health and Safety Code.

Income, Area Median (AMI): “Area Median Income” shall mean the median household income for the County of Riverside, as published annually by the State of California Department of Housing and Community Development.

Income, Moderate: “Moderate Income Household” shall mean persons or families whose gross incomes do not exceed 120% of the median income adjusted for family size in accordance with adjustment factors adopted by the U.S. Department of Housing and Urban Development, as published annually by the California Department of Housing and Community Development, pursuant to Section 50093 of the California Health and Safety Code.

Income, Very Low: “Very Low Income Household” shall mean persons and families whose household income does not exceed the qualifying limits for Very Low Income Households as established and amended from time to time pursuant to §10105(a) of the California Health & Safety Code, as such limits are published annually by the California Department of Housing and Community Development.

Infill: Development on vacant properties that are essentially surrounded by urban development and inside the City limits.

Infill Housing: Development of housing on vacant lots within the City limits on property zoned for such uses.

Interim Open Space: A land-use category for areas that may be suitable for development someday, but that should be kept open until certain development constraints are overcome.

Inland Empire: A region in Southern California generally used to refer to the cities and unincorporated areas of western Riverside County and southwestern San Bernardino County. A generally broader definition includes eastern Los Angeles County cities in the Pomona Valley, or the desert community of Palm Springs, as well as its surrounding area; a much larger definition will include all of San Bernardino and Riverside counties.

In-lieu Fee: Cash payments that may be required of an owner or developer as a substitute for a dedication of land for public use, usually calculated in dollars per lot, and referred to as in-lieu fees or in-lieu contributions.

Insulation: Insulation means a material or the property of a material that resists the flow of heat from one place to another. Governmental codes and manufacturers' specifications use a measure called the "R-value" for this property. The higher the value, the greater is the resistance to heat or cold conduction.

Intelligent Transportation System: Advanced applications that aim to provide innovative services relating to different modes of transportation and traffic management, enabling various users to be better informed and make safer, more coordinated, and 'smarter' use of transportation networks.

J

Jobs/Housing Balance or Ratio: A ratio expressed as the number of jobs divided by the number of dwelling units in a defined geographic area, which is used to describe the adequacy of the housing supply to meet community needs as identified in the General Plan Housing Element.

Joint Use Site: Joint use sites include facilities and/or properties where long-term development and uses between the City and another agency have been established through a formal agreement.

L

Landslide: A general term for a falling, sliding, or flowing mass of soil, rocks, water, and debris. This includes mudslides, debris flows, and debris torrents.

Leadership in Energy and Environmental Design (LEED®): A voluntary, consensus-based national standard for developing and rating high-performance, sustainable "green" buildings and neighborhoods. LEED® provides a complete framework for assessing project performance and meeting sustainability goals, such as water

savings, energy efficiency, materials selection, and indoor environmental quality.

Levels of services, Streets (LOS): LOS is a qualitative measurement of the degree of congestion along a street section or at an intersection. LOS is described by a letter scale from A to F with Level of Service (LOS) “A” describing a free-flowing traffic, while LOS “F” describing a situation of extreme congestion. LOS E occurs when the volume of traffic approaches the road’s capacity. LOS E is characterized by low operating speeds and numerous delays with much congestion. LOS F represents a forced flow situation with more traffic attempting to use the road than it can handle. LOS F is characterized by stop-and-go traffic with numerous, lengthy delays.

Light Trespass: Unwelcome light spilling off originating property. Typical causes include poorly shielded lights that are aimed partially horizontally, not down, and too much light power.

Liquefaction: A process by which water-saturated granular soils transform from a solid to a liquid state during strong ground shaking.

Living Streets: Streets that embody complete streets (see Complete Streets definition in Glossary) and include consideration of other issues related to economic vibrancy, equity, environmental sustainability, aesthetics, and more. (from *Model for Living Streets Design Manual*, Los Angeles County, 2011)

Live-Work or Work-Live Unit: An integrated housing unit and work space, occupied and utilized by a single household in a structure, either single-family or multifamily, that has been designed or structurally modified to accommodate joint residential occupancy and work activities, and which includes: (1) complete kitchen and sanitary facilities in compliance with City building code, and (2) working space reserved for and regularly used by one or more occupants of the unit. The difference between “live-work” and “work-live” units is that the work component of a live-work unit is secondary to its residential use and may include only commercial activities and pursuits compatible with the character of a quiet residential environment, while the work component of a work-live unit is the primary use, to which the residential component is secondary.

Local Agency Formation Commission (LAFCO): A five- or seven-member commission within each county that reviews and evaluates all proposals for formation of special districts, incorporation of cities, annexation to special districts or cities, consolidation of districts, and merger of districts with cities. Each county’s LAFCO is empowered to approve, disapprove, or conditionally approve such proposals.

Local Street: A street providing access to all or part of a neighborhood and not carrying through traffic. See also the Circulation Element.

Low-Density Residential: A land-use category for dwellings that provide a sense of individual identity and neighborhood cohesion for the households occupying them, generally consisting of

detached, one- or two-story buildings, with private outdoor space separating them from neighboring dwellings and near other uses, which are supportive of, and compatible with these dwellings.

M

Major Land Use Actions: Any action related to proposed land uses (e.g., conditional use permit, rezoning, general plan amendment) for which compatibility with airport activities is of particular concern by the County of Riverside Airport Land Use Commission (ALUC), but for which ALUC review is not always required under state law. (*See Appendix 4.0 for more information*).

Major Remodel: See Remodel, Major.

Major Scenic Corridor: See Scenic Corridor, Major.

Minor Scenic Corridor: See Scenic Corridor, Minor.

Minor Remodel: See Remodel, Minor

Mitigation Banking: Mitigation banking is a method of resource or habitat protection. It is a method for compensating for unavoidable impacts of development. It involves a public or private entity creating, restoring, or preserving fish, plant, and wildlife habitats in advance of an anticipated need for actual mitigation. When habitat areas are created, a credit is created. When unavoidable impacts occur to habitat or a resource as a result of development, the developer (whether public or private) may utilize an existing credit created from previous successful habitat restoration, create an additional bank area, or pay a mitigation fee (as specified by the City).

Mitigation Fee: Mitigation fee is a fee paid to mitigate development impacts to creek, sensitive habitat, unique resource, or similar resources. This fee is paid to protect existing resources or buy land for the future protection of resources or habitat.

Mitigation Monitoring Plan: Mitigation Monitoring Plan is a plan and program to insure the proper implementation of mitigation measures identified in an environmental impact report or negative declaration with mitigation. It typically involves a monitoring and reporting process to document the implementation of all mitigation measures.

Mitigation Plan: Mitigation Plan is a plan, which provides for natural resources mitigation and long-term preservation.

Mixed-Use Development: Development in which various uses, such as office, commercial, manufacturing, institutional, and residential are combined in single building or in multiple buildings on a single parcel or on multiple, contiguous parcels, developed as integral unit with significant functional interrelationships and a coherent physical design; property designated “MU” on the City’s General Plan Land Use Map.

Mitigation: A specific action taken to reduce environmental impacts to insignificant levels. Mitigation measures are required as a component of an environmental impact report (EIR).

Mixed-Use: Any mixture of dwellings and commercial land uses on a single parcel or multiple contiguous parcels, such as dwellings combined with offices, retail, or other non-residential uses or multiple buildings with different uses on a single parcel where the different types of land uses are in proximity and planned as a unified, complementary and cohesive whole. As distinguished from a single-use land use designation or zone, mixed use refers to an authorized variety of uses for buildings and structures in a particular area.

Mixed-Use, Horizontal: Mixed-use, horizontal: Two or more different types of uses are placed next to each other, planned as a unit, and connected together with pedestrian and vehicular access. For instance, a subdivision containing single-family dwellings that is adjacent to a neighborhood commercial development and office complex.

Mixed-Use, Vertical: Where two or more different uses occupy the same building usually on different floors. For instance, retail on the ground floor and office and/or residential uses on the second and/or third floors (refer to Figure 12-10.)

Figure 12-10: Example of Vertical Mixed Use (State of Oregon Transportation and Growth Management Program)

Modal Shift: The percent change in the number of trips made within, or originating from, a specific geographic area during a defined period and using specific transportation methods or "modes," such as cycling, walking, riding public transit, and driving automobiles. For example, a modal shift increase of 15% in bicycle use means

that the number of bicycle trips in an area increased 15% over a previous period.

Multi-Family Dwelling: A dwelling that is part of a structure containing one or more other dwellings, or part of a non-residential use. An example of the latter is a mixed-use development where one or more dwellings are part of a structure that also contains one or more commercial uses (e.g., retail, office). Multi-family dwellings include duplexes, triplexes, fourplexes (buildings under one ownership containing two, three, or four dwellings, respectively, in the same structure), apartments (five or more units under one ownership in a single building), and townhouse development (three or more attached dwellings where no unit is located above another unit. It does not include Granny Flats or Secondary Dwelling Units.

Multi-Generational: Housing, City programs and facilities designed to meet the needs of a broad range of age levels – preschool and school age children, teens, adults, seniors.

Multi-Modal Transportation: Refers to multiple modes of transportation, including, but not limited to pedestrian, bicycle, automobile or transit forms of travel.

Municipal Project: A development project designed, funded, or carried out by the City of Jurupa Valley and described as a “capital project” in the City’s Financial Plan.

N

Natural Areas: An area of land largely unaltered by modern human activity, where vegetation is distributed in naturally occurring patterns.

Nitric Oxide (NO): A gaseous compound that may result from combustion or industrial processes. It is a precursor to nitric acid, which contributes to acid rain, and contributes to the depletion of stratospheric ozone.

Nitrogen Dioxide (NO₂): A reddish brown gas that is a byproduct of the combustion process and is a key to the ground-level ozone production process.

Nitrous Oxide (N₂O): A colorless gas that is byproduct of the combustion process and certain industrial process. It has certain industrial and clinical applications and is both a precursor to ground level ozone and a greenhouse gas.

Noise Contour: Areas around a noise source with equal levels of noise exposure. Noise contours are drawn similar to a topographic map.

Noise-Sensitive Use or Sensitive Land Use: A location where people reside or where the presence of unwanted sound could adversely affect land use. Sensitive land uses include schools, hospitals, senior housing and convalescent facilities, residential uses, places of worship, libraries, and passive outdoor recreation areas.

Native Plants: Native plants are those plant species that existed in California before the arrival of European explorers and settlers.

Natural State: Natural state means how a site would be found in nature under climax conditions and not altered appreciably by humans. Providing a natural state on a hillside or creek is to provide plants typical to that resource. Within a creek or wetland, an essentially natural state would allow some non-riparian vegetation [that would not negatively affect that resource] to remain or to be planted.

Neighborhood Commercial: Neighborhood Commercial is a commercial land-use category for businesses, which primarily meet the frequent shopping demands of people who live nearby, such as neighborhood grocery markets and drug stores.

New Development: New development means development projects that require discretionary planning approvals, engineering or building approvals or permits, but excludes single-family house remodeling or additions.

Noise Exposure Contours: Noise exposure contours are lines drawn around a noise source, indicating average levels of noise exposure, as shown in the Noise Element.

Noise Level Reduction (NLR): Noise level reduction, abbreviated “NLR,” is the arithmetic difference between the levels of sound outside and inside a building, measured in decibels, also referred to as “noise attenuation.” For example, if the sound level outside a house is 70dB and the level inside a room of the house is 45 dB, the NLR is 25 dB ($70 - 45 = 25$).

Noise-Sensitive Land Use: Noise-sensitive land use means residential land uses; hotels, motels, bed-and-breakfast inns, or hostels; schools; libraries; churches; hospitals and nursing homes; playgrounds and parks; theaters, auditoriums, and music halls; museums; meeting halls and convention facilities; professional offices; and similar uses as determined by the Community Development Director.

Non-Conforming Use: A land use that was lawfully established according to land use requirements that were in effect when the use was initiated.

O

Open Space: A land or water area, which remains in a predominantly natural or undeveloped state, and is generally free of structures. Such lands protect and preserve the community’s natural and historical resources, define the urban boundary, and provide visual and physical relief from urban development. Open spaces may consist of small portions of a parcel, such as small wilderness preservation areas, or large tracts of land. Such lands may include farming and grazing; creeks, marshes, watershed and floodplains; scenic resources; plant and animal habitat; historic and archaeological resources; and passive recreation areas.

Outdoor Activity Areas: Outdoor activity areas are patios, decks, balconies, outdoor-eating areas, swimming pool areas, yards of

dwellings, and other areas commonly used for outdoor activities and recreation.

Overlay: A land use designation or zoning designation that modifies the basic underlying land use designation or designations in some specific manner. Typically, the overlay provides additional or optional policies or standards, depending on the individual overlay.

Ozone (O₃): An oxidant, O₃, which at ground level makes up the largest single portion of smog. In the upper atmosphere, the presence of ozone acts as a protectant against harmful ultraviolet rays.

P

Paratransit: Transportation systems such as jitneys, carpooling, van pooling, dial-a-ride services and taxis that serve the specialized needs of groups such as the elderly or handicapped.

Parcel: An area of land defined by boundaries set by the Tax Assessor of the County of Riverside, roughly equivalent to the meaning of a “lot” for development purposes, and consisting of a single lot or contiguous group of recorded, legal lots under single ownership or control.

Park-In-Lieu Fees: Fees charged to sub-dividers in lieu of dedicating real property for parks. Fees are used to defray public costs of providing parks and recreation facilities to serve new residents, as allowed under State law (the Quimby Act).

Parkways: Park areas that provide a transition from one area to another, such as linear parks, landscape areas within public rights-of-way, and parkway arterial streets. A parkway arterial is an arterial street with landscaped medians and roadside areas where the number of cross streets is limited, direct access from fronting properties is discouraged and special street beautification measures are included.

Passive Recreation: Passive recreation means low-intensity recreational activities such as hiking, bird watching, nature photography, trails, individual picnic areas, nature study, viewing stations, interpretive areas, and similar uses.

Passive Recreation Area: A park or an area designed for lower levels of recreational activity, such as hiking, picnicking, nature study and similar activities that generally do not involve active uses such as team sports, playground equipment, or intensive landscape modification.

Passive Solar Energy System: Passive solar energy system (sometimes called a “direct” system) means a design that uses landscape and architectural features to collect and store energy directly, without any external, mechanical, or electrical power source. Such systems are nearly always used for heating or cooling space within a building. Many passive systems work best with some management by the occupant, such as opening windows or closing curtains.

Figure 12-11: Duplex Patio Home (houz buzz.com; American Style)

Patio Home: A patio home describes a type of attached housing, generally located in urban or suburban settings. The term is usually applied to two or more single-family houses sharing at least one wall and often with exterior maintenance and landscaping provided through a homeowners' association fee, *Figure 12-11*.

Peak Hour Traffic: Is the single period during the day when the greatest number of vehicles is using a street.

Pedestrian Path: Pedestrian Path is a walkway reserved for pedestrians that is not along or immediately adjacent to a street.

Practical Alternative: Practical alternative shall mean 1) the project's basic purpose could still be accomplished through either a redesign or a reduction in massing, scale, or density, or 2) if changes are required to the project's design, scale, or density, reasonable use of the subject property could still occur. Reasonable use of the property in the case of new development may include less development than indicated by zoning. In the case of additional development on an already developed site, reasonable development may mean that no additional development is reasonable considering site constraints and the existing development's scale, design, or density.

Prime Agricultural Land: Prime agricultural land means land, which the U.S. Soil Conservation Service considers Class I or Class II. These soils have few or no limitations for growing crops due to slope, depth, texture, drainage, or inherent fertility.

Prime Farmland: Prime farmland is the land that is best suited to producing food, feed, forage, fiber, and oilseed crops. It must either be used for producing food or fiber or be available for these uses. It has the soil quality, length of growing season, and moisture supply needed to produce a sustained high yield crops economically when managed properly. Prime farmland commonly has an adequate and dependable supply of moisture from precipitation or irrigation (as defined by the U.S. Department of Agriculture, Soil Conservation Service, Soil Survey of Jurupa Valley, CA, 1984).

Programs: Programs are general plan implementation actions which the City intends to take in pursuit of its goals and policies. Programs typically require the allocation of budget and staff resources to accomplish, and their achievement is measurable.

Proposed Endangered and Threatened Species: Proposed endangered and threatened species are those taxa for which a proposed regulation has been published in the Federal Register, but not a final rule.

Public Utilities: Public Utilities include telephone lines, electrical power lines, cable television, fire protection valves and related plumbing, traffic signal control boxes, and other equipment and facilities that are often placed above ground.

Parkland: The land included in the County of Riverside Regional Parks and Open Space District and the Jurupa Community Service District, Recreation, and Park system, which include public parks,

campgrounds and nature centers, playgrounds, sports fields, trails, open space and other park facilities.

Particulate Matter (PM₁₀): Minute, separate airborne solid or liquid particles including smoke, dust, aerosols, metallic oxides, and pollen.

Paseo: A walkway that allows pedestrians to travel between buildings, linking points of activity, and which are designed to provide a welcoming and aesthetically appealing experience through the use of architectural and landscape elements.

Peak Hour Traffic: The number of vehicles passing over a designated section of a street during the busiest one-hour peak A.M. and P.M. periods during a 24-hour period.

Peak Water Supply: The supply of water available to meet both domestic water and firefighting needs during the particular season and time of day when domestic water demand on a water system is at its peak.

Policy: A specific statement that guides decision-making. It indicates a commitment of the local legislative body to a particular course of action. A policy is based on and helps implement a general plan's goal or objectives. A policy is carried out by implementation measures. For a policy to be useful as a guide to action, it must be clear and unambiguous. Clear policies are particularly important when it comes to judging whether zoning decisions, subdivisions, public works projects, etc., are consistent with the General Plan.

Pedestrian Experience: The experience had by pedestrians while walking or exploring urban environments. The experience typically includes visual qualities of the streetscape, behaviors of other people, ability to access areas of interest, comfort, traffic density, and sidewalk safety.

Pedestrian Facilities. Facilities that enhance pedestrian experience, including but not limited to clean sidewalks, parkway plantings, street trees, plazas, bus stop signage and benches, trash receptacles (where appropriate), lighting and other features which help improve pedestrian safety, comfort and convenience.

Public View Corridor (also, "Designated Public View Corridor"): A view from a public right-of-way, public facility or other publicly-owned use area which is specifically designated in the General Plan and which provides the public at large with views of the Jurupa Mountains, Pedley Hills, Rubidoux Hills or Santa Ana River and floodplain. Approximate boundaries of a view corridor are identified using a motorists, cyclists, or pedestrians line of vision, and are typically defined or enframed by landforms, structures, and vegetation.

Figure 12-12: Paseo development, Southern California

Q

Quiet Zone: Areas along the railroad where improvements have been made such that trains are not required to sound their horns as they pass. Train engineers still may sound horns at their discretion if they perceive a safety risk.

Quimby Act: Authorizes cities and counties to pass ordinances requiring that developers set aside land, donate conservation easements, or pay fees for park improvements. Revenues generated through the Quimby Act must be used for the acquisition and development of park facilities.

R

RTA: An abbreviation for “Riverside Transit Agency,” a regional agency with broad responsibility for transportation program planning and operations, including public transit, Metrolink connections, park ‘n ride sharing, funding and grants.

Rare Species: Rare species are plant or animal species not necessarily threatened with extinction, but that occur in such small numbers that they may become endangered if their environment worsens.

Regional Housing Needs Assessment (RHNA): A determination of a locality’s housing needs by income category as determined by the local council of government (SCAG for Jurupa Valley) and based on State law, that takes into account various factors such as population growth, employment growth, vacancy rates, housing removals, and concentration of poverty. Since RHNA is based on regional growth projections, the RHNA is considered a city’s share of the regional projected housing demand. The RHNA represents a housing construction target to be accommodated by the City’s General Plan.

Rehabilitation: The repair, preservation, and or improvement of housing; and for historically designated structures, work done according to standards established by the U.S. Secretary of the Interior and described in the Secretary of the Interior’s Standards for the Treatment of Historic Properties and related documents.

Renewable Energy Source: Renewable energy source means a type of energy, which is more or less continuously flowing from source to potential user, such as sunlight, wind, tidal and wave action, growing plants, geologic heat, and difference between temperatures of layers of ocean water. Non-renewable sources include stocks of coal, oil, natural gas, uranium ore, and intermediate sources derived from them.

Restoration: Restoration is the process of returning a resource to a more natural state. Restoration includes planting vegetation native to that area, removing wildlife barriers, removing debris and trash, removing invasive non-native plant species, and other similar activities. It can also refer to changes to an historic building to return it to a more original condition, as defined by standards

established by the U.S. Secretary of the Interior. Restoration is not considered development.

Retrofit: Retrofit means to install a system or devices in an existing building or vehicle.

Riparian Vegetation: Riparian vegetation means vegetation and habitat characteristic of rivers and creeks or their edges.

Remodel, Major: Changes that significantly alter a building's design (e.g., additions that significantly change the footprint of the building, the addition of new stories, new roof design).

Remodel, Minor: Changes that leave the existing building footprint and structure essentially intact, with primarily cosmetic exterior and interior changes (e.g., paint, stucco, enlarged windows, small additions of less than 121 square feet).

Renewable Energy: Any naturally occurring, theoretically inexhaustible source of energy, as biomass, solar, wind, tidal, wave, and hydroelectric power, that is not derived from fossil or nuclear fuel.

Right-of-Way (ROW): The land on which a roadway and/or utilities is located. Highway and utility right-of-ways are owned and maintained by the agency having jurisdiction over that specific roadway or utility.

Riparian Corridor: A habitat and vegetation zone that is associated with the banks and floodplains of a river, creek, stream, or lake (see *Figure 12-8*).

Road Diet: A technique in transportation planning whereby the number of travel lanes in a roadway or its effective width is reduced to beautify the roadway, provide parking, meet multi-modal transportation or provide other system improvements.

Roadway Performance Evaluation: The evaluation of development impacts to roadways from a multimodal perspective. Evaluation measures other than standard automobile traffic levels of service have yet to be developed for the City of Jurupa Valley.

S

Safe Routes to Schools: Pedestrian and bicycle routes that provide safe access to and from schools.

Scenic Resources: Scenic Resources are resources having high aesthetic qualities, such as hills and mountains; creeks and other wetland resources; sensitive habitat and unique resources; and agricultural lands that contain grazing or cropland.

Scenic Roadways: Scenic Roadways are segments of Residential Arterial or Arterial streets, Regional Routes and Highways or Freeway that provide people with views of important scenic resources, as designated in the Conservation and Open Space Element.

Secondary Residential (or Dwelling) Unit: An attached or detached studio or one-room dwelling, with not more than 450 square feet of gross floor area and including permanent provisions for cooking,

sleeping and sanitation. A second residential unit must be located on the same parcel on which the primary dwelling unit is located, pursuant to requirements in Section 17.172.130 of the Zoning Ordinance.

Scenic Corridor: A scenic corridor is a linear segment of major or minor streets, designated to: 1) identify scenic highways and local arterials, 2) describe significant visual linkages between the resources and amenities of Jurupa Valley, and 3) establish objective design and landscaping criteria to maintain quality visual experiences along such corridors through appropriate landscaping, enhancement and protection of public views.

Second Unit: Small, separate living quarters located on the same site as a single-family detached home. A second unit can be rented, but cannot be sold separately from the main house.

Sensitive Habitats: See **Environmentally Sensitive Habitat Areas**

Sensitive Land Uses: See Noise-Sensitive Use.

Sensitive Receptors: Include those segments of the population that are most susceptible to poor air quality, such as children, elderly people, and sick people, as well as sensitive land uses, such as schools, hospitals, parks, and residential communities. Air quality problems intensify when sources of air pollutants and sensitive receptors are located near one another.

Shall vs. Should: When “shall” is used in a policy it indicates that the policy will always be carried out; no exceptions. When “should” is used in a policy, it indicates that the policy will be carried out most of the time, unless the City Council indicates why an exception is warranted.

Significant: Significant means a substantial, or potentially substantial, adverse change in the environment, as defined by the California Environmental Quality Act (CEQA).

Significant Wetland: Means those wetlands that are important because of their uniqueness or because they provide habitat for rare, endangered, or threatened plants or animals.

Single-family Dwelling, Detached: A dwelling occupied or intended for occupancy by only one household, and which is structurally and physically separate from any other such dwelling.

Single Room Occupancy (SRO) Unit: A single-room dwelling, typically 80-250 square feet in floor area, with a sink and a closet, with communal or individual facilities for cooking and sanitation.

Single-Occupant Vehicle: A motor vehicle occupied only by the driver.

Slope Failures: Includes two types, major slide masses such as landslides and minor soil slips like mud or debris flows. Slope failures can occur on natural or manmade slopes. Failures are often the result of interrelated natural hazards, earthquake-induced rock fall, or storm induced mudflows.

Small Residential Care Facility: Small residential care facility means a home for not more than six people who need supervision or help with daily activities.

Solar Access: Solar access means exposure of a solar collector or passive system to the amount and duration of sunlight necessary for the successful operation of the system. As used in this General Plan, “reasonable solar access” means that solar collectors or passive system can be located to receive full, unobstructed sunlight between the hours of 10:00 a.m. and 3:00 p.m. on winter solstice, December 21.

Solar Collector: Solar collector means a device, which transforms sunlight striking it into another form of energy, such as heat, electricity, or chemical potential.

Sound Transmission Class: Sound transmission class, abbreviated “STC,” is a single-number rating of the amount of noise reduction provided by a window, door, or other building component. The higher the STC rating, the more effective the component will be in reducing noise. Windows and doors having a minimum STC rating are sometimes required to ensure that a building façade will achieve a minimum Noise Level Reduction (NLR). However, STC ratings cannot be subtracted from exterior noise exposure values to determine interior noise exposure values.

Special Needs: Persons who require reasonable accommodations as defined under the Americans with Disabilities Act, or as otherwise described in the Housing Element.

Specialty Store: Specialty store is one, which offers a limited range of typically small consumer items to a wide market area, such as a shoe store, bookstore, or tobacco shop.

Specific Plan: Specific plan is a document adopted by the City to show land uses, roads, utilities, other public facilities, and development timing in more detail than the general plan, but not so precisely as subdivision maps or construction plans. As provided in Article 8 of the Government Code (Section 65450 et. seq.), a legal tool for detailed design and implementation of a defined portion of the area covered by a general plan. A specific plan may include all detailed regulations, conditions, programs, and/or proposed legislation, which may be necessary or convenient for the systematic implementation of any General Plan element(s). The contents are similar to those of a general plan except they will be more comprehensive with respect to utilities, public facilities, and their funding. If a specific plan essentially provides more detailed policy guidance, it is a “policy” level plan and is adopted by resolution. If it establishes development regulation, it is a “regulatory” specific plan and becomes customized zoning for the affected property, and is adopted by ordinance.

Sphere of Influence (SOI): The probable, ultimate physical boundaries and service area of the city, as determined by the Local Agency Formation Commission (LAFCO) of the county.

Stationary Noise Source: Stationary noise source is any noise source not preempted from local control by Federal or State regulations. Examples of such sources include industrial and commercial

facilities, and vehicle movements on private property (such as parking lots, truck terminals, or auto racetracks).

Storm Water Runoff: Storm water runoff refers to seasonal rainfall flows. It is very noticeable during a heavy rainstorm when large volumes of water drain off paved areas.

Stream: See **Creek**.

Street Right-of-Way: Street Right-of-Way is a strip of land that contains public facilities such as streets and highways (including paved and unpaved shoulders), bike lanes, sidewalks, landscaped areas, and utilities.

Structure: Structure means anything assembled or constructed on the ground, or attached to anything with a foundation on the ground.

Subdivision: The division of a lot, tract, or parcel of land into two or more lots, tracts, parcels, or other divisions of land for sale, development, or lease.

Subsidence: The gradual sinking of land because of natural or fabricated causes.

Sulfur Dioxide: The chemical compound with the formula SO_2 . It is a toxic gas with a pungent, irritating smell that is released in various industrial processes.

Sustainability: Sustainability or “Sustainable” means an activity, system, procedure, resource, or material that is used or implemented in a manner that does not compromise the ability of future generations to meet their own needs.

T

Taxa: Taxa refers to any species or subspecies of a bird, mammal, fish, amphibian, reptile, invertebrate, or plant.

Tenure, Housing: The mode or status of residency, whether by renting or owning real property.

Threatened Species: Threatened species are any species likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range as identified by the U.S. Fish and Wildlife Service or the California Department of Fish and Wildlife.

Through Traffic: Through traffic consists of motorists who drive through an area where neither their origin nor their destination is within the area.

Tourist Commercial: Tourist Commercial is a land-use category for businesses, which primarily serve visitors and the traveling public, such as motels, gas stations, and restaurants.

Traffic Reduction Programs: Any activity that promotes use of alternative forms of transportation.

Transitional Housing: Housing provided to homeless persons, abused women or children, or other persons with special housing needs for a temporary period, and generally integrated with other social services and programs including counseling, education, and

training to assist in the transition to self-sufficiency through gaining stable income and permanent housing.

Transportation Noise Source: Transportation noise source means traffic on public roadways, rail line operation, and aircraft in flight. Control of noise from these sources is preempted by federal and state regulations. However, the effects of noise from transportation sources may be controlled by regulating the location and design of land uses affected by transportation noise sources.

Trip: Trip means a person traveling from one place (origin) to another (destination).

Traffic Calming: Measures designed to reduce motor vehicle speeds and to encourage pedestrian use, which may include but are not limited to the following:

- Narrow streets
- Tight turning radii
- Sidewalk bulbouts
- Parking bays
- Textured paving at intersections
- Parkways between sidewalks and streets
- Chicanes
- Speed tables

Transit Oriented Development (TOD): Residential and commercial areas designed to maximize access by public transportation, such as trains and buses. TODs typically have a neighborhood center with a transit station, surrounded by relatively high-density development, with progressively lower-density spreading outwards.

Transportation Demand Management: Application of strategies and policies to reduce travel demand (specifically that of single-occupancy private vehicles), or to redistribute this demand in space or in time.

U

Underutilized Site: A site that has the land area capacity to accommodate additional dwelling unit(s) or non-residential floor area while meeting all General Plan policies and all zoning regulations, including setbacks, building height and lot coverage requirements without the application of variances.

Universal Design: Universal design is the design of products and environments to be usable by all people, to the greatest extent possible without the need for adaptation, specialized equipment, or design.

Unincorporated Area: Encompasses properties that are located outside of cities. Development in the unincorporated area is subject to County jurisdiction.

Universal Access: Accessibility to buildings, facilities, and services to both people without disabilities and people with disabilities.

Urban Forest: Collectively refers all of the trees growing within the City of Jurupa Valley. The urban forest can include the trees along streets, within parks and other public spaces, or in the yards of private citizens.

Urban Runoff: Urban runoff can happen anytime of the year when excessive water use from irrigation, car washing, and other sources carries litter, lawn clippings and other urban pollutants into storm drains. Even automobile leading motor oil 20 miles inland can still pollute the ocean.

V

Value: See Community Value.

Vegetative Cover: Collective term for vegetation covering the ground.

Vehicle Trip: A trip made by a vehicle (may equal one or more person-trips).

View: View refers to a person's opportunity to see a scenic or visual resource from a stationary point or a moving vehicle on a major street, as described in the Conservation and Open Space Element.

View Corridor or Public View Corridor: See **Scenic Corridor**.

Viewshed: Viewshed is the area that can be seen from a scenic roadway.

Vista: Same as **View**.

Visually Open Fence: A fence designed to avoid obstructing views.

W

Warehouse Store: Warehouse store is a large retail or wholesale store which sells items primarily in bulk quantities or containers, and which has minimal range of brands and minimal display space that is separate from storage areas.

Wastewater: Is water that has already been used (i.e., for washing, flushing, or in manufacturing), and therefore contains waste products such as sewage or chemical byproducts.

Watershed: The total area above a given point on a watercourse that contributes water to the flow of the watercourse; the entire region drained by a watercourse.

Wayfinding: Ways in which people orient themselves in physical space and navigate from place to place. Signage is an obvious wayfinding method. Other methods include continuous landscaping, visible landmarks, distinctive paving/sidewalks, etc.

Wetlands: An area that is inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions, commonly known as hydrophytic vegetation.

Wildlife Corridor: A wildlife corridor means a creek way, trail, path, culvert, underpass or overpass, open space or other linear feature that provides the conditions necessary to allow wildlife to move

safely through urban areas, or across barriers to wildlife movement such as, but not limited to arterial streets and highways.

Winter Solstice: Winter solstice means the day – usually December 21– when the sun is lowest in the southern sky and the period of daylight is shortest. (The summer solstice is the day when the sun is at its most northern position at noon and the period of daylight is longest. It occurs June 21.)

Wildland Fire: A fire occurring in a suburban or rural area, which contains uncultivated lands, timber, range, watershed, brush, or grasslands. This includes areas where there is a mingling of developed and undeveloped lands.

X

Xeriscape: Landscaping that uses water-conserving, drought-tolerant plant species that are environmentally and horticulturally adapted to local conditions, and which uses design strategies to minimize water use while maintaining an attractive and neat appearance.

Z

Zoning Ordinance: Title 17 of the City of Jurupa Valley Municipal Code, also known as the Riverside County Land Use Ordinance, which has been adopted by the City as amended.

WESTERN RIVERSIDE COUNCIL OF GOVERNMENTS

SUBREGIONAL CLIMATE ACTION PLAN

FINAL REPORT
SEPTEMBER 2014

A Letter to the Subregion

It is a pleasure to present the Western Riverside Council of Governments (WRCOG) Subregional Climate Action Plan, the result of over three years of collaborative efforts among community leaders, industry experts, renowned scientists and consultants, and local governments. This plan describes the effects climate change could have on our subregion and suggests ways we can work together to address these challenges and reduce our collective carbon footprint while concurrently growing the economy and improving community livability and public health.

In 2012, WRCOG made a commitment to achieve a sustainable quality of life by adopting a Sustainability Framework for Western Riverside County. The Framework is a blueprint that serves as a beginning point to establish, implement, and continuously refine a subregional sustainability plan for jurisdictions within WRCOG. The Framework presents a practical, integrated approach to sustainability which consists of six core components: Economic Development, Education, Health, Transportation, Water and Wastewater, and Energy and the Environment. WRCOG continues to demonstrate leadership in implementing programs that are environmentally, economically, and socially beneficial to the subregion including innovative award winning programs such as the HERO Program—an energy efficiency and water conservation financing program, the Transportation Uniform Mitigation Fee (TUMF), the Western Riverside Energy Leader Partnership (WRELP), and the Western Riverside County Clean Cities Coalition.

We believe our efforts demonstrate that implementing sustainable practices creates green jobs and a better economy, and makes our subregion a cleaner, safer, more enjoyable place to live. As you will notice in this report, some of the steps we need to take, such as investing in transportation infrastructure, require the involvement of the state and federal government. But many other important, and simple, steps can be achieved at the local level, such as driving less and walking more, using energy-efficient light bulbs, or turning down the thermostat a few degrees in the winter.

This Climate Action Plan provides a roadmap—a set of ideas—to help expand on our successes to slow the effects of climate change. It's no secret that this will require an enormous amount of hard work and cooperation. It will require the commitment of not only government, but of communities, individuals and businesses in our subregion. Our goal is to make WRCOG a vibrant example of how a subregion can collaborate to achieve climate protection goals and, as a result, enhance quality of life for all its residents and businesses. We are confident that if we can embrace this common challenge with creativity and commitment, WRCOG and its member jurisdictions will continue to lead the effort toward a sustainable future.

Sincerely,

Rick Bishop
Executive Director

Acknowledgements

The preparation of the Subregional Climate Action Plan was funded by a Sustainable Communities Planning Grant through California's Strategic Growth Council. The Strategic Growth Council, created in September 2008 by Senate Bill 732, is a cabinet level committee that is tasked with coordinating the activities of member state agencies to improve air and water quality, improve natural resource protection, meet the goals of the California Global Warming Solution Act of 2006, encourage sustainable land use planning, and revitalize urban and community centers in a sustainable manner. The Sustainable Communities Planning Grant Program is funded by The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84).

We would like to especially thank the WRCOG Planning Directors' Technical Advisory Committee for their leadership and passion for the project and the communities of Western Riverside County.

WRELP – Western Riverside Energy Leader Partnership

Executive Summary

Climate change is occurring and needs to be addressed to successfully prepare for a sustainable future in which residents are healthy, businesses thrive, and communities prosper. The Western Riverside Council of Governments (WRCOG) tactic to mitigating climate change is to take a unified, collaborative approach and develop this Subregional Climate Action Plan (CAP). The objectives are to create more livable, equitable, and economically vibrant communities. By using energy more efficiently, harnessing renewable energy to power our buildings, enhancing access to sustainable transportation modes, recycling our waste, conserving water, and building local food systems, we can keep dollars in our local economy, create new green jobs, and improve public health and community quality of life. By integrating these elements, the WRCOG Subregional CAP will:

- **Create Local Jobs:** The technologies, products and services required for the shift to a low-carbon future can be provided by employers in our communities. Dollars currently spent on fossil fuels will no longer leave our economy. They will stay here to pay for home insulation; lighting retrofits; solar panels; bicycles; and engineering, design, and construction of more sustainable communities. WRCOG's adopted Sustainability Framework prioritizes sustainability as a key economic engine of the subregion, and our HERO financing program is a prime example of our success. HERO has created more than 1,700 jobs since its inception in 2011.

- **Promote Healthier Communities:** Walkable and bikeable neighborhoods, fresh foods, and clean air provide healthier, more active lifestyle options for our residents. Healthy communities are areas where public health and climate action policy priorities intersect, creating new active transportation and living options, enhancing access to nutritious foods, and improving our quality of life and environment.

- **Become More Energy Self-Sufficient:** Actions in this CAP will help reduce our reliance on fossil fuels. As energy prices continue to increase and supplies become more uncertain, reduced reliance on volatile oil supplies will diminish risks faced by everyone.

- **Enhance Social Equity:** Disparities among residents can be reduced by ensuring that communities most vulnerable to climate change effects are given priority for green jobs, healthy local food, energy-efficient homes and affordable, efficient transportation. We can also improve equity by ensuring that these communities are enabled to implement the CAP in a meaningful and engaging way.

- **Reduce Emissions, Improve Air Quality, and Protect Natural Systems:** Reducing GHG emissions from major sources helps protect and improve the air we breathe and the environment in which we live. Sustaining the values and functions of our habitat is an essential strategy that can simultaneously reduce emissions, sequester carbon and strengthen our ability to adapt to a changing climate. Healthy watersheds and ecosystems are an integral part of a sustainable Western Riverside County.

- **Save Money:** Using less energy in our homes, buildings and vehicles means lower energy and transportation bills for residents, business and government. Residents and local governments can also realize health-care cost savings inherent to a healthier, more active community.

Twelve cities in our subregion have joined efforts to develop this Subregional CAP, which sets forth a subregional emissions reduction target, emissions reduction measures, and action steps to assist each community to demonstrate consistency with California's Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32).

MEASURING OUR EMISSIONS

To ensure that the subregion stays on course to meet its greenhouse gas (GHG) reduction target, it is necessary to track our progress by conducting regular, community-wide GHG emissions inventories. It helps to think of an inventory as a "snapshot" of our subregion's GHG emissions for a given year. An inventory identifies the major sources and quantity of GHG emissions produced by residents, businesses, and public institutions. In 2010, Subregional CAP cities emitted approximately 5,834,400 metric tons of GHG emissions. Figure ES-1 below illustrates these emissions by source.

Figure ES-1: Baseline Greenhouse Gas Emissions by Source

The inventory reflects the emissions that result from motor vehicles driven, electricity and natural gas consumed, waste generated, water consumed, and wastewater treated within participating

jurisdictions' limits. It provides a useful tool to track community and local government emissions over time, and to target climate protection strategies to address the main emissions sources.

REDUCING OUR EMISSIONS

WRCOG's subregional emissions reduction targets are 15% below 2010 levels by 2020, and 49% below 2010 levels by 2035. This plan focuses on feasible actions Western Riverside County communities can and should take between now and 2020, as well as innovative approaches currently beyond our current reach that will be needed to achieve the 2035 target. Based on forecasted emissions levels, a 15% reduction from 2010 levels equates to a GHG emissions reduction of nearly 2,330,647 metric tons below business-as-usual (BAU) conditions by 2020, as shown in Figure ES-2. This CAP identifies objectives and actions in four categories to set the subregion on a path to meet our 2020 GHG emission target.

Figure ES-2: WRCOG Subregion—Community GHG Business as Usual Forecasts and Reduction Target for 2020

*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted in Chapter 2.

TAKING ACTION

This CAP includes feasible strategies that will help the WRCOG subregion advance toward GHG emissions reduction goals, while affording our communities other economic and environmental benefits. The Plan builds upon existing successes and encompasses a range of strategies from expanding the successful HERO program, to increasing residential and business recycling, to reducing vehicle miles traveled, and increasing energy efficiency. It offers cost-effective strategies that will support our local economy; reduce risks for energy and fuel price increases and volatility; and offer a wide range of other

environmental, social, and economic benefits. Actions that reduce GHG emissions also support other local community goals and contribute to sustaining the WRCOG subregion as a vibrant community.

The CAP contains GHG reduction measures organized into four primary sectors, as follows:

ENERGY

- Energy measures will increase community-wide building and equipment efficiency and renewable energy use, and promote energy efficiency and renewable energy generation throughout our communities, supporting municipal operations.

TRANSPORTATION AND LAND USE

- Transportation and land use measures will reduce single-occupancy vehicle travel, increase non-motorized travel, improve public transit access, increase motor vehicle efficiency, and promote sustainable growth patterns.

SOLID WASTE

- Solid waste measures will reduce community and municipal solid waste sent to landfills.

WATER

- Water measures will increase community water conservation and reduce water consumed to support municipal operations in our communities.

If fully implemented, the CAP will exceed our 2020 goal by 2.1%, achieving an overall 17.1% reduction in GHG emissions by 2020. Annual progress reports will allow the Plan to evolve along with local budget priorities, carbon markets, and technology.

REALIZING OUR GOALS

While measuring GHG emissions, establishing reduction targets, and developing a CAP are essential steps, the most important work lies ahead: **Implementation.**

Turning this plan into action rests on more than just good ideas and intentions. It requires residents, businesses, municipal governments, and other institutions in our communities to rise to the challenge of change. Infrastructure, technology, workforce development, and our daily decisions must reflect these goals.

The CAP recommends strategies to support individuals' and businesses' efforts to consume less energy, move more efficiently, and produce less waste. Implementing the plan will, for example, increase access to public transit and make it safer to commute by foot or bicycle, provide incentives to make homes and businesses more energy efficient, and increase the convenience of recycling and composting waste.

WRCOG is committed to leading the region toward a more sustainable future by realizing the goals set forth in this plan. How can **you** contribute?

Western Riverside County is establishing itself as a leader in energy efficiency and sustainability efforts and each of WRCOG's member jurisdictions are addressing climate change through different local programs. Twelve cities in Western Riverside County have joined efforts to develop this Subregional CAP, which sets forth a subregional emissions reduction target, emissions reduction measures, and action steps to assist each community to demonstrate consistency with California's Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32). Several jurisdictions in the WRCOG subregion have already adopted a local CAP, or are in the process of doing so. **Table 1-1** below illustrates which jurisdictions are participating in this Subregional CAP effort, and also lists additional sustainability programs that jurisdictions participate in relevant to the subregional CAP. The WRELP Program is a collaboration between WRCOG Southern California Edison (SCE), and the Southern California Gas Company (SCG), which includes the development of Energy Action Plans for 11 communities. Several jurisdictions are participating in separate partnership efforts with SCE, also targeting energy efficiency. Four of WRCOG's member jurisdictions have municipally-owned utilities, which provide energy and/or water and wastewater services to their communities and pursue individual efficiency and sustainability efforts.

AB 32 directs California to reduce statewide GHG emissions to 1990 levels by 2020. To achieve these reductions, the California Air Resources Board (CARB) recommends that local governments target their 2020 emissions at 15% below “current”¹ levels, consistent with the statewide commitment, to account for emissions growth that has occurred since 1990. Several initiatives at the state level will help the subregion reduce GHG emissions, but they alone will not be sufficient to meet the 2020 target. This CAP provides a roadmap for individual communities in the subregion to reduce GHG emissions through local actions.

The release of GHGs into the atmosphere is the direct and indirect result of everyday activities as residents and businesses use energy in their homes and offices, travel to work, generate waste, and use water. Local governments also emit GHGs as they perform essential services and operate buildings, vehicles, street lights, traffic signals, water systems, and wastewater plants. Strategies in this CAP to reduce such emissions include increasing energy efficiency in buildings and facilities, utilizing renewable energy sources, increasing vehicle fuel efficiency, supporting alternative modes of transportation, reducing waste generation, and reducing water consumption. In addition to addressing climate change, reducing GHG emissions often provides co-benefits such as reducing energy and transportation costs for residents, businesses, and local governments; creating green jobs and supporting advancement of green technologies and industries; improving air quality and the overall health of residents; and making the community a more attractive place to live and locate a business.

The WRCOG Subregional CAP is the result of an analysis of existing GHG reduction programs and policies that have already been implemented in the subregion and of applicable best practices from other regions to assist in meeting the 2020 subregional reduction target. The resulting GHG reduction measures were chosen by the subregion based on their GHG-reduction potential, cost-benefit characteristics, funding availability, and feasibility of implementation. The level of implementation of each measure was determined by each community; however, this CAP presents the results collectively, demonstrating the collaborative effort and partnership that will facilitate implementation.

This CAP is organized into four chapters:

- **Chapter 1, Introduction:** provides the framework for the CAP, places the CAP in the context of current climate change science and policy, describes existing regional and local sustainability efforts and accomplishments, and discusses the CAP’s relationship to the California Environmental Quality Act (CEQA).
- **Chapter 2, Emissions Inventory, Projections, and Goals:** describes the emissions inventory process and results, forecasted business-as-usual emissions for the subregion, and the adopted subregional emissions reduction target.
- **Chapter 3, Reduction Measures and Actions:** contains the anticipated State and federal emissions reductions, and the local reduction measures and actions that will be implemented to meet the subregional reduction target.
- **Chapter 4, Implementation and Monitoring:** provides best practices and specific resources for implementing reduction measures, the role for measure-specific evaluations, periodic updates to the inventories, the use of indicators to monitor the subregion’s progress, and the need for future iterations of the CAP to incorporate new data and reduction measures as they become available.

¹ “Current” is a term used by CARB in its Climate Change Scoping Plan of September 2008, but is undefined. It is generally taken to mean emissions for a year between 2005 and 2008, although other years have been used by local communities.

GREENHOUSE GAS EMISSIONS IMPACTS

Naturally occurring gases dispersed in the atmosphere determine the Earth's climate by trapping infrared radiation (heat). This phenomenon is known as the greenhouse effect and without it, the Earth would be about -2°F. Overwhelming evidence shows that human activities are increasing the concentration of GHGs in the atmosphere, trapping more heat, and changing the global climate. The most significant contributor is the burning of fossil fuels for transportation, electricity generation, and other purposes, which introduces large amounts of carbon dioxide and other GHGs into the atmosphere. Collectively, these gases intensify the natural greenhouse effect, causing global average surface and lower atmospheric temperatures to rise, a phenomenon known as global climate change.

The most important GHGs to reduce are carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O), which constitute over 98% of human-released GHGs in the U.S.² Other important GHGs include hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆). These gases are emitted through a variety of natural processes and human activities (see **Figure 1-2**), including:

- Fossil fuel combustion (CO₂, N₂O, and CH₄);
- Agricultural operations, such as fertilization of crops (N₂O), livestock production, and rice cultivation (CH₄);
- Anaerobic composting and landfill off-gassing (CH₄);
- Refrigeration and cooling (HFCs); and
- Industrial manufacturing, including aluminum production (PFCs), semi-conductor manufacturing (SF₆), and cement production (CO₂).

Figure 1-2: Greenhouse Gases Regulated Under AB 32

Global Warming Potential (GWP) is a quantitative measurement that expresses the relative warming potency of each GHG over a specific period of time. CO₂ is assigned a GWP value of 1 and the other GHGs are assigned GWPs relative to CO₂. For GHG emission inventories, the amount of each gas emitted is multiplied by its GWP and presented in units of carbon dioxide equivalents (CO₂e). **Table 1-2** lists the six primary GHGs as defined in AB 32, their chemical formula, the lifetime of the compound, and their

² U.S. Environmental Protection Agency, 2011, <http://www.epa.gov/climatechange/ghgemissions/gases.html>

GWPs relative to CO₂. Although CO₂ has a lower GWP than other GHGs, it is the largest contributor to human-caused global warming, constituting about 84% of U.S. emissions.³

Table 1-2: Greenhouse Gases Regulated Under AB 32

| Greenhouse Gas | Chemical Formula | Lifetime (years) | Global Warming Potential for 100-year horizon |
|---------------------|------------------|------------------|---|
| Carbon Dioxide | CO ₂ | Variable | 1 |
| Methane | CH ₄ | 12 | 21 |
| Nitrous Oxide | N ₂ O | 114 | 310 |
| Sulfur Hexafluoride | SF ₆ | 3,200 | 23,900 |
| Hydrofluorocarbons | HFCs | 1.4 – 270 | 140 – 11,700 |
| Perfluorocarbons | PFCs | 1,000 – 50,000 | 6,500 – 9,200 |

Source: International Panel on Climate Change (IPCC) Second Assessment Report: Climate Change 1995 (SAR). Available at: http://www.ipcc.ch/publications_and_data/publications_and_data_reports.shtml

Note: According to the Local Government Operations Protocol (LGO Protocol) and the U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions (Community Protocol), the GWP values in **Table 1-2** were applied in this CAP. Since the SAR was published in 1995, the IPCC has published updated GWP values in its Third Assessment Report (TAR) and Fourth Assessment Report (AR4) that reflect new information on atmospheric lifetimes of GHGs and an improved calculation of the radiative forcing of CO₂. However, GWP values from the SAR are still used by international convention to maintain consistency in GHG reporting. For GWP values that were not quantified in the SAR, GWP values from the TAR were used.

While the anticipated effects of climate change are likely to vary regionally, it is anticipated to have the following global effects⁴:

- Higher maximum temperatures and more hot days over most land areas;
- Higher minimum temperatures, fewer cold days, and frost days over most land areas;
- Reduced diurnal temperature range over most land areas;
- Increased heat index over land areas; and
- More intense precipitation events.

Many secondary effects are anticipated to result from climate change in California, including: loss in snow pack; sea level rise and inundation of coastal areas; increased flooding of low-lying areas; more extreme heat days per year; high ozone days; increased incidence of large forest fires; and more frequent and severe drought years.

REGULATORY CONTEXT

Many strategies for monitoring and addressing climate change have emerged at the international, national, and state levels. California remains a leader in the effort to reduce GHG emissions through mitigation and adaptation strategies. With AB 32, California is the first state in the U.S. to mandate GHG emissions reductions across its entire economy. To support AB 32, California has been developing policy and passing legislation that seeks to control emissions of gases that contribute to climate change. These have included regulatory approaches such as mandatory reporting for significant sources of GHG emissions and caps on emission levels, as well as market-based mechanisms, such as cap-and-trade. Voluntary local actions are also increasing, such as conducting emissions inventories, implementing practices to reduce emissions, and purchasing offsets and renewable energy certificates. While many local actions are currently voluntary, there is more emphasis being placed on monitoring and reporting emissions to demonstrate the effectiveness of policies and local consistency with state reduction goals. The following section highlights the primary state legislation and guidance related to this CAP.

STATE LEGISLATION AND GUIDANCE

AB 32, also known as the Global Warming Solutions Act of 2006, directs public agencies in California to support the statewide goal of reducing GHG emissions to 1990 levels by 2020. Preparing a CAP supports AB 32 at the local level. The CAP provides a policy framework for how the subregion can do its part to reduce emissions. While compliance with AB 32 is not a requirement for local jurisdictions, demonstrating consistency with statewide reduction goals can significantly assist WRCOG jurisdictions in qualifying for incentives such as grant funding. Efforts to address climate change, reduce consumption of resources, and improve energy efficiency led by state legislation or programs are briefly described below and identified in **Figure 1-3**.

Executive Order S-3-05

On June 1, 2005, Governor Arnold Schwarzenegger signed Executive Order (EO) S-3-05, which established the following GHG emission reduction targets:

- by 2010, California shall reduce GHG emissions to 2000 levels;
- by 2020, California shall reduce GHG emissions to 1990 levels; and
- by 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

EO-S-3-05 created the California Climate Action Team (CAT), which is tasked with the preparation of biennial science assessment reports on climate changes and adaptation options for California. The first CAT Report to the Governor and Legislature was published in 2006, and contains recommendations and strategies to help meet the targets in EO-S-3-05. These were expanded upon in the 2009 CAT Biennial Report to the Governor and Legislature. The new information includes revised climate and sea-level projections, and an evaluation of climate change within the context of broader social changes, such as land-use changes and demographic shifts⁵. The action items in the report focus on the preparation of the Climate Change Adaptation Strategy, required by EO-S-13-08.

⁵ California EPA - Climate Action Team Report to Governor Schwarzenegger and the Legislature, March 2006. Available at: http://www.climatechange.ca.gov/climate_action_team/reports/index.html

Assembly Bill 32 – California Global Warming Solutions Act of 2006

AB 32 was approved by the legislature and signed by Governor Schwarzenegger in 2006. The landmark legislation requires CARB to develop mechanisms that will reduce GHG emissions to 1990 levels by 2020. Mandatory actions under the legislation to be completed by CARB include:

- Identification of early action items that can be quickly implemented to achieve GHG reductions. These early action items were adopted by CARB in 2007 and include regulations affecting landfill operations, motor vehicle fuels, car refrigerants, and port operations, among other regulations.
- Development of a scoping plan⁶ to identify the most technologically feasible and cost-effective measures to achieve the necessary emissions reductions to reach 1990 levels by 2020. The Scoping Plan identifies a variety of GHG reduction measures that include direct regulations, alternative compliance mechanisms, incentives, voluntary actions, and market-based cap-and-trade program. The Plan identifies local governments as strategic partners to achieving the state goal and translates the reduction goal to a 15% reduction of current emissions by 2020.
- Creation and adoption of regulations to require the state’s largest industrial emitters of GHGs to report and verify their emissions on an annual basis.

Senate Bill 97 – California Environmental Quality Act Guideline Amendments of 2007

Senate Bill (SB) 97 was adopted in 2007 and directed the Governor’s Office of Planning and Research (OPR) to amend the CEQA Guidelines to address GHG emissions. The CEQA Guidelines prepared by OPR were adopted in December 2009 and went into effect March 18, 2010. Local governments may use adopted plans consistent with the CEQA Guidelines to assess the cumulative impacts of projects on climate change, if the plan for the reduction of GHG emissions accomplishes the following:

- Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area.
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area.
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level.
- Establish a mechanism to monitor the plan’s progress toward achieving the level and to require an amendment if the plan is not achieving specified levels.
- Be adopted in a public process following environmental review.

SB 375 – Sustainable Communities and Climate Protection Act of 2008

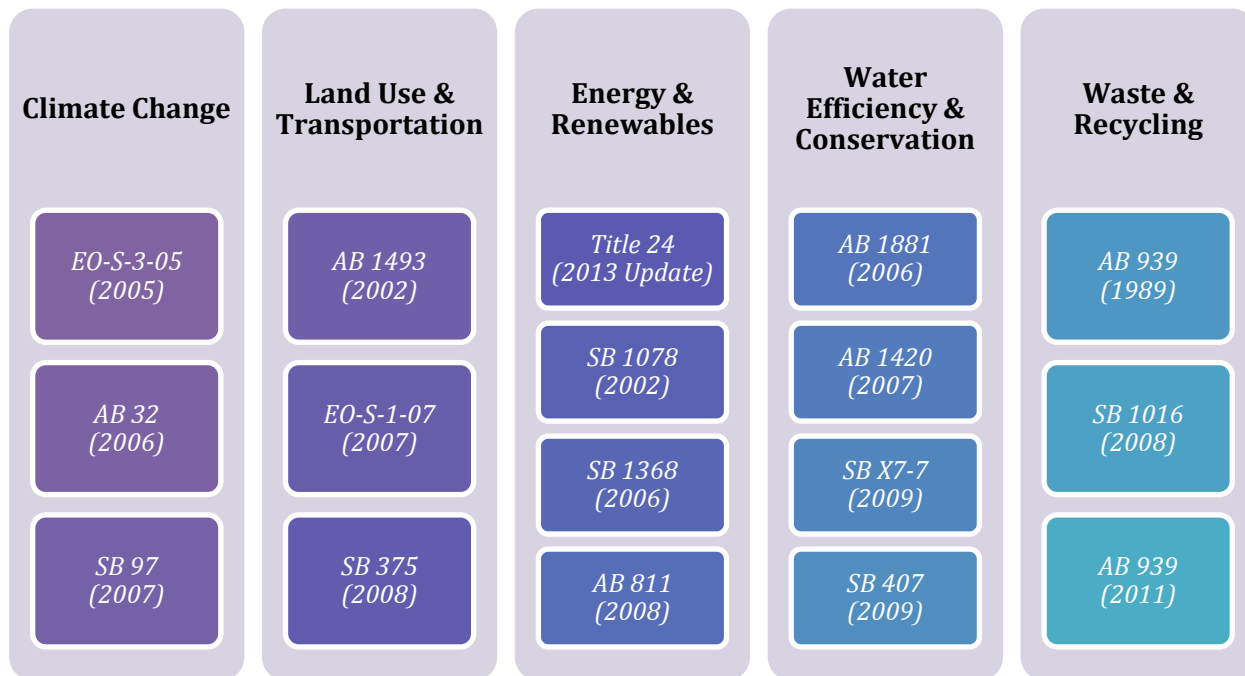

SB 375, also known as the Sustainable Communities and Climate Protection Act of 2008, builds off of AB 32 and aims to reduce GHG emissions by linking transportation funding to land use planning. It requires the state’s metropolitan planning organizations (MPO) to create a sustainable communities strategy (SCS) in their regional transportation plans (RTP) for the purpose of reducing urban sprawl. Under SB 375, CARB established regional targets for GHG emissions reductions from passenger vehicle use for each MPO. The regional reduction targets for the Southern California Association of Governments (SCAG) region, which is the MPO with jurisdiction over the WRCOG subregion, are 8% per capita by

⁶ CARB 2008 Scoping Plan. Available at <http://arb.ca.gov/cc/scopingplan/scopingplan.htm>

2020, and a conditional target of 13% per capita by 2035 from 2005 levels. In April 2012, SCAG adopted its first SCS, which demonstrates how the region will achieve the GHG emissions reduction targets set by CARB.

Figure 1-3 categorizes the applicable state regulations that provide a policy framework for addressing climate change. A more detailed description of these regulations is included in the jurisdictional Greenhouse Gas Inventory Reports (Appendix A).

Figure 1-3: Regulatory Framework for Climate Change

REGIONAL PROGRAMS

The regional initiatives described below contribute to the development and success of this CAP. Many of these programs are administered by WRCOG and several are conducted by other regional entities in partnership with WRCOG.

Southern California Association of Governments Regional Transportation Plan and Sustainable Communities Strategy

SCAG is the regional planning agency for Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties, and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG serves as the federally designated MPO for the Southern California region and is the largest MPO in the U.S. With respect to air quality planning, SCAG has prepared the 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (2012 RTP/SCS): Towards a Sustainable Future, to fulfill federal planning requirements contained in the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users (SAFETEA-LU), which calls for regions to consider urban form and natural resources as part of the transportation planning process. Under SB 375, all of California’s MPOs must prepare an SCS as a component of their RTP. The RTP serves as a long-range transportation plan that is developed and updated by SCAG every four years. The RTP provides a vision for the development of transportation

facilities throughout the region based on growth forecasts and economic trends that project over a 20-year period. The SCS expands upon transportation strategies in the RTP to analyze growth patterns and establish future land use strategies that aid the region in meeting its GHG reduction targets. The SCS does not mandate future land use policies for local jurisdictions, but rather provides a foundation of regional policy upon which local governments can build. WRCOG and its member jurisdictions partner with SCAG and are active members in the development and implementation of the RTP/SCS.

HERO Program

Established under the guidance of AB 811 (2008) and AB 474 (2009), WRCOG's HERO Program is a Property Assessed Clean Energy (PACE) program that provides financing to residential and commercial property owners for the installation of energy efficient, renewable energy, and water conservation improvements on existing properties. Financing provided through the HERO Program is repaid through an assessment on property tax bills over 5-, 10-, 15-, 20-, and 25-year terms, based on the useful life of the products, and upon sale of the property, the balance generally stays with the property.

Sustainability Framework for Western Riverside County

WRCOG's Sustainability Framework (Framework) is a subregional planning effort that establishes, implements, and continuously refines an overarching sustainability plan for the communities in Western Riverside County. The Framework aims to: initiate a dialogue about the importance of sustainability in the region; provide a vision and goals to guide local action and regional collaboration; define more immediate short-term goals that can contribute to the longer-term vision of the Framework; and define indicators, benchmarks, and targets that provide a measure of the effectiveness of Framework programs and policies. The Framework acts as a "living" document and contains goals and actions applying to economic development, education, public health, transportation, water and wastewater, energy, and the environment.

Western Riverside County Clean Cities Coalition

The Western Riverside County Clean Cities Coalition (Coalition) is a voluntary local government and industry partnership that aims to reduce the consumption of petroleum fuels and improve air quality in the WRCOG subregion. The Coalition works to mobilize local stakeholders toward expanding the use of alternative fuel vehicles (AFV) and advanced technology vehicles, promoting local idle reduction measures, and strengthening local AFV fueling infrastructure. The governments of Western Riverside County have taken leadership roles in the Coalition, coordinating efforts between government and industry to recognize the value of partnership in achieving air quality, energy efficiency, economic development, and transportation goals, while advancing the clean air and energy efficiency goals of the national Clean Cities program administered by the U.S. Department of Energy.

Healthy Communities

WRCOG and its member jurisdictions are engaged in numerous efforts and initiatives to promote healthy communities, including participating in the Riverside County Health Coalition (RCHC). The RCHC is a collaboration of public and private sectors, school districts, community businesses, local and regional organizations and community members committed to policy development and advocacy, environmental change and community empowerment for healthy lifestyles in Riverside County. This initiative includes a focused partnership effort with local governments to integrate healthy communities into the local planning and policy-making process.

Multiple Species Habitat Conservation Plan

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional plan to conserve sensitive species and their associated habitats in the subregion. Created in 2004 by the Western Riverside County Regional Conservation Authority (RCA), the MSHCP provides subregional transportation and green infrastructure benefits to local agencies and allows WRCOG jurisdictions to make land use decisions and maintain a strong economy in a context that comprehensively addresses federal and state Endangered Species Acts (ESA and CESA) requirements.

Transportation Uniform Mitigation Fee

WRCOG's Transportation Uniform Mitigation Fee (TUMF) was implemented in 2003 as one of the largest multi-jurisdictional fee programs in the nation. TUMF makes improvements to the regional transportation system and provides transportation demand management through funds from new development, ensuring that development mitigates for increases in traffic volumes. TUMF is a 32-year program that provides subregional transportation and infrastructure benefits to local agencies in Western Riverside County. The program is expected to raise \$4.2 billion, and 1.64% is allocated to the Riverside Transit Agency (RTA) for transit improvements. To mitigate the impacts of transportation construction projects, WRCOG allocates 1.59% of TUMF funds collected to the RCA to purchase habitat for the MSHCP.

EXISTING LOCAL SUSTAINABILITY ACCOMPLISHMENTS

Several jurisdictions within the WRCOG subregion have already adopted, or are in the process of adopting, GHG emissions reduction policies or entire CAPs independent of the Subregional CAP process. Existing policies and programs were identified that reduce GHGs through energy conservation, renewable energy development, solid waste reduction, commute reduction, and the expansion of the urban forest. Several energy programs are available throughout the subregion, which are managed by WRCOG, SCE, Southern California Gas Company (SCG), Riverside Public Utilities (RPU), Banning Electric Utility (BEU), and the County of Riverside. These programs include financing for building energy retrofits and renewable energy projects, energy efficiency retrofit rebates, smart metering and smart grid technologies, and various energy efficiency education and outreach campaigns.

Some jurisdictions have building code requirements to implement and expand upon the California Green Building Standards Code (CALGreen), or policies to streamline energy efficiency and renewable energy permitting. Many are improving the efficiency of public realm lighting, including street lights, traffic lights, parking lot lighting and outdoor commercial lighting, and their water and wastewater conveyance and treatment facilities.

Policies to reduce solid waste include waste collection billing policies through municipalities or their contracted waste haulers, food scrap and compostable paper diversion outreach, lumber scrap diversion ordinances and outreach, yard waste collection, recycling outreach campaigns and voluntary waste audits, landfill methane capture, and food waste biodigestion programs in Norco and Riverside.

Policies that reduce GHG emissions from potable water conveyance focus on reducing water demand through consumer behavior pricing, water conservation education, and landscape irrigation efficiency. Some jurisdictions have adopted ordinances requiring the installation of certain water conservation measures at properties before selling or renovating properties. While many jurisdictions are seeking to expand recycled water deliveries, fewer promote rainwater collection or graywater system use at this time.

Existing transportation policies focus on enhancing pedestrian and bicycle amenities and facilities alongside the expansion and improvement of transit systems, but also include various transportation demand management programs to reduce single-occupancy vehicle miles traveled (VMT) during commute hours. Several jurisdictions have policies supporting the expansion of the urban forest, and some have mandatory shade tree planting requirements that also reduce building energy. Finally, many jurisdictions are actively expanding mixed-use developments and transit-oriented developments to encourage people to drive less, and enrich the character and economic vitality of their communities.

WESTERN RIVERSIDE ENERGY LEADER PARTNERSHIP

The WRELP Program builds upon the existing policies and programs in the region to analyze energy-sector emissions and propose energy conservation and renewable energy measures that reduce GHG emissions within Energy Action Plans (EAPs) for 11 WRCOG jurisdictions served by SCE. The WRELP partners include Calimesa, Canyon Lake, Hemet, Lake Elsinore, Menifee, Murrieta, Norco, Perris, Temecula, San Jacinto, and Wildomar (see **Table 1-1**). The WRELP effort uses funding provided by SCE to implement within the region the California Long-Term Energy Efficiency Strategic Plan (CEESP), developed by the California Energy Commission (CEC) as a collaborative effort in response to California's need for a long-term strategic energy efficiency plan. Following CEESP Goal 4, individual EAPs were developed for each participating jurisdiction, creating a comprehensive program to address energy efficiency, sustainability, and climate change through the years 2020 and 2035. The EAPs informed the development of the energy efficiency measures in this CAP.

RELATIONSHIP TO THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

In 2007, state lawmakers identified the need to analyze GHG emissions in the CEQA process through the adoption of SB 97. The bill required OPR to develop, for adoption by the Natural Resources Agency, amendments to the CEQA Guidelines that clarified several points about the analysis and mitigation of GHG emissions. Aside from establishing the need for lead agencies to analyze and mitigate for a project's potentially significant impacts relating to GHG emissions, the amendments also provided that a lead agency may streamline the analysis of GHG emissions for projects that follow a programmatic GHG emissions reduction plan, or climate action plan, meeting certain criteria. The amendments to the CEQA Guidelines became effective on March 18, 2010. OPR is currently developing a Technical Advisory that will further describe, among other climate action planning topics, how plans for reducing GHGs can be used in CEQA analyses.

Chapter 2

Emissions Inventory

A jurisdiction's greenhouse gas (GHG) inventory serves multiple purposes. It quantifies the GHG emissions resulting from activities taking place throughout the community by residents, businesses, and local governments, and creates an emissions baseline against which the jurisdiction can set emissions reduction targets and measure future progress. It also provides an understanding of where GHG emissions originate and allows a jurisdiction to develop effective policies, strategies, and programs to reduce emissions.

As part of the Subregional Climate Action Plan (CAP) process for Western Riverside County, baseline inventories were prepared for each participating jurisdiction to quantify GHG emissions resulting from the community and government operations (Appendix A). Community-wide inventories encompass the GHG emissions resulting from activities taking place within each jurisdiction's boundaries, where the local government has jurisdictional authority, in addition to some activities taking place outside the boundaries that support activities in the jurisdiction (for example, solid waste sent to landfill areas outside the boundaries). The baseline inventories include emissions from the following sectors: residential energy, commercial/industrial energy, transportation, waste, and wastewater.

2010 is the inventory base year for 10 of the 12 participating jurisdictions within the WRCOG subregion (the cities of Banning, Calimesa, Canyon Lake, Hemet, Norco, Perris, Riverside, San Jacinto, Temecula, and Wildomar). For the cities of Eastvale and Jurupa Valley, which incorporated in October 2010 and July 2011, respectively, the most recent available data were used. The baseline inventory summary presented in this chapter describes the cumulative GHG emissions generated by the jurisdictions participating in the WRCOG Subregional CAP effort, as determined from individual jurisdictional inventories.

BASELINE EMISSIONS INVENTORY

INVENTORY PROCESS

The emissions inventory for each participating jurisdiction was developed using guidance from two standards for emissions accounting and reporting: the Local Government Operations Protocol (LGO Protocol) and the U.S. Community Protocol for Accounting and Reporting of GHG Emissions (Community

Protocol). The LGO Protocol was developed through a partnership between CARB, The Climate Registry, and ICLEI USA. The Community Protocol was released by ICLEI USA in October 2012 and represents the first comprehensive U.S. standard for community-wide inventories.

The emissions inventory is intended to represent emissions sources in each jurisdiction with greatest influence on community-wide activities and government operations. As communities provide different services to their residents and businesses, the scale of the services and resulting emissions are highly dependent upon the size and purview of the local government. For these reasons, comparisons among community or local government inventories should not be made without also describing the municipal services provided by each jurisdiction or presenting community-level indicators such as population or socioeconomic factors.

Furthermore, the inventory estimates current emissions using the best available data and methods at the time the inventory was completed. As data collection and estimation methodologies evolve, future inventories may incorporate emission sources that were not captured previously, or may use newer approaches to estimating emissions.

INVENTORY CATEGORIES

In the community inventory, baseline emissions are categorized into sectors based on their source(s), as follows:

- Residential Energy: Residences consume electricity and natural gas for daily operations and heating/cooling.

- Commercial/Industrial Energy: Commercial and industrial buildings consume electricity and natural gas for daily operations and heating/cooling. This sector includes all non-residential building energy use, including municipal government buildings, industrial buildings, and commercial buildings.

- Transportation: On-road passenger and freight vehicle use results in combustion of gasoline and diesel fuels.

- Waste: Disposal of solid waste in landfills causes anaerobic decomposition, which results in GHG emissions (CH₄).

- Wastewater: Emissions in this sector are associated with the treatment of community industrial, residential, and commercial wastewater.

The LGO inventory is a subset of the community inventory, and represents what the municipality owns or operates and has operational control over, such as government buildings, vehicles, and other municipally-owned equipment and services. While the overall community inventory is important to focus GHG reduction efforts, the LGO inventory provides a closer look at what changes a local jurisdiction can make to improve efficiency and reduce emissions.

INVENTORY RESULTS

The baseline GHG inventory for the 12 WRCOG subregion jurisdictions participating in the CAP totals 5,834,400 metric tons (MT) of carbon dioxide equivalents (CO₂e). **Figure 2-1** and **Table 2-1** provide a breakdown of these emissions by sector. Emissions from the transportation sector accounted for 3,317,387 MT CO₂e, or 57% of the total emissions in the subregion, followed by the commercial/industrial energy sector, which generated 1,226,479 MT CO₂e, or 21% of the total. The residential energy sector produced 1,167,843 MT CO₂e, or 20% of the total.

Figure 2-1: WRCOG Subregion – Baseline Community Emissions by Sector

Table 2-1: WRCOG Subregion – Baseline Community Emissions by Sector (MT CO₂e)

| Sector | Total Emissions (MT CO ₂ e) | % of Total |
|------------------------------|--|-------------|
| Transportation | 3,317,387 | 56.9% |
| Commercial/Industrial Energy | 1,226,479 | 21.0% |
| Residential Energy | 1,167,843 | 20.0% |
| Waste | 112,161 | 1.9% |
| Wastewater | 10,531 | 0.2% |
| TOTAL INVENTORY | 5,834,400 | 100% |

Note: Totals may not add up due to rounding.

The baseline total GHG inventory for each participating jurisdiction is shown in **Figure 2-2** below, sorted by greatest to smallest total emissions. **Figure 2-3** shows baseline community emissions by service population for each jurisdiction. Service population is the number of residents and jobs in each community, and can be useful for measuring progress per-unit reduction of GHGs and comparing emissions between jurisdictions. Per capita emissions ranged from 3.6 MT CO₂e emissions per service population in Eastvale to 7.2 MT CO₂e in Calimesa.

Figure 2-2: Baseline Total Community Emissions by Jurisdiction (MT CO₂e)

Figure 2-3: Baseline Community Emissions per Service Population by Jurisdiction (MT CO₂e/SP)

The baseline GHG Inventory by sector for each participating region is shown in **Figure 2-4** below. The transportation sector is the largest emissions source in each jurisdiction, followed by residential energy, commercial/industrial energy, and waste for most jurisdictions. For the communities of Jurupa Valley and Riverside, commercial/industrial energy takes up a larger share of emissions than residential energy, due to a more developed commercial and industrial building infrastructure. Perris is the only jurisdiction for which wastewater emissions are included, because it's the only community containing a wastewater treatment plant within its boundaries for which emissions data could be calculated, and these emissions make up a larger share of the Perris inventory than waste-related emissions.

Figure 2-4: Baseline Community Emissions by Jurisdiction by Sector

EMISSIONS FORECASTS

The emissions forecasts establish projections for future-year 2020 and 2035 emissions under “business-as-usual” (BAU) conditions. If the WRCOG subregion were to continue historic patterns of vehicular travel, energy consumption, and waste/wastewater generation and disposal, the resulting emissions would be considered business-as-usual. BAU emissions are GHG emissions that would take place in the absence of state, regional, and local strategies designed to reduce emissions over time.

Future BAU emissions projections have been developed using regionally-adopted estimates for population and employment growth within each city under BAU conditions. Reduction goals were established for 2020 and 2035 using guidance from the California Air Resources Board (CARB).

Annual community emissions in participating WRCOG subregion jurisdictions are projected to increase over time. In 2020, subregional emissions are expected to be approximately 7,289,887 MT CO₂e, which represents an approximate 25% increase from baseline conditions. In 2035, subregional emissions are projected to increase to about 9,113,087 MT CO₂e, which represents an increase of approximately 56% from baseline conditions.

Table 2-2 presents community GHG emissions BAU forecasts by sector for 2020 and 2035. Transportation is expected to contribute the largest share of emissions through 2035. **Figure 2-5** illustrates 2020 BAU community emissions by sector. The percentage contributions from each sector in 2035 are expected to be similar to those in 2020. **Figure 2-6** shows community emissions BAU forecasts by jurisdiction for 2020 and 2035.

Table 2-2: WRCOG Subregion – Projected Business-As-Usual Community Emissions by Sector (MT CO₂e)

| Sector | 2020 Emissions (MT CO ₂ e) | % of Total | 2035 Emissions (MT CO ₂ e) | % of Total |
|------------------------------|---------------------------------------|-------------|---------------------------------------|-------------|
| Transportation | 4,057,626 | 55.7% | 5,399,600 | 59.3% |
| Commercial/Industrial Energy | 1,655,925 | 22.7% | 1,953,137 | 21.4% |
| Residential Energy | 1,368,126 | 18.8% | 1,729,452 | 19.0% |
| Waste | 138,326 | 1.9% | 169,107 | 1.9% |
| Wastewater | 13,740 | 0.2% | 18,797 | 0.2% |
| TOTAL INVENTORY | 7,289,887 | 100% | 9,113,087 | 100% |

Note: Totals may not add up due to rounding.

Figure 2-5: WRCOG Subregion – 2020 Community Emissions Business as Usual Forecast by Sector

Figure 2-6: 2020 and 2035 Community Emissions Business as Usual Forecast by Jurisdiction (MT CO₂e)

EMISSIONS REDUCTION TARGET

The WRCOG Subregional CAP establishes a community-wide emissions reduction target of 15% below 2010, following guidance from CARB and the Governor’s Office of Planning and Research. CARB and the California Attorney General have determined this approach to be consistent with the state-wide AB 32 goal of reducing emissions to 1990 levels.¹ The Subregional CAP does not establish a reduction target for 2035 or future years; however the CAP identifies a reduction goal of 49% below baseline emissions levels to set the WRCOG subregion on a trajectory to meet targets identified in SB 375 and Executive Order (EO) S-3-05, recognizing that information, methodologies, and data availability may change between now and 2035.

As further described in Chapter 4, progress toward achieving the 2020 emissions reduction target will be monitored over time through preparation of an annual memorandum documenting program implementation and performance. Following each annual report, WRCOG and the participating jurisdictions may adjust or otherwise modify the strategies to achieve the reductions needed to reach the target. Such adjustments could include more prescriptive measures, reallocation of funding to more

¹ In its Climate Change Scoping Plan of September 2008, CARB recommends that local governments adopt a GHG reduction target consistent with the State’s commitment to reach 1990 levels by 2020. This is identified as equivalent to either 15% below 2005 levels by 2020 or a 28% reduction below BAU forecasts by 2020.

successful programs, and modifications to the 2020 BAU emissions projection and reduction target based on revised population, housing, and employment growth estimates. Additionally, there will be a comprehensive inventory update prior to 2020 to track overall progress toward meeting the GHG reduction target.

COMMUNITY EMISSIONS TARGET

The Subregional CAP target for community emissions in 2020 is 4,959,240 MT CO₂e equivalent to a 15% reduction from 2010 baseline emissions of 5,834,400 MT CO₂e. This is a net a reduction of 2,330,647 MT CO₂e from the 2020 BAU emissions forecast of 7,289,887 MT CO₂e. The community-wide emissions reduction target is shown in **Figure 2-7**. As outlined in the next chapter, CAP strategies are expected to reduce community-wide emissions by 2,454,383 MT CO₂e by 2020, exceeding the target by approximately 2.1% (for a total 17.1% reduction).

Figure 2-7: WRCOG Subregion–Community GHG Business as Usual Forecasts and Reduction Target for 2020

*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted previously.

Chapter 3

Reduction Measures

The emissions projections described in Chapter 2 illustrate the need for the subregion to implement strategies to reduce greenhouse gas (GHG) emissions by 2020 and beyond. Western Riverside County jurisdictions have a long history of working collectively through WRCOG toward common objectives, and have successfully demonstrated commitment to reduce energy and water consumption, solid waste, and vehicle miles traveled (VMT) through existing programs like the HERO Program, the Western Riverside County Clean Cities Coalition, and the Transportation Unified Mitigation Fee (TUMF).

This chapter discusses how participating jurisdictions are uniting to meet shared GHG emissions reduction goals. The approach offers flexibility to jurisdictions to participate at a level that is feasible and practical for each community.

PROCESS AND OVERVIEW

The process of developing this Subregional Climate Action Plan (CAP) included ongoing coordination and information sharing among participating jurisdictions. The WRCOG Planning Directors' Technical Advisory Committee (PD TAC) served as the primary technical working group. The PD TAC met regularly over the course of three years to discuss the CAP and provide feedback. Perspectives from jurisdictions participating in this CAP and those in the subregion who had already prepared a CAP were shared. In addition, WRCOG staff met individually with each participating jurisdiction to review emissions inventories, discuss potential emissions reduction measures and participation levels, and review the Draft CAP. Regular presentations were made to the WRCOG Public Works Committee, Technical Advisory Committee, and Executive Committee to keep jurisdictional staff, management officials, and elected leaders informed.

The following stakeholder agencies and organizations served as advisors throughout the process:

- American Lung Association
- Building Industry Association – Riverside County Chapter
- California Apartment Association – Apartment Association of the Greater Inland Empire
- California Air Resources Board

- Caltrans, District 8
- The Governor’s Office of Planning & Research
- Riverside County Department of Public Health
- Riverside County Transportation Commission
- Riverside Transit Agency
- Safe Routes to School – Southern California Regional Network
- Southern California Edison
- South Coast Air Quality Management District
- Southern California Association Governments
- Southern California Gas Company
- TransForm

*Why a “subregional”
Climate Action Plan?*

Developing a subregional CAP encourages input and coordination among participating jurisdictions. A subregional CAP uses consistent methodologies and allows jurisdictions to collaboratively implement regionally-effective measures. This creates economies of scale and may lead to lower administrative costs and greater publicity of incentives. It also demonstrates that WRCOG member jurisdictions can continue to work effectively towards common goals.

REDUCTIONS ACHIEVED

To meet emissions reduction targets, the CAP considers existing programs and policies in the subregion that achieve GHG emissions reductions in addition to new GHG reduction measures. Several proposed measures apply to participating jurisdictions uniformly, because they respond to adoption of a state law (e.g., the Low Carbon Fuel Standard) or result from programs administered at the discretion of a utility serving multiple jurisdictions (e.g. utility rebates). For other, more discretionary measures, participating jurisdictions have voluntarily committed to a participation level that could be implemented in their community. These levels—categorized and referred to for the purposes of this CAP as Silver, Gold, and Platinum—generally range from programs that a jurisdiction may promote through its website or outreach campaigns (Silver level), to programs that could be codified through local ordinances (Platinum level). Gold and Platinum levels have the benefit of achieving higher GHG reductions using fewer programs and often with less administrative burden to the jurisdiction. However, Silver level programs offer greater flexibility to determine how GHG reduction measures best fit individual projects.

MEASURE DEVELOPMENT

The GHG emissions reduction potential of each measure was estimated for jurisdictions participating at each level. Maximum participation in GHG reduction measures was encouraged, but jurisdictions were also encouraged to participate at a level that could be realistically achieved by 2020. As a result of the subregion’s efforts, the 2020 reduction goal is achieved through implementation of the measures described below. Implementation of the CAP will result in a 15% reduction from the subregion’s baseline (2010) emissions, consistent with State-recommended goals for local jurisdictions. Considering the large amount of anticipated growth in Western Riverside County, this equates to a 32% reduction below a business-as-usual (BAU) scenario. The CAP also looks beyond 2020 and demonstrates an ongoing commitment to reducing GHG emissions aligned with State-established goals included in SB 375 and Executive Order (EO) S-3-05. Continued implementation of the CAP beyond 2020 will place the subregion on a trajectory to reduce GHG emissions 49% below baseline emissions by 2035.

FEDERAL, STATE, AND REGIONAL EMISSIONS REDUCTIONS

Emissions reductions are achieved through the efforts of federal, State, and regional programs, in addition to local measures that jurisdictions will implement in their community. State and federal emissions reductions are primarily achieved through regulations, such as efficiency standards for passenger vehicles (e.g., the Corporate Average Fuel Economy standards), reduction in carbon content of transportation fuels (e.g., the Low Carbon Fuel Standard), and minimum renewable energy supply requirements for utilities (e.g., the Renewables Portfolio Standard). Measures regulated and implemented by the State and federal government achieve reductions without additional action by local communities. That is, even if vehicle miles traveled within the subregion remain constant over time, resulting GHG emissions would decrease because as new vehicles are purchased, they would in general be more GHG-efficient than those they replace.

Some State and federal programs also require local action within communities. The California Green Building Standards Code (CALGreen) requires, at a minimum, that new buildings and renovations in California meet certain design standards. New residential and commercial buildings must meet certain baseline efficiency and sustainability standards. These baselines are established through locally-adopted building codes and will result in GHG reductions. Additional voluntary building code provisions, known as Tier 1 and Tier 2 requirements, can be adopted locally, providing even greater energy savings and emissions reductions.

The Water Conservation Bill, known as SB X7-7, requires the State to reduce urban per capita water use 20% by 2020. Regional Urban Water Management Plans provide strategies and create incentives to achieve these targets, but local implementation strategies vary, and consumer participation is necessary to realize water use reductions. Local implementation strategies typically include tiered pricing or water budget-based (i.e., pricing water according to the amount consumed); water-efficient landscape requirements for water and irrigation management, planting location, and plant materials; and incentives where some utilities pay for turf grass removal and replacement with efficiently-irrigated landscaping.

Regional programs are those developed or administered at a level of government above the local jurisdiction but below the State. These programs often are more responsive to local context than statewide programs. They require local participation but do not require local administration to achieve GHG reductions.

The WRCOG HERO Program, described in Chapter 1, is a regionally-administered program that offers financing options for home and business owners to retrofit or install energy-efficient, water conservation, and/or renewable energy generating products. This program is voluntary and therefore also up to individuals to implement, but regional administration lowers the burden to local governments and has already led to demonstrable reductions in the subregion since the HERO Program's inception in 2011.

WRCOG also administers the TUMF Program. The TUMF Program establishes a funding source to mitigate the cumulative regional transportation impacts of new development on regional arterials. TUMF fees are collected locally, and WRCOG works with its member agencies to identify priority projects to fund using fee revenues in order to reduce subregional transportation impacts caused by development. Facilitating movement on roads, by encouraging non-motorized transportation, increasing access to transit, or easing congestion on critical roadways may lead to GHG reductions. Therefore,

TUMF can fund projects that meet this objective. Because the project relies on locally-collected fees, available funding depends on the economic vitality and development opportunities in the region.

A number of other transportation-related programs and projects under the primary control of the Riverside Transit Agency (RTA), Riverside County Transportation Commission (RCTC), California Department of Transportation (Caltrans), and other transportation entities can be implemented to reduce GHG emissions. The long-term planning of major transportation infrastructure is not under the participating jurisdictions' direct control; however, subregional jurisdictions participate in transportation planning decisions in a way that benefits the subregion. Local jurisdictions are in direct control of land uses, which can dictate how future transit is shaped. Individuals also play an important role in how they choose to move throughout the subregion; therefore, while individual jurisdictions do not implement these programs, local input is critical to the success of these programs. Additional projects anticipated to result in GHG reductions include California High Speed Rail, Metrolink expansion, express lanes, congestion pricing, goods movement, high frequency transit service, and electric vehicle infrastructure implementation.

Through federal, state, and regional measures implemented at the subregion level, participating jurisdictions can reduce 2020 emissions by 1,885,859 MTCO₂e, representing 77% of the subregion's 2020 reductions, as illustrated in **Figure 3-1**.

Figure 3-1: WRCOG Subregion—GHG Reductions Achieved through State, Regional, and Local Measures

*2010 is used as baseline year for all jurisdictions except for the cities of Eastvale and Jurupa Valley, as noted previously.

LOCAL EMISSIONS REDUCTIONS

While federal, state, and regional measures are critical to meet emission reduction goals, choices made by each local government, resident, and business owner will determine the subregion's ability to

achieve the overall emissions reduction target. Through outreach campaigns, incentives, zoning changes, and ordinances, local communities can achieve additional reductions identified in this CAP.

Reduction measures are organized into major economic sectors, similar to the emissions inventory:

- Energy – including electricity and natural gas consumption
- Transportation and Land Use
- Water
- Waste

Each measure is described using the following information.

MEASURE DESCRIPTION

A general description of each measure is provided along with the implementing actions that constitute the Silver, Gold, or Platinum level that each participating jurisdiction will take to implement the measure. Jurisdictions are listed by level of participation.

What is a metric ton of CO₂e?

GHG emissions are reported as metric tons (MT) of CO₂e. Emitting 1 MT CO₂e is equal to the following:

- **102 gallons of gasoline**
- **41 propane cylinders used for home barbecues**
- **One month's worth of energy used in a house**

In contrast, reducing 1 MT CO₂e would require:

- **Growing 25 tree seedlings for 10 years**
- **Recycling 600 pounds of waste instead of throwing it away**

Note: Equivalencies are approximate and are adapted from: <http://www.epa.gov/cleanenergy/energy-resources/calculator.html>

GHG REDUCTIONS

The GHG reduction potential of each measure is quantified based on the assumption that past trends would continue into the future (e.g., energy consumption, VMT) and standard methods and assumptions recommended by the State (e.g., CAPCOA 2010)¹. For voluntary programs, the level of participation anticipated by each jurisdiction was developed using case studies and evidence of success with similar programs.

PROGRESS METRICS

Monitoring emissions and reporting reductions will be necessary to validate the success of the measures or to identify measures that are not achieving anticipated reductions. Metrics for monitoring progress are provided for individual measures, although jurisdictions are also encouraged to work with WRCOG to re-inventory local government and community-wide emissions to demonstrate progress.

¹ California Air Pollution Control Officers Association Report titled Quantifying Greenhouse Gas Mitigation Measures (CAPCOA), 2010

COMMUNITY BENEFITS

CAP measures often have benefits that go beyond reducing GHG emissions. Many measures will improve public health by encouraging walking and biking or reducing air pollution; increase economic potential of the subregion by providing development and retrofitting incentives; reduce energy use and lower utility bills; preserve natural resources by consuming and wasting less; and increase mobility through alternative transportation measures. The following icons are used to identify co-benefits that jurisdictions can achieve by implementing local GHG reduction measures.

STATE AND REGIONAL MEASURES

Table 3-1 lists the state and regional measures included in the Subregional CAP and provides a breakdown of the GHG reduction potential for these measures.

Table 3-1: 2020 Reductions Achieved Through State and Regional Measures

| State and Regional Measures by Sector | | 2020 (MT CO ₂ e/yr) |
|--|---|-----------------------------------|
| SR-1 | Renewables Portfolio Standard | 434,606 |
| SR-2 | 2013 California Building Energy Efficiency Standards (Title 24, Part 6) | 30,923 |
| SR-3 | HERO Residential Program | 71,649 |
| SR-4 | HERO Commercial Program | 10,079 |
| SR-5 | Utility Programs | 7,873 |
| SR-6 | Pavley & Low Carbon Fuel Standard | 1,095,555 |
| SR-7 | Metrolink Expansions | 23,074 |
| SR-8 | Express Lanes | 60,864 |
| SR-9 | Congestion Pricing | 3,246 |
| SR-10 | Telecommuting | 40,576 |
| SR-11 | Goods Movement | 22,688 |
| SR-12 | Electric Vehicle Plan and Infrastructure | 81,152 |
| SR-13 | Construction and Demolition Waste Diversion | 3,574 |
| SR-14 | Water Conservation and Efficiency | Not Estimated |
| TOTAL STATE AND REGIONAL REDUCTIONS | | 1,885,859 |

Note: Total may not add up due to rounding.

STATE AND REGIONAL ENERGY MEASURES

The following are state and regional measures that are expected to reduce GHG emissions associated with the energy sector.

Measure SR-1: Renewables Portfolio Standard

Utilities must secure 33% of their power from renewable sources.

2020 GHG Reduction Potential: 434,606 MT CO₂e/yr

Through a series of increasingly stringent bills first enacted in 2002, California has placed requirements on electric utilities to procure a portion of their energy from renewable sources. The standard, known as the Renewables Portfolio Standard (RPS), applies to investor-owned utilities, publicly-owned utilities, electricity service providers, and community choice aggregators. Therefore, all electricity-providing utilities in Western Riverside (SCE, Riverside Utility and Banning Utility) must meet these targets:

- 20% of retail sales from renewables by 2013
- 25% of retail sales from renewables by 2016
- 33% of retail sales from renewables by 2020

Meeting these goals will likely lead to reduced emissions associated with electricity, as more electricity will be generated by less carbon-intensive sources.

Community Benefits

Measure SR-2: 2013 California Building Energy Efficiency Standards (Title 24, Part 6)

Mandatory energy efficiency standards for buildings.

2020 GHG Reduction Potential: 30,923 MT CO₂e/yr

Building energy efficiency standards are designed to ensure new and existing buildings achieve energy efficiency and preserve outdoor and indoor environmental quality. These measures (Title 24, Part 6) are listed in the California Code of Regulations. These standards began in 1978 and are updated every 5 years. The 2013 standards differ from the 2008 standards by requiring usage of less energy for lighting, heating, cooling, ventilation, and water heating. Buildings are also required to be solar-ready, allowing for easier and less expensive installation of photovoltaic or solar thermal panels in the future. The California Energy Commission estimates that the 2013 standards will result in residential construction that is 25% more efficient and nonresidential construction that is 30% more efficient than the 2008 standards. The new standards go into effect on July 1, 2014 and as the industry moves toward the goal of net-zero energy, even greater energy and GHG savings may be achieved over time.

Community Benefits

Measure SR-3: HERO Residential Program

Financing for homeowners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 71,649 MT CO₂e/yr

The HERO Program is a public-private partnership administered by WRCOG, offering financing to homeowners in the subregion for the installation of energy efficient, renewable energy, and water conservation improvements. This property assessed clean energy (PACE) financing program offers a continually expanding list of eligible products for financing and an ever-growing cadre of trained contractors who can assist property owners with selecting and installing eligible products. Products eligible for HERO Financing include, but are not limited to:

- Energy audits
- Insulation of attics, floors, walls, and home perimeter
- Lighting upgrades
- Drip and weather-based irrigation systems
- Rainwater catchment systems
- Pool pumps and heaters
- Energy-efficient windows
- Solar PV panels
- Air sealing and weatherization
- Cool roof system
- Cool wall coatings

This award-winning program is offered to eligible property owners in the WRCOG subregion who wish to participate.

WRCOG's Residential Program partner, Renovate America, collects data regarding participation, energy savings, renewable energy installation, job creation, and economic development by jurisdiction in the subregion. WRCOG will continue to partner with Renovate America to track ongoing participation and energy savings on a monthly or annual basis. Emissions reduction estimates for this CAP were calculated based on program participation assumptions developed by Renovate America. Since its inception in 2011, the HERO program has funded more than \$135 million worth of eligible projects, and created more than 1,000 jobs. The program's growth has led to energy savings, GHG reductions, water conservation, and local job creation in each of its participating communities. The HERO program has also been an award-winning model for other PACE programs, earning recognition from various industry organizations including the Southern California Association of Governments, the U.S. Green Building Council, the Urban Land Institute, and the Governor of California.

Community Benefits

Measure SR-4: HERO Commercial Program

Financing for business owners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 10,079 MT CO₂e/yr

The HERO Program is a public-private partnership administered by WRCOG, offering financing to business owners in the subregion for the installation of energy efficient, renewable energy, and water conservation improvements. This PACE financing program offers a continually expanding list of eligible products for financing and an ever-growing cadre of trained contractors who can assist property owners with selecting and installing eligible products. Products eligible for HERO Financing include, but are not limited to:

- Energy audits
- Insulation of attics, floors, walls, and home perimeter
- Lighting upgrades
- Drip and weather-based irrigation systems
- Rainwater catchment systems
- Pool pumps and heaters
- Energy-efficient windows
- Solar PV panels
- Air sealing and weatherization
- Cool roof system
- Cool wall coatings

This award-winning program is offered to eligible property owners in the WRCOG subregion who wish to participate.

Community Benefits

Measure SR-5: Utility Programs

Financing for business owners to make energy efficient, renewable energy, and water conservation improvements.

2020 GHG Reduction Potential: 7,873 MT CO₂e/yr

Southern California Edison (SCE), Southern California Gas Company (SCG), Riverside Public Utilities (RPU), and the Banning Electric Utility (BEU) provide energy to customers in the subregion. Each utility offers rebate programs to reduce energy consumption, which in turn, reduces local GHG emissions. The utilities offer a selection of rebates and other incentives to assist property owners (residential and commercial) with the installation of energy- and water-saving products. The following list provides a sample of programs and indicates which utilities are currently offering:

- ENERGY STAR[™] appliance rebates – SCE, SCG, RPU, BEU
- Light bulb discounts – SCE
- Solar rebates – SCE, RPU
- Low-income programs – SCE, SCG, RPU, BEU
- Shade trees – RPU, BEU

Note: Some programs may have funding cycle and annual rebate limits; check with your local utility for up-to-date information regarding specific rebates.

These utility programs are provided to customers throughout the subregion and are managed at the discretion of each participating utility. Therefore, they do not have tiered implementation actions.

Community Benefits

STATE AND REGIONAL TRANSPORTATION MEASURES

The following are state and regional measures that are expected to reduce GHG emissions associated with the transportation sector.

Measure SR-6: Pavley and Low Carbon Fuel Standard

Requirements for vehicles to use cleaner fuels.

2020 GHG Reduction Potential: 1,095,555 MT CO₂e/yr

In 2002, California adopted AB 1493, referred to as “Pavley I”, which directed CARB to develop fuel-efficiency standards for passenger vehicles in California by 2005. Through a series of rulings, CARB and the federal government agreed on federal standards that began in 2009 and increase through 2016. CARB and the federal government are currently finalizing fuel-efficiency standards that continue to become increasingly-stringent from 2017 through 2025. Building from Pavley I, Executive Order S-1-07, known as the Low Carbon Fuel Standard (LCFS), requires the carbon-intensity of California’s transportation fuel to be reduced by at least 10% by 2020.

Community Benefits

Measure SR-7: Metrolink Expansion

Additional Metrolink transit service provided to Western Riverside County.

2020 GHG Reduction Potential: 23,074 MT CO₂e/yr

Identified in SCAG's 2012 RTP/SCS, the Metrolink Perris Valley Line will be extended from Riverside to Perris in Western Riverside County, allowing for alternative transportation, reducing VMT and GHG emissions in Western Riverside County. Service along this route is expected to begin in 2015.

Community Benefits

Measure SR-8: Express Lanes

Additional express lanes added along major freeways in Western Riverside County.

2020 GHG Reduction Potential: 60,864 MT CO₂e/yr

SCAG's analysis of critical corridors found inter-county trips account for over 50% of all trips. Ongoing congestion issues—and therefore increased idle time and GHG emissions—have led to SCAG proposing increasing the network of express lanes that connect counties, including Riverside County. Extension of express lanes along State Route-91 (SR-91) and Interstate-15 (I-15) would be operational by 2017 and 2020 respectively, and would lead to reduced congestion according to regional transportation modeling. The SR-91 extension project is currently under construction. The I-15 Toll Express Lanes from State Route-60 (SR-60) to Cajalco Road has entered the preliminary engineering phase, and the anticipated opening year is 2020.

Community Benefits

Measure SR-9: Congestion Pricing

Pricing mechanisms to discourage automobile traveling by increasing travel costs.

2020 GHG Reduction Potential: 3,246 MT CO₂e/yr

Transportation demand management (TDM) consists of methods used to encourage transportation other than single-occupancy vehicle travel at peak traffic times. TDM strategies and are generally categorized as “soft” or “hard” strategies. Soft mechanisms are incentive-based and include:

- Increasing the availability and use of carpooling, vanpooling, transit, bicycling, and walking;
- Shifting work schedules to non-peak periods or locations; and
- Using telecommuting.

Congestion pricing is a TDM tool examined by SCAG through its Express Travel Choices Study. Pricing mechanisms may include toll lanes/roads or mileage-based user fees, which discourage automobile traveling by increasing travel costs. Currently an expansion of the toll lanes on SR-91 is planned to continue these toll lanes through Corona and into Riverside.

The effectiveness of congestion pricing reflects the regional share of VMT reduction associated with this strategy, in addition to local actions. This approach accounts for the high degree of out-commuting that currently occurs in Western Riverside County as residents travel to jobs in Los Angeles, San Bernardino, and Orange Counties. Since many TDM strategies will be implemented at employment locations instead of residential locations, a separate accounting is needed in addition to the jurisdiction-specific TDM strategies identified in this Subregional CAP.

Community Benefits

Measure SR-10: Telecommuting

Reducing the amount of vehicle miles travelled from commuting by encouraging telecommuting practices.

2020 GHG Reduction Potential: 40,576 MT CO₂e/yr

Telecommuting is a soft TDM mechanism that has increased considerably over the past decade. According to SCAG, telecommuting could increase even more by 2020 (to 5% of workers in the region) and 2035 (to 10% of workers), from the current 2.6% that currently telecommute. By telecommuting, GHG emissions associated with vehicles no longer on the road are reduced, as are idling or congestion-related emissions from vehicles remaining on the road. Similar to **Measure SR-9: Congestion Pricing**, this strategy reflects the regional share of TDM strategies that may be implemented on a regional level given the high degree of out-commuting that occurs in Western Riverside County.

Community Benefits

Measure SR-11: Goods Movement

Efficient movement of goods through inland Southern California.

2020 GHG Reduction Potential: 22,688 MT CO₂e/yr

Southern California is a major hub for importing and exporting goods. SCAG estimates that over \$2 trillion in cargo was moved across the region in 2010 alone, much of which travels through inland Southern California, including Western Riverside County. However, the many warehouses and distribution facilities employ non-passenger vehicles that contribute to GHG emissions. At the state level, more standards are being implemented to increase vehicle efficiencies and the 2012 RTP/SCS and AQMD are supporting greater penetration of low-emission trucks in the region. While goods will continue to be moved to support local and regional economies, electrification and other low-emission technologies installed in vehicles can reduce the GHG emissions of goods movement. The GHG reductions estimated here account for the region's "share" of SCAG and AQMD's anticipated investments and the effect of the investment on GHG emissions. These investments include both policies as well as physical improvements such as "truck climbing" lanes on State Route-60 (SR-60), funded by RCTC.

Community Benefits

Measure SR-12: Electric Vehicle Plan and Infrastructure

Facilitate electric vehicle use by providing necessary infrastructure.

2020 GHG Reduction Potential: 81,152 MT CO₂e/yr

SCAG has developed a regional plug-in electric vehicle (PEV) readiness plan, and WRCOG has a similar subregional plan for PEV readiness. Together, these plans identify viable locations for charging stations, changes to development codes, and other strategies to encourage the purchase and use of electric vehicles. PEV chargers are already being installed in the WRCOG subregion. Through these plans and outreach efforts, alternative-fuel vehicles will be promoted as one strategy to reduce GHG emissions associated with passenger vehicles. This measure is anticipated to reduce nearly 82,000 MT CO₂e in participating jurisdictions by 2020.

Community Benefits

STATE SOLID WASTE MEASURE

The following state measure is expected to reduce GHG emissions associated with the solid waste sector.

Measure SR-13: Construction & Demolition Waste Diversion

Mandatory requirement to divert 50% of construction and demolition waste from the landfill waste stream.

2020 GHG Reduction Potential: 3,574 MT CO₂e/yr

Recycling construction and demolition materials reduces GHG emissions by removing material from landfills that would otherwise generate methane. Construction and demolition (C&D) waste recycling also may reduce the need to harvest and transport new raw construction materials, as recycled materials can be locally repurposed and reused. For growing areas like the WRCOG subregion, C&D waste accounts for a significant portion of the waste stream.

Effective July 1, 2012, CALGreen, the state's Green Building Standards Code, requires jurisdictions to divert a minimum of 50% of their nonhazardous C&D waste from landfills.

Community Benefits

STATE AND REGIONAL WATER MEASURES

The following state measure is expected to reduce GHG emissions associated with the water sector.

Measure SR-14: Water Conservation and Efficiency

State requirement to reduce urban per capita water use.

2020 GHG Reduction Potential: Not Estimated

SB X7-7 is part of a California legislative package passed in 2009 that requires urban retail water suppliers to reduce per-capita water use by 10% from a baseline level by 2015, and to reduce per-capita water use by 20% by 2020. In Southern California, energy costs and GHG emissions associated with the transport, treatment, and delivery of water from outlying regions are high. Therefore, the region has extra incentive to reduce water consumption. While this is considered a state measure, it will be up to the local water retailers, jurisdictions, and water users to meet these targets. A number of policies have been established at the local level within the subregion requiring more efficient use of water, including landscape ordinances that require native or low-irrigation landscaping. Water retailers also offer resources that incentivize purchase of high-efficiency appliances and provide information on best management practices, landscaping, and the use of recycled and gray water systems.

While emissions reductions associated with water conservation efforts are likely, the emissions inventories do not separately include a water emissions sector. Therefore, to be conservative in estimating the CAP's emissions reduction potential, reductions associated with this measure are not quantified here. Future emissions inventory updates may include a separate water emissions sector, in which case it would be appropriate to estimate the reduction potential of water conservation efforts.

Community Benefits

LOCAL REDUCTION MEASURES

Table 3-2 lists the local measures included in the Subregional CAP and provides a breakdown of the GHG reduction potential for these local measures.

Table 3-2: 2020 Reductions Achieved from Local Measures

| Local Measures by Sector | | 2020 Reductions Achieved (MT CO ₂ e/yr) |
|--------------------------------------|--|---|
| E-1 | Energy Action Plans | 357,581 |
| E-2 | Traffic and Street Lights | 4,895 |
| E-3 | Shade Trees | 141 |
| Energy Subtotal | | 362,617 |
| T-1 | Bicycle Infrastructure Improvements | 29,255 |
| T-2 | Bicycle Parking | 6,290 |
| T-3 | End of Trip Facilities | 1,836 |
| T-4 | Promotional Transportation Demand Management | 1,831 |
| T-5 | Transit Service Expansion | 704 |
| T-6 | Transit Frequency Expansion | 2,723 |
| T-7 | Traffic Signal Coordination | 94,600 |
| T-8 | Density | 2,857 |
| T-9 | Mixed-Use Development | 4,069 |
| T-10 | Design/Site-Planning | 912 |
| T-11 | Pedestrian Only Areas | 2,812 |
| T-12 | Limited Parking Requirements for New Development | 28,423 |
| T-13 | High Frequency Transit Services | 1,801 |
| T-14 | Voluntary Transportation Demand Management | 2,464 |
| T-15 | Accelerated Bike Plan Implementation | 5,340 |
| T-16 | Fixed Guideway Transit | 10,489 |
| T-17 | Neighborhood Electric Vehicle Programs | 4,707 |
| T-18 | Subsidized Transit | 3,628 |
| Transportation Subtotal | | 204,744 |
| SW-1 | Yard Waste Collection | 1,007 |
| SW-2 | Food Scrap and Paper Diversion | 155 |
| Solid Waste Subtotal | | 1,162 |
| TOTAL LOCAL ACTION REDUCTIONS | | 568,524 |

LOCAL ENERGY MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the energy sector. As described in Chapter 1, at the time this CAP was developed 11 jurisdictions were participating in the Western Riverside Energy Leader Partnership (WRELP) Program, which includes the development of municipal and community-wide Energy Action Plans (EAPs) for these jurisdictions (**Table 1-1**). Measure E-1 includes the aggregate total GHG reduction potential for the 11 WRELP jurisdictions implementing the EAPs, while Measures E-2 and E-3 describe the GHG reduction potential from energy strategies implemented by the 4 jurisdictions included in this Subregional CAP that were not WRELP jurisdictions at the time of this CAP development.

Measure E-1: Energy Action Plans

Improve municipal and community-wide energy efficiency and reduce energy consumption through the adoption of local Energy Action Plans (EAP).

2020 GHG Reduction Potential: 357,581 MT CO₂e/yr

In 2011, Southern California Edison (SCE) provided funding to WRCOG to implement the California Long-Term Energy Efficiency Strategic Plan (CEESP) developed by the California Energy Commission. WRCOG and 11 participating jurisdictions established the WRELP Program and adopted energy efficiency targets and programs to meet those targets, which will reduce utility costs and GHG emissions associated with the energy use at the municipal and community level (**Table 1-1**). These targets and actions are captured in each jurisdiction's EAP. The EAPs use a similar approach to that described in this CAP, but only address emissions and GHG reductions associated with the energy sector. The CAP contains similar energy-efficiency actions for non-EAP jurisdictions.

By implementing the proposed efficiency measures, jurisdictions demonstrate the potential economic, social, and environmental benefits of increasing energy efficiency and providing environmental stewardship within the community.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|---|---|
| | This measure does not include tiered implementation actions. Each WRELP jurisdiction has individual energy-conserving measures and actions in its EAP. Energy sector reductions anticipated in each jurisdiction's EAP are captured within this local CAP measure, and will be tracked and reported in conjunction with the measures proposed within the CAP for non-WRELP jurisdictions. | 357,581 |
| PROGRESS INDICATORS | YEAR | |
| 1 | Each WRELP jurisdiction has received a tracking and monitoring tool, which identifies the jurisdiction's energy usage projections and goals, and provides a user-friendly workbook to evaluate emissions annually. Each jurisdiction has its own monitoring tool, but the assumptions used are consistent across all tools in the subregion and can be aggregated for subregional monitoring and reporting. | 2020 |

Measure E-2: Traffic and Street Lights

Replace traffic and street lights with high-efficiency bulbs.

2020 GHG Reduction Potential: 4,895 MT CO₂e/yr

Similar to many household light fixtures, traffic lights are typically illuminated with inefficient incandescent bulbs. Street lights commonly use high-pressure sodium (HPS) bulbs, which also produce light inefficiently. Newer lighting technology, such as light-emitting diodes (LEDs), last significantly longer than traditional incandescent or HPS bulbs, and use much less energy to perform the same task. Jurisdictions can install LEDs in their traffic signals and upgrade street light fixtures to accommodate LEDs or other high-efficiency bulbs to lower municipal utility costs and reduce maintenance costs associated with bulb replacement.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|---|---|
| PLATINUM LEVEL | 100% of traffic and street lights converted to high-efficiency bulbs by 2020. | 4,895 |
| | Banning, Jurupa Valley, Riverside | |
| GOLD LEVEL | 75% of traffic and street lights converted to high-efficiency bulbs by 2020. | 0 |
| | No jurisdictions participating at this level. | |
| SILVER LEVEL | 50% of traffic and street lights converted to high-efficiency bulbs by 2020. | 0 |
| | No jurisdictions participating at this level. | |
| PROGRESS INDICATORS | | YEAR |
| 1 | Banning: 950,000 million kWh/year in savings from Freeway Lighting and Streetlights subsectors of Local Government GHG Inventory. (Appendix A) | 2020 |
| 2 | Jurupa Valley: 11,000 kWh/year in savings from Streetlights subsector of Local Government GHG Inventory. (Appendix A) | 2020 |
| 3 | Riverside: 12.6 million kWh/year in savings from Streetlights and Traffic Signals/Controllers subsector of Local Government GHG Inventory. (Appendix A) | 2020 |

Community Benefits

Measure E-3: Shade Trees

Strategically plant trees to reduce the urban heat island effect.

2020 GHG Reduction Potential: 141 MT CO₂e/yr

Planting additional trees in urban environments has a number of benefits, including lowering peak-load energy demands during the hottest months, enhancing the visual aesthetic of a community, and naturally sequestering carbon dioxide. Properly selected and located shade trees can help keep indoor temperatures low, thereby reducing air conditioner demands and utility costs. Trees can also provide shade for parking lots and other paved areas, reducing the urban heat island effect communitywide.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|--|---|---|
| PLATINUM LEVEL | Shade trees are required for all new development or redevelopment. Eastvale, Jurupa Valley | 47 |
| GOLD LEVEL | Subsidized program to support planting jurisdiction-identified shade tree species. Banning, Riverside | 94 |
| SILVER LEVEL | Outreach program to promote the benefits of planting additional trees in urban environments. No jurisdictions participating at this level. | 0 |
| PROGRESS INDICATORS | | YEAR |
| 1 Banning: 2,150 new shade trees by 2020 | | 2020 |
| 2 Eastvale: 2,000 new shade trees by 2020 | | 2020 |
| 3 Jurupa Valley: 2,150 new shade trees by 2020 | | 2020 |
| 4 Riverside: 6,000 new shade trees by 2020 | | 2020 |

Community Benefits

LOCAL TRANSPORTATION MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the transportation sector.

Measure T-1: Bicycle Infrastructure Improvements

Expand on-street and off-street bicycle infrastructure, including bicycle lanes and bicycle trails.

2020 GHG Reduction Potential: 29,255 MT CO₂e/yr

By providing more bicycle lanes and better connections between existing bicycle lanes, WRCOG jurisdictions can increase the viability of bicycling as an emission-free commute option. Several WRCOG jurisdictions have adopted or are preparing bicycle master plans. Implementing these plans will increase alternative transportation options in the sub-region and can reduce vehicle miles traveled and congestion for vehicles. Community health benefits from increased bicycling include improved air quality and exercise.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|----------------------------|--|---|
| PLATINUM LEVEL | Implement a 50% increase in bicycle lane mileage from baseline levels. Riverside | 15,905 |
| GOLD LEVEL | Implement a 25% increase in bicycle lane mileage from baseline levels. No participating jurisdictions at this level. | 0 |
| SILVER LEVEL | Implement a 10% increase in bicycle lane mileage from baseline levels. Banning, Canyon Lake, Eastvale, Hemet, Jurupa Valley, Norco, Perris, San Jacinto, Temecula, Wildomar | 13,350 |
| PROGRESS INDICATORS | | YEAR |
| 1 | Annual percentage increase in bicycle lane mileage from baseline levels. | 2020 |

Community Benefits

Measure T-2: Bicycle Parking

Provide additional options for bicycle parking.

2020 GHG Reduction Potential: 6,290 MT CO₂e/yr

Safe and convenient bicycle parking is a relatively low-cost action that leads to a demonstrated shift from automobile use to bicycle use. Helping business owners understand the potential benefits of bicycle parking and requiring new development projects to include bike racks as a condition of approval can facilitate implementation of this measure.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|--|---|
| PLATINUM LEVEL | Amend zoning to require provision of bike parking for all multi-family or mixed-use projects consisting of a mix of residential, retail, and office space. Calimesa, Canyon Lake, Eastvale, Hemet, Jurupa Valley, Norco, Perris, Riverside, San Jacinto, Temecula, Wildomar | 6,152 |
| GOLD LEVEL | Amend zoning to require provision of bike parking for multi-family projects consisting of more than 50 dwelling units, and mixed-use projects greater than 50,000 square feet consisting of a mix of residential, retail, and office space. Banning | 138 |
| SILVER LEVEL | Provide information to applicants for large development projects describing the benefits of bike parking. No jurisdictions participating at this level. | 0 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual number of new bike parking spaces installed. | | 2020 |

Community Benefits

Measure T-3: End of Trip Facilities

Encourage use of non-motorized transportation modes by providing appropriate facilities and amenities for commuters.

2020 GHG Reduction Potential: 1,836 MT CO₂e/yr

End-of-trip commuter facilities further incentivize alternative transportation modes, such as walking and biking. Such facilities commonly include showers, changing rooms, lockers, and bike racks.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|---|---|
| PLATINUM LEVEL | Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 50,000 square feet. Riverside | 1,119 |
| GOLD LEVEL | Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 100,000 square feet. Banning, Jurupa Valley, Perris | 391 |
| SILVER LEVEL | Provide information to commercial project applicants describing the benefits of installing end-of-trip facilities. Calimesa, Canyon Lake, Eastvale, Hemet, San Jacinto, Temecula, Wildomar | 326 |
| PROGRESS INDICATORS | | YEAR |
| 1 | Annual number of development projects installing end-of-trip facilities. | 2020 |

Community Benefits

Measure T-4: Promotional Transportation Demand Management

Encourage Transportation Demand Management strategies.

2020 GHG Reduction Potential: 1,831 MT CO₂e/yr

Transportation demand management (TDM) describes strategies to reduce demand for roadway travel, particularly in single-occupancy vehicles. TDM strategies can include both “carrot” and “stick” approaches to change travel behavior patterns. Specific examples include preferential parking for carpoolers and parking pricing.

While SCAG offers regional approaches such as high-occupancy vehicle lanes, this measure focuses on efforts by individual existing business owners in the WRCOG sub-region to develop TDM strategies, such as parking “cash out” programs and allowing telecommuting. Several TDM strategies can be offered; often, multiple programs can enhance one another rather than being redundant. In addition to reducing GHG emissions, TDM strategies often ease congestion and improve air quality.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|--|---|
| PLATINUM LEVEL | Allocate a full-time staff person to promote TDM strategies to existing businesses. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Allocate the equivalent of ½ of a full- time staff person to promote TDM strategies to existing businesses. No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | Train an existing staff person to promote TDM strategies to existing business. Eastvale, Hemet, Jurupa Valley, Norco, Riverside | 1,831 |
| PROGRESS INDICATORS | | YEAR |
| 1 Number of jurisdictions with full-time or part-time staff promoting TDM programs to be established through an annual survey conducted by WRCOG. | | 2020 |

Community Benefits

Measure T-5: Transit Service Expansion

Collaborate with local and regional transit providers to increase transit service provided in the subregion.

2020 GHG Reduction Potential: 704 MT CO₂e/yr

It will be crucial for jurisdictions anticipating growth to coordinate with the Riverside Transit Agency (RTA) and Banning Pass Transit to appropriately expand service. Several jurisdictions have identified a need for additional transit service and are working with RTA to identify critical investments to maximize ridership. Increased transit ridership improves air quality as fewer single-occupancy vehicles use the roadways, improves traffic flow for remaining vehicles, and offers mobility to low-income and other disadvantaged communities. Information related to this measure may be updated upon completion of the RTA Forward 10-Year Transit Plan, a comprehensive operational analysis that will guide RTA's bus route and service decisions in future years.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|--|---|
| PLATINUM LEVEL | Work with RTA to increase fixed-route service miles by 20% by 2020. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Work with RTA to increase fixed-route service miles by 10% by 2020. Eastvale, Norco | 324 |
| SILVER LEVEL | Work with RTA to increase fixed-route service miles by 5% by 2020. Banning, Jurupa Valley, Temecula, Wildomar | 380 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual miles of fixed-route service provided by RTA | | 2020 |

Community Benefits

Measure T-6: Transit Frequency Expansion

Collaborate with local and regional transit providers to provide more frequent transit in the subregion.

2020 GHG Reduction Potential: 2,723 MT CO₂e/yr

Future annual transit ridership is expected to grow by 3.5% across the nation, and many transportation systems are already operating beyond their capacity (APTA 2010). In addition to expanding service, transit agencies will need to increase service frequency by reducing headways or the time between buses on existing routes. WRCOG jurisdictions are working with RTA and Banning Pass Transit to share information regarding anticipated land development patterns and to maximize service frequency investments. Similar to transit service expansion, this measure provides air quality and mobility co-benefits by reducing the number of single-occupancy vehicles on the road. Information related to this measure may be updated upon completion of the RTA Forward 10-Year Transit Plan, a comprehensive operational analysis that will guide RTA's bus route and service decisions in future years. This measure differs from T-5 in that it considers service improvements along existing routes.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|--|--|---|
| PLATINUM LEVEL | Work with RTA to increase fixed-route service frequency by 20% over baseline levels in transit priority areas as defined by SCAG in the RTP/SCS. Perris | 698 |
| GOLD LEVEL | Work with RTA to increase fixed-route service frequency by 10% over baseline levels in transit priority areas as defined by SCAG in the RTP/SCS. Eastvale | 241 |
| SILVER LEVEL | Work with RTA to increase fixed-route service frequency by 5% over 2010 levels in transit priority areas as defined by SCAG in the RTP/SCS. Banning, Jurupa Valley, Norco, Temecula, Wildomar | 1,784 |
| PROGRESS INDICATORS | | YEAR |
| 1 Percentage change in average annual fixed-route service frequency in transit priority areas compared to baseline levels. | | 2020 |

Community Benefits

Measure T-7: Traffic Signal Coordination

Incorporate technology to synchronize and coordinate traffic signals along local arterials.

2020 GHG Reduction Potential: 94,600 MT CO₂e/yr

Traffic signal coordination describes a method of timing groups of traffic signals along an arterial to provide smooth movement of traffic with minimal stops. This technique reduces motorist stops and delays, lowers the amount of fuel need to move a certain distance, and reduces GHG emissions. Signal coordination also lessens congestion and resulting tail pipe emissions, which reduces GHG emissions and improves air quality.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|---|---|
| PLATINUM LEVEL | Coordinate traffic signals on an additional 50% of arterial roads that were not coordinated in the base year. Canyon Lake, Perris, Riverside, Temecula | 78,318 |
| GOLD LEVEL | Coordinate traffic signals on an additional 25% of arterial roads that were not coordinated in the base year. Banning, Hemet, San Jacinto | 10,131 |
| SILVER LEVEL | Coordinate traffic signals on an additional 10% of arterial roads that were not coordinated in the base year. Eastvale, Jurupa Valley, Wildomar | 6,151 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual percentage of arterial roads with signal coordination which were not coordinated in the base year. | | 2020 |

Community Benefits

Measure T-8: Density

Improve jobs-housing balance and reduce vehicle miles traveled by increasing household and employment densities.

2020 GHG Reduction Potential: 2,857 MT CO₂e/yr

Density describes the number of people, jobs, or housing units in a given area. Increasing density generally results in shorter distances between locations, making transit and non-motorized transportation options such as walking and biking more viable. GHG emissions associated with vehicle miles traveled (VMT) are reduced as more individuals choose alternative transportation modes. Increases in density must generally fit within assumptions of a jurisdiction's General Plan, although amendments can be made to increase density in certain areas.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|--|---|
| PLATINUM LEVEL | Achieve a 25% increase in community-wide household and employment density over baseline conditions by 2020. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Achieve a 10% increase in community-wide household and employment density over baseline conditions by 2020. Perris, Riverside, Temecula | 2,054 |
| SILVER LEVEL | Achieve a 5% increase in community-wide household and employment density over baseline conditions by 2020. Eastvale, Hemet, Jurupa Valley, Norco, San Jacinto, Wildomar | 803 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual percentage change in community-wide household and employment density compared to baseline conditions | | 2020 |

Community Benefits

Measure T-9: Mixed-Use Development

Provide for a variety of development types and uses.

2020 GHG Reduction Potential: 4,069 MT CO₂e/yr

Development can occur in many forms, ranging from single-family homes on large plots of land to multi-family housing with high vertical construction for residential areas, and single-use to multi-use zoning for commercial properties. While land development choices are typically made at the household or business level, recent studies show that individuals are more frequently demanding higher-density, multi-use regions that are more walkable. Most WRCOG jurisdictions have identified portions of their communities where future higher-density development is desirable. Such development reduces both VMT and GHGs, as individuals can accomplish many tasks in a single mixed-use area. This also can improve community health by encouraging bicycling and walking, improve air quality by reducing tailpipe emissions, and increase the community's sense of place.

For the WRCOG subregion, mixed-use development is classified as having at least three of the following features either on-site or within ¼ mile:

- Residential development;
- Retail development;
- Park;
- Open space; or
- Office.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|--|---|---|
| PLATINUM LEVEL | Achieve a 25% jobs/housing ratio improvement over baseline conditions. Eastvale, Jurupa Valley | 1,897 |
| GOLD LEVEL | Achieve a 10% jobs/housing ratio improvement over baseline conditions. Hemet, Perris | 764 |
| SILVER LEVEL | Achieve a 5% jobs/housing ratio improvement over baseline conditions Banning, Norco, Riverside, Temecula, Wildomar | 1,408 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual percentage change in jobs/housing ratio within new development areas compared to baseline conditions. | | 2020 |

Community Benefits

Measure T-10: Design/Site Planning

Design neighborhoods and sites to reduce VMT.

2020 GHG Reduction Potential: 912 MT CO₂e/yr

The design of projects affects travel behavior. Typical suburban development patterns feature longer blocks which often discourage walking and biking. Conversely, projects with shorter blocks and more frequent intersections have higher levels of walking, biking, and transit use. This higher use of non-motorized and alternative modes leads to a reduction in automobile use, VMT, and GHG emissions.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|--|---|---|
| PLATINUM LEVEL | 25% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | 10% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | 5% increase in intersection density and reduction in block length in new development compared to the baseline countywide average. Hemet, Perris, Temecula | 912 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual percentage of neighborhood streets with traffic calming treatments installed. | | 2020 |

Community Benefits

Measure T-11: Pedestrian-Only Areas

Encourage walking by providing pedestrian-only community areas.

2020 GHG Reduction Potential: 2,812 MT CO₂e/yr

Also referred to as an urban non-motorized zone, a pedestrian-only area restricts certain portions of a central business district or major activity center to non-motorized transportation.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|--|---|---|
| PLATINUM LEVEL | Designate one additional major activity center in the community as a permanent pedestrian-only area over baseline conditions. Perris, Riverside | 1,747 |
| GOLD LEVEL | Designate one additional pedestrian-only area during weekends over baseline conditions. No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | Designate one additional pedestrian-only area during weekends tied to a special event (e.g. farmer's market) over baseline conditions. Banning, Hemet, Jurupa Valley, Norco, San Jacinto, Temecula | 1,065 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual number of temporary or permanent pedestrian-only zones compared to baseline conditions. | | 2020 |

Community Benefits

Measure T-12: Limit Parking Requirements for New Development

Reduce requirements for vehicle parking in new development projects.

2020 GHG Reduction Potential: 28,423 MT CO₂e/yr

Limiting parking requirements for new development in certain areas may encourage alternative individual transportation choices, but caution should be taken to minimize the resulting incentive to travel to more distant locations with plenty of parking. This can be accomplished by:

- Eliminating (or reducing) minimum parking requirements;
- Creating maximum parking requirements; and
- Implementing shared parking.

Limiting parking requirements would encourage modes of transportation other than single-occupancy vehicles, thereby reducing VMT and GHG emissions. If these alternative transportation modes include walking and biking, mobility and health benefits would also be realized.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|--|---|
| PLATINUM LEVEL | Amend zoning to reduce parking requirements for new non-residential development by 25% over baseline conditions. Riverside | 17,482 |
| GOLD LEVEL | Amend zoning to reduce parking requirements for new non-residential development by 10% over baseline conditions Jurupa Valley, Perris | 6,093 |
| SILVER LEVEL | Amend zoning to reduce parking requirements for new non-residential development by 5% over baseline conditions. Canyon Lake, Hemet, Norco, Temecula, Wildomar | 4,848 |
| PROGRESS INDICATORS | | YEAR |
| 1 | Number of jurisdictions which have amended their parking requirements to reduce parking spaces required within new development or redevelopment areas. | 2020 |

Community Benefits

Measure T-13: High Frequency Transit Service

Implement high frequency transit service in the subregion to provide alternative transportation options.

2020 GHG Reduction Potential: 1,801 MT CO₂e/yr

The WRCOG subregion is one of the fastest growing areas in California. As more residents and employees occupy the area, there will be increased need to move people efficiently in and out of the area. A high frequency transit system such as bus rapid transit (BRT) would provide an alternative to constructing more roadways and allow commuters and residents additional transportation options. Jurisdictions participating in this measure have an objective to work with RTA to identify corridors where BRT service would provide an effective and logical transportation option.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|---|---|
| PLATINUM LEVEL | Work with RTA to offer high frequency transit service within three (3) corridors No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Work with RTA to offer high frequency transit service within two (2) corridors Eastvale, Riverside | 1,640 |
| SILVER LEVEL | Work with RTA to offer high frequency transit service within one (1) corridor Hemet | 161 |
| PROGRESS INDICATORS | | YEAR |
| 1 Number of corridors in which high frequency transit service has been implemented. | | 2020 |

Community Benefits

Measure T-14: Voluntary Transportation Demand Management

Reduce demand for roadway travel through incentives for alternative modes of transportation and disincentives for driving.

2020 GHG Reduction Potential: 2,464 MT CO₂e/yr

TDM describes strategies to reduce demand for roadway travel, particularly in single-occupancy vehicles. TDM strategies can include both “carrot” and “stick” approaches to change travel behavior patterns. Specific examples include preferential parking for carpoolers and parking pricing.

While SCAG offers regional approaches such as high-occupancy vehicle lanes, this measure focuses on efforts by individual existing business owners in the WRCOG subregion to develop TDM strategies, such as parking “cash out” programs and allowing telecommuting. Several TDM strategies can be offered; often, multiple programs can enhance one other rather than being redundant. In addition to reducing GHG emissions, TDM strategies often ease congestion and improve air quality.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|---|---|
| PLATINUM LEVEL | 50% of employees within the jurisdiction participate in voluntary TDM programs No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | 25% of employees within the jurisdiction participate in voluntary TDM programs Riverside | 2,185 |
| SILVER LEVEL | 12.5% of employees within the jurisdiction participate in voluntary TDM programs Perris | 279 |
| PROGRESS INDICATORS | | YEAR |
| 1 Percentage of employees in each jurisdiction participating in voluntary TDM programs. | | 2020 |

Community Benefits

Measure T-15: Accelerated Bike Plan Implementation

Accelerate the implementation of all or specified components of a jurisdiction's adopted bike plan.

2020 GHG Reduction Potential: 5,340 MT CO₂e/yr

Several jurisdictions within WRCOG are currently implementing existing Bicycle Master Plans and/or Trails Plans. These plans outline a series of on-street and off-street facilities to increase bicycle use within the community. This measure addresses accelerated implementation of these Master Plans to provide additional facilities by 2020 beyond those identified in Measure T-1.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|--|---|
| PLATINUM LEVEL | Install 75% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020. Riverside | 3,496 |
| GOLD LEVEL | Install 50% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020. No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | Install 25% of all bicycle facility miles identified in jurisdiction's Bike Plan by 2020. Hemet, Perris, Temecula, Wildomar | 1,844 |

NOTE: Reductions are assumed to be 1/2 of total reductions for bicycle infrastructure measure.

| PROGRESS INDICATORS | YEAR |
|--|------|
| 1 Annual % of bicycle facility miles identified in jurisdiction's Bike Plan installed. | 2020 |

Community Benefits

Measure T-16: Fixed Guideway Transit

Introduce a fixed-route transit service in the jurisdiction.

2020 GHG Reduction Potential: 10,489 MT CO₂e/yr

This measure applies specifically to the City of Riverside's efforts to conduct a preliminary engineering and economic study for a proposed Streetcar. This Streetcar would provide fixed-route transit service through the City of Riverside, providing access to major destinations such as the University of California, Riverside, Downtown Riverside, and other major destinations throughout the city. The City would plan, design, construct, and operate the streetcar.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|---|---|
| PLATINUM LEVEL | Implement a fixed-guideway transit system. Riverside | 10,489 |
| GOLD LEVEL | N/a No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | N/a No jurisdictions participating at this level. | 0 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual community-wide fixed guideway transit ridership. | | 2020 |

Community Benefits

Measure T-17: Neighborhood Electric Vehicle Programs

Implement development requirements to accommodate Neighborhood Electric Vehicles and supporting infrastructure.

2020 GHG Reduction Potential: 4,707 MT CO₂e/yr

Neighborhood electric vehicles (NEVs) emit fewer GHGs than traditional passenger vehicles and reduce local air pollution. NEVs generally are used in areas with speed limits of 35 miles per hour or less for relatively short (less than 30 miles) trips. This measure introduces development requirements for signage and educational programs related to the use of NEVs consistent with state regulations.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---------------------|--|---|
| PLATINUM LEVEL | Provide dedicated NEV facilities within the community. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Adopt a comprehensive NEV program including signage for NEVs and an educational program related to the use of NEVs. Riverside | 3,496 |
| SILVER LEVEL | Adopt an educational program related to the use of NEVs. Hemet | 1,211 |
| PROGRESS INDICATORS | | YEAR |
| 1 | Number of jurisdictions which have implemented NEV plans. | 2020 |

Community Benefits

Measure T-18: Subsidized Transit

Increase access to transit by providing free or reduced passes.

2020 GHG Reduction Potential: 3,628 MT CO₂e/yr

One approach to increase transit use within a jurisdiction is lowering the cost of using transit. Within Western Riverside County, the typical approach has been to provide reduced cost transit passes such as those provided by several universities. This approach is generally targeted at groups such as students or seniors who may lack access to vehicles.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|--|---|
| PLATINUM LEVEL | Provide subsidized or discounted transit passes to 3% of residents, students, and employees living, working, or going to school in the community. Riverside | 3,496 |
| GOLD LEVEL | Provide subsidized or discounted transit passes to 2% of residents, students, and employees living, working, or going to school in the community. No jurisdictions participating at this level. | 0 |
| SILVER LEVEL | Provide subsidized or discounted transit passes to 1% of residents, students, and employees living, working, or going to school in the community. Norco | 132 |
| PROGRESS INDICATORS | | YEAR |
| 1 Annual number of discounted transit passes provided per total of residents, students, and employees living, working, or going to school in the community. | | 2020 |

Community Benefits

LOCAL SOLID WASTE MEASURES

The following are local measures that can be implemented to reduce GHG emissions associated with the solid waste sector.

Measure SW-1: Yard Waste Collection

Provide green waste collection bins community-wide.

2020 GHG Reduction Potential: 1,007 MT CO₂e/yr

All jurisdictions in the subregion offer green waste collection bins for residential yard waste. Diverting yard waste from landfills helps to extend the life of area landfills. In addition, grass clippings and leaves can be composted into nutrient-rich topsoil amendments, and branches can be chipped into mulch for reuse in landscaping. Removing beneficial organic materials from landfills also helps avoid the creation of landfill methane, a potent GHG.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|-----------------------|--|---|
| PLATINUM LEVEL | Adopt an ordinance prohibiting deposit of yard waste in the solid waste stream. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Provide residential green waste bins for collection and transport to an organic waste processing facility. Banning, Calimesa, Canyon Lake, Eastvale, Hemet, Jurupa Valley*, Norco, Perris, Riverside, San Jacinto, Temecula, Wildomar | 1,007 |
| SILVER LEVEL | Conduct an outreach campaign promoting the benefits of yard waste collection, without provision of green waste bins. No jurisdictions participating at this level. | 0 |

*Jurupa Valley offers yard waste collection bins, however waste emissions were not quantified within the jurisdiction's inventory due to lack of available data. Therefore, yard waste reductions for Jurupa Valley are not included within this CAP.

| PROGRESS INDICATORS | YEAR |
|--|------|
| 1 Achievement of 95% diversion of residential yard waste from landfill waste stream. | 2020 |

Community Benefits

Measure SW-2: Food Scrap and Compostable Paper Diversion

Divert food and paper waste from landfills by implementing collection system.

2020 GHG Reduction Potential: 155 MT CO₂e/yr

Food scraps are unwanted cooking preparation and table scraps, such as banana peels, apple cores, vegetable trimmings, bones, egg shells, meat, and pizza crusts. Compostable paper, sometimes called food-soiled paper, usually comes from the kitchen and is not appropriate for paper recycling due to contamination. Materials such as stained pizza boxes, uncoated paper cups and plates, used coffee filters, paper food cartons, napkins, and paper towels are all compostable paper. Food scraps alone represent nearly 20% of total landfilled solid waste statewide. Diverting these organic items from landfills helps to reduce landfill methane gas generation, and can help prolong the lifespan of area landfills.

| PARTICIPATION LEVEL | ACTIONS + PARTICIPATING CITIES | GHG REDUCTION POTENTIAL (MT CO ₂ e/yr) |
|---|---|---|
| PLATINUM LEVEL | Accept food scraps and compostable paper within residential green waste bins; establish a commercial food scrap collection program. No jurisdictions participating at this level. | 0 |
| GOLD LEVEL | Accept food scraps and compostable paper within residential green waste bins or provide separate food scrap collection bins. Riverside, Temecula | 155 |
| SILVER LEVEL | Provide community outreach about benefits of food scrap and compostable paper collection with information about at-home composting. Banning, Calimesa, Canyon Lake, Eastvale, Jurupa Valley, Norco, Perris | 0 |
| PROGRESS INDICATORS | | YEAR |
| 1 Temecula - 20% of commercial businesses divert 90% of their waste | | 2020 |

Community Benefits

Chapter 4

Next Steps

PREPARING THE SUBREGION FOR CLIMATE CHANGE

A key next step, and important to the success of WRCOG's sustainability planning efforts including the Subregional Climate Action Plan (CAP), is the evaluation, analysis, and integration of climate adaptation and resiliency strategies. The WRCOG subregion is expected to experience impacts due to projected changes in the climate, and jurisdictions should begin preparing for them. The effects of climate change will cumulatively affect all sectors, including: water supply and wastewater management, agriculture, public infrastructure (pipelines, wastewater treatment plants, bridges, and roads), public health and public services (fire protection, emergency preparedness), and ecosystem health (diversity and connectivity of habitats), among others.

Despite significant efforts by the subregion and the State of California to reduce GHG emissions, changes in our climate are inevitable over the long term. Even if GHG emissions were reduced to pre-industrial levels today, the GHG emissions that have already been added to the atmosphere will continue to warm the planet for centuries. While mitigation is still the most cost-effective approach to preventing long-term catastrophic impacts of climate change, adaptation efforts are needed to increase the resilience of communities and natural resources to changes expected over the next few decades.

In California, anticipated climate change impacts include sea level rise; increased periods of drought; and more frequent extreme weather events, including heat waves and severe storms. Secondary effects include projected inundation of the shoreline; more frequent and severe flooding; more frequent and severe wildfires on the urban fringe; a less reliable water supply; altered agricultural productivity, increased incidence of disease and mortality (both from effects of heat waves and from changing patterns of disease distribution); and disruption of local ecosystems.

The *California Planning Adaptation Planning Guide: Understanding Regional Characteristics*¹ designates climate impact regions based on county boundaries in combination with projected climate impacts, existing environmental setting, socioeconomic factors, and regional designations. The WRCOG subregion falls within the Desert climate impact region, which includes Imperial, Riverside, and San Bernardino Counties, and the *Adaptation Planning Guide* identifies the following climate change impacts to this area:

- Temperature increases
- Reduced precipitation
- Flooding
- Reduced agricultural productivity
- Reduced water supply
- Wildfires
- Public health and heat

ADAPTATION PLANNING APPROACH

Effective adaptation planning and management entails dealing with uncertainty. Adaptation is likely to be a long-term process, including immediate action when necessary and allowing adjustments to changing conditions and new knowledge. Effective public engagement and education is critical, along with an inclusive planning process that ensures the resulting actions are feasible and widely accepted. Five important steps to effective adaptation planning are summarized below:

- **Increase Public Awareness; Engage and Educate the Community:** Local outreach campaigns to build awareness of the dangers of heat exposure and to promote low-cost and low-GHG emitting adaptation strategies. It is critical that the public understand the magnitude of the challenge and why action is needed. The planning process should be inclusive of all stakeholders. These efforts should leverage similar efforts undertaken at the regional, state, and federal levels.
- **Assess Vulnerability:** Perform a detailed vulnerability analysis to assess potential climate change impacts to infrastructure and natural systems. Both short-term and long-term adaptation strategies should be identified. Level of risk can be categorized in terms of likelihood of damage within the forecasting period and the severity of the damages. Understanding vulnerability to climate change impacts is critical to developing effective adaptation strategies. The vulnerability assessment can also provide a framework for agency and community education and participation, inform other planning documents, and identify funding needs. WRCOG intends to initiate a vulnerability/risk assessment in Spring 2014 that will inform not only the CAP, but member jurisdictions' General Plan Safety Elements and Local Hazard Mitigation Plans. It will incorporate the diversity of needs and integrate climate adaptation strategies with existing and proposed programs and initiatives to make the best use of limited resources.
- **Establish Goals, Criteria and Planning Principles:** Engage with stakeholders to establish planning priorities, decision criteria, and build community support for taking action. Rank physical and natural assets for preservation efforts. Where possible, look for situations where a mitigation

¹ California Climate Planning Adaptation Guide, July 2012. Available at http://resources.ca.gov/climate_adaptation/docs/1APG_Planning_for_Adaptive_Communities.pdf

action has adaptation co-benefits (e.g., planting trees to reduce urban heat islands while sequestering carbon and providing habitat).

- **Develop Adaptation Plan:** Identify specific strategies, develop cost estimates, and prioritize actions to increase local resilience of public infrastructure and critical assets, including natural systems like wetlands and urban forests. Look for synergies between natural processes and engineering solutions. An adaptation plan should include a prioritized list of actions (e.g. projects), with a timeline, capital expenditure plan, and a framework for monitoring and adaptive management.
- **Ongoing Monitoring and Adaptive Management:** Reassess climate change vulnerabilities on a regular basis and modify actions accordingly. This includes monitoring the effectiveness of current policies, strategies and actions, and keeping up with changing science, funding opportunities, and regulatory actions.

IMPLEMENTATION OF THE SUBREGIONAL CLIMATE ACTION PLAN

Implementation of the Subregional CAP, including meeting the subregional reduction targets and achieving GHG reduction benefits, will require collaboration between WRCOG, local governments, and the communities at large. Meaningful implementation of the CAP would require the following components, described in more detail below:

- Administration
- Schedule of implementation
- Potential funding sources
- Monitoring and reporting

These steps are not specific to WRCOG or any individual jurisdiction, but are basic steps that WRCOG or any jurisdiction might take, or that other California communities have taken to implement a CAP. These are suggested, not required, and are intended to guide WRCOG and its members in implementation planning for the future.

ADMINISTRATION

WRCOG will continue to provide staffing and administrative support at the subregional level, particularly in implementing subregional programs such as the Transportation Uniform Mitigation Fee (TUMF), HERO Program, Western Riverside Energy Leader Partnership (WRELP) and Clean Cities Coalition. WRCOG will also work to align these programs, and future subregional initiatives, with the goals established in this CAP, where applicable. WRCOG recommends that participating jurisdictions appoint a “CAP coordinator” to oversee the successful implementation and tracking of local GHG reduction strategies. The local CAP coordinator would primarily be responsible for coordinating across municipal departments to gather data, report on progress, track completed projects, and ensure that scheduling and funding of upcoming projects is discussed at key meetings. Some jurisdictions may wish to have the coordinator work primarily as part of the development review process for new projects (i.e., Planning Department staff). The coordinator may be existing staff and does not necessarily require a dedicated full-time position. **Table 4-1** describes the potential responsibilities for WRCOG staff and local CAP coordinators.

In general, the goal in implementing the CAP is not to create new administrative tasks or new staff positions, but rather to leverage existing programs and staff to the maximum extent feasible. Local governments should seek to incorporate GHG planning and long-term reductions into their existing procedures, institutional organization, reporting and long-term planning; this is a process that will be unique to each jurisdiction.

Table 4-1: Climate Action Plan Implementation Responsibilities

| WRCOG | Jurisdictions/CAP Coordinators |
|---|--|
| Secure financing to implement GHG reduction measures (i.e., grants) | Secure long-term financing to implement GHG reduction measures |
| Coordinate meetings among member jurisdictions, regional partners and stakeholders | Coordinate meetings amongst local community stakeholders |
| Serve as the external communication hub to regional climate action organizations including California Air Resources Board (CARB), South Coast Air Quality Management District (SCAQMD), Southern California Association of Governments (SCAG) | Serve as the communication hub to the community and local stakeholders |
| Conduct public outreach to inform the community of the subregion's reduction planning efforts | Submit annual reports to governing bodies |
| Develop a protocol for monitoring the effectiveness of emissions reduction programs | Utilize tool developed by WRCOG to report and document emission reduction progress |
| Establish guidelines and develop a tool for reporting and documenting emissions reduction progress | |
| Submit annual reports to the WRCOG Executive Committee and member agency governing bodies | |
| Develop a protocol for utilizing the real-time information collected through the verification process to modify and revise existing reduction programs | |
| Track state and federal legislation and its applicability to member jurisdictions | |

SCHEDULE OF IMPLEMENTATION

WRCOG will track State measures, facilitate implementation of the regional measures and will coordinate with each participating jurisdiction to implement local measures. When feasible, WRCOG will act as the convener and assist in identifying funding, establishing partnerships, and track and monitor progress. Ultimately, each participating jurisdiction will be responsible for initiating the local actions to reduce emissions, but success for many measures will ultimately depend on public participation. Tasks that require active promotion may require updates to the WRCOG and jurisdictions' websites, distribution of physical promotional materials, and other active outreach activities. WRCOG and its

members will develop programs to reach the public, including public forums, workshops, and meetings; these programs will be administered with the intent to foster an open public input and commenting process. Collaboration and coordination with transportation agencies (e.g., Riverside Transit Agency [RTA], Banning Pass Transit, and Riverside County Transportation Commission [RCTC]) will be essential to improving and increasing transit ridership, and enhancing mobility and transportation efficiency through better planning.

Further, coordination with external agencies and the private sector is critical for the success of many strategies, including utility companies for energy conservation and renewable energy programs, waste haulers for waste reduction actions, local water purveyors for water saving actions, and other local jurisdictions for work-sharing partnerships designed to take advantage of the common goals across Western Riverside County. Dependence on outside agency participation is mentioned explicitly in the strategy descriptions; WRCOG, its member jurisdictions, and partner stakeholders will continue to explore strategies for collaboration.

Table 4-2 provides a summary of the state, regional, and local measures included in this Subregional CAP and the emissions reductions associated with these measures anticipated by 2020. Chapter 3 provides a detailed description of each measure, jurisdictional participation, progress indicators, and community benefits.

Table 4-2: Implementation Summary

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|---|--|---|
| SR-1: Renewables Portfolio Standard | 434,606 | <ul style="list-style-type: none"> • 20% of retail sales from renewables by 2013. • 25% of retail sales from renewables by 2016. • 33% of retail sales from renewables by 2020. |
| SR-2: 2013 California Building Energy Efficiency Standards (Title 24, Part 6) | 30,923 | <ul style="list-style-type: none"> • Residential construction 25% more efficient and nonresidential construction 30% more efficient than the 2008 standards. |
| SR-3: HERO Residential Program | 71,649 | <ul style="list-style-type: none"> • Expanding list of eligible products for financing. • Increase in funded applications and completed projects. • Increased energy savings, renewable energy installation, job creation, and economic development. |
| SR-4: HERO Commercial Program | 10,079 | <ul style="list-style-type: none"> • Expanding list of eligible products for financing. • Increase in funded applications and completed projects. • Increased energy savings, renewable energy installation, job creation, and economic development. |
| SR-5: Utility Programs | 7,873 | <ul style="list-style-type: none"> • Increased participation in programs. |

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|--|--|---|
| SR-6: Pavley & Low Carbon Fuel Standards | 1,095,555 | <ul style="list-style-type: none"> Increasingly-stringent fuel-efficiency standards for passenger vehicles 2017 through 2025. The carbon-intensity of California's transportation fuel to be reduced by at least 10% by 2020. |
| SR-7: Metrolink Expansion | 23,074 | <ul style="list-style-type: none"> Extension of service to Perris by 2015. |
| SR-8: Express Lanes | 60,864 | <ul style="list-style-type: none"> Extended express lanes along SR-91 and I-15 operational by 2020. |
| SR-9: Congestion Pricing | 3,246 | <ul style="list-style-type: none"> Congestion pricing on the SR-91 and I-15 by 2020. |
| SR-10: Telecommuting | 40,576 | <ul style="list-style-type: none"> Increasing the availability and use of carpooling, vanpooling, transit, bicycling, and walking. Shifting work schedules to non-peak periods or locations. Using telecommuting. 5% of workers in the region telecommuting by 2020. |
| SR-11: Goods Movement | 22,688 | <ul style="list-style-type: none"> Penetration of electric and low-emission trucks. Physical improvements on freeways such as truck climbing lanes. |
| SR-12: E-Vehicle Plan and Infrastructure | 81,152 | <ul style="list-style-type: none"> Charging stations, changes to development codes, and other strategies to encourage purchase and use of electric vehicles. |
| SR-13: Construction and Demolition Waste Diversion | 3,574 | <ul style="list-style-type: none"> 50% of scrap lumber diverted from landfill waste stream. |
| SR-14: Water Conservation | Not Estimated | <ul style="list-style-type: none"> Urban retail water suppliers to reduce per-capita water use by 10% from a baseline level by 2015. Reduce per-capita water use by 20% by 2020. |
| E-1: Energy Action Plans | 357,581 | <ul style="list-style-type: none"> Implement programs to meet energy efficiency targets. |
| E-2: Traffic & Street Lights | 4,895 | <ul style="list-style-type: none"> Platinum Level: 100% of traffic & street lights converted to high-efficiency bulbs by 2020. Gold Level: 75% of traffic & street lights converted to high-efficiency bulbs by 2020. Silver Level: 50% of traffic & street lights converted to high-efficiency bulbs by 2020. |

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|---|--|---|
| E-3: Shade Trees | 141 | <ul style="list-style-type: none"> • Platinum Level: Shade trees required for all new developments. • Gold Level: Subsidized program to support planting city-identified tree species. • Silver Level: Outreach program promoting the benefits of planting additional trees in urban environments. |
| T-1: Bicycle Infrastructure | 29,255 | <ul style="list-style-type: none"> • Platinum Level: 50% increase in bicycle lane mileage from 2010 levels. • Gold Level: 25% increase in bicycle lane mileage from 2010 levels. • Silver Level: 10% increase in bicycle lane mileage from 2010 levels. |
| T-2: Bicycle Parking | 6,290 | <ul style="list-style-type: none"> • Platinum Level: Amend zoning to require provision of bike parking for all multi-family or mixed-use projects. • Gold Level: Amend zoning to require provision of bike parking for multi-family projects consisting of more than 50 dwelling units, and mixed-use projects greater than 50,000 sf. • Silver Level: Provide information to applicants for large development projects describing the benefits of bike parking. |
| T-3: End of Trip Facilities | 1,836 | <ul style="list-style-type: none"> • Platinum Level: Amend zoning code to require installation of end-of-trip facilities for new commercial buildings greater than 50,000 sf. • Gold Level: Amend zoning to require installation of end-of-trip facilities for new commercial buildings greater than 100,000 sf. • Silver Level: Provide information to commercial project applicants describing the benefits of installing end-of-trip facilities. |
| T-4: Promotional Transportation Demand Management | 1,831 | <ul style="list-style-type: none"> • Platinum Level: Allocate a full-time staff person to promote TDM strategies to existing businesses. • Gold Level: Allocate the equivalent of ½ of a full-time staff person to promote TDM strategies to existing businesses. • Silver Level: Train an existing staff person to promote TDM strategies to existing businesses. |

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|----------------------------------|--|--|
| T-5: Transit Service Expansion | 704 | <ul style="list-style-type: none"> Platinum Level: 20% increase in fixed-route service miles. Gold Level: 10% increase in fixed-route service miles. Silver Level: 5% increase in fixed-route service miles. |
| T-6: Transit Frequency Expansion | 2,723 | <ul style="list-style-type: none"> Platinum Level: 20% increase in fixed-route service frequency over 2010 levels in transit priority areas (TPAs) as determined by the latest available SCAG SCS/RTP. Gold Level: 10% increase in fixed-route service frequency over 2010 levels in TPAs. Silver Level: 5% increase in fixed-route service frequency over 2010 levels in TPAs. |
| T-7: Traffic Signal Coordination | 94,600 | <ul style="list-style-type: none"> Platinum Level: Coordinate traffic signals on an additional 50% of arterial roads. Gold Level: Coordinate signals on an additional 25% of arterial roads. Silver Level: Coordinate signals on an additional 10% of arterial roads. |
| T-8: Density | 2,857 | <ul style="list-style-type: none"> Platinum Level: Achieve a 25% increase in community-wide household and employment density over 2010 baseline conditions by 2020. Gold Level: Achieve a 10% increase in density by 2020. Silver Level: Achieve a 5% increase in density by 2020. |
| T-9: Mixed-Use Development | 4,069 | <ul style="list-style-type: none"> Platinum Level: Achieve a 25% jobs/housing ratio improvement Citywide over 2010 baseline conditions. Gold Level: Achieve a 10% jobs/housing ratio improvement. Silver Level: Achieve a 5% jobs/housing ratio improvement. |

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|---|--|--|
| T-10: Design/Site Planning | 912 | <ul style="list-style-type: none"> • Platinum Level: 25% increase in intersection density and reduction in block-length in new development. • Gold Level: 10% increase in intersection density and reduction in block-length in new development. • Silver Level: 5% increase in intersection density and reduction in block-length in new development. |
| T-11: Pedestrian Only Areas | 2,812 | <ul style="list-style-type: none"> • Platinum Level: Designate one additional major activity center in the community as a permanent pedestrian-only area. • Gold Level: Designate one additional pedestrian-only area during weekends. • Silver Level: Designate one additional pedestrian-only area during weekends tied to a special event such as a Farmer's market. |
| T-12: Limiting Parking Requirements for New Development | 28,423 | <ul style="list-style-type: none"> • Platinum Level: Amend zoning to reduce parking requirements for new non-residential development by 25%. • Gold Level: Reduce parking requirements for new non-residential development by 10%. • Silver Level: Reduce parking requirements for new non-residential development by 5%. |
| T-13: High Frequency Transit Service | 1,801 | <ul style="list-style-type: none"> • Platinum Level: Work with RTA to offer high frequency transit service within 3 corridors. • Gold Level: Offer high frequency transit service within 2 corridors. • Silver Level: Offer high frequency transit service within 1 corridor. |
| T-14: Voluntary Transportation Demand Management | 2,464 | <ul style="list-style-type: none"> • Platinum Level: 50% of employees within the jurisdiction participation in voluntary TDM programs. • Gold Level: 25% of employees within jurisdiction participate in voluntary TDM programs. • Silver Level: 12.5% of employees within the jurisdiction participate in voluntary TDM programs. |
| T-15: Accelerated Bike Plan Implementation | 5,340 | <ul style="list-style-type: none"> • Install 75% of all bicycle facility miles identified in City's Bike Plan by 2020. • Install 50% of all bicycle facility miles. • Install 25% of all bicycle facility miles. |

| Measure | 2020 Annual GHG Reductions (MT CO ₂ e/yr) | Objectives |
|--|--|--|
| T-16: Fixed Guideway Transit | 10,489 | <ul style="list-style-type: none"> Implementation of streetcar could potentially double existing transit mode split within city, which equates to 1.5% reduction in VMT. |
| T-17: Neighborhood Electric Vehicle Programs | 4,707 | <ul style="list-style-type: none"> Adopt comprehensive NEV programs including signage and designated facilities. |
| T-18: Subsidized Transit | 3,628 | <ul style="list-style-type: none"> Platinum Level: Provide subsidized or discounted transit passes to 3% of residents, students, and employees living, working, or going to school in the community. Gold Level: Provide subsidized or discounted transit passes to 2% of the community. Silver Level: Provide subsidized or discounted transit passes to 1% of the community. |
| SW-1: Yard Waste Collection | 1,007 | <ul style="list-style-type: none"> Platinum Level: Adopt an ordinance prohibiting deposit of yard waste in the solid waste stream. Gold Level: Provide residential green waste bins for collection and transport to organic waste processing facility. Silver Level: Conduct an outreach campaign promoting the benefits of yard waste collection, without provision of green waste bins. |
| SW-2: Food Scrap and Paper Diversion | 155 | <ul style="list-style-type: none"> Platinum Level: Accept food scraps and compostable paper within residential green waste bins; establish a commercial food scrap collection program. Gold Level: Accept food scraps and compostable paper within residential green waste bins or provide separate food scrap collection bins. Silver Level: Provide community outreach about benefits of food scrap and compostable paper collection with information about at-home composting. |

POTENTIAL FUNDING SOURCES

Funding Mechanisms

The GHG reduction strategies in this document were formulated with an understanding that WRCOG and member jurisdictions have limited staff time and financial resources to implement them. The costs for implementation include the creation or promotion of voluntary programs, continuing administration of those programs, coordination and outreach with other government agencies and businesses, and—in some cases—exploration or study of potential legislative or regulatory mechanisms not yet codified. A few strategies require up-front capital expenditures by local agencies. WRCOG and member jurisdictions will use a combination of staff time, grant funding, direct spending, and collaboration with other agencies and organizations to achieve CAP goals. This section presents a summary of funding and financing options (Table 4-3) available at the time this document was prepared.

Some funding sources are not necessarily directed towards a jurisdiction, but to a larger regional agency such as WRCOG, SCAG, a Joint Powers Authority (JPA), or a waste services provider serving multiple jurisdictions. WRCOG and its members should continually monitor private and public funding sources for new grant and rebate opportunities and to better understand how larger agencies are accessing funds that can be used for GHG reductions at the local level. Leveraging financing sources is one of the most important roles WRCOG and a local government can play in helping the community to implement many of the GHG reduction measures.

Table 4-3: Potential Funding Sources to Support CAP Implementation

| Federal Funds | |
|--|---|
| Energy Efficient Mortgages | <ul style="list-style-type: none">The Federal Housing Administration (FHA) offers an Energy Efficient Mortgage Loan program that assists current or future homeowners with lowering their utility bills. This would be accomplished by enabling homeowners to incorporate the cost of adding energy-efficient improvements into their home mortgage. Energy efficient upgrades could be chosen that would allow owners to realize net monthly savings. The goal is to provide owners additional financing for energy efficiency upgrades at a discounted interest rate. |
| Moving Ahead for Progress in the 21 st Century (MAP-21) | <ul style="list-style-type: none">Federal funding through the MAP-21 program is administered through the state and regional governments. MAP-21 funding is administered through Caltrans, MPOs (SCAG in Southern California) and RTPAs (RCTC in Riverside County). Most of the funding programs are transportation versus recreation oriented, with an emphasis on reducing auto trips and providing an intermodal connection. In most cases, MAP-21 provides matching grants of 50 to 100%. |
| Safe Routes to Schools | <ul style="list-style-type: none">Safe Routes to Schools is an international movement focused on increasing the number of children who walk or bike to school by funding projects that remove barriers to doing so. These barriers include a lack of infrastructure and non-infrastructure projects, safety, and limited programs that promote walking and bicycling. In California, two separate Safe Routes to School programs are available at both the state and federal level, and both programs fund qualifying infrastructure projects. |

| | |
|---|--|
| American Recovery and Reinvestment Act (ARRA) Community Partnerships | <ul style="list-style-type: none"> Federal funding for local energy efficiency programs is available. Funding for energy efficiency has been provided to the California Department of Community Services and Development, which has dispersed funds locally through the Community Action Partnership of Riverside County. The Partnership provides free home weatherization and other energy assistance resources to low-income and elderly citizens of Riverside County. Programs include the Low-Income Home Energy Assistance Program and the Weatherization Assistance Program. |
| State Funds | |
| California Air Resources Board (CARB) | <ul style="list-style-type: none"> CARB offers several grants, incentives, and credits programs to reduce on-road and off-road transportation emissions. Residents, businesses, and fleet operators can receive funds or incentives depending on the program. The following programs can be utilized to fund local measures: <ul style="list-style-type: none"> Air Quality Improvement Program (AB 118) Carl Moyer Program – Voucher Incentive Program Goods Movement Emission Reduction Program (Prop 1B Incentives) Loan Incentives Program Lower-Emission School Bus Program/School Bus Retrofit Replacement Account (Prop 1B and EPA Incentives) |
| California Energy Efficiency Financing | <ul style="list-style-type: none"> For years, the California Energy Commission (CEC) has provided a loan program that supports local government energy retrofits and some new construction projects. Since 1979, more than \$272 million has been allocated to more than 773 recipients, as of 2012. The program provides low interest loans for feasibility studies and the installation of cost-effective energy projects in schools, hospitals, and local government facilities. The loans are repaid out of the energy cost savings and the program will finance lighting, motors, drives and pumps, building insulation, heating and air conditioning modifications, streetlights and traffic signal efficiency projects, and certain energy generation projects, including renewable energy projects and cogeneration. Loans can cover up to 100% of project costs and there is a maximum loan amount of \$3 million. |
| California Department of Resources Recycling and Recovery (CalRecycle) | <ul style="list-style-type: none"> CalRecycle grant programs allow jurisdictions to assist public and private entities in management of waste streams. Incorporated cities and counties in California are eligible for funds. Program funds are intended to: <ul style="list-style-type: none"> Reduce, reuse, and recycle all waste. Encourage development of recycled-content products and markets. Protect public health and safety and foster environmental sustainability. |
| Strategic Growth Council (SGC) | <ul style="list-style-type: none"> In September 2008, California Senate Bill 732 created the Strategic Growth Council, which is a cabinet level committee whose tasks include coordinating the activities of member state agencies to assist state and local entities in the planning of sustainable communities and meeting AB 32 goals, including coordination of Planning Grants and Urban Greening Grants. |

| | |
|---|---|
| State Funding for Infrastructure | <ul style="list-style-type: none"> ▪ The state's Infill Infrastructure Grant Program may potentially be used to help fund measures that promote infill housing development. ▪ Grants can be used for gap funding for infrastructure improvements necessary for specific residential or mixed-use infill development projects. |
| Existing Capital Improvement Program | <ul style="list-style-type: none"> ▪ State and federal funds would most likely continue to local governments, builders, and homeowners in the following forms: <ul style="list-style-type: none"> ○ Grants ○ Transportation and transit funding ○ Tax credit and rebate programs ▪ The Capital Improvement Program can be utilized for measures relating to traffic or transit. |
| Private and Non-Governmental Support | |
| <ul style="list-style-type: none"> ▪ Community-based non-profits, local businesses, and investor owned utilities should be considered as resources for direct and indirect support, including funding, for program activation and operations. ▪ Private investors may provide funding to local governments. For example, energy service companies can finance the up-front investments in energy efficiency, reimbursed by the local government over a contract period. Private companies may finance solar power installations, and then recoup their investment by selling the resulting power to the building owner. | |

Additional Considerations

In addition to pursuing the funding options above and monitoring the availability of others, WRCOG and its member jurisdictions may take the following steps to inform decisions related to the cost of GHG reduction measures.

- **Perform and refine cost estimates:** Cost estimates for local reduction measures should be performed to identify the cost-effectiveness of each measure to inform and guide the implementation process. This analysis will likely be based on a variety of participation, per-unit and other assumptions. As programs are developed, cost estimates should be refined and updated over time with more precise implementation-level data.
- **Integrate GHG measures into existing city budget and Capital Improvement Plan (CIP):** Certain capital improvements, particularly those identified in Energy and Land Use/Transportation Measures, may need to be added to the city's CIP and facility master plan programs, as well as those of the city utility enterprises and other public agencies (such as transit agencies) that have control for project implementation. For CIPs completely under the city's control, new projects would need to be assessed for consistency with a city's local CAP or adherence to some minimum energy efficiency standard similar to that achieved by the local plan.
- **Adopt or update ordinances and/or codes:** Some local reduction measures may represent a continuation of recently enacted ordinances, while others would require new ordinances. WRCOG will develop a "plug and play" implementation toolkit of model general plan, zoning and building code amendments and other programs to help facilitate the GHG reduction and climate adaptation measures outlined in the Subregional CAP. The model "best practices and programs" aspect of the toolkit will include, but not be limited to, those related to energy, water, land use, transportation, stormwater management, building reuse, and waste reduction. The policies and model codes of the toolkit will be drafted so they can be easily integrated into a jurisdiction's planning process.
- **Pursue outside funding sources:** A range of funding from state and federal agencies has been identified. WRCOG and local jurisdictions should pursue these and other emerging funding sources as a part of implementation efforts.

- **Implement and direct preferred city funding sources.** While city funding sources are limited in most cities, the city, when financially able, as a part of its budget process, could appropriate funding from general sources or make changes in its fee schedules, utility rates, and other sources as needed to support funding the implementation of the GHG reduction measures.
- **Create monitoring/tracking processes:** Local reduction measures will usually require program development, tracking, and/or monitoring. WRCOG will develop a tool to enable member jurisdictions to report their progress on a regular basis. GHG emissions reduction and adaptation measures could be sorted based on implementation timing, responsible agency, and level of success/completion. By allowing specific tasks to be checked off once each phase of the CAP is completed, jurisdictions will be able to save time reviewing reports, tracking data manually, and verifying that measures are fully completed. Each proposed measure included in the CAP will be built-in the database with information such as:
 - Program;
 - Responsibility;
 - Cost;
 - Potential Funding Sources;
 - Priority; and
 - Time Frame
- **Identify economic and health indicators to consider future funding options:** Identification and monitoring of economic and health indicators and trends, such as home prices, energy prices cost per kWh on solar installations, unemployment rates, or real wage increases, can guide the potential for funding local reduction measures through different financing mechanisms. WRCOG will work with the County of Riverside and other regional agencies to identify and develop measurable health outcome indicators for each CAP measure. Indicators will be used to identify health co-benefits of the CAP, establish priorities, develop target resources, create benchmarks, and track progress towards community objectives.

MONITORING AND REPORTING

Regular monitoring is important to ensure programs are functioning as they were originally intended. Early identification of effective strategies and potential issues would enable WRCOG and its member jurisdictions to make informed decisions on future priorities, funding, and scheduling. Moreover, monitoring provides concrete data to document the subregion's progress in reducing GHG emissions. WRCOG will work with local jurisdictions to develop a protocol for monitoring the effectiveness of emissions reduction programs as well as for undertaking emissions inventory updates.

- **Update GHG Inventory:** It is recommended that emissions be inventoried on a regular basis, including regular data collection in each of the primary inventory sectors (utility, regional VMT, waste, wastewater, and water), and compare to the baseline GHG emissions in 2010. A combined inventory effort could be conducted through WRCOG similar to the inventory preparation that was done for this Subregional CAP.
- **Track State Progress:** The Subregional CAP relies heavily on state-level measures. WRCOG may be responsible for tracking the state's progress on implementing state-level programs. Close monitoring of the real gains being achieved by state programs would allow WRCOG and participating jurisdictions to adjust its CAP, if needed.
- **Track Completion of GHG Reduction Measures:** Tracking of measures implemented as scheduled in the CAP, including progress reports on each measure, funding, and Savings will allow at least a rough attribution of gains when combined with regular GHG inventory updates.

- **Regular Progress Reports:** WRCOG will develop a formal framework for monitoring performance and tracking the progress of CAP implementation, including health and economic indicators. The framework may take the form of an annual report card, progress report, or similar type of tool that will help monitor the achievements, effectiveness and appropriateness of each performance measure. If annual reports, periodic inventories, or other information indicate that the GHG reduction measures are not as effective as originally anticipated, the CAP may need to be adjusted, amended, or supplemented. The report card (or similar) will be periodically presented to WRCOG's Executive Committee and various technical committees (Technical Advisory Committee, Planning Directors' Technical Advisory Committee, and Public Works Committee) as well as member jurisdictions and will focus on the status of agreed upon performance measures.

REDUCING GHG EMISSIONS AFTER 2020

In order to assess whether implementing this CAP achieves the state's long-term climate goals, one must look beyond 2020 to see whether the emissions reduction measures included for the 2020 milestone set the subregion on the trajectory toward future greater reductions in the post-2020 period. To date, there is no state or federal mandate requiring local action to reduce GHG emissions after 2020. AB 32 contains no post-2020 reduction target nor provides CARB with the authority to mandate compliance with a post-2020 target. SB 375, while it contains requirements for SCAG to promote reductions in the passenger and light duty vehicle sector, does not contain mandatory requirements for local jurisdictions to reduce their GHG emissions overall.

Governor Schwarzenegger's Executive Order (EO) S-3-05 calls for an 80% reduction below 1990 GHG emissions levels by 2050. However, an executive order is only binding on state agencies, and does not represent a legal mandate for local governments or the private sector. Nevertheless, S-03-05 contains a 2050 reduction target that is based on current scientific understanding of the reductions needed to avoid the effects of climate change that could result from unabated rise in anthropogenic GHG emissions. The 2050 target in EO-S-03-05 is equivalent to a 2050 statewide target of about 85 million metric tons of carbon dioxide equivalent (MT CO₂e) (total emissions), as compared to the 1990 level of 427 million MT CO₂e.

The state is on track to achieve significant reductions by 2020 and has made some advancement towards deeper reductions by 2050, however, it is clear that our energy-intensive economy cannot achieve long-term growth unless we find greater efficiencies and low-carbon alternatives to powering our industries, homes, businesses, and transportation systems. Climate protection must be compatible with economic growth for successful implementation of GHG reduction strategies in California. The AB 32 Scoping Plan emphasizes clean energy, end-use efficiencies and clean vehicle standards to lower the state's emissions, outlining a mix of incentives and programs designed to smooth California's transition to a low-carbon economy. The 2013 update to the Scoping Plan points to the critical need for rapid market penetration of new technologies that reduce energy demand, electrify our vehicle fleets, and decarbonize electricity and fuel supplies.

Meanwhile, the Governor's Office of Planning and Research (OPR) recently released its first draft Environmental Goals and Policy Report (EGPR) in almost 35 years, entitled *California @ 50 Million:*

*California's Climate Future.*² The central theme of that document is “growth in the context of climate change,” emphasizing the massive challenge the state faces in meeting its long-term (2050) GHG emissions goal. As the report states, achieving the 2020 target is just one step toward long-term stabilization of the climate. Significant GHG reductions by 2050 can only be achieved through a low-carbon transformation of our economy and its supporting infrastructure and mobility systems, which in turn must be driven by focused investments and strong policy signals. This is the direction the state is headed, calling for commitments that will “send a strong signal of support for the innovators and entrepreneurs to drive technology and development to tackle the challenge of climate change.” The EGPR indicates that climate change will influence nearly every aspect of the state’s next phase of planning and investment for the future.

Full implementation and expansion of CARB’s Scoping Plan to increase efforts beyond 2020 and expansion of the strategies studied in this CAP could put the subregion on a path toward achieving these required long-term reductions. While the specific measures needed to meet the 2050 goal are too far in the future to define in detail, one can examine the level of achievement that would be needed to keep the region on track through 2035. The measures needed to achieve longer-term targets are logical extensions of the programs recommended in the CARB Scoping Plan at the state level and the measures included in this CAP at the local level. By building on planned state efforts during this period and ramped up efforts in the local building energy and transportation (and other) sectors on the part of local governments, the subregion can be on track to reach a 2035 goal.

This CAP has not assumed any benefit from a cap-and-trade system by 2020, but when implemented, such a system may result in reductions beyond those currently anticipated in the CAP for 2020, and in additional reductions for 2030. The California Cap-and-Trade Program will particularly affect large stationary sources, which are excluded from local measures in this CAP to avoid duplication of state and federal regulatory efforts. In addition, the Cap-and-Trade Program will also affect electricity generation and transportation fuels, which may change energy prices, in turn potentially altering energy use and transportation behavior beyond that assumed for the various local measures included in this CAP.

WRCOG will continue to monitor developments at the national and state levels regarding implementation of GHG emissions reductions beyond 2020.

CEQA PROJECT REVIEW

Under the California Environmental Quality Act (CEQA), the effects of GHG emissions are considered a potentially significant environmental impact. In addressing climate change, CEQA provides a useful mechanism for local agencies to evaluate the environmental effects of new development, but may also create inefficiencies for both agency staff and applicants through repetitive assessments of small projects on an individual basis, rather than considering cumulative effects of future development and determining needed mitigation up front. The CEQA Guidelines recognize this, and include a provision for streamlining the analysis of projects that are consistent with a comprehensive plan for the reduction of GHG emissions (CEQA Guidelines, Section 15183.5).

² California @ \$50 Million, September 2013. Available at opr.ca.gov/docs/EGPR_ReviewDraft.pdf.

To meet the requirements of CEQA Guidelines Section 15183.5(b)(1) a qualified CAP must:

1. Quantify existing and projected GHG emissions within the plan area
2. Establish a reduction target based on AB 32's provisions (a level where GHG emission are not cumulatively considerable)
3. Identify and analyze sector specific GHG emissions from Plan activities
4. Specify policies and actions (measures) that local jurisdictions will enact and implement over time to achieve specified reduction target
5. Establish a tool to monitor progress and amend if necessary
6. Adopt in a public process following environmental review

WRCOG is seeking funding to prepare the required environmental document in order for jurisdictions to adopt the Subregional CAP and utilize streamlining benefits. A Program EIR specifically for the Subregional CAP will be prepared explicitly with tiering in mind, by developing mitigation measures that are tailored to the WRCOG subregion environment, and will set performance metrics for future project impacts that cannot be analyzed at the program level.

A development project would demonstrate consistency with the CAP if it is consistent with the CAP assumptions regarding the amount and type of future development, and is consistent with the GHG reduction measures identified in the CAP. Projects consistent with the CAP, including conformance with any performance measures applicable to the project, would not require additional GHG emissions analysis and mitigation under CEQA Guidelines Sections 15064(h) and 1513.5(b)(2).³ However, a project applicant can always choose to demonstrate compliance with the AB 32 target by preparing an individual project analysis that calculates GHG emissions as part of their CEQA documentation.

In a future phase of the work program, WRCOG will develop a checklist to assist with determining project consistency with the CAP. The checklist is intended to provide individual projects the opportunity to demonstrate that they are minimizing GHG emissions, while ensuring that new development achieves a proportion of emissions reduction consistent with what is assumed in the CAP. The project review checklist will screen projects for important GHG reduction measures that, when implemented, will facilitate and not impede the subregion's ability to meet its 2020 GHG emissions target. The checklist will apply to all projects subject to CEQA.

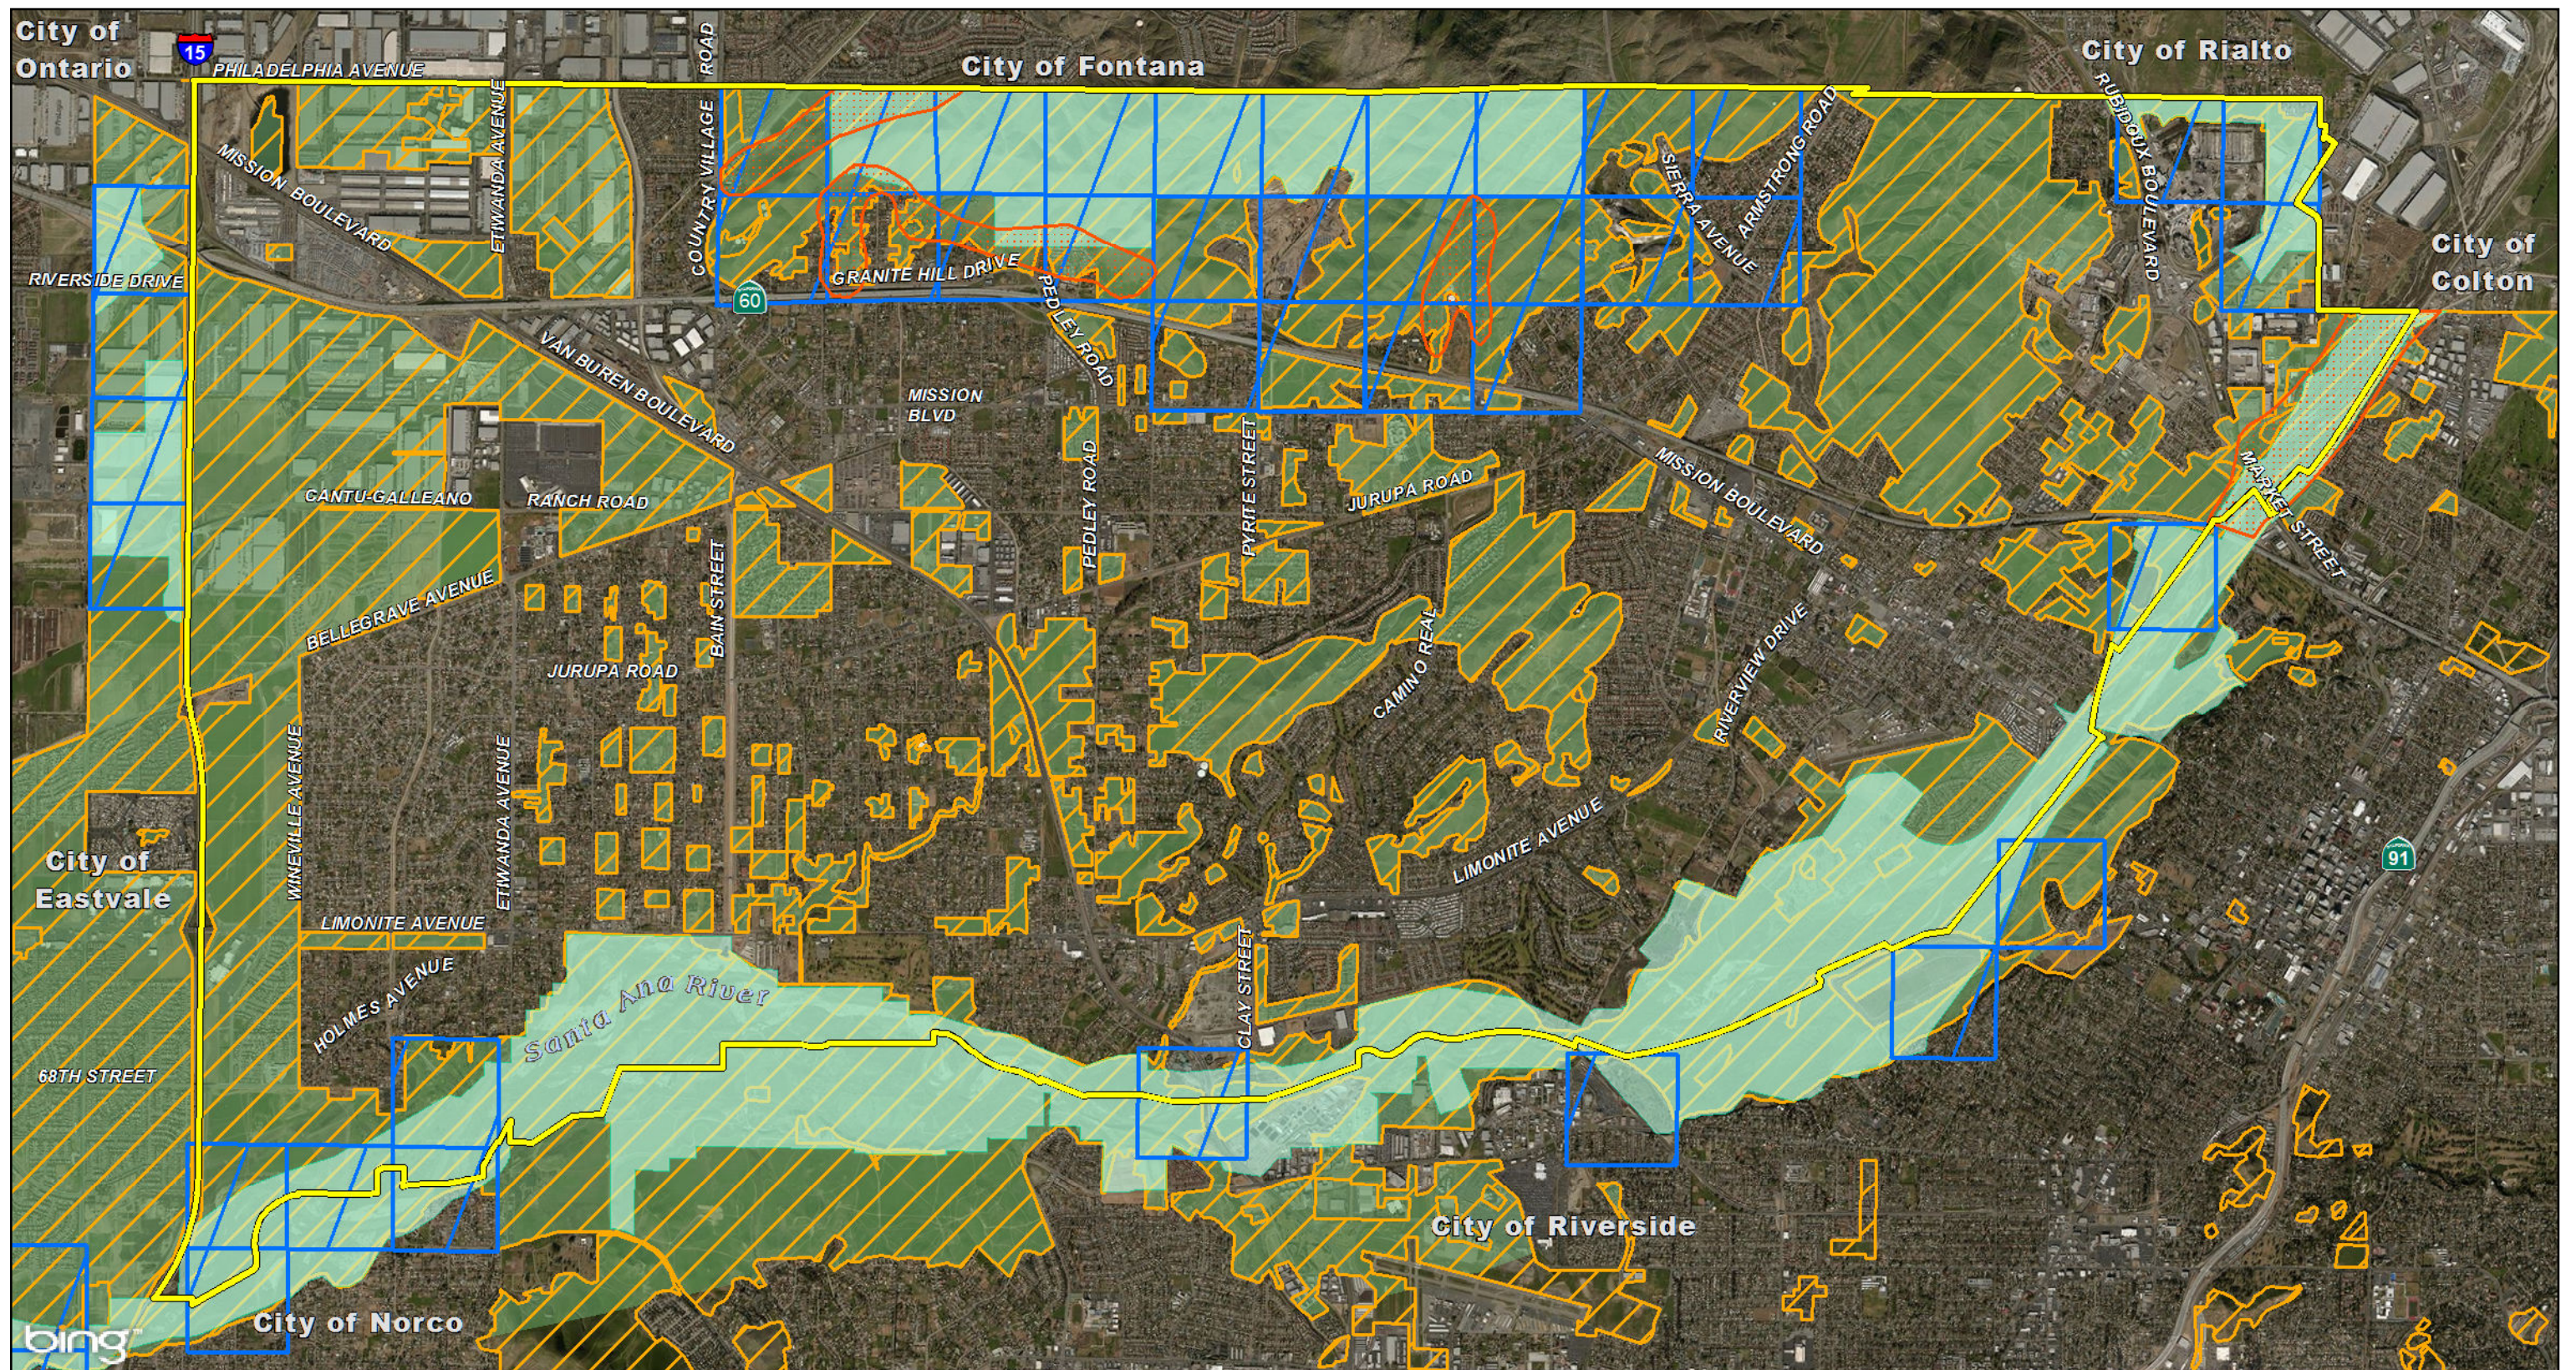

³ If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding the project's compliance with the CAP, CEQA requires that an EIR be prepared.

DRAFT GENERAL PLAN

CONSERVATION AND OPEN SPACE ELEMENT

Figure COS-1: Sunset Over Indian Hills Reservoir

INTRODUCTION

State law requires that general plans include two different but complementary chapters addressing natural resources: the Conservation Element and the Open Space Element. In this General Plan, these chapters are combined into the Conservation and Open Space Element. Other chapters that also address natural resources include the Land Use Element, Safety, Public Services, and Facilities Elements. The Conservation and Open Space Elements are combined because they both address environmental resources. They address the conservation, development, and use of energy and natural resources, and the preservation of open space for protection of natural resources such as wildlife habitat, wetlands, recreation trails, and facilities, cultural and historic resources. From the input received at many general plan outreach and GPAC meetings, it is clear that preserving open spaces and protecting Jurupa Valley's semi-rural, equestrian lifestyle are very important to residents. These environmental qualities attract residents and visitors, and enhance Jurupa Valley's quality of life. The importance of open space is reflected in the City's Community Values Statement:

“Open Space and Visual Quality. We value and protect the Santa Ana River and river plain, ridgelines, and hillsides for their exceptional value for recreation, watershed, wildlife habitat, environmental health, and as scenic backdrops for the City. As part of our values, we support prevention and removal of visual blight, protection of public vistas, and community awareness and beautification activities. Jurupa Valley’s special places will be protected, maintained, and promoted to preserve our unique character, instill local pride, and encourage tourism.”

The Conservation and Open Space Element also promotes public health and safety by redirecting development away from areas subject to geologic hazards, flooding, and fires. Jurupa Valley contains a variety of open spaces that serve many functions, hence the often used label of “multi-purpose.” The City’s quilted pattern of hills, valleys, and slopes provides a variety of habitats including riparian corridors, oak woodlands, and chaparral habitats. Examples include the Jurupa Mountains, the Santa Ana River, and the Pedley Hills. In particular, the Santa Ana River borders the City on its eastern and southern flanks and includes many native plant species, some of which grow only in the habitat this river provides.

Open Space is a critical part of what gives the City of Jurupa Valley its unique visual character. With Jurupa Valley poised to continue experiencing significant growth pressure in the next 10-15 years, protected open spaces ensure future generations can continue to enjoy these visual and recreational amenities. In 2016, about 11%, or 6500 acres remain undeveloped, or essentially so, in the forms of parkland, open space and to a lesser degree, agricultural use. Thus, open space and related land uses can play a key role in maintaining distinct community boundaries or “edges” (i.e., between Sunnyslope and Belltown), and by buffering the City from more urbanized areas to the north, south and east. The City is literally “shaped,” in terms of both geography and scenic character, by its open spaces.

Regional resource planning to protect threatened or endangered species, such as the Stephens Kangaroo Rat, has occurred in various locales for many years. Privately owned reserves and publicly owned land have served as habitat for many different species. This method of land and wildlife preservation proved to be piecemeal and disjointed, resulting in islands of reserve land without corridors for species migration and access. To address these issues of wildlife health and habitat sustainability, the Western Riverside County Regional Conservation Authority (RCA) Multiple Species Habitat Conservation Plan (MSHCP) was developed and adopted by the County and other jurisdictions within the County, including the City of Jurupa Valley. The MSHCP comprises a reserve system that encompasses core habitat, habitat linkages, and wildlife corridors outside of existing reserve areas and existing private and public reserve lands into a single comprehensive plan that can accommodate the needs of species and habitat in the present and future.

Primary Goal

Within the urban area, the City will secure and maintain a diverse network of open land encompassing particularly valuable natural and agricultural resources, connected with the landscape around the urban area. Particularly valuable resources are the following:

- A. Santa Ana River and adjacent riparian corridors with natural banks and vegetation.
- B. Natural and manmade creeks, lakes and other water bodies.
- C. Wetlands and vernal pools.

- D. Jurupa Mountains and Pedley Hills.
- E. Undeveloped land within the City's limits not intended for urban uses.
- F. Grassland communities and woodlands.
- G. Wildlife habitat and corridors for the health and mobility of individuals and of the species.
- H. Habitats of species listed as threatened or endangered by State or Federal governments.
- I. Prime agricultural soils and economically viable farmland.
- J. Hills, ridgelines, box canyons, scenic rock outcroppings, and other significant land features.
- K. Unique plant and animal communities, including "species of local concern."

Key Findings and Recommendations

The City's conservation and open space resources are preserved and managed to protect and enhance the quality of life for all Jurupa Valley residents. It is the City's intent to protect and where possible, enhance natural systems and cycles. This enables the natural diversity of plants and animals to sustain themselves because of the critical relationships between them. Land areas will be preserved, set-aside for this purpose and linked by corridors of various designs to allow wildlife movement within and between habitat areas. In addition, the public's access to the open space system is ensured through a network of public and private trails for recreation purposes, enabling a variety of active and passive recreation pursuits. Trails provide a means of recreation in themselves, as well as access for less intensive

recreation. Creative and effective means of acquiring open space have enabled establishment of this system so that private property rights are respected and open space acquisition is feasible. This system also provides an effective approach that reduces conflicts over development activities because of the City's commitment to permanently preserving critical open space resources.

In developing conservation and open space policies, the City Council finds that:

1. Multi-purpose open space is a critical part of the City's system of public facilities and services necessary to improve the quality of life and to accommodate new residents and visitors.
2. The open space system and the methods for its acquisition, maintenance, and operation are related to how it is to be used, including its value for community vistas, visual relief, natural resource protection, habitat preservation, passive and active recreation, and protection from natural hazards, and combinations of these purposes.
3. A primary purpose of the City's open space system is the preservation of components of the ecosystem and landscape that embody the historic character and diverse landscapes of the City, even though some areas have been impacted by human-caused changes.

4. Native habitat for plants and animals endemic to Jurupa Valley must have interconnected spaces, or “corridors”, that allow these natural communities to prosper and be sustained.
5. Incentive-based systems for habitat protection are available to help preserve and where appropriate, expand open space resources, including the use of density averaging, conservation credits, and management programs to achieve equitable sharing of costs and benefits.
6. Lands identified for habitat preservation are based on the best available scientific information regarding species and habitat requirements and that information is updated as better methods emerge.
7. Strategies and incentives for voluntary conservation on private land are an integral part of the City’s policy/regulatory system.
8. Where natural streams and watercourses are located within designated open space areas, they are to be preserved as natural living systems. Where they pass through areas that are developed or designated for development, to the extent allowed by existing conditions, their continuity is maintained and protected as environmental corridors linking open space areas. In addition, where possible, their viability is enhanced in numerous cases by being included in publicly maintained open spaces rather than in narrow concrete channels.

CONSERVATION AND OPEN SPACE ELEMENT GOALS, POLICIES AND PROGRAMS

Policies within the Conservation section of this element seek to guide decision-making related to renewable and non-renewable resources. These types of resources require conservation—a conscious effort to consume less of scarce resources so that they can be sustained for future generations. By conserving resources, we prevent degradation of the environment through pollution or the loss of sustainable resources and environments for future generations.

Figure COS-3: Hidden Valley Wildlife Area, School Tour. (Riverside County Parks)

COS 1. Biological Resources

Jurupa Valley provides diverse habitats for a variety of native plant and animal species. The pattern of hills, valleys, and river basins provide wildlife habitats including riparian corridors, oak woodlands, and chaparral. Examples include features such as the Jurupa Mountains, the Santa Ana River, and the Pedley Hills.

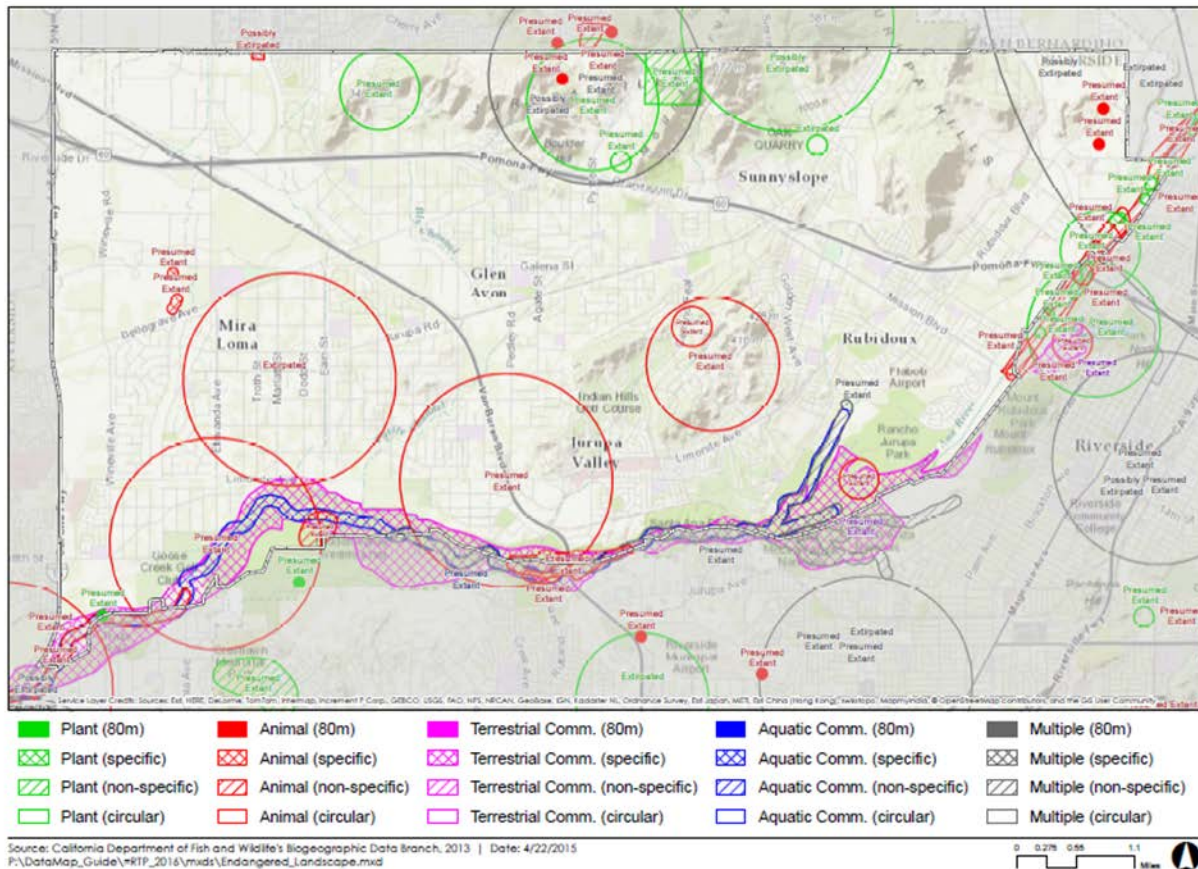

Located along Jurupa Valley's eastern and southern boundary, the Santa Ana River is a significant ecological, recreational, and visual resource. Many native and endangered species thrive here, including the Least Bell's Vireo, Santa Ana River Woolly Star, and San Bernardino Kangaroo Rat. The Santa Ana River Wildlife Area and Jurupa Nature Center provide nature study, conservation and outdoor education, and hiking and equestrian activities. Throughout the area, interconnecting trails provide access to outstanding scenery. The Jurupa Mountains are the dominant visual resource in the northern portion of the City. The highest peak, Mount Jurupa, stands at an elevation of 2,217 feet. Substantial portions of the mountains are identified as potential habitat for the endangered Delhi Sands Flower-loving Fly. [See *GLOSSARY OF SPECIES, Appendix 12.0.*]

The vegetation of Jurupa Valley is diverse in its size, shape and form, yet various species share similar adaptations to climatic and environmental conditions. Further, habitat areas are associated with the dominant natural vegetation that thrives in the City. Although ecological conditions fluctuate in the various plant communities, these natural changes occur gradually, with most species adapting to the habitat and climate changes. However, with development, changes occur that can adversely affect wildlife habitats, local microclimates, water percolation, soil erosion, fires, and aesthetic quality.

To address the important issues of biological resources health and habitat sustainability, the Western Riverside County Regional Conservation Authority (RCA) Multiple Species Habitat Conservation Plan (MSHCP) was developed by the County of Riverside in cooperation with state and federal agencies [See *MSHCP, Appendix 12.0*]. The Plan applies to unincorporated and incorporated Riverside County land, including Jurupa Valley west of the crest of the San Jacinto Mountains to the Orange County line. It applies to a total area of approximately 1.26 million acres (approximately 1,997 square miles) and is one of the largest conservation plans in the U.S. The Plan covers multiple species and multiple habitats within multiple jurisdictions.

Figure COS-4: Biological Resources Map (SCAG)

Known Sightings of Endangered, Threatened, and Rare Plant and Animal Species in City of Jurupa Valley

The Interim General Plan outlines policies and goals that aim to protect the biological resources of Jurupa Valley in conjunction with the MSHCP. It is of the utmost importance to maintain a balance between growth and natural resource preservation throughout Jurupa Valley to preserve the ecological health and overall character of this special environment. The habitat requirements of sensitive and listed species, combined with sound habitat-management practices, help shape the following policies and guide the City's conservation efforts.

Goal:

COS 1.1 Protect, preserve, and create the conditions that will promote the preservation of significant trees and other vegetation, particularly native California species.

Policies:

COS 1.1.1 Habitat Conservation. Conserve key habitats, including existing wetlands and California native plant communities, with a focus on protecting and restoring the following endangered species habitats:

- Conserve alluvial fan sage scrub associated with the Santa Ana River to support key populations of Santa Ana Woolly-Star (*Eriastrum densifolium*, ssp. *sanctorum*).
- Conserve clay soils to support key populations of Many-Stemmed Live-Forever plants (*Dudleya multicaulis*) known to occur along the Jurupa Valley portion of the Santa Ana River.

- C. Conserve known populations of Least Bell's Vireo (*Vireo bellii* ssp. *pusillus*) and Southwestern Willow Flycatcher (*Empidonax traillii* ssp. *extimus*) along the Santa Ana River.
- D. Conserve large intact habitat areas consisting of coastal sage scrub, chaparral, and grasslands to support known locations of Coastal California Gnatcatcher (*Polioptila californica*).
- E. Conserve grassland and coastal sage scrub supporting known populations of San Bernardino Kangaroo Rat (*Dipodomys merriami* ssp. *parvus*) in the Jurupa Mountains.
- F. Conserve grasslands adjacent to sage scrub for foraging habitat for raptors.

COS 1.1.2 Protection of Significant Trees. Protect and preserve significant trees, as determined by the City Council upon the recommendation of the Planning Commission. Significant trees are those trees that make substantial contributions to natural habitat or to the urban landscape due to their species, size, or rarity. In particular, California native trees should be protected.

COS 1.1.3 Other Significant Vegetation. Maintain and conserve superior examples of agricultural windrows, street trees, stands of mature native and non-native trees, and other features of ecological, aesthetic, and conservation value.

Programs:

COS 1.1.1.1 Soil Conservation and Landform Modification. Public and private development projects shall be designed to prevent soil erosion, minimize landform modifications to avoid habitat disturbance and conserve and reuse on-site soils.

COS 1.1.1.2 Riparian Corridors. Identify and protect riparian corridors through zoning, easements, or other measures that ensure effective, long-term conservation.

COS 1.1.1.3 Public Information. Provide public information materials regarding the City's sensitive habitats, the values of watershed, biological resources, and sensitive habitats and how to protect them.

COS 1.1.1.4 Nature Trail Signage. Working with Community Service Districts and other agencies, help create minimal and appropriate signage along major trails (e.g. Santa Ana River and Jurupa Mountains) for educational outreach about critical habitats and native plant and animal species.

COS 1.1.1.5 Urban Encroachment. Amend the Municipal Code to regulate the establishment or encroachment of non-compatible land uses or activities in habitat areas and passive open space, such as commercial uses, off-road motorized vehicle use, off-trail, non-motorized vehicle use, hang gliding, grading or other activities that conflict with biological resource conservation goals or policies.

COS 1.1.1.6 Volunteer Conservation Programs. Working with community volunteers, conservation clubs, youth groups, recreation and conservation agencies, help plan and support conservation activities such as habitat restoration, interpretive signage and tours, trail building, erosion control and litter removal.

COS 1.1.1.7 Tree Protection Ordinance. Develop a Tree Protection Ordinance.

Figure COS-5: Bobcat, Riverside County

COS 2. Wildlife Habitats

The following set of policies seeks to preserve wildlife habitat that supports many wildlife species in Jurupa Valley, including some that are listed as threatened, endangered and species of concern. These resources deserve special protection to ensure the continued viability of natural systems and

ecological values that enhance the quality of life for all citizens.

Open space preservation serves many purposes, including the preservation and enhancement of both ecological and recreational resources, and the reduction or avoidance of environmental hazards. As urbanization has spread into Western Riverside County, community development has not only involved the local land use planning process, but also coordination with state and federal wildlife agencies in order to manage and protect threatened and endangered species and other wildlife species. To accomplish this, the Riverside County RCA, in conjunction with the United States Fish and Wildlife Service and California Department of Fish and Wildlife, hereafter "Wildlife Agencies," prepared and adopted Multiple Species Habitat Conservation Plans (MSHCPs). MSHCPs are stakeholder driven, comprehensive, and multi-jurisdictional plans that focus on the conservation of diverse wildlife species and their habitats. They address biological and ecological needs and provide mitigation for the impacts of development in Jurupa Valley and other areas within Riverside County.

Goals:

COS 2.1 The City will seek to achieve self-sustaining populations of the native birds, fish and other wildlife and avoid actions that remove or damage habitat for native plants and animals.

Policies:

COS 2.1.1 MSHCP Implementation. Implement provisions of the MSHCP when conducting review of development applications, General Plan amendments/Zoning changes, transportation or other infrastructure projects that are covered activities in the MSHCP.

COS 2.1.2 Wildlife Corridors. Identify and maintain a continuous wildlife corridor along the City's northern boundary through the Jurupa Mountains and along the Santa Ana River from the northern boundary to the City's western boundary. Condition development approvals to ensure important corridors for wildlife movement and dispersal are protected. Features of particular importance to wildlife include riparian corridors, wetlands, streams, springs and protected natural areas with cover and water. Linkages and corridors shall be provided to maintain connections between habitat areas.

COS 2.1.3 Biological Reports. Require the preparation of biological reports to assess the impacts of

development and provide mitigation for impacts to biological resources when reviewing discretionary development projects with the potential to affect adversely wildlife habitat.

Programs:

COS 2.1.1.1 Preservation Incentives. Develop and provide incentives to private landowners that will encourage the protection of significant wildlife habitat resources, such as density averaging, tax incentives, and grants.

COS 2.1.1.2 Regulation and Enforcement of Destructive Practices. Develop and adopt regulations that effectively regulate dumping, camping, off-road vehicle use, illegal entry and polluting within protected conservation areas such as the Santa Ana River corridor and the Jurupa Hills along the north City boundary.

Figure COS-6: Great Blue Heron, Santa Ana River restoration area in Jurupa Valley

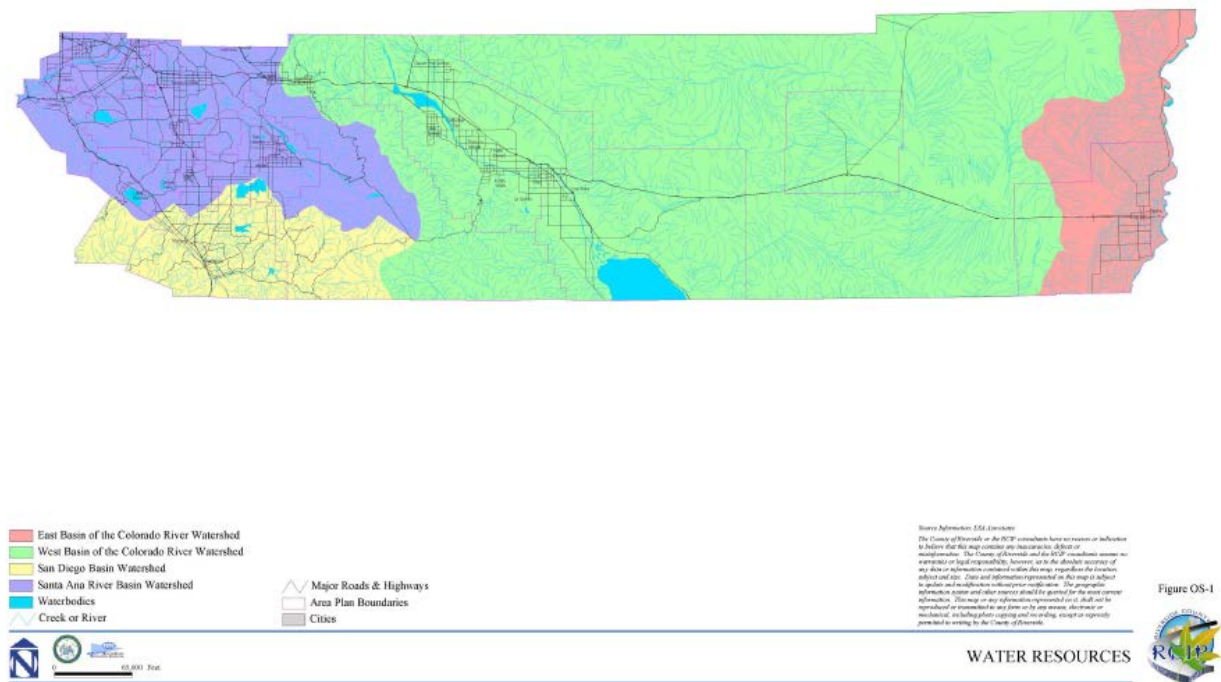

COS 3. Water Resources

Riverside County includes four major watershed areas in which river systems, numerous lakes and reservoirs, and natural drainage areas are located. Water resources are shown in *Figure COS-7*. The City and County's supply of water is limited by its arid climate, agricultural practices, projected population growth and its associated demand and development, and the dependence on low quality imported water. Further, the availability of imported surface water has been reduced due to extended period of drought in California, and changing regulations, despite an ever-increasing water demand. In Jurupa Valley, contamination from Stringfellow Acid Pits, mining and other human activities has affected groundwater quality such that its use requires treatment. Management of the amount of water available (local and imported) and its quality, is an important response to the gap between supply and demand. Policies in this section seek to protect and enhance Jurupa Valley's water resources and to meet future water needs. These policies also address broad water planning issues, and their relationship to land use decisions.

Figure COS-7: Water Resources Map, Riverside County

City of Jurupa Valley

Although Jurupa Valley receives all of its potable water from groundwater supplies, regional and statewide water demands and on-going drought conditions require continued conservation efforts and careful monitoring of water supplies to ensure adequacy for future growth. The overall County water supply is uncertain for two reasons: water apportionments from northern California have been reduced as part of the CALFED Bay-Delta Program, as well as decreased supplies to California from the Colorado River. Additionally, most of the County's sources of water are currently at capacity. Water storage to meet peak demand, or a two-day to one-day supply, is provided by many local water agencies within Riverside County. However, long-term storage of large quantities of water is provided only in the Metropolitan Water District (MWD) and California Department of Water Resources (DWR) facilities. Total storage capacity in the existing reservoir system is 871,000-acre feet (AF). Three of these storage facilities are located in Riverside County: Lake Mathews, Lake Skinner, and Lake Perris. Together, these facilities have 342,300 AF of storage capacity. Diamond Valley Lake triples this capacity with an additional 800,000 AF of storage, bringing the total storage capacity available within Riverside County to 1,142,300 AF. Even though the creation of Diamond Valley Lake has allowed for three times the current storage of water, there is no increase in the total amount of water available to the County that can be identified.

This increase in water storage will benefit the whole South Coast region, which includes other significant jurisdictional water users, such as San Diego County, as well as Riverside County. Currently, approximately 3/8 of existing storage capacity may be used to meet seasonal demand. The remaining 5/8 is reserved for emergency needs such as severe droughts and/or use when a natural disaster, such as an earthquake, makes it impossible to meet demand through usual supply facilities. Projected 2020 water use and population levels indicate an expected water shortage for the two hydrologic regions that comprise Riverside County: the South Coast and Colorado River regions. Though these regions include most of southern California, and not just Riverside County, they are each representative of the types of supply and demand within the County. The two regions are defined as follows:

City of Jurupa Valley

- South Coast Region: Basins draining into the Pacific Ocean from the southeastern boundary of Rincon Creek Basin in western Ventura County, south to the Mexican border. Jurupa Valley is part of the South Coast Region.
- Colorado River Region: Basins south and east of the South Coast and South Lahontan regions; areas that drain into the Colorado River, the Salton Sea, and other closed basins north of the Mexican border.

The DWR produces a California Water Plan every five years that not only includes a statewide water budget but also regional watershed water budgets. These water budgets are based on California Department of Finance population projections and indicate clearly that demand for water will exceed supply in 2020 whether or not a drought condition exists at that time. Most of the State's regions, except for the North Coast and San Francisco Bay Regions, experience average-year and drought-year shortages now, and are forecasted to experience increased shortages in 2020. The largest average-year shortages are forecasted for the South Coast Region, which heavily relies on imported water. Future average-year shortages in the South Coast Region reflect forecasted population growth plus lower Colorado River supplies as California reduces its use of Colorado River water to the State's basic apportionment.

To help bridge the projected gap between water supply and demand, water conservation must be a priority. Following are water conservation policies and programs to help manage water supplies by promoting conservation and efficient water use.

*Figure COS-9:
Rancho Jurupa
Lake*

Goals:

COS 3.1 - Work with JCSD, RCSD and other community service districts and agencies, to help meet Jurupa Valley's urban water needs without substantial harm to the

natural environment or to agriculture. Measures to help meet water needs include requiring conservation measures such as drought-tolerant landscaping and water saving fixtures in new homes.

COS 3.2 Protect and maintain water quality in aquifers, Santa Ana River, streams and wetlands that help support beneficial uses, including domestic and commercial/industrial uses, agricultural uses, and wildlife habitat.

COS 3.3 Protect and improve the quality of local water sources, including groundwater and the Santa Ana River.

COS 3.4 Encourage JCSD and RCSD to retain and where possible, expand the capacity of wells, aquifers and other groundwater reserves.

COS 3.5 Preserve natural floodways, floodplains and wetlands, and avoid actions that adversely affect waterways or riparian areas, or that increase flood hazards to urban uses.

Policies:

COS 3.1.1 **Water use planning.** Adopt and strive for the most efficient available water conservation practices in the City's operations and planning and encourage community service districts and other agencies to do the same. "Most efficient available practices" means actions and equipment that use the least water for a desired outcome, considering available equipment, life-cycle costs, social and environmental side effects, and the regulations of other agencies.

COS 3.1.2 **Multi-Use Consideration.** Consider, in planning, land use decisions, and municipal operations, the effects of water supply on urban growth, wildlife habitat, agriculture and stream flows, and seek to ensure continued water availability for these uses in planning for long-term water supplies. The City will encourage individuals, organizations, and other agencies to follow this policy.

COS 3.1.3 **Water Quality.** Employ the best available practices for pollution avoidance and control and encourage others to do the same. "Best available practices" means actions and equipment that result in the highest water quality, considering available equipment, life-cycle costs, social and environmental side effects, and the regulations of other agencies.

COS 3.1.4 **Water Conservation Systems.** Encourage the installation of water-conserving systems such as dry wells and graywater systems, where feasible, especially in new developments. The installation of cisterns or infiltrators shall also be encouraged to capture rainwater from roofs for irrigation in the dry season and to reduce runoff during heavy storms.

COS 3.1.5 **Site Water Collection and Retention.** Consider requiring design practices such as permeable parking bays and porous parking lots with bermed, landscaped storage areas for rainwater detention as a condition of development approval,

COS 3.1.6 **Landscaping with Native Plants.** Encourage the use of California Native Plants for drought-resistant landscape planting.

COS 3.1.7 **Edible Landscaping.** Encourage the use of edible landscaping in residential areas, streetscapes, public spaces, and parks, including vegetable gardens, herbs and fruit trees in lieu of large expanses of lawn or other more water-demanding plantings.

Programs:

COS 3.1.1.1 **Public Information.** Promote and support educational outreach programs that provide information services to the public about water conservation techniques, benefits and water-saving technologies in conjunction with water providers, Riverside County, community services districts, and other entities.

COS 3.1.1.2 **Regional Cooperation.** Monitor and participate in regional activities addressing water resources, groundwater and water quality to help ensure adequate and safe water supplies for existing and future residents and businesses.

Water Quality

Water quality problems that have occurred in Jurupa Valley have related to Stringfellow runoff, inadequate subsurface sewage disposal, waste disposal management in the Santa Ana River and floodway, and pollution due to urban storm water system runoff. Regional Water Quality Control Boards for Region 8 provides state-level water quality policy for the City and Riverside County. Further, the National Pollutant Discharge Elimination System mandates Best Management Practices in order to effectively minimize the adverse effects of pollution and protect water quality and groundwater resources.

Groundwater resources, or “aquifers,” are defined by their quality as well as quantity. Most groundwater basins store local and imported water for later use to meet seasonal and drought-year demands. Under current groundwater recharge programs, groundwater is artificially replenished in wet years with surplus imported water. Water is then extracted during drought years or during emergencies. Groundwater recharge that may also involve the recharge of reclaimed water enhances the City's ability to meet water demand during years of short supply and increases overall local supply reliability. The following policies are intended to provide local guidance for the protection and maintenance of water quality and groundwater resources.

Policies:

COS 3.1.8 Wastewater Treatment. Encourage the use of innovative and creative techniques for wastewater treatment.

COS 3.1.9 Pollution Discharge. Minimize pollutant discharge into storm drainage systems and natural drainage and aquifers.

COS 3.1.10 Regional Cooperation. Support efforts to create additional water storage where needed, in cooperation with federal, state, community service districts, Riverside County Flood Control District, and other water authorities. Additionally, support and/or engage in water banking in conjunction with these agencies where appropriate, as needed.

COS 3.1.11 Aquifer Protection. Require that aquifer water-recharge areas are preserved and protected.

COS 3.1.12 Drainage Systems in Development Projects. Require that developers and designers incorporate natural drainage systems into development projects where appropriate and feasible.

COS 3.1.13 Storm Water Retention. Retain storm water at or near the site of generation for percolation into the groundwater to conserve it for future uses and to mitigate adjacent flooding.

COS 3.1.14 Natural Channels. Collaborate with the Riverside County Flood Control District to promote natural approaches to managing streams and avoid lined, non-porous channels to the maximum extent possible where groundwater recharge is likely to occur.

COS 3.1.15 Water Retention Incentives. Consider granting incentives to landowners to preserve natural ground water recharge areas, through measures such as density averaging..

Program:

COS 3.1.1.3 Aquifer Recharge. Participate in the development, implementation, and maintenance of a program to recharge the aquifers underlying the City and Western Riverside County, where feasible and appropriate. The program shall make use of flood and other waters to offset existing and future groundwater pumping, except where:

- A. Groundwater quality would be reduced,
- B. Available groundwater aquifers are full, or
- C. Rising water tables threaten the stability of existing structures.

Floodplain and Riparian Area Management

Watercourses and their floodways are usually the focus of construction and control; while fertile, flat and "reclaimed" floodplain lands are typically used for other activities, such as agriculture, commerce, and residential development. These areas form a complex physical and biological system that not only supports a variety of natural resources, but also provides natural flood and erosion control. In addition, the floodplain represents a natural filtering system, with water percolating back into the ground and replenishing groundwater. When a watercourse is separated from its floodplain with levees and other flood control facilities, then natural, built-in benefits are lost, altered, or significantly reduced. The floodway fringe is that portion of the floodplain between the floodway and the limits of the existing 100-year floodplain.

Figure COS-10: Existing Floodways and Drainage Facilities (Riverside County Flood Control and Water Conservation District

The City follows Riverside County's adopted methods of using the USGS "blue line stream" overlay as its major form of mapping watercourses in its boundaries (see Figure COS-10, the Land Use Element, and Area Plan Maps). Also, see the Flood and Inundation Hazard Abatement section of the Safety Element). The conventional assumption that flooding can be completely eliminated has meant not only an unrealistic reliance on manufactured flood protection, but also the development of a flood control system that squeezes rivers into artificially narrow channels, adds steeply sloped levees (devoid of riparian vegetation), and eliminates historic floodplains, all in the interest of reclamation, flood protection and urban growth. Unfortunately, this highlights the fact that floods have been viewed for far too long as everything except part of the natural life cycle of rivers and floodplains.

Figure COS-11: Van Buren Bridge Collapse during 1969 Santa Ana River Flooding

Flooding is part of the dynamic nature of healthy rivers and ecosystems. High flows and floodwaters are needed to cleanse the channels of accumulated debris, build stream banks, import gravels for aquatic life, thin riparian forests and

create riparian habitat.

The open space of floodplains adjacent to rivers and streams helps store and slowly release floodwaters, thus reducing flood flow, peaks, and their subsequent impacts during small and frequent flood events. Further, riparian habitat within floodplains is of great value to resident and migratory animal species, as it provides corridors and linkages to and from the City's wildlife corridors. The following set of policies address floodways, the floodplain fringe, and riparian areas.

Wetlands typically occur in low-lying areas that receive fresh water at the edges of lakes, ponds, streams, and rivers. Wetlands provide habitat for a wide variety of plants, invertebrates, fish, and larger animals, including many rare, threatened, or endangered species. The plants and animals found in wetlands include both those that are able to live on dry land or in the water and those that can live only in a wet environment. Wetlands in Jurupa Valley may include riverbanks, vernal springs and pools, and desert washes.

Policies:

COS 3.1.16 Floodway Modification. Encourage other agencies to limit floodway modification or channelization only as a "last resort," and limit the alteration to:

- a. That necessary for the protection of public health and safety, only after all other options are exhausted
- b. Essential public service projects where no other feasible construction method or alternative project location exists,
- c. Projects where the primary function is improvement of fish and wildlife habitat, or

- d. private development entitlements shall be required to design floodplain and river edge treatments to simulate and ultimately regenerate natural terrain and riparian habitat, using techniques such as covering and re-planting over rip-rap embankments, utilizing gentle contoured slopes that do not exceed 8:1 slope ratio, etc.

COS 3.1.17 Environmental Mitigation. Encourage, and where possible, require substantial modifications of a floodplain to be designed to reduce adverse environmental effects to the maximum extent feasible, considering the following factors:

- a. Stream scour
- b. Erosion protection and sedimentation
- c. Wildlife habitat and linkages
- d. Groundwater recharge capability
- e. Adjacent property
- f. Designed to achieve a natural effect. Examples could include soft riparian bottoms, riparian corridors within the floodway, and gentle bank slopes, wide and shallow floodways, minimization of visible use of concrete, and landscaping with California native plants to the maximum extent possible. A site-specific hydrologic study may be required.

COS 3.1.18 Setbacks. Based upon site-specific study, all development shall be set back from the designated floodway boundary or top of bank, whichever is most appropriate, a distance adequate to address the following issues:

- a. Public safety
- b. Erosion
- c. Riparian or wetland buffer
- d. Wildlife movement corridor or linkage, and
- e. Slopes

COS 3.1.19 Trails. Consider designating floodway setbacks to accommodate greenways, trails, and recreation opportunities and allowing such uses within floodways, where appropriate.

COS 3.1.20 Riparian Area Preservation. Require development projects to preserve and enhance native riparian habitat and prevent obstruction of natural watercourses. Zoning incentives, such as averaging of development rights, should be used to the maximum extent possible.

COS 3.1.21 Ecotones. Identify and, to the maximum extent possible, conserve remaining upland habitat areas, or “ecotones” adjacent to wetland and riparian areas that are critical to the feeding, hibernation, or nesting of wildlife species.

Programs:

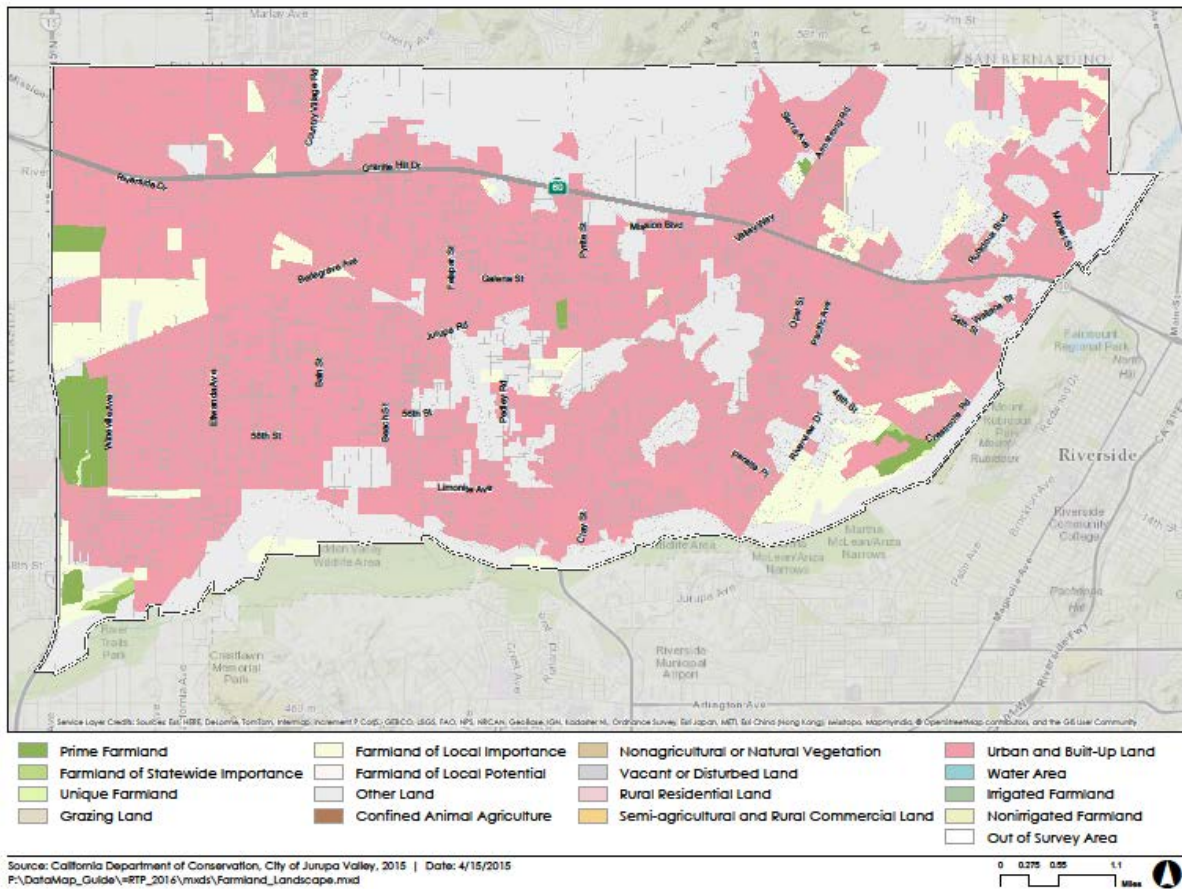

COS 3.1.1.4 Floodway Protection and Enhancement. Working with other responsible agencies, help implement the following actions:

- A. Encourage preparation of an inventory of natural areas that have been degraded and list sites in priority order, for restoration efforts.
- B. Encourage revegetation of disturbed areas using native plants.

- C. Eliminate sources of water pollutants and improper water diversions.
- D. Remove invasive, non-native species in natural habitat areas, and prevent the introduction or spread of invasive, non-native species.
- E. Discourage the placement and where possible, remove man-made elements such as buildings, paving, structural elements, concrete lining of waterways, signs, streets and utilities within floodways or floodplains, unless they are needed for public health or safety, or for implementation of City plans.
- F. Require that suitably sized access corridors be provided and/or maintained through or under new and previously established, man-made obstacles to wildlife movement (such as appropriately sized culverts under arterial streets, highways and other major roads).
- G. Discourage or prevent camping, off-road vehicles, hunting and other activities that are not compatible with floodplain health and preservation.
- H. Remove trash, debris, and contaminants, using methods that minimally disrupt the open-space resources.
- I. Provide continuing community education and outreach for all citizens, youth, and youth groups, and property owners on open space and natural resource values, programs and responsibilities.
- J. Enlist the help of volunteers, youth and service groups, and academic programs in restoring and monitoring habitat health.

Figure COS-12: Farmland in Jurupa Valley (SCAG)

Farmland in City of Jurupa Valley

COS 4. Agricultural Resources

Agriculture was once the dominant land use and economic activity in Jurupa Valley. Over time, land use and economic changes have largely displaced farming, grazing, vineyards, dairy, orchards, and other agricultural activities to less urbanized areas. Reflecting this change, the last dairy in Jurupa Valley closed in 2015. However, the City continues to have areas in agricultural use, particularly along the I-15 corridor and near the Santa Ana River. Countywide, agriculture continues to contribute significantly to the overall economy. In Jurupa Valley, agriculture continues to be important as a contributor to the local economy, a key open space resource, and a defining feature of the communities' overall visual character and rural heritage. Moreover, agriculture is fundamental to the notion of "sustainability" -- it helps preserve productive soils and Jurupa Valley's capacity to grow food for local use.

Goal:

COS 4.1 To continue to accommodate agricultural uses and encourage its expansion, where appropriate.

Policies:

COS 4.1.1 Support Agricultural Uses. Employ a variety of agricultural land conservation programs to improve the viability of farms and ranches and thereby ensure the long-term conservation of viable agricultural uses in cooperation with individual farmers, farming organizations, farmland conservation organizations and the County.

COS 4.1.2 Agricultural Land Conversion. Discourage the conversion of productive agricultural lands to urban uses unless the property owner can demonstrate overarching Community-wide benefits or need for conversion.

COS 4.1.3 Compatible Uses. Encourage the combination of agriculture with other compatible uses to help provide an economic advantage to agriculture. In areas designated for agricultural uses, allow activities related to the production of food, fiber, and support uses incidental to the on-site agricultural operation, such as farm stores, retail sales of produce or wares, and related, accessory uses.

Programs:

COS 4.1.1.1 Farmland Conservation. Encourage individuals, non-profit agencies and the County to seek out grants and programs that promote farmland conservation, such as land trusts, conservation easements, Williamson Act designation, Land Conservation Contracts, Farmland Security Act contracts, the Agricultural Land Stewardship Program Fund; agricultural education programs, density averaging and development standards, and/or incentives (e.g., clustering and density bonuses) to encourage conservation of productive agricultural land.

COS 4.1.1.2 Sustainable Agriculture. Encourage sustainable agricultural practices to protect the health of human and natural communities and to minimize conflicts between agriculture and urban neighbors.

Figure COS-13: Residential Photo-Voltaic Solar Collectors

COS 5. Renewable Energy Resources

Conservation policies in this element protect the City's physical resources as well as its energy resources, including renewable energy. This category of renewable energy resources includes wind, solar, geothermal, and biomass resources. Although the use of these resources is not widespread in Jurupa Valley at the time of General Plan adoption, there is potential for their use and development, particularly solar generation. Renewable energy can be developed as a substitute for oil, natural gas, and other limited energy supplies used for electricity generation, and to reduce consumption of these supplies.

Energy Conservation

For a sustainable economy and environment, and continued quality of life, we must reduce our

dependence on fossil fuels. A key strategy in that effort is to use energy more efficiently and to shift to cleaner, renewable, locally generated and/or controlled energy sources. While local governments have made significant progress in energy conservation, more can be done through emerging technologies and increased emphasis on “sustainable” practices and building design in both public and private development. Conservation is an important component of using energy resources in an efficient manner. Sensible energy conservation and design practices can help mitigate the “heat island” effects of urban development that increase local temperatures and result in increased energy demand. The following policies address energy conservation.

Goal:

COS 5.1 Increase use of sustainable energy sources such as solar, wind and thermal energy, and reduce reliance on non-sustainable energy sources to the extent possible with available technology and resources.

Policies:

COS 5.1.1 Use Best Available Practices. Employ the best available practices in energy conservation, procurement, use, and production, and encourage individuals, organizations and other agencies to do likewise. “Best available practices” means behavior and technologies that reflect recommendations of specialists and that use the least energy for a desired outcome, considering available equipment, life-cycle costs, social and environmental side effects, and the regulations of other agencies. Best available practices include use of sustainable energy sources. Sustainable energy sources are naturally renewed in a relatively short time and avoid substantial undesirable side effects, and include:

- A. Space heating and cooling using earth, plantings and/or building thermal mass to moderate temperature changes.
- B. Space cooling through natural ventilation.
- C. Space cooling through reflectivity and shading.
- D. Indoor illumination by natural light.
- E. Solar space and water heating.
- F. Wind electricity generation.

COS 5.1.2 Energy-Efficient City Facilities. Operate and maintain City facilities in the most energy-efficient manner, without reducing public safety or service levels, as budget resources allow.

COS 5.1.3 Energy-efficiency improvements. Identify energy efficiency improvement measures to the greatest extent possible, undertake all necessary steps to seek funding for their implementation and, upon securing availability of funds, implement the measures in a timely manner, as budget resources allow.

COS 5.1.4 Agency Cooperation. Cooperate with Federal, State and local governments and other appropriate entities to accomplish energy conservation objectives when consistent with the City’s General Plan goals and policies.

COS 5.1.5 Energy Efficiency and Green Building. Encourage energy-efficient “green buildings” as certified by the U.S. Green Building Council’s LEED® (Leadership in Energy and Environmental Design) Program or equivalent certification.

COS 5.1.6 Energy Efficiency Incentives. Support standards and incentives that encourage developers, designers, and property owners to design, build, and operate buildings to achieve energy savings that exceed Title 24 requirements of the State Building Code.

COS 5.1.7 Energy Efficient Materials. Specify and use energy efficient materials and systems for City facilities as budget resources allow.

COS 5.1.8 Reduce “Heat Island” Effect. Encourage the conversion of asphalt and concrete paving to porous surfaces that help reduce surface runoff and the “heat island” effect.

COS 5.1.9 Renewable Energy Projects. Encourage and accommodate applications for projects that will produce renewable energy for the grid, such as solar generating stations, etc.

Programs:

COS 5.1.1.1 Energy-Efficient Operations. Budget for, and manage City operations, capital improvements, and facilities for energy efficiency, including purchase and use of fleet vehicles, equipment, and materials.

COS 5.1.1.2 Sustainable Design. Incorporate sustainable design and sustainable energy sources and features in existing and new City facilities.

COS 5.1.1.3 Zoning Ordinance Update. Update the Zoning Ordinance to further the energy conservation goals, policies and implementations actions and reduce impediments or disincentives to it.

COS 5.1.1.4 Encourage Public Information Programs. Encourage private utility programs for public information programs and energy audits to promote energy conservation.

COS 5.1.1.5 Energy Grants. Solicit state and federal grants to implement the City's energy conservation programs as such funding becomes available.

Wind Energy

Because of its valley location and pattern of development, Jurupa Valley is generally not suitable for efficient, large-scale wind energy generation. Small-scale, non-commercial wind energy generation, and “windmotors” historically associated with agricultural uses may be appropriate in connection with residential, institutional, recreational and agricultural uses.

Policy:

COS 5.1.10 Wind Energy. Where appropriate, allow non-commercial wind energy generation in a manner that maximizes beneficial uses and minimizes detrimental effects to residents and the environment.

Solar Energy

Due to its location and climate, solar energy generation has important applications for residential, commercial, and institutional applications in Jurupa Valley. Sunlight can be utilized for energy production in two ways: active solar systems involve the use of electronic and mechanical devices to convert solar energy to heat or electricity; passive solar systems utilize natural heating and cooling from the sun through building orientation and building design techniques.

Policies:

COS 5.1.11 Solar access. Encourage the provision for and protection of solar access.

COS 5.1.12 Solar Energy Use. Use solar energy in City facilities and operations, as budget resources allow, and encourage the use of active and passive solar energy by homeowners, business owners, developers, government, and public agencies.

Programs:

COS 5.1.1.6 Update City Regulations. Update development and subdivision standards to include clear, specific standards to ensure desirable solar access is provided for all new development.

Biomass Resources

Biomass resources refer to organic materials, either waste products, residues, or specific crops that can be converted to energy fuel to replace conventional sources or directly used in combustion processes. Due to agricultural production in the County, resources exist that enable this technology to be more widely employed.

Policies:

COS 5.1.12 Biomass Conversion. Encourage economic biomass conversion under sensible environmental controls, and where compatible with adjacent uses.

Figure COS-14: Former Jensen Quarry (last active mining 1974-79. Now the Oak Quarry Golf Club.

COS 6. Non-Renewable Resources

The non-renewable resources discussed in this element are mineral resources and certain energy resources. Mineral Resources are classified under the State Mining and Reclamation Act of 1975 (SMARA). The Energy Resources section addresses petroleum resources as well as energy conservation.

Goal:

COS 6.1 The City will help to reduce consumption of non-renewable energy sources and ensure efficient use, development and conservation of sustainable, non-polluting energy sources.

Policy:

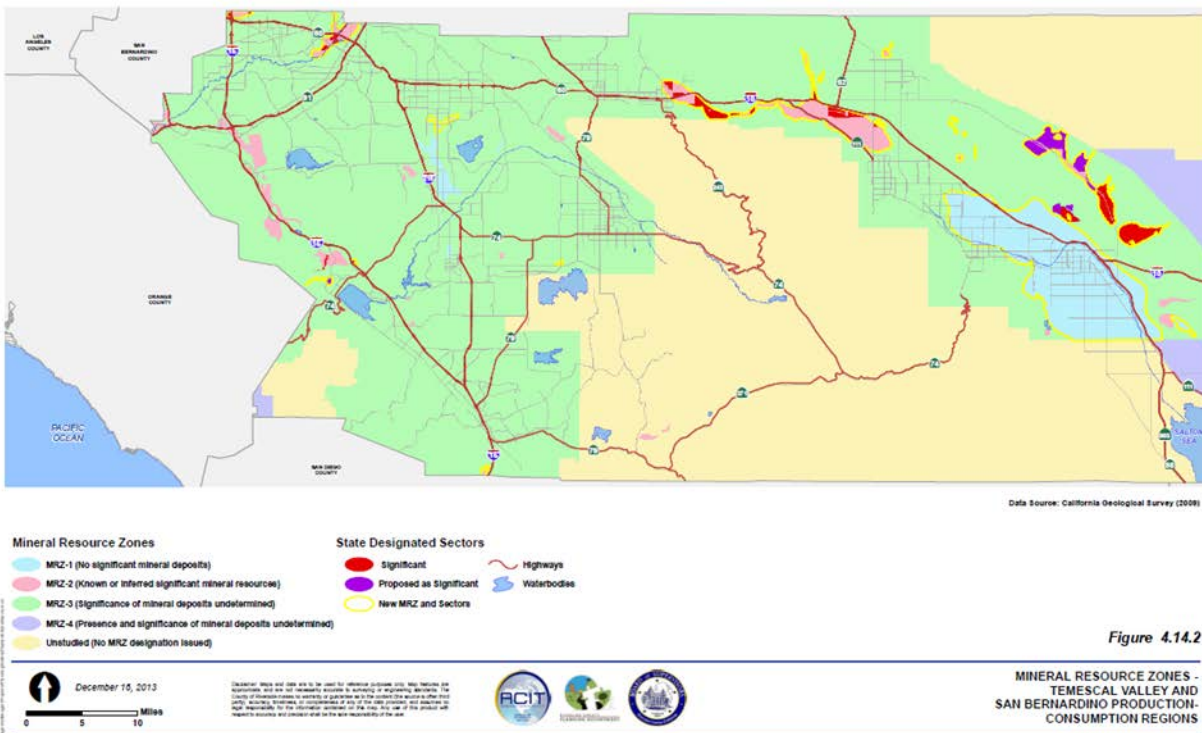

COS 6.1.1 Efficient Use of Non-Renewable Resources. Utilize non-renewable resources efficiently in City buildings and facilities, services and operations, and encourage others to do the same.

Mineral Resources

Historically, mineral extraction has been an important component of Jurupa Valley's economy. Western Riverside County has extensive deposits of clay, limestone, iron, sand, and aggregates. Classification of

land within California takes place according to a priority list that was established by the State Mining and Geology Board (SMGB) in 1982, or when the SMGB is petitioned to classify a specific area. The SMGB has also established Mineral Resources Zones (MRZ) to designate lands that contain mineral deposits. The State of California has also designated Aggregate Mineral Resource areas within the County. These mineral resource zones are shown in *Figure COS-15*.

Figure COS-15: Mineral Resources Map, Riverside County

Mineral deposits are important to many industries, including construction, transportation, and chemical processing. The value of mineral deposits is enhanced by their close proximity to urban areas. However, these mineral deposits are endangered by the same urbanization that enhances their value. The non-renewable characteristic of mineral deposits necessitates the careful and efficient development of mineral resources to prevent their premature depletion or adverse impacts due to their extraction and use.

Policies in this section seek to conserve areas identified as containing significant mineral deposits and oil and gas resources for potential future use, while promoting the reasonable, safe, and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land-use compatibility impacts can be adequately mitigated.

Policies:

COS 6.1.2 Compliance with SMARA. Require that the operation and reclamation of surface mines be consistent with the State Surface Mining and Reclamation Act (SMARA) and with the Municipal Code.

COS 6.1.3 Incompatible Uses. Restrict incompatible land uses within the impact area of legal existing or potential surface mining uses and within areas designated in the General Plan as Open Space-Mineral Resources.

COS 6.1.4 Approval Conditions. Impose conditions as necessary on mining operations to minimize or eliminate the potential adverse impact of mining operations on surrounding properties, and environmental resources.

COS 6.1.5 Buffers. Require that new non-mining land uses adjacent to existing mining operations be designed to provide a buffer between the new development and the mining operations. The buffer distance shall be based on an evaluation of noise, aesthetics, drainage, operating conditions, biological resources, topography, lighting, traffic, operating hours, and air quality.

Programs:

COS 6.1.1.1 Minerals Inventory. Maintain up-to-date information regarding the location of mineral resource zones in the City.

COS 6.1.1.2 City Review. Update City ordinances to require that all proposals for mineral extraction and reclamation be reviewed by the Planning Commission and City Council.

Energy Resources

Energy resources provide the power necessary to maintain the quality of life enjoyed by City residents. Many of the energy resources used within the City are non-renewable. For example, electricity and natural gas are the primary sources of household energy, while fossil fuels are the primary source of energy for most modes of transportation. Energy conservation and the substitution of renewable resources should be encouraged if these resources are to be preserved for future generations.

Petroleum Resources

Riverside County's petroleum resources are deposited in the form of oil and gas seeps. The State Division of Oil and Gas does not report significant or active petroleum extraction in Jurupa Valley or the County. Should extraction activities be undertaken in the future, the following policy provides direction for the siting of oil and gas facilities.

Policies:

COS 6.1.6 City Operations. Seek ways to improve the energy efficiency of City operations to save energy, reduce consumption of non-renewable materials, reduce municipal costs, and set a positive example for the community.

COS 6.1.7 City Vehicles and Equipment. Purchase and use vehicles and equipment that are fuel efficient and meet or surpass state emissions requirements and/or use no- or low-emission sources of energy, if economically feasible.

COS 6.1.6 Renewable Energy Resources. Work with other agencies and utility providers to encourage safe, economical, and renewable energy resources, and to reduce non-renewable energy use through public education and participation in energy conservation programs.

COS 7. Cultural and Paleontological Resources

City of Jurupa Valley

Jurupa Valley is rich in history dating back hundreds of years. Jurupa Valley derives its name from the first inhabitants of the area, Native Americans who called “Jurupa” their home. The Jurupa Valley area lies at the territorial boundaries of two different Tribes, the Gabrieleno Tribe and the Serrano Tribe. Over the years, there have been various interpretations of the meaning of “Jurupa”, from a greeting meaning “peace and friendship” to the first padre to visit the area, to a more widely recognized origination that “Jurupa” refers to the California Sagebrush common to the area. In 1838 the area became known as Rancho Jurupa under a land grant to Senõr Don Juan Bandini by the Mexican government. By the late 1800’s the Jurupa Valley area began to live in the shadow of the more popular City of Riverside. Much of Jurupa Valley area has what once was a Riverside mailing address. Yet, settlement of the area in and around what is now the City of Riverside actually began in the Jurupa Valley many years before Riverside’s founding.

Figure COS-16 shows an 1889 map of two Mexican-era land grants in the Jurupa Valley: Rancho Jurupa (1838) and Rancho El Rincon (1839). This 1889 map reflects the “patented titles” for the ranchos confirmed by the US Land Commission after California became part of the United States and before the formation of Riverside County in 1893.

Figure COS-16: Historic Jensen-Alvarado Ranch House, 1870

Cultural resources consist of places (historic and prehistoric archaeological sites), structures, or objects that provide evidence of past human activity. They are important for scientific, historic, and/or religious reasons to cultures, communities, groups, or individuals. The cultural history of Riverside County and Jurupa Valley can be divided chronologically into three periods: prehistory, ethno-history, and history. Native American cultures predominate in the prehistorical and ethno-historical periods. The Relative

City of Jurupa Valley

Figure COS-17: Archaeological Sensitivity Map, Riverside County

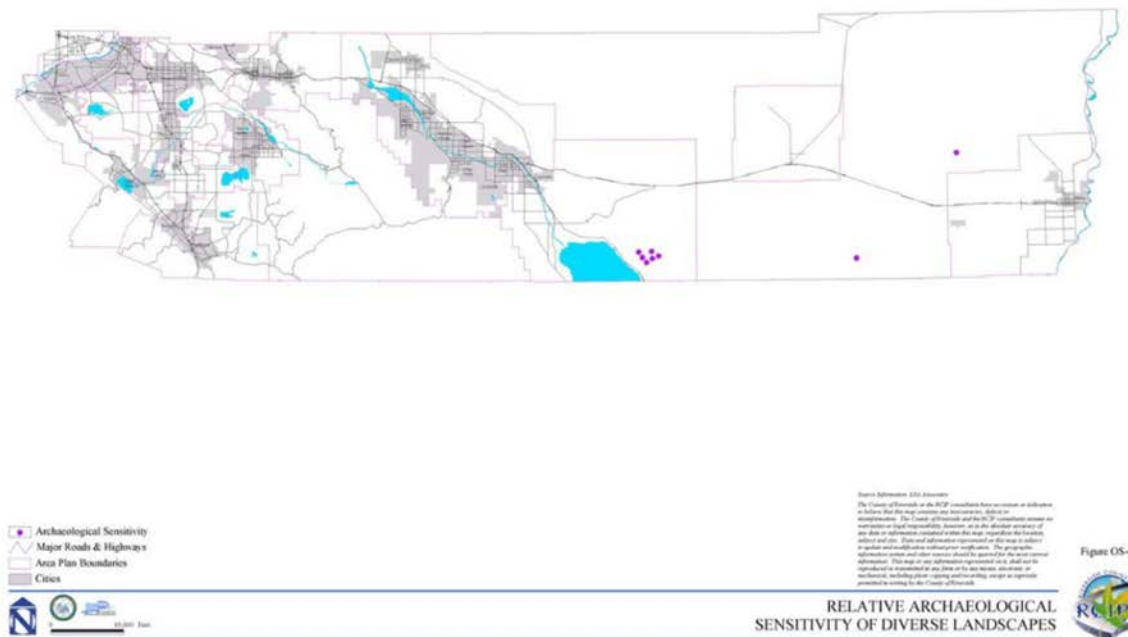

Figure COS-18: Historical Resources, Riverside County

City of Jurupa Valley

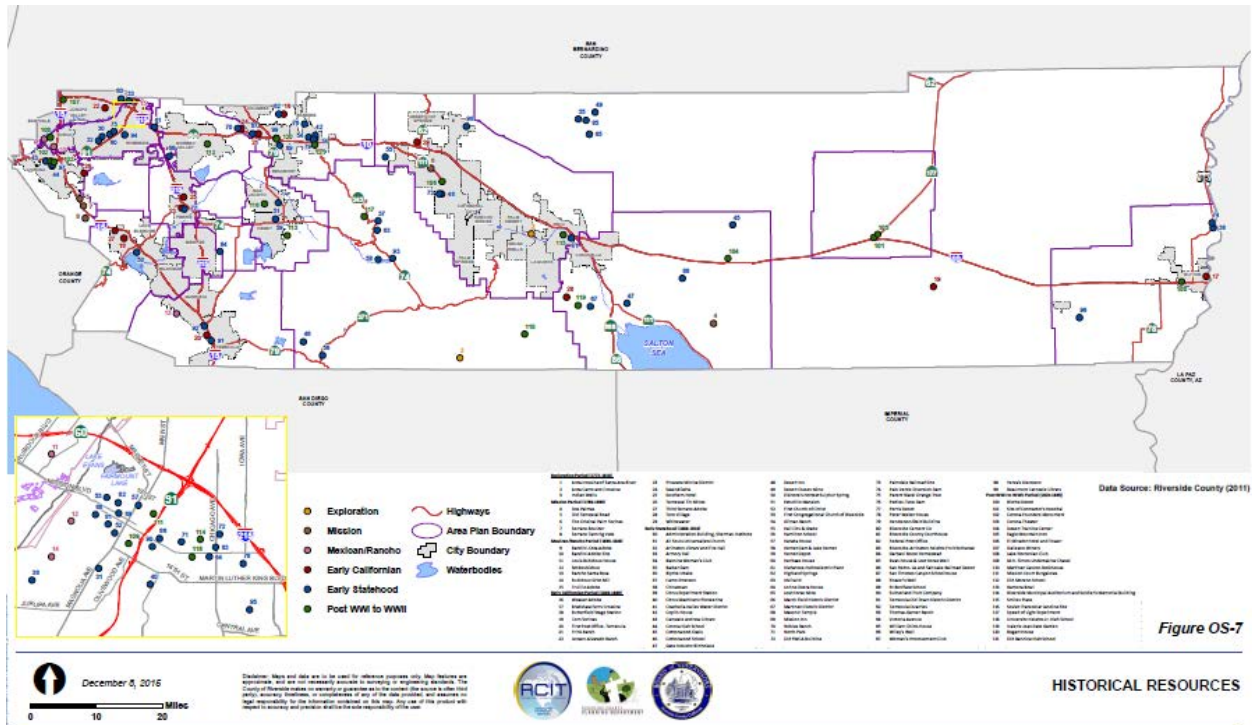

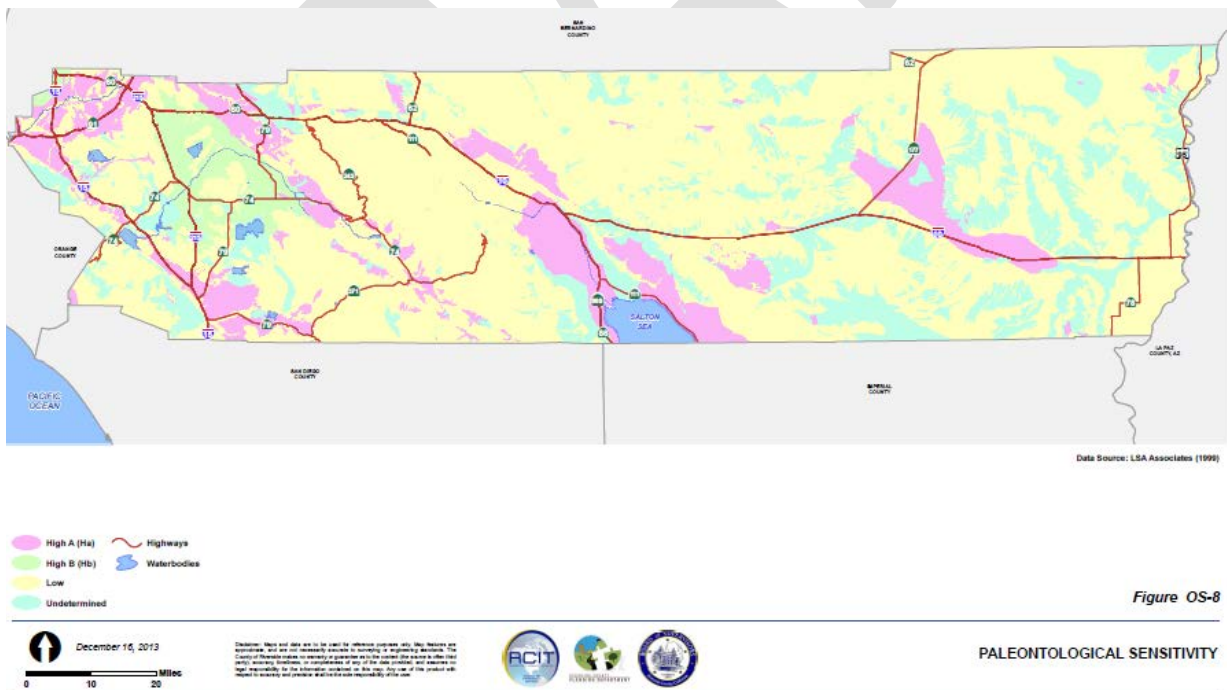

Figure COS-19: Paleontological Resources Sensitivity, Riverside County

The area has also been inventoried for geologic formations known potentially to contain paleontological

resources. Paleontological resources are the fossilized biotic remains of ancient environments. They are valued for the information they yield about the history of the earth and its past ecological settings. Lands with low, undetermined, or high potential for finding paleontological resources are mapped on Figure COS-18, the Paleontological Resources Sensitivity map. This map is used in the environmental assessment of development proposals and the determination of required impact mitigation. Riverside County has an extensive record of fossil life starting in Jurassic time, 150 million years ago.

Goal:

COS 7.1 The City will seek to ensure the preservation of cultural, historical, archaeological, and paleontological resources.

Policies:

COS 7.1.1 Preservation of Significant Cultural Resources. Identify, protect, and where necessary, archive significant paleontological, archaeological, and historical resources.

COS 7.1.2 Public Information. Encourage programs that provide public information on the City's history and cultural heritage, and participate with other agencies to help educate students about the City's rich natural and manmade environment.

COS 7.1.3 Development Review. Evaluate project sites for archaeological sensitivity and for a project's potential to uncover or disturb cultural resources as part of development review.

COS 7.1.4 Site Confidentiality. Protect the confidentiality and prevent inappropriate public exposure or release of information on locations or contents of paleontological and archaeological resource sites.

COS 7.1.5 Native American Consultation. Refer development projects for Native American tribal review and consultation as part of the environmental review process, in compliance with State law.

COS 7.1.6 Non-Development Activities. Prohibit activities other than private development projects that could disturb or destroy cultural resource sites, such as off-road vehicle use, site excavation or fill, mining, or other activities on or adjacent to known sites, or the unauthorized collection of artifacts.

COS 7.1.7 Qualified archaeologist present. Cease construction or grading activities in and around sites where substantial archaeological resources are discovered until a qualified archaeologist knowledgeable in Native American cultures can determine the significance of the resource and recommend alternative mitigation measures.

COS 7.1.8 Native American Monitoring. Include Native American participation in the City's guidelines for resource assessment and impact mitigation. Native American representatives should be present during archaeological excavation and during construction in an area likely to contain cultural resources. The Native American community shall be consulted as knowledge of cultural resources expands and as the City considers updates or significant changes to its General Plan.

COS 7.1.9 Archaeological Resources Mitigation. Require a mitigation plan to protect resources when a preliminary site survey finds substantial archaeological resources before permitting construction. Possible mitigation measures include presence of a qualified professional during initial grading or trenching; project redesign; covering with a layer of fill; excavation, removal and curation in an appropriate facility under the direction of a qualified professional.

COS 7.1.10 Historically significant buildings. Prohibit the demolition or substantial alteration in outward appearance of historically significant buildings and structures unless doing so is necessary to remove a threat to health and safety and other means to eliminate or reduce the threat to acceptable levels are

infeasible. (See *Table COS-20* for a listing of Historic and Potentially Historic Structures)

Table COS-20:- Historic and Potentially Historic Resources in Jurupa Valley

| Historic Name | Location | Category/Status | Significance |
|---|--|---|--|
| Jensen-Alvarado Ranch | 4307 Briggs St, Jurupa Valley, CA 92509 | California Historical Landmark (Cornelius and Mercedes Jensen Ranch, No. 943); listed on the National Register of Historic Places on September 6, 1979. | First kiln-fired brick building built in Riverside County and the oldest non-adobe structure in the Inland Empire. Ranch house and grounds serve as an 1880s living history interpretive museum administered by Riverside County Parks |
| Crestmore Manor | 4600 Crestmore Road Jurupa Valley, CA 92509 | Potentially significant, architecture and commerce. | Crestmore Manor, a 10,830 sq. ft. colonial-style mansion, built in mid-1950s by W.W. "Tiny" Naylor, a restaurateur and the state's then second-leading thoroughbred horse breeder. |
| Galleano Winery | 4231 Wineville Rd., Jurupa Valley, CA | Listed, National Register of Historic Places, architecture and commerce. | Early example of Southern California vineyard and winery. |
| Robidoux Grist Mill Site | 5540 Molina Way, Rubidoux | California State Historic Landmark #303; marker. | One of the first grist mills in this part of Southern California, built by Jurupa Valley pioneer Louis Rubidoux on the Rancho Jurupa in 1846-47. |
| Site of Louis Robidoux House | 5575 block, Mission Boulevard, Rubidoux | California State Historic Landmark and Riverside County Historic Landmark; marker.. | Location of former home of Louis Rubidoux (nee' Robidoux). |
| Site of de Anza crossing of the Santa Ana River, 1775 and 1776. | Jurupa Hills Country Club. Site is near Union Pacific Bridge, Jurupa Heights; plaque is located between the clubhouse and No. 1 tee, Jurupa Hills Country Club Golf Course, 6161 Moraga Avenue | California State Historic Landmark; marker. | On January 1, 1776, the first party of colonists to come overland to the Pacific Coast, led by Early California explorer Juan Bautista de Anza, crossed the Santa Ana River south of this marker and camped between here |

| | | | |
|---------------------------|------------------------|---|---|
| | | | and the River. |
| Spinney House | 7811 Mission Boulevard | Potentially significant, architecture and commerce. | Two-story Victorian farmhouse, pre-1900. |
| Rubidoux Drive-in Theater | 3770 Opal Street | Potentially significant, architecture and entertainment/cultural. | Vintage 1948 drive-in movie theatre, one of the oldest drive-in theaters in continuous operation; only about 20 drive-in theaters remain in California. |

Programs:

COS 7.1.1.1 Historic Resources, Districts and Neighborhoods. Identify historic resources, districts and neighborhoods, such as the historic city areas or Rubidoux, Glen Avon, and Pedley with the HRO Overlay and protect and, where possible enhance, their historic character through appropriate district signage, public improvements, and development incentives.

COS 7.1.1.2 Historical Preservation Incentives. Consider offering preservation incentives, such as the Mills Act Tax Reduction program to encourage maintenance and restoration of historic properties.

COS 7.1.1.3 Construction in Historic Districts. Prepare (or update, where guidelines already exist) architectural design guidelines to provide specific guidance on the construction of new buildings and public improvements within areas designated in the General Plan with the Historic Resource Overlay ("HRO"), such as village centers, historic districts and historic neighborhoods.

COS 7.1.1.4 Public Information Programs. Foster public awareness and appreciation of cultural resources by sponsoring educational programs or by partnering with agencies, non-profit organizations, and citizens groups to provide public information on cultural resources and display artifacts that illuminate the City's history. The City will encourage private development to include historical and archaeological displays where feasible and appropriate.

Figure COS-21: Mt. Jurupa Trail Overlooking Jurupa Valley

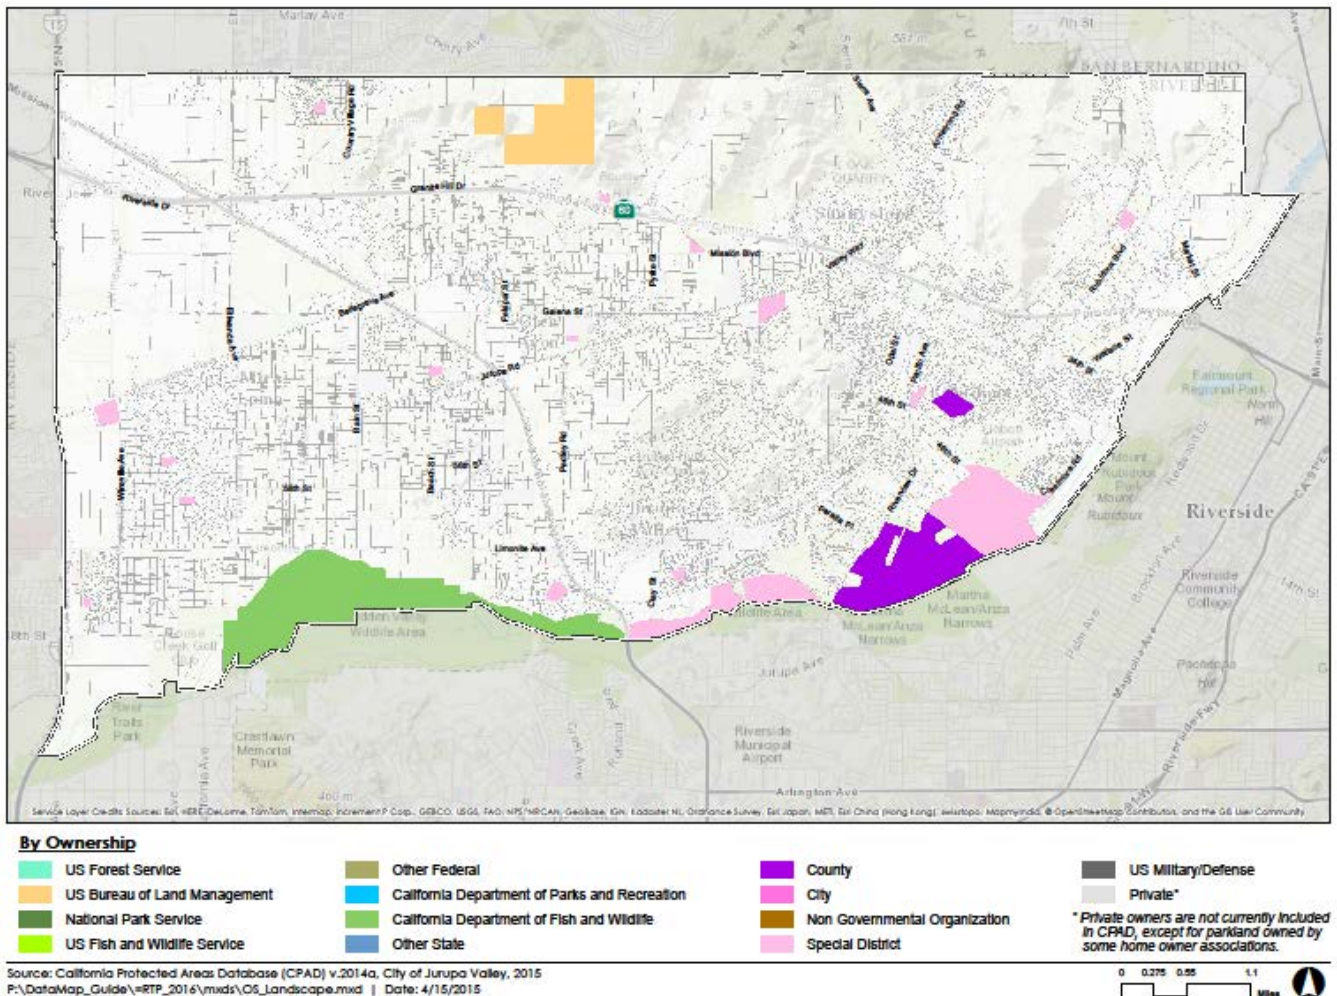

COS 8. Open Space and Recreation Resources

In partnership with other agencies, such as the Riverside County Regional Park and Open Space District, the Jurupa Community Services District and the Jurupa Area Recreation and Park District, the City of Jurupa Valley offers a wide range of open spaces, parks, recreational areas, and trails, as shown in *Figure COS-21*. Open space and recreation facilities provide a variety of recreational opportunities and help maintain a distinct urban boundary and buffer between the City and adjacent urbanized areas. The following policies relate to the preservation, use, and development of a comprehensive open space system consisting of passive open space areas, and parks and recreation areas that have recreational, ecological, and scenic value.

COS-22: Protected Open Space in Jurupa Valley

Protected Open Space in City of Jurupa Valley

Goals:

COS 8.1 Secure and maintain a diverse network of open lands including valuable natural and recreational resources, including:

- Santa Ana River floodway and riparian areas
- Jurupa Mountains
- Wetlands and vernal pools
- Wildlife habitat and corridors, particularly for species of local concern or for species that are officially listed as threatened or endangered.
- Parks and natural areas with significant recreational opportunities

COS 8.2 Encourage public access to open space without harming the resource and without exposing the public or property owners to unacceptable risk.

COS 8.3 Preserve open space and wildlife habitat and help provide trails and other recreation opportunities where they will not harm the environment.

COS 8.4 Avoid actions that will result in the loss of designated open space resources and when feasible, require mitigation for their loss.

Policies:

COS 8.1.1 Environmental Resource Protection. Preserve and maintain open space that protects environmental resources and protects public health and safety.

COS 8.1.2 Extension of Public Facilities. Avoid the extension of public streets, facilities, services, and utilities for urban uses into areas designated as Open Space in the General Plan.

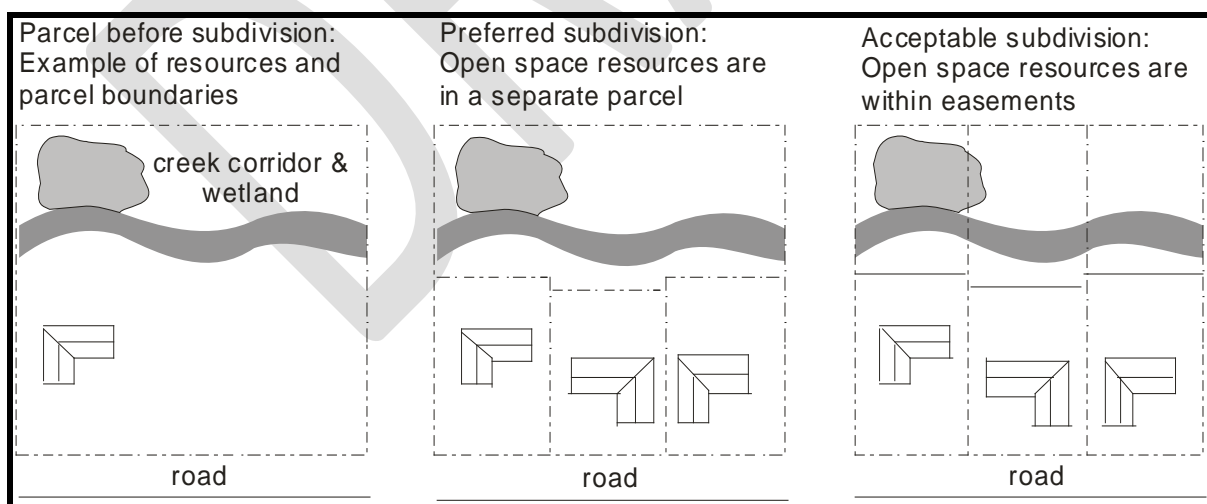

COS 8.1.3 Conversion of Recreation and Open Space Uses. Discourage the conversion of dedicated parklands and designated open space to non-recreational or non-open space uses. Where conversion is unavoidable, require developers or responsible agencies to replace parklands that are converted to other uses with similar or improved facilities and programs, and open space with land of equivalent open space value.

COS 8.1.4 Equal Access to Recreation and Open Space Resources. Ensure the City's open space and recreational network accommodate the needs of all residents, regardless of their income, ethnicity, physical capabilities, or age.

COS 8.1.5 Parkland Implementation Strategies. Require new development to provide funding and/or long-term implementation strategies for the acquisition and improvement of active and passive parks, open space, and recreational sites, when appropriate.

COS 8.1.6 Provision of Recreation Facilities. Require that parkland or open space dedication and improvement occur prior to, or concurrent with, construction, as a condition of approval of new residential subdivisions (Figure COS-23).

Figure COS-23: Open Space Resources in a Subdivision

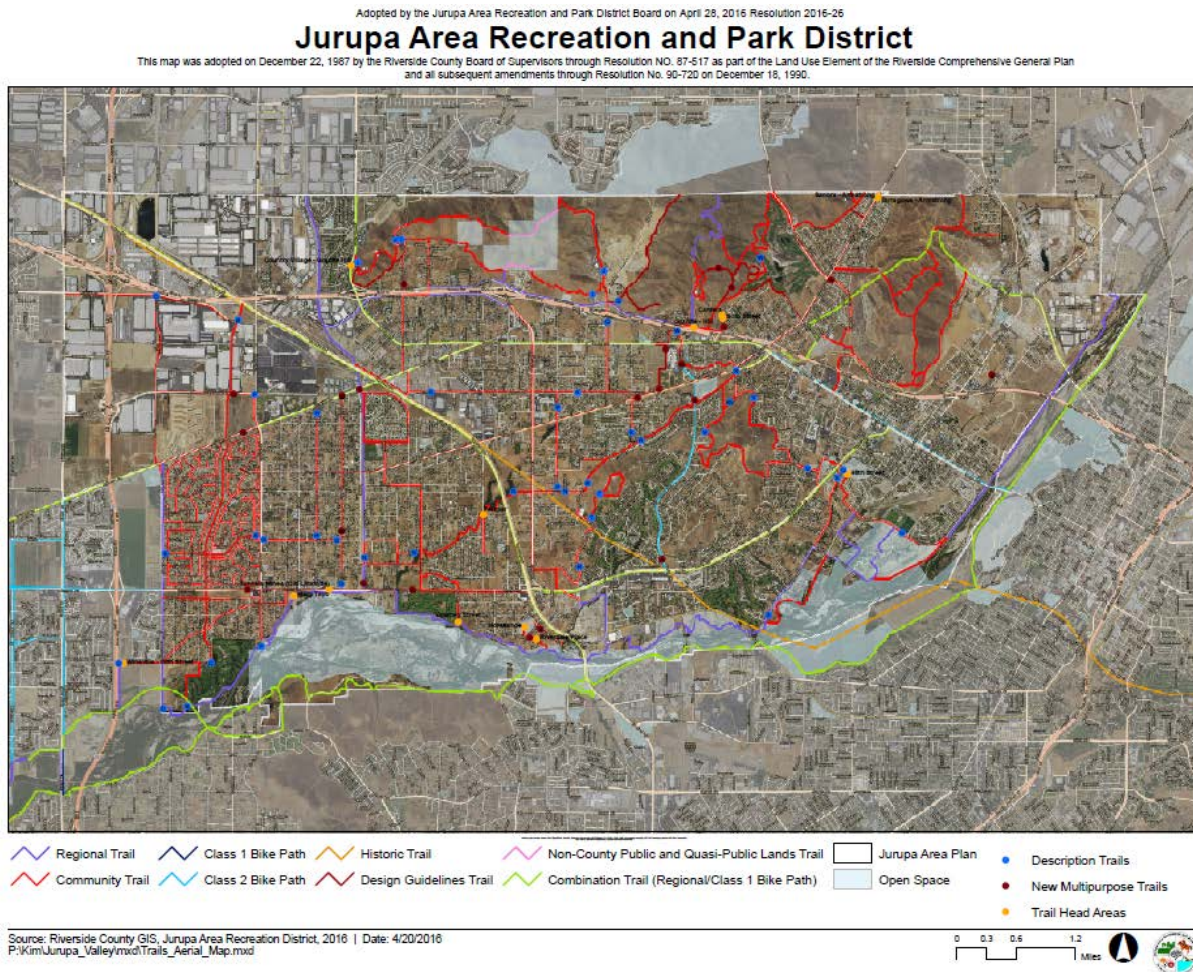

COS 8.1.7 Public access. Provide public access to open space resources when doing so is consistent with protection of the resources, and with the security and privacy of affected landowners and occupants.

Access will generally be limited to non-vehicular movement, and may be restricted in sensitive areas.

COS 8.1.8 Trails Network. Establish an off-street trails network, linking residential/equestrian areas, local open space attractions, staging areas and regional trail connections, generally as shown in the Master Trails Plan, *Figure COS-24*.

Figure COS-24: Master Trails Plan, Jurupa Area Recreation and Park District

COS 8.1.9 Open Space Enhancement and Restoration. Encourage, and as budget resources allow, support the enhancement and restoration of permanently dedicated open space and trail easements. Enhancements may include trail clearing, erosion protection, drainage, fencing, revegetation, trash clean up, directional and interpretative signage, and other improvements the City Council determines necessary for public health and safety.

COS 8.1.10 Fire prevention activities. Conduct fire prevention activities such as fuel clearance or thinning, grading, prescribed burns, or other activities pursuant to an approved Conservation Plan, and under the supervision of State and local wildlife authorities and CalFire representatives, except in an emergency. Habitat preservation shall be given equal priority with fire prevention.

Programs:

COS 8.1.1.1 Protect open space resources. Take the following actions to protect open space, and encourage individuals, organizations, and other agencies to take the same actions within their areas of responsibility and jurisdiction:

- A. **Open Space Designation.** Apply Open Space or Agriculture zoning to private property where equitable development potential is granted to the property owner for the remainder of the land and appropriate and consistent with General Plan goals and policies.
- B. **Open Space and Trails Dedication.** Preserve or enhance open space and trails resources through application of conditions of subdivision and development approvals, consistent with General Plan goals and policies, including dedications of fee ownership or easements where necessary and appropriate.
- C. **Donations and Grants.** Seek and use grants, donations, other revenue sources, and long-term financing mechanisms to purchase fee ownership or easements. The City will consider allocating funding for open space acquisition and protection, and will explore all potential funding sources and other creative incentive programs, including general obligation bonds, sales tax increase, property transfer tax, assessment districts, tax incentives, and state and federal loans and grants.
- D. **Interagency Cooperation.** Promote interagency cooperation for open space acquisition, greenbelt, creeks, wetlands, and wildlife habitat protection in open space areas by coordinating with other government agencies and organizations having interest or expertise in resource protection.
- E. **Taxes and Fees.** Avoid imposing taxes or fees that discourage dedication, improvement and retention of open space, trails, or agricultural uses.

Figure COS-25: San Bernardino Mountains in snow, looking northeast from Jurupa Valley

COS 9. Scenic Resources

Jurupa Valley's outstanding scenic resources give the City's its distinctive character and appeal, and contribute to its residents' quality of life. In general, scenic resources include natural areas that are visible to the public and include natural landmarks, hills, and mountain peaks, ridgelines, floodplains and stream channels, agricultural fields, mature trees and agricultural windbreaks, riparian woodlands and other prominent or unusual landscape features. Scenic backdrops include hillsides and ridges that rise above or adjacent to urban or rural areas or highways. Scenic vistas are points or corridors that are accessible to the public and that provide a view of scenic areas and/or landscapes. Following are policies to protect these resources and ensure that development enhances and does not obscure them or detract from their

beauty.

Several roadways in Jurupa Valley provide outstanding views of surrounding scenic resources. Enhancing aesthetic experiences for residents and visitors to the City and County is essential to preserving the aesthetic qualities and character of Jurupa Valley. It may also help to promote tourism, a small but potentially significant contributor to the City's economic health. Enhancement and preservation of these scenic requires careful application of scenic highway standards along officially designated scenic routes. City policies that seek to protect and maintain resources in corridors along scenic highways are also provided below.

Goals:

COS 9.1 Preserve the City's scenic resources, including mountains, hills, ridgelines, rock outcroppings, canyons, mature trees, Santa Ana River and floodplain, riparian corridors, agricultural fields and other landscape features deemed significant by the City Council.

COS 9.2 Preserve views of scenic resources from vista points or along scenic street or highway corridors.

Policies:

COS 9.1.1 Protect scenic resources, especially the skylines, undeveloped ridgelines, rocky hillsides, river view corridors, and outstanding scenic vistas not designated for urban uses from development and maintain it in their current patterns of use.

COS 9.1.2 Ensure that development in areas with scenic values, including natural or agricultural landscapes, is visually subordinate to and compatible with the dominant landscape features, colors and textures. Development includes, but is not limited to buildings, signs (including billboard signs), roads, utility and telecommunication lines and structures. Such development shall:

1. Avoid visually prominent locations such as ridgelines, and slopes exceeding 20 percent.
2. Avoid unnecessary grading, vegetation removal, and site lighting.
3. Incorporate building forms, architectural materials, and landscaping, that respect the setting, including the historical pattern of development in similar settings, and avoid stark contrasts with its setting.
4. Preserve scenic or unique landforms, significant trees in terms of size, age, species or rarity, historical features, and rock outcroppings.

COS 9.1.3 **Urban development.** Implement the following aesthetic principles and will encourage other agencies with jurisdiction to do so:

- A. **Design Context.** Urban development should be designed to reflect its architectural, environmental, and historical context. This does not necessarily prescribe a specific style, but requires deliberate design choices that acknowledge human scale, natural site features, and neighboring urban development, and that are compatible with historical and architectural resources. Plans for sub-areas of the city and within the three village centers may require certain distinctive architectural styles.
- B. **Utilities and Signs.** In and near public streets, public spaces and parks, and important scenic resources, features that clutter, degrade, intrude on, or obstruct views should be avoided. Necessary features, such as utility and communication equipment, and traffic equipment and signs should be designed and placed to not impinge upon or degrade scenic views, consistent with

the primary objective of safety. New billboard signs within scenic corridors should be avoided and existing billboard signs should be removed when possible.

- C. **Streetscapes and Major Roadways.** In the acquisition, design, construction or significant modification of major roadways (highways/regional routes and arterial streets), the City will promote the creation of “streetscapes” and linear scenic parkways or corridors that promote the City’s visual quality and character, enhance adjacent uses, and integrate roadways with surrounding districts. To accomplish this, the City will:
- Establish streetscape design standards for major roadways.
 - Encourage the creation and maintenance of planted medians and widened parkway landscaping.
 - Retain mature trees in the public right-of-way.
 - Emphasize the planting and maintenance of California Native tree species of sufficient height, spread, form and horticultural characteristics to create the desired streetscape canopy, shade, buffering from adjacent uses, and other desired streetscape characteristics.
 - Encourage the use of water-conserving landscaping, street furniture, decorative lighting and paving, arcaded walkways, public art, and other pedestrian-oriented features to enhance streetscape appearance, comfort, and safety.
 - Encourage and where possible, require undergrounding of overhead utility lines and structures.

COS 9.1.4 View protection in new development. The City will include in all environmental review and carefully consider effects of new development, streets and road construction, grading and earthwork, and utilities on views and visual quality.

COS 9.1.5 Views to and from public places, including scenic roadways. The City will preserve and improve views of important scenic resources from public places, and encourage other agencies with jurisdiction to do so. Public places include parks, plazas, the grounds of civic buildings, streets and roads, and publicly accessible open space. In particular, the route segments shown in Figure COS-25 are designated as local scenic roadways.

Figure COS-26: Jurupa Valley Scenic Corridors and Roadways

To be added

COS 9.1.6 Scenic Corridors and Roadways. Development projects along and within scenic corridors, including State highway projects, noise walls, and new private or public construction shall not wall off scenic roadways and block views of scenic resources. The following measures shall be implemented:

- Utilities, traffic signals, and public and private signs and lights shall not intrude on or clutter views, consistent with safety needs.
- Where important vistas of distant landscape features occur along local streets, street trees shall be clustered to facilitate viewing.

Programs:

COS 9.1.1.1 Visual assessments. Require evaluations and/or visual simulations for development projects that could affect scenic resources and scenic vistas.

COS 9.1.1.2 Scenic Highway Designation. Advocate State and County scenic highway designations and protective programs for highways and other roads connecting Jurupa Valley with other communities.

COS 9.1.1.3 Undergrounding Utilities. Place existing overhead utilities underground, with highest priority for scenic roadways, entries to the City and require utilities, community service districts and other responsible agencies to do likewise.

COS 9.1.1.4 Billboards. Amend the Municipal Code as needed to discourage and where necessary and appropriate, prohibit the installation of new billboard signs along scenic corridors and roadways and to provide for the eventual removal of existing billboards through amortization, conditions of development approval, and grants for enhancing open-space and transportation corridors. The highest priority for billboard limitations and removal shall be along scenic roadways and at City gateways.

COS 9.1.1.5 New Development. Ensure that new development within designated scenic highway corridors are designed with adequate site planning, setbacks, non-structural noise buffers and construction assemblies to avoid the need for sound attenuation, while balancing the objectives of maintaining scenic resources with accommodating compatible land uses.

COS 9.1.1.6 Grading. Utilize contour grading and slope rounding to gradually transition graded roads slopes, utilities and development sites within and adjacent to scenic highway corridors to create natural landscape forms that follow the area's natural topography.

Figure COS 27: Dark Sky Preservation

The red glow of a very rare display of the aurora borealis over Borrego Springs, California. Photo by Dennis Mammana.

COS 10. Dark Skies

A dark sky is the night sky with minimal light impact from urban land uses or structures. Light intrusion into the night sky obstructs views of astrological features, has been shown to disrupt animal behavior and natural plant cycles, and to negatively affect human health. Focusing lights where they are needed reduces light glare and light pollution, allowing the sky to be observed and enjoyed in a more natural state. Furthermore, strategies to reduce light impacts can also help conserve energy, lower energy costs and improve safety.

The International Dark Sky Association (IDA) is a non-profit, 501c3 organization with chapters forming in many parts of the world. It is one of many such organizations dedicated to reducing the environmental and health effects of unwanted light. Its mission is to preserve and protect the nighttime environment and our heritage of dark skies through environmentally responsible outdoor lighting. IDA provides information and resources to communities to help them:

1. Improve the nighttime environment by reducing light pollution through better lighting practices that provide:

- Energy savings resulting in economic benefits
- Superb nighttime ambience and quality of life
- Conservation of nocturnal wildlife and ecosystems

- Safeguarding of scientific and educational opportunities, such as astronomy
- Increased visibility, safety, and security at night by reducing glare
- Preservation of cultural heritage and inspiration for the arts

Many cities throughout California and the U.S. have become International Dark Sky Communities, such as Borrego Springs, pictured above. An IDA International Dark Sky Community is a town, city, municipality or other legally organized community that has shown exceptional dedication to the preservation of the night sky through the implementation and enforcement of a quality outdoor lighting ordinance, dark sky education and citizen support of dark skies. Dark Sky Communities excel in their efforts to promote responsible lighting and dark sky stewardship, and set good examples for surrounding communities.

Goal:

COS 13.1 Minimize light trespass and pollution caused by public and private structures, new development, and public facilities to ensure safety, protection of the natural environment, and preservation of dark nighttime skies.

Policies:

COS 13.1.1 **Outdoor Lighting.** Avoid outdoor lighting that:

- Operates at unnecessary locations, levels, and times
- Spills onto areas offsite or to areas not needing or wanting illumination
- Produces glare (intense line-of-site contrast)
- Includes lighting frequencies (colors) that interfere with astronomical viewing

COS 13.1.2 **New Residential Development and Remodeling Projects.** Require development projects and major remodel projects to minimize light pollution and trespass while enhancing safety and aesthetics.

COS 13.1.3 **Public Facilities, Buildings and Streets.** Use outdoor light shielding measures to minimize light trespass and glare while enhancing safety and aesthetics.

COS 13.1.4 **Commercial and Industrial Buildings.** Require that site lighting for commercial and industrial uses is unobtrusive and constructed or located so that only the intended area is illuminated, off-site glare is prevented and adequate safety is provided.

COS 13.1.5 **Public Education and Outreach.** Support programs that provide public education on the importance of dark skies and how to protect them. Collaborate with non-profit and other public agencies to help achieve our goals.

Programs:

COS 13.1.1.1 **Lighting Standards.** Develop lighting standards based on the International Dark-Sky Association's (IDA's) Model Lighting Ordinance, with emphasis on preserving the City's equestrian, semi-rural character.

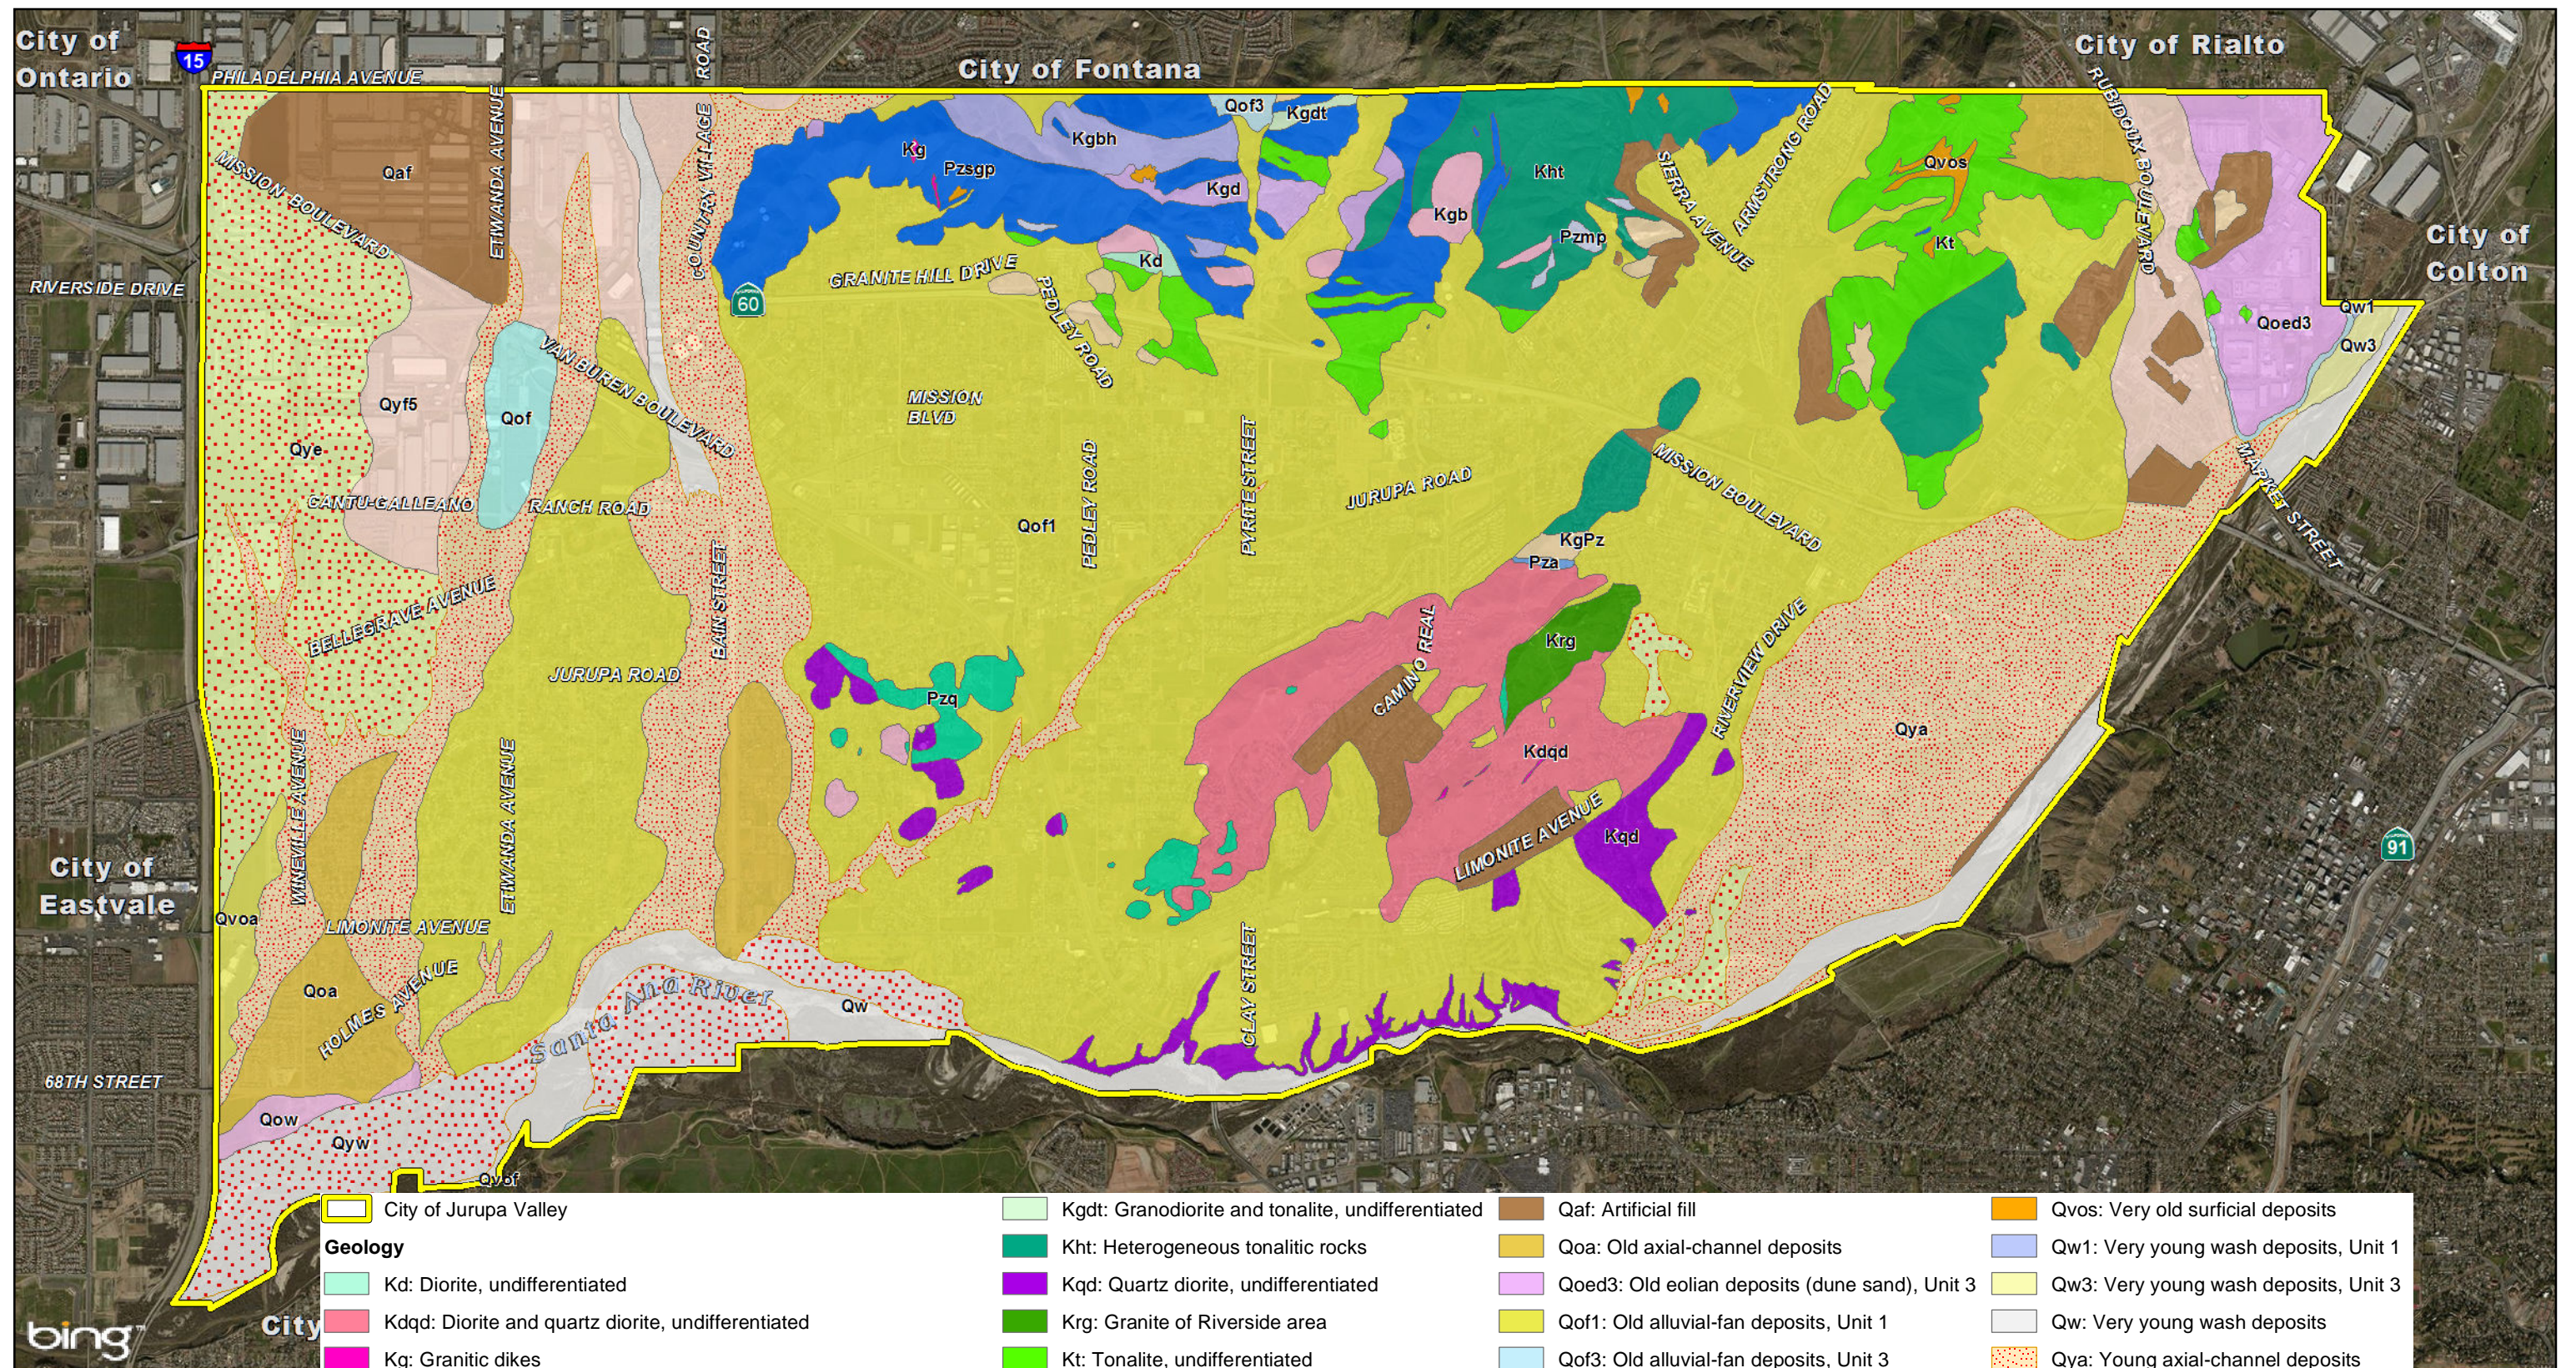

COS 13.1.1.2 **Retrofit Plan.** Establish a retrofitting plan for outdoor lighting on City streets and at City facilities, and encourage community service districts to do the same.

COS 13.1.1.3 **Grant Funding.** Seek grant funding for City lighting upgrades, incentive programs, and new fixtures.

COS 13.1.1.4 **Public Awareness.** Develop a dark sky public awareness campaign (e.g., April is Dark Sky Month, dark sky page on city's website, City Council proclamation, etc.).

COS 13.1.1.5 **Regional Collaboration.** Collaborate with neighboring jurisdictions to identify the appropriate location and night lighting standards for a dark sky park.

COS 13.1.1.6 **Engineering Standards.** Review City engineering standards for possible changes to public street lighting locations, design and spacing to reduce light pollution, improve energy efficiency and maintain safety.

Executive Summary

Since the adoption of the 2010 Urban Water Management Plan, the Jurupa Community Services District has been successful in meeting the goals and intent of both the Urban Water Management Planning Act of 1983 and the Water Conservation Act of 2009. The District has accomplished the following:

- Adopt Ordinance No. 389 to implement the emergency State regulations for water conservation as part of the District's Water Shortage Contingency Plan;
- Replace all of the meters in the District's service area and update the system to an Automatic Meter Reading technology;
- Co-sponsor a State grant application for a recycled water intertie project with Inland Empire Utilities Agency to recharge the Chino Basin and irrigate portions of the Eastvale area with recycled water;
- Adopt Resolution Nos. 2511 and 2512 to increase the tiered water rates and to add a sewer quantity charge to encourage conservation;
- Adopt Resolution Nos. 2627 and 2628 to update the Water and Sewer Capacity Charges to fund future capital projects to benefit existing and future customers;
- Increase funding of the Water Conservation Program to support the Conservation Coordinator and expand rebate programs;
- Participate with the voluntary reporting requested by the California Urban Water Conservation Council;
- Replace 971 water service laterals and 191 mainline pipes that were broken or leaking;
- Construct two new high-producing groundwater wells and a new intertie to Rubidoux Community Services District at the Jewel Street interagency booster station; and
- Increase the total number of service connections by 10 percent while decreasing total water production by 10 percent since 2011.

Future water savings will be achieved by focusing conservation efforts on residential indoor use, outdoor irrigation, and commercial properties. In total, these three sectors constitute 83 percent of the District's water demands, as of 2015.

This Plan estimates the District's 2015 population at 119,034 persons and projects ultimate build-out at about 159,000 persons by 2039. Based on the growth assumptions contained herein, additional sources of water supply may be needed by 2030, which are currently in various stages of development, to meet projected needs of JCSD. By 2040, the District's total annual water demand (potable and non-potable) is anticipated to be approximately 37,000 acre-feet.

This Page Intentionally Blank.

CHAPTER 1: INTRODUCTION AND OVERVIEW

1.1 Background

As specified in the California Water Code (CWC) Sections §10608– 10656, Urban Water Management Plans (UWMPs or Plans) are required of “urban water suppliers” pursuant to the Urban Water Management Planning Act of 1983. An “urban water supplier” may be publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. UWMPs are intended to support long-term resource planning by urban water suppliers, and to ensure adequate water supplies are available to meet existing and future water demands.

Every urban water supplier is also required to assess the reliability of its water sources over a 20-year planning horizon, and report its progress on 20 percent reduction in per-capita urban water consumption by the year 2020, as required in the Water Conservation Bill of 2009 (“SBX7-7,” aka Senate Bill 7 of the Senate’s 7th Extraordinary Session). Prior to the adoption of the UWMP Act, there were no specific requirements that water agencies conduct long-term resource planning. While many water agencies conducted long-term water supply and resource planning prior to the Act, those that did not were left vulnerable to supply disruptions during dry periods or catastrophic events.

UWMPs must be updated by the urban water supplier at least once every 5 years and submitted to the Department of Water Resources (DWR). DWR staff then reviews the submitted plans to make sure they have completed the requirements identified in the California Water Code (CWC), Sections §10608– 10656, then submits a report to the Legislature summarizing the status of the plans.

This UWMP follows the chapter organization outlined in the DWR UWMP Guidebook (March, 2016) and utilizes data kept and maintained by Jurupa Community Services District, as well as supplemental data from Carollo Engineers, Inc. (Carollo) and Albert A. Webb Associates (WEBB). The required UWMP tables provided by DWR are shades of blue and titled “**Table 2-1**,” for example. The additional tables created during the writing of this report have no color and contain letters after the Table number (e.g., **Table 2A**). Required tables pertaining to Chapter 5 Baselines and Targets begin with “**SB X7-7 Table...**” and are shaded brown and green.

WEBB is the District Engineer for the Jurupa Community Services District and submits this document on their behalf with their review and approval. A copy of JCSD Resolution No. 2660 to adopt the 2015 UWMP is provided in **Appendix P**.

1.2 Purpose

It is the stated goal of the Jurupa Community Services District (JCSD or District) to deliver a reliable and high quality water supply for their customers, even during dry periods. The purpose of the 2015 UWMP is to outline progress toward conservation and supply reliability goals since the 2010 UWMP was prepared,¹ as well to outline future long-term opportunities to meet projected water demands. The identification of future potential opportunities for water supplies in the UWMP neither commits JCSD to any stated endeavor, nor precludes them from exploring a different project that is not identified in the UWMP.

The sections of the CWC that apply to UWMPs (§10608– 10656) require water suppliers to report, describe, and evaluate:

- Water deliveries and uses;
- Water supply sources;
- Efficient water uses;
- Demand management measures, and
- Water shortage contingency planning.

Another purpose of the UWMP is to obtain eligibility for any water management grant or loan administered by DWR. In order for JCSD to be eligible, they must have a current UWMP on file that has been determined by DWR to address the requirements of the CWC. A current UWMP must also be maintained by JCSD throughout the term of any grant or loan administered by DWR.² Beginning in 2016, retail water suppliers like JCSD are also required to comply with the water conservation requirements in SB X7-7 in order to be eligible for State water grants or loans (CWC §10608.56(a)). As detailed in Chapter 5, JCSD has met the 2015 interim water conservation target and the requirements of SB X7-7.

¹ 2010 Urban Water Management Plan for JCSD, prepared by Kennedy/Jenks Consultants. May, 2011.

² An UWMP may also be required in order to be eligible for other State funding, depending on the conditions that are specified in the funding guidelines.

Another purpose of this document is to inform the local wholesale water providers, Western Municipal Water District (WMWD) and Chino Desalter Authority (CDA), of JCSD's projected population and projected need for water supplies. Likewise, this document is also intended to communicate forecasted growth to the wastewater treatment agencies that service the District.

There is no substitute for water planning at the local water supplier level. Only a local supplier has the knowledge, ability to consider the unique circumstances of the individual agency, can provide for participation by the community, and tailor the planning to local conditions (DWR UWMP Guidebook, March 2016).

This Page Intentionally Blank.

CHAPTER 2: PLAN PREPARATION

2.1 Plan Preparation

CWC §10620 states: *Every person that becomes an urban water supplier shall adopt an urban water management plan within one year after it has become an urban water supplier.*¹ JCSD is considered an “urban retail water supplier” because it directly provides water to more than 3,000 customers, and it supplies more than 3,000 acre-feet of water annually. The District is not a “wholesale” water supplier. Therefore, the tables and information provided in the UWMP follow the requirements for “retail” water suppliers. A checklist to ensure compliance of this Plan with the UWMP Act requirements is provided in **Appendix A**.

Public Water Systems (PWSs) are the systems that provide drinking water for human consumption. These are regulated by the State Water Resources Control Board (SWRCB), Division of Drinking Water. The PWS name and number, the total number of connections, and volume of water supplied by the District as of December 31, 2015 is shown in **Table 2-1**. DWR guidelines require the water use and planning data for the entire year of 2015, and because JCSD reports on a calendar year (CY) basis, data included in this UWMP is through December 31, 2015.

| Table 2-1 Retail Only: Public Water Systems | | | |
|--|------------------------------------|--------------------------------------|-------------------------------|
| Public Water System Number | Public Water System Name | Number of Municipal Connections 2015 | Volume of Water Supplied 2015 |
| CA3310021 | Jurupa Community Services District | 29,669 | 21,645 |
| Sources: JCSD Finance Dept. & Annual Report. Includes non-potable. CY data, volume in acre-feet. | | | |

During CY 2015, JCSD delivered 21,106 acre-feet (AF)² of potable water and 539 AF of non-potable water to 29,669 meters for a total of 21,645 AF (**Table 2-1**).

DWR suggests water suppliers engage in *regional* planning to reduce inefficiencies when many agencies are involved. Although the CWC provides mechanisms for participating in area-wide,

¹ “Person” means any individual, firm, association, organization, partnership, business, trust, corporation, company, public agency, or any agency of such an entity (CWC §10614).

² One acre-foot (AF) equals 43,560 cubic feet or 325,851.43 gallons.

regional, watershed, or basin-wide urban water management planning, JCSD has chosen “Individual Reporting” for its UWMP, as identified in **Table 2-2**.

| Table 2-2: Plan Identification (Select One) | |
|---|--|
| <input checked="" type="checkbox"/> | Individual UWMP |
| <input type="checkbox"/> | Regional UWMP (RUWMP) <i>(checking this triggers the next line to appear)</i> |
| NOTES: <input type="checkbox"/> | |

The District’s basic information for the UWMP is listed in **Table 2-3**: that JCSD is a retailer with the data provided in CY and all units in AF.

| Table 2-3: Agency Identification | |
|---|-----------------------------------|
| Type of Agency (select one or both) | |
| <input type="checkbox"/> | Agency is a wholesaler |
| <input checked="" type="checkbox"/> | Agency is a retailer |
| Fiscal or Calendar Year (select one) | |
| <input checked="" type="checkbox"/> | UWMP Tables Are in Calendar Years |
| <input type="checkbox"/> | UWMP Tables Are in Fiscal Years |
| Units of Measure Used in UWMP (select from Drop down) | |
| Unit | AF |
| NOTES: | |

As required by DWR guidelines for the UWMP, JCSD has notified and solicited input from the following pertinent agencies for preparation of this Plan:

- Chino Basin Desalter Authority
- Chino Basin Watermaster
- City of Eastvale (*required*)
- City of Jurupa Valley (*required*)
- City of Norco
- City of Ontario
- City of Riverside Public Utilities Department
- Corona-Norco Unified School District
- Inland Empire Utilities Agency

- Jurupa Unified School District
- Rubidoux Community Services District
- Santa Ana River Water Company
- Western Municipal Water District

At least 60 days before the public hearing on the Plan, the District is required to notify every city to whom it provides water that JCSD is reviewing and considering changes to the UWMP. JCSD issued a notification letter to the agencies listed above on April 21, 2016 that included the date, time, and location of the public hearing held at JCSD on June 27, 2016. The draft UWMP became publicly available on June 13, 2016, two weeks prior to the public hearing. A hard copy was provided at the front counter in the District office, as well as the JCSD Web site. Copies of the required agency notification letters, proof of public notice in *The Press Enterprise* newspaper, as well as a screenshot of JCSD's Web site where the draft UWMP was available are included in **Appendix B**.

The Chino Desalter Authority (CDA) is a Joint Exercise of Powers Agency³ and water wholesaler that provides potable water to its member agencies. To date, JCSD has not received water supplies from a wholesale agency other than CDA; however the potential for future partnership is discussed in Chapter 6. **Table 2-4** simply identifies Western Municipal Water District (WMWD) and CDA as the water wholesalers in the region and acknowledges that WMWD and CDA have been notified of this Plan.

| Table 2-4 Retail: Water Supplier Information Exchange |
|---|
| The retail supplier has informed the following wholesale supplier(s) of projected water use in accordance with CWC 10631. |
| Wholesale Water Supplier Name <i>(Add additional rows as needed)</i> |
| Western Municipal Water District (WMWD) |
| Chino Desalter Authority (CDA) |

Retail agencies, like JCSD, that may receive a water supply from one (or more) wholesalers, like WMWD, are required to provide their wholesaler with their projected water demand from that source, in five-year increments for 20 years. CWC §10631(j) requires JCSD to include documentation in the UWMP that they have provided WMWD and CDA with their water use projections. **Appendix C** contains documentation that JCSD provided a copy of **Table 4-2**:

³ Often referred to as Joint Powers of Authority, or JPA.

Demands for Potable and Raw Water-Projected, and **Table 6-9**: Water Supplies-Projected to WMWD on May 9, 2016 and to CDA on May 26, 2016. The District has also provided, upon request, its population projections from **Table 3-1** to both WMWD and CDA for their respective UWMPs.

CHAPTER 3: SYSTEM DESCRIPTION

3.1 General Description

JCSD was formed in 1956 for the purpose of providing a sewer system to the community of Jurupa. Water service with JCSD began in 1966 with the consolidation of three mutual water companies: Jurupa Heights Water Company, La Bonita Mutual Water Company, and the Monte Rue Acres Mutual Water Company. Through the years, JCSD's area expanded along with their services, which include the following:

- Treatment, production, and distribution of safe and reliable water;
- Collecting, transporting, and treating residential, commercial, and industrial wastewater;
- Removing graffiti from public areas;
- Administering the street lighting maintenance program;
- Providing parks and recreation programs in the parks service area of the City of Eastvale; and
- Maintaining landscaping in public areas.

JCSD is a public agency with an elected five-person Board of Directors overseeing the five divisions of the service area. The Board of Directors is the legislative governing body for JCSD and is responsible for developing and implementing laws that govern the services provided within the jurisdiction of its community services. Each of the five Board Members is elected to four-year terms by registered voters who reside within the JCSD service territory. To ensure that each area has equal representation, JCSD's service area is divided into five divisions. The Board of Directors conducts public meetings on the 2nd and 4th Monday of each month. The Board President appoints each member to serve on Board Committees.

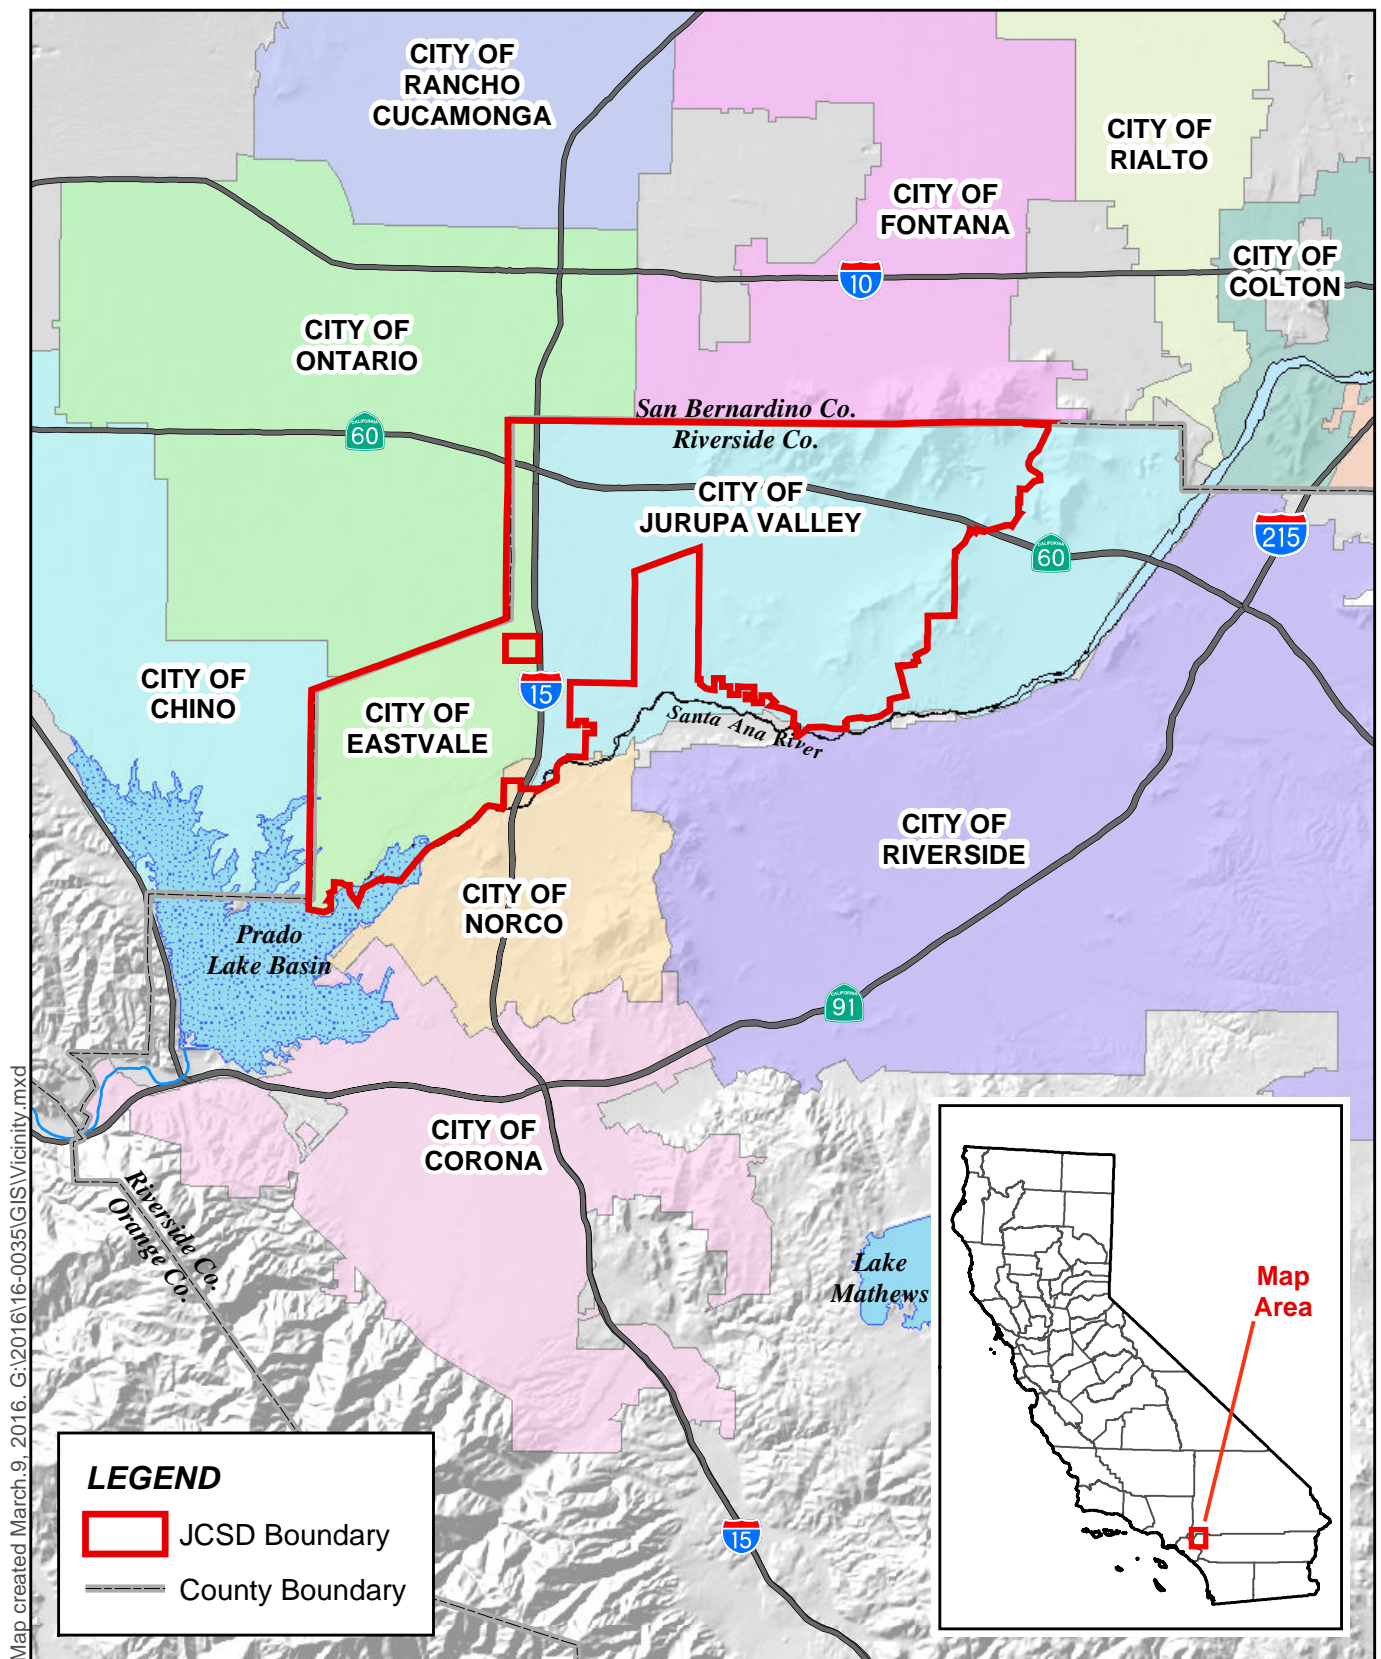

3.2 Service Area Boundary

The JCSD service area covers 40.5 square miles of northwest Riverside County and includes the City of Eastvale and a majority of the City of Jurupa Valley. Refer to **Figure 3-1** for locations of surrounding cities. JCSD's service area is demarcated along the northern and western boundaries by the Riverside/San Bernardino County line, beyond which lie parts of the Cities of Chino, Ontario and Fontana. JCSD is bounded to the east by the City of Jurupa Valley. To the east and south of the Santa Ana River are the City of Riverside and its supplier, Riverside

Public Utilities Agency (RPU). To the south, JCSD is bounded partially by the City of Norco, the Santa Ana River Water Company (SARWC) service area and generally by the Santa Ana River. **Figure 3-2** illustrates the surrounding water providers, including Rubidoux Community Services District (RCSD). Swan Lake Mobile Home Park is included in the District's population estimate since they are a master contract water customer, but not included in the service area acreage. A gap in the service area along the river is served by SARWC, a mutual water company.

Changes to the JCSD service area since the 2010 UWMP include annexation of the "Riverbend" development (Tract 36391) totaling 95 acres, located south of 68th Street, east of Interstate 15, and west of Dana Street (see **Figure 3-3**). There are also two potential annexations to JCSD's service area, including:

- Paradise Knolls: 30 acres (of the total 113 acres) of residential development, with a small area for commercial development, located along Limonite Avenue between Van Buren Boulevard and Etiwanda Avenue.
- Highland Park (Tract 31894): 124 acres (of the total 167 acres) located north of the 60 Freeway and east of Sierra Avenue.

3.3 Service Area Climate

The climate of JCSD's service area within the greater "Chino Basin" valley is generally semi-arid and warm. As shown in **Table 3A**, summers are dry with average temperatures as high as 95 degrees Fahrenheit (°F) and maximum daily temperatures that sometimes exceed 100°F. Winters are somewhat cool with average temperatures as low as 40°F. Average rainfall for the past 14 years (2001-2015) is approximately 8 inches per year, whereas the historical average rainfall data from 1908-1988 was approximately 13 inches per year. Recent rainfall is much lower than in previous years because the region is currently in its fourth year of severe drought (USGS, 2016). The elevations within the JCSD service area range from 368 feet to 2,210 feet above mean sea level.

Table 3A: Climate Data for the JCSD Service Area

| | Jan | Feb | Mar | Apr | May | Jun | Jul ⁴ | Aug | Sep | Oct | Nov | Dec |
|---|------|------|------|------|------|------------------|------------------|------|------|------|------|------|
| Standard Monthly Average ET_o (inches)¹ | 2.8 | 3.3 | 4.8 | 6.0 | 6.8 | 7.7 | 7.6 | 7.2 | 5.4 | 3.8 | 2.4 | 2.2 |
| Average Rainfall (inches)² | 1.3 | 1.9 | 0.8 | 0.6 | 0.2 | 0.0 ³ | 0.2 | 0.1 | 0.2 | 0.5 | 0.8 | 1.8 |
| Average Max. Temperature (°F)² | 70.5 | 69.7 | 74.3 | 75.9 | 81.9 | 88.2 | 93.3 | 95.8 | 94.0 | 84.2 | 76.3 | 68.1 |

¹ ET_o data represents monthly averages from 2012 to 2015 from the JCSD CIMIS station (from JCSD staff).

² Average rainfall and temperature data are reported from 2001 through 2015 the UCR weather station, http://gacc.nifc.gov/oscc/predictive/weather/ucr_data/ucr_climate_files.html.

³ Average monthly values which are rounded; therefore, values reported as zero may not actually be equal to zero.

⁴ Data was missing for the month of July from 2002 through 2006. Thus, the average rainfall and maximum temperature for July includes data from 2001, and 2007 through 2015.

The region's annual average climate data is provided in **Table 3B**. Monthly average ET_o data was collected from JCSD's California Irrigation Management Information System (CIMIS) weather station. This station does not record temperature or average rainfall data. Therefore, standard monthly average rainfall and temperature data was collected from the University of California, Riverside (UCR) CIMIS station (No. 44) and the UCR weather station. These sites were selected as representative of JCSD's service area climate because these were the closest weather and CIMIS stations that had reliable data from within the past 10 years. It was important to use data from recent years because, as stated above, California is currently

experiencing a severe drought. In addition to the drought, temperatures have been higher than usual, with 2014 being California's hottest year on record (NASA, 2015).

Table 3B: Climate Summary for the JCSD Service Area

| | |
|--|-----|
| Total Annual ET_o (inches) | 60 |
| Total Annual Rainfall (inches) | 8.4 |
| Average Max. Temperature (°F)² | 88 |

3.4 Climate Change

Although the CWC does not specifically require the Plan to address climate change, DWR guidelines recommend a discussion of possible effects and an opportunity for water suppliers to outline response actions. The following discussion is guided by the "Climate Change Vulnerability Assessment" provided in the DWR guidelines that comes from the U.S. Environmental Protection Agency (EPA) and DWR document, "Climate Change Handbook for Regional Water Planning" (2011).

Water Demand

- *Are water curtailment efforts effective in your area?*
 - Response: Curtailment measures have been effective in JCSD's service area. As detailed in Chapter 8, JCSD has developed a five-level Water Shortage Contingency Plan. Water production per meter has decreased roughly 18 percent from 2011 to 2015, according to the Annual Reports submitted to the SWRCB.

Water Supply

- *Does a portion of the water supply in your region come from snowmelt?*
 - Response: JCSD primarily relies on groundwater pumped from the Chino Basin. Because snowmelt naturally contributes to groundwater recharge, decreasing snowmelt could indirectly impact JCSD's water supply. However, JCSD is exploring a variety of options to supplement its existing water supply including using recycled water for recharge.
- *Does part of your region rely on water diverted from the Delta, imported from the Colorado River, or imported from other climate-sensitive systems outside your region?*

- Response: JCSD indirectly relied upon imported water from the State Water Project for recharge of the Chino Basin; however, the Chino Basin has not been recharged with imported water from the State Water Project for many years due to drought restrictions. The Chino Basin Watermaster and other agencies have successfully turned to other resources such as storm water, treated municipal wastewater (i.e., recycled water) and conservation measures to accommodate the loss of recharged imported water to the Chino Basin.

Water Quality

- *Are increased wildfires a threat in your region? If so, does your region include reservoirs with fire-susceptible vegetation nearby which could pose a water quality concern from increased erosion?*
 - Response: Increased wildfires are one consequence of climate change, due to decreased rainfall and increasingly dry vegetation. JCSD's primary water source is groundwater from the Chino Basin. Increased erosion due to wildfires would not pose a water quality concern because water percolates into the ground before being withdrawn for treatment and use. The greatest concern related to wildfires is loss of power to the pumping and distribution system; however, JCSD has developed an Emergency Response Plan to prepare for system impacts resulting from wildfires, earthquakes, and other threats (discussed further in Chapter 8).

Ecosystem and Habitat Vulnerability

- *Do climate-sensitive fauna or flora populations live in your region?*
 - Response: The flora and fauna in JCSD's service area are adapted to a Mediterranean climate, with a mild winter and a hot, dry summer. However, climate change is expected to increase the occurrence of drought and higher temperatures, which could reasonably be expected to negatively impact flora and fauna residing in the area.

Hydropower

- *Are energy needs in your region expected to increase in the future? If so, are there future plans for hydropower generation facilities or conditions for hydropower generation in your region?*
 - Response: Energy needs are expected to increase as the population of JCSD's service area increases. However, the arid climate of JCSD's service area generally makes hydropower infeasible in this area.

3.5 Service Area Population and Demographics

The population in the District's service area consists of the cities of Jurupa Valley and Eastvale. All of the City of Eastvale and approximately 70 percent of the City of Jurupa Valley are within the District's service area. The DWR Population Tool was used to generate the current and projected population estimates shown in **Table 3-1**. The DWR Population Tool output results are included in **Appendix D**, which is required for inclusion in this Plan per DWR guidelines. The Tool uses U.S. Census year data (1990, 2000, 2010) with the number of residential meters (combined single-family and multi-family residential) from the JCSD Annual Reports to the SWRCB to calculate a Persons-Per-Connection ratio. To calculate the 2015 population for JCSD, the total number of residential connections for 2015 is entered (28,462 meters) and the Tool multiplies that by a person-per-connection ratio of 4.18 (with 6 digits). This generates a population of 119,034 people within the District for CY 2015. For comparison, in 2014, the JCSD Board of Directors adopted an official District population of 118,731. The 2015 population estimate generated by the Tool is therefore considered a reasonable estimate.

| Table 3-1 Retail: Population - Current and Projected | | | | | | |
|--|---------|---------|---------|---------|---------|-----------|
| Population Served | 2015 | 2020 | 2025 | 2030 | 2035 | 2040(opt) |
| | 119,034 | 127,004 | 134,974 | 142,944 | 150,914 | 157,290 |
| NOTES: From DWR Population Tool. Projections from JCSD data. | | | | | | |

The District's population projections shown in **Table 3-1** are based on information from the JCSD Development Status and Water Demands Map and Tables (WEBB(a), updated June 2015). The methodology consists of adding the number of residential dwelling units proposed by future projects with the number of dwelling units for vacant properties that are identified as future residential by the General Plan's Land Use Plan. This gives 9,155 future residential

dwelling units (single-family and multifamily combined), which is multiplied by the 2015 persons-per-connection ratio of 4.18 for a possible future addition of 38,268 people. This was divided by the number of years until build-out (24) for an approximate annual increase of 1,594 residents.

Table 3-1 gives the projections as described. By build-out in 2039, this method estimates a District population of 157,290 persons.¹

The City of Eastvale makes up 30 percent of the JCSD service area, and the entirety of Eastvale is within the boundary of JCSD. A recently incorporated City (2010), with relatively new housing, infrastructure, and residents, Eastvale is nearly built-out. Most notably, Eastvale's median household income (MHI) of approximately \$110,000 is in the 92nd percentile for the state.² Eastvale is a wealthy, modern, dense, and diverse City of approximately 59,039 people (as of July 1, 2015).

The City of Jurupa Valley also recently incorporated in 2011 but contains a population 71 percent greater than Eastvale, with roughly half the MHI.³ Approximately 58 percent of Jurupa Valley's population of roughly 100,314 people (as of July 1, 2015) is within the District's service area.⁴ As of 2014, the MHI was reported by the City of Jurupa Valley as \$53,215. The City has potential for significant growth and redevelopment in all urban land use types.

The current (as of March, 2016) development status of properties in the District is shown in **Figure 3-4**. The active properties are identified as either residential or non-residential (i.e., commercial or industrial) based on the current development plans, and their development status is classified as either "Availability Letter", "Plan Check", or "Under Construction". The vacant properties not in the development process were identified using GIS spatial analysis⁵ and verified against 2014 aerial imagery. As of June 1, 2015, there are approximately 331 acres of residential land uses actively proceeding through the development process and 600 acres under construction. In addition, approximately 1,821 acres of inactive residential-designated properties within the District boundaries (i.e., expired availability letter or undeveloped land) (**Figure 3-4**).

¹ The District projects build-out by 2039. Therefore the projected population for 2039 is shown in Table 3-1 as the population for 2040.

² Source: U.S. Census data, Median household income (in 2014 dollars), 2010-2014

³ Source: U.S. Census QuickFacts, July 1, 2014

⁴ Source: U.S. Census data, "American Fact Finder" as of July 1, 2015.

⁵ Parcels were filtered by structure values less than or equal to \$10,000 per the latest Riverside County Assessors Database.

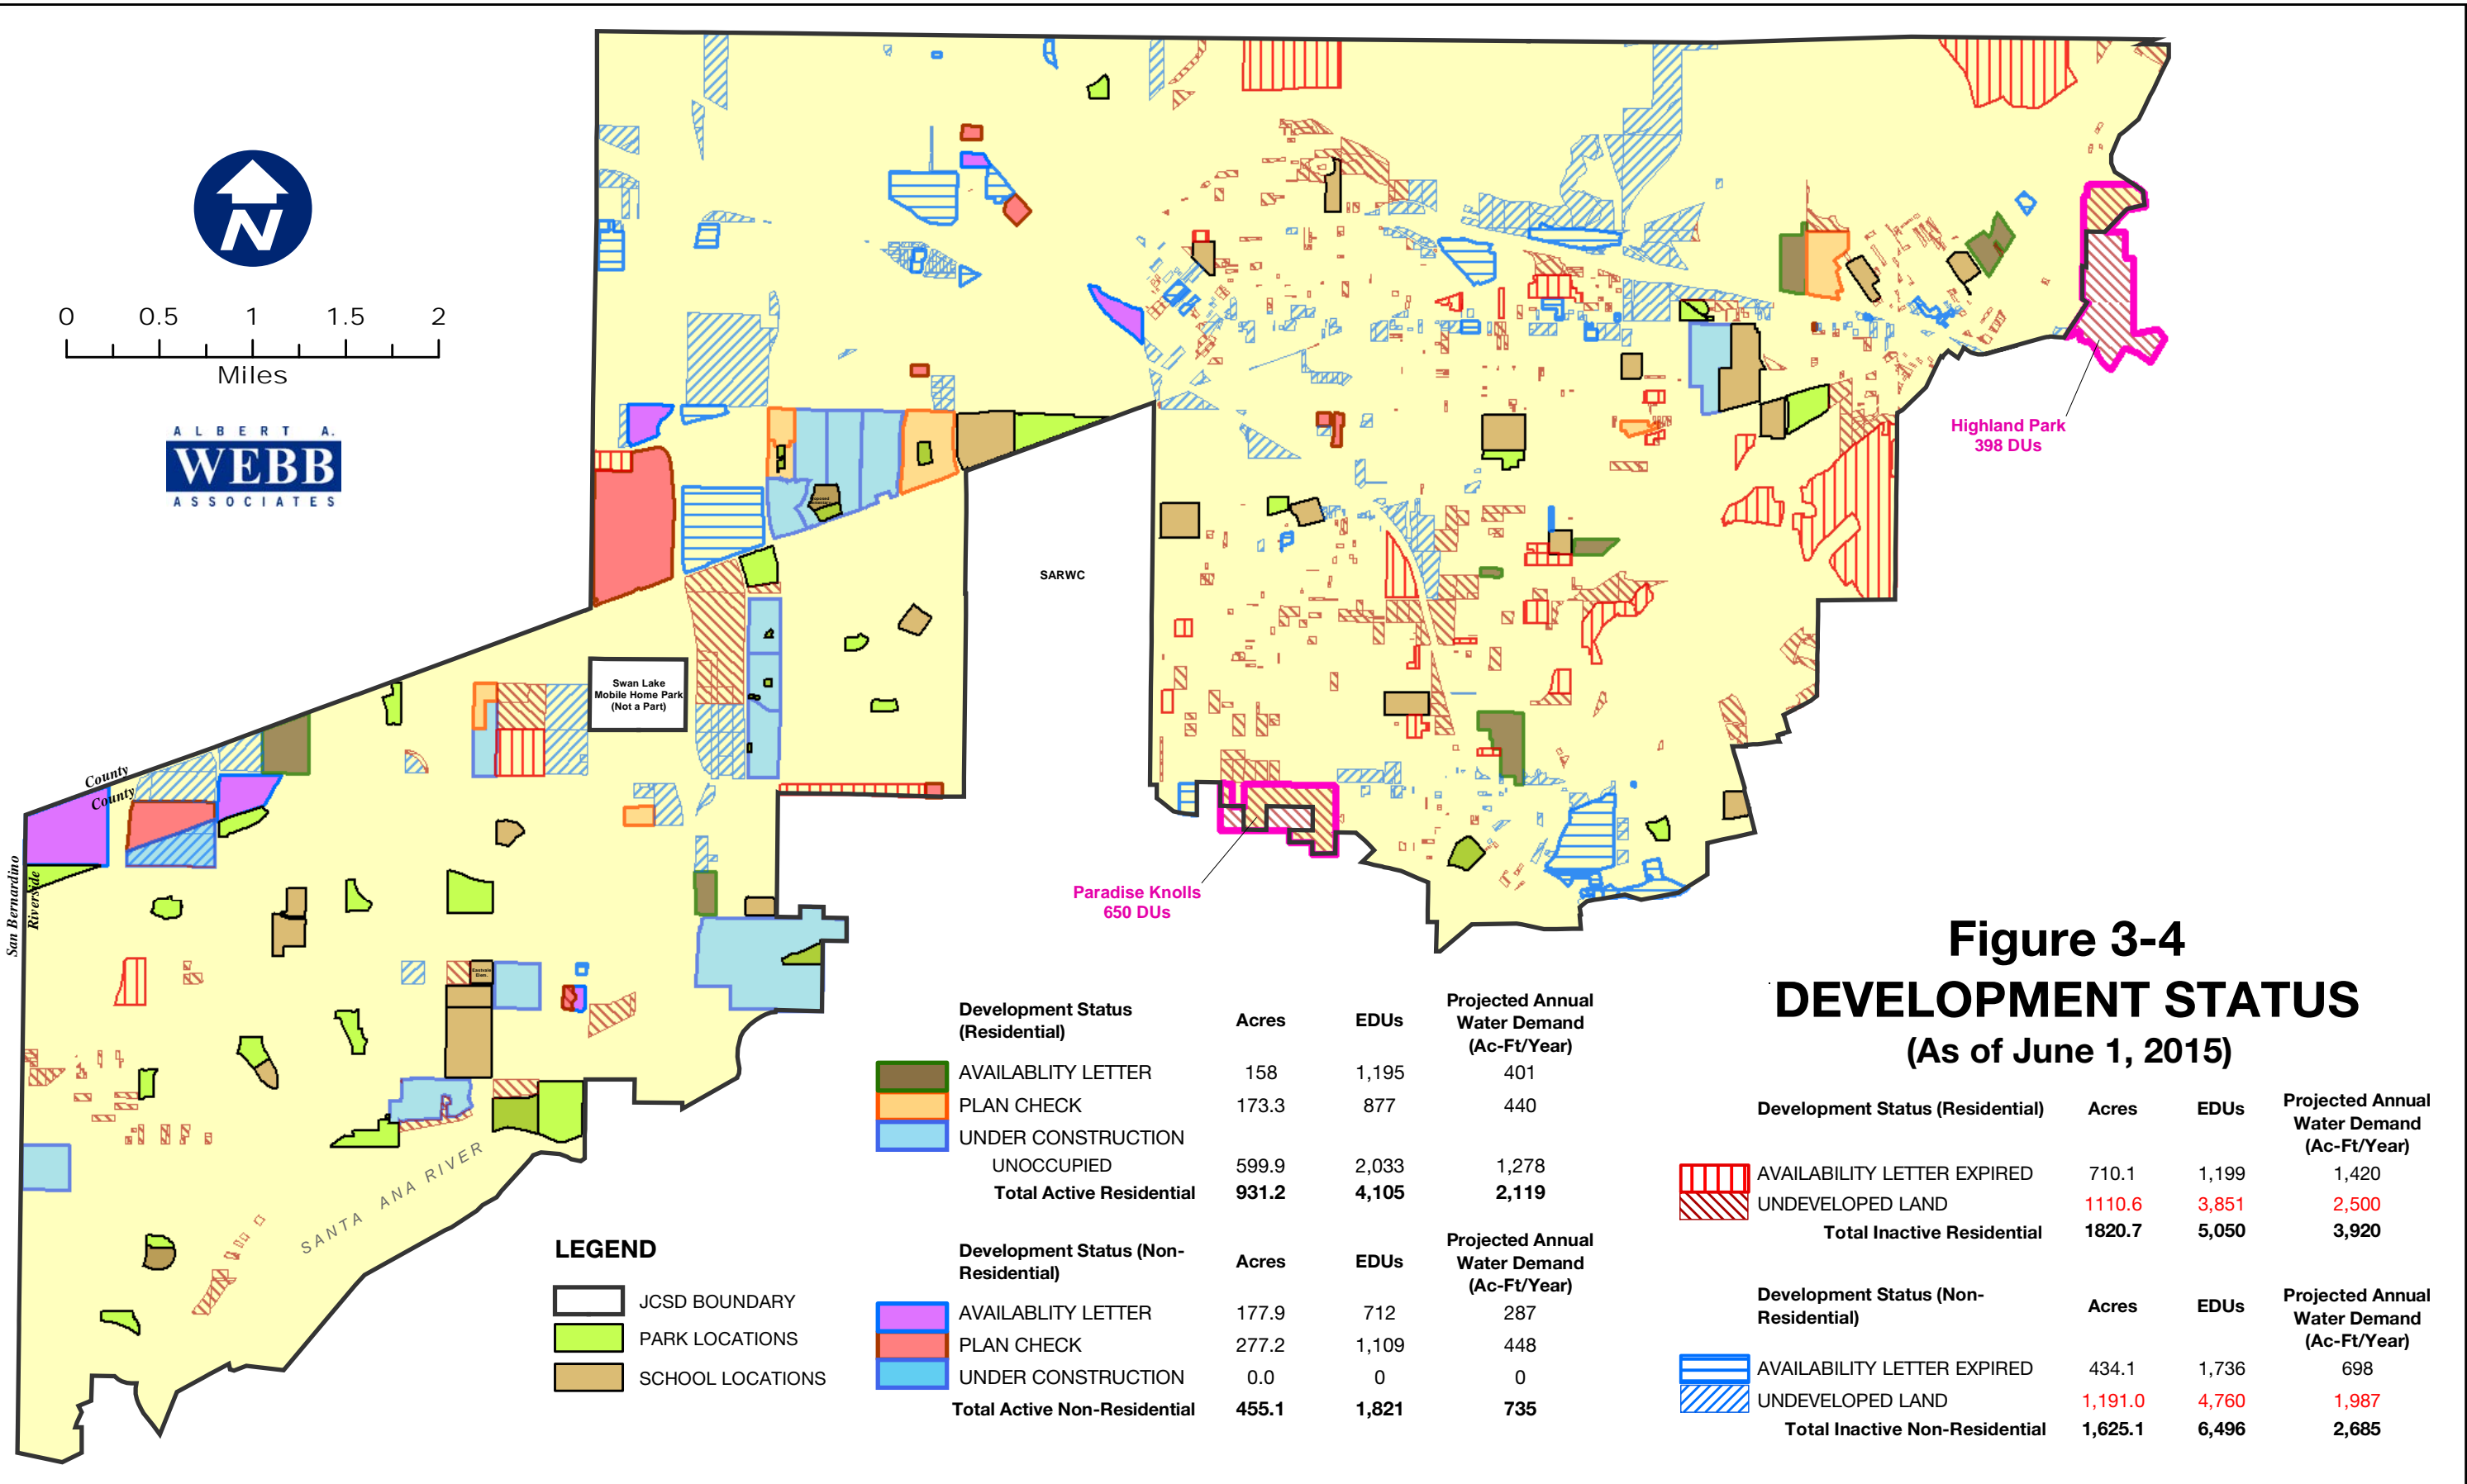

In addition, approximately 455 acres of active commercial and/or industrial land uses in the development process, and no projects under construction. Approximately 1,625 acres of inactive non-residential land uses appear to be within the District (i.e. expired availability letter or undeveloped land, **Figure 3-4**).

U.S. Census data is gathered at three levels of precision: at the broadest level for unincorporated areas is the Census Designated Place (CDP), followed by Census Tracts that are made up of Block Groups. According to U.S. Census data collected from 2009 to 2013 by the Water Management Planning Tool⁶ at DWR, some Community Tracts and Block Groups within the JCSD service area qualify as “disadvantaged”. California Code of Regulations Section 596.1(b)(2) defines a “disadvantaged community (DAC)” as: “A community with an annual median household income (MHI) that is less than 80 percent of the statewide annual MHI.” The statewide MHI according to the 2009-2013 Census data is \$61,094, and 80 percent of that is the DAC threshold of \$48,875.

The Census Block Groups that qualify as “disadvantaged” and “severely disadvantaged”⁷ are shown in **Figure 3-5**. The information contained in Figure 3-5 is taken directly from the DWR Web site, “Disadvantaged Communities (DAC) Mapping Tool,” which is a reference to assist local agencies to evaluate DAC status, using the definition provided by Proposition 84 Guidelines. Having areas that qualify as a DAC opens the District to the possibility of applying for State grant funding to assist with the implementation, planning, and disadvantaged community involvement efforts through Proposition 1 (Water Quality, Supply, and Infrastructure Improvement Act of 2014), and potentially grant funding through Proposition 84, Chapter 2 (Integrated Regional Water Management). In the event JCSD proceeds with either grant application process, additional research per the grant requirements may be necessary.

⁶ Source: *U.S. Census American Community Survey (ACS) 5-Year Data: 2009-2013* (with a median household income (MHI) of \$61,094 and hence a calculated disadvantaged communities (DAC) threshold of \$48,875) located at the DWR Water Management Planning Tool, <https://gis.water.ca.gov/app/boundaries/>

⁷ “Severely” disadvantaged communities have an annual median household income less than 60 percent of the State’s annual median household income, or \$36,656 according to the ACS data shown here.

CHAPTER 4: SYSTEM WATER USE

This chapter describes and quantifies the District's current water use¹ and water use projections through the year 2040, to the extent information is available. Impacts to water use from climate change are discussed in Chapter 3 and recycled water is discussed separately in Chapter 6.

4.1 Current Use

As of December 31, 2015, JCSD delivered 21,106 AF of potable water and 539 AF of non-potable water for a total of 21,645 AF. The 2010 UWMP estimated a total demand volume of 28,962 AF for CY 2015. As shown in **Table 4-1**, the actual metered water use is divided into sectors including: single-family residential, multi-family residential, commercial (includes governmental/institutional meters and non-billing meters²), industrial facilities, landscape irrigation, non-potable landscape irrigation, hydrants,³ and losses.⁴

| Table 4-1 Retail: Demands for Potable and Raw Water - Actual | | | |
|--|--|---|---------------|
| Use Type <i>(Add additional rows as needed)</i> | 2015 Actual | | |
| <i>Use Drop down list</i> <i>May select each use multiple times</i> <i>These are the only Use Types that will be</i> <i>recognized by the WUEdata online</i> <i>submittal tool</i> | Additional Description <i>(as needed)</i> | Level of Treatment When Delivered <i>Drop down list</i> | Volume |
| Single Family | includes "no-sewer" accounts | Drinking Water | 14,286 |
| Multi-Family | | Drinking Water | 1,236 |
| Commercial | includes governmental/institutional and "non-billing EDUs" for commercial landscape irrigation | Drinking Water | 2,185 |
| Industrial | | Drinking Water | 653 |
| Landscape | | Drinking Water | 2,141 |
| Landscape | non-potable | Raw Water | 539 |
| Other | hydrants | Drinking Water | 605 |
| Losses | production minus consumption | Raw Water | 307 |
| Losses | production minus consumption | Drinking Water | 429 |
| TOTAL | | | 22,381 |
| NOTES: CY 2015. Units in acre-feet (AF). Source: 2015 JCSD Annual Report Table 6b. | | | |

¹ For purposes of the UWMP, the terms "water use" and "water demand" will be used interchangeably.

² At some commercial sites, the District has installed sub-metering to track landscape irrigation separately.

³ Fire hydrants are used for fire suppression and to supply water for dust control and construction.

⁴ Losses in Table 4-1 are calculated as the difference between production volumes and consumption volumes for both potable and non-potable water, from the PWSS/Annual Reports submitted to the State.

The non-potable irrigation demand is satisfied with non-potable well water and is listed separately in the District's Annual Reports to the Drinking Water Program. The system loss that is shown in **Table 4-1** is calculated by subtracting metered deliveries from total production sources for both potable and non-potable sources. The District's distribution system also includes a meter to track pass-through water delivered to the Santa Ana River Water Company (SARWC), the City of Ontario, and the City of Norco. This pass-through water comes from the Chino Desalter Authority, which is treated groundwater and is not considered part of JCSD's production volumes and is not billed.

Listed in **Table 4A** is the District's water use by sector from 2011 to 2015. Total water use increased 24 percent from 2011 to 2013; however in response to conservation measures, total water use then decreased 23 percent by 2015. Notably, system losses decreased substantially in response to new meter installations across the entire District.

Table 4A: JCSD Water Use by Sector (AF), 2011-2014

| SECTOR | 2011 | 2012 | 2013 ⁵ | 2014 | 2015 |
|-------------------------------|---------------|---------------|-------------------|---------------|---------------|
| Single-Family Residential | 14,787 | 16,986 | 19,341 | 16,839 | 14,286 |

| Other* | 3,259 | 1,734 | 0 | 1,543 | 605 |
| TOTAL (AF) | 22,193 | 24,089 | 27,508 | 25,366 | 21,106 |
| Losses (calculated)** | 2,126 (9%) | 1,155 (4%) | 125 (0.5%) | 869 (3%) | 736 (4%) |
| Non-Potable Irrigation | 552 | 750 | 0 | 727 | 539 |

Source: JCSD PWSS/Annual Reports 2011-2015.

*Hydrants or construction water may be included in the "other" category.

**Losses are calculated as the difference between production and consumption data from JCSD.

4.2 Projected Use

Estimating future demand, as accurately as possible, allows water agencies to manage their water supply and appropriately plan their infrastructure investments. Factors to consider are current and future land uses, number of occupants or dwelling units, and typical water demand generation factors.

⁵ The reports changed beginning in 2013 from "Public Water System Statistics" reports under the review of DWR, to "Annual Report to the Drinking Water Program" reports under the review of the State Water Resources Control Board (SWRCB).

On March 14, 2016, the JCSD Board of Directors approved new water and sewer capacity charge rate schedules based on a study by Carollo Engineers, Inc. (Carollo, 2016) from which the demand projections included in **Table 4-2** are derived.⁶ The Carollo capacity rate study utilizes information from the JCSD Development Status Map (WEBB(a), 2015), discussed previously in Chapter 3 and shown on Figure 3-4. The WEBB Associates Development Status Map and associated data tables identify the current development status of parcels within JCSD's service area and their associated demand projections. For each parcel, the projected annual water demands are determined using the "Unit Values of Applied Water" from JCSD's draft Summary Master Water Plan (Table 5-1, WEBB(b), 2005).

In summary, after analyzing all potential land uses of undeveloped land, WEBB Associates (June, 2015) projected an increase of 9,460 AFY,⁷ which is a 37 percent increase in water consumption by 2039 (or "build-out"). According to the Carollo study, a 37 percent increase in water demand provides sufficient volume to support 15,753 additional Meter Equivalent Units (MEUs)⁸ to the District. Carollo (March, 2016) estimates JCSD currently has 42,421 MEUs and will have a total of 58,173 MEUs at build-out. For this UWMP, JCSD Finance Department forecasted demand projections from 2015 through 2040 using approximately 58,173 MEUs as its end-point. This produced an annual growth in water use across all sectors of approximately 2 percent, as shown in **Table 4-2**. System losses shown in **Table 4-2** were calculated as 5 percent of the projected potable and non-potable water demands in five year increments provided by JCSD Finance Department data.

⁶ Resolution Nos. 2627 and 2628

⁷ Calculated from a baseline assumption for 2015 water demand of 25,472 AF per year of potable water.

⁸ One MEU is meant to represent a typical, single family residential customer with a 5/8x3/4 inch meter. Larger customers, such as apartment complexes or manufacturing facilities are assigned a higher number of MEUs based on their meter size and flow rates to better represent the capacity ratio of their potential demand on the water system. Every account, existing and future, is assigned a number of MEUs to represent how many typical customers it is equivalent to (Carollo, section 3.1.2, March 2016).

| Table 4-2 Retail: Demands for Potable and Raw Water - Projected | | | | | | |
|--|---|---|---------------|---------------|---------------|---------------|
| Use Type <i>(Add additional rows as needed)</i> | Additional Description <i>(as needed)</i> | Projected Water Use <i>Report To the Extent that Records are Available</i> | | | | |
| <i>Use Drop down list</i> <i>May select each use multiple times</i> <i>These are the only Use Types that will be recognized by the WUEdata online submittal tool</i> | | 2020 | 2025 | 2030 | 2035 | 2040-opt |
| Single Family | | 15,700 | 17,341 | 19,153 | 21,154 | 23,364 |
| Multi-Family | | 1,359 | 1,501 | 1,657 | 1,830 | 2,022 |
| Landscape | potable | 2,353 | 2,599 | 2,870 | 3,170 | 3,502 |
| Other | CII | 3,119 | 3,444 | 3,804 | 4,202 | 4,641 |
| Other | Hydrant (construction) | 665 | 735 | 811 | 896 | 990 |
| Landscape | non-potable (raw water) | 592 | 654 | 722 | 797 | 881 |
| Losses | potable & non-potable combined | 1,189 | 1,314 | 1,451 | 1,602 | 1,770 |
| TOTAL | | 24,977 | 27,588 | 30,468 | 33,651 | 37,170 |

NOTES: Units in AF. Assumes 2% per year growth. Losses are 5% of total demand. Source: JCSD Finance Dept.

The demand projections in **Table 4-3** begin with 2015 actual water use, which is considered by the District as significantly low in response to the ongoing drought and mandatory water conservation efforts. The projections plan for future water demand based on a “normal” or non-drought condition.

Although future water savings (or “Passive Savings”) from codes, standards, ordinances, or transportation and land use plans are not explicitly included in the District’s demand projections, the District has been successful in reducing demand, as discussed in Chapter 9. Total water demand for JCSD beginning with current demand and projected through 2040 is summarized in **Table 4-3**.

| Table 4-3 Retail: Total Water Demands | | | | | | |
|---|---------------|---------------|---------------|---------------|---------------|---------------|
| | 2015 | 2020 | 2025 | 2030 | 2035 | 2040 (opt) |
| Potable and Raw Water <i>From Tables 4-1 and 4-2</i> | 22,381 | 24,977 | 27,588 | 30,468 | 33,651 | 37,170 |
| Recycled Water Demand <i>From Table 6-4</i> | 0 | 500 | 500 | 500 | 500 | 500 |
| TOTAL WATER DEMAND | 22,381 | 25,477 | 28,088 | 30,968 | 34,151 | 37,670 |

NOTES: Includes potable and non-potable water use.

Although the UWMP **Table 4-3** automatically adds the projected recycled water demand to the projected potable and raw water demands, JCSD expects the opposite to occur when recycled

water becomes a part of its supply. Indeed, recycled water is expected to take the place of potable and raw water used for irrigation, and therefore decreasing future demand for them.

4.3 Distribution System Water Losses

Distribution system water losses are the physical water losses from the water distribution system and the supplier's storage facilities, up to the point of customer consumption. In a rough sense, the difference between the water brought into the system and the volume sold to customers. System water losses can occur because of leaking or broken pipes, system flushing, theft, metering inaccuracies, or unbilled authorized and unauthorized consumption. California Senate Bill No. 1420 (SB 1420) requires water utilities that submit UWMPs to calculate annual system water losses using the water audit methodology developed by the American Water Works Association (AWWA). SB 1420 also requires that utilities submit these audits every five years as part of their respective UWMP. To facilitate user-friendly and consistent water auditing practices, AWWA has developed the AWWA Free Water Audit Software, which is based on the principles of the AWWA M36 Water Audit methodology. Per DWR guidelines, utilities must use this software to complete their audit. **Table 4-4** summarizes the total water loss volume for 2015. The complete water loss audit is included in **Appendix E** and summarized below.

| Table 4-4 Retail: 12 Month Water Loss Audit Reporting | |
|--|----------------------|
| Reporting Period Start Date (mm/yyyy) | Volume of Water Loss |
| 01/2015 | 351.4 |
| NOTES: CY 2015. Volume in AF. Source: JCSD Engineering Dept. | |

The water audit performed by JCSD for production and consumption data for CY 2015 considered the water supplied, the water consumed, pipeline system details, and cost data to arrive at a real loss⁹ volume of 351.4 AF per year and a "Water Audit Data Validity Score" of 65 out of 100. The Data Validity Score of 65 puts JCSD's water audit data within "Level III" on a five-level rating scale. This is a composite score that reflects the quality of the data entered into the audit, as determined by the District's self-reported data validity scores for individual fields. The score is a volumetrically-weighted average, in which a lower score reflects less confidence in the accuracy of data, and a higher score reflects greater confidence. DWR provides

⁹ Real Loss is the difference between Water Losses (water supplied minus authorized consumption) and Apparent Losses (sum of unauthorized consumption, customer metering inaccuracies and systematic data handling errors).

suggestions for data improvement for each Level to control water loss in five focus areas, as shown below in **Table 4B**.

Table 4B: Water Loss Control Recommendations

| | Audit Data Collection | Short-Term Loss Control | Long-Term Loss Control | Target-Setting | Benchmarking |
|------------------------------------|--|--|---|---|--|
| Level III (score 51-70) | Establish/revise policies and procedures for data collection | Establish ongoing mechanisms for customer meter accuracy testing, active leakage control and infrastructure monitoring | Begin to assemble economic business case for long-term needs based upon improved data becoming available through the water audit process. | Establish long-term apparent and real loss reduction goals (+10 year horizon) | Preliminary Comparisons – can begin to rely upon the Infrastructure Leaking Index (ILI) for performance comparisons for real losses. |

According to the District's production and consumption data in 2015, it had a system loss of 351.4 AF, or 1.6 percent of production, which is considered very low by industry standards. In the 2010 UWMP, JCSD reported a system loss of 10 percent and was in the process of assessing its water losses. Since then, the District has replaced all of its meters and significantly improved system efficiency.

4.4 Water Use for Lower Income Households

California Senate Bill No. 1087 (SB 1087) requires the water use projections of an UWMP to include the water demands for affordable housing as identified in the housing element of any city, county, or city and county in the service area of the supplier. SB 1087 builds on an existing statutory priority for providing water and sewer services to affordable housing developments. JCSD will not deny nor condition approval of water services, or reduce the amount of services applied for by a proposed development that includes housing units affordable to low-income households.

The City of Eastvale's General Plan Housing Element (June, 2013) identifies a housing need of **624** low-income¹⁰ units (a combination of extremely low-, very low-, and low-income categories) for the 2013-2021 planning period.¹¹

¹⁰ Low-Income is defined the same as "disadvantaged community", which is defined by CCR §596.1(b)(2) as "an annual median household income that is less than 80 percent of the statewide annual median household income."

Although the City of Jurupa Valley does not yet have an adopted Housing Element, the Southern California Association of Governments (SCAG) has identified the regional housing needs allocation (RHNA) for the city of 684 low-income units (a combination of very low-income and low-income categories) in the 5th Cycle Regional Housing Needs Assessment Final Allocation Plan (SCAG, 2012). This is anticipated to be incorporated into their forth-coming General Plan document.

To address the intent of SB 1087, water use during CY 2014 and 2015 from residential meters located in a low-income area (Route 220) of the JCSD service area were compared to water use from residential meters located in a high-income area (Route 420). Although only two years were analyzed, the volumes consumed per meter were nearly the same, as shown in **Table 4C**. This data suggest that residential water consumption in the District, on average, is generally equivalent between income levels. It should be noted that this did not tease-out the influence of any factors such as multi-family residential meters or property size.

Table 4C: Residential Water Use by Income Level, 2014-2015

| | Metered Deliveries (AF) | Residential Meters | Annual Water Use per meter (AF) |
|--------------------------|----------------------------|--------------------|------------------------------------|
| Low-Income Route | | | |
| 2014 | 797 | 1,474 | 0.54 |
| 2015 | 703 | 1,482 | 0.47 |
| High-Income Route | | | |
| 2014 | 2,350 | 4,051 | 0.58 |
| 2015 | 1,979 | 4,260 | 0.46 |

Source: JCSD data.

The District's water use projections are based on a build-out land use scenario that incorporates the existing and planned housing needs that are required of each city in its service area. The planned housing needs are developed under the edict of the State Department of Housing and Community Development who then directs the Southern California Association of Governments (SCAG) to allocate each jurisdiction its share. The District also does not deny services or otherwise discriminate against affordable housing projects simply because they are for low-income residents. The demand projections included herein that were prepared by JCSD include the projected water demands for future low-income housing by virtue of accounting for land use

¹¹ This is based on the 5th Cycle Regional Housing Needs Allocation (January 2014-October 2021 planning period) generated by the State Department of Housing and Community Development to allocate the regional housing need to the SCAG (SCAG RTP, 2012).

designations from approved Housing Elements.¹² Therefore, the required verification to answer “yes” in **Table 4-5** is provided in **Table 4D**.

Although future water savings (or “Passive Savings”) from codes, standards, ordinances, or transportation and land use plans are not explicitly included in the District’s demand projections, the District has been successful in reducing demand, as discussed in Chapter 9.

| Table 4-5 Retail Only: Inclusion in Water Use Projections | |
|---|-----|
| Are Future Water Savings Included in Projections? (Refer to Appendix K of UWMP Guidebook) <i>Drop down list (y/n)</i> | No |
| If "Yes" to above, state the section or page number, in the cell to the right, where citations of the codes, ordinances, etc... utilized in demand projections are found. | |
| Are Lower Income Residential Demands Included In Projections? <i>Drop down list (y/n)</i> | Yes |
| NOTES: Assumed 0.5 AF/meter/year for low-income water use based on actual data. | |

Assuming an average annual water demand of 0.5 AF per connection based on the findings in **Table 4C**, the projected low-income water use shown in **Table 4D** is accounted for in the District’s water demand projections for single-family residential.

Table 4D: Projected Low-Income Water Use (AF)

| City | Projected Low-Income Housing Units | Average Annual Water Use (AF) per Meter | Projected Low-Income Water Use (AF) |

¹² In the case of Jurupa Valley, the County of Riverside General Plan land use plan is used until the City of Jurupa Valley adopts its own General Plan.

CHAPTER 5: SB X7-7 BASELINES AND TARGETS

With the adoption of the Water Conservation Act of 2009, also known as the SB X7-7, the State is required to set a goal of reducing per capita urban water use by 20 percent by the year 2020. Each retail urban water supplier must determine baseline water use during their baseline period and also target water use for the years 2015 and 2020 in order to help the State achieve the 20 percent reduction. In this UWMP, JCSD must demonstrate compliance with their Interim Water Use Target for the year 2015 to determine if they are on-track to achieve the 2020 target. Compliance is verified by DWR reviewing the SB X7-7 Verification Forms submitted with this UWMP (the complete set of SB X7-7 tables is provided in **Appendix F**). Tables from the SB X7-7 Verification Forms that are shown below differ from the UWMP tables in the rest of this Plan as they are colored green and brown and begin with the title “SB X7-7 Table ...”

In the 2010 UWMP, the District calculated water use targets using the best available census data at the time, which was the 2000 U.S. Census. DWR requires use of the 2010 U.S. Census data; therefore the baseline and targets were updated and recalculated as part of this UWMP.

On May 9, 2016, Governor Brown issued Executive Order B-37-16,¹ which directs DWR to publish a draft framework by January 10, 2017 to develop new water use targets as part of a permanent framework for urban water agencies. The Executive Order states:

These water use targets shall be customized to the unique conditions of each water agency, shall generate more statewide water conservation than existing requirements, and shall be based on strengthened standards for: (a) indoor residential per capita water use; (b) outdoor irrigation, in a manner that incorporates landscape area, local climate, and new satellite imagery data; (c) commercial, industrial, and institutional water use; and (d) water lost through leaks.

JCSD will review the new regulations when they become available and revise the water conservation targets described herein as needed.

¹ https://www.gov.ca.gov/docs/5.9.16_Executive_Order.pdf

5.1 Updating Calculations from 2010 UWMP

As allowed by the California Water Code (CWC) and explained in DWR guidelines, water agencies may update their 2020 Target using a different Target Method and/or revising population estimates for the baseline years. JCSD used Target Method 1 in their 2010 Plan, and will continue to use Target Method 1 in their 2015 Plan. Revised population estimates used to calculate the Targets and Baselines are derived from DWR's Population Tool provided in **Appendix D**. The calculation methodology for Target Method 1 is detailed in **Appendix F** and summarized below.

5.2 Baseline Periods

According to the CWC, water suppliers who used less than 10 percent recycled water in 2008 must use a 10-year baseline period for water use and calculate the average water use, in Gallons Per Capita per Day (GPCD),² over that length of time. JCSD has yet to use recycled water and will therefore continue using a 10-year baseline period beginning in 1999 and ending in 2008, as identified in the 2010 UWMP.

Water suppliers must also calculate water use, in GPCD, for a 5-year baseline period, which is used to confirm that the selected 2020 target meets the minimum water use reduction requirements. In other words, the 10-year baseline can be considered the "Baseline GPCD" and the 5-year baseline as the "Target Confirmation". The District selected in their 2010 Plan a 5-year base period beginning in 2003 and ending in 2007 as shown in SB X7-7 **Table 1**.

² Two terms are often used interchangeably; Daily per Capita Water Use and Gallons per Capita per Day (GPCD). Daily per Capita Water Use is the amount of water used per person per day. In the UWMP, this is total water use within a service area, divided by population and is measured in gallons. GPCD is Daily per Capita Water Use measured in gallons. These are different from R-GPCD, which is solely the residential water use divided by population, and is used in drought reporting to the SWRCB.

| SB X7-7 Table-1: Baseline Period Ranges | | | |
|---|--|--------|-----------|
| Baseline | Parameter | Value | Units |
| 10- to 15-year baseline period | 2008 total water deliveries | 24,279 | Acre Feet |
| | 2008 total volume of delivered recycled water | 0 | Acre Feet |
| | 2008 recycled water as a percent of total deliveries | 0.00% | Percent |
| | Number of years in baseline period ¹ | 10 | Years |
| | Year beginning baseline period range | 1999 | |
| | Year ending baseline period range ² | 2008 | |
| 5-year baseline period | Number of years in baseline period | 5 | Years |
| | Year beginning baseline period range | 2003 | |
| | Year ending baseline period range ³ | 2007 | |
| ¹ If the 2008 recycled water percent is less than 10 percent, then the first baseline period is a continuous 10-year period. If the amount of recycled | | | |
| ² The ending year must be between December 31, 2004 and December 31, 2010. | | | |
| ³ The ending year must be between December 31, 2007 and December 31, 2010. | | | |
| NOTES: Source: PWSS Reports. | | | |

5.3 Service Area Population

In order to correctly calculate annual GPCD, agencies must determine the population that they served for each baseline year in both of the baseline periods and for the 2015 compliance year. The Population Tool utilizes U.S. Census year (i.e., 1990, 2000, and 2010) population data and electronic boundary maps of the JCSD service area for each census year (developed by WEBB) to obtain population numbers for census years. Using the number of residential meters (single-family and multifamily residential combined) from the District's annual Public Water System Statistics (PWSS) reports or Annual Reports to the SWRCB, the tool calculates the population for the non-census years as shown in **SB X7-7 Table 3**.

| SB X7-7 Table 3: Service Area Population | | |
|--|------|------------|
| Year | | Population |
| 10 to 15 Year Baseline Population | | |
| Year 1 | 1999 | 49,914 |
| Year 2 | 2000 | 50,489 |
| Year 3 | 2001 | 54,844 |
| Year 4 | 2002 | 63,142 |
| Year 5 | 2003 | 70,484 |
| Year 6 | 2004 | 82,893 |
| Year 7 | 2005 | 90,315 |
| Year 8 | 2006 | 97,688 |
| Year 9 | 2007 | 101,693 |
| Year 10 | 2008 | 103,270 |
| 5 Year Baseline Population | | |
| Year 1 | 2003 | 70,484 |
| Year 2 | 2004 | 82,893 |
| Year 3 | 2005 | 90,315 |
| Year 4 | 2006 | 97,688 |
| Year 5 | 2007 | 101,693 |
| 2015 Compliance Year Population | | |
| 2015 | | 119,034 |
| NOTES: From Population Tool. | | |

The DWR Population Tool (**Appendix D**) generated population numbers that are close to the District's expected population in all years. In particular, the 2015 Compliance Year Population of 119,034 is on-par with the official District 2014 population of 118,731 persons described in Chapter 3. Therefore the Tool is used herein for measuring SB X7-7 compliance.

5.4 Gross Water Use

Gross water use is a measure of water that enters the distribution system of the supplier over a 12-month period (calendar year) with certain allowable exclusions. These exclusions are:

- Recycled water delivered within the service area;
- Indirect recycled water;
- Water placed into long term storage (surface or groundwater);
- Water conveyed to another urban supplier;
- Water delivered for agricultural use; or
- Process water.

None of the water brought into JCSD's system is used for any of the purposes listed above; one exception is "water conveyed to another supplier" because JCSD does meter pass-through water from the Chino Desalter Authority through its system to Santa Ana River Water Company and the Cities of Norco and Ontario. However, the District does not include this water in its supply source volumes nor does it include it in consumption volumes or billing numbers. Therefore, JCSD does not qualify for the exclusions to its gross water use for SB X7-7 compliance.

Gross water use is reported for each year in the baseline periods as well as 2015, the compliance year. Two versions of **SB X7-7 Table 4-A** are shown below for the District's water sources: one for JCSD's own wells (i.e., "The supplier's own water source"), and the other for water purchased from other sources (i.e., "A purchased or imported source"). This data is kept by JCSD in order to track recorded well production and purchased water (described in Chapter 6).

Annual gross water use is then the sum of the two water sources (**SB X7-7 Table 4-A** on the right and **SB X7-7 Table 4-A** on the left) for each year.

As shown in **SB X7-7 Table 4** below, and **Appendix F**, the 10-year baseline average gross water use from 1999 to 2008 is 21,689 AF. Likewise, the 5-year baseline average gross water use is 24,065 AF and the 2015 compliance year gross water use is 22,381 AF.³ This includes both sources of water to the District; pumping from its own wells (potable and non-potable), and purchases from other sources described in Chapter 6.

³ Indeed, this volume of water into the distribution system differs from the volume of water supplied shown in **Table 2-1** by approximately 736 AF. This can be explained in-part by system water loss.

| SB X7-7 Table 4: Annual Gross Water Use * | | | |
|---|---|--|-----------------------------------|
| | Baseline Year <i>Fm SB X7-7 Table 3</i> | Volume Into Distribution System <i>Fm SB X7-7 Table(s) 4-A</i> | Annual Gross Water Use |

| NOTES: Volume in AF from PWSS/Annual Reports | | | |

5.5 Baseline Daily per Capita Water Use

To obtain the GPCD, divide the yearly gross water use by the service area population. As shown on **SB X7-7 Table 5**, the 10-year Average Baseline GPCD is 260 and the 5-year Average Baseline GPCD is 242. The 2015 Compliance Year GPCD of 168 is calculated in the same manner as the 5- and 10-year periods using the total population and total volume of water into the system.

5.6 2015 and 2020 Targets

Each water supplier has four different methods to choose from when determining the 2020 Urban Water Use Target; they are:

- Method 1: *80 Percent of 10-Year Baseline GPCD;*
- Method 2: *Efficiency Standards (Indoor Residential Use, Landscaped Area Water Use and Baseline CII Water Use);*
- Method 3: *95 Percent of Hydrologic Regional Target from the 20x2020 Water Conservation Plan, State of California Agency Team, 2010; and*
- Method 4: *Savings by Water Sector.*

According to DWR, Method 1 is the most common while Methods 2 and 4 are the least commonly-used. JCSD chose Method 1 in their 2010 Plan and will continue for this 2015 Plan, as shown in **SB X7-7 Table 7**.

| SB X7-7 Table 7: 2020 Target Method | | |
|-------------------------------------|----------|--|
| Target Method | | Supporting Documentation |
| <input checked="" type="checkbox"/> | Method 1 | SB X7-7 Table 7A |
| <input type="checkbox"/> | Method 2 | SB X7-7 Tables 7B, 7C, and 7D <i>Contact DWR for these tables</i> |
| <input type="checkbox"/> | Method 3 | SB X7-7 Table 7-E |
| <input type="checkbox"/> | Method 4 | Method 4 Calculator |
| NOTES: | | |

SB X7-7 Table 7-A is required by retail water suppliers that use Target Method 1. The 2020 Target GPCD of 208 is calculated as 80 percent of the 10-year baseline GPCD shown.

| SB X7-7 Table 7-A: Target Method 1 20% Reduction | |
|---|---------------------|
| 10-15 Year Baseline GPCD | 2020 Target GPCD |
| 260 | 208 |
| NOTES: | |

SB X7-7 Table 7-F illustrates the next step in the process to verify that the 2020 Water Use Target calculated above will reduce the District's 2020 water use by a minimum of 5 percent from the 5-year baseline. This confirmation is automatically calculated in **SBX7-7 Table 7-F**.

| SB X7-7 Table 7-F: Confirm Minimum Reduction for 2020 Target | | | |
|--|-------------------------|---|--------------------------|
| 5 Year Baseline GPCD <i>From SB X7-7 Table 5</i> | Maximum 2020 Target* | Calculated 2020 Target <i>Fm Appropriate Target Table</i> | Confirmed 2020 Target |
| 242 | 230 | 208 | 208 |
| * Maximum 2020 Target is 95% of the 5 Year Baseline GPCD | | | |
| NOTES: | | | |

Next, the 2015 Interim Urban Water Use Target is calculated to determine the District's current compliance status as of 2015. The 2015 Interim Target is the value halfway between the 10-year Baseline GPCD of 260 GPCD (from **SB X7-7 Table 5**) and the confirmed 2020 Target of 208 GPCD (**SB X7-7 Table 7**).

As shown in **SB X7-7 Table 8**, JCSD's 2015 Interim Target is 234 GPCD, which was achieved and exceeded based on their 2015 compliance GPCD of 168 as summarized in **Table 5-1**.

| SB X7-7 Table 8: 2015 Interim Target GPCD | | |
|---|--|-----------------------------|
| Confirmed 2020 Target <i>Fm SB X7-7 Table 7-F</i> | 10-15 year Baseline GPCD <i>Fm SB X7-7 Table 5</i> | 2015 Interim Target GPCD |
| 208 | 260 | 234 |
| NOTES: | | |

SB X7-7 Table 9 compares the District's actual 2015 GPCD with the calculated 2015 Interim Target and summarizes that JCSD did achieve their water conservation Target for compliance with SB X7-7.

| SB X7-7 Table 9: 2015 Compliance | | | | | | | | |
|---|-----------------------------|---------------------------------------|--------------------------|------------------------|----------------------|-----------------------|--|-------------------------------------|
| Actual 2015 GPCD | 2015 Interim Target GPCD | Optional Adjustments <i>(in GPCD)</i> | | | | | 2015 GPCD <i>(Adjusted if applicable)</i> | Did Supplier Achieve Targeted |
| | | Extraordinary Events | Weather Normalization | Economic Adjustment | TOTAL Adjustments | Adjusted 2015 GPCD | | |
| 168 | 234 | 0 | 0 | 0 | 0 | 167.8531783 | 167.8531783 | YES |
| NOTES: | | | | | | | | |

JCSD has demonstrated water use reductions above and beyond that which is required by the State's SB X7-7 law. Considering their baseline population growth over the last few years and gross water use, the District must use no more than 208 GPCD as of 2020, and no more than 234 GPCD as of 2015. The District's GPCD for 2015 is 168; therefore, JCSD is well within compliance and certainly projected to meet the water conservation Target for 2020, as summarized in **Table 5-1**.

CHAPTER 6: SYSTEM SUPPLIES

JCSD's potable and non-potable water supply primarily consists of groundwater pumped from the Chino Basin, and is supplemented with water from the Riverside-Arlington (Riverside south) Basin. As one of the largest groundwater basins in southern California, the Chino Basin is adjudicated and pumping activities are closely monitored by the Chino Basin Watermaster. A copy of the 1978 Chino Groundwater Basin Judgment is provided in **Appendix G**. The Riverside Basin is also adjudicated by the 1969 Orange County Judgment,¹ which is provided in **Appendix H**. The Riverside Basin pumping rights are further defined in the 1969 Western-San Bernardino Judgment located in **Appendix I**.²

Groundwater pumped from some parts of the Chino Basin is impaired by nitrates and TDS concentrations in excess of drinking water standards; however, the Chino Desalter Authority (CDA), the Roger D. Teagarden Ion Exchange Facility (JCSD), and the Wells 17/18 Ion Exchange Facility (JCSD) described below are able to treat this impaired water to potable standards. JCSD is actively involved in the expansion of the CDA facilities to further increase water supply to meet future demands. The District's Water Supply Outlook as of June 7, 2016 is provided in **Appendix J**. The Outlook lists the current sources of pumped water supply, which well is treated, their current production rates, operating status, and whether they have a back-up generator.

JCSD does not rely on imported water, surface water, storm water, or recycled water directly to supplement their water supply. However, all of these sources can, and are, being used by other agencies in the Chino Basin, in particular the Chino Basin Watermaster, to recharge the groundwater basin. Thus, it is important to include these activities in a discussion of JCSD's water supply.

¹ Orange County Water District vs. City of Chino, et al., Case No. 117628 (i.e. the Orange County Judgment of April 17, 1969).

² Western Municipal Water District vs. East San Bernardino County Water District, et al., Case No. 78426 (i.e. the Western-San Bernardino Judgement of April 17, 1969) describes the groundwater pumping rights in the Colton, Riverside, and San Bernardino Area and is administered by the two-person Western-San Bernardino Watermaster.

6.1 Purchased or Imported Water

Rubidoux Community Services District

Since 2000, JCSD has purchased water extracted from the Riverside South Groundwater Basin from Rubidoux Community Services District (RCSD, or Rubidoux CSD). In 2014, JCSD finalized an agreement with Rubidoux CSD to allow JCSD to pump potable water from Rubidoux CSD into JCSD's 1110' Pressure Zone via the new Jewel Street Booster Station. In CY 2015, JCSD purchased 2,250 AF from RCSD, and **Table 6A** lists the purchases for the last five years. JCSD assumes future annual purchases of 2,000 AF from RCSD, as shown in **Table 6-9**, which is located at the end of this chapter.

Table 6A: Purchased Riverside Basin Water from RCSD, 2011-2015

|--------------------|-------------|-------------|-------------|-------------|-------------|
| Volume (AF) | 808 | 702 | 774 | 1,062 | 2,250 |

Source: JCSD Water Operations Dept.

Chino Desalter Authority

JCSD also purchases water from the Chino Desalter Authority (CDA) through a "take or pay" contract. JCSD is a member of the CDA, a Joint Powers Authority (JPA) created in 2001, along with Santa Ana River Water Company (SARWC), Inland Empire Utilities Agency (IEUA), Western Municipal Water District (WMWD), and the Cities of Chino, Chino Hills, Ontario, and Norco. The stated goals of the CDA include:

- Achieve hydraulic control of the Chino Basin to prevent contaminated Chino Basin groundwater from entering the Santa Ana River;
- Reduce TDS and removal contaminants, including nitrates, TCE, PCE, and TCP, from groundwater in the southern portion of the Chino Basin; and
- Deliver the treated water to member agencies to offset the need for imported water.

As part of the Watermaster's Optimum Basin Management Plan (OBMP) for the Chino Basin, the member agencies of the JPA decided to extract and treat approximately 40,000 AF per year of groundwater from the southern portion of the Basin, treat it to potable water standards, and

deliver it to the member agencies. CDA treats the groundwater with two desalters,³ known as “Chino I” and “Chino II”. As a member of CDA, JCSD is entitled to 8,200 AF per year from the Chino I and Chino II Desalters. During CY 2015, JCSD purchased 8,616 AF from CDA, and the purchases for the last five years are listed in **Table 6B**. The CDA facilities are currently being expanded to increase treatment capacity by 10,600 AF per year, of which JCSD will receive approximately 3,533 AF per year in addition to the existing contracted amount of 8,200 AF. JCSD assumes future annual purchases of 11,733 AF from CDA beginning in 2017, as shown in **Table 6-9**.

Table 6B: Purchased Water from CDA, 2011-2015

Source: JCSD Water Operations Dept.

Imported Water Supplies

JCSD has no existing imported water supplies. Development of imported water supplies will require a large financial commitment by JCSD to construct the infrastructure necessary to bring imported water to the JCSD service area. Several potential sources of imported water being considered are:

- State Water Project water purchased from The Metropolitan Water District of Southern California (MWD), purchased off a proposed connection on the Etiwanda or Rialto Feeder (would need the participation of IEUA and WMWD at a minimum);
- Western Municipal Water District Mills Pipeline or La Sierra Pipeline project;
- Construction of a water treatment plant off of MWD’s Upper Feeder to treat water delivered from the Colorado River.

Timing and implementation of any future water development projects is dependent on the reliability of the existing groundwater supply, growth in water demand, and the feasibility and

³ Each “desalter” is a water treatment plant that uses both reverse osmosis and ion exchange processes to remove total dissolved solids (TDS) and nitrates.

cost of obtaining future water supplies. JCSD has planned to invest \$500,000 a year up to a maximum of \$30 million to develop an imported water source.⁴

6.2 Groundwater

Water supplied within the JCSD service area is entirely from groundwater production. The largest source of groundwater within JCSD's service area is the Chino Groundwater Basin (Chino Basin, No. 8-2.01),⁵ which supplies all of the District's potable wells, in addition to CDA's wells. A small portion of JCSD's service area overlies the Riverside Groundwater Basin (No. 8-2.03). The location of the groundwater basins within the District's service area are shown in **Figure 6-1**. The actual groundwater volumes pumped by groundwater basin in the last five years is presented in **Table 6-1**.

⁵ DWR collects, summarizes, and evaluates groundwater data in the "Bulletin 118" series, which present the results of basin evaluations and defines the boundaries of California's 515 alluvial groundwater basins. An update was provided in 2003. In Bulletin 118, DWR identifies each basin and subbasin with a number code.

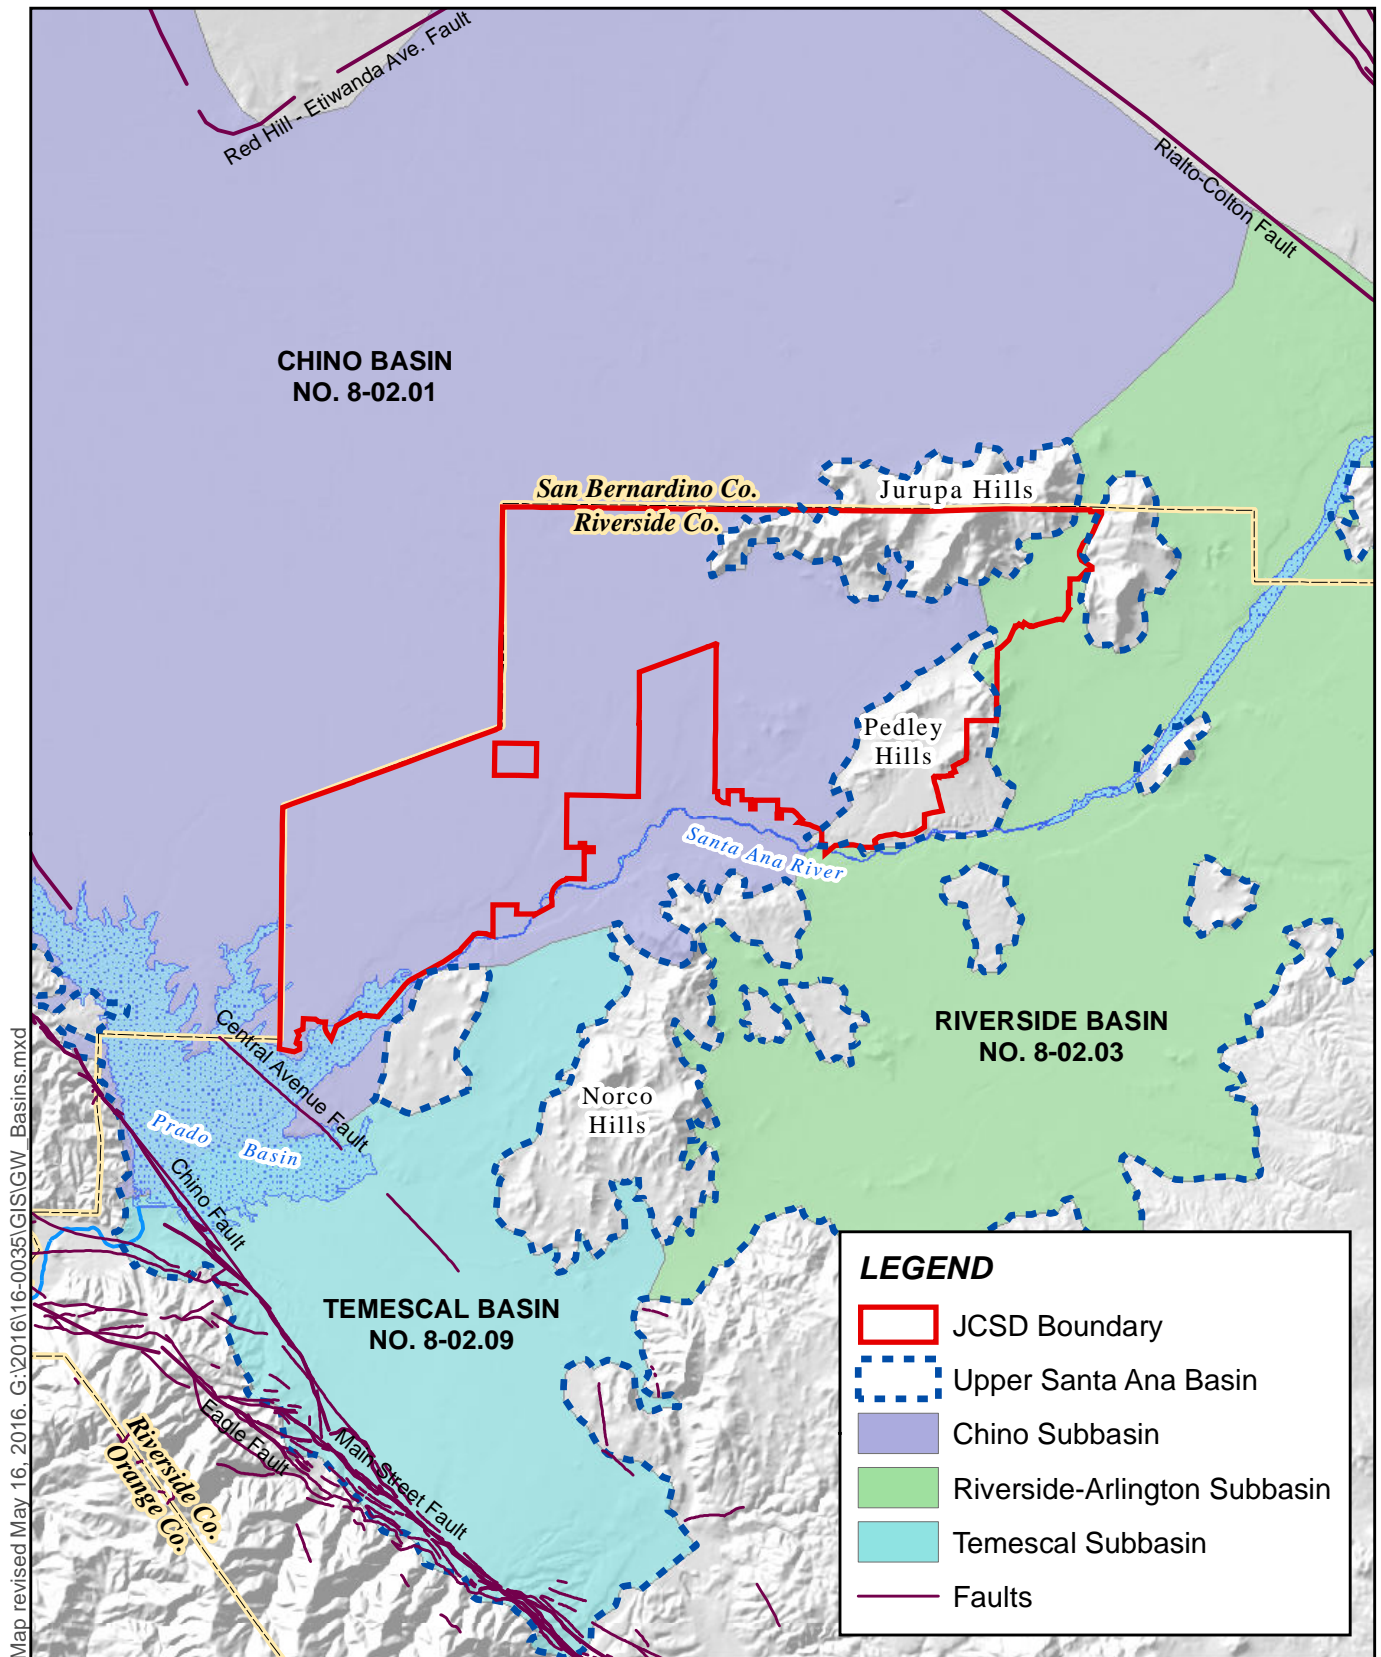

Figure 6-1 – Groundwater Basin Map
JCSD 2015 Urban Water Management Plan

This Page Intentionally Blank

Chino Groundwater Basin – Potable Water

JCSD currently operates 18 potable water wells in the Chino Basin that have a theoretical maximum production rate of 47.6 million gallons per day (MGD or 33,085 gallons per minute, GPM). However, JCSD does not operate its wells at maximum capacity,⁶ but rather they fluctuate on and off as demand changes. During CY 2015, JCSD pumped 8,993 AF from its potable wells. The pumped potable water volumes from the last five years are provided in **Table 6-1**.

The Board of Directors of JCSD authorized the construction of two new wells; Well No. 29 and Well No. 30 that are expected to be operational by 2020 and each contribute an additional 2,500 AF per year. Therefore, by 2020 the District's total maximum day groundwater production capacity will be 54.8 MGD (or 38,000 GPM). Construction of these wells will not only contribute additional supply, but also increase redundancy and replacement capacity.

The District operates two ion-exchange plants to denitrify water from several of their wells. The first is the Roger D. Teagarden Ion Exchange Facility which removes nitrates from seven potable wells. The other plant is the Well 17/18 Ion Exchange Facility that removes nitrates from JCSD Well Nos. 17 and 18.

As part of the planning process developing this UWMP, JCSD has taken the position to assume the future pumped volumes from its potable well field will peak at 14,000 AF per year, beginning in 2030, as shown in **Table 6-9**. This level of production aims to minimize a decline in the groundwater table in the vicinity of JCSD's well field.

Chino Groundwater Basin – Non-Potable Water

JCSD also operates five non-potable wells located in the Chino Groundwater Basin. During CY 2015, JCSD pumped 266 AF from its non-potable Chino Basin wells to serve local park landscape irrigation-only accounts. The pumped non-potable water volumes from the last five years are listed in **Table 6-1**. The District's future non-potable water supply pumped from the Chino Basin is anticipated at 310 AF per year, as shown in **Table 6-9**.

Chino Groundwater Basin (Outside Adjudicated Area) – Non-Potable Water

⁶ 'Maximum capacity' is considered operating wells 24 hours per day every day of the year.

JCSD also pumps non-potable water from the “Van Leeuwen” well, which is located in the Chino Basin; however it is not within the area adjudicated by the 1978 Chino Basin Judgment, nor within the purview of Chino Basin Watermaster. Water from the Van Leeuwen well is non-potable and has been used for irrigation purposes at the Eastvale Community Park located at 12750 Citrus Street in Eastvale. During CY 2015, JCSD pumped 115 AF of non-potable water from the Van Leeuwen well. The pumped volumes from the last five years are listed in **Table 6-1**. JCSD plans for closure of this well in the near future and expects long-term irrigation of the Park will be supplied with recycled water from Western Riverside County Regional Wastewater Authority (WRCRWA) plant.

Riverside Groundwater Basin – Non-Potable Water

In addition to the potable and non-potable wells operated by JCSD within the Chino Basin described above, the District also operates two non-potable wells located in the Riverside Groundwater Basin. Water from these wells is used to irrigate Oak Quarry Golf Club located at 7151 Sierra Avenue in Jurupa Valley. During CY 2015, JCSD pumped 464 AF from its non-potable wells in the Riverside Groundwater Basin. The pumped non-potable water volumes from the last five years are listed in **Table 6-1**. The District’s future non-potable water supply pumped from the Chino Basin is anticipated at 450 AF per year, as shown in **Table 6-9**.

6.2.1 Basin Description

Chino Groundwater Basin

The Chino Groundwater Basin encompasses approximately 240 square miles and is identified in the 2003 Update to the DWR Bulletin 118 as the Chino Subbasin (No. 8.2-01), which is part of the Upper Santa Ana Valley Groundwater Basin (No. 8.2). The Chino Basin is one of the largest groundwater basins in Southern California, with approximately five million AF of water in storage and an unused storage capacity of approximately one million AF. This alluvial groundwater basin formed from the eroded sediments of the San Gabriel Mountains, the Chino Hills, Puente Hills, and the San Bernardino Mountains to fill a structural depression. The water-bearing units in the Chino Basin include the Older Alluvium of Pleistocene and Younger Alluvium of Holocene age. Older Alluvium is exposed mainly in the northern part of the Chino Basin and supplies most of the water to wells. It varies in thickness from about 200 feet thick near the southwestern end of Chino Basin to over 1,100 feet thick southwest of Fontana, and

averages about 500 feet throughout the basin. Pumping capacities of wells completed in the Older Alluvium generally range between 500 and 1,500 gallons per minute (gpm). In the southern part of the basin where sediments tend to be more clayey, wells generally yield 100 to 1,000 gpm. Indeed, wells have been constructed to yield more than 4,000 gpm at favorable locations within the basin (OBMP DYY Modeling Report, 2003).

While still considered a single basin for hydrologic purposes, the Chino Basin can be hydrologically subdivided into at least five flow systems that act as separate and distinct hydrologic units. Each flow system can be considered a management zone (MZ) as shown in **Figure 6-2**. Each management zone has a unique hydrology, and water resource management activities that occur in one management zone have limited impact on the other management zones.

Many parties including farmers, overlying industries, cities, and other water supply entities produce groundwater from the Chino Basin. JCSD has rights to groundwater pumping in the Chino Basin through the adjudication process and by participating in the Chino Desalter Authority.

Chino Basin Water Quality

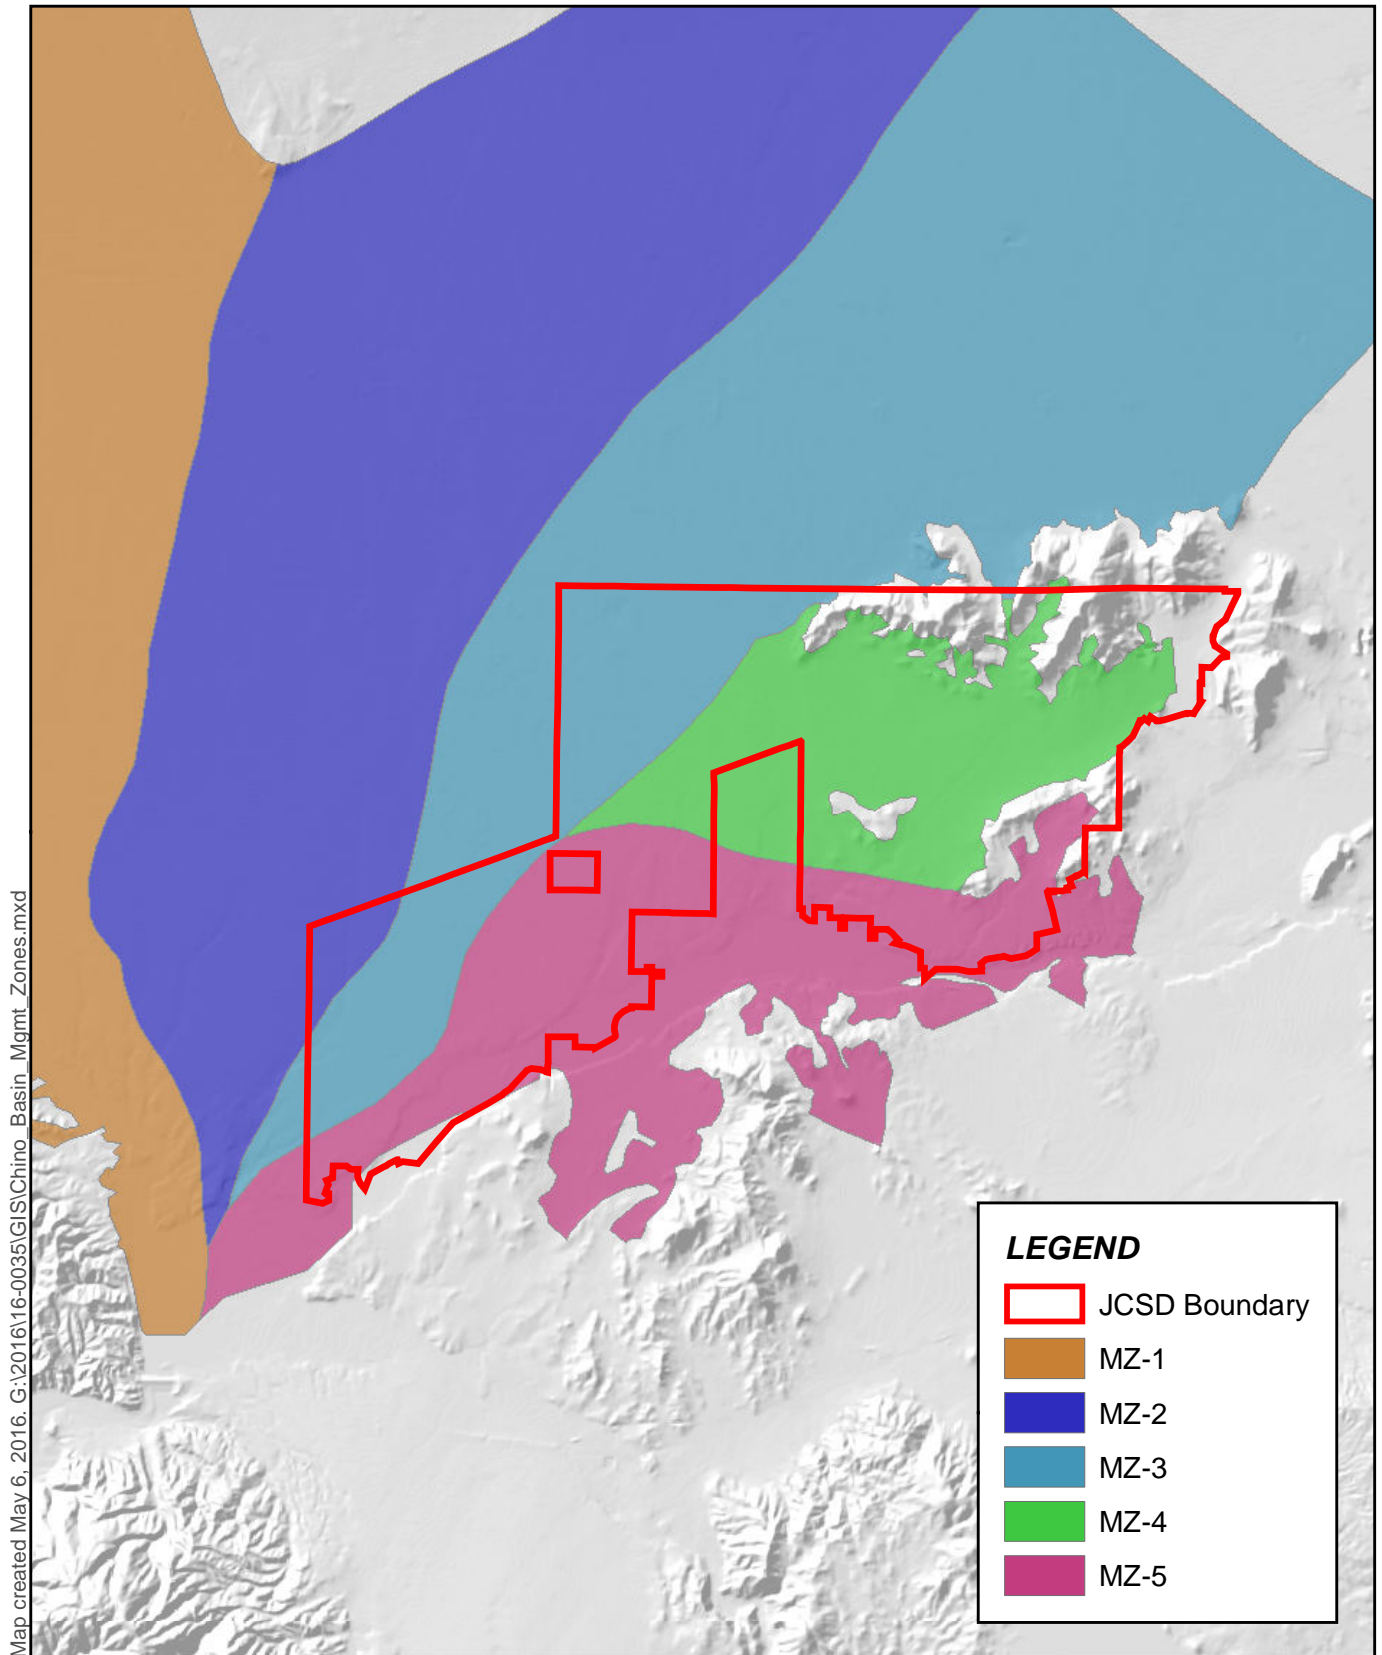

All groundwater pumpers in the Chino Groundwater Basin have to address the issues of elevated nitrates and TDS (discussed in Chapter 6.6). The concentrations of nitrates found in the basin are high enough to correlate with historic overlying land uses such as dairies (OBMP Phase 1, 1999). The California Department of Public Health (DPH) places nitrate into the health risk category of “acute toxicity” wherein a single detection may result in public health concerns. Purveyors of drinking water typically strive to provide customers with drinking water that has a nitrate concentration less than 10 mg/L as nitrogen. The District’s Roger D. Teagarden Ion Exchange facility (18 MGD treatment capacity) and Wells 17/18 Ion Exchange facility (7.2 MGD treatment capacity) remove nitrates from groundwater prior to entering the distribution system.

Since 2005, JCSD has reported that all samples of delivered water have been below the State and Federal MCL⁷ of 45 mg/L. This is due to JCSD’s treatment and blending plan within the service area. JCSD has obtained a permit from the California DPH that allows high nitrate water

⁷ Maximum Contaminant Levels (MCLs) are standards that are set by the U.S. Environmental Protection Agency for drinking water quality. A MCL is the legal threshold limit on the amount of a substance that is allowed in public water system under the Safe Drinking Water Act. The limit is usually expressed as a concentration in milligrams or micrograms per liter of water.

to be blended with lower nitrate waters. This approach results in a level of nitrate consistently below the MCL. A monthly “Nitrate 980 Blending Report” is produced and posted to JCSD’s Web site showing that JCSD maintains concentrations less than 35 mg/L nitrate at the JCSD Blend Points (before the first customers’ tap).

The Remainder of This Page Intentionally Blank.

Source: SAWPA, 2014

Figure 6-2 – Chino Basin Management Zones

JCSD 2015 Urban Water Management Plan

This Page Intentionally Blank

As detailed in the 2014 State of the Basin Report that is published annually as required by the Chino Basin OBMP (Watermaster, June 2015), there are currently 13 groundwater plumes in the larger Chino Basin that are monitored and remediated by various agencies and responsible parties. One of these, the Stringfellow site, is located within the JCSD service area. None of the District's wells have been impacted by the Stringfellow plume, which is located in the Jurupa Hills.⁸ In addition, the District makes a conscious effort to ensure none of its future wells interfere with the clean-up efforts at Stringfellow and that a safe distance is always maintained.

Riverside Groundwater Basin

The Riverside Groundwater Basin is identified by DWR as the Riverside portion of the Riverside-Arlington Sub-basin (No. 8-2.03), which is part of the Upper Santa Ana Valley Groundwater Basin. See **Figure 6-1** for locations of groundwater basins. The Riverside Basin was divided as a result of the 1969 Western-San Bernardino Judgment into the Riverside North (San Bernardino County) and Riverside South (Riverside County), and all of JCSD's non-potable wells in the Riverside Groundwater Basin, are located in the Riverside South Groundwater Basin.

6.2.2 Groundwater Management

DWR implemented the California Statewide Groundwater Elevation Monitoring (CASGEM) Program in response to legislation enacted in California's 2009 Comprehensive Water package. As part of the CASGEM Program and pursuant to the California Water Code (CWC §10933), DWR is required to prioritize California groundwater basins, so as to help identify, evaluate, and determine the need for additional groundwater level monitoring. A DWR spreadsheet summarizing the prioritization grading and results for the Chino Basin and Riverside Basin is provided in **Appendix K**.

Chino Groundwater Basin

The Chino Basin is designated as a High Priority Basin under CASGEM. The Superior Court of the State of California for the County of San Bernardino adjudicated the Chino Groundwater Basin on January 27, 1978 (**Appendix G**). The principal function of the adjudication is to control

⁸ The Stringfellow facility operated from 1957 to 1968 as a Class I hazardous waste disposal site. Approximately 34 million gallons of toxic waste was disposed there over an area of 9.1 acres (EPA.gov).

the use of the water source in order to ensure the source is utilized in an optimum manner. Operation of the basin is governed by the Judgment and agreement among producers, whereby producers are allotted a “Base Water Right” to a certain amount of the operating “Safe Yield”⁹ of the basin. According to the Judgment, participating entities including JCSD, can pump in excess of their allotted “Base Water Right” but must pay a replenishment assessment to the Watermaster to cover the cost to replenish any overdraft caused by the excess pumping. The provisions of the Judgment and the monitoring of the basin are carried out by the court-appointed Chino Basin Watermaster. The Watermaster files an annual report to the court that addresses pumping and replenishment.¹⁰

The 1978 Judgment grouped Chino Basin property owners into three groups, or “pools” consisting of: the Overlying Agricultural Pool, the Overlying Non-Agricultural Pool, and the Appropriative Pool. JCSD is a member of the Appropriative Pool and therefore has adjudicated production rights to the Chino Basin groundwater. As required by the Judgment, the Watermaster determines each Party’s share of Safe Yield and Operating Safe Yield from year-to-year. The Judgment does not limit a Party’s groundwater production to its share of Safe Yield. JCSD’s portion of Safe Yield is the sum of Base Rights and agricultural land use conversions. Since 2000, JCSD is credited two acre-feet per acre per year of water rights for every acre converted to non-agricultural use within the JCSD service area (Peace I Agreement, 2000).¹¹ The District’s Base Right is 2,061 AF per year. As of 2014/2015, the water right from the land use conversion program is 12,598 AF per year, for a total production right in the Chino Groundwater Basin of 14,659 AF.

The 1978 Judgment established the Safe Yield of the Chino Basin in the amount of 140,000 AF per year. The Watermaster is conducting a Safe Yield Redetermination, which has been ongoing for several years. Consequently, subject to certain localized physical limitations, any potential reduction in Safe Yield with or without augmenting Basin management measures affects the cost of groundwater production rather than the reliability of groundwater supplies. The Judgment evinces a clear expectation that parties, including JCSD would produce water in excess of their adjudicated production rights; provided, they pay a replenishment assessment. Therefore, JCSD’s ability to produce water from the Basin is thus largely a matter of cost. Water

⁹ The safe yield of a groundwater basin is defined as the amount of water than can be withdrawn annually without producing an undesirable result. Withdrawal in excess of safe yield is termed overdraft.

¹⁰ Reports are available at www.cbwm.org.

¹¹ Prior to the Peace I Agreement, the appropriator in which the agricultural property was located received 1.3 acre-feet per acre per year of water rights.

produced in excess of production rights will cost more than water produced within a party's production rights. Thus, the quantity and reliability of water supplies is a matter of cost of the water produced from the Basin rather than limitations on JCSD's access to groundwater supply.

As stated previously, the Chino Basin Watermaster is the responsible agency for recharging and preventing overdraft within the Chino Basin. Parties to the Judgment entered into an agreement called the "Peace Agreement" on June 29, 2000, the provisions of which are implemented in the OBMP. In 2000, the Watermaster approved the OBMP, which consists of nine key elements to cover a range of water activity in the basin. Some of the key elements include development and implementation of comprehensive monitoring and recharge programs and establishment of a cooperative program to improve basin management. As part of the OBMP, the Watermaster has a groundwater management program comprised of approximately 1,000 wells. This program measures both groundwater quantity and quality throughout the Chino Basin and can be used to monitor groundwater pumping and to identify pollution sources and problems.

Beginning September 30, 2011, MWD delivery of State Water Project (SWP) water for replenishment of the Chino Basin ended. Therefore two primary sources of recharge are currently pursued by the Watermaster on behalf of the parties to the Judgment: stormwater recharge and recycled water from wastewater treatment plants. In the 2013 Amendment to the 2010 Recharge Master Plan, the Watermaster identified several supplemental sources of water that could be used for recharge activities, including:

- Metropolitan's SWP supplies delivered through Metropolitan facilities, when available;
- Groundwater and surface water supplies in the Santa Ana Watershed that can be supplied to the Chino Basin directly through existing or new conveyance facilities or by exchange;
- Surplus groundwater from the Six Basins area;
- Recycled water from the Western Riverside County Regional Wastewater Authority (WRCRWA) Plant located in the Chino Basin;
- Recycled water from the Rapid Infiltration Extraction Treatment Plant in Colton, from the City of Rialto, from the City of Riverside, and from others;
- Groundwater and surface supplies from the Central Valley, conveyed to the Chino Basin through SWP and Metropolitan facilities, San Bernardino Valley Municipal Water District facilities, and San Gabriel Municipal Water District facilities; and
- Groundwater and surface water supplies from the Colorado River Basin conveyed to the Chino Basin through Metropolitan facilities.

Riverside Groundwater Basin

The Riverside Basin is designated as a High Priority Basin under CASGEM. The major pumper of this basin is the City of Riverside who has water rights per the Western-San Bernardino Judgment (**Appendix I**).¹² The City of Riverside Public Utilities (RPU) prepared the Riverside Basin Groundwater Management Plan (GWMP) in 2012 through a stakeholder-based groundwater management planning effort with DWR. According to the RPU 2010 UWMP, the average Safe Yield for the Riverside South Basin is 35,100 AF per year, and the Base Right is 29,633 AF per year (RPU GWMP). RPU pumped 13,571 AF of potable and raw water during CY 2015 from the Riverside South Basin (RPU 2015 draft UWMP). In addition, RPU plans to augment natural recharge of the Riverside Basins through a conjunctive use project slated for completion in 2020 (RPU 2015 draft UWMP). RPU's pumping volumes are based on safe yield modeling and calculations for the Riverside North and Riverside South basins.

According to the 2012 RPU GWMP, the projected groundwater production in Riverside South Basin will exceed Base Rights. In addition, the 2012 GWMP identified that Riverside South Basin is projected to be in overdraft in the future. WMWD is responsible for replenishment of the Riverside South Basin should extractions exceed the base period extraction (over a 5-year period), or by more than 20 percent in a single year, unless credits are available from previous years, as specified by the Western-San Bernardino Judgment (RPU 2010 UWMP). RPU participates in independent groundwater level and quality monitoring in the Riverside Basin, and all groundwater production is metered and reported to the Western-San Bernardino Watermaster.

California Statewide Groundwater Elevation Monitoring Program (CASGEM)

Final Basin Prioritization findings indicate that 127 of California's 515 groundwater basins and sub-basins are High and Medium priority. These basins account for 96 percent of California's annual groundwater pumping and supply 88 percent of the population which resides over groundwater basins. The remaining 388 basins are Low and Very Low priority and comprise 75 percent of the groundwater basins in the State.

¹² Other entities that exercise rights to pump in Riverside South Basin in addition to JCSD and RPU are, Riverside Highland Water Company, Rubidoux CSD, private wells and others (Table 4.3, RPU GWMP, 2012).

The Chino Basin and the Riverside Basin are ranked as High priority according to the CASGEM program. The CWC (§10933) specifies the eight criteria for prioritization: overlying population, projected growth of overlying population, public supply wells, total number of wells, irrigated acreage overlying the basin, reliance on groundwater as the primary source of water, impacts on groundwater, and any other information determined relevant by DWR staff. DWR then used statewide datasets from the Department of Finance census data, Department of Health, and DWR to grade each component on a scale of 0 to 5. The overall basin ranking is a calculation of the scores for each of the 8 criteria, using the following formula: Overall Basin Ranking = Population + Population Growth + Public Supply Wells + (Total Wells x .75) + Irrigated Acreage + [(Groundwater Use + % of Total Supply)/2] + Impacts + Other information. High priority basins have a grade of more than 21.08 and medium priority basins have a grade between 13.42 and 21.08.

The list of High and Medium priority groundwater basins that are not monitored under the CASGEM program will be provided to State water grant programs. Although CASGEM is a voluntary program, not participating could result in ineligibility for a State water grant or loan. Grant eligibility will be determined by the respective grant program.¹³

6.2.3 Overdraft Conditions

Chino Groundwater Basin

Prior to the 1978 adjudication, the Judgment found that the Chino Basin was operating in a continuous state of over-draft. The Judgment in this case found that the safe yield from the Chino Basin is equal to 140,000 AFY. As a party to the adjudication, JCSD's legal right to pump groundwater in the Chino Basin includes amounts in excess of allocated safe yield as described in the Judgment. This can occur when a member of the Chino Basin Agricultural Pool converts property to a non-agricultural use. For every acre converted to non-agricultural use, the appropriator in which the property is located receives two AF per acre per year of water rights (Peace I Agreement, Section 5.3(h), June 2000). Pumping in excess of safe yield can occur because of the OBMP activities under the oversight of the Watermaster that supply groundwater recharge.

¹³ http://water.ca.gov/groundwater/casgem/basin_prioritization.cfm

All Watermaster processes are governed by Rules and Regulations and receive active oversight from the Court, which retains continuing jurisdiction over the administration of the Judgment. Consequently, the sufficiency of the groundwater is not only directed by rigorous Watermaster management processes, but validated and ensured by continuing Court oversight.

Riverside Groundwater Basin

The Riverside Basin is adjudicated by the Western-San Bernardino Judgment as described previously. The Riverside South Basin is not identified by DWR as operating in “critical overdraft” conditions per the Sustainable Groundwater Management Act. The Riverside South Basin, where JCSD pumping occurs, covers approximately 20,000 acres with an estimated storage of 986,000 AF. The majority of pumping and management is done by the City of Riverside who developed a Riverside Groundwater Basin Management Plan in 2012. For the Riverside South Basin, the Western-San Bernardino Judgment set a 5-year Base Period Average and Base Period Extraction of 29,633 AF for use in Riverside County. In Riverside South, should extractions exceed the base period extraction over a 5-year period, or by more than 20 percent in a single year, WMWD is responsible for replenishment in the following year equal to the excess extractions over a 20 percent peaking allowance, unless credits are available from previous years due to production below the base period extraction or to importing water. With the management of the Riverside Basin by RPU and reporting by WMWD to the court-appointed Western-San Bernardino Watermaster, JCSD’s extractions are not anticipated to contribute to overdraft.

6.2.4 Historical Groundwater Pumping

Water agencies that have pumped groundwater at any time during the years 2011-2015 are required to complete **Table 6-1**, which is provided at the beginning of this Chapter. The sufficiency of groundwater pumped by JCSD has been a matter more of cost than of physical supply. Each of the groundwater basins that are tapped by the District’s wells has been analyzed and is expected to have substantial volumes, far more than the volumes pumped by JCSD. In addition, each groundwater basin is adjudicated and monitored by court-appointed Watermasters. The cost to the District to pump the groundwater basins includes not only the cost of deeper wells and larger pumping facilities, but also the cost of desalter and/or denitrification systems, and replenishment assessment to replace water taken in exceedance of safe yield allocations.

6.3 Surface Water

JCSD does not use surface water as part of its supply, nor does it have plans to expand supply sources by using surface water. There are three major creeks that flow through the District's service area; Day Creek, San Sevaine Creek, and Cucamonga Creek that drain towards the south from the San Gabriel mountains to the Santa Ana River. These waterways are concrete-lined and heavily managed by other entities and not a part of JCSD's activities. Surface water quantity and quality is managed and monitored throughout the Chino Basin as a component of the OBMP. The Watermaster and IEUA continually measure the quantity of storm water and supplemental water entering the recharge basins. In addition to these quantity measurements, Watermaster receives water quality information from MWD on SWP imported water (when deliveries are permitted) and from IEUA on recycled water being used for recharge in the Chino Basin.

6.4 Stormwater

Communities are increasingly implementing opportunities to beneficially use storm water to meet local water supply demands. JCSD does not have the authority to manage storm water intentionally to divert for beneficial use, but there are many facilities in the Chino Basin that are performing this task. Groundwater recharge with storm water capture and infiltration (or spreading) basins is an integral part of the Chino Basin Watermaster's OBMP efforts to increase supply and improve groundwater quality. Stormwater recharge in the San Bernardino County portion of the Chino Basin is guided by the Chino Basin Recharge Facilities Operation Procedures (GRCC, 2006) developed by the Groundwater Recharge Coordinating Committee whose members include the Chino Basin Watermaster, Chino Basin Water Conservation District, IEUA, and the San Bernardino Flood Control District. The 2013 Update to the Watermaster's 2010 Recharge Master Plan for the Chino Basin will expand recharge facilities with the first phases due for completion in 2018 (Wildermuth, 2013).

6.5 Wastewater and Recycled Water

JCSD does not currently rely on wastewater or recycled water. However, the District is planning to replace some potable water use with recycled water to meet the demands of future irrigation needs. Utilizing recycled water for irrigation and other non-potable purposes, JCSD can more efficiently allocate its potable water supply and increase the overall reliability of water supplies in the service area. As discussed previously for storm water recharge, recycled water recharge

throughout the Chino Basin is managed by a partnership between IEUA, Chino Basin Watermaster, Chino Basin Water Conservation District, and the San Bernardino County Flood Control District (SBCFCD) under the Chino Basin Recycled Water Groundwater Recharge Program. The recycled water infrastructure consists of a network of pipes that direct stormwater run-off, imported water from SWP, and IEUA recycled water to a network of sixteen recharge sites, most of which contain multiple recharge basins. IEUA annually recharges approximately 10,000 AF of recycled water annually.¹⁴

6.5.1 Recycled Water Coordination

As discussed in Chapter 4, the future water demand in the JCSD service area will increase as development continues; thus, JCSD recognizes that recycled water as a source of non-potable water could be an important and reliable source. The use of recycled water has been gaining wide support in the JCSD area, where there are irrigation, commercial, landscapes, and industrial customers that could convert some or most of their water use to recycled water. JCSD has been exploring potential non-potable water sources not only to supplement the water supply portfolio but also to convert some of the existing irrigation pumping that is currently met by potable supplies.

JCSD is the responsible agency for collecting, treating, and discharging of municipal wastewater generated within its service area. Wastewater collected by JCSD is treated at three regional wastewater treatment plants:

- City of Riverside Regional Water Quality Control Plant (RWQCP);
- Orange County Sanitation District via the Inland Empire Brine Line (IEBL); and
- Western Riverside County Regional Wastewater Authority's Wastewater Treatment Plant (WRCRWA).

City of Riverside RWQCP provides recycled water for irrigation of 41 acres at the Van Buren Golf Center, 10 acres of Van Buren Blvd. median and frontage, and industrial use at the Toro Manufacturing Company. WRCRWA and the IEBL do not currently provide recycled water. JCSD has worked with IEUA to submit a grant application to fund a recycled water program for

¹⁴ IEUA Website: <http://www.ieua.org/water-sources/groundwater/>

the Eastvale area. At this time, implementation of proposed recycled water projects is pending funding availability.

6.5.2 Wastewater Collection, Treatment, and Disposal

JCSD's sewer system is centered on the regional approach to treatment as a cost-effective way to treat wastewater. JCSD has over 387 miles of collection pipelines and the vast majority of flow is collected and transmitted by gravity flow. For situations where gravity flow was unattainable, pressure systems were utilized with lift stations and pumps. JCSD delivers wastewater to two treatment plants and a regional brine line from three independent sewer systems (**Figure 6-3**). First, the JCSD Regional Lift Station pumps wastewater to the City of Riverside RWQCP. Second, the Community Facilities District (CFD) No. 1 wastewater system discharges into the Inland Empire Brine Line (IEBL)¹⁵ for treatment by the Orange County Sanitation District, which has higher salt limits because it is an ocean discharge. Finally, the Eastvale area discharges to the River Road Lift Station, which pumps the wastewater to WRCRWA. JCSD is a member of the WRCRWA Joint Powers Authority (JPA) and has a capacity right to the plant, as well as capacity rights to the RWQCP, as summarized below in **Table 6C**.

¹⁵ Formerly known as the Santa Ana River Interceptor (SARI) System.

Table 6C: Information for Treatment Plants that Serve JCSD

| | City of Riverside RWQCP | WRCRWA | IEBL & Orange County Sanitation District |
|---|---|---|--|
| Operator: | City of Riverside | WMWD | Santa Ana Watershed Project Authority (SAWPA) |
| Service Provided: | Primary, secondary and tertiary treatment. Meets all Title 22 requirements for recycled water. | Primary, secondary and tertiary treatment. Meets all Title 22 requirements for recycled water. | Conveys brine from Upper Santa Ana River Watershed sources to treatment in Orange County and discharge to ocean. |
| Volume JCSD Contributes*: | 3 MGD | 3.5 MGD | 0.85 MGD |
| JCSD Capacity Right: | 5 MGD | 3.25 MGD | 3.493 MGD for IEBL conveyance, 0.94 MGD in OCSD treatment plant. |
| JCSD Projected Build-Out Contribution: | 4.9 MGD | 6 MGD | Not yet known. Ample space available. |
| Current Volume Treated from all Sources: | 29 MGD | 6 MGD | 9.8 MGD*** |
| Current Maximum Permitted Capacity: | 40 MGD | 8 MGD | 17 MGD*** |
| Upgradable Potential Capacity: | 46 MGD** | 14 MGD** | JCSD in process to purchase 0.215 MGD of additional treatment capacity. SAWPA has the ability to purchase up to 30 MGD of capacity rights from OCSD. |

*Average of most recent 12 months of information available (October 2014-September 2015).

**Currently under construction to reach this treatment capacity, completion expected in 2017.

*** Source: SAWPA staff, 5/11/16.

The City of Riverside RWQCP and WRCRWA have tertiary treatment facilities and both discharge the tertiary-treated effluent into the Santa Ana River. IEBL is treated by Orange County Sanitation District and discharged to the Pacific Ocean. Information on collection of wastewater within the service area is summarized in **Table 6-2**.

| Table 6-2 Retail: Wastewater Collected Within Service Area in 2015 | | | | | | |
|--|--|--|--|--|--|---|
| <input type="checkbox"/> | There is no wastewater collection system. The supplier will not complete the table below. | | | | | |

| NOTES: Volume in AF. Riverside WQCP is on the border of our service area and recycled water pipes are installed in Van Buren Bridge, but are not connected. | | | | | | | | | | |

6.5.3 Recycled Water System

As defined in CWC §13050(n), recycled water means, "...water which, as a result of treatment of waste, is suitable for a direct beneficial use or a controlled use that would not otherwise occur

and is therefore considered a valuable resource.” JCSD does not operate nor participate in a recycled water system at this time. However, the District is in the process of developing a recycled water system that will deliver irrigation water to parks and playgrounds in the Eastvale area utilizing a portion of the recycled water entitled to the District from the WRCRWA treatment plant. JCSD has also taken great effort recently to partner with IEUA who does operate a recycled water system adjacent to JCSD. The partnership has resulted in a grant application titled, “Joint IEUA-JCSD Recycled Water Intertie Project” to the SWRCB Proposition 1 Grant and State Revolving Fund Loan (CWSRF Project No. 8167-110).

6.5.4 Recycled Water Beneficial Uses

The definition of recycled water includes the term “direct beneficial use”, which is defined in CCR, Title 22, §60301.200 as “the use of recycled water that has been transported from the point of treatment or production to the point of use without an intervening discharge to waters of the State.” JCSD does not currently operate nor participate in a recycled water system and therefore cannot provide recycled water beneficial use information for recycled water delivered within the service area. In the future as recycled water use becomes a reality for JCSD, beneficial uses¹⁶ could include:

- Landscape irrigation (excluding golf courses);
- Golf course irrigation;
- Commercial use;
- Industrial use; and
- Groundwater recharge.

Future recycled water use is expected to become available by 2020, as shown in **Table 6-4**. At such time that recycled water becomes part of JCSD’s supply portfolio, the District expects to see an equal decrease in potable water that was previously used for irrigation purposes.

¹⁶ The different types of beneficial uses are listed in CWC §10633(d).

| Table 6-4 Retail: Current and Projected Recycled Water Direct Beneficial Uses Within Service Area | | | | | | | | | |
|--|----------------------------------|---|---|------|------|------|------|------------|-----|

| | | | Total: | 0 | 500 | 500 | 500 | 500 | 500 |
| IPR - Indirect Potable Reuse | | | | | | | | | |
| NOTES: Volumes in AF. Future landscape irrigation using recycled water from the Joint IEUA-JCSD Recycled Water Intertie Project. | | | | | | | | | |

The 2015 UWMP must provide a description of the actual use of recycled water in comparison to recycled water use previously projected in the 2010 UWMP. **Table 6-5** provides the required information. Table 4-10 of the District's 2010 UWMP projected that up to 500 AF per year of recycled water would be available from the WRCRWA plant for JCSD irrigation purposes. Work is still ongoing to achieve this goal and recycled water is expected for JCSD by 2020.

Table 6-5 Retail: 2010 UWMP Recycled Water Use Projection Compared to 2015 Actual

| □ | Recycled water was not used in 2010 nor projected for use in 2015. The supplier will not complete the table below. | |
|--|---|-----------------|

6.5.5 Actions to Encourage and Optimize Future Recycled Water Use

JCSD has been involved with public outreach and coordinating with local entities, local water agencies, regional wastewater agencies, and other planning agencies to discuss the feasibility of using recycled water in lieu of potable or non-potable groundwater that is currently used for irrigation. In this Plan, it is projected that some level of recycled water use may potentially result from these ongoing efforts. This regional planning and coordination effort should continue to the extent possible as a project develops toward implementation. Funding availability, securing grant funding, and financial incentives are among the factors that will play a big role in the future implementation of recommended recycled water projects. JCSD has completed detailed evaluations of potential alternatives and projects to use recycled water, but implementation of such alternatives, at this time, is pending funding availability, given the high estimated project costs and high unit cost of water when compared to JCSD's current unit cost of potable and non-potable groundwater. State and federal funding, if available, could offset the cost imposed during project construction which typically makes the project cost-prohibitive. Obtaining funding can also help build community support for a project because it results in reduced taxpayer contribution.

Production of recycled water from the existing regional wastewater treatment plants is anticipated to be adequate to meet the non-potable irrigation demands for JCSD. As potable water demands increase and, consequently, recycled water production increases, treated effluent to meet non-potable demands would also increase. As described earlier, JCSD has completed studies to identify both existing and future potential non-potable demands that could be potentially supplied by non-potable sources, thus, freeing up potable supplies currently used to meet portion of irrigation demands.

The expected increase in recycled water (and subsequent decrease in potable and non-potable water demand) if the District's grant application is approved by DWR is provided in **Table 6-6**.

| Table 6-6 Retail: Methods to Expand Future Recycled Water Use | | | |
|--|--|-----------------------------|---|
| <input type="checkbox"/> | Supplier does not plan to expand recycled water use in the future. Supplier will not complete the table below but will provide narrative explanation. | | |
| | Provide page location of narrative in UWMP | | |
| Name of Action | Description | Planned Implementation Year | Expected Increase in Recycled Water Use |
| <i>Add additional rows as needed</i> | | | |
| Joint IEUA-JCSD Recycled Water Intertie Project (CWSRF Project No. 8167-110) | To use 500 AFY recycled water for irrigating parks, playgrounds and other landscaped areas in JCSD boundary. Also to replace current irrigation source of recycled water so that 1500 AFY more can be put in spreading basins. | 2020 | 2,000 |
| Total | | | 2,000 |
| NOTES: Project is pending grant funding. Volume in AF. | | | |

6.6 Desalinated Water Opportunities

The Chino Basin has several areas of elevated concentrations of nitrate and TDS resulting from dairy and agricultural activities. As stated previously, JCSD is a member of the Chino Desalter Authority (CDA), a joint exercise of powers agency created in 2001. CDA owns and operates two desalters, Chino I and Chino II, which pump and treat approximately 28,000 AFY.¹⁷ These facilities include groundwater extraction wells, pumps and pipelines that extract and pump water to the desalters for pretreatment, filtration, air stripping of volatile organic compounds, ion exchange for nitrate removal, reverse osmosis for salt removal, and disinfection to produce high

¹⁷ From Space Center Water Supply Assessment prepared for JCSD (WEBB(c), July 2015).

quality drinking water. JCSD will continue participating in the CDA and support future expansions.

Salinity measured in the form of TDS and nitrate (discussed previously) in the Chino Basin are the greatest concerns for water quality. The southern part of the basin has the highest measured TDS levels exceeding 500 milligrams per liter (mg/L). These levels are above the recommended secondary MCL of 500 mg/L. TDS is not considered a public health risk but rather relates to the aesthetic quality of water. Depending on the location and water usage, TDS can contribute to the corrosion of metal surfaces or have deleterious effects on sensitive crops. Taste however, is the driving force behind the secondary MCLs from the state.

6.7 Conjunctive Use, Exchanges or Transfers

JCSD participates in a conjunctive use program called the Dry Year Yield (DYY) Storage Program. The DYY program is a cooperative conjunctive use effort involving MWD, IEUA, Chino Basin Watermaster, Three Valleys Municipal Water District (TVMWD) and Chino Basin groundwater producers.¹⁸ Under this Program, MWD is allowed to store up to 100,000 AF per year of SWP water in the Chino Basin when surplus water is available during wet years, and to reduce imported water deliveries up to 33,000 AF per year during dry, drought, or emergency periods. The DYY program provides MWD the right to store groundwater in the basin, as a hedge against drought, in exchange for paying the costs of developing the facilities that deliver that water. This program has now completed a full cycle, with Chino Basin benefiting from those facilities, and by MWD received approximately 100,000 AF of supplies.

JCSD entered into a Local Agency Agreement on January 12, 2004 with the City of Ontario because Ontario has a direct connection with imported water from MWD at the Water Facilities Authority treatment plant in Upland. When MWD makes a “call” for its stored water, the participating agencies will produce up to 33,000 AF per year (i.e. Dry Year Yield) from MWD’s “storage account.” In exchange, MWD will provide agencies an Operation and Maintenance credit per AF for the cost of pumping. During “wet years” or “non-call” years, Ontario will increase MWD deliveries, which JCSD will purchase from Ontario and becomes part of JCSD’s supply in the form of Ontario’s portion of CDA water. Up to 2,000 AF over 12 months is anticipated. During a “call year”, Ontario will stop deliveries to JCSD to meet the performance

¹⁸ Information on the Dry Year Yield Program is available at the Chino Basin Watermaster Web site, http://cbwm.org/rep_engineering.htm.

requirements of the program. JCSD will stop receiving Ontario's portion of CDA water and return to District well supply to meet demand. This program provides JCSD an indirect access, through City of Ontario facilities, to imported water.

6.8 Future Water Projects

Expected future water supply projects or programs that will have a quantifiable increase in water supply to JCSD, and can reasonably be expected to be implemented within the 20-year time frame of the UWMP are summarized in **Table 6-7**. Wells No. 29 and 30 have been authorized by the JCSD Board of Directors and are expected to be brought online by 2020. Approximately 2,500 AF per year of potable water supply is expected from each well.

| Table 6-7 Retail: Expected Future Water Supply Projects or Programs | | | | | | |
|---|---|----------------------------|-------------------------|-----------------------------|------------------------------|---|
| <input type="checkbox"/> | No expected future water supply projects or programs that provide a quantifiable increase to the agency's water supply. Supplier will not complete the table below. | | | | | |
| <input checked="" type="checkbox"/> | Some or all of the supplier's future water supply projects or programs are not compatible with this table and are described in a narrative format. | | | | | |
| | Provide page location of narrative in the UWMP | | | | | |
| Name of Future Projects or Programs | Joint Project with other agencies? | | Description (if needed) | Planned Implementation Year | Planned for Use in Year Type | Expected Increase in Water Supply to Agency |
| | <i>Drop Down List (y/n)</i> | <i>If Yes, Agency Name</i> | | | | |
| <i>Add additional rows as needed</i> | | | | | | |
| Well No. 29 | No | | | 2019 | Average Year | 2,500 |
| Well No. 30 | No | | | 2020 | Average Year | 2,500 |
| | | | | | | |
| NOTES: Volume in AF. | | | | | | |

NOTES: Volume in AF.

Other future water supply projecta may result from a JCSD partnership with WMWD to connect with the Mills Pipeline or La Sierra Pipeline projects. Both projects would directly connect imported water supplies with the District.

6.9 Summary of Existing and Planned Sources of Water

The actual source and volume of water pumped or purchased by JCSD during CY 2015 is provided in **Table 6-8**.

| Table 6-8 Retail: Water Supplies — Actual | | | | |
|---|---|---------------|--|--|
| Water Supply | Additional Detail on Water Supply | 2015 | | |
| Drop down list <i>May use each category multiple times. These are the only water supply categories that will be recognized by the WUEdata online submittal tool</i> | | Actual Volume | Water Quality <i>Drop Down List</i> | Total Right or Safe Yield <i>(optional)</i> |

| Total | | 31,993 | 0 | 36,493 | 0 | 40,993 | 0 | 40,993 | 0 | 40,993 | 0 |
| NOTES: Volumes in AF provided by JCSD. | | | | | | | | | | | |

Items of note from Table 6-9 include the addition of purchased water from WMWD beginning in 2020. Notably, the water supply volumes projected in Table 6-9 are much higher than the water demand volumes projected in Table 4-2 (Chapter 4). Projected water supply needs to exceed projected demand in order to meet maximum day water demand which is approximately 2.7 times average day water demand.

CHAPTER 7: WATER SUPPLY RELIABILITY ASSESSMENT

Assessment of water supply reliability is complex and dependent upon a number of factors, such as the number of water sources, regulatory and legal constraints, climate change, and expected growth, among others. JCSD provides in this chapter its best determination of the long term reliability of their water supplies based upon what is known by the District at the time the 2015 UWMP was prepared. Shorter term reliability planning is addressed in Chapter 8, Water Shortage Contingency Planning.

JCSD's primary source of potable water is local groundwater from the Chino Groundwater Basin, which is pumped from wells located throughout the JCSD service area. JCSD also pumps non-potable groundwater from the Chino Basin and the Riverside (south) Basin. In addition to these groundwater sources, JCSD also purchases potable water from Rubidoux CSD. JCSD is a member of the Chino Desalter Authority (CDA), a Joint Powers Authority, which allows them to obtain Chino Basin groundwater treated by the Chino I and Chino II Desalters. Lastly, the District is partner to a conjunctive-use program with the City of Ontario for an indirect connection to MWD (DYY program). This diverse portfolio provides JCSD with a relatively stable and reliable water supply, even when environmental conditions are exceptionally dry. To ensure reliability in the future, the District intends to further diversify its supplies by partnering with the local wholesale supplier, Western Municipal Water District (WMWD) to obtain a direct connection to an imported water supply.

7.1 Constraints on Water Sources

JCSD relies predominantly upon groundwater supplies. Therefore JCSD could be constrained in the future by physical, financial, or legal limitations that are dependent upon a wide variety of unknown future scenarios. As described in Chapter 6, the District intends to pursue a partnership with the local wholesale supplier, WMWD, in order to diversify its supply portfolio, and to avoid risks related to prolonged drought or decreasing groundwater levels. In addition, JCSD is pursuing State grant funds (described in Chapter 6) to bring recycled water from the WRCRWA plant into the District's service area for landscape irrigation and additional recharge water to the Chino Basin. Otherwise, JCSD does not foresee nor is it preparing for other potential constraints on water sources.

A physical constraint to the groundwater resources utilized by JCSD could result from inadequate recharge of the basin. In the event the Watermaster (and partner agencies) are unable to install enough storm water recharge basins, or possibly less rain falls in the basin (from continuing drought or climate change), groundwater levels may continue to decline. Likewise, if a legal constraint limits recycled water from being used for recharge in the Chino Basin then all users of the groundwater basin might be impacted. A possible response by JCSD to the potential further decline in groundwater levels might include higher costs to JCSD as a result of increased energy usage to pump groundwater. Higher costs to the District may also include additional wells that may be located where groundwater is not potable; therefore additional treatment facilities could be required. Another constraint in terms of cost would arise if the Watermaster were to increase the Chino Basin replenishment assessment price and/or reduce the District's safe yield allocation.

Water Quality Impacts on Reliability and Planned Management Strategies

Three factors can affect the availability of groundwater: sufficient source capacity (wells and pumps); sustainability of the groundwater resource to meet pumping demand on a renewable basis; and protection of groundwater sources (wells) from known contamination, or provisions for treatment in the event of contamination. The first two of those factors are addressed in Chapter 6. The third factor, the impact and resolution of contamination, is being addressed for the Chino Basin as follows.

First, JCSD does provide water quality treatment of several of its wells for denitrification (remove nitrates) as described in Chapter 6. As discussed previously, groundwater in the Chino Basin may require removal of various constituents such as nitrates and TDS. In addition, there are areas of contamination that are to be avoided such as the Stringfellow site. The District may construct additional treatment facilities in the future it deems necessary to provide additional potable water supply.

Second, JCSD is partner to and recipient of groundwater treated by the CDA Chino I and Chino II desalters (reverse osmosis and ion exchange), which remove both TDS and nitrates from Chino Basin groundwater. A copy of JCSD's 2014 Consumer Confidence Report (CCR) is provided in **Appendix L**. These annual reports summarize the weekly, monthly, and quarterly sampling and analysis of all drinking water supplies that are required by the State. As shown on the CCR, JCSD is divided into three areas depending on the source of water. Area 1 is supplied

by water from the Chino I Desalter and supplemented from Area 2. Area 2 is supplied from the Teagarden Ion Exchange plant, the Chino II Desalter and additional wells. Area 3 is supplied primarily from Area 2 sources, occasionally from Area 1 during low water use periods, and supplemented from Rubidoux CSD purchases.

The Chino Basin Watermaster has identified three management practices to ensure water quality does not impact the reliability of groundwater supply. These are: minimizing agricultural activities, desalting the groundwater, and maximizing the storm water recharge of the Basin (JCSD UWMP, 2010). Agricultural activities have decreased as a result of urbanization according to approved city and county land use plans, and recharge basins continue to obtain maximum infiltration from storm water and urban runoff. Continued implementation of these efforts is expected to provide sustainable groundwater supplies from the Chino Basin.

7.2 Reliability by Type of Year

JCSD has various sources of water supplies available to meet demands during normal, single-dry, and multiple-dry years. Notably, the District has had sufficient supplies during the ongoing drought, of which the State is in the fourth year. JCSD assumes 2004 as its “Normal¹ Water Year”, 1977 as its “Single Dry² Year” and 2012-2015 as its “Multiple-Dry³ Water Years”. The Normal and Single Dry years were established in the 2010 UWMP and will be continued as the assumption herein. However, the District has updated its Multiple-Dry years to 2012-2015 because the rainfall amounts are less than the previous dry year period used in the 2010 UWMP of 1990-1992.

As shown in **Table 7-1**, JCSD expects 100% of its supply to be available in all year types. Since the District’s supply source is groundwater, and in particular knowing the Chino Basin has five million AF of water in storage, providing water during drought conditions would result in increased pumping costs (discussed in Chapter 6). JCSD does not operate its groundwater wells at full capacity (refer to **Appendix J**). Therefore, it can be assumed if drought conditions persisted or worsened, groundwater pumping could increase to continue meeting water demands. On the other hand, water conservation efforts have been significant over the past few years (Chapter 9). Additional drought regulations on water end-use, as described in Chapter 8,

¹ A year, or an averaged range of years, that most closely represents the average water supply available to the agency. The UWMP Act uses the term “normal”.

² The single-dry year is the year that represents the lowest water supply available to the agency.

³ The multiple dry year period that represents the lowest average water supply availability to the agency for a consecutive multiple year period (three years or more).

could further decrease water demands and ensure that existing supplies could meet future demands even if drought conditions persist.

| Table 7-1 Retail: Basis of Water Year Data | | | |
|---|-----------|---|---------------------|
| Year Type | Base Year | Available Supplies if Year Type Repeats | |
| | | Agency may provide volume only, percent only, or both | |
| | | Volume Available | % of Average Supply |
| Average Year | 2004 | | 100% |
| Single-Dry Year | 1977 | | 100% |
| Multiple-Dry Years 1st Year | 2012 | | 100% |
| Multiple-Dry Years 2nd Year | 2013 | | 100% |
| Multiple-Dry Years 3rd Year | 2014 | | 100% |
| Multiple-Dry Years 4th Year <i>Optional</i> | 2015 | | 100% |

*Agencies with different water sources that each may have a different hydrology, resulting in different base years for each source should complete Table 7-1 for each source. The hydrology does not differ between JCSD's sources.

7.3 Supply and Demand Assessment

Per CWC §10635(a), "Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry years. This water supply and demand assessment shall compare the total water supply sources available to the water suppliers with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years."

JCSD water demands are discussed in Chapter 4 and projections during a Normal Year are provided in Table 4-3. JCSD water supplies are presented in Chapter 6 and projections during a Normal Year are provided in Table 6-9. The Normal Year supply and demand projections are compared in **Table 7-2**.

| Table 7-2 Retail: Normal Year Supply and Demand Comparison | | | | | |
|---|--------|--------|--------|--------|---------------|
| | 2020 | 2025 | 2030 | 2035 | 2040 (Opt) |
| Supply totals (autofill from Table 6-9) | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| Demand totals (autofill from Table 4-3) | 25,477 | 28,088 | 30,968 | 34,151 | 37,670 |
| Difference | 6,516 | 8,405 | 10,025 | 6,842 | 3,323 |
| NOTES: | | | | | |

During Normal Years, with the addition of an imported source from WMWD, the District has sufficient supply and groundwater pumping capacity to meet maximum day water demands⁴ to the year 2040.

The Single Dry Year supply and demand comparisons are provided in **Table 7-3**. In this scenario, the District assumes the same supply volumes from the Normal Year will be available and projected demand volumes will also remain the same. A surplus of water supply continues through 2040 (build-out). JCSD expects by 2020 that recycled water will meet some of the irrigation water demand, thus making available several hundred acre-feet of groundwater potentially.

| Table 7-3 Retail: Single Dry Year Supply and Demand Comparison | | | | | |
|---|--------|--------|--------|--------|---------------|
| | 2020 | 2025 | 2030 | 2035 | 2040 (Opt) |
| Supply totals | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| Demand totals | 25,477 | 28,088 | 30,968 | 34,151 | 37,670 |
| Difference | 6,516 | 8,405 | 10,025 | 6,842 | 3,323 |
| NOTES: Assumes no change in supply or demand projections. | | | | | |

The Multiple Dry Year supply and demand comparisons are provided in **Table 7-4**. During the first dry year, JCSD assumes no change in projected demand (same demand totals from Table 7-3). During the second dry year, JCSD assumes a decrease in water use of 5%, using the first year as a baseline. During the third year, JCSD assumes a 10% decrease in demand in response to water conservation efforts, measured from the first year as the baseline. Lastly during the fourth dry year, the District assumes a 20% decrease in demand, as measured from the first year baseline. This demonstrates the expected time-lag between the first dry year until

⁴ Maximum Day Demand (MDD) is calculated as 2.7 times Average Day Demand (ADD). Peak Hour Demand is 1.5 times MDD, or 4.05 times ADD.

water conservation efforts start to show an impact in water use. A multiple dry year decrease in demand of 20 percent has been demonstrated by JCSD, which has reduced water production by 23 percent since 2013, according to Annual Reports of production volumes to the SWRCB.

In the 2010 UWMP, JCSD assumed that water supply and water demand would be equal in all dry year scenarios since the volume of groundwater pumped would equal demand. In addition, during the single and multiple dry years, supply and demand increased equally by 10% in the 2010 UWMP. This is no longer the District's expected response to drought. Demand is expected to gradually decrease in response to drought regulations and water conservation.

| Table 7-4 Retail: Multiple Dry Years Supply and Demand | | | | | | |
|--|---------------|--------|--------|--------|--------|---------------|
| | | 2020 | 2025 | 2030 | 2035 | 2040 (Opt) |
| First year | Supply totals | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| | Demand totals | 25,477 | 28,088 | 30,968 | 34,151 | 37,670 |
| | Difference | 6,516 | 8,405 | 10,025 | 6,842 | 3,323 |
| Second year | Supply totals | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| | Demand totals | 24,203 | 26,684 | 29,420 | 32,443 | 35,787 |
| | Difference | 7,790 | 9,809 | 11,573 | 8,550 | 5,206 |
| Third year | Supply totals | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| | Demand totals | 22,929 | 25,279 | 27,871 | 30,736 | 33,903 |
| | Difference | 9,064 | 11,214 | 13,122 | 10,257 | 7,090 |
| Fourth year (optional) | Supply totals | 31,993 | 36,493 | 40,993 | 40,993 | 40,993 |
| | Demand totals | 20,382 | 22,470 | 24,771 | 27,321 | 30,136 |
| | Difference | 11,611 | 14,023 | 16,222 | 13,672 | 10,857 |

As shown in the tables above, JCSD anticipates having adequate water supplies to meet future demands during normal, single-dry, and multiple-dry years through the 20-year planning period. However, the available supply shown above in Table 7-4 assumes that the District develops an imported water supply from WMWD or an alternate source as noted on Table 6-9.

7.4 Regional Supply Reliability

JCSD will continue making efforts to maximize the use of local water resources and minimize the need to import water. District actions such as increased implementation of demand management measures, increased use of recycled water, and enhanced groundwater management are anticipated.

Demand management measures implemented by JCSD are outlined in Chapter 9, and are designed to help JCSD meet its water use reduction targets as defined in Chapter 5. Although the District has achieved the target for water conservation pursuant to SB X7-7, it is understood that drought conditions are likely ongoing in the foreseeable future. And therefore, water conservation efforts are planned to continue and expand to reduce potable water use to the maximum extent practicable. To encourage water use reductions during drought conditions, JCSD has developed a multi-level Water Shortage Contingency Plan, as discussed in detail in Chapter 8 of this UWMP.

The District has also made efforts to replace some non-potable and potable landscape water use with an equal allotment of treated water from the WRCRWA plant. Notably, using recycled water as groundwater recharge and/or other beneficial uses is expected to expand in the Chino Basin. JCSD aims to partner with pertinent agencies to bring recycled water supplies into its supply portfolio.

JCSD primarily relies on local Chino Basin groundwater supplies to meet water demands, which due to its size and constraints, requires extensive management and monitoring. The Chino Basin Optimum Basin Management Plan (OBMP) is administered by the Watermaster to protect the basin from overproduction by way of nine elements. The element that could potentially impact JCSD's supply directly is Program Element 2, which addresses the recharge program (OBMP Phase I, 1999). The decisions and infrastructure related to this OBMP element will be used to balance long-term groundwater production. Similarly, JCSD will continue supporting storm water capture and infiltration projects within its service area and local Chino Basin Management Zone.

Although JCSD will continue utilizing local water supplies to the maximum extent practicable following the intent of CWC §10620 to minimize the need to import water from other regions, the District has chosen to diversify the supply portfolio with the DYY Program and future purchases

from WMWD. Local water supplies will continue to constitute a majority of JCSD's supply portfolio, as previously shown in **Table 6-9**.

CHAPTER 8: WATER SHORTAGE CONTINGENCY PLANNING

Water shortage contingency planning is a strategic planning process to prepare for and respond to water shortages. Good planning and preparation helps agencies maintain reliable supplies and reduce the impacts of supply interruptions. Water supplies may be interrupted or reduced significantly in a number of ways, such as an ongoing drought that limits recharge, or a large earthquake that damages water delivery or storage facilities, a regional power outage, or a toxic spill that affects water quality. This Chapter describes how JCSD will implement staged responses to a water shortage that occurs over a period of time, as well as catastrophic supply interruptions which occur suddenly.¹

California is currently in its fourth year of a significant drought, which impacts California's water supplies and its ability to meet all of the demands for water in the state. Thus, the SWRCB formally adopted emergency regulations in spring of 2015 prohibiting certain types of potable water use, ordering all urban water suppliers to implement mandatory conservation measures, and requiring water providers with 3,000 or more service connections to provide monthly data on water production.

In May 2015, in response to these emergency regulations, the JCSD Board of Directors adopted Ordinance No. 389 which is provided in **Appendix M**. This Ordinance sets forth a five-level Water Shortage Contingency Plan (WSCP), which details mandatory water conservation measures as described herein.

On May 9, 2016, Governor Brown issued Executive Order B-37-16,² which directs DWR to publish draft requirements by January 10, 2017 to strengthen urban WSCPs. The Executive Order states, "These updated requirements shall include adequate actions to respond to droughts lasting at least five years, as well as more frequent and severe periods of drought." JCSD will update the WSCP described herein according to future regulations.

In light of the Governor's Executive Order B-37-16 (May 9, 2016), the District is considering modifications to some of the language of JCSD Ordinance No. 389.

¹ According to DWR UWMP Guidelines, a WSCP can be created separately from the UWMP and amended as needed without amending the corresponding UWMP. JCSD has updated its WSCP from the 2010 UWMP and included herein.

² https://www.gov.ca.gov/docs/5.9.16_Executive_Order.pdf

8.1 Stages of Action

The number of stages of action in a WSCP is at the discretion of each water supplier. The stages reflect increasing levels of prohibitions and consumption reduction methods. JCSD Ordinance No. 389 describes the District's five-level WSCP to be invoked during declared water shortages. Notably, the District maintains that Stage 1 is in force at all times and prohibits water waste. The WSCP includes both voluntary and mandatory rationing depending on the causes, severity, and anticipated duration of the water supply shortage. Therefore, the District may declare a Drought Emergency (Level 5) at any time based on the current circumstances, without regard to the Drought Response Level previously in effect. The five-level program is outlined in **Table 8-1** and detailed in Ordinance No. 389 provided in **Appendix M**:

| Table 8-1 Retail Stages of Water Shortage Contingency Plan | | |
|---|--|--|
| Stage | Complete Both | |
| | Percent Supply Reduction ¹ <i>Numerical value as a percent</i> | Water Supply Condition <i>(Narrative description)</i> |
| <i>Add additional rows as needed</i> | | |
| 1 | 10% | Drought Watch |
| 2 | 20% | Drought Caution (10-20% reduction target) |
| 3 | 30% | Drought Alert (20-30% reduction target) |
| 4 | 40% | Drought Critical (30-40% reduction target) |
| 5 | 40% | Drought Emergency (40%+ reduction target) |
| ¹ One stage in the Water Shortage Contingency Plan must address a water shortage of 50%. | | |
| NOTES: Water shortage of 50% addressed in Level 5 Drought Emergency | | |

The General Manager shall monitor drought conditions and regulations, evaluate the supply and demand for water within the service area, and recommend the Drought Response Level to be declared to the Board of Directors. The Board of Directors may declare Drought Response Levels 1 through 5 by resolution of the Board and adopted at a regular or special public meeting, in accordance with State law. A Drought Response Level shall remain in full force and effect until discontinued by resolution of the Board of Directors.

Within ten days of declaration of a drought response level, the District shall publish notice in a newspaper used for such notices and on the JCSD Web site. Customers will be notified of water allocations associated with Drought Response Levels 4 or 5 by mailing to the address where the

billing statement is normally sent, and shall take effect on the fifth day following mailing of notice, or at a later date as specified on the notice. On May 26, 2015, the JCSD Board of Directors adopted Level 3 Drought Alert conditions.

Drought Response Level 1 – Drought Watch Condition

A Level 1 condition applies when the Board of Directors requests all water users to voluntarily reduce their water use up to 10 percent. During a Level 1 Drought Watch condition, the District will increase its public education and outreach efforts to implement the voluntary water conservation practices listed in **Table 8A** (located at end of this section).

Drought Response Level 2 – Drought Caution Condition

A Level 2 condition applies when the Board of Directors mandates all water users to reduce their water use more than 10 percent and up to 20 percent. The water conservation measures required in addition to Level 1 measures are presented in **Table 8A**. Beginning with Drought Response Level 2, violation of the mandatory water conservation measures shall be subject to civil penalties.

Drought Response Level 3 – Drought Alert Condition³

A Level 3 condition applies when the Board of Directors mandates all water users to reduce their water use more than 20 percent and up to 30 percent to ensure sufficient supplies. The water conservation measures required in addition to Level 1 and Level 2 measures are presented in **Table 8A**. According to Ordinance No. 389, new service availability letters will be issued by JCSD provided that the applicant proves to the satisfaction of the District of an enforceable commitment that water demands for the project will be offset by 100 percent prior to the provision of a new water meter. However, in light of the JCSD 2015 Capacity Charges Study (Carollo, 2016), the District has chosen to implement JCSD Resolution No. 2627 and specifically, a new Water Resources Capacity Charge (**Appendix N**).⁴ New customers are billed a one-time Water Resources Capacity Charge upon connecting to the water system in order to recover the costs related to securing additional water resources. Therefore, during Drought Level 3 Conditions, new customers are conditioned to pay the Water Resources Capacity

³ At the time of this Plan preparation, the JCSD Board of Directors adopted Level 3 Drought Alert conditions (beginning May 26, 2015).

⁴ JCSD also adopted Resolution No. 2628 to establish a revised Sewer Capacity Charge to recover the cost of future sewer infrastructure capacity (**Appendix N**).

Charge instead of providing an enforceable commitment to offset demands by 100 percent. In light of the Governor's Executive Order B-37-16 (May 9, 2016), the District is considering modifications to some of the language of JCSD Ordinance No. 389.

Drought Response Level 4 – Drought Critical Condition

A Level 4 condition applies when the Board of Directors mandates all water users to reduce their water use more than 30 percent and up to 40 percent to ensure sufficient supplies. The water conservation measures required in addition to Level 1, Level 2, and Level 3 measures are presented in **Table 8A**. Upon declaration of a Level 4 condition, the issuance of new service availability letters shall be suspended, unless already approved, provided the applicant provides proof to the satisfaction of the District of an enforceable commitment that water demands from the project will be offset by 125 percent prior to the provision of a new water meter.⁵ In light of the Governor's Executive Order B-37-16 (May 9, 2016), the District is considering modifications to some of the language of JCSD Ordinance No. 389. New connections and temporary construction meters shall be permitted as necessary under the discretion of the Board of Directors to protect public's health, safety and welfare.

Beginning with Level 4, the District shall also suspend consideration of annexations to its service area, unless the annexation increases the water supply available to the District by more than the anticipated demands of the property to be annexed. Also beginning with a Level 4 condition, the Board of Directors will determine the Water Allocation Target for each property served. The calculation will only be applied to consumption in excess of the Public Health and Safety threshold of eleven units per monthly billing period.

Drought Response Level 5 – Drought Emergency Condition

In the event of a water shortage of more than 40 percent, or at any other time the Board of Directors deems necessary, the Board of Directors may consider a moratorium on new service connections regardless of approved water availability letters. The water conservation measures required in addition to Level 1, Level 2, Level 3, and Level 4 measures are presented in **Table 8A**. The Water Allocation Target percentage calculations would be continued from Level 4.

⁵ Substituting this requirement with imposition of the Water Resources Capacity Charge is at the discretion of the District at such time they enter Drought Level 4.

Table 8A: Drought Response Level Water Conservation Measures

| Prohibition | Voluntary | Prohibition is mandatory | | | |
|---|-----------|--------------------------|---------|---------|---------|
| | Level 1 | Level 2 | Level 3 | Level 4 | Level 5 |
| Do not use water to wash down paved surfaces | X | X | X | X | X |
| Adjust sprinklers and irrigation systems to avoid overspray, runoff, and waste | X | X | X | X | X |
| Irrigate all landscapes before dawn, and never between 8:00 AM and 8:00 PM | X | X | X | X | X |
| Irrigation is prohibited during and 48 hours after measurable rain | X | X | X | X | X |
| Agricultural users are requested to reduce water usage and consult with local Resource Conservation District as needed for appropriate measures | X | X | X | X | X |
| Developers and residents are encouraged to design and install water-efficient landscaping and minimize turf areas | X | X | X | X | X |
| Install water saving devices in indoor plumbing | X | X | X | X | X |
| Check for and repair leaks both indoors and outdoors | X | X | X | X | X |
| Use re-circulated water in decorative features | X | X | X | X | X |
| Wash motor vehicles and other mobile equipment with a bucket or hand-held hose with positive shut-off valve | X | X | X | | |
| Vehicles may only be washed at commercial carwashes | | | | X | X |
| Restaurants do not serve water unless requested | X | X | X | X | X |
| Hotels and motels must provide guests with a no-wash option | X | X | X | X | X |
| Limit all outdoor irrigation to 4 days per week, no more than 10 minutes per station per day; does not apply to functional landscapes. | | X | | | |
| Limit all outdoor irrigation to 3 days per week, no more than 10 minutes per station per day; functional landscapes watering limited to 4 days per week | | | X | | |
| Limit all outdoor irrigation to 2 days per week, no more than 10 minutes per station per day; functional landscapes watering limited to 3 days per week | | | | X | X |
| Irrigation will be limited to odd-numbered addresses on Mondays, Wednesdays, Fridays and even-numbered addresses on Tuesdays, Thursdays, Saturdays | | | X | | |
| Irrigation will be limited to odd-numbered addresses on Mondays and Thursdays, even-numbered addresses on Tuesdays and Fridays | | | | X | X |
| Ornamental landscapes with properly operating water-efficient devices can be irrigated 30 minutes/station/day for drip irrigation or 20 minutes/station/day for stream rotors on the days authorized for landscape irrigation | | X | X | X | X |
| Repair or stop leaks within 72 hours of notification | | X | | | |
| Repair or stop leaks within 48 hours of notification | | | X | X | X |
| No irrigation of turf on public medians | | | X | X | X |
| Irrigation with potable water outside newly constructed homes inconsistent with CBSC or DHCD standards is prohibited ⁶ | | | X | X | X |
| Each developer must submit a Water Conservation Plan prior to using water for dust control and grading at construction sites | | | X | X | X |
| The District may establish a water allocation for each property served | | | | X | X |

⁶ CBSC = California Building Standards Commission, DHCD = Department of Housing and Community Development

JCSD Resolution No. 2499 was approved by the Board of Directors on August 11, 2014 to elevate the District to Drought Response Level 2. According to staff records, residential water use (as R-GPCD) at that time was 179.2. More than nine months later, the JCSD Board of Directors approved Resolution No. 2542 on May 26, 2015 to elevate the District to Drought Response Level 3. From the time JCSD went from Level 2 to Level 3, residential water use decreased from 179.2 GPCD to 119.6 GPCD (a 33% drop). Since May 26, 2015 to April 2016 (the most recent month of records), JCSD residential water use has decreased nearly 14 percent from 119.6 GPCD to 103 GPCD.

8.2 Prohibitions on End Uses

JCSD Ordinance No. 389 defines and prohibits unreasonable uses of water regardless of the Drought Response Level in effect. These uses include, but are not limited to, the following:

- Allowing water to flow from a person's property onto adjacent properties, roadways, or streets due to excessive irrigation and/or leaks;
- Failing to repair a water leak;
- Using water to wash down sidewalks, driveways, parking areas, or other paved areas, except to alleviate immediate safety or sanitation hazards; and
- Watering lawns and/or groundcovers and irrigating landscaping between the hours of 8:00 AM and 8:00 PM.

In addition to the above listed restrictions, **Table 8-2**, details the specific prohibitions on end uses associated with each Drought Response Level.

| Table 8-2 Retail Only: Restrictions and Prohibitions on End Uses | | | |
|--|--|---|---|
| Stage | Restrictions and Prohibitions on End Users <i>Drop down list</i> <i>These are the only categories that will be accepted by the WUEdata online submittal tool</i> | Additional Explanation or Reference (optional) | Penalty, Charge, or Other Enforcement? <i>Drop Down List</i> |
| Add additional rows as needed | | | |
| 1 | Other - Prohibit use of potable water for washing hard surfaces | Note: During a Level 1 Drought Watch Condition, the Board will request all water users to make the following voluntary reductions in water use. | No |
| 1 | Landscape - Restrict or prohibit runoff from landscape irrigation | Adjust sprinklers to avoid overspray, avoid watering on windy days. | No |
| 1 | Landscape - Limit landscape irrigation to specific times | Irrigation is limited to before 8 AM and after 8 PM. | No |
| 1 | Landscape - Other landscape restriction or prohibition | Irrigation is prohibited during at for 48 hours after measurable rain. | No |
| 1 | Other | Agricultural users are encouraged to meet with Conservation District staff to identify water conservation measures. | No |
| 1 | Other | Residents/developers are urged to install waterwise landscaping/minimize turf areas. | No |
| 1 | Other | Install water saving devices indoors. | No |
| 1 | Other - Customers must repair leaks, breaks, and malfunctions in a timely manner | Check for leaks indoors/outdoors and repair them immediately. | No |
| 1 | Water Features - Restrict water use for decorative water features, such as fountains | Use re-circulated water in these features. | No |
| 1 | Other - Require automatic shut of hoses | Wash vehicles/etc. with a hose and shut-off nozzle, or at a commercial site. | No |
| 1 | CII - Restaurants may only serve water upon request | Also applicable in other public places where food is served. | No |
| 1 | CII - Lodging establishment must offer opt out of linen service | Notice of this option should be displayed prominently in each room. | No |

(continued on next page)

| Table 8-2 Retail Only: Restrictions and Prohibitions on End Uses | | | |
|--|--|--|---|
| Stage | Restrictions and Prohibitions on End Users <i>Drop down list</i> <i>These are the only categories that will be accepted by the WUEdata online submittal tool</i> | Additional Explanation or Reference <i>(optional)</i> | Penalty, Charge, or Other Enforcement? <i>Drop Down List</i> |
| Add additional rows as needed | | | |
| 2 | Landscape - Other landscape restriction or prohibition | Limit all outdoor irrigation to 4 days per week and no more than 10 minutes per station. (separate requirement for ornamental landscape) | Yes |
| 2 | Other - Customers must repair leaks, breaks, and malfunctions in a timely manner | All leaks must be repaired/stopped within 72 hours of notification. | Yes |
| 3 | Landscape - Other landscape restriction or prohibition | Limit irrigation to 3 days per week, 10 minutes per station. | Yes |
| 3 | Landscape - Limit landscape irrigation to specific days | Odd and even addresses water on opposite days. | Yes |
| 3 | Landscape - Other landscape restriction or prohibition | No irrigation of turf on public medians. | Yes |
| 3 | Landscape - Prohibit certain types of landscape irrigation | Irrigation with potable water outside of newly-constructed homes and buildings inconsistent with CBSC standards. | Yes |
| 3 | Other | Restrict use of potable water for dust control, projects must submit Water Conservation Plan for construction | Yes |
| 3 | Other - Customers must repair leaks, breaks, and malfunctions in a timely manner | Repair or stop leaks within 48 hours | Yes |
| 4 | Landscape - Other landscape restriction or prohibition | Limit outdoor irrigation to 2 days per week, 10 minutes per station. (Some exemptions for safety/ornamental landscapes) | Yes |
| 4 | Landscape - Limit landscape irrigation to specific days | Odd and even addresses water on opposite days. | Yes |
| 4 | Other - Prohibit vehicle washing except at facilities using recycled or recirculating water | Vehicles can only be washed at commercial carwashes. | Yes |
| 5 | Other | District will calculate water allocation amounts at Drought Response Level 5. | Yes |

As can be seen in **Table 8-2**, JCSD is pursuing a variety of enforcement mechanisms to ensure that the targeted reductions at each Drought Response Level are met. Upon declaration of Drought Response Level 4 or 5, specific allocations may be established for each property served. Water allocation targets will be calculated for each account by comparing usage in the current billing period to the same period identified in the resolution.

8.3 Penalties, Charges, Other Enforcement of Prohibitions

The District will make a reasonable effort to assist customers with compliance, including personal contact, door hanger, letter, email, or telephone to notify customers of violation. Violation of the mandatory water restrictions associated with Drought Response Levels 2 through 5 will be subject to civil penalties set forth in Section 10.0 of Ordinance No. 389, as well as all other criminal and civil sanctions available under State law. During Drought Response Level 1, all reduction measures are voluntary.

As outlined in Section 10.0 of Ordinance No. 389, each day that a violation occurs is a separate offense. First violation of any provision will result in a civil penalty fee of \$25.00; fees associated with any other provisions within one year of the first violation of any provision of Ordinance No. 389 will be assessed as follows in **Table 8B**.

Table 8B: Civil Penalties for Violations of Drought Levels 2-5 Water-Use Restrictions

| | |
|------------------|----------|
| First Violation | \$25.00 |
| Second Violation | \$50.00 |
| Third Violation | \$100.00 |
| Fourth Violation | \$200.00 |
| Fifth Violation | \$500.00 |

If a water allocation has been imposed by the District during a Drought Response Level 4 or Level 5, water use in excess of the violation shall also constitute a violation. Water use in excess of the water allocation target per equivalent dwelling unit in any monthly period shall constitute a first offense, resulting in written notification. Monthly water use in excess of the water allocation target of any provision in any subsequent monthly billing period within one year of the first violation will constitute subsequent violation and the user will be assessed fees according to the following schedule:

Table 8C: Civil Penalties for Violations of Water Allocation Target

| | |
|------------------|----------------------|
| First Violation | Written Notification |
| Second Violation | \$20.00 |
| Third Violation | \$50.00 |
| Fourth Violation | \$100.00 |
| Fifth Violation | \$250.00 |
| Sixth Violation | \$500.00 |

When a civil penalty is to be imposed, the customer will be given written notification of the penalty to be imposed. The customer then has seven days to contest the penalty, and the District will hold a hearing within 14 days if requested. Penalty amounts may be separately itemized on the Districts monthly bill for water service, and will be due at the same time and in the same manner as charges for water service. Penalties collected will be used solely to implement and enforce water conservation measures.

Violation of a provision of this ordinance is subject to enforcement through installation of a flow-restricting device at the meter and could also be persecuted as a misdemeanor, punishable by imprisonment or fines. Willful violations could also constitute cause for termination of service to the property in violation.

8.4 Consumption Reduction Methods

In addition to the drought action stages described in Chapter 8.1 and the end-use restrictions described in Chapter 8.2, the District's water conservation program also includes provisions aimed at reducing water demand within the service area. This is described in Chapter 9.1.4, Public Education and Outreach.

As summarized from Chapter 8.1, when the Board of Directors declares a Drought Response Level 1, the District will make an effort to expand its drought public information campaign. Under Drought Response Level 4, issuance of new service letters may be suspended, but new connections will be allowed pursuant to service availability letters then in effect provided that the applicant provides substantial evidence, to the satisfaction of the District, of an enforceable commitment that water demands for the project will be offset by 125 percent prior to provision of a new water meter.⁷ There may be a moratorium on new service connections under Drought Response Level 5 conditions. Additionally, under Drought Response Levels 4 and 5, the District will suspend consideration of any proposed annexations to its service area unless the annexation would increase the water supply available to the District by more than the anticipated demands of the property to be annexed.

The consumption reduction methods from the stages of action of the WSCP are outlined in **Table 8-3**.

⁷ Substituting this requirement with imposition of the Water Resources Capacity Charge is at the discretion of the District at such time they enter Drought Level 4.

Table 8-3 Retail Only: Stages of Water Shortage Contingency Plan - Consumption Reduction Methods

| Stage | Consumption Reduction Methods by Water Supplier <i>Drop down list</i> <i>These are the only categories that will be accepted by the WUEdata online submittal tool</i> | Additional Explanation or Reference <i>(optional)</i> |
|--------------------------------------|---|--|
| <i>Add additional rows as needed</i> | | |
| 1 | Expand Public Information Campaign | During a Drought Watch Level 1 condition, the District will increase its public education and outreach efforts to enhance awareness of the need to implement water conservation measures. |
| 3 | Moratorium or Net Zero Demand Increase on New Connections | Issuance of new service availability letters shall be allowed provided that the applicant provides substantial evidence that the water demands will be offset 100% prior to the provision of new water meters. |
| 4 | Moratorium or Net Zero Demand Increase on New Connections | Issuance of new service letters shall be suspended, but new connections shall be allowed pursuant to service availability letters provided that the applicant provides substantial evidence to the satisfaction of the District of an enforceable commitment that water demands will be offset by 125% prior to provision of new water meters. |
| 4 | Other | The District will suspend consideration of annexations to its service area, unless the annexation would increase the water supply available to the District by more than the anticipated demands of the annexed property. |
| 4 | Other | The District may establish a water allocation for property served. Separate methods will be used for residential/multi-family customers and other accounts. |
| 5 | Moratorium or Net Zero Demand Increase on New Connections | The Board may consider a moratorium on new service connections, regardless of the existence of water availability letters for such connections. |
| 5 | Other | The District may establish a water allocation for property served. Separate methods will be used for residential/multi-family customers and other accounts. |

A drought rate structure or surcharge that is implemented in times of water shortage differs from a conservation rate structure (described in Chapter 9.1.3 and **Appendix O**), which is in place at all times.⁸ JCSD does not utilize a drought rate structure at this time.

⁸ When considering a new rate structure, some water suppliers have embedded a drought rate structure within their proposed conservation rate structure. This can help avoid the difficulty and delay of instituting a drought structure during an emergency and streamlines the public process so that all rate structures are reviewed together.

8.5 Determining Water Shortage Reductions

CWC §10632(a)(9) requires, “A mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.” JCSD meets this requirement by relying upon water meters to record the production and consumption of water. JCSD issues bills to their customers on a monthly basis. The prior year’s consumption is included on most customer bills, which allows for comparison of the total consumption from each billing period to the same billing period from the prior year. The Conservation Coordinator (discussed in Chapter 9.1.6) reports the Residential-GPCD (as volume pumped/produced) to the SWRCB as required in the statewide drought regulations. The volume pumped/produced per meter across all customers (e.g., residential, industrial, non-potable, etc.) has decreased 23 percent from 2013 to 2015.

Under “normal” supply conditions, potable water production figures are recorded daily. Totals are reported weekly to the Operations Manager and incorporated into the water supply report. During drought conditions, the JCSD Operations Department reports weekly production figures to the Conservation Coordinator, who then prepares a monthly report to the Board of Directors. The report updates the Board members on progress toward the water conservation target.

8.6 Revenue and Expenditure Impacts

As described in Section 8.3, above, JCSD has established a graduated fee structure for successive violations of water use restrictions during each Drought Response Level. Any penalties collected under this policy will be used to implement and enforce water conservation measures.

In June 2012, JCSD adopted a Reserve Policy (Policy No. 2007-02) to ensure that the District will have sufficient funding available to meet the District’s operating, capital, and debt service obligations. Reserves are managed in a manner that allows JCSD to fund costs consistent with its annually updated Capital Replacement Program as well as other long term plans while avoiding significant rate fluctuations due to changes in cash flow requirements.

One component of this Reserve Policy is a Rate Stabilization Fund, established specifically to shield the Water Fund from the financial effects of extraordinary circumstances. This Reserve is in place to ensure that the District can meet costs of necessary services while lessening the impact of otherwise significant changes in user fees, in any one year. Funding is determined at

the end of each fiscal year based on analysis of available funds remaining based on the District's operations as presented in the audited financial statements.

8.7 Resolution or Ordinance

The District approved the current WSCP outlined above under Ordinance No. 389 on May 26, 2015 (**Appendix M**). It became effective immediately as an urgency ordinance in accordance with CWC §376. This Ordinance replaced Ordinance No. 387, the District's previous WSCP. The District is considering modifications to Ordinance No. 389 in light of the Governor's Executive Order B-37-16.

8.8 Catastrophic Supply Interruption

JCSD adopted an Emergency Response Plan (ERP) in January 2016 to ensure that District services can safely resume normal operation as quickly as possible following any natural, weather-related, man-made, or technological disaster.⁹ The goals of the ERP are as follows:

- Rapidly restore service after an emergency;
- Ensure adequate water service for fire suppression;
- Minimize water or electrical system damage;
- Minimize impact and loss to customers; and
- Provide emergency public information concerning customer services.

To accomplish these goals, JCSD has adopted an Incident Command System (ICS) to organize emergency response efforts by clearly establishing a uniform set of processes and procedures that can be used to conduct response operations. Standard Operating Procedures included in the ICS include, but are not limited to, search and rescue, first aid, and medical emergency responses. JCSD has a designated Safety Coordinator who is responsible for establishing and implementing the ERP, and all JCSD staff are trained on these policies.

The ERP identifies earthquakes and fires as the two greatest natural threats to the service system. In order to mitigate risks associated with these events, JCSD's facilities were designed and built to withstand earthquakes. Most of the District's systems are built of concrete and steel,

⁹ Required by the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (Public Law 107-188).

but the potential for electrical and structural fires still exists. In addition to causing structural damage, both earthquakes and fires could cause regional power outages. JCSD has installed standby power sources and repair supplies at strategic locations to lessen this risk to service disruption. The District's potable wells that are equipped with back-up generators at this time are listed in the Water Supply Outlook in **Appendix J**. More than half of JCSD's potable wells are equipped with back-up generators with a generator-based production rate of 24,925 gpm, which is 71 percent of the total current production rate. Therefore, in the event of a regional power outage and wells were run on generators, the District could provide approximately 71 percent of their current demand. Standby generators are also installed at all JCSD booster stations. Furthermore, each of JCSD's 17 storage tanks totaling 56.7 million gallons of storage has dedicated emergency water supply equal to 75 percent of maximum day demand, in addition to supply reserved to meet fire flow, and peak demands.

JCSD is a member of the statewide Water/Wastewater Agency Response Network (CalWARN) that functions in coordination with the State Office of Emergency Services. CalWARN is a network of agencies that support and promote statewide emergency preparedness, disaster response, and mutual assistance for public and private water and wastewater utilities.

JCSD is also a member of the Emergency Response Network of the Inland Empire (ERNIE), which facilitates public agency preparedness for, response to, and recovery from local and regional disasters. Agencies volunteer to enter into an agreement to provide mutual aid and assistance to other member agencies. ERNIE assists agencies with trainings, communication, documentations for reimbursement, concept of emergency operations, and writing after-action reports and corrective action plans.

In addition to the ERP, the District has prepared a Hazard Mitigation Plan and Vulnerability Assessment (confidential), which are updated bi-annually.

In addition to drought, earthquake, fire, and power outages, the District's ERP considers appropriate responses to floods, waterborne diseases, vandalism, terrorism, pandemic, system neglect, cross connections, backflow conditions, construction accidents, chemical spills, and sewage spills.

Notably, SARWC has just one well and depends on JCSD's pass-through system to deliver the majority of its water supply. If JCSD's operations are impacted by a disaster, drinking water

would be jeopardized temporarily to SARWC. Nevertheless, in the event of a regional disaster many other water sources may also be jeopardized and it is critical that JCSD can return to full operation as quickly and safely as possible.

As a result of preparing this UWMP, JCSD identified a potential future need to review and update the District's catastrophic event response procedures, so that they are consistent with current State guidance.

8.9 Minimum Supply Next Three Years

The minimum supply available during the next three years would occur during a three-year multiple-dry year event between 2016 and 2018. JCSD, like most water suppliers in the State, is operating in the fourth year of a statewide drought and are subject to drought regulations to reduce demand. The District anticipates drought regulations to continue. On May 9, 2016, Governor Brown issued Executive Order B-37-16 to establish longer-term water conservation measures, including permanent monthly water use reporting, new permanent water use standards in California communities and bans on clearly wasteful practices such as hosing-off sidewalks, driveways and other hardscapes.

The minimum supply available to JCSD during each of the next three water years based on the driest three-year historic sequence (i.e., 2013-2015) is expected to meet minimum anticipated demand, as shown in **Table 8-4**.

| Table 8-4 Retail: Minimum Supply Next Three Years | | | |
|--|--------|--------|--------|
| | 2016 | 2017 | 2018 |
| Available Water Supply | 21,969 | 22,411 | 22,860 |
| NOTES: Volume in AF, CY data from JCSD Finance Dept. | | | |

The volumes shown in Table 8-4 are based off 2015 actual demand volumes, which are considered significantly depressed in response to several years of drought regulations and water conservation. The difference between years in Table 8-4 is conservatively assumed at 2 percent growth. As described in Chapter 7, water supplies available to JCSD are limited in most part by costs of pumping and replenishment assessments. Therefore, JCSD has adequate supplies available to meet projected demands should the multiple-dry year period continue for the next three years.

This Page Intentionally Blank

CHAPTER 9: DEMAND MANAGEMENT MEASURES

This chapter provides a comprehensive description of the water conservation programs that JCSD has implemented, is currently implementing, and plans to implement in the future to meet its urban water use reduction targets. The section of the CWC that addresses Demand Management Measures (DMMs) was significantly modified in 2014, based on recommendations from the Independent Technical Panel to the State Legislature. The Panel was formed by DWR to provide information and recommendations to DWR and the Legislature on new DMMs, technologies, and approaches to water use efficiency. The Panel recommended, and the legislature enacted, streamlining the retail agency requirements from 14 specific measures to six general requirements plus an “other” category, as discussed below.

9.1 Demand Management Measures for Retail Agencies

This section communicates JCSDs efforts to promote conservation and reduce the demand for water supplies with programs to implement each of the following DMM categories. As required by CWC §10631, each DMM description includes how the measure has been implemented over the past five years, and how future projects will help the District continue to meet its water use targets described in Chapter 5.

9.1.1 Water Waste Prevention Ordinances

The JCSD Board of Directors adopted Ordinance No. 389 on May 26, 2015, which contains the District’s Water Conservation Program (and water waste ordinance). The Ordinance is provided in **Appendix M**. A water waste ordinance explicitly states that the waste of water is to be prohibited. According to DWR, the ordinance may prohibit specific actions that waste water, such as excessive runoff from landscape irrigation, or use of a hose outdoors without a shut off nozzle. It is in place at all times and is not dependent upon a water shortage for implementation. However a water waste ordinance may include increasingly restrictive prohibitions that may be implemented in response to shortages (DWR 2015 UWMP Guidebook).

Because the SWRCB adopted additional emergency regulations for urban water suppliers on March 17, 2015 and May 5, 2015, Ordinance 389 was prepared as an update and replacement of JCSD Ordinance No. 387 that was adopted in response to the first emergency regulations adopted by the SWRCB on July 15, 2014. Article 3.0, Item A of Ordinance 389, states: “The water conservation measures set forth in this Article 3.0 shall be in effect at all times and shall

be subject to the penalties hereafter set forth.” Item B continues, “It shall be unlawful for any Person to waste water or to use it unreasonably.” The Ordinance includes the five Drought Response Levels (of which the District is always in one), prohibitions, and penalties as detailed in Chapter 8.

➤ **Implementation Over the Past Five Years**

JCSD actively pursues incidents of water waste. They are investigated by staff and, depending on the nature of the situation, noticed to the property owner, repaired, or disconnected in cases of excessive leakage and/or facilities failure.

➤ **Planned Implementation to Achieve Water Use Targets**

Water waste has always been a priority of JCSD and will continue to be a focus of their operations. The District allocates a portion of its annual Capital Improvement Plan budget for waterline replacement projects based on information from the JCSD Master Water Plan Update (Sept., 1982). The pipeline replacement program uses the following criteria to discern which pipes are replaced each year:

1. Leakage: District Water Operations data suggests leaking or ruptured pipes;
2. Size: Pipeline diameters that do not meet minimum State requirements;
3. Fire Flow: Maximum velocities that exceed 10 feet per second;
4. Inefficient System Operations: Old pipes that could rupture when water pumped in from a high pressure zone is then depressurized;
5. Odd Sizes: Maintenance is problematic with oddly-sized pipes (3 inch and 5 inch diameters) due to their nonconformity with standard water system sizes.

9.1.2 Metering

JCSD is fully metered. Since the last UWMP in 2010, the District replaced all residential and non-residential (potable and non-potable) water meters. JCSD uses Automatic Meter Reading (AMR) on all of their service connections. AMR is a technology of automatically collecting consumption data from water meters and transferring that data to a central database for billing, troubleshooting, and analysis. AMR can reduce the cost of meter reading, provide real-time information, reduce billing errors, monitor tampering and promotes conservation with time-of-use consumption.

➤ **Implementation Over the Past Five Years**

As discussed previously, during the past five years the District completed an effort to become fully metered with an AMR system at all of its service connections.

➤ **Planned Implementation to Achieve Water Use Targets**

Over the next five years, the District will continue its efforts to ensure that all service connections are fully metered and a part of their AMR system. Meters will continue to be updated, replaced, and repaired as needed.

9.1.3 Conservation Pricing

Conservation pricing sends a signal to customers regarding their water use. For example, the rates might be tiered at progressively higher prices to encourage efficient water use. Like a water waste ordinance, a conservation pricing structure is always in place and is not dependent upon a water shortage for implementation; although, a conservation rate structure could include *drought* rate structures.

JCSD Board of Directors adopted Resolution No. 2511 on November 10, 2014 (effective January 1, 2015) establishing rates for water service through 2019. The complete Resolution is provided in **Appendix O**. Customers are charged for water based on their meter size for a monthly service charge and second, based on their volume of water use. There are different charges for potable meters and non-potable irrigation meters, as well as fire hydrants, and private fire protection lines. Most residences in the District have a 3/4-inch meter. Irrigation meters are either 1½-inch or 2-inch and commercial/institutional/industrial customers vary from the smallest (5/8x3/4-inch) to the largest (10-inch). In 2015, the monthly service charges range from \$25.36 for a 5/8x3/4-inch meter to \$2,208.71 for a 10-inch meter.

The second monthly charge is from a four-tier rate structure based on the volume of water used measured in “hundred cubic feet” (HCF), as shown below in **Table 9A**.

Table 9A: JCSD Tiered Rate Structure for Potable Water, 2015-2019

| HCF | 2015 | 2016 | 2017 | 2018 | 2019 |
|---------------------------------|--------|--------|--------|--------|--------|
| Tier 1: 0-20 HCF | \$1.41 | \$1.51 | \$1.46 | \$1.49 | \$1.52 |
| Tier 2: 21-50 HCF | \$1.79 | \$1.92 | \$1.85 | \$1.89 | \$1.93 |
| Tier 3: 51-100 HCF | \$2.06 | \$2.21 | \$2.13 | \$2.18 | \$2.22 |
| Tier 4: Over 100 HCF | \$2.30 | \$2.46 | \$2.38 | \$2.43 | \$2.48 |

Reproduced from Resolution No. 2511, page A-2.

Fire hydrant meters and private fire protection lines (if use is unauthorized)¹ are also subject to their own tiered rate structures as shown in Resolution 2511 (**Appendix O**). Non-potable irrigation meters do not have a tiered rate structure at this time; however there are currently 10 non-potable irrigation meters that do not constitute a significant source of demand (539 AF, or 2.5 percent of total delivered in 2015).

➤ **Implementation Over the Past Five Years**

The District has initiated several financial studies and updates to their water rate schedules since the 2010 UWMP. This tiered commodity charges have increased over this period of time, and are projected to increase through 2019 per JCSD Resolution No. 2511. In addition, the District adopted a HCF Quantity Charge in addition to the monthly base rate for sewer services in Resolution No. 2512. These changes in rates are designed to encourage water conservation and have resulted in a decrease of per capita water consumption along with other conditions including economic swings and drought regulations. Since 2011, JCSD has realized an 18 percent drop in total water production per customer concurrently with a 10 percent increase of connections.

Beginning in June of 2015, JCSD and the City of Eastvale partnered to offer “E-Citizen,” a free smart phone application for the public to report water waste and other non-emergency issues. Users can upload a photo or video of the issue and mark the geographic location on a map. Each request can then be tracked for follow-up by the

¹ Unauthorized use of private fire lines for non-fire protection use will result in a quantity charge per each HCF (hundred cubic feet) used without proper authorization from the District. If use is authorized, then there is tiered quantity charge in addition to the monthly standby service charge.

District. In 2015, 445 reports of water waste or property flooding were sent to the District. So far in 2016, the District has received 278 reports of water waste.

➤ **Planned Implementation to Achieve Water Use Targets**

The District will continue striving for conservation pricing that is on par with industry standard to be effective, yet fair and equitable.

9.1.4 Public Education and Outreach

JCSD continues to educate their customers about the importance of meeting water reduction targets through a number of avenues including print materials and neighborhood and school presentations. Education and Outreach is typically divided into two different areas: Residential/CII (Commercial, Industrial, and Institutional) and School Outreach.

Residential/CII: Community education programs include informational booths at community events including the 4th of July celebration, Healthy Jurupa Events, Home Depot Plant Sales, and the Community Fall Festival. Also, JCSD coordinates “Drought Drop Ins,” wherein JCSD staff visit various neighborhoods and set up water conservation information booths. Invitations to these events are mailed to residents in the area asking them to stop by for giveaways and water conservation information. Upon request, conservation staff provides presentations to CII customers and their employees. Information about outreach events and other water conservation strategies is also available on JCSD’s Web site (<https://www.jcsd.us/home>) and social media accounts. Printed materials are mailed to all customers or handed out at outreach events and include quarterly newsletters, monthly bill inserts, and flyers marketing a variety of programs, including:

- Rebates for water saving devices;
- Free water conservation kits;
- Water Wise landscaping workshops;
- Free sprinkler replacement programs;
- Turf replacement programs;
- Informational door hangers;
- EPA WaterSense Partnership;
- Water Wise violation door hangers;
- Direct mailers; and

- Mulch giveaway events.

School Programs: JCSD's school education program provides school assembly presentations, classroom presentations, curriculum, grant opportunities, and field trips on the importance of water. All programs meet curriculum standards for specific grades. All schools within the District receive brochures for each teacher outlining the available programs. The JCSD Conservation Coordinator works with partners throughout the District (e.g., Inland Empire Waterkeeper, Western Municipal Water District, etc.) to schedule the requested services. In addition, outreach includes Earth Day celebrations, science fairs and open house nights. Other examples of education outreach include: "Water is Life" children's poster contest, Lois B. Kreiger Grants for Educators, and Kids Club afterschool programs.

➤ **Implementation Over the Past Five Years**

Over the past five years, JCSD continued to provide a variety of water conservation outreach to its customers. One-time events held since 2010 include speaking at the Kid's Zone, conducting community "drought drop-ins", participation in "iEfficient," and a rain barrel distribution event. There are approximately 100 attendees at each "drought drop-in" event. More than 300 discounted rain barrels were distributed. Rain barrels are no longer given away, due to overwhelming demand; however, residents can apply for a rain barrel rebate through The Metropolitan Water District of Southern California (MWD). Many new programs were implemented since the last UWMP in 2010, which are listed in **Table 9B**.

Table 9B: Water Conservation Outreach Programs, 2011-2015

| Outreach Event | Status | Total Number Reached |
|---|---|--|
| Children's Poster Contest | JCSD has sponsored a "Water is Life" poster contest annually since 2011. | 35,000 entries and participants |
| Bill Stuffer | Bills with water reduction informational stuffer sent out monthly since May 2012. | 25,000 per month |
| Newsletter | Distributed quarterly to JCSD customers and posted online. | 25,000 recipients |
| JARPD 3 rd of July | Independence Day Celebration annually on July 3 rd . | 5,000 attendees annually |
| Web site | JCSD Web site continues to prominently display water conservation information. | 4,000 daily online visitors |
| Social Media | JCSD maintains various social media profiles including Facebook, Twitter, YouTube, and Instagram that are regularly updated. | 1,200 weekly reach |
| Add Water Waste Category to E-Citizen | Citizens can report water waste using JCSD's E-Citizen Web site and smart phone application. | 2,000 reports annually |
| Mulch giveaway | Free mulch provided to JCSD customers annually every March. | 500 |
| Eastvale Town Hall Meeting | Ongoing quarterly meetings, since May 2015. | Approximately 45 per meeting |
| Ad in <i>Record News</i> | Ongoing weekly water-related advertisements since May 2015. | 5,000 per month |
| Ad in <i>Eastvale News</i> | Advertisements from May through November 2015. | 5,000 per month |
| "Construction-type" Signs with Drought Messaging | Display of banners including message "JCSD is at a Level 3 Drought Status. Visit jcsd.us for restrictions or call (951) 727-8002 for more information" has been ongoing since May 26, 2015. | 20,000 per day |
| Picnic in the Park Info Booth | Multi-day event was held June 26 through June 28, 2015. | 10,000 participants per day |
| Theater Ad at Eastvale and Jurupa Valley Theaters | Informational advertisement displayed for three months from June through August 2015. | Approx. 10,000 per month in Eastvale, 5,000 per month in Jurupa Valley |
| Regulations Infographic | Ongoing distribution and posted on JCSD Web site since June 2015. | 118,700 |
| Hold Message | Hold message with water conservation information ongoing since June 2015. | Approximately 500 per day |
| Lawn Signs for Residents | Distribution of lawn signs for residents with "Brown is the new Green" and "This yard is helping to save water" messaging is ongoing since June 2015. | 15,000 have been distributed |
| Parks and Recreation Brochure | Quarterly distribution with water information since June 2015. | 7,000 recipients |

Over the past five years, JCSD has developed comprehensive educational programs such as:

- Partnering with Inland Empire Resource Conservation District (IERCD) to offer free educational programs to schools and community groups within JCSD's service area on topics such as water-use efficiency, growing native, and wonders of wetlands.
- Offering Lois B. Krieger Water Project Grants for educators seeking to do creative classroom projects or go on field trips.

- Partnering with Discovery Science Center to provide assembly-style interactive programs promoting water awareness and introducing simple water conservation practices for 4th and 5th grade students.
- Distributing curriculum and activity materials designed by WMWD to local educators at no cost. These materials correlate with current California state content standards, particularly related to science and history/social science.
- Providing field trips with Inland Empire Waterkeeper at the Santa Ana River to learn about water supply and the environment, and with the Jurupa Mountains Discovery Center to learn about the gold rush and California's water history.

➤ **Planned Implementation to Achieve Water Use Targets**

JCSD plans to provide more resources to teachers and their students by sponsoring a "Project WET" (Water Education for Teachers) program to provide educators with activities that they can share with their students to learn about water-related topics. Upon completion of the free workshop, educators will receive the Project WET Curriculum Activity Guide.

9.1.5 Programs to Assess and Manage Distribution System Real Loss

Production losses are estimated at 1.6 percent based on the JCSD Water Loss Audit described in Chapter 4. System leaks are detected visually and reported by employees and customers. The majority of leaks occur on water service laterals (the line between the meter and the main line), which are replaced completely instead of repaired.

JCSD is committed to limiting the amount of water loss and has also required that all temporary sales and construction waters be metered to minimize unaccounted-for water that is attributed to these uses.

➤ **Implementation Over the Past Five Years**

The meter and main repairs performed by the District for the past five years are detailed in **Table 9C** as evidence of JCSD's ongoing efforts to detect leaks quickly and minimize water loss.

Table 9C: JCSD Repairs, 2011-2015

| Year | Service Connection (Meter) Breaks or Leaks | Main Breaks or Leaks |
|------|---|-------------------------|
| 2011 | 140 | 49 |
| 2012 | 190 | 50 |
| 2013 | 171 | 33 |
| 2014 | 234 | 45 |
| 2015 | 236 | 14 |

Source: JCSD PWSS/Annual Reports

➤ **Planned Implementation to Achieve Water Use Targets**

JCSD staff will continue to check for leaks visually and respond to reports from the public to perform repairs quickly. Staff will continue to monitor production and consumption data to quickly detect a spike in loss, and respond accordingly to locate the leak or break. JCSD will also continue its annual waterline replacement program described in Chapter 9.1.1 to replace aging main lines.

Executive Order B-37-16 issued by Governor Brown on May 9, 2016 directs the SWRCB, DWR, and the California Energy Commission to develop funding sources, programs, and technology to decrease water system losses. JCSD will respond to forthcoming regulations for improving system loss detection.

9.1.6 Water Conservation Program Coordination and Staffing Support

The Conservation Coordinator for JCSD is currently Alison Loukeh. She began with the District in 2014 and was previously a Water Conservation Coordinator for ten years with nearby cities. The Conservation Coordinator has had assistance periodically from temporary water conservation specialists and/or interns. The District's conservation program budget for FY 2015-2016 has expanded significantly to over \$1 million in response to the drought regulations.

➤ **Implementation Over the Past Five Years**

One of the stated goals for JCSD according to the 2010 UWMP was to hire a water conservation coordinator and expand the program from its then-budget of \$385,000 (FY 2010-2011). Beginning in 2011, JCSD has achieved its goal of filling a Conservation Coordinator position and expanding the program budget to over \$1 million. Beginning in 2011, several programs were instituted to reduce water demand. These include:

Residential Audit and Direct Install Program: This comprehensive program from 07/01/2012 through 03/20/2013 and was a water efficiency makeover for many homes. The replacement totals are:

- Faucet aerators – 507
- Showerheads – 366
- Sprinkler nozzles – 6,896
- High Efficiency Toilets – 282
- Weather Based Irrigation Controllers -289
- Indoor Audits – 324
- Outdoor Audits – 300

Turf Replacement: Funded through three different entities (WMWD, MWD, and JCSD), the turf replacement program targeted both CII and residential customers. CII customers included Nestle (25,000 square feet), MCC Corporation (260,000 square feet) and Lennox (46,000 square feet) among other smaller projects. Public agencies including school districts also took advantage of the additional funding provided by JCSD to offset their costs and replace turf with drought tolerant plants materials. Residential customers also enjoyed the benefits of the turf replacement program with 103 customers receiving a rebate since FY 13-14.

Rebates: Different devices that are available for rebates include High Efficiency Toilets, High Efficiency Clothes Washers, Irrigation controllers, Rain Barrels, and Rotating Nozzles. From 2010 to 2015, a total of 1,854 different rebates were paid to residential customers. The corresponding amount for CII customers is 24. This does not include turf replacement programs.

JCSD landscape areas: Select landscape facilities were retrofitted with rain sensors to ensure that irrigation systems are automatically turned off during rain events. This saves water and employees the time it takes to drive to the location and physically turn off the controller. Approximately 125 were installed. Additionally, many park and frontage areas

were retrofitted with drought tolerant landscaping and water-efficient spray nozzles and drip irrigation.

Grants: JCSD participates in several grants. Generally, funding comes from the DWR or the Bureau of Reclamation and is administered by WMWD or the Santa Ana Watershed Project Authority (SAWPA). Additionally, JCSD supports other member agencies like the Inland Empire Utilities Agency (IEUA) in their grant process as many water projects are regional in nature. Grants that JCSD was involved in directly during the UMWP time frame include the CUWCC landscape class grant, Kreiger grant for educators, WECAN grant (SAWPA), High Visibility Turf grant (SAWPA), and a Urinal replacement grant (Bureau of Reclamation).

Cost-share rain barrel program: At a one-time event, over 300 rain barrels were pre-ordered and picked up by customers in one day. JCSD offset the cost of the rain barrels by purchasing in bulk and providing a discounted price to residential customers.

CII Account Analysis: Conservation staff began tracking usage from high water users and contacting each company to review the findings and provide conservation advice. This generally led to water conservation methods to reduce demand.

Water Waste Procedures: Although JCSD has a water waste ordinance the new drought Emergency Regulations made this a priority. To ensure reporting ease, several methods were added:

E-Citizen: A Web-based app allows anyone to report water waste on their smart phone.

Email: Numerous residents and employees report water waste directly to the Conservation Coordinator.

Hotline: A conservation hotline was added. Beginning in May 2014, conservation staff began tracking additional calls from residents that do not necessarily escalate to a formal water waste issue. Through December 2015, the number of calls was 1,228.

Water waste reports: Water waste reports are assessed and acted on in the order of urgency. Main line leaks are reported to the maintenance department; all others are investigated and resolved by conservation staff. This is a component of the SWRCB drought report. From July 2015 through December 2015, JCSD reported 2,114 follow-up items to the SWRCB.

Free Sprinkler Nozzles: This is a program offered through WMWD. Beginning in 2011, the program offers free high efficiency nozzles to commercial and residential customers at no charge through a voucher program. To date, approximately 12,000 vouchers have been redeemed for 300,000 nozzles.

Conservation Garden: To provide an example of a “water wise” landscape, JCSD removed 8,100 square feet of turf at their headquarters and replaced it with drought tolerant and native plants.

Saturation Study: Conservation staff requested and received a high efficiency toilet saturation study from WMWD. According to the study, approximately 13 percent of toilets within the District have not been changed to a more efficient toilet. Through natural attrition, that number will decrease, thereby illustrating that a direct installation program for toilets would not be cost effective. Instead, conservation staff increased the rebate amount leading to an increase in toilet replacement activity without increasing staff time or the conservation budget significantly.

Urinal Program: This is a grant-funded program offered by WMWD. To date, 110 urinals have been replaced to JCSD customers at no cost to the District.

➤ **Planned Implementation to Achieve Water Use Targets**

JCSD understands that drought conditions may become the new normal for Southern California and therefore plans to budget additional staff for the water conservation program to assist and expand the efforts of the Conservation Coordinator. Many of the currently existing programs will be continued, however, additional programs are currently in development:

Drip Irrigation Rebate: JCSD-funded, this program is in development to offset the cost of drip irrigation to both CII and residential customers.

Limited Turf Replacement: To encourage customers who want to replace part of their turf, JCSD is developing a program to assist customers in removing turf in areas that come into contact with hard surfaces such as a driveway or sidewalk.

Grants: JCSD will continue the WECAN grant through 2017 and apply for additional conservation grants as they become available.

Audits: JCSD will continue to offer audits selectively to large water users.

CII: JCSD plans to implement an extensive CII program that includes cooling towers and process water.

Executive Order B-37-16 issued by Governor Brown on May 9, 2016 directs the SWRCB and DWR to permanently require urban water suppliers to issue a monthly report on their water usage, amount of conservation achieved, and any enforcement efforts. JCSD will abide by the requirements of the Order and continue reporting to the State.

9.2 Members of the California Urban Water Conservation Council

The California Urban Water Conservation Council (CUWCC) is a consensus-based partnership of agencies and organizations concerned with California's water supply and conservation of natural resources. Urban water suppliers that are members of the CUWCC have the option of submitting their 2013-2014 Best Management Practice (BMP) annual reports in lieu of, or in addition to, describing the DMMs in their 2015 UWMP. Although JCSD is a signatory to the CUWCC Memorandum of Understanding (since 1994), the BMP reports were not filed for 2009, 2010, 2011, 2012, 2013, and 2014. The District's Conservation Coordinator has submitted the 2009-2014 BMP reports and expects the District to receive credits for the reported water conservation efforts. Submittal of the 2015 BMP report to the CUWCC is expected to bring JCSD into compliance with the MOU. The District maintains its firm commitment to the implementation of the BMPs (aka DMMs) as a signatory to the CUWCC and every effort will be made to bring the District into compliance.

This Page Intentionally Blank

CHAPTER 10: PLAN ADOPTION, SUBMITTAL, AND IMPLEMENTATION

This chapter provides guidance to address the CWC requirements for a public hearing, the UWMP adoption process, submitting an adopted UWMP, plan implementation, and the process for amending an adopted UWMP.

10.1 Inclusion of All 2015 Data

2015 UWMPs must include the water use and planning data for the entire year of 2015. If an agency is reporting on a calendar year basis (January to December), the 2015 UWMP cannot be completed before the end of the calendar year 2015. If an agency is reporting on a fiscal year basis (July to June), they may complete their 2015 UWMP at the end of their fiscal year. Since JCSD is reporting on a calendar year basis, the 2015 UWMP was not completed until the end of the calendar year 2015.

10.2 Notice of Public Hearing

A public hearing must be hosted by JCSD prior to adopting the Plan; it may be held at the adoption hearing, but the public hearing must be listed as an agenda item to allow time for public input. DWR guidelines state that all public input shall be considered by the Board of Directors. There are two audiences within the service area that are required to be noticed for the public hearing: cities and counties, and the public. JCSD held a joint public hearing and adoption hearing on June 27, 2016.

10.2.1 Notice to Cities and Counties

10.2.1.1 60 Day Notification

The CWC states that cities and counties must be notified that the supplier will be reviewing the UWMP and considering amendments to the Plan. This notice must be sent at least 60 days prior to the public hearing. Notices were sent to applicable cities and counties on April 21, 2016.

| Table 10-1 Retail: Notification to Cities and Counties | | |
|---|-------------------------------------|-------------------------------------|
| City Name | 60 Day Notice | Notice of Public Hearing |
| <i>Add additional rows as needed</i> | | |
| Eastvale | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Jurupa Valley | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

Table 10-1: Notification to Cities and Counties lists the required notifications. JCSD also notified the following list of interested agencies and organizations.

- Chino Basin Desalter Authority
- Chino Basin Watermaster
- City of Eastvale (*required*)
- City of Jurupa Valley (*required*)
- City of Norco
- City of Ontario
- City of Riverside Public Utilities Department
- Corona-Norco Unified School District
- Inland Empire Utilities Agency
- Jurupa Unified School District
- Rubidoux Community Services District
- Santa Ana River Water Company
- Western Municipal Water District

10.2.1.2 Notice of Public Hearing

JCSD also provided notice of the time and place of the public hearing to cities and counties, as well as interested agencies. The notices to the cities and counties also included the location where the 2015 UWMP can be viewed, the UWMP revision schedule, and contact information of the UWMP preparer. Notices were sent to applicable cities and counties on April 21, 2016.

10.2.2 Notice to the Public

The public was notified of the public hearing and availability to review the Plan in the local newspaper (*The Press Enterprise*) once a week for two successive weeks pursuant to Government Code 6066, on June 13 and June 20, 2016. JCSD provided a public draft of the

Plan on their Web site www.icsd.us and at the District office beginning on June 13, 2016.

Appendix B contains copies of all notices.

10.3 Public Hearing and Adoption

Before submitting the UWMP to DWR, the JCSD Board of Directors must formally adopt the plan, as prepared or as modified after the public hearing.

In relation to the “20 percent by 2020” baseline and targets described in Chapter 5, the CWC requires the public hearing to also accomplish the following in order to comply with SB X7-7:

- Allow community input on the implementation plan;¹
- Consider the economic impacts of the implementation plan; and
- Adopt a method for determining its urban water use target.²

Therefore, the hearing provided information on the baseline values, water use targets, and implementation plan developed by JCSD as required by the Water Conservation Act of 2009.

10.3.1 Adoption

The 2015 UWMP was adopted by the JCSD Board of Directors on June 27, 2016 following a public hearing on June, 27, 2016. A copy of the JCSD adoption Resolution No. 2660 is included in **Appendix P**.

10.4 Plan Submittal

10.4.1 Submitting a UWMP to DWR

2015 UWMPs must be submitted to DWR within 30 days of adoption and by July 1, 2016.

UWMP submittal will be done electronically through WUEdata, an online submittal tool.

After the UWMP has been submitted, DWR will review the plan utilizing the checklist provided in Appendix A and make a determination as to whether or not the UWMP addresses the

¹ The term “implementation plan” as mentioned in the 20% by 2020 Water Conservation Act of 2009 is not defined. But according to DWR staff, it is meant to suggest the District’s plans as described in the UWMP for continuing to meet its water conservation target.

² The method chosen by JCSD to calculate the 2020 water use target has been, “Method 1: Eighty percent of the water supplier’s baseline per capita water use” as defined in CWC Section 10608.20(a)(1).

requirements of the CWC. The DWR reviewer will contact JCSD as needed during the review process. Upon completion of the Plan review, DWR will issue a letter to the agency with results of the review.

10.4.2 Electronic Data Submittal

DWR developed an online submittal tool, WUEdata, which was used for the 2015 UWMPs. The tool accepts complete UWMPs, as well as tabular data from all the data tables. The WUE data online submittal tool is online at <https://wuedata.water.ca.gov.secure/>.

JCSD submitted its electronic data via the WUEdata online submittal tool on June 28, 2016.

10.4.3 Submitting a UWMP to the California State Library

No later than 30 days after adoption, JCSD shall submit a CD or hardcopy of the adopted 2015 UWMP to the California State Library at:

California State Library
Government Publications Section
P.O. Box 942837
Sacramento, CA 94237-0001
Attention: Coordinator, Urban Water Management Plans

Or by courier or overnight carrier to the State Library at:

California State Library
Government Publications Section
914 Capitol Mall
Sacramento, CA 95814

10.4.4 Submitting a UWMP to Cities and Counties

No later than 30 days after adoption, JCSD shall submit a hard or electronic copy of the adopted 2015 UWMP to any city or county to which it provides water including the City of Jurupa Valley and the City of Eastvale. This submittal satisfies Water Code Section 10635(b).

10.5 Public Availability

The adopted UWMP is available for public review at JCSD, located at 11201 Harrel Street, Jurupa Valley, CA 91752 during normal business hours Monday through Friday 7:30 AM to 5:30 PM. In addition, a copy of the adopted UWMP can be found on JCSD's Web site (<http://www.jcsd.us/documents>) for public viewing anytime.

10.6 Amending an Adopted UWMP

If JCSD decides to amend the adopted UWMP, each of the steps for notification, public hearing, adoption, and submittal must also be followed for the amended plan. Notably, the water use target method described in Chapter 5 may not be changed in any amendments to the 2015 Plan or in the 2020 Plan.

INTRODUCTION

This noise and vibration study has been prepared to evaluate the potential noise and vibration impacts and mitigation measures associated with the implementation of the proposed General Plan for the City of Jurupa Valley (City). This report discusses the fundamentals of sound; examines federal, state, and local noise guidelines, policies, and standards; reviews noise levels under existing conditions; evaluates potential noise impacts associated with the implementation of City's General Plan; and provides mitigation where necessary to reduce noise impacts. This report evaluates the potential for implementation of the General Plan to result in noise impacts in the City and surrounding areas adjacent to the City.

Project Location and Description

The City's 2016 General Plan area constitutes the boundaries of the City of Jurupa Valley, as shown in Figure 1. The City is adjacent to the cities of Eastvale on the west, Norco and Riverside on the south and east in Riverside County, and Ontario and Fontana on the north and east, and the city of Colton on the northeast in San Bernardino County. The western portion of Jurupa Valley is primarily flat, with gentle rolling foothills scattered throughout the Glen Avon and Mira Loma areas. North of State Route 60 (SR-60) lies the dramatic sloping terrain of the Jurupa Mountains, that provide a natural backdrop for the communities of Sunnyslope and Belltown. The Pedley Hills provide a picturesque setting for the community of Pedley as well as a pleasing backdrop for communities adjacent to the hills. The Santa Ana River, with its lush riparian habitat, provides a natural contrast along the southern boundary of Jurupa Valley. Over the years, the Jurupa Valley has consisted of many unincorporated communities.

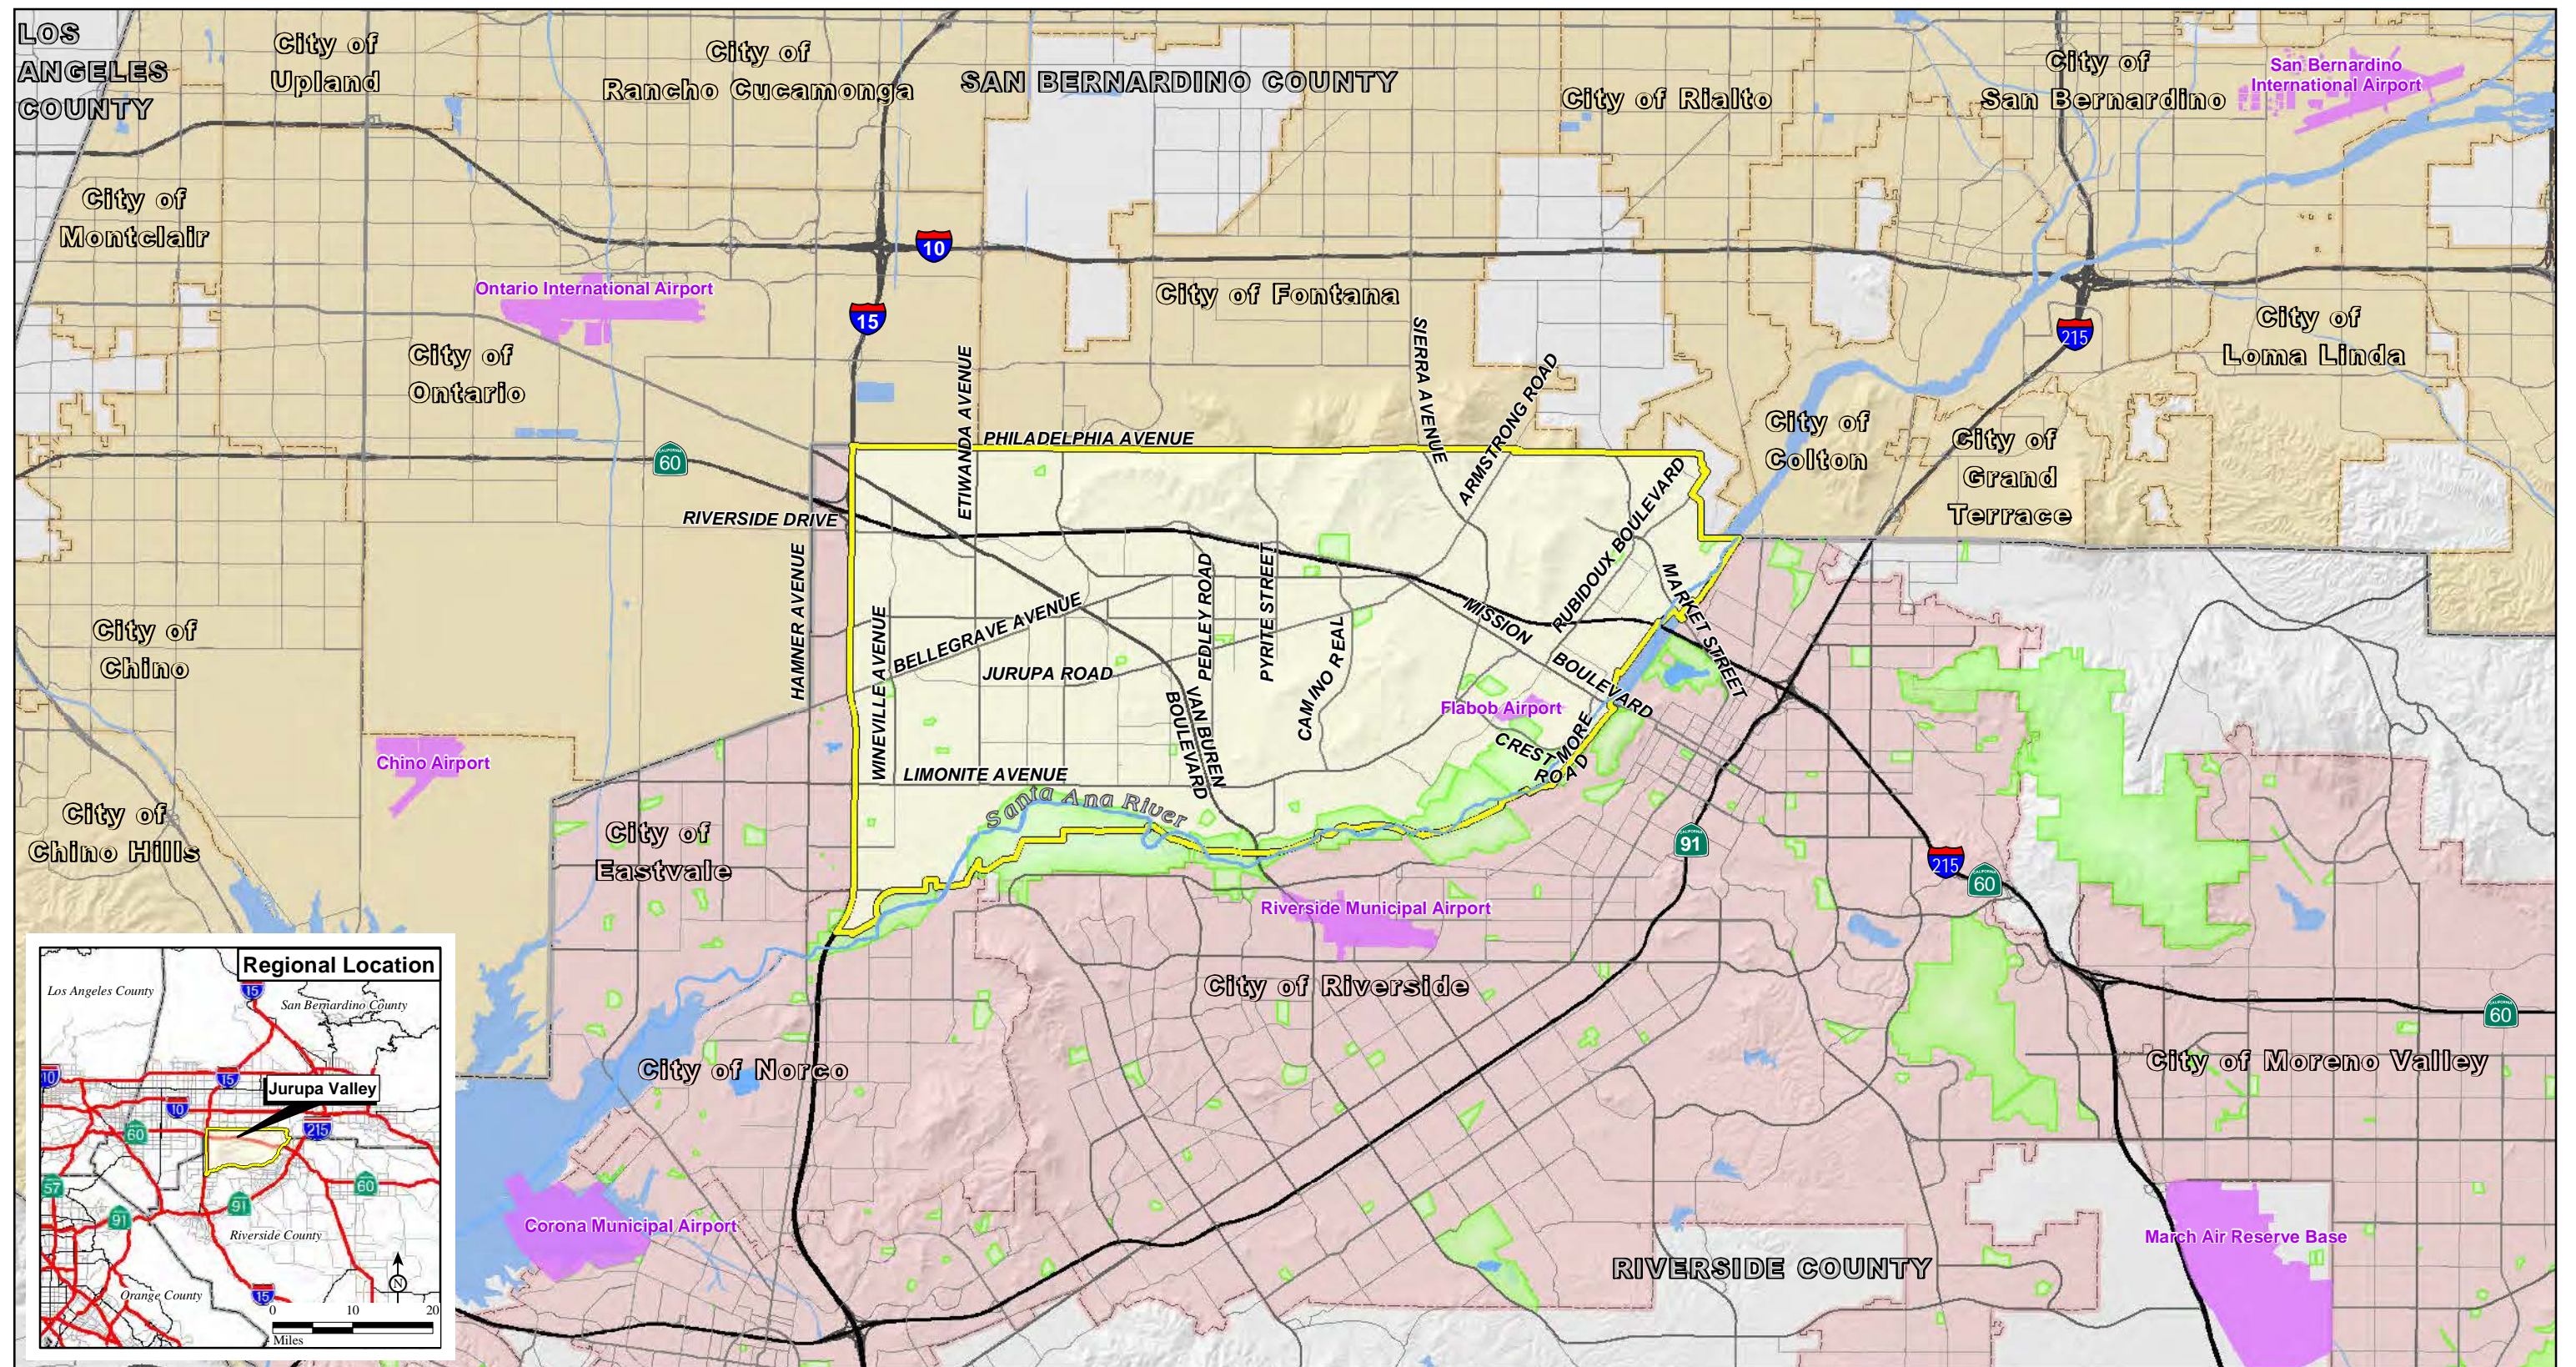

The City of Jurupa Valley was incorporated in July 2011. The City of Jurupa Valley Ordinance Nos. 2011-01 and 2011-10 adopted all ordinances and resolutions of the County of Riverside in effect as of July 1, 2011 (including land use ordinances and resolutions), to remain in full force and effect as City Ordinances. As such, development activities that occur in the City of Jurupa Valley are regulated by the City's current General Plan, which follows Riverside County's General Plan in effect in 2011, as since amended, and Riverside County Zoning Ordinance (Ordinance No. 348) and Subdivision Ordinance (Ordinance No. 460) that were in effect on July 1, 2011, unless otherwise superseded by a City ordinance or resolution.

The City's 2016 General Plan is consistent with and derives its authority from California State law. Once adopted, it becomes the basis for land use and other important municipal decisions; however, the Plan itself is not a regulation. The General Plan is implemented through Zoning Regulations, adopted standards and other City laws. As required by State law, capital improvement programs, zoning regulations and related land use policies must be consistent with the General Plan.

CHARACTERISTICS OF SOUND

Sound is increasing to such disagreeable levels in the environment that it can threaten quality of life. Noise is usually defined as unwanted sound. Noise consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

This page intentionally left blank

This page intentionally left blank

To the human ear, sound is technically described in terms of its loudness (amplitude) and pitch (frequency). Pitch is generally an annoyance, while loudness can affect our ability to hear. Pitch is the number of complete vibrations, or cycles per second, of a wave resulting in the tone's range from high to low. Loudness is the strength of a sound that describes a noisy or quiet environment and is measured by the amplitude of the sound wave. Loudness is determined by the intensity of the sound waves combined with the reception characteristics of the human ear. Sound intensity refers to how hard the sound wave strikes an object, which in turn produces the sound's effect. This characteristic of sound can be precisely measured with instruments. The analysis of a project defines the noise environment of the project area in terms of sound intensity and its effect on adjacent sensitive land uses.

Measurement of Sound

Sound intensity is measured through the A-weighted scale to correct for the relative frequency response of the human ear. That is, an A-weighted noise level de-emphasizes low and very high frequencies of sound similar to the human ear's de-emphasis of these frequencies. Unlike linear units (e.g., inches or pounds), decibels are measured on a logarithmic scale representing points on a sharply rising curve.

For example, 10 decibels (dB) is 10 times more intense than 1 dB, 20 dB is 100 times more intense than 1 dB, and 30 dB is 1,000 times more intense than 1 dB. Thirty decibels (30 dB) represents 1,000 times as much acoustic energy as 1 dB. The decibel scale increases as the square of the change, representing the sound pressure energy. A sound as soft as human breathing is about 10 times greater than 0 dB. The decibel system of measuring sound gives a rough connection between the physical intensity of sound and its perceived loudness to the human ear. A 10 dB increase in sound level is perceived by the human ear as only a doubling of the loudness of the sound. Ambient sounds generally range from 30 dB (very quiet) to 100 dB (very loud).

Sound levels are generated from a source, and their decibel level decreases as the distance from that source increases. Sound dissipates exponentially with distance from the noise source. For a single point source, sound levels decrease approximately 6 dB for each doubling of distance from the source. This drop-off rate is appropriate for noise generated by stationary equipment. If noise is produced by a line source (e.g., highway traffic or railroad operations) the sound decreases 3 dB for each doubling of distance in a hard site environment. Line source (noise in a relatively flat environment with absorptive vegetation) decreases 4.5 dB for each doubling of distance.

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoying effects of sound. The equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the day-night average noise level (L_{dn}) based on A-weighted decibels (dBA). CNEL is the time-varying noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours), and a 10 dBA weighting factor applied to noises occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the evening hours. CNEL and L_{dn} are within 1 dBA of each other and are normally interchangeable. The City uses both CNEL and L_{dn} noise scales for long-term noise impact assessment.

Other noise rating scales of importance when assessing the annoyance factor include the maximum instantaneous noise level (L_{\max}), which is the highest exponential time-averaged sound level that occurs during a stated time period. The noise environments discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{\max} , which reflects peak operating conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

Noise impacts can be described in three categories. The first category includes audible impacts that refer to increases in noise levels noticeable to humans. Audible increases in noise levels generally refer to a change of 3 dB or greater because this level has been found to be barely perceptible in exterior environments. The second category, potentially audible, refers to a change in the noise level between 1 dB and 3 dB. This range of noise levels has been found to be noticeable only in laboratory environments. The last category includes changes in noise levels of less than 1 dB, which are inaudible to the human ear. Only audible changes in existing ambient or background noise levels are considered potentially significant.

Physiological Effects of Noise

Physical damage to human hearing begins at prolonged exposure to noise levels higher than 85 dBA. Exposure to high noise levels affects the entire system, with prolonged noise exposure in excess of 75 dBA increasing body tensions, thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of noise exposure above 90 dBA would result in permanent cell damage. When the noise level reaches 120 dBA, a tickling sensation occurs in the human ear, even with short-term exposure. This level of noise is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by the feeling of pain in the ear (the threshold of pain). A sound level of 160–165 dBA will result in dizziness or loss of equilibrium. The ambient or background noise problem is widespread and generally more concentrated in urban areas than in outlying, less developed areas.

Table A lists definitions of acoustical terms, and Table B shows common sound levels and their sources.

Table A: Definitions of Acoustical Terms

| Term | Definitions |
|-----------------------------|---|
| Decibel, dB | A unit of measurement that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio. |
| Frequency, Hz | Of a function periodic in time, the number of times that the quantity repeats itself in 1 second (i.e., number of cycles per second). |
| A-Weighted Sound Level, dBA | The sound level obtained by use of A-weighting. The A-weighting filter deemphasizes the very low- and very high-frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. (All sound levels in this report are A-weighted, unless reported otherwise.) |

Table A: Definitions of Acoustical Terms

| Term | Definitions |
|---|---|
| L_{01} , L_{10} , L_{50} , L_{90} | The fast A-weighted noise levels that are equaled or exceeded by a fluctuating sound level 1%, 10%, 50%, and 90% of a stated time period. |
| Equivalent Continuous Noise Level, L_{eq} | The level of a steady sound that, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound. |
| Community Noise Equivalent Level, CNEL | The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 5 dBA to sound levels occurring in the evening from 7:00 PM to 10:00 PM and after the addition of 10 dBA to sound levels occurring in the night between 10:00 PM and 7:00 AM. |
| Day/Night Noise Level, L_{dn} | The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 10 dBA to sound levels occurring in the night between 10:00 PM and 7:00 AM. |
| L_{max} , L_{min} | The maximum and minimum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging. |
| Ambient Noise Level | The all-encompassing noise associated with a given environment at a specified time; usually a composite of sound from many sources at many directions, near and far; no particular sound is dominant. |
| Intrusive | The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content, as well as the prevailing ambient noise level. |

Table B: Common Sound Levels and Their Noise Sources

| Noise Source | A-Weighted Sound Level in Decibels | Noise Environments | Subjective Evaluations |
|--|------------------------------------|----------------------|------------------------|
| Near Jet Engine | 140 | Deafening | 128 times as loud |
| Civil Defense Siren | 130 | Threshold of Pain | 64 times as loud |
| Hard Rock Band | 120 | Threshold of Feeling | 32 times as loud |
| Accelerating Motorcycle at a Few Feet Away | 110 | Very Loud | 16 times as loud |
| Pile Driver; Noisy Urban Street/Heavy City Traffic | 100 | Very Loud | 8 times as loud |
| Ambulance Siren; Food Blender | 95 | Very Loud | — |
| Garbage Disposal | 90 | Very Loud | 4 times as loud |
| Freight Cars; Living Room Music | 85 | Loud | — |
| Pneumatic Drill; Vacuum Cleaner | 80 | Loud | 2 times as loud |
| Busy Restaurant | 75 | Moderately Loud | — |
| Near Freeway Auto Traffic | 70 | Moderately Loud | — |
| Average Office | 60 | Quiet | One-half as loud |
| Suburban Street | 55 | Quiet | — |
| Light Traffic; Soft Radio Music in Apartment | 50 | Quiet | One-quarter as loud |
| Large Transformer | 45 | Quiet | — |
| Average Residence without Stereo Playing | 40 | Faint | One-eighth as loud |
| Soft Whisper | 30 | Faint | — |
| Rustling Leaves | 20 | Very Faint | — |
| Human Breathing | 10 | Very Faint | Threshold of Hearing |
| — | 0 | Very Faint | — |

Vibration

Vibration refers to groundborne noise and perceptible motion of the earth. Similar to airborne noise, vibration is transmitted in noise-like waves through the earth and solid objects. There are several ways to categorize vibration sources. One way is to divide vibration into natural sources (e.g., earthquakes, volcanic eruptions, sea waves, and landslides) and human sources (e.g., explosions, machinery, traffic, trains, and construction equipment). Similar to noise sources, vibration sources can also be described as continuous (e.g., operating factory machinery) or transient (e.g., explosions).

As with noise, ground vibrations can be described by amplitude and frequency. Vibration amplitude is characterized by its displacement, velocity, and acceleration. Displacement is the distance that soil particles travel from their original location as a result of vibration, as measured in inches or millimeters. Velocity is the speed of the soil particles measured in inches per second or millimeters per second. Acceleration of the soil particles is measured in inches per second or millimeters per second. Particle velocity is the most commonly used vibration attribute used to describe vibration. Table C presents the human reaction to various levels of peak particle velocity. Vibrations also vary in frequency. Traffic vibrations generally range in frequencies from 10 to 30 hertz (Hz), and tend to average around 15 Hz. As a point of reference, city buses often generate frequencies around 3 Hz at high vehicle speeds, due to their suspension systems.

Table C: Human Reaction to Typical Vibration Levels

| Vibration Level Peak Particle Velocity (inches/second) | Human Reaction |
|--|---|
| 0.0059–0.0188 | Threshold of perception, possibility of intrusion. |
| 0.0787 | Vibrations readily perceptible. |
| 0.0984 | Level at which continuous vibrations begin to annoy people. |
| 0.1968 | Vibrations annoying to people in buildings. |
| 0.3937–0.5905 | Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges. |

Source: Caltrans 1992.

Groundborne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernable. However, without the effects associated with the shaking of a building, there is less adverse reaction. Building vibration may be perceived by the occupants as motion of building surfaces, rattling of items on shelves or hanging on walls, or as a low-frequency rumbling noise. Building damage is not a factor for normal projects, with the occasional exception of blasting and pile driving during construction or mining. Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by up to 10 decibels. This is an order of magnitude below the damage threshold for normal buildings.

Typical sources of groundborne vibration are construction activities (e.g., blasting, pile driving, and operating heavy-duty earthmoving equipment), steel-wheeled trains, and occasional traffic on rough roads. Problems with groundborne vibration and noise from these sources are usually localized to within about 100 feet of the vibration source, although there are examples of groundborne vibration causing interference out to distances greater than 200 feet. When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible.

Factors that influence groundborne vibration and noise include the following:

- **Vibration Source:** Vehicle suspension, wheel types and condition, railroad track/roadway surface, railroad track support system, speed, transit structure, and depth of vibration source
- **Vibration Path:** Soil type, rock layers, soil layering, depth to water table, and frost depth
- **Vibration Receiver:** Foundation type, building construction, and acoustical absorption

Among the factors listed above, there are significant differences in the vibration characteristics when the source is underground versus at ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock. Vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at a great distance from the track. Factors such as layering of the soil and depth to water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils.

Table D shows the various land use compatibility classifications based on exterior noise levels, and these categories are described as follows:

- **Noise Range I**—Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
- **Noise Range II**—Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made, and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.
- **Noise Range III**—Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
- **Noise Range IV**—Clearly Unacceptable: New construction or development should generally not be undertaken.

Table D: Land Use Compatibility for Exterior Community Noise

| Land Use Category | Noise Range (L_{dn} or CNEL), dB | | | |
|--|-------------------------------------|-------|-------|-----|
| | I | II | III | IV |
| Passively used open spaces | 50 | 50–55 | 55–70 | 70+ |
| Auditoriums, concert halls, amphitheaters | 45–50 | 50–65 | 65–70 | 70+ |
| Residential, low-density single-family, duplex, mobile homes | 50–55 | 55–70 | 70–75 | 75+ |
| Residential multifamily | 50–60 | 60–70 | 70–75 | 75+ |
| Transient lodging, motels, hotels | 50–60 | 60–70 | 70–80 | 80+ |
| Schools, libraries, churches, hospitals, nursing homes | 50–60 | 60–70 | 70–80 | 80+ |

Table D: Land Use Compatibility for Exterior Community Noise

| Land Use Category | Noise Range (L _{dn} or CNEL), dB | | | |
|--|---|-------|-------|-----|
| | I | II | III | IV |
| Actively used open spaces, playgrounds, neighborhood parks | 50–67 | – | 67–73 | 73+ |
| Golf courses, riding stables, water recreation, cemeteries | 50–70 | – | 70–80 | 80+ |
| Office buildings, business commercial and professional | 50–67 | 67–75 | 75+ | – |
| Industrial, manufacturing, utilities, agriculture | 50–70 | 70–75 | 75+ | – |

CNEL = Community Noise Equivalent Level

dB = decibel(s)

L_{dn} = day-night average noise level

REGULATORY FRAMEWORK

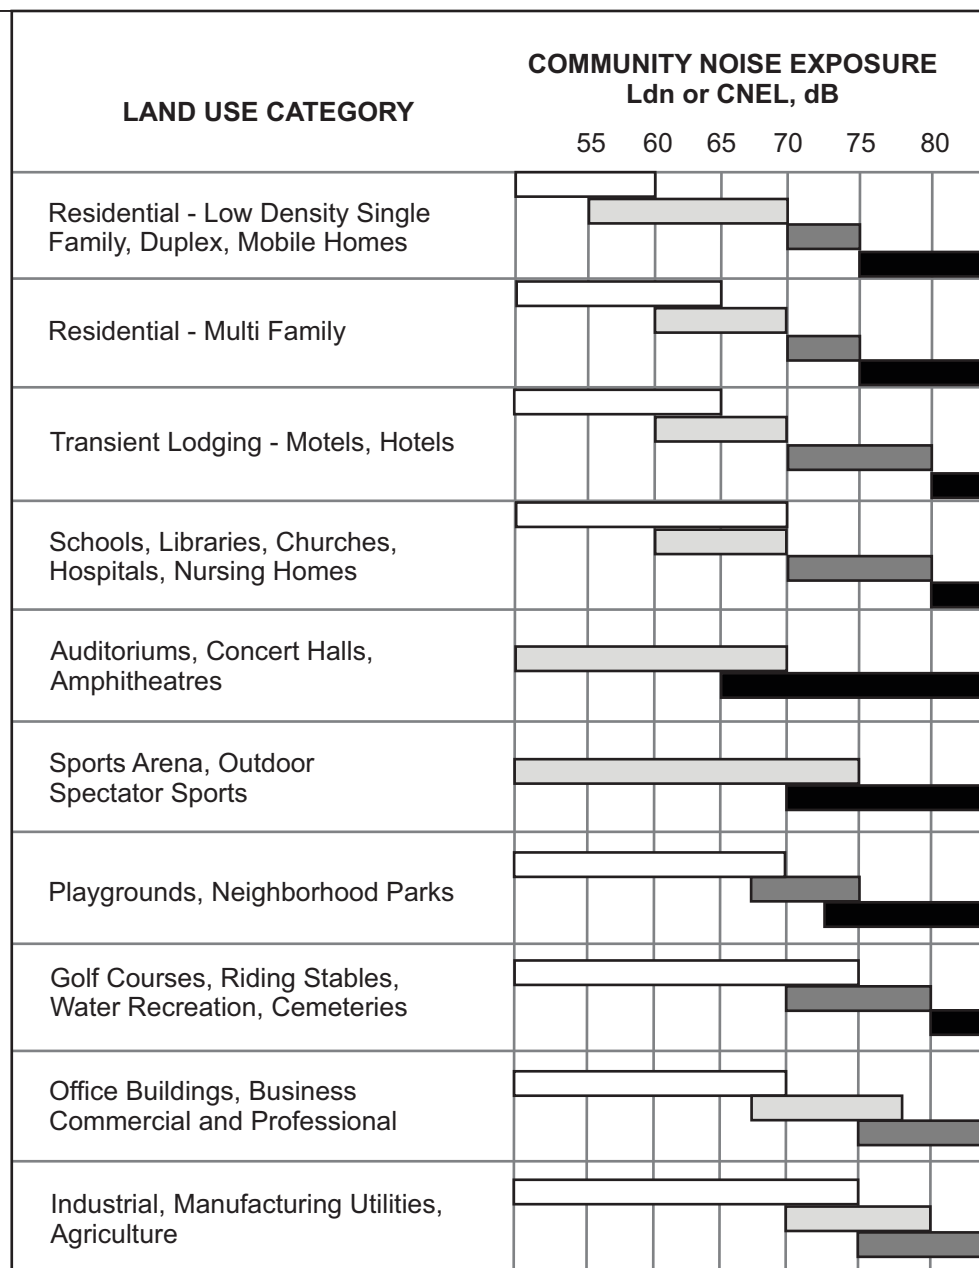

Federal Guidelines

For train vibration, the typical criteria are those in the Transit Noise and Vibration Impact Assessment (FTA 2006) by the Federal Transit Administration. The criterion presented in Table 8-1 of that report for infrequent events (defined as fewer than 30 per day) in residences is that the vibration levels not exceed 80 VdB. (VdB is a measurement of ground velocity relative to 10⁻⁶ inches per second.) Note that the threshold of perception is usually taken to be approximately 65 VdB. Therefore, even if the requirements are met, vibration from train pass-bys will be felt.

State Regulations

Noise Compatibility Guidelines. The State of California Noise Compatibility Guidelines, published by the Department of Health, Services provides guidance for use when siting land uses. Figure 2 shows the compatibility guidelines, which are used to evaluate the compatibility of the proposed land uses with the noise environment. The guidelines show compatibility of various land uses with different noise environments and demonstrate that residential uses are normally acceptable in noise environments up to 60 dBA CNEL for low-density single-family uses and 65 dBA CNEL for multifamily residential uses.

State of California Building Code. The State of California's noise insulation standards are codified in the California Code of Regulations (CCR), Title 24, Building Standards Administrative Code, Part 2, California Building Code (CBC). These noise standards are applied to new construction in California for the purpose of ensuring that the level of exterior noise transmitted to and received within the interior living spaces of buildings is compatible with their comfortable use. For new residential dwellings, hotels, motels, dormitories, and school classrooms, the acceptable interior noise limit for habitable rooms in new construction is 45 dBA CNEL or L_{dn}. Title 24 requires acoustical studies for residential development in areas exposed to more than 60 dBA CNEL to demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. Where exterior noise levels are projected to exceed 60 dBA CNEL or L_{dn} at the façade of a building, a report must be submitted with the building plans that describe the noise control measures that have been incorporated into the design of the project to meet the 45 dBA CNEL or L_{dn} noise limit.

-  **NORMALLY ACCEPTABLE**
Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
-  **CONDITIONALLY ACCEPTABLE**
New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
-  **NORMALLY UNACCEPTABLE**
New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise reduction features included in the design.
-  **CLEARLY UNACCEPTABLE**
New construction or development should generally not be undertaken.

State of California General Plan Guidelines, Appendix C.

*Jurupa Valley General Plan
Noise and Vibration Study*

Figure 2
California Noise Compatibility Guidelines

This page intentionally left blank

State Land Use Compatibility Criteria. The State of California adopts suggested land use noise compatibility levels as part of its General Plan Update Guidelines. These suggested guidelines provide urban planners with an integral tool to gauge the compatibility of land uses relative to existing and future noise levels. The guidelines identify normally acceptable, conditionally acceptable, and clearly unacceptable noise levels for various land uses. A conditionally acceptable designation implies new construction or development should be undertaken only after a detailed analysis of the noise reduction requirements for each land use is made and needed noise insulation features are incorporated into the design. By comparison, a normally acceptable designation indicates that standard construction can occur with no special noise reduction requirements. Previously referenced Figure 2 shows the Land Use Compatibility Guidelines.

State and federal agencies regulate vehicle noise emissions from the source, but local governments have little direct control of transportation noise at the source. The most effective methods available to the City for mitigating transportation noise are the locating of sensitive uses away from noise sources, establishing commercial truck routes, constructing and maintaining adequate setbacks between land uses and noise sources, constructing noise barriers, and by requiring development project site design review. The State's Land Use Compatibility Matrix (Figure 2) may be used to assess the compatibility of the proposed land uses with the noise environment. These criteria are the basis for specific Noise Standards.

Riverside County

Riverside County Airport Land Use Commission. The California Public Resources Code requires that the adoption or approval of any amendment to a general or specific plan affecting the property within an airport influence area (AIA), as defined by an airport land use compatibility plan, shall require review from the Airport Land Use Commission (ALUC) for determination of consistency with the Commission's Plan prior to its approval by the local jurisdiction. In general, consistency with the Commission's Plan is determined based on noise and safety compatibility issues.

The locations of CNEL contours are among the factors used to define compatibility zone boundaries and criteria. According to guidelines included in the Riverside County Airport Land Use Compatibility Plan (ALUCP), areas exposed to aircraft noise levels above 65 dBA CNEL are considered clearly unacceptable for new residential land uses, schools, libraries, and hospitals. For churches, auditoriums, concert halls, and amphitheaters, noise levels above 70 dBA CNEL are clearly unacceptable. These standards shall be based upon projected noise contours calculated based upon forecasted aircraft activity as indicated in an airport master plan, or that is considered by the Riverside County ALUC to be plausible.

The maximum aircraft-related interior noise level that shall be considered acceptable for land uses near airports is 45 dBA CNEL in: (a) any habitable room of single-family or multifamily residences; (b) hotels and motels; (c) hospitals and nursing homes; (d) churches, meeting halls, theaters, and mortuaries; (e) office buildings; and (f) schools, libraries, and museums. According to the Riverside County ALUC, when reviewed as part of a general plan or zoning ordinance amendment or as a major land use action, evidence that proposed structures will be designed to comply with the above criteria shall be submitted to the ALUC under the following circumstances:

- Any mobile home situated within an airport's 55 dBA CNEL contour. (A typical mobile home has an average exterior-to-interior noise level reduction (NLR) of approximately 15 dBA with windows closed);
- Any single-family or multifamily residence situated within an airport's 60 dBA CNEL contour. (Wood frame buildings constructed to meet 1990s standards for energy efficiency typically have an average NLR of approximately 20 dBA with windows closed.); and
- Any hotel or motel, hospital or nursing home, church, meeting hall, office building, mortuary, school, library, or museum situated with an airport's 65 dBA CNEL contour.

City of Jurupa Valley General Plan

Noise Element. The Noise Element of the proposed 2016 General Plan contains the following goals, policies, and programs to help monitor, regulate, and mitigate excessive noise levels (i.e., potential noise impacts) within the City as development occurs:

Goal

- NE 1.1 Ensure adjacent land uses are compatible and protect sensitive receptors from outside sources of noise and vibration.

Policies

- NE 1.1.1 **Land Use/Noise Compatibility.** Utilize the Land Use/Noise Compatibility Matrix, Table NE-2, to determine the compatibility of proposed general plan amendments and rezones with existing noise-sensitive land uses and/or noise exposure due to transportation sources.
- NE 1.1.2 **New Development and Stationary Noise Sources.** New development of noise-sensitive land uses near existing stationary noise sources may be permitted only where their location or design allow the development to meet the standards of Table NE-1.
- NE 1.1.3 **New or Modified Stationary Noise Sources.** Noise created by new, stationary noise sources, or by existing stationary noise sources that undergo modifications that may increase noise levels, shall be mitigated to not exceed the noise level standards of Table NE-1, for noise-sensitive uses. This policy does not apply to noise levels associated with agricultural operations existing in 2016.
- NE 1.1.4 **Acoustical Assessment.** Require an acoustical assessment for proposed general plan amendments and rezones that exceed the "Normally Acceptable" thresholds of the Land Use/Noise Compatibility Matrix.
- NE 1.1.5 **Noise-Sensitive Uses.** Consider the following uses noise-sensitive and discourage these uses in areas in excess of 65 dBA CNEL: schools, hospitals, assisted living facilities, mental care facilities, residential uses, libraries, passive recreational uses, and places of worship.
- NE 1.1.6 **Protection of Noise-Sensitive Uses.** Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land uses cannot be relocated, then measures such as building techniques, setbacks, landscaping and noise walls should be considered.

- NE 1.1.7 **Noise-Tolerant Uses.** Guide new or relocated noise-tolerant land uses into areas irrevocably committed to land uses that are noise producing, such as along major transportation corridors or within the projected noise contours of area airports.
- NE 1.1.8 **Airport Noise Compatibility.** Ensure that new land use development within Airport Influence Areas complies with airport land use noise compatibility criteria contained in the applicable Airport Land Use Compatibility (ALUC) plan for the area.
- NE 1.1.9 **Acoustic Site Planning and Design.** Incorporate acoustic site planning into the design and placement of new development, particularly large scale, mixed-use, or master-planned development, including building orientation, berming, special noise-resistant walls, window and door assemblies, and other appropriate measures.
- NE 1.1.10 **Mixed Uses.** Require that mixed commercial and residential development minimizes the transfer or transmission of noise from the commercial land use to the residential land use.

Programs

- NE 1.1.1.1 **Municipal Code:** Amend the Municipal Code to require that development entitlements (tract maps, site development plans, conditional use permits, etc.) comply with the Land Use/Noise Compatibility Matrix (Table NE-2) and other requirements of the General Plan.
- NE 1.1.1.2 **Noise Guide.** The Planning Department shall prepare and maintain a Noise Guide containing “Good Neighbor” guidelines and rules for neighborhood noise reduction and procedures for mitigating noise, and make the Guide available to the public, property owners, and developers.
- NE 1.1.1.3 **Homeowner Assistance.** Assist homeowners living in high noise areas to reduce noise levels in their homes through funding assistance and retrofitting program development, as City resources allow.

Goal

- NE 2.1 Minimize excessive noise levels and community health risks due to mobile noise sources.

Policies

- NE 2.1.1 **Roadway Projects.** Include noise mitigation measures in the design and construction of new roadway projects in the City. Noise mitigation may include speed reduction, roadway design, noise-reducing materials or surfaces, edge treatments and parkways with berms and landscaping, and other measures.
- NE 2.1.2 **Commercial Truck Deliveries.** Require commercial or industrial truck delivery hours be limited to least-sensitive times of the day when adjacent to noise-sensitive land uses, unless there is no feasible alternative or there are overriding transportation benefits, as determined by the Planning Director.
- NE 2.1.3 **Off-Road Vehicles.** Restrict the use of motorized trail bikes, mini-bikes, and other off-road vehicles except where designated for that purpose. Enforce strict operating hours for these vehicles where they are located to minimize noise impacts on sensitive land uses adjacent to public trails and parks.

- NE 2.1.4 **Rail Noise.** Minimize the noise effect of rail transit (freight and passenger) on residential uses and other sensitive land uses through the land use planning and discretionary approval process.
- NE 2.1.5 **Rail Noise Mitigation.** Encourage, and where possible, require the rail service provider to install noise mitigation features where rail operations impact existing adjacent residential or other noise-sensitive uses.
- NE 2.1.6 **Noise Contours.** Check all proposed development projects for possible location within roadway, railroad, and airport noise contours.
- NE 2.1.7 **Airport Compatibility.** Comply with applicable noise mitigation policies contained in the Airport Land Use Compatibility (ALUC) Plans for Flabob Airport, Riverside Municipal Airport, and the LA/Ontario International Airport.
- NE 2.1.8 **Preferred Noise Mitigation Methods.** When approving new development of noise-sensitive uses or noise-generating uses, the City will require noise mitigation in the order of preference, as listed below, with “1” being most preferred. For example, when mitigating outdoor noise exposure, providing distance between source and recipient is preferred to providing berms and walls. Before approving a less desirable approach, the City approval body must make a finding that more desirable approaches are not effective or that it is not practical to use the preferred approaches consistent with other design criteria based on the General Plan.
- A. Mitigating Noise Generation
1. Design the site of the noise-producing project so that buildings or other solid structures shield neighboring noise-sensitive uses;
2. Limit the operating times of noise-producing activities;
3. Provide features, such as walls, with a primary purpose of blocking noise.
- B. Mitigating Outdoor Noise Exposure
1. Provide distance between noise source and recipient;
2. Provide distance plus planted earthen berms;
3. Provide distance and planted earthen berms, combined with sound walls;
4. Provide earthen berms combined with sound walls;
5. Provide sound walls only;
6. Integrate buildings and sound walls to create a continuous noise barrier.
- NE 2.1.9 **Noise Walls.** Noise mitigation walls (sound walls) should be used only when it is shown that preferred approaches are not effective or that it is not practical to use the preferred approaches consistent with other design criteria based on the General Plan. Where noise walls are used, they should be designed to enhance community character, protect significant views, discourage graffiti, and help create an attractive pedestrian, residential setting through features such as setbacks, changes in vertical and horizontal alignment, detail and texture, public art, walkways or trails, and landscaping. The height of such walls should be minimized, and where sound attenuation requires that a buffer that exceeds ten feet in height, the sound buffer

should consist of a combination of berms and a wall, or two or more retaining walls stepped back to allow intervening landscaping.

Programs

- NE 2.1.1.1 **Truck Routes.** Prepare and adopt truck routes to direct commercial trucks away from sensitive noise receptors.
- NE 2.1.1.2 **City Actions.** The City will consider implementing one or more of the following measures where existing or cumulative increases in noise levels from new development significantly affect noise-sensitive land uses or residential neighborhoods:
- A. Rerouting traffic onto streets that can maintain desired levels of service, consistent with the Mobility Element, and which do not adjoin noise-sensitive land uses.
 - B. Rerouting commercial trucks onto streets that do not adjoin noise-sensitive land uses.
 - C. Constructing noise barriers.
 - D. Reducing traffic speeds through street or intersection design methods (also refer to the Mobility Element).
 - E. Retrofitting buildings with noise-reducing features.
 - F. Establishing financial programs, such as low cost loans to owners of noise-impacted property, or requiring noise mitigation or trip reduction programs as a condition of development approval.
 - G. Encourage and support stepped up enforcement of traffic laws and the California Vehicle Code.
- NE 2.1.1.3 **City Operations and Purchasing.** City will pursue alternatives to the use of noisy equipment and vehicles, and will purchase equipment and vehicles only if they incorporate the best available noise reduction technology.

Goal

- NE 3.1 Minimize excessive noise levels and community health risks due to stationary noise sources.

Policies

- NE 3.1.1 **Noise Analysis.** Require that a noise analysis be conducted by an acoustical specialist for all proposed development projects that have the potential to generate significant noise near a noise-sensitive land use, or on or near land designated for noise-sensitive land uses, and ensure that recommended mitigation measures are implemented.
- NE 3.1.2 **Truck Loading, Shipping, and Parking.** Require that the loading, shipping or parking facilities of commercial and industrial land uses, which abut residential parcels, be located and designed to minimize potential noise impacts upon residents. Overnight Commercial Truck parking areas shall be regulated in the Zoning Ordinance as a commercial use.

- NE 3.1.3 **Noise Buffers.** Require major stationary noise-generating sources to install noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest level practical as a condition of the approval or renewal of project entitlements.
- NE 3.1.4 **Construction Equipment.** Require that all construction equipment utilize noise reduction features (i.e., mufflers and engine shrouds) that are at least as effective as those originally installed by the manufacturer.
- NE 3.1.5 **Construction Noise.** Limit commercial construction activities near residential uses to weekdays, between 7:00 am and 6:00 p.m., and limit high-noise generating construction activities (e.g. grading, demolition, pile driving) near sensitive receptors to weekdays between 9:00 a.m. and 3:00 p.m.
- NE 3.1.6 **Commercial Truck Idling.** Restrict truck idling near noise sensitive receptors.
- NE 3.1.7 **Automobile-Oriented Uses.** Require that parking structures, terminals, drive-through restaurants, automobile sales, and repair, fueling stations, mini-marts, car washes and similar automobile-oriented uses be sited and designed to minimize potential noise impacts on adjacent land uses.
- NE 3.1.8 **Entertainment Uses.** Minimize the generation of excessive noise from entertainment and restaurant/bar establishments into adjacent residential or noise-sensitive uses.
- NE 3.1.9 **Neighborhood Noise.** Support efforts of the Sheriff's Department, Animal Control, and Code Enforcement to curb nuisance noise from private parties, barking dogs and illegal firework use.

Program

- NE 3.1.1.1 **Ensuring Compliance.** Ensure that required noise mitigation measures are carried out as a project is built, and in place and/or fully implemented prior to release of occupancy, including enforcement of the State Building Codes regarding Chapter 35, "Sound Transmission Control," as amended, and "Noise Insulation Standards" (California Code of Regulations, Title 24).

Goal

- NE 4.1 Minimize excessive noise levels and community health risks due to groundborne vibration.

Policies

- NE 4.1.1 **Sensitive Land Uses.** Avoid the placement of sensitive land uses in proximity to vibration-producing land uses.
- NE 4.1.2 **Vibration Producing Land Uses.** Avoid the placement of vibration-producing land uses near sensitive receptors.
- NE 4.1.3 **Truck Idling.** Restrict truck idling near sensitive vibration receptors.
- NE 4.1.4 **Passing Trains.** Prohibit exposure of residential dwellings to perceptible ground vibration from passing trains as perceived at the ground or second floor. Perceptible motion shall be presumed to be a motion velocity of 0.01 inches/second over a range of 1 to 100 Hz.

- NE 4.1.5 **Mining Operations.** Require measures to protect properties adjacent to mining or construction sites that will entail blasting as part of the operation when considering land use entitlement applications.

Programs

- NE 4.1.1.1 **Rail-related Noise.** Minimize the noise impact of passenger (Metrolink) and freight rail service on sensitive land uses by coordinating with rail authorities to effectively manage train noise and by establishing and enforcing noise mitigation measures that apply to rail uses.
- NE 4.1.1.2 **Quiet Zone Crossings.** Require new development in the vicinity of railroad crossings that are within 1,000 feet of existing residential neighborhoods to design and construct Quiet Zone railroad crossing improvements and seek to qualify for a Quiet Zone designation.

The applicable noise standards governing activities in the City are in the City General Plan and the City's Municipal Code, Noise Ordinance. The General Plan noise policies cite to applicable state standards including the California Administrative Code, Section 1092 of Title 25, Chapter 1, Subchapter 1, Article 4 and Section 5014 of Title 21, Subchapter 6, Article 2.

City General Plan Stationary Source Noise Standards. The City of Jurupa Valley Noise Element in the General Plan considers the impacts of stationary noise producers. Stationary noise producers are entities with a fixed location that emit noise. The General Plan requires that sensitive land uses not be subjected to excessive stationary noise, either by mitigation at the source or through planning measures that reduce sound exposure. Table E summarizes the criteria for sensitive receivers.

Table E: Jurupa Valley General Plan Noise Standards

| Land Use | Stationary Source Land Use Noise Standards | |
|---------------------------------|--|--------------------------------|
| | Interior Standards | Exterior Standards |
| Residential 10:00 pm to 7:00 am | 40 L _{eq} (10 minute) | 45 L _{eq} (10 minute) |
| Residential 7:00 am to 10:00 pm | 55 L _{eq} (10 minute) | 65 L _{eq} (10 minute) |

Source: City of Jurupa Valley General Plan Table N-22

L_{eq} = equivalent continuous sound level

City of Jurupa Valley Municipal Code

The City of Jurupa Valley's Municipal Code (Section 11.10.040 – General sound level standards) has established maximum exterior sound levels standards. Standards vary depending on land use. Therefore, future development will be subject to different standards depending on the proposed land uses of a particular project. Table F outlines examples of these criteria.

Table F: Maximum Local Noise Criteria

| General Plan Land Designation | Maximum Noise Criteria (dB L _{max}) | |
|-------------------------------|---|----------------|
| | 7 a.m.–10 p.m. | 10 p.m.–7 a.m. |
| Low Density (LDR) | 55 | 45 |
| Medium Density (MDR) | 55 | 45 |
| Medium High Density (MHDR) | 55 | 45 |
| Very High Density (VHDR) | 55 | 45 |
| Retail Commercial (CR) | 65 | 55 |
| Open Space (OS) | 45 | 45 |

Source: City of Jurupa Valley Municipal Code Section 11.10.040
L_{max} = maximum instantaneous noise level

The criteria in Table F represent some but not all the noise limits that persons shall not exceed through sound they create or allow to be created. Private construction projects are exempt under the City's Noise Ordinance.

Thresholds of Significance

A project is considered to have a significant effect on the environment related to noise if it would substantially increase the ambient noise levels for adjoining areas or if it would conflict with adopted environmental plans and goals of the community in which it is located.

The applicable noise standards and guidelines governing the project are those specified above. In summary, these criteria are contained within the City's Noise Element of the General Plan, the City Municipal Code, the California Vehicle Code, and the State Noise Compatibility Guidelines.

The City of Jurupa Valley has not established local CEQA significance thresholds as described in §15064.7 of the State CEQA Guidelines. For this reason, this Draft EIR incorporates the CEQA checklist included in Appendix G of the State CEQA Guidelines to determine the significance of environmental impacts. The following thresholds of significance regarding potential impacts to noise and are based on Appendix G of the *CEQA Guidelines*). A project would have a significant impact if it would:

- Expose persons to or generate noise levels in excess of standards established in the *City General Plan, Municipal Code*, or applicable standards of other agencies;
- Expose persons to or generate excessive groundborne vibration or groundborne noise levels;
- Cause a substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels; and/or
- For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

The standards within the *City General Plan* and *City Municipal Code* determine the acceptable noise environment for future proposed development and the areas surrounding that development. The standards are as follows:

- Ensure through the design review process that exterior noise levels at residential areas do not exceed 60 dBA CNEL for low density housing and 65 dBA CNEL for multifamily.
- Prohibit facility-related noise, received by any sensitive use, from exceeding the following worst-case noise levels:
 - a) 45 dBA-10-minute L_{eq} between 10 p.m. and 7 a.m.
 - b) 65 dBA-10-minute L_{eq} between 7 a.m. and 10 p.m.
- Consider the following uses noise-sensitive and discourage them in areas where exterior noise levels exceed 65 dBA CNEL unless measures are implemented that reduce the noise exposure below this level: single-family and multiple-family residential uses, group homes, hospitals, schools and other learning institutions, and parks and open space areas where quiet is a basis for use.

Sensitive Land Uses

People that reside in certain land uses are considered more sensitive to noise than others of the general public. Examples include residential areas, educational facilities, hospitals, childcare facilities, and senior housing. These local land uses would be considered to have “sensitive receptors” and careful planning is required to ensure future land uses and transportation routes do not create significant noise impacts on these uses.

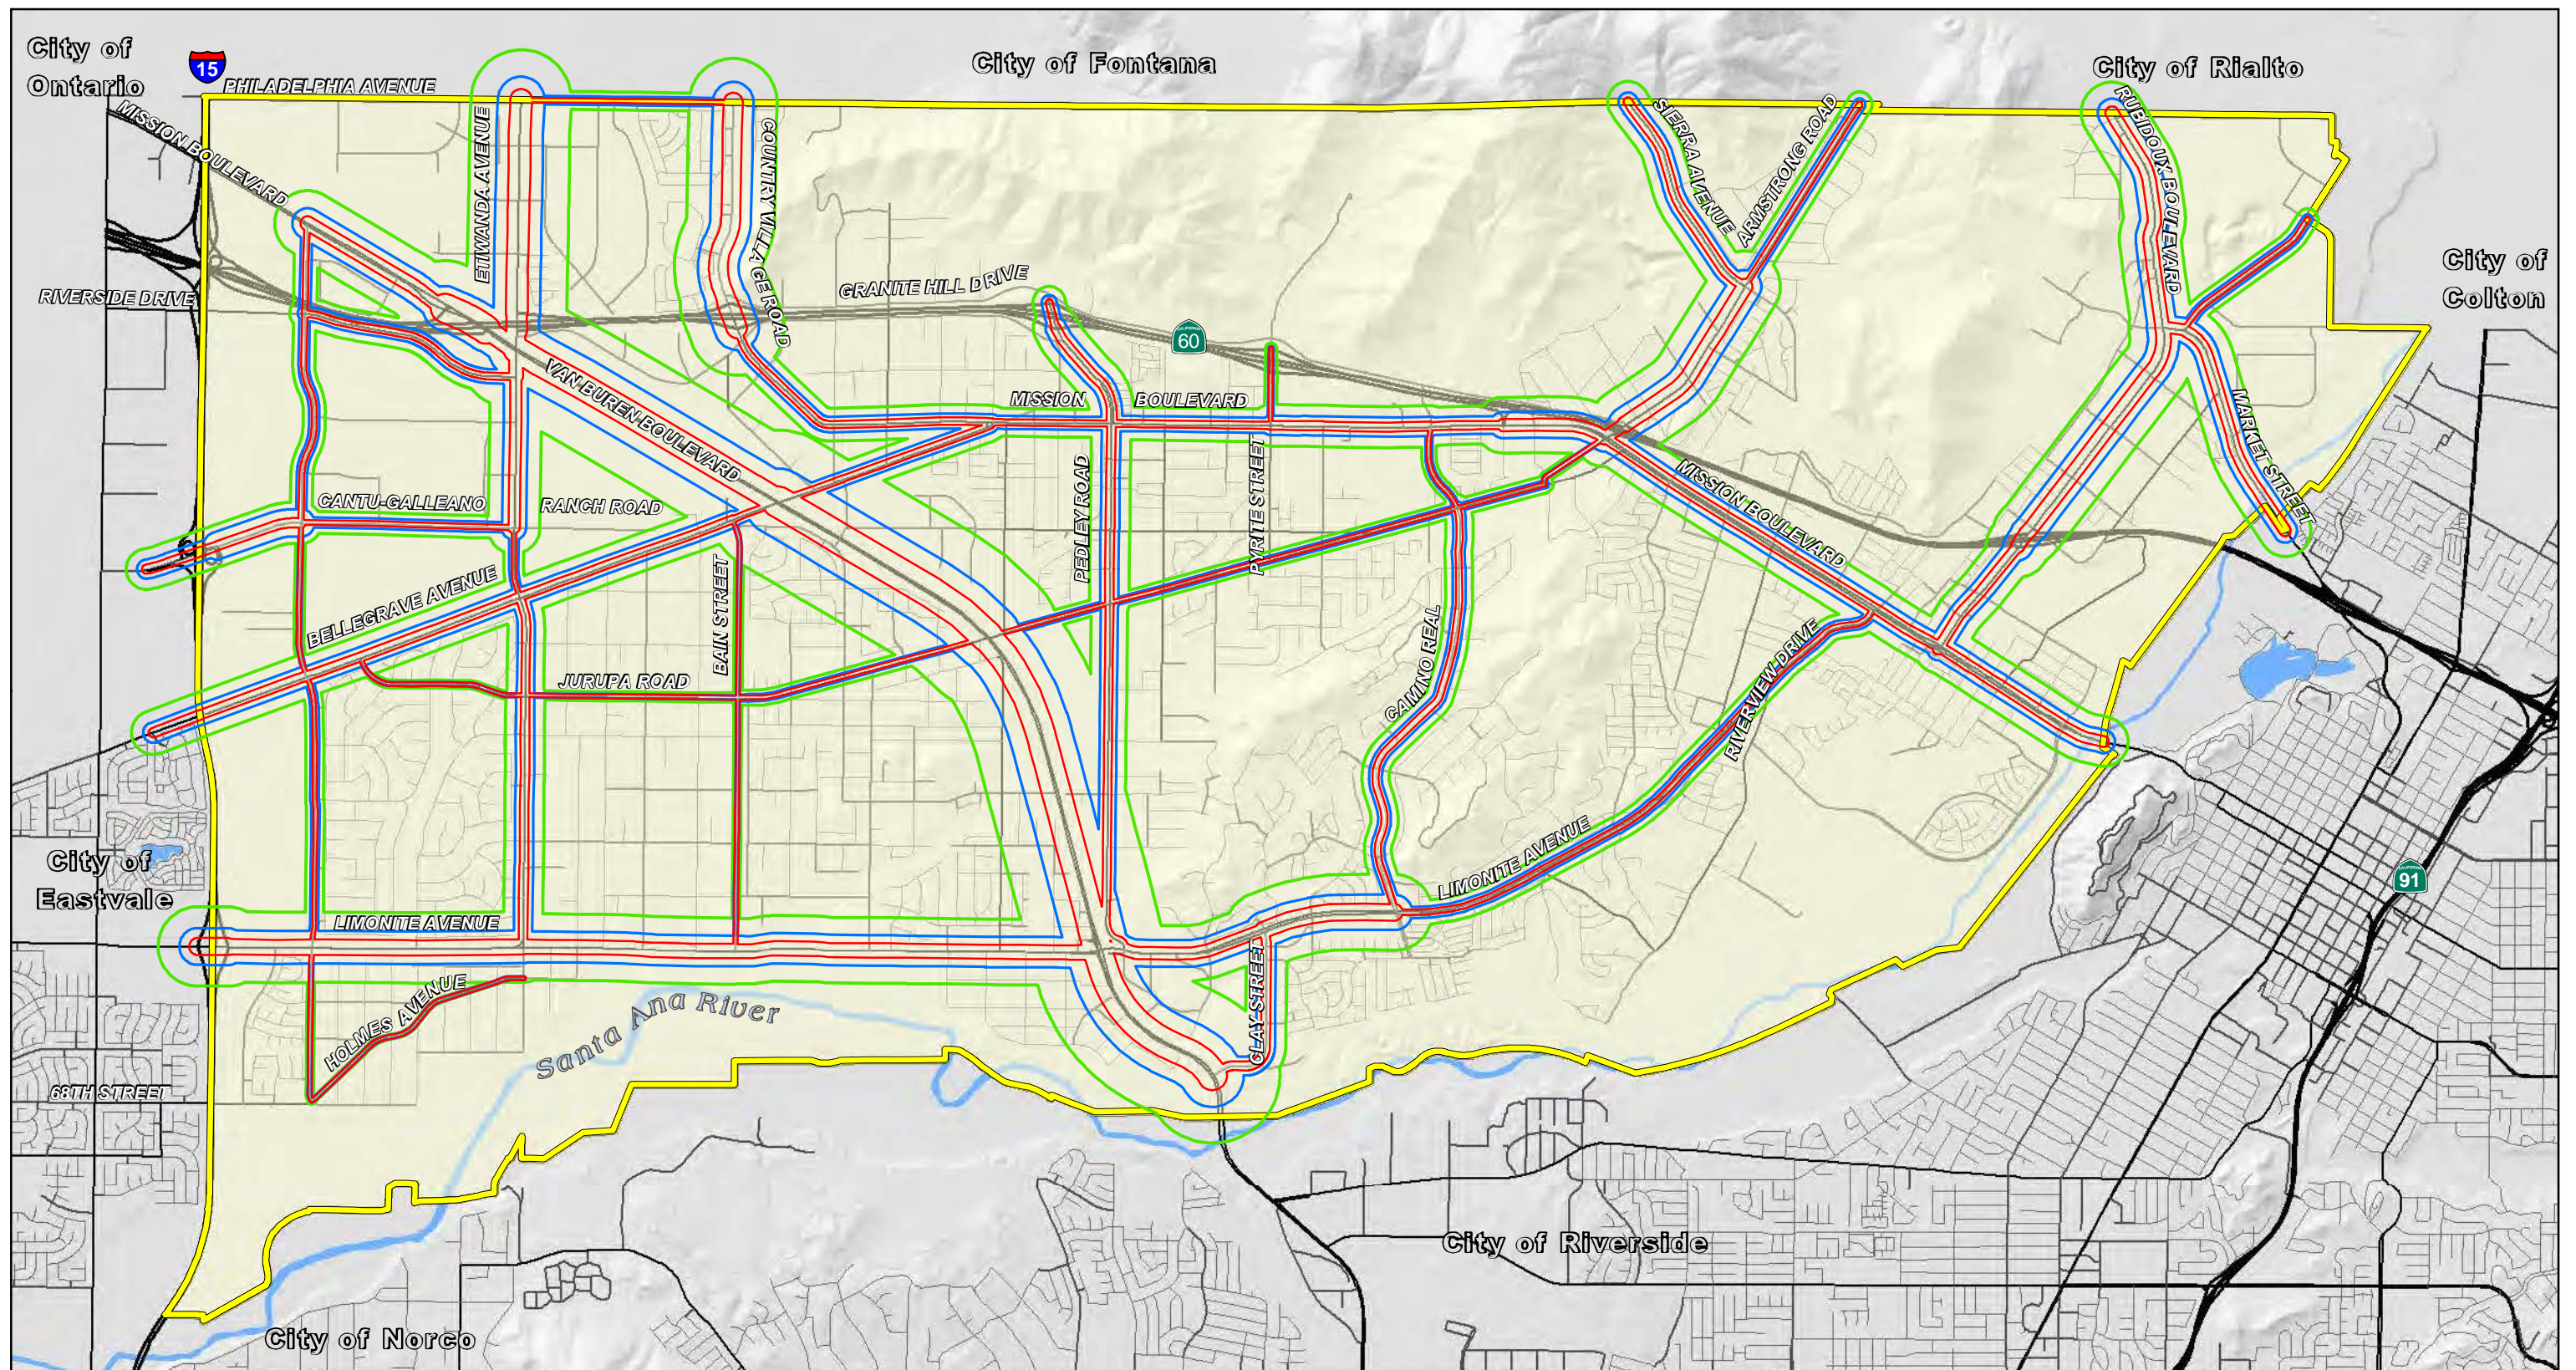

EXISTING SETTING

Overview of the Existing Noise Environment

Vehicular Noise. The primary source of noise in the City is vehicular traffic on the two local freeways (Interstate 15 [I-15] and SR-60), Van Buren Boulevard as a regional highway, and over a dozen roadways considered to be urban highways or arterials in the roadway classification used for the traffic study (see Table 4.16.D and Figure 4.16.2 in the Environmental Impact Report Traffic Section for more details on roadway classifications). Noise levels vary depending on distance from the centerline of a particular roadway, time of day, and traffic speeds and activities. The General Plan noise study modeled noise contours using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model. Figure 3 illustrates the existing (Year 2015) noise contours from major roads and highways in and near the City.

Automobiles, buses, trucks, and trains dominate transportation noise in the City. Bus service is provided on major streets, collectors, and local streets within the City’s circulation system. For purposes of assessing vehicular noise, three general weight classifications are considered (light, medium, and heavy). Buses do not fit exactly into either the medium truck or heavy truck category, and their measured noise emission characteristics are equally intermediate. At 35 miles per hour (mph), 1 medium duty truck is as loud as 10 cars, and 1 heavy truck is as loud as 30 cars. A bus is approximately equivalent to 20 cars. In addition, bus noise may be worsened by grade or by the

condition of the pavement. Major transportation noise sources in the City include traffic on I-15, SR-60, Mission Boulevard, Van Buren Boulevard, Bellegrave Avenue, Jurupa Road, Etiwanda Avenue, Limonite Avenue, Armstrong Road, Rubidoux Boulevard, Pedley Road, and Market Street.

The City is currently served by Riverside Transit Agency, a public transit agency serving Riverside County, with bus service along Limonite Avenue, Mission Boulevard and other small segments within the City through various routes (i.e., Routes 3, 21, 29, 49 and 204).

Rail Noise. The noise impacts associated with rail activities depend heavily on a number of factors, including the type of train, the length of train, the physical track conditions, the geometry and intervening structures between the rail line and its receptor, the number of trains operating during the daytime, the number of trains operating during the nighttime, and the speed of the train. Additionally, if the horn is required to sound a warning (typically at at-grade crossings), the noise level impact will be greater to those uses nearest the intersection.

Currently, one main rail line passes through the City operated by Union Pacific Railroad Company. The rail line generally runs from the northwest corner of the City to the southeastern corner of the City. The rail line also has a spur, which starts at the intersection of Van Buren Boulevard and Jurupa Road and continues northeast generally along the eastern side of Jurupa Road ending in the northeast corner of the City.

Based on the Federal Railroad Administration (FRA) crossing inventory completed on January 1, 2011, at various crossings within the City, typical operations along the main rail line included approximately 10 daytime trains and 8 nighttime freight trains ranging in speed from 45 to 80 mph. Typical operations on the spur include approximately 2 daytime trains ranging in speed from 5 to 10 mph. In addition to freight train operations on the main line, Metrolink operates a commuter train line, the Riverside Line that is scheduled to have 6 trains pass through in each direction, Monday through Friday.

For all future developments within the City that fall within the required noise screening distances as specified in the Federal Transit Authority (FTA) *Noise and Vibration Manual*, a detailed noise analysis would be required. The screening distances for commuter and freight rail are 750 feet with no obstruction between the rail line and receptor and 375 feet with intervening buildings. Figures 4A, 4B, and 4C show typical railroad 65 dBA CNEL, 70 dBA CNEL, and 75 dBA CNEL noise contours and their distances from railroad centerline of commuter trains and freight trains of various sizes.

Aircraft Noise. The City of Jurupa Valley has the potential to be influenced by operations at two different airports: Flabob Airport located within the Jurupa Valley city limits and Riverside Municipal Airport to the south.

The Flabob Airport is a source of noise, primarily from takeoffs and landings. Average inbound and outbound flights from this airport are approximately 75 per day currently and may reach up to approximately 120 per day in the future (Riverside County ALUCP 2004). Aircraft at this airport include single-engine airplanes, twin-engine piston and turboprop airplanes, and sail planes. Noise from the aircraft generates a relatively minor contribution to the overall noise environment.

Based on the noise contour map shown in Figure 5A, the 65 dBA CNEL contour appears to overlap with very few single-family homes located near the intersections of 42nd Street and Wallace Street and Carol Way and Wallace Street, otherwise, the 65 dBA CNEL contour remains within the Flabob Airport property limits.

Figure 5B shows the noise contours the Riverside Municipal Airport. The Riverside Municipal Airport's 65 dBA CNEL and 60 dBA CNEL contours are within the Riverside city limits.

Stationary Noise. A stationary noise source is a land use, building, or activity in a relatively fixed location that emits noise. They may be temporary, intermittent, or continuous. Stationary noise sources are common in many noise-sensitive areas. Motors, appliances, air conditioners, lawn and garden equipment, power tools, and generators, and amplified sounds are often found in residential neighborhoods, as well as on or near the properties of schools, hospitals, and parks. Industrial, commercial, and manufacturing facilities can also generate stationary noise that may affect sensitive land uses. Another local source of nuisance noise reported during public meetings on the General Plan is diesel trucks idling in residential neighborhoods, especially late at night or in the early morning, and to a lesser degree diesel truck noise from commercial and industrial areas that are close to residential areas. The emitted noise can usually be reduced to acceptable levels either at the source or on the adjacent property through the use of proper planning, setbacks, block walls, acoustic-rated windows, dense landscaping, or by changing the location of the noise producer. In Jurupa Valley, some of the stationary noise producers include truck transfer stations, construction activities, idling trucks, and a go-kart racetrack. Maximum noise exposure levels from stationary sources for noise-sensitive uses are regulated by the Municipal Code.

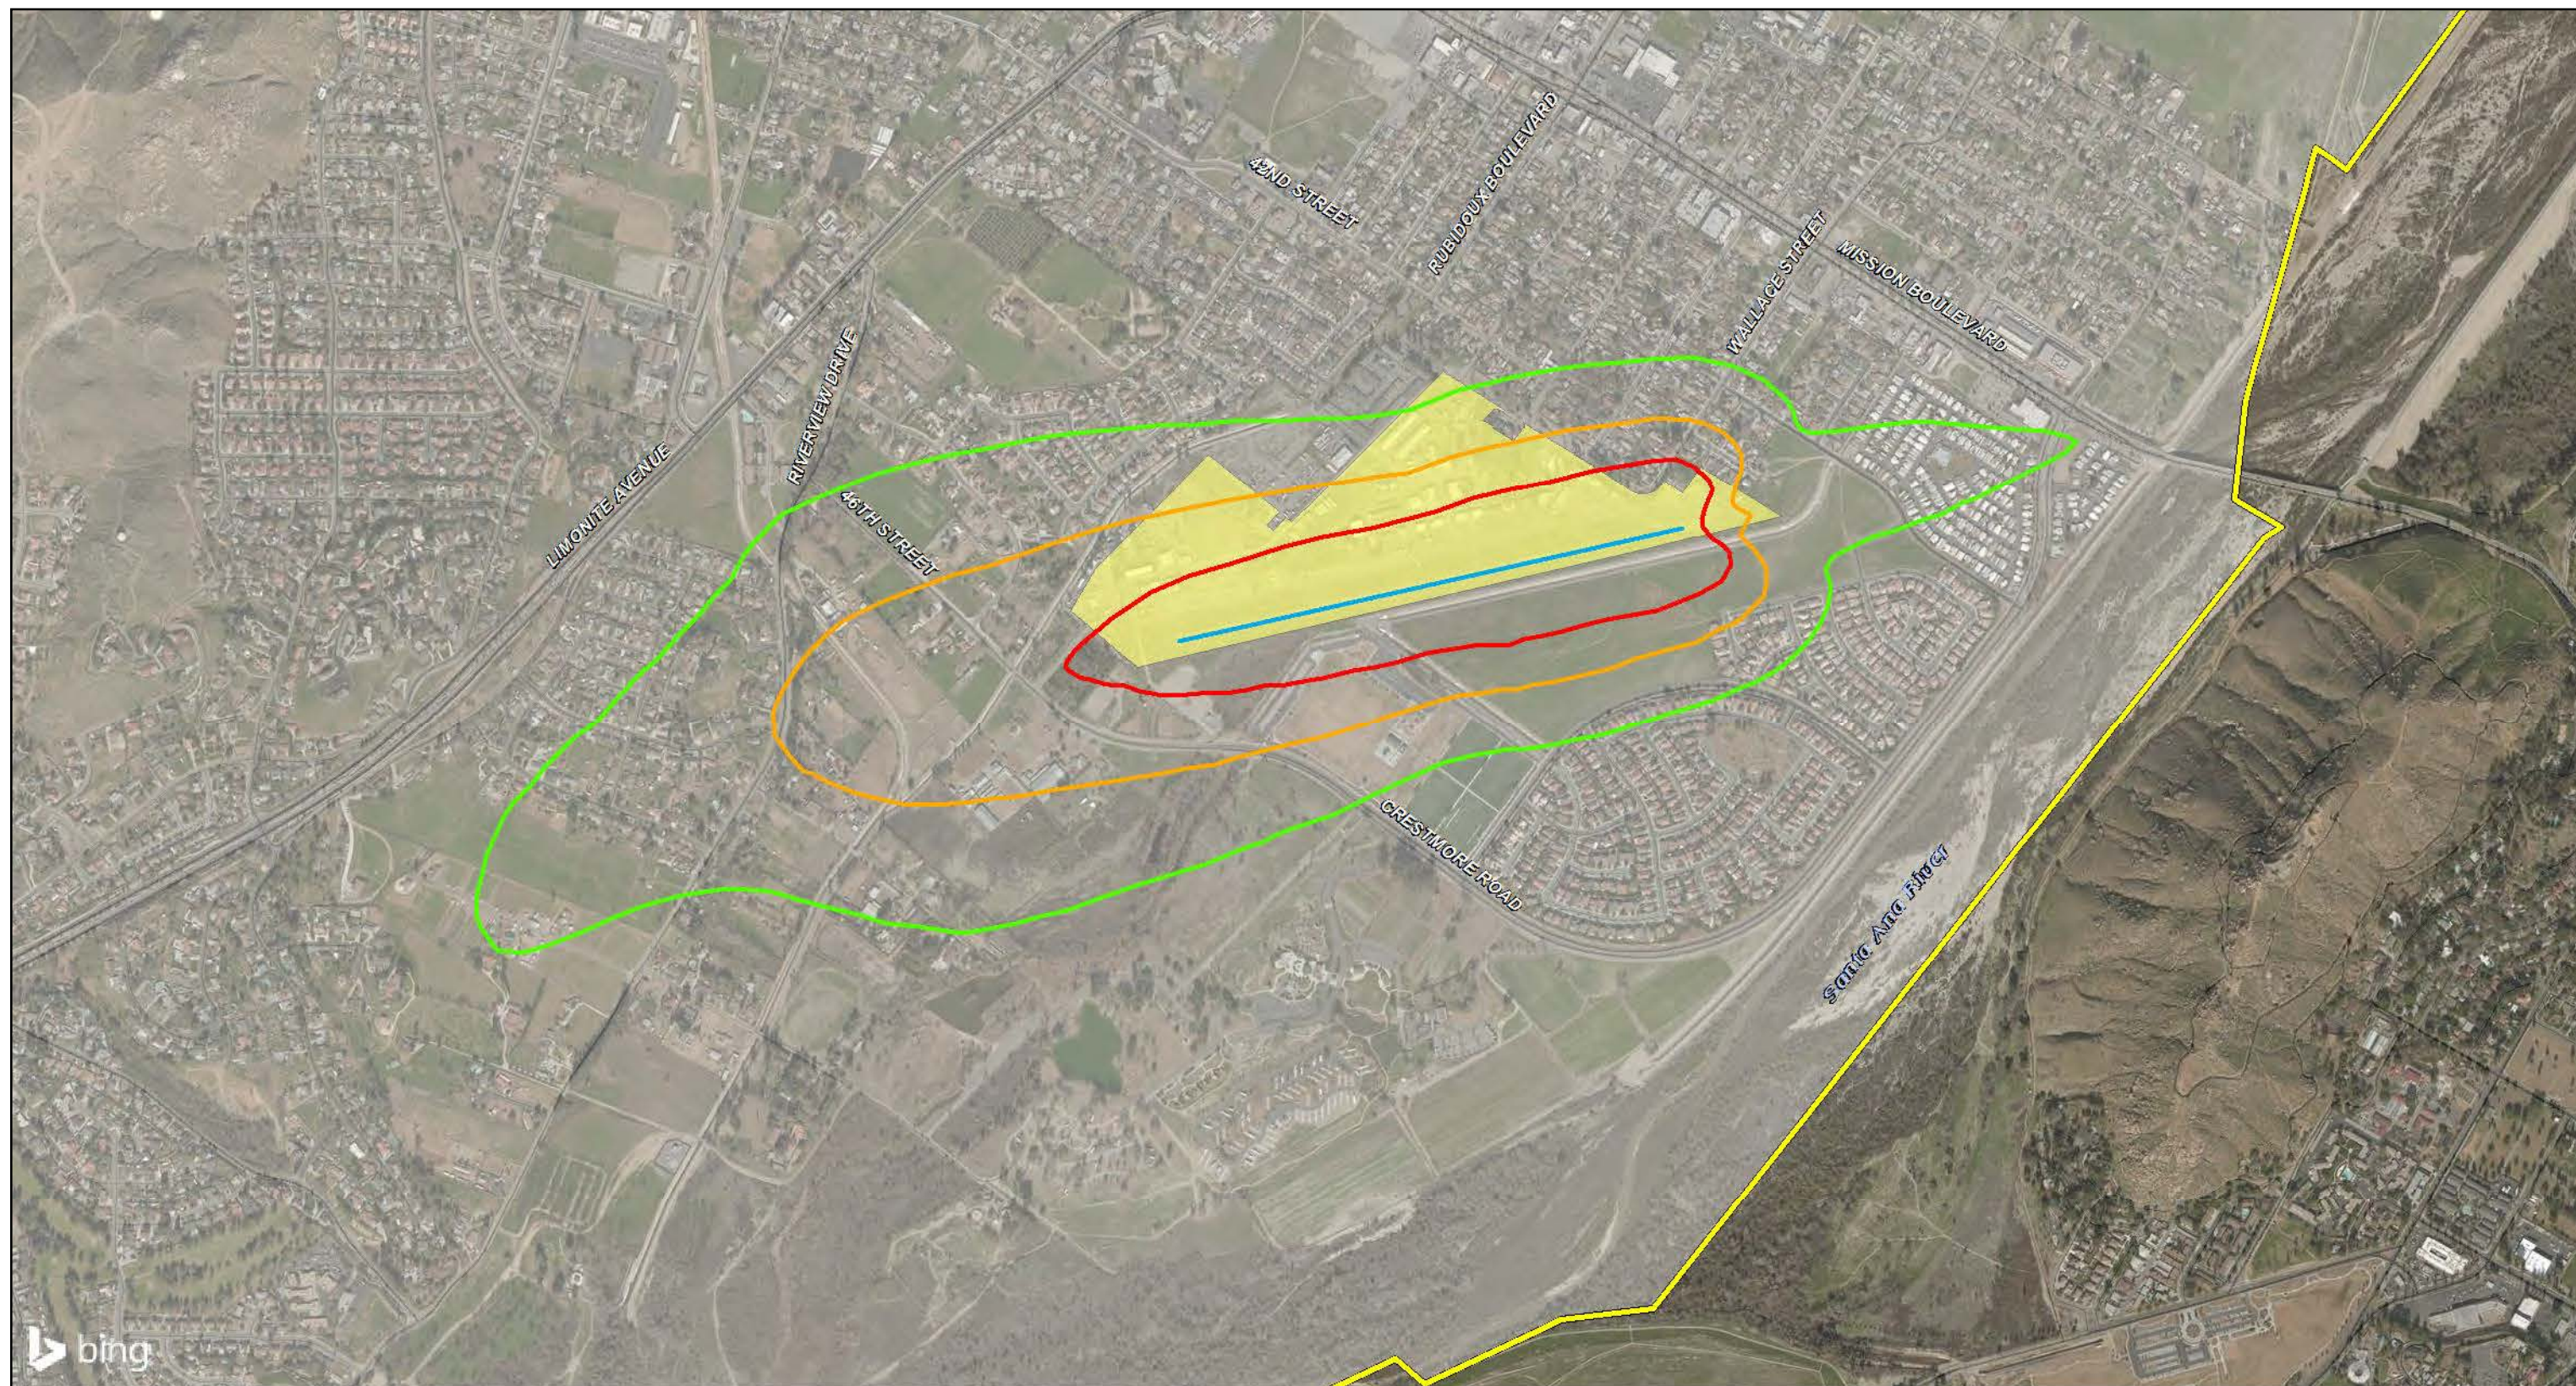

Nuisance Noise. Many infrequent sources of noise, such as amplified music from bars and private parties, dogs barking, and illegal firework use, is another type of stationary source noise that has been identified by area residents as creating a problem within the City. The effects or significance of nuisance noise can be compounded by the time of day, volume, and proximity to sensitive receptors. For instance, a loud party might be tolerated by neighbors in the early evening hours but be considered a nuisance after 10:00 p.m. The City's Noise Ordinance contains regulations limiting the allowable noise generated by private parties and other events.

Commercial-industrial and light-industrial land uses in the City have the potential to generate high noise levels and impact surrounding land uses with their equipment operation. Noise sources from these land uses include air conditioning or refrigeration units, power tools, lawn equipment, generators, and other powered mechanical equipment. Chapter 11.10, Sections 010–090, of the City's Municipal Code has established noise level requirements for operations involving stationary noise sources.

Existing Noise Measurements

Existing noise levels in the vicinity of the proposed project are used to establish baseline noise levels in key areas. The noise study conducted by LSA included 19 short-term and 12 long-term noise measurement locations distributed throughout the City based on potential areas of concern regarding noise impacts. Several criteria were used in the site selection process including, but not limited to, the

This page intentionally left blank

proximity of a measurement site to sensitive land uses as well as its proximity to significant noise generators. Significant noise generators within the City are SR-60, I-15, Van Buren Boulevard, and Etiwanda Avenue. This was due to the very high volume of automobile and truck traffic on these freeways and roadways. In addition, many houses in the City are adjacent to railroad lines, which generate infrequent but substantial noise as trains pass houses or idle on stacked tracks to allow other trains to pass.

To provide noise measurement coverage of the area, measurement sites were chosen within the confines of the City. After the site selection process was over, a series of long-term 24-hour and short-term noise 15-minute measurements was taken at the chosen sites. The measurement site locations are described in Table G, and their locations are shown in Figure 6, *Noise Measurement Locations*. Previously referenced Figure 3 shows the existing (ambient) noise levels along major roadways in and adjacent to the City, which are summarized in Table H. Many residences (and residents) experience ongoing noise from I-15 but especially from SR-60, which passes through the northern portion of the City in an east/west direction. There are also isolated locations in the City (e.g., in the northwest and northeast portions) where industrial land uses and truck activity raise ambient noise levels in adjacent or surrounding residential neighborhoods. In addition, many residences in the southeastern and eastern portions of the City experience infrequent noise from aircraft overflights from the Flabob and Riverside Municipal Airports.

IMPACTS AND MITIGATION MEASURES

Long-Term Noise Impacts

Vehicular Noise. Future development in the City adds traffic and increased human activity as growth occurs. Table I and Figure 7 show future noise levels and areas of noise impacts based on Year 2035 conditions. The City of Jurupa Valley will experience significant noise impacts if noise generated by traffic or other activities exceeds the City's established noise standards. For example, if exterior noise levels exceed 65 dBA in residential areas where sensitive receptors that would conduct outdoor activity.

The future traffic noise levels along City arterials were calculated using the FHWA Highway Traffic Noise Prediction Model. Table I lists the calculated Year 2035 traffic noise levels along roadway links within the City. Similar to the existing condition, these traffic noise levels represent the worst-case scenario, which assumes that no shielding is provided between the roadway traffic and where the contours are drawn.

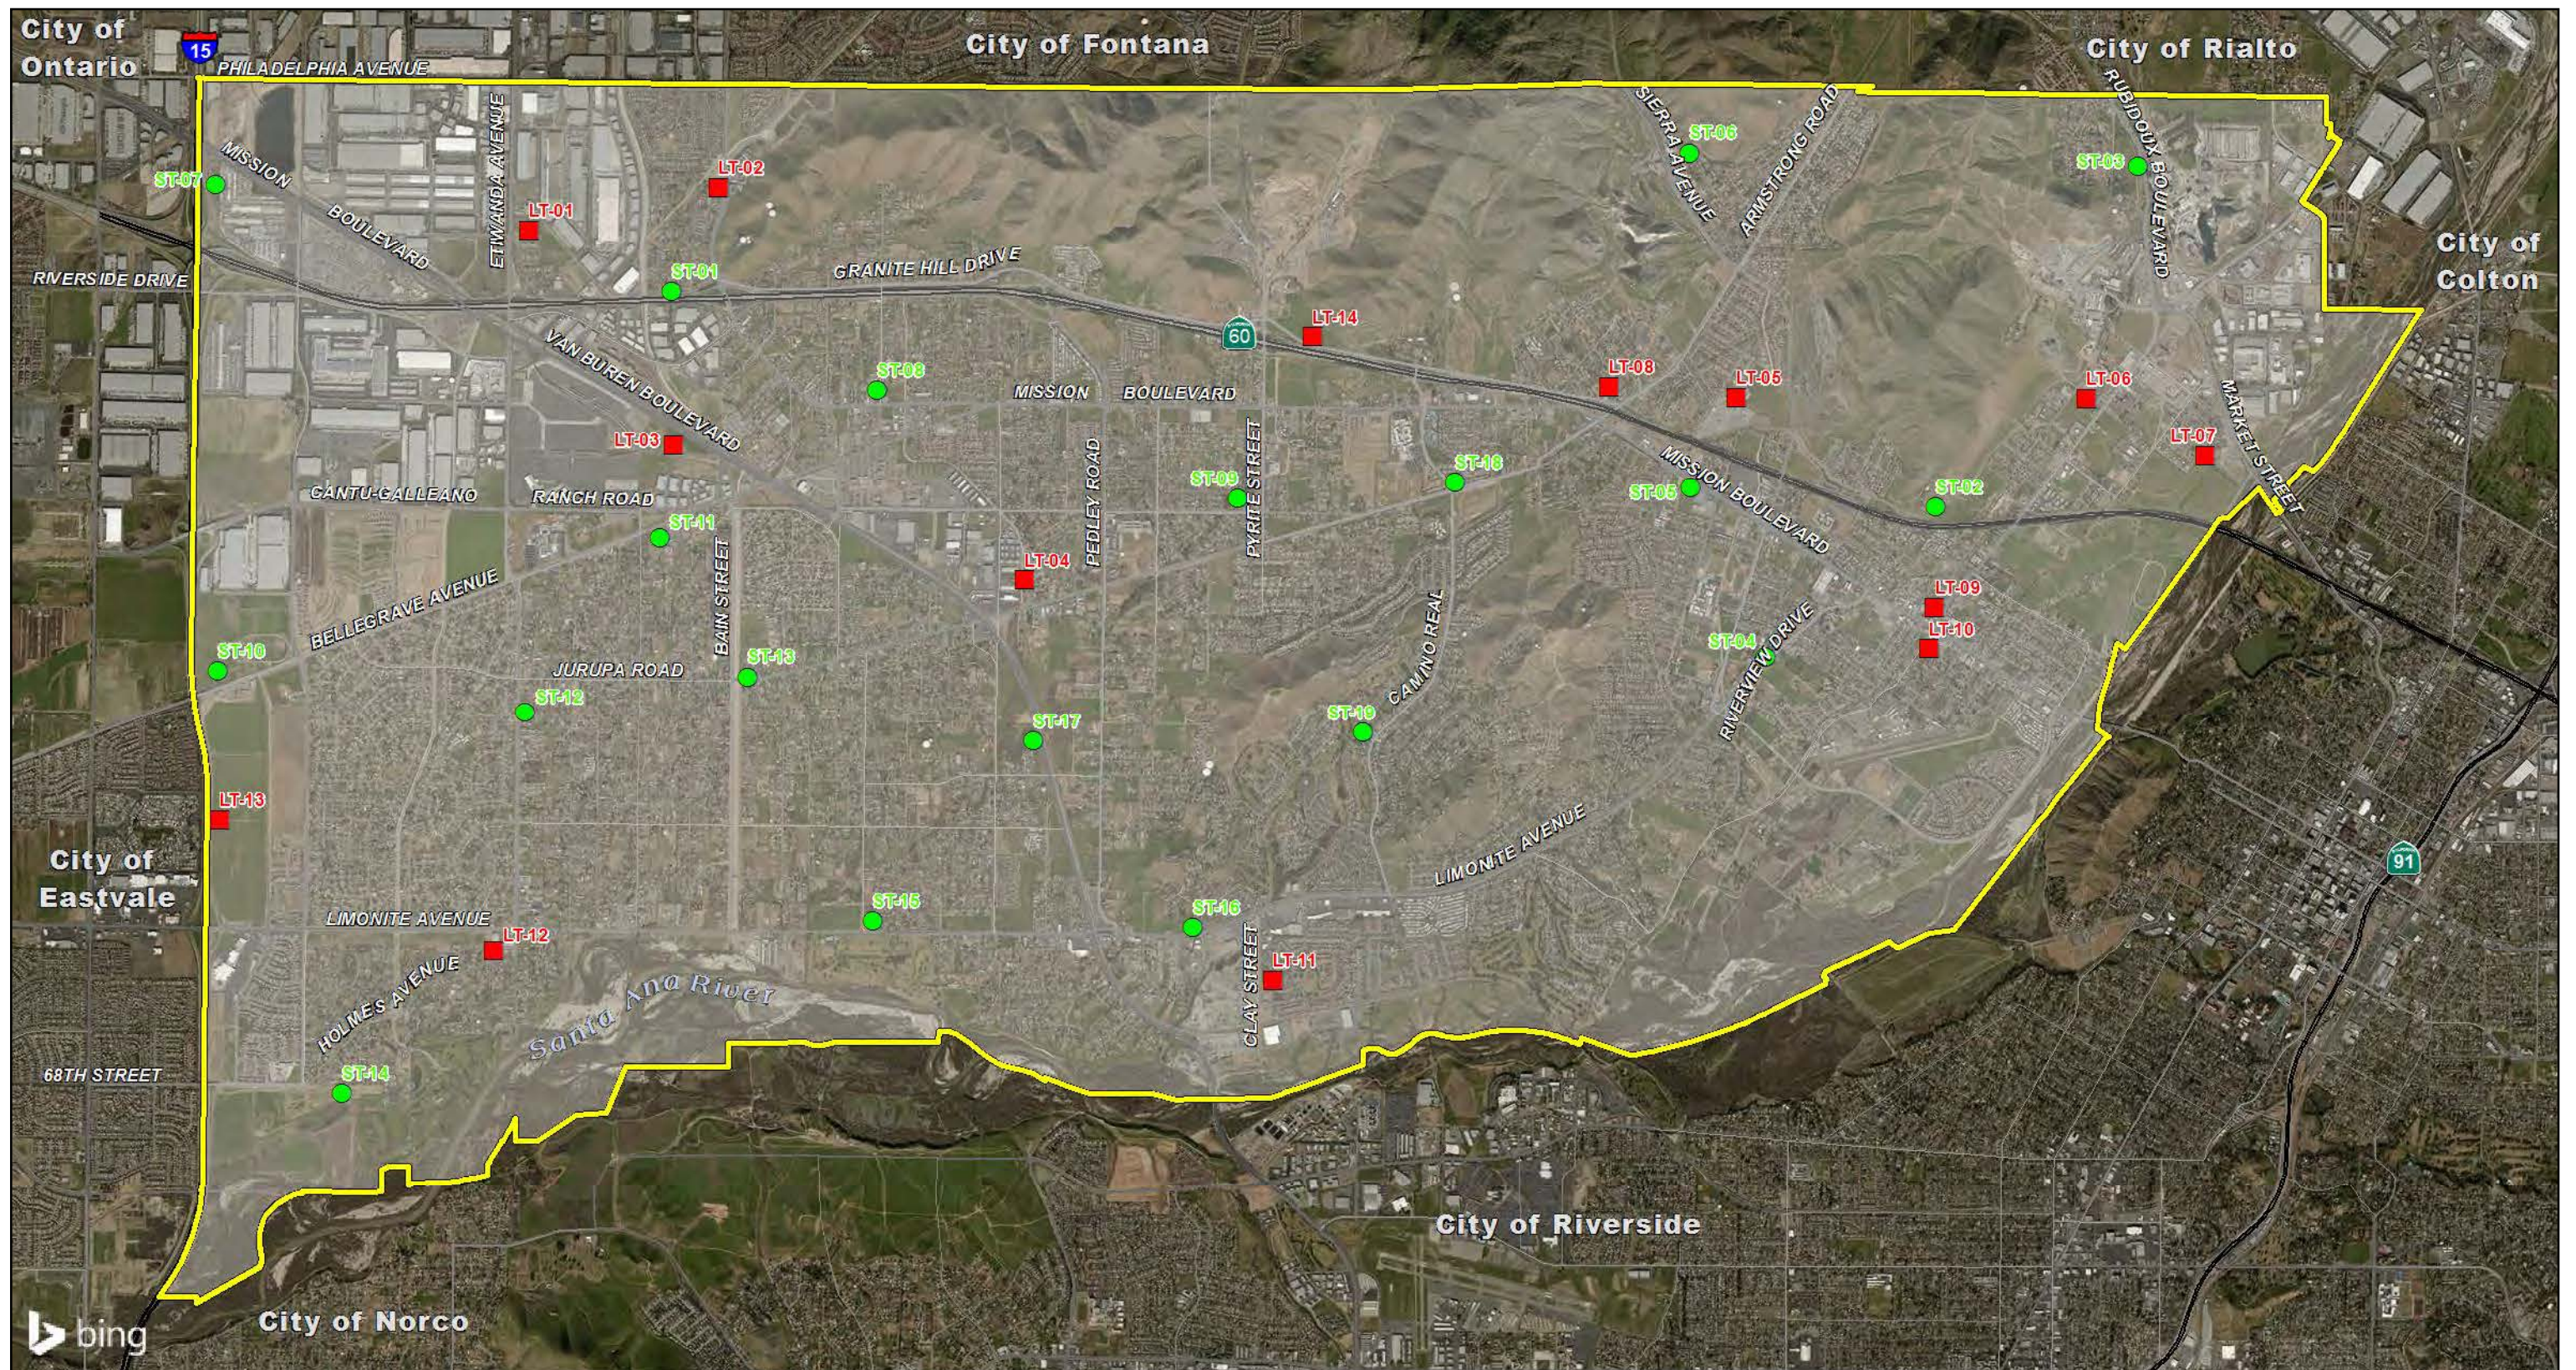

This programmatic analysis is different than project-level determinations. For example, if a specific project's contribution to increases in the ambient noise environment equals 3.0 dBA or more, then it is considered a significant noise impact at a project level. For context, a change of 3.0 dBA is considered "barely perceptible" by the human ear and changes of less than 3.0 dBA generally cannot be perceived except in carefully controlled laboratory environments. Based on available information, it appears future development in the City will generate significant noise impacts along certain major transportation routes.

Jurupa Valley General Plan Noise and Vibration Study

Figure 7

Future Noise Contours (2035)

This page intentionally left blank

Table I shows that increased traffic would add up to 7.9 dBA to area roadway links. Twenty-five of the 82 roadway sections modeled have a projected increase in noise greater than or equal to the 3 dBA threshold of significance. Previously referenced Figure 7 shows the 60, 65, and 70 dBA CNEL contours along all modeled roadways. As can be seen, nearly all of the roadway links analyzed have the 65 dBA CNEL extending outside the roadway right-of-way. The 65 dBA CNEL extends up to 1,085 feet from the centerline of the road. Noise-sensitive uses along the roadway links where the 65 dBA CNEL extends beyond the roadway right-of-way may be exposed to traffic noise exceeding the City's exterior noise standards.

Rail Noise. Although the proposed General Plan would not result in potential measureable project-related increases in railroad noise, there could be new proposed sensitive land uses along and adjacent to the railroads that would be affected by high noise levels from railroad operations. New development, particularly residential uses adjacent to railroad corridors, could be exposed to excessive train-related noise levels. Future increases in rail usage are anticipated as the result of establishment and expansion of commuter rail service. However, it is not possible to quantify impacts as specific plans for commuter operations (e.g., number and size of trains) are not available.

Stationary Noise. New development associated with implementation of the proposed General Plan could expose existing and/or new sensitive uses to stationary noise sources, such as industrial and/or commercial uses. The development of new commercial and industrial uses pursuant to the proposed General Plan may increase noise levels in their vicinity due to the establishment of new stationary noise sources. Although vehicular noise is exempt from local regulation when operating on public streets, cities and counties can regulate vehicular noise operating on private property. The use of heavy trucks on private properties (e.g., making deliveries to commercial and industrial uses) will result in noise levels of 73 dBA at 50 feet from the source of the noise (e.g., truck's engine, idling trucks). The use of multiple trucks on a site, such as might occur at a warehouse, could generate noise levels of about 80 dBA L_{eq} as measured at a distance of 50 feet. Industrial processing equipment and conducting outdoor industrial activities could also generate increased noise levels. New projects developed under the proposed General Plan would be subject to the City's noise ordinance and the provisions of the proposed General Plan.

Evaluation of General Plan Goals and Policies. While all of the following goals, policies, and programs of the Noise Element of the 2016 General Plan are intended to help reduce noise impacts to City residents and sensitive receptors, the following summarized goals, policies, and programs are examples of the degree to which the 2016 General Plan goes in that effort:

Goal

NE 1.1 Ensure adjacent land uses are compatible and protect sensitive receptors from outside sources of noise and vibration.

Policies

NE 1.1.1 Use the Land Use/Noise Compatibility Matrix to determine the compatibility of projects and noise exposure due to transportation sources.

- NE 1.1.2 Allow new noise-sensitive land uses near existing stationary noise sources only when the project can be designed to prevent significant noise impacts.
- NE 1.1.3 Stationary source projects must mitigate impacts on noise-sensitive uses.
- NE 1.1.4 Require acoustical studies for projects that exceed the “Normally Acceptable” thresholds of the Land Use/Noise Compatibility Matrix.
- NE 1.1.5 Discourage noise-sensitive land uses in areas in excess of 65 dBA CNEL.
- NE 1.1.6 Protect noise-sensitive land uses from high levels of noise.
- NE 1.1.7 Place noise-tolerant land uses in areas with elevated noise levels if possible.
- NE 1.1.8 New uses within Airport Influence Areas must comply with airport land use noise compatibility criteria contained in the ALUC plan.
- NE 1.1.9 Use acoustic site planning techniques.
- NE 1.1.10 Mixed commercial/residential development shall minimize internal noise impacts.

Programs

- NE 1.1.1.1 Amend the Municipal Code to require that development comply with the Land Use/Noise Compatibility Matrix and other requirements of the General Plan.
- NE 1.1.1.2 Maintain a Noise Guide containing “Good Neighbor” guidelines and rules for neighborhood noise reduction and procedures for mitigating noise.
- NE 1.1.1.3 Assist homeowners living in high noise areas to reduce noise levels in their homes.

Goal

- NE 2.1 Minimize excessive noise levels and health risks due to mobile noise sources.

Policies

- NE 2.1.1 Design and construct new roads to minimize noise impacts on adjacent land uses.
- NE 2.1.2 Restrict truck deliveries to the least-sensitive times of the day.
- NE 2.1.3 Restrict use of off-road vehicles to allowed areas to minimize noise impacts.
- NE 2.1.4 Carefully plan land uses to minimize rail-related noise impacts.
- NE 2.1.5 Encourage rail service providers to install noise mitigation features when possible.
- NE 2.1.6 Check project location within roadway, railroad, and airport noise contours.
- NE 2.1.7 Comply with applicable noise mitigation policies contained in the Airport Land Use Compatibility (ALUC) Plans for Flabob Airport, Riverside Municipal Airport, and the LA/Ontario International Airport.
- NE 2.1.8 Require noise mitigation for new development in prioritized order.
- NE 2.1.9 Limit installation of noise mitigation walls (sound walls) where possible.

Programs

- NE 2.1.1.1 Prepare truck route map to direct trucks away from sensitive noise receptors.
- NE 2.1.1.2 Implement strategies to reduce significant noise impacts in the community.

Goal

NE 3.1 Minimize excessive noise levels and health risks due to stationary noise sources.

Policies

- NE 3.1.1 Require a noise analysis for projects near sensitive receptors.
- NE 3.1.2 Design truck loading areas to minimize noise impacts on nearby residential areas.
- NE 3.1.3 Stationary noise sources to install noise buffering or reduction mechanisms.
- NE 3.1.4 Require all construction equipment use mufflers and engine shrouds.
- NE 3.1.5 Limit commercial construction activities near residential uses.
- NE 3.1.6 Restrict truck idling near noise sensitive receptors.
- NE 3.1.7 Design automobile-oriented uses to minimize potential noise on adjacent land uses.
- NE 3.1.8 Minimize excessive noise from entertainment and restaurant/bar establishments.
- NE 3.1.9 Support efforts to curb noise from parties, barking dogs, and illegal firework use.

Program

- NE 3.1.1.1 Ensure required noise mitigation measures are built and in place.

Level of Programmatic Impact Before Mitigation. Implementation of the 2016 General Plan goals, policies, and programs would help reduce vehicular noise levels in the City as future land uses build out; however, due to the level of growth and location of major roadways, there will be significant impacts and no additional feasible mitigation is available to reduce these impacts.

Implementation of the 2016 General Plan goals, policies, and programs would reduce the effect of rail noise on sensitive land uses and include mechanisms to ensure appropriate review and placement of noise reduction requirements into new development. As a result, impacts of railroad noise will be reduced to less than significant levels.

Implementation of the 2016 General Plan goals, policies, and programs would reduce the impacts of stationary noise sources on sensitive land uses, and include mechanisms to ensure appropriate review and placement of noise reduction requirements on new development. As a result, impacts from stationary noise sources will be reduced to less than significant levels.

Programmatic Mitigation Measures. No mitigation required.

Level of Programmatic Impact After Mitigation. Implementation of the goals, policies, and programs of the 2016 General Plan would help reduce overall noise levels and impacts in the City, but some areas with identified traffic congestion will result in significant noise impacts over the long term and no additional feasible mitigation is available.

Long-Term Airport Noise Impacts

The noise contours of two public airports affect the City of Jurupa Valley. The Flabob Airport is located in the eastern portion of the City and its noise contours overlap both developed uses and vacant land within the City. To minimize land use conflicts with adjacent uses, much of the remaining undeveloped area adjacent to the airport is designated as Estate Density Residential, with most of the developed land designated and used for Medium-Density Residential. The Riverside Municipal Airport (RMA) is south of the eastern portion of the City across the Santa Ana River. Portions of the City are within RMA's Airport Land Use Compatibility (ALUC) Plan Zone E and also within its 65 dBA CNEL noise contour. If future residential land uses were to be located where airport activities exceeded the applicable residential noise standards, which is within 65 dBA CNEL noise contour of either airport, the General Plan might contribute to significant noise impacts in the future.

Evaluation of General Plan Goals and Policies. The following summarized goals, policies, and programs of the Noise and Land Use Elements of the 2016 General Plan address airport-related noise impacts:

Noise Element

Goal

- NE 1.1 Ensure adjacent land uses are compatible and protect sensitive receptors from outside sources of noise and vibration.

Policies

- NE 1.1.8 **Airport Noise Compatibility.** Ensure that new land use development within Airport Influence Areas complies with airport land use noise compatibility criteria contained in the applicable Airport Land Use Compatibility (ALUC) plan for the area.
- NE 1.1.7 **Noise-Tolerant Uses.** Guide new or relocated noise-tolerant land uses into areas irrevocably committed to land uses that are noise producing, such as along major transportation corridors or within the projected noise contours of area airports.

Goal

- NE 2.1 Minimize excessive noise levels and community health risks due to mobile noise sources.

Policies

- NE 2.1.6 **Noise Contours.** Check all proposed development projects for possible location within roadway, railroad, and airport noise contours.
- NE 2.1.7 **Airport Compatibility.** Comply with applicable noise mitigation policies contained in the Airport Land Use Compatibility (ALUC) Plans for Flabob Airport, Riverside Municipal Airport, and the LA/Ontario International Airport.

Land Use Element

Policies

- LUE 5.53 **ALUP Compliance.** To provide for the orderly operation and development of Flabob and Riverside Municipal Airports and the surrounding area, the City will comply

with the Airport Land Use Compatibility Plan as fully set forth in Appendix 4.0 and as summarized in Table-34, as well as any applicable policies related to airports in the Land Use, Circulation, Safety and Noise Elements of the 2016 General Plan, unless the City Council overrides the Plan as provided for in State law.

- LUE 5.54 **Development Review.** Until such time as 1) the Commission finds the City's General Plan to be consistent with the ALUP, or 2) the City Council has overruled the Commission's determination of inconsistency, or 3) the Commission elects not to review a particular action, the City will refer all major land use actions to the Airport Land Use Commission for review, pursuant to Policy 1.5.3 of the ALUP.
- LUE 5.55 **Continued Airport Operation.** Support the continued operation of Flabob and Riverside Municipal Airports to help meet airport services needs within the land-use compatibility criteria with respect to potential noise and safety impacts.
- LUE 5.56 **Consistency Requirement.** Review all proposed projects and require consistency with any applicable provisions of the Riverside County Airport Land Use Plan as set forth in Appendix A-4.0, and require General Plan and/or Zoning Ordinance amendments to achieve compliance, as appropriate.
- LUE 5.57 **ALUP Amendments.** Review all subsequent amendments to any airport land-use compatibility plan and either adopt the plan as amended or overrule the Airport Land Use Commission as provided by law (Government Code Section 65302.3).
- LUE 5.58 **General Plan Adoption or Amendment.** Prior to the adoption or amendment of this General Plan or any specific plan, or the adoption or amendment of a zoning ordinance or building regulation within the planning boundary of any airport land use compatibility plan, the City will refer such proposed actions for determination and processing as provided by the Airport Land Use Law.
- LUE 5.59 **Cluster Development.** Allow the use of development clustering and/or density transfers to meet airport compatibility requirements as set forth in the applicable airport land-use compatibility plan.
- LUE 5.62 **Voluntary Review.** The City, from time to time, may elect to submit proposed actions or projects voluntarily that are not otherwise required to be submitted to the ALUC under the Airport Land Use Law in the following circumstances:
- a. Clarification: If there is a question as to the purpose, intent or interpretation of an airport land use compatibility plan (LUCP) or its provisions; or
 - b. Advisory: If assistance is needed concerning a proposed action or project relating to Airport Land Use matters.
- LUE 5.63 **Airport Referrals.** All development proposals located within an Airport Influence Area will be submitted to the affected airport.
- LUE 9.1 **Land Use Compatibility.** Require land to be developed and used in accordance with the General Plan, specific plans and community and village plans to ensure compatibility and minimize impacts.

Level of Programmatic Impact Before Mitigation. Implementation of the 2016 General Plan goals and policies of the 2016 General Plan will help protect City residents from future noise impacts related to airport activities. Impacts on this regard will be less than significant.

Programmatic Mitigation Measures. No mitigation required.

Level of Programmatic Impact After Mitigation. Implementation of the goals and policies of the 2016 General Plan will prevent existing and future land uses from experiencing significant noise impacts from airport operations and no mitigation is required.

Groundborne Vibration Impacts

Future development under the General Plan could generate substantial noise and vibration near construction sites. If sensitive receptors or land uses are adjacent to these sites, there could be significant impacts from noise or vibration. Construction activities can produce vibration that may be felt by adjacent land uses. As long as construction of a particular development does not require the use of equipment known to generate substantial construction vibration levels, such as pile drivers, the primary source of vibration during construction would likely be from bulldozer operation. A small bulldozer has a vibration impact of 0.003 inches per second peak particle velocity (PPV) at 25 feet and 0.035 inches per second PPV is considered barely perceptible. It is possible that future development could result in significant vibration impacts if large construction projects are located adjacent to residential or other sensitive uses.

Evaluation of General Plan Goals and Policies. The following summarized goals, policies, and programs of the Noise Element of the 2016 General Plan addresses vibration-related noise impacts:

Noise Element

Goal

NE 1.1 Ensure adjacent land uses are compatible and protect sensitive receptors from outside sources of noise and vibration.

NE 4 Groundborne Vibration

Goal

NE 4.1 Minimize excessive noise levels and community health risks due to groundborne vibration.

Policies

NE 4.1.1 **Sensitive Land Uses.** Avoid the placement of sensitive land uses in proximity to vibration-producing land uses.

NE 4.1.2 **Vibration Producing Land Uses.** Avoid the placement of vibration-producing land uses near sensitive receptors.

NE 4.1.3 **Truck Idling.** Restrict truck idling near sensitive vibration receptors.

- NE 4.1.4 **Passing Trains.** Prohibit exposure of residential dwellings to perceptible ground vibration from passing trains as perceived at the ground or second floor. Perceptible motion shall be presumed to be a motion velocity of 0.01 inches/second over a range of 1 to 100 Hz.
- NE 4.1.5 **Mining Operations.** Require measures to protect properties adjacent to mining or construction sites that will entail blasting as part of the operation when considering land use entitlement applications.

Programs

- NE 4.1.1.1 **Rail-related Noise.** Minimize the noise impact of passenger (Metrolink) and freight rail service on sensitive land uses by coordinating with rail authorities to effectively manage train noise and by establishing and enforcing noise mitigation measures that apply to rail uses.
- NE 4.1.1.2 **Quiet Zone Crossings.** Require new development in the vicinity of railroad crossings that are within 1,000 feet of existing residential neighborhoods to design and construct Quiet Zone railroad crossing improvements and see to qualify for a Quiet Zone designation.

Level of Programmatic Impact Before Mitigation. Implementation of the 2016 General Plan goals, policies, and programs will help the City reduce potential noise and vibration impacts, especially to sensitive receptors, to less than significant levels (i.e., within City standards).

Programmatic Mitigation Measures. No mitigation required.

Level of Programmatic Impact After Mitigation. Implementation of the goals, policies, and programs of the 2016 General Plan will reduce potential vibration impacts to less than significant levels and no mitigation is required.

Short-Term Construction Noise Impacts

Short-term noise would occur during the construction of future development projects under the proposed 2016 General Plan. First, construction crew commuting and the transport of construction equipment and materials to a project site in the future would incrementally increase noise levels on access roads in the particular project area. In addition, noise would be generated during excavation, grading, and building construction on various portions of a specific development site.

Each step of the construction process has its own mix of equipment, and consequently, its own noise characteristics. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. The site preparation phase, which includes excavation and grading of a site, tends to generate the highest noise levels, because the noisiest construction equipment is earthmoving equipment, which includes excavating machinery such as backfillers, bulldozers, draglines, and front loaders. Earthmoving and compacting equipment includes compactors, scrapers,

and graders. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings.

Figure 8 presents general construction noise levels measured at 50 feet, which are based on FHWA data from typical equipment. The peak noise level for the majority of the equipment that will be used during construction of typical development projects will range from 68 to 105 dBA. Noise levels would diminish rapidly with distance from a particular construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 86 dBA measured 50 feet from the source would reduce to 80 dBA at 100 feet. At 200 feet from the source, the noise level would reduce to 74 dBA, and then reduce to 68 dBA at 400 feet. Typical construction noise measurements for urban type development projects demonstrate that the noise levels generated by commonly used grading equipment (e.g., loaders, graders, and trucks) generate noise levels that typically do not exceed the middle of the range shown in Figure 8.

It should be noted the City has an exemption for noise levels created during construction, but limits times of construction activity. Future development projects will be required to provide site-specific noise impact studies when residential land uses are adjacent to demonstrate there will be no project-specific significant noise impacts.

Evaluation of General Plan Goals and Policies. While all of the following goals, policies, and programs of the Noise Element of the 2016 General Plan are intended to help reduce noise impacts to City residents and sensitive receptors, the following summarized goals, policies, and programs are examples of the degree to which the General Plan goes in that effort:

Noise Element

Goal

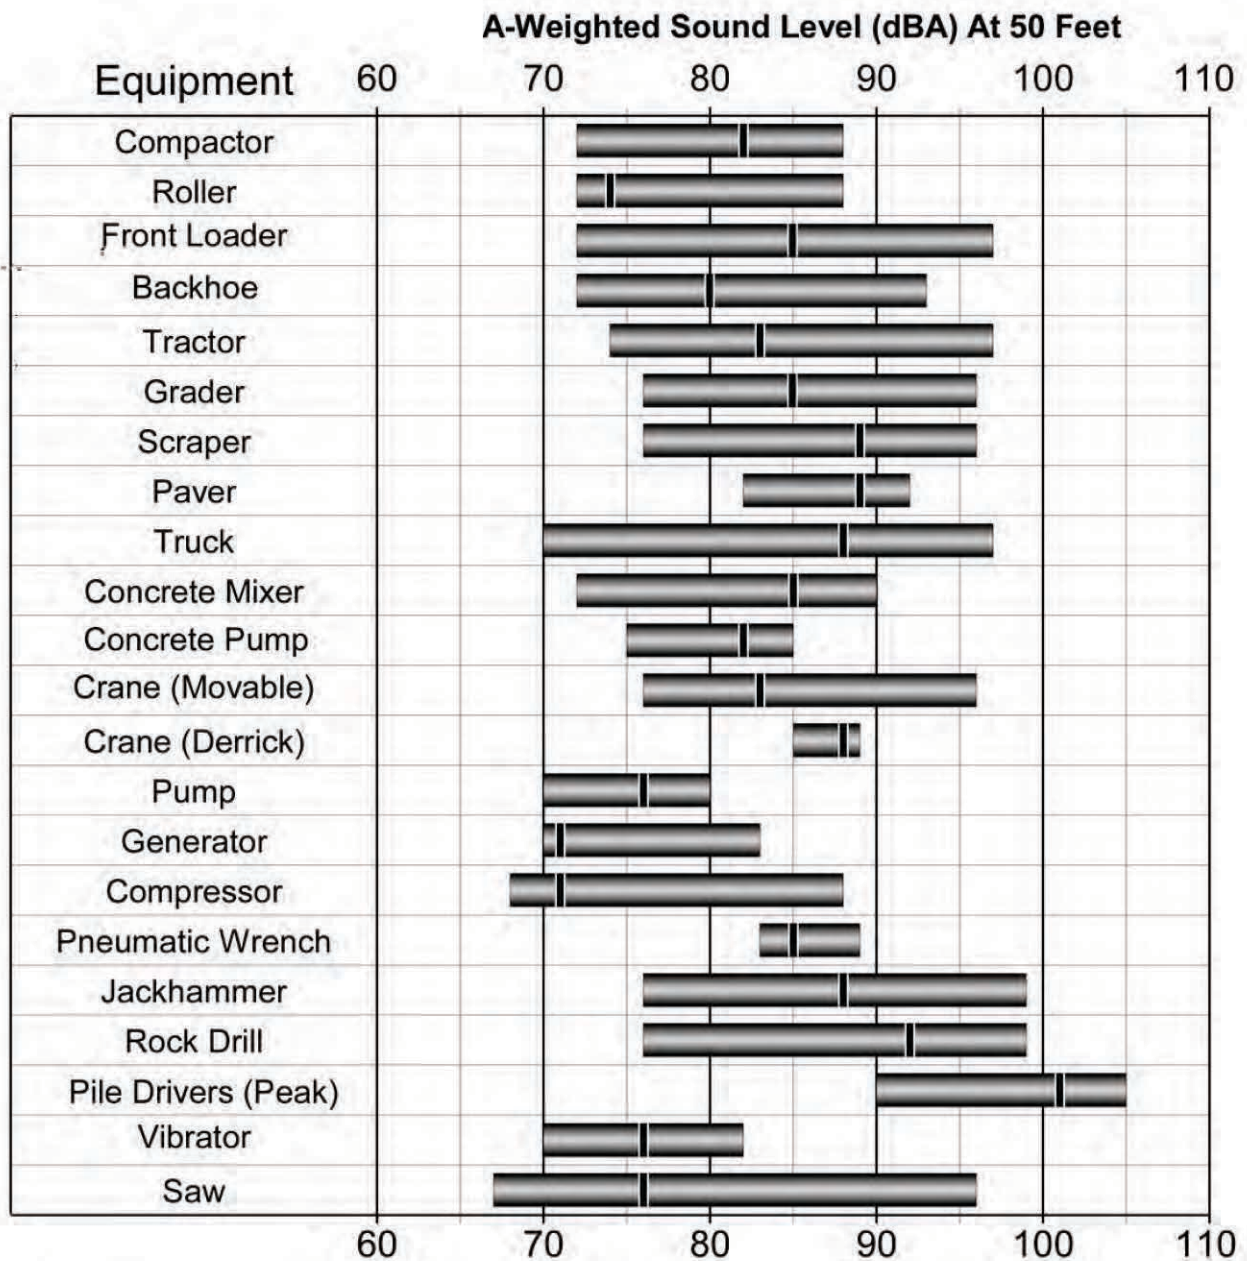

- NE 1.1 Ensure adjacent land uses are compatible and protect sensitive receptors from outside sources of noise and vibration.

Policies

- NE 1.1.2 Allow new noise-sensitive land uses near existing stationary noise sources only when the project can be designed to prevent significant noise impacts.
- NE 1.1.3 Stationary source projects must mitigate impacts on noise-sensitive uses.
- NE 1.1.4 Require acoustical studies for projects that exceed the “Normally Acceptable” thresholds of the Land Use/Noise Compatibility Matrix.
- NE 1.1.9 Use acoustic site planning techniques.
- NE 1.1.10 Mixed commercial/residential development shall minimize internal noise impacts.

Programs

- NE 1.1.1.1 Amend the Municipal Code to require that development comply with the Land Use/Noise Compatibility Matrix and other requirements of the General Plan.
- NE 1.1.1.2 Maintain a Noise Guide containing “Good Neighbor” guidelines and rules for neighborhood noise reduction and procedures for mitigating noise.

Noise and Vibration Study*

Figure 8

Typical Construction Equipment Noise Levels

This page intentionally left blank

NE 1.1.1.3 Assist homeowners living in high noise areas to reduce noise levels in their homes.

Goal

NE 2.1 Minimize excessive noise levels and health risks due to mobile noise sources.

Policies

NE 2.1.2 Restrict truck deliveries to the least-sensitive times of the day.

NE 2.1.3 Restrict use of off-road vehicles to allowed areas to minimize noise impacts.

NE 2.1.8 Require noise mitigation for new development in prioritized order.

NE 2.1.9 Limit installation of noise mitigation walls (sound walls) where possible.

Programs

NE 2.1.1.2 Implement strategies to reduce significant noise impacts in the community.

Goal

NE 3.1 Minimize excessive noise levels and health risks due to stationary noise sources.

Policies

NE 3.1.1 Require a noise analysis for projects near sensitive receptors.

NE 3.1.2 Design truck loading areas to minimize noise impacts on nearby residential areas.

NE 3.1.3 Stationary noise sources to install noise buffering or reduction mechanisms.

NE 3.1.4 Require all construction equipment use mufflers and engine shrouds.

NE 3.1.5 Limit commercial construction activities near residential uses.

NE 3.1.6 Restrict truck idling near noise-sensitive receptors.

Program

NE 3.1.1.1 Ensure required noise mitigation measures are built and in place.

Level of Programmatic Impact Before Mitigation. Implementation of the 2016 General Plan goals, policies, and programs will help prevent significant noise impacts from construction on adjacent sensitive uses.

Programmatic Mitigation Measures. No mitigation required.

Level of Programmatic Impact After Mitigation. Implementation of the goals, policies, and programs of the 2016 General Plan will effectively reduce potential noise impacts during future construction; therefore, noise impacts will be less than significant and no mitigation is required.

Cumulative Impacts

Cumulative impacts refer to incremental effects of an individual project when viewed in connection with the effects of past projects, current projects, and probable future projects. In this case, the proposed project or action is the City's General Plan, which by its very nature is an assessment of various potential cumulative impacts from future development. Under the 2016 General Plan, the City will experience incremental conversion of vacant land in various locations of the City based on market conditions over the years.

CEQA typically requires a cumulative analysis using a list of cumulative projects or a plan summary of long-term development impacts. In this case, the growth projections of the 2016 General Plan represent the "plan summary" for the purposes of characterizing cumulative impacts related to General Plan implementation. The projected growth conditions in the City by 2035 include conversion of a total of 4,258 acres of vacant land with a mixture of rural and suburban land uses which is 15.3 percent of the total City area. If development occurs at a regular pace, that would equal roughly 224 acres or 5 percent per year for approximately 19 years (2016 to 2035). Future growth is expected to add a maximum of 13,140 new residential units and maximum of 33 million square feet of new non-residential building. (See Tables 3.A through 3.C in Section 3, *General Plan Components, Projected Growth*.)

The cumulative "universe" for noise impacts is the City of Jurupa Valley and adjacent surrounding communities. As growth occurs, vehicular traffic (passenger cars and various sizes of trucks) will incrementally increase depending on the size, type, and location of future development. Major roadways are expected to experience considerable traffic increases, which will substantially increase noise levels adjacent to these roadways. It should be noted that a significant percentage of the expected traffic increases on local roads and freeways will come from regional sources (i.e., land uses in other jurisdictions). The *Long-term Noise Impacts* section determined there would be significant noise impacts in the City from future traffic along selected roadways; therefore, the 2016 General Plan will make an incremental but significant contribution to cumulatively considerable regional noise impacts in the future.

It is also possible that future residents will experience noise impacts from increased rail and airport activities in the future, as well as stationary noise impacts from new commercial and industrial development, but these are not expected to be significant on a local level, so any contributions of noise by local land uses under the 2016 General Plan would not represent a significant contribution to a cumulatively considerable regional noise impacts related to airport or railroad sources.

MEMORANDUM

DATE: October 15, 2015

TO: Project Team

FROM: J.T. Stephens, LSA Associates, Inc.

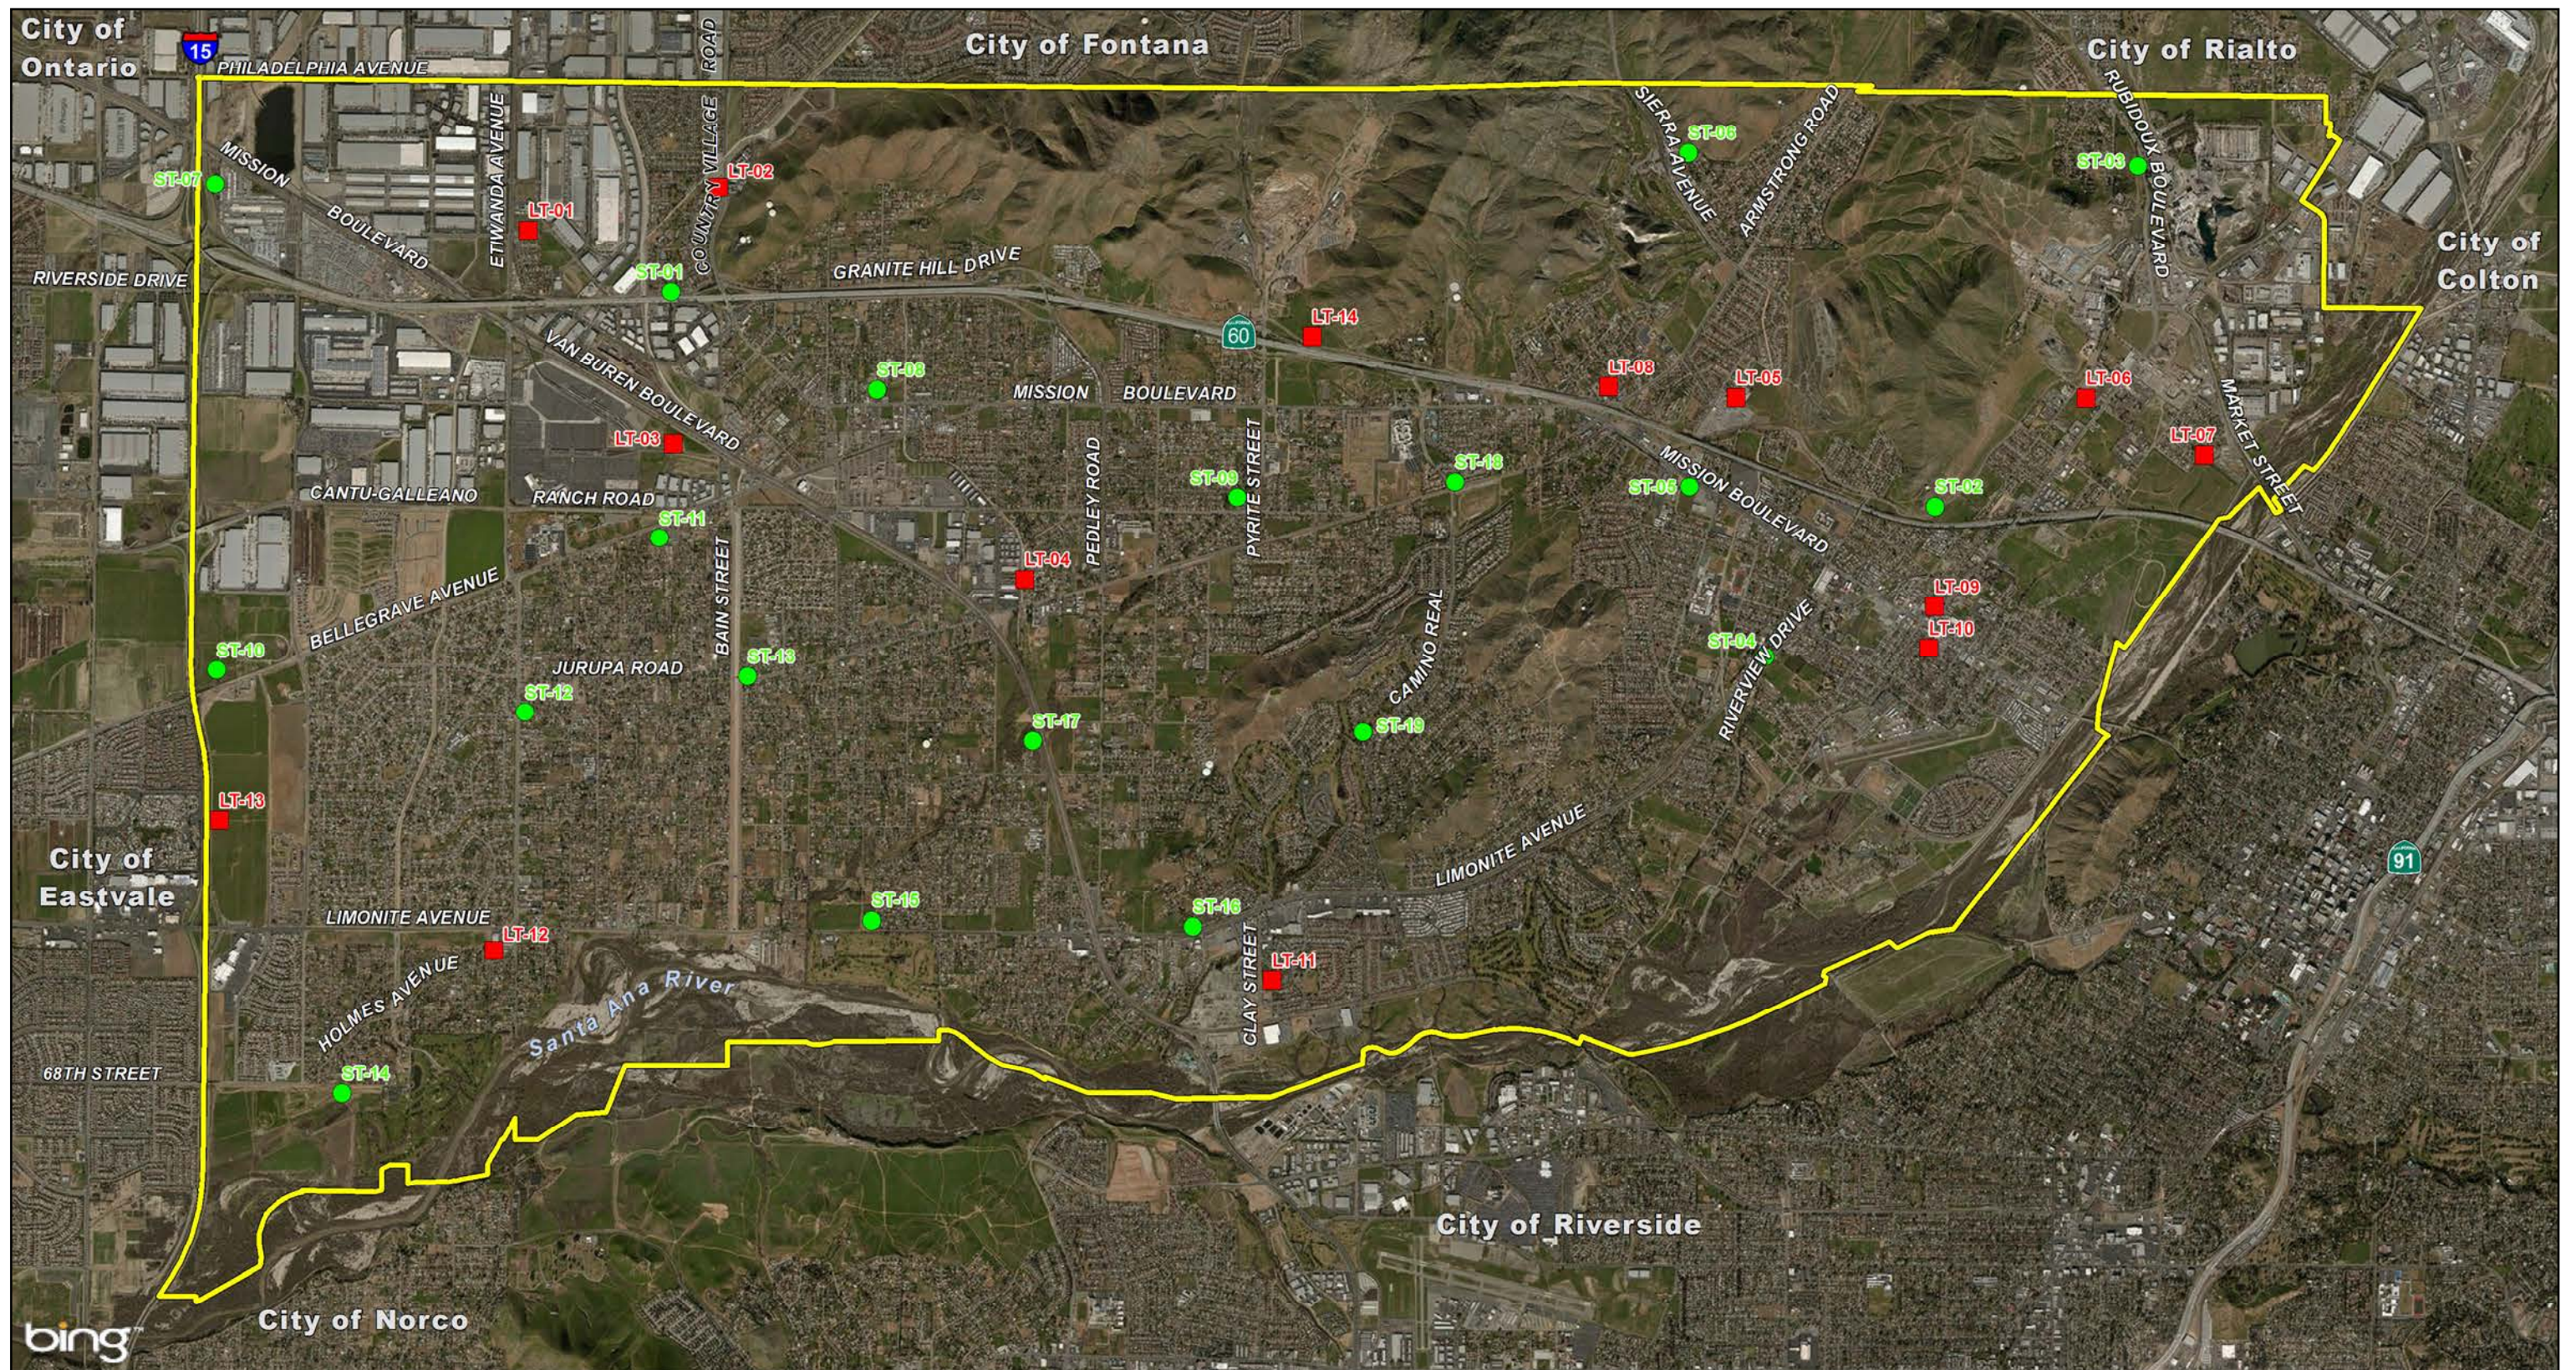

SUBJECT: City of Jurupa Valley General Plan Update – Noise Element Existing Conditions Memo

LSA Associates, Inc. (LSA) is assisting in preparation of the City of Jurupa Valley (City) General Plan Update. One portion of the General Plan that is in the process of being updated is the Noise Element. The first step in establishing a Noise Element within a City's General Plan that will provide standards, goals and policies to insure that development and operations within the City are in compliance with the desired environment, is the existing noise conditions must be analyzed and documented. The results of the noise monitoring will provide the project team guidance on goals and policies as well as set reasonable standards.

Existing noise sources in City today include transportation or traffic related impacts, rail noise, aircraft noise and noise impacts associated with operations at commercial and industrial uses. Currently, one of the main issues in the City related to noise is the existence of incompatible land uses. Typically, when commercial or industrial operations are located in close proximity of residential or other noise-sensitive uses, complaints from residents are more likely to occur.

In coordination with current City staff, specific locations at which incompatible uses exist today were identified. These locations were chosen to represent some of the noise monitoring locations presented in the attached figure. In addition to the incompatible use locations, noise monitoring locations, both long-term 24-hour and short term 15-minute, were chosen to assess noise impacts from the existing rail operations and traffic noise impacts from major roadways within the City limits. Figure 1 below shows the location of the proposed measurements and Table 1 provides a description of the measurement type and purpose.

Upon completion of the noise monitoring, the information will be utilized along with the modeling results of the existing traffic noise contours to determine the existing noise conditions throughout the City. Once the existing conditions are established, future conditions can be modeled and compared to the current General Plan. The future conditions will include future airport operation, proposed haul routes along the City streets, future rail activities, and expected continued/future incompatible land use noise issue. The policies, goals and standards will then be revised, where necessary to comply with the vision of the City.

CHAPTER 1 – INTRODUCTION

The City of Jurupa Valley (City) is located in Riverside County and is generally bounded by Interstate 15 (I-15) to the west, Philadelphia Street/El Rivino Road to the north, and the Santa Ana River to the east and south. Figure 1.1 illustrates the regional location of the City of Jurupa Valley.

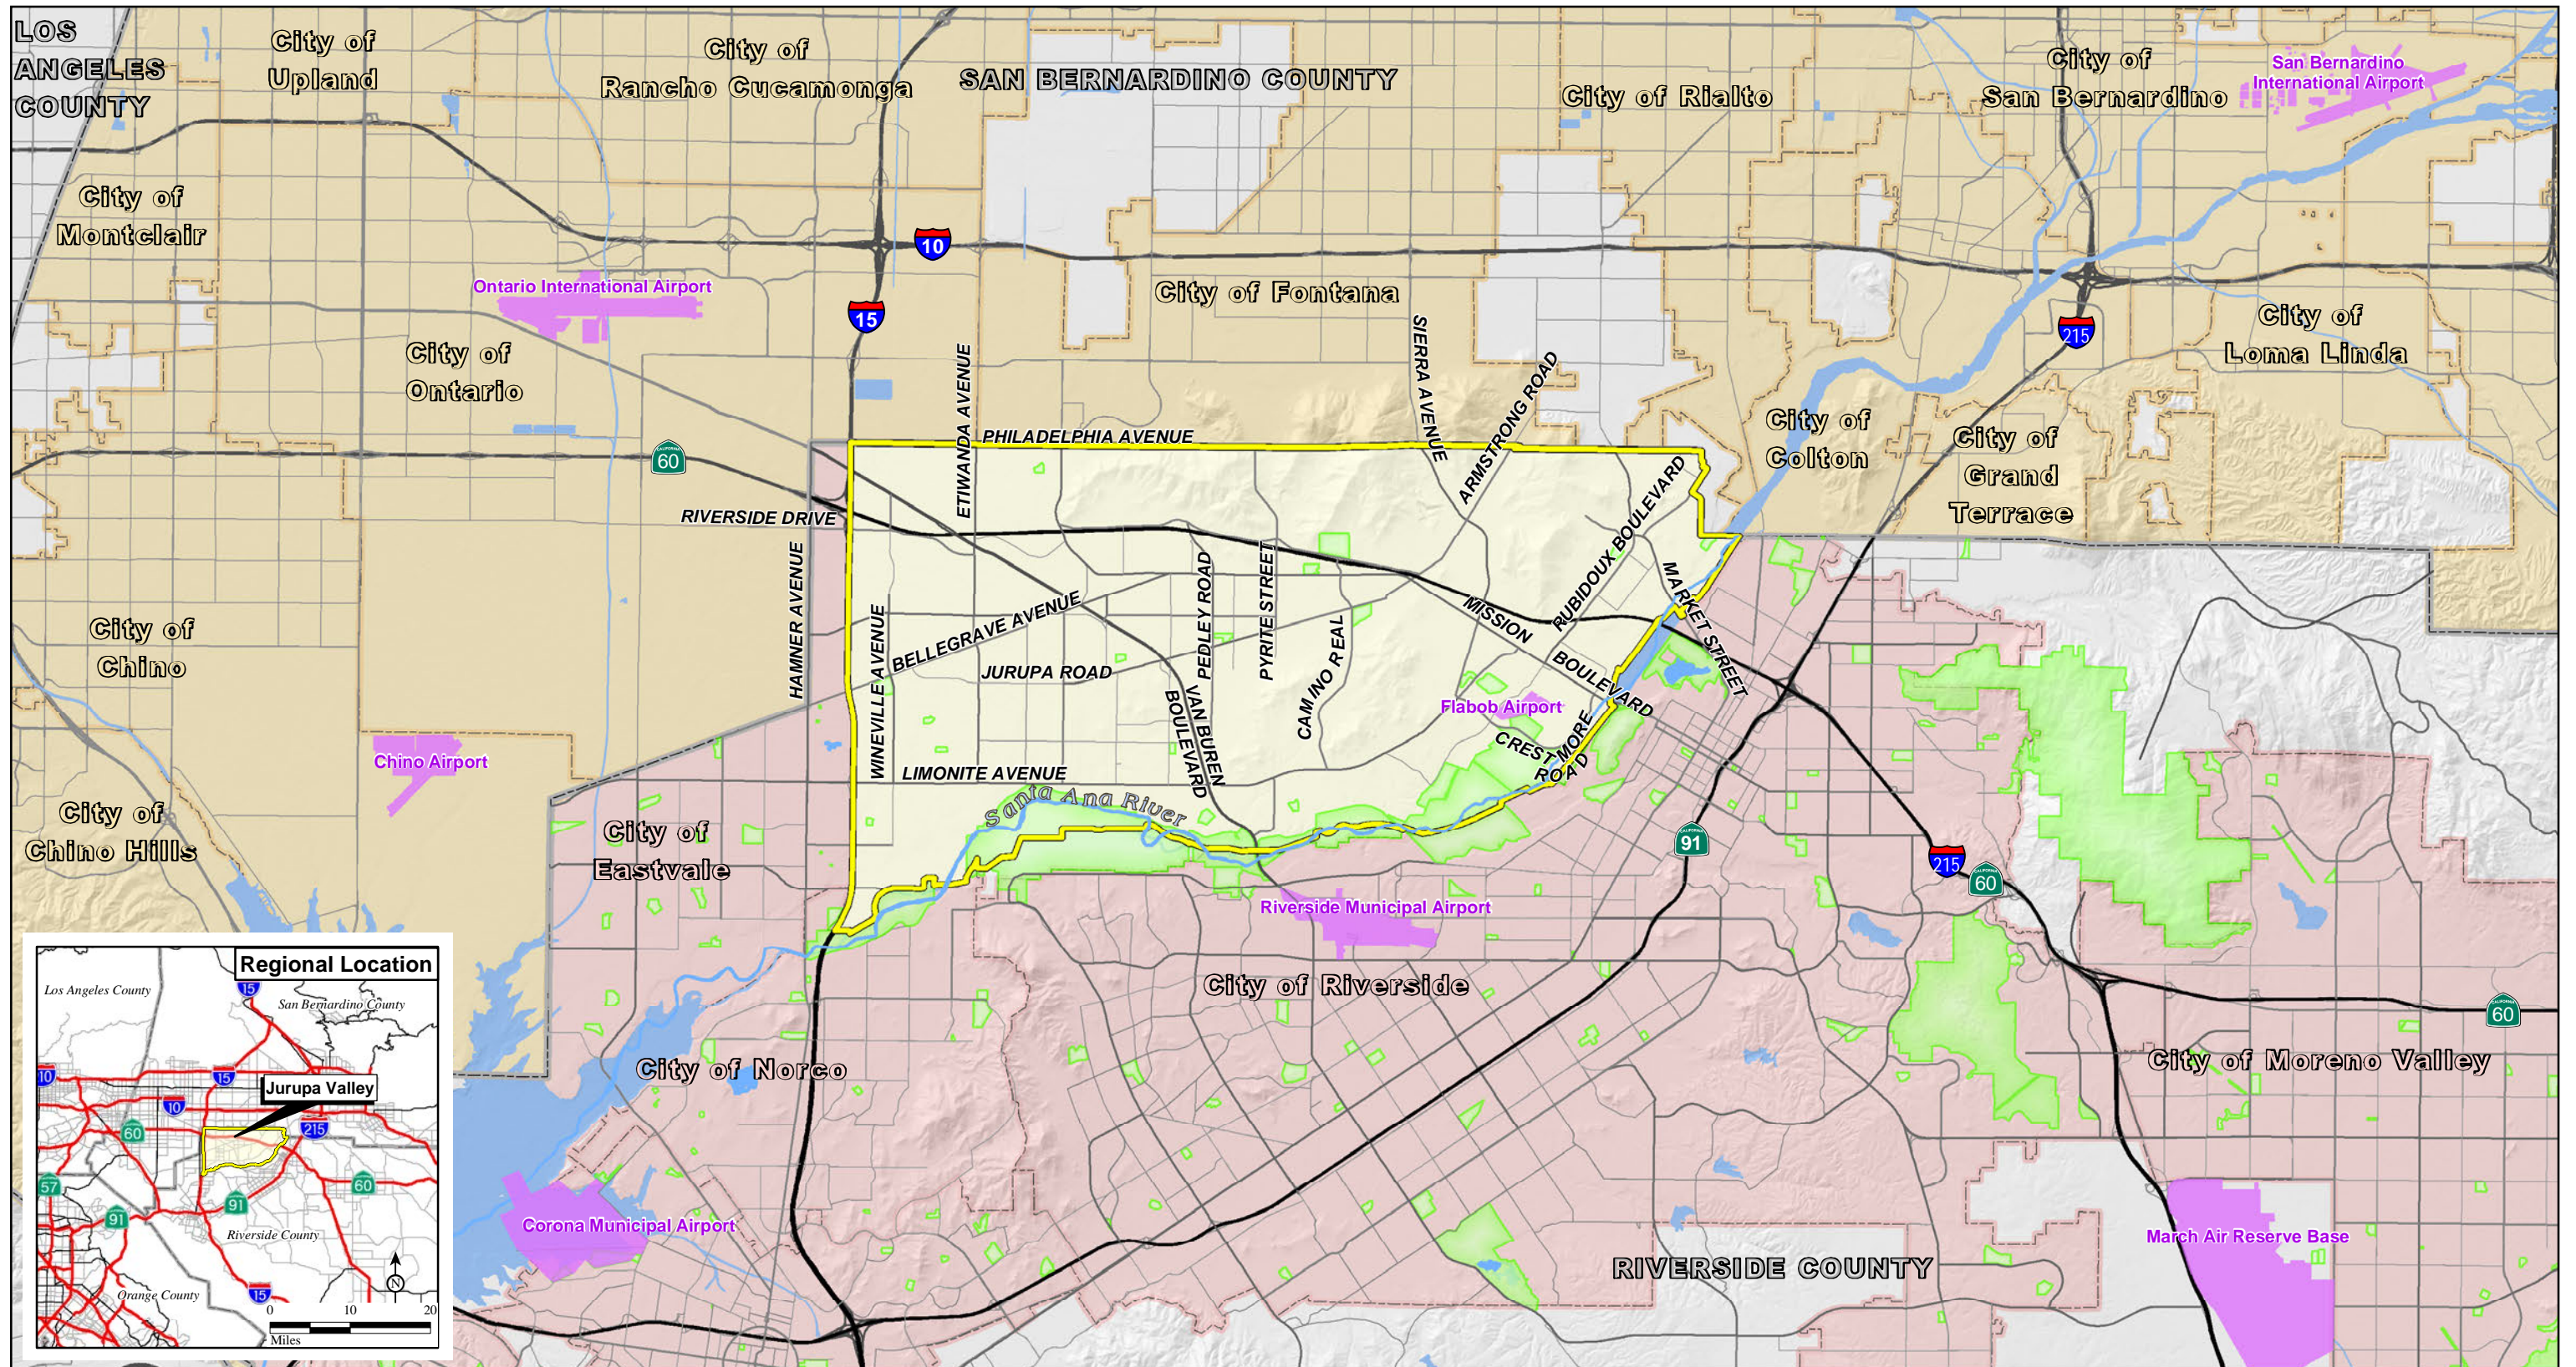

The ability to move people and goods throughout Jurupa Valley and beyond is important to residents and businesses. Local roadways are the most important element for mobility in Jurupa Valley, but transit, the trail system, and bicycle facilities provide opportunities for alternative modes of travel that could relieve pressure on roadways. Furthermore, alternative modes, such as bicycles and pedestrians, have valuable secondary benefits that enhance the overall setting of Jurupa Valley. These benefits include traffic calming, walkability, health gains, air quality improvement and community cohesion. The Circulation Element governs the long-term mobility system of the City. The goals and policies in the Circulation Element are closely correlated with the Land Use Element and are intended to provide the best possible balance between the City's future growth and land use development, roadway size, traffic service levels, bicycle and pedestrian amenities, transit opportunities and community character.

This Traffic Study will aid in determining existing circulation deficiencies within the City of Jurupa Valley and act as a benchmark for future improvements to the City's circulation network. The Traffic Study includes a level of service analysis at study area intersections and roadway segments, and a summary of existing transit service, truck routes, and bicycle and pedestrian facilities and trails within the City of Jurupa Valley.

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

The transportation system in the City of Jurupa Valley includes motorized and non-motorized travel modes. This circulation system is considered multi-modal, which provides alternatives to the automobile such as bicycle facilities, pedestrian facilities, rail, trails, and transit. These systems, along with streets and highways, all provide for the movement of people and goods throughout the City and region. How these systems complement one another and interact with each other represents the complete transportation system.

This chapter presents the existing setting for vehicles, as well as bicycle, transit, and pedestrian facilities in the City of Jurupa Valley.

Street Network

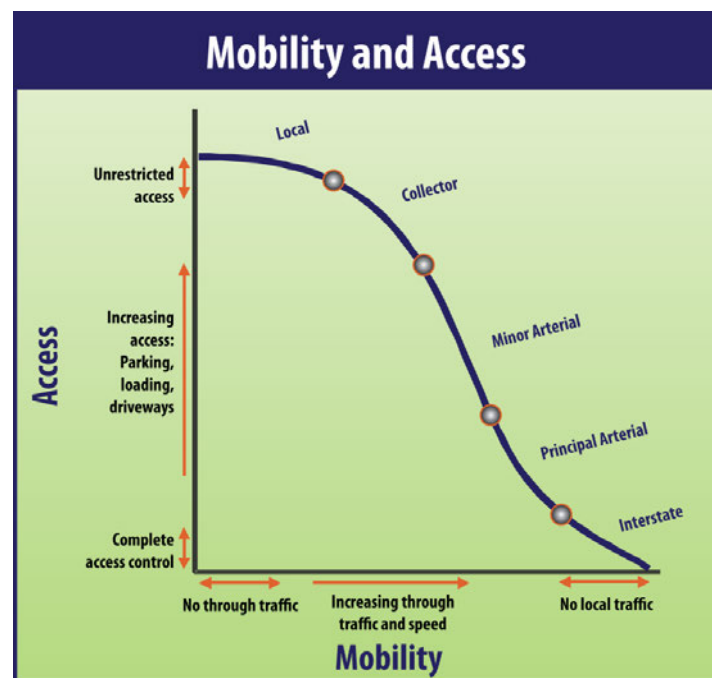

A well laid-out and well-designed roadway network is essential for safe and efficient surface transportation. Such a network can cut down travel times, reduce accidents on certain facilities, assist in emergency operations, and help in allocating roadway funding. These facilities also serve as the primary thoroughfares for freight and goods movement that supply the local and regional economies.

The functionality of a street is related to traffic mobility and land access. Higher level facilities, such as freeways and expressways, have lower access, which allows for higher speeds and capacities. Conversely, lower level facilities, such as local streets and minor arterials, allow for greater access, but have reduced mobility due to lower speeds and capacities. The relationship can be seen in Figure 2.1.

FIGURE 2.1: RELATIONSHIP BETWEEN MOBILITY AND ACCESS ON ROADWAYS

Source: Federal Highway Administration

Functional Classification

Functional classification groups roadways into classes according to the type of service they are intended to provide. The eight basic roadway classifications are briefly described below:

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

Freeway

A highway upon which the abutter's rights of access are controlled and that provides separated grades at intersecting streets. The minimum right-of-way width and number of lanes is determined by the California Department of Transportation (Caltrans). Figure 2.2 illustrates the existing functional classification of roadways. Roadway cross-sections are illustrated in Figure 2.3.

Expressway

An Expressway is a multimodal roadway corridor for through traffic. Access from abutting property is restricted. Intersections with other streets or roadways are limited to approximately one-half mile intervals. The minimum right-of-way is 184 feet to 220 feet. The number of lanes is 6 or 8 and additional right-of-way may be needed at intersections. Figure 2.3, Exhibit 1 illustrates the cross-section for an Expressway. Segments of Van Buren Boulevard are currently designated as an Expressway.

Urban Arterial

An Urban Arterial is a roadway primarily for through traffic where access from other streets or roadways is limited to approximately one-quarter mile intervals. The minimum right-of-way is 152 feet. The number of lanes is 6 or 8 and additional right-of-way may be needed at intersections. Figure 2.3, Exhibit 2 illustrates the cross-section for an Urban Arterial roadway. Segments of Limonite Avenue are currently designated as an Urban Arterial roadway.

Arterial

An Arterial is a divided roadway primarily for through traffic to which access from abutting property is kept at a minimum. Intersections with other streets or roadways are limited to approximately one-quarter mile intervals. The minimum right-of-way is 128 feet. The number of lanes is 4 or 6 and additional right-of-way may be needed at intersections. Figure 2.3, Exhibit 3 shows the cross-section for an Arterial roadway.

Segments of Etiwanda Avenue are currently designated as an Arterial roadway.

Major

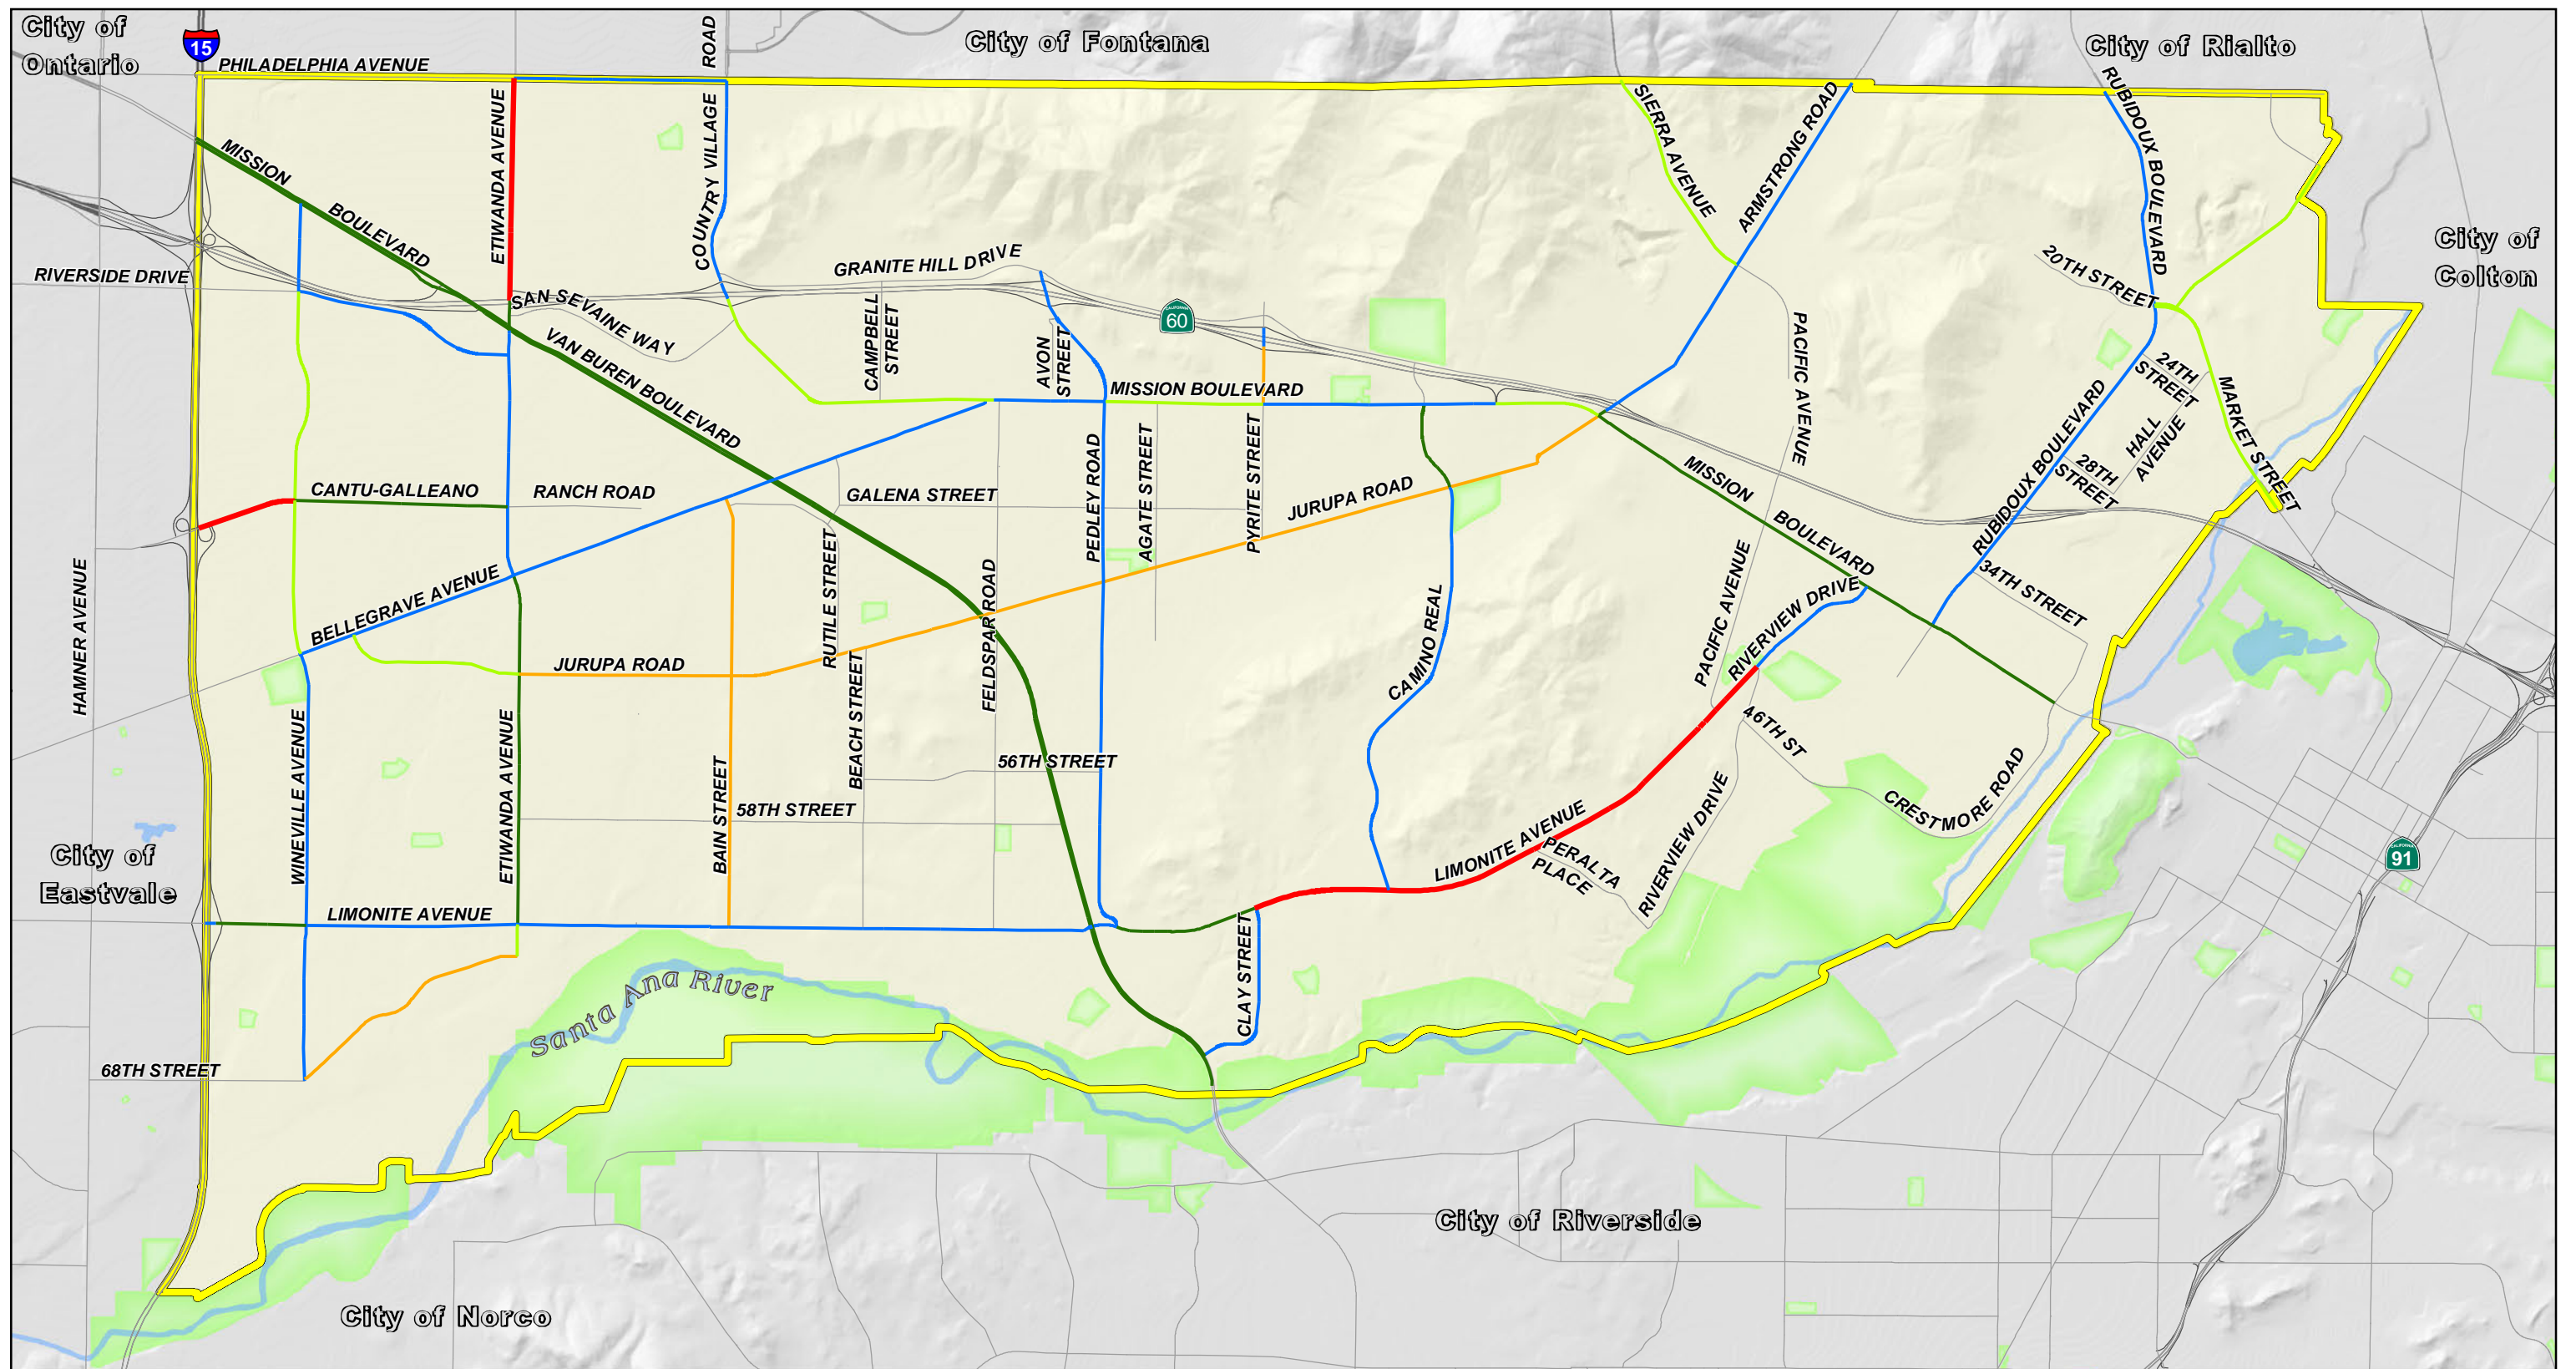

A Major roadway serves property zoned for major industrial and commercial uses or serves through traffic. Intersections with other streets or roadways may be limited to approximately 660-foot intervals. The minimum right-of-way is 118 feet. The number of lanes is 4 and additional right-of-way may be needed at intersections. Figure 2.3, Exhibit 4 illustrates the cross-section for a Major roadway. Segments on Pedley Road are currently designated as a Major roadway.

Secondary

A Secondary roadway serves through traffic along longer routes between major traffic-generating areas or serves property zoned for multiple residential, secondary industrial, or commercial uses. Intersections with other streets and roadways may be limited to 330-foot intervals. The minimum right-of-way is 100 feet. The number of lanes is 4 with no turn lanes and additional right-of-way may be needed at intersections. Figure 2.3, Exhibit 5 shows the cross-section for a Secondary roadway. Segments on Pacific Avenue are currently designated as a secondary roadway.

Collector Street

Collector streets are intended to serve intensive residential land uses, multiple-family dwellings, or to convey traffic through an area to roads of equal or similar classification or higher. A Collector street may also serve as a cul-de-sac in industrial or commercial use areas but shall not exceed 660 feet in length when so used. The minimum right-of-way is 74 feet and the number of lanes is 2. Figure 2.3, Exhibit 6 shows the cross-section for a Collector roadway. Segments on 58th Street are currently designated as a Collector roadway.

Industrial Collector

An Industrial Collector is a circulatory street with a continuous left-turn lane with at least one end connecting to a road of equal or greater classification. The minimum right-of-way is 78 feet and the number of lanes is 2. Figure 2.3, Exhibit 7 shows the cross-section for an Industrial Collector roadway.

Study Area Intersections

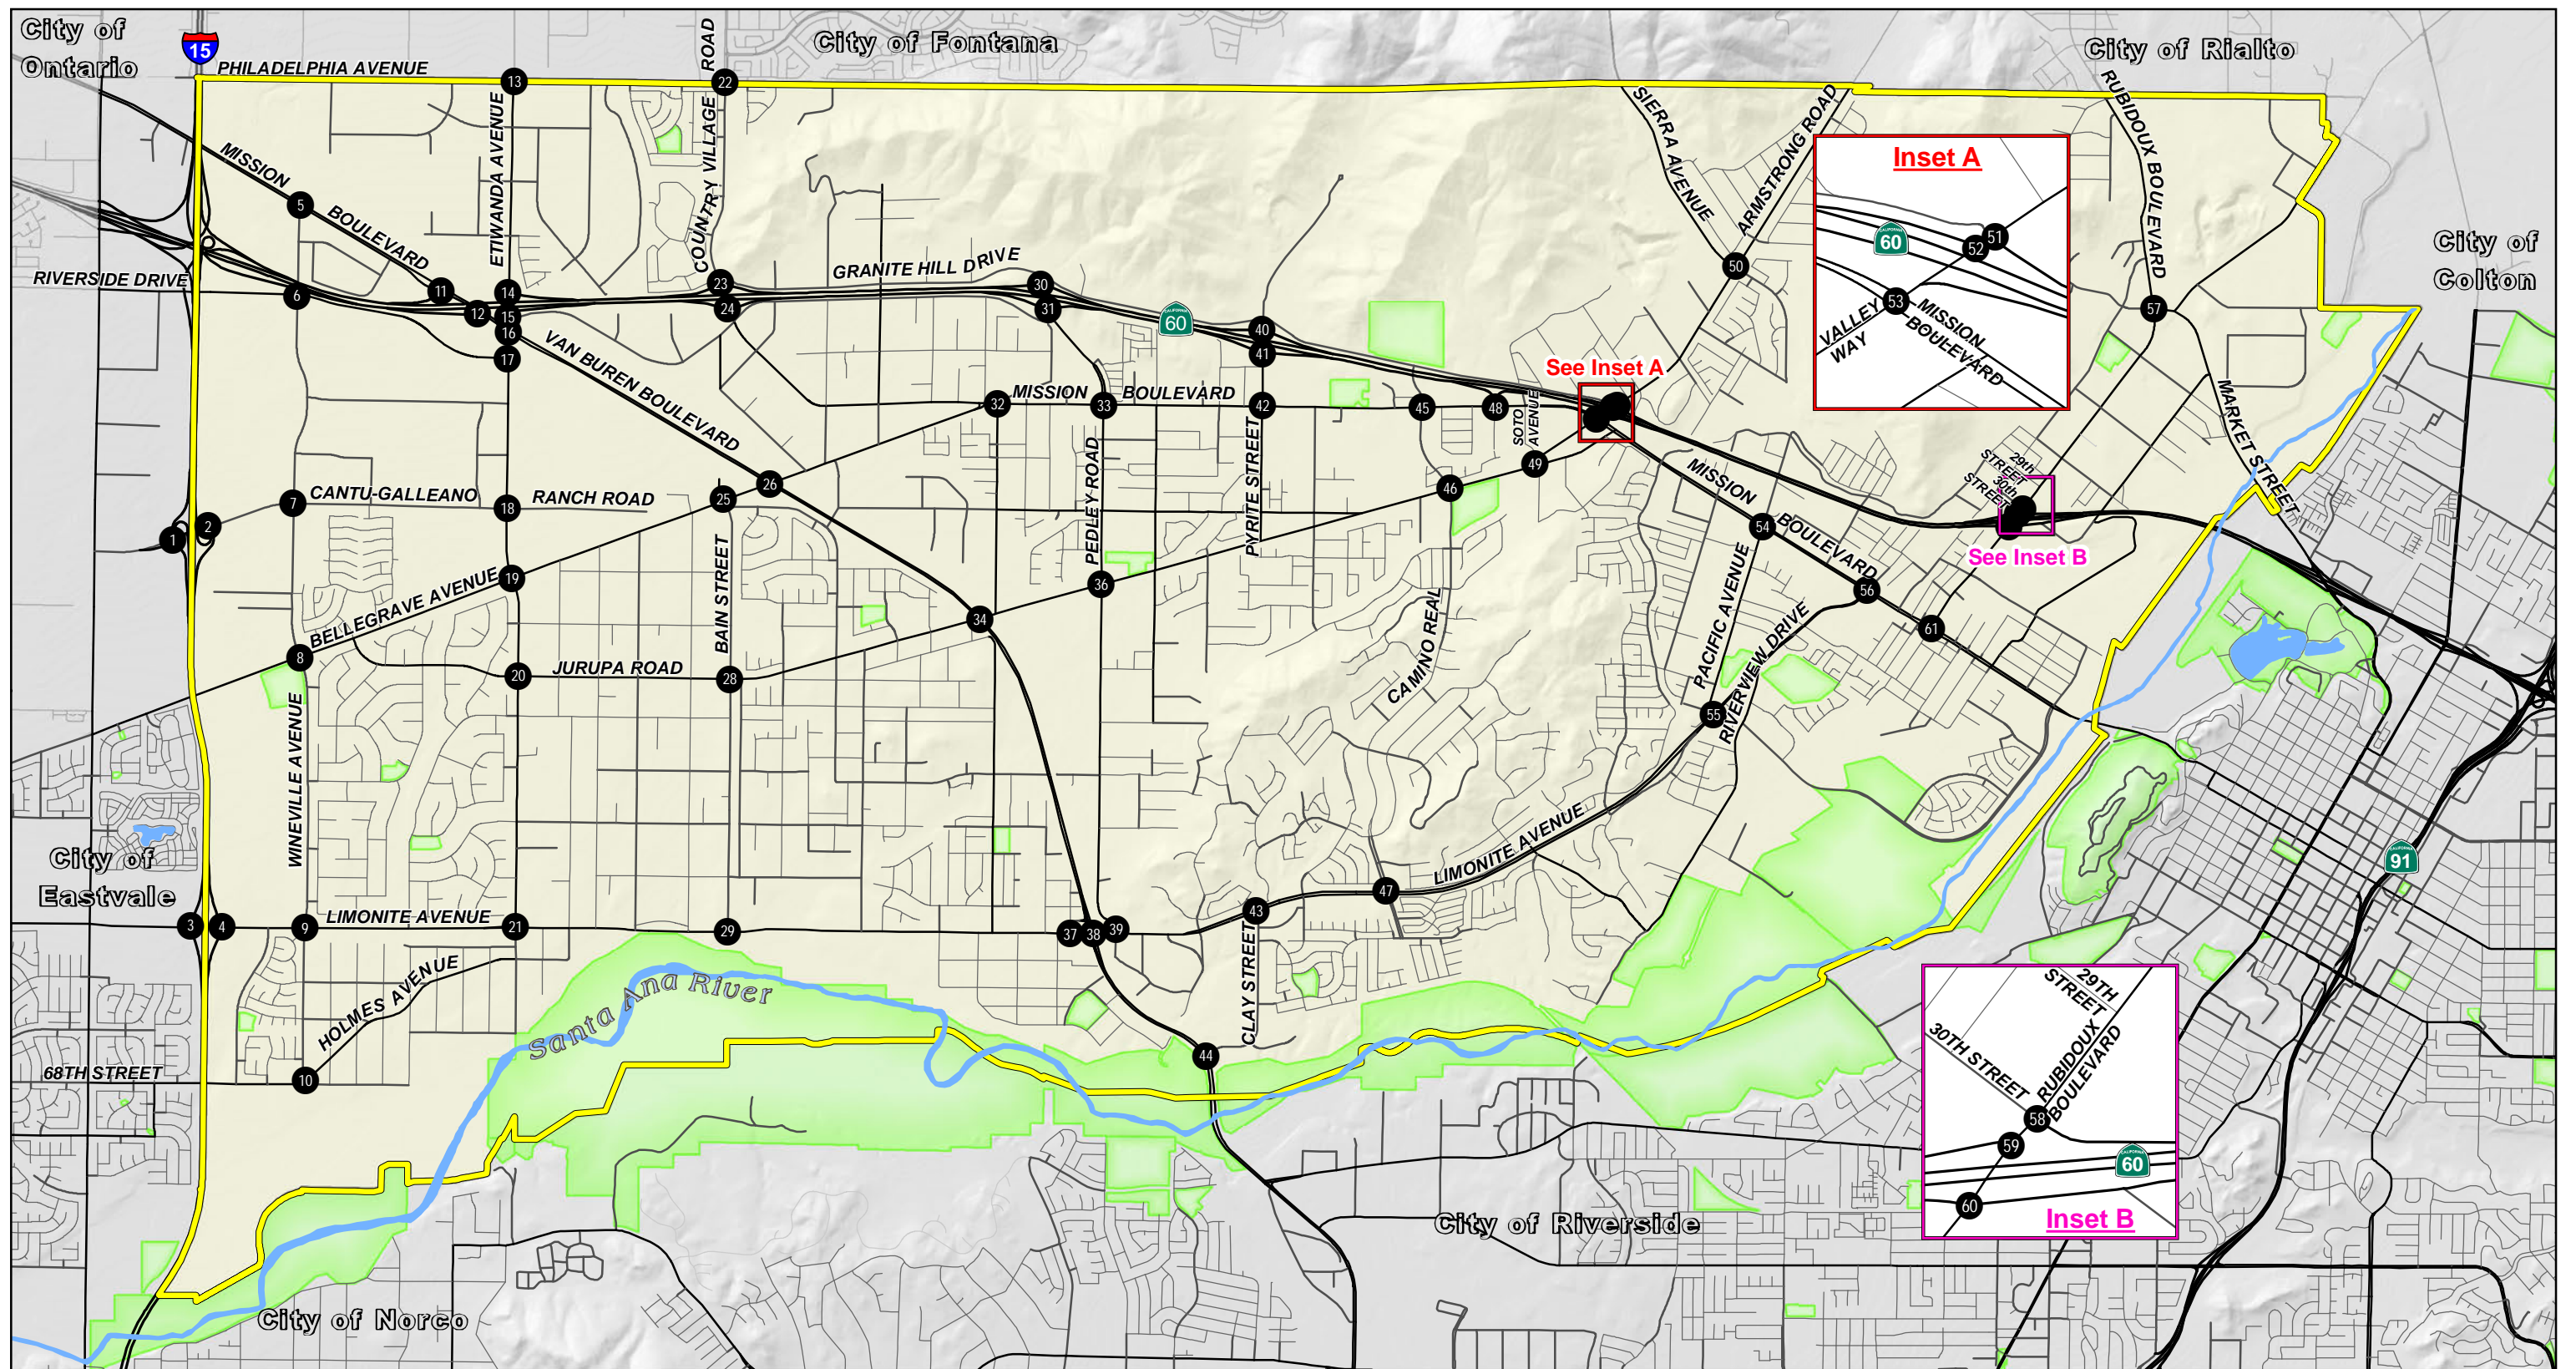

The study area includes all roadway segments and intersections that would be necessary to analyze the impacts of the City's future Land Use plan and was defined through collaboration between LSA and City staff. As Figure 2.4 shows, the study area includes the following intersections:

Intersections

1. Interstate 15 (I-15) Southbound Ramps/Cantu-Galleano Ranch Road;
2. I-15 Northbound Ramps/Cantu-Galleano Ranch Road;
3. I-15 Southbound Ramps/Limonite Avenue;
4. I-15 Northbound Ramps/Limonite Avenue;

Study Area Roadways

The major roadways within the City of Jurupa Valley are described below:

Wineville Avenue is oriented in a north-south direction and from Mission Boulevard to Riverside Drive is a four-lane Major, from Riverside Drive to Cantu-Galleano Ranch Road is a four-lane Secondary, from Cantu-Galleano Ranch Road to Bellegrave Avenue is a three-lane Secondary, from Bellegrave Avenue to Elba Drive is a four-lane Major, from Elba Drive to Boca Place is a two-lane Collector, from Boca Place to Limonite Avenue is a four-lane Major, and from Limonite Avenue to 68th street is a three-lane Major. The speed limit on Wineville Avenue varies from 45–50 miles per hour.

Etiwanda Avenue is oriented in a north-south direction and is a six-lane Urban Arterial from the northern City limits to State Route 60 (SR-60) and transitions to a four-lane Arterial from SR-60 to Van Buren Boulevard. The segment from Van Buren Boulevard to Cantu-Galleano Ranch Road is a four-lane Major, from Cantu-Galleano to Bellegrave Avenue is a three-lane Major, from Bellegrave Avenue to Limonite Avenue is a four-lane Major, and from Limonite Avenue to Holmes Avenue is a two-lane Secondary. Etiwanda Avenue has a speed limit of 45–55 miles per hour.

Bain Street is oriented in a north-south direction and is a two-lane Collector. Additional right-of-way is available for a four-lane Major. The speed limit on Bain Street is 45 miles per hour.

Country Village Road is oriented in a north-south direction and is a three-lane Major from Philadelphia Avenue to Country Club Drive. The

segment from Country Club Drive to Ben Nevis Boulevard is a four-lane Major. The speed limit on Country Village Road is 45 miles per hour.

Pedley Road is oriented in a north-south direction and is a two-lane Major from Granite Hill Drive to Francisco Junior Avenue. The segment from Francisco Junior Avenue to Mission Boulevard is a four-lane Major, from Mission Boulevard to Jurupa Road is a three-lane Major, from Jurupa Road to 60th Street is a two-lane Collector, and from 60th Street to Limonite Avenue is a two-lane Major. The speed limit on Pedley Road is 45 miles per hour.

Pyrite Street is oriented in a north-south direction and is a two-lane Collector north of Granite Hill Drive. The segment from Granite Hill Drive to SR-60 EB Ramps is a two-lane Secondary, from SR-60 WB Ramps to Mission Boulevard is a two-lane Collector, from Mission Boulevard to Galena Street is a two-lane Major, and from Galena Street to Jurupa Road is a two-lane Collector. The speed limit on Pyrite Street is 40 miles per hour.

Clay Street is oriented in a north-south direction from Limonite Avenue to General Road and transitions to an east-west direction from General Road to Van Buren Boulevard. Clay Street is a four-lane Major with a speed limit of 35 miles per hour.

Camino Real is oriented in a north-south direction and is a two-lane Secondary from Granite Hill Drive to Mission Boulevard. The segment from Mission Boulevard to Jurupa Road is a four-lane Arterial, from Jurupa Road to Whitney Drive is a two-lane Collector, from Whitney Drive to Limonite Avenue is a four-lane Major. The speed limit on Camino Real is 25–40 miles per hour.

Philadelphia Avenue is oriented in an east-west direction from the western City limits to Rochester Avenue, from Rochester Avenue to Wineville Avenue is a two-lane Major, from Wineville Avenue to Etiwanda Avenue is a three-lane Major, and from Etiwanda Avenue to Country Village Road is a two-lane Major. The speed limit on Philadelphia Avenue is 45 miles per hour.

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

Van Buren Boulevard is oriented in a north-south direction and is a four-lane Arterial from the western City limits to the southern City limits. The speed limit on Van Buren Boulevard is generally 55 miles per hour.

Riverside Drive is oriented in an east-west direction and is a three-lane Major. The speed limit on Riverside Drive is 50 miles per hour.

Cantu-Galleano Ranch Road is oriented in an east-west direction and is a six-lane Urban Arterial from the I-15 northbound ramps to Wineville Avenue/Road. The segment from Wineville Avenue/Road to Etiwanda Avenue is a two-lane Arterial, and from Etiwanda Avenue to west of Dodd Street is a four-lane Major. The speed limit on Cantu-Galleano Ranch Road is 45 miles per hour.

Mission Boulevard is oriented an east-west direction and is a four-lane Secondary from SR-60 EB Ramps to Bellegrave Avenue, from Bellegrave Avenue to Pedley Road is a four-lane Major, from Pedley Road to Pyrite Street is a four-lane Secondary, from Pyrite Street to SR-60 EB Ramps is a four-lane Major, from SR-60 EB Ramps to Valley Way is a four-lane Secondary, and from Valley Way to east of Rubidoux Boulevard is a four-lane Arterial. The speed limit on Mission Boulevard is generally 35–45 miles per hour.

Bellegrave Avenue is oriented in an east-west direction and is a three to four-lane Major from Wineville Avenue to Bain Street, and transitions to a two-lane Major east of Bain Street. Bellegrave Avenue has a speed limit of 25–45 miles per hour.

Jurupa Road is oriented in an east-west direction and is two-lane Secondary roadway from Bellegrave Avenue to Etiwanda Avenue and from Etiwanda Avenue to Valley is a two-lane Collector. The speed limit on Jurupa Road is 40–45 miles per hour.

Valley Way is oriented in a north-south direction and is two-lane Collector from Jurupa Road to Mission Boulevard, from Mission Boulevard to SR-60 is a four-lane Arterial, from SR-60 to Sierra Avenue is a four-lane Major, and north of Sierra Avenue is a two-lane Major. The speed limit on Valley Way is 30–45 miles per hour.

Limonite Avenue is oriented in an east-west direction and is a four-lane Major from I-15 SB Ramps to I-15 NB Ramps, from I-15 NB Ramps to Wineville Avenue is a four-lane Arterial, from Wineville Avenue to Etiwanda Avenue is a four-lane Major, from Etiwanda Avenue to Collings Street is a two-lane Major, from Collins Street to Pedley Road is a four-lane Major, from Pedley Road to Clay Street is a four-lane Arterial, from Clay Street to Riverview Drive is a five-lane Urban Arterial, and from Riverview Drive to Mission Boulevard is a four-lane Major. The speed limit on Limonite Avenue is generally 45–50 miles per hour.

Rubidoux Boulevard is oriented in a north-south direction and is a two-lane Collector from Tilton Avenue to Mission Boulevard, a four-lane Major from Mission Boulevard to 20th Street, a four-lane arterial from 20th Street to Production Circle, and a four-lane Major from Production Circle to the northern City limits. The speed limit on Rubidoux Boulevard is 40–50 miles per hour.

Congestion

Congestion results when traffic demand approaches or exceeds the available capacity of the system. While this is a simple concept, it is not constant. Traffic demands vary significantly depending on the season of the year, the day of the week, and even the time of day. Also, the capacity can change because of weather, work zones, traffic incidents, or special events.

Congestion can be classified as either recurring or non-recurring. Recurring congestion most often occurs when the volume of traffic on a facility becomes more than that facility can handle. Non-recurring congestion is usually short in duration and is caused by such things as weather, construction, or special events. One way to gauge the level of congestion is grading a facility on its level of service.

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

Level of Service Definitions

Roadway operations and the relationship between capacity and traffic volumes are generally expressed in terms of levels of service (which are defined using the letter grades A through F). These levels recognize that, while an absolute limit exists as to the amount of traffic traveling through a given intersection (the absolute capacity), the conditions that motorists experience rapidly deteriorate as traffic approaches the absolute capacity. Under such conditions, congestion is experienced. There is general instability in the traffic flow, which means that relatively small incidents (e.g., momentary engine stall) can cause considerable fluctuations in speeds and delays. This near-capacity situation is labeled Level of Service (LOS) E. Beyond LOS E, capacity has been exceeded, and arriving traffic will exceed the ability of the intersection to accommodate it. An upstream queue will then form and continue to expand in length until the demand volume again declines.

A complete description of the meaning of level of service can be found in the Transportation Research Board Special Report 209, *Highway Capacity Manual 2010* (HCM 2010). For both roadway segments and intersections, the HCM establishes levels of service A through F as shown in Table 2.A and Figure 2.5.

Table 2.A: Level of Service Definitions

| LOS | Description |
|----------|---|
| A | No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. Typically, the approach appears quite open, turns are made easily and nearly all drivers find freedom of operation. |
| B | This service level represents stable operation, where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles. |
| C | This level still represents stable operating conditions. Occasionally drivers may have to wait through more than one red signal indication, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so. |

Table 2.A: Level of Service Definitions

| LOS | Description |
|----------|--|
| D | This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak period; however, enough cycles with lower demand occur to permit periodic clearance of developing queues, thus preventing excessive backups. |
| E | Capacity occurs at the upper end of this service level. It represents the most vehicles that any particular intersection approach can accommodate. Full utilization of every signal cycle is seldom attained no matter how great the demand. |
| F | This level describes forced flow operations at low speeds, where volumes exceed capacity. These conditions usually result from queues of vehicles backing up from a restriction downstream. Speeds are reduced substantially and stoppages may occur for short or long periods of time due to the congestion. In the extreme case, both speed and volume can drop to zero. |

Source: Highway Capacity Manual 2010

FIGURE 2.5: LEVEL OF SERVICE

Source: FHWA

The LOS criteria used to evaluate signalized and unsignalized intersections are based on HCM 2010 methodologies and are shown in

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

Table 2.B. All levels of service were calculated using Synchro 9 software, which uses HCM 2010 methodologies.

Table 2.B: Level of Service Criteria for Unsignalized and Signalized Intersections

| Level of Service | Unsignalized Intersection Average Delay per Vehicle (seconds) | Signalized Intersection Average Delay per Vehicle (seconds) |
|------------------|---|---|
| A | ≤ 10 | ≤ 10 |
| B | > 10 and ≤ 15 | > 10 and ≤ 20 |
| C | > 15 and ≤ 25 | > 20 and ≤ 35 |
| D | > 25 and ≤ 35 | > 35 and ≤ 55 |
| E | > 35 and ≤ 50 | > 55 and ≤ 80 |
| F | > 50 | > 80 |

Source: Highway Capacity Manual, 2010.

The level of service criteria used to evaluate roadway segments is based on the daily capacity for each functional classification and is shown in Table 2.C. The daily traffic volume represents the total vehicles (both directions) traveling on a roadway segment within 24 hours.

Table 2.C: Roadway Segment Capacity and Levels of Service

| Functional Classification | Number of Lanes | Maximum Two-Way Daily Traffic Volume | | |
|---------------------------|-----------------|--------------------------------------|--------------------|--------------------|
| | | Level of Service C | Level of Service D | Level of Service E |
| Collector Street | 2 | 10,400 | 11,700 | 13,000 |
| Secondary | 4 | 20,700 | 23,300 | 25,900 |
| Major | 4 | 27,300 | 30,700 | 34,100 |
| Arterial | 4 | 28,700 | 32,300 | 35,900 |
| Urban Arterial | 4 | 28,700 | 32,300 | 35,900 |
| Urban Arterial | 6 | 43,100 | 48,500 | 53,900 |
| Urban Arterial | 8 | 57,400 | 64,600 | 71,800 |
| Expressway | 6 | 49,000 | 55,200 | 61,300 |

Table 2.C: Roadway Segment Capacity and Levels of Service

| Functional Classification | Number of Lanes | Maximum Two-Way Daily Traffic Volume | | |
|---------------------------|-----------------|--------------------------------------|--------------------|--------------------|
| | | Level of Service C | Level of Service D | Level of Service E |
| Expressway | 8 | 65,400 | 73,500 | 81,700 |
| Freeway | 6 | 94,000 | 105,800 | 200,600 |
| Freeway | 8 | 128,400 | 144,500 | 160,500 |

Level of Service Standard

With the development of this General Plan Circulation Element, the City of Jurupa Valley will establish an LOS standard for intersections and roadways. This set of standards will balance the need for safe and efficient mobility with key quality of life and community standards. Many cities within the County maintain LOS D as their minimum threshold for their roadway systems. The County of Riverside maintains an LOS standard of D; therefore, for this particular analysis, LOS D was used for the intersection and roadway segment LOS analysis. Intersections or roadway segments operating at LOS E or F exceed the minimum LOS standard D. This threshold may be revisited and modified based on a balancing of overall community objectives.

Caltrans endeavors to maintain levels of service between C and D at all intersections under its jurisdiction; this has been interpreted to mean that a maximum average delay at a Caltrans intersection exceeding 45 seconds is considered to exceed the minimum LOS standard.

Existing Intersection Traffic Volumes

Existing intersection traffic volumes are based on a.m. and p.m. peak hour intersection turn movement counts within the City collected by Counts Unlimited in June 2015 and National Data and Surveying Services in September 2015. For several intersections, counts were conducted between 2012 and 2014. For these intersections, a growth rate of 1

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

percent per year was applied to develop 2015 volumes at these locations. Count sheets are contained in Appendix A. Classification counts separate vehicle types into passenger cars, two-axle trucks, three-axle trucks, and trucks with four or more axles. The concept of passenger car equivalents (PCEs), accounts for the larger impact of trucks on traffic operations. It does so by assigning each type of truck a PCE factor that represents the number of passenger vehicles that could travel through an intersection in the same time that a particular type of truck could. For example, trucks with four or more axles have been assigned a PCE factor of 3.0, indicating that three passenger vehicles could travel through an intersection in the same amount of time required for a single truck with four or more axles. PCE volumes for study area locations with classification counts were computed using a PCE factor of 1.5 for two-axle trucks, 2.0 for three-axle trucks, and 3.0 for trucks with four or more axles. The percentage of trucks at the remaining study intersections without classification counts was determined from classification counts at nearby intersections. PCE volumes for these intersections were computed using a PCE factor of 2.0 for all trucks. Detailed volume development worksheets are included in Appendix B. Figures 2.6-1 and 2.6-2 illustrate the existing intersection geometrics and stop control at the study intersections. The existing a.m. and p.m. peak hour traffic volumes for the study intersections are illustrated in Figures 2.7-1 and 2.7-2.

Existing Roadway Segment Traffic Volumes

The existing daily traffic volumes at study area roadway segments are based on traffic counts conducted by the City of Jurupa Valley between 2012 and 2014. A growth rate of one percent per year was then applied to the counts. Table 2.D shows the existing daily traffic volumes at study area roadway segments.

Existing Intersection Levels of Service

A site survey was conducted at the study area intersections to observe the intersection geometrics, turn pocket lengths, and existing signal

cycle lengths. The results of the survey were included as input parameters into the Synchro 9 software. A level of service analysis was conducted at study area intersections to determine current intersection performance and is shown in Table 2.E, which shows all intersections are currently operating at satisfactory levels of service, with the exception of the following 12 intersections:

- Wineville Road/Mission Boulevard (p.m. peak hour);
- Mission Boulevard/SR-60 EB Off-Ramp (a.m. and p.m. peak hours);
- Etiwanda Avenue/Limonite Avenue (a.m. and p.m. peak hours);
- Country Village Road/SR-60 WB Ramps (a.m. peak hour);
- Pedley Road/SR-60 WB Ramps (a.m. and p.m. peak hours);
- Van Buren Boulevard/Jurupa Road (a.m. and p.m. peak hours);
- Pedley Road/Jurupa Road (a.m. and p.m. peak hours);
- Van Buren Boulevard/Clay Street (p.m. peak hour);
- Camino Real/Jurupa Road (a.m. peak hour);
- Armstrong Road/Sierra Avenue (a.m. and p.m. peak hours);
- Riverview Drive/Mission Boulevard (p.m. peak hour);
- Rubidoux Boulevard/Market Street (p.m. peak hour); and
- Rubidoux Boulevard/Mission Boulevard (p.m. peak hour).

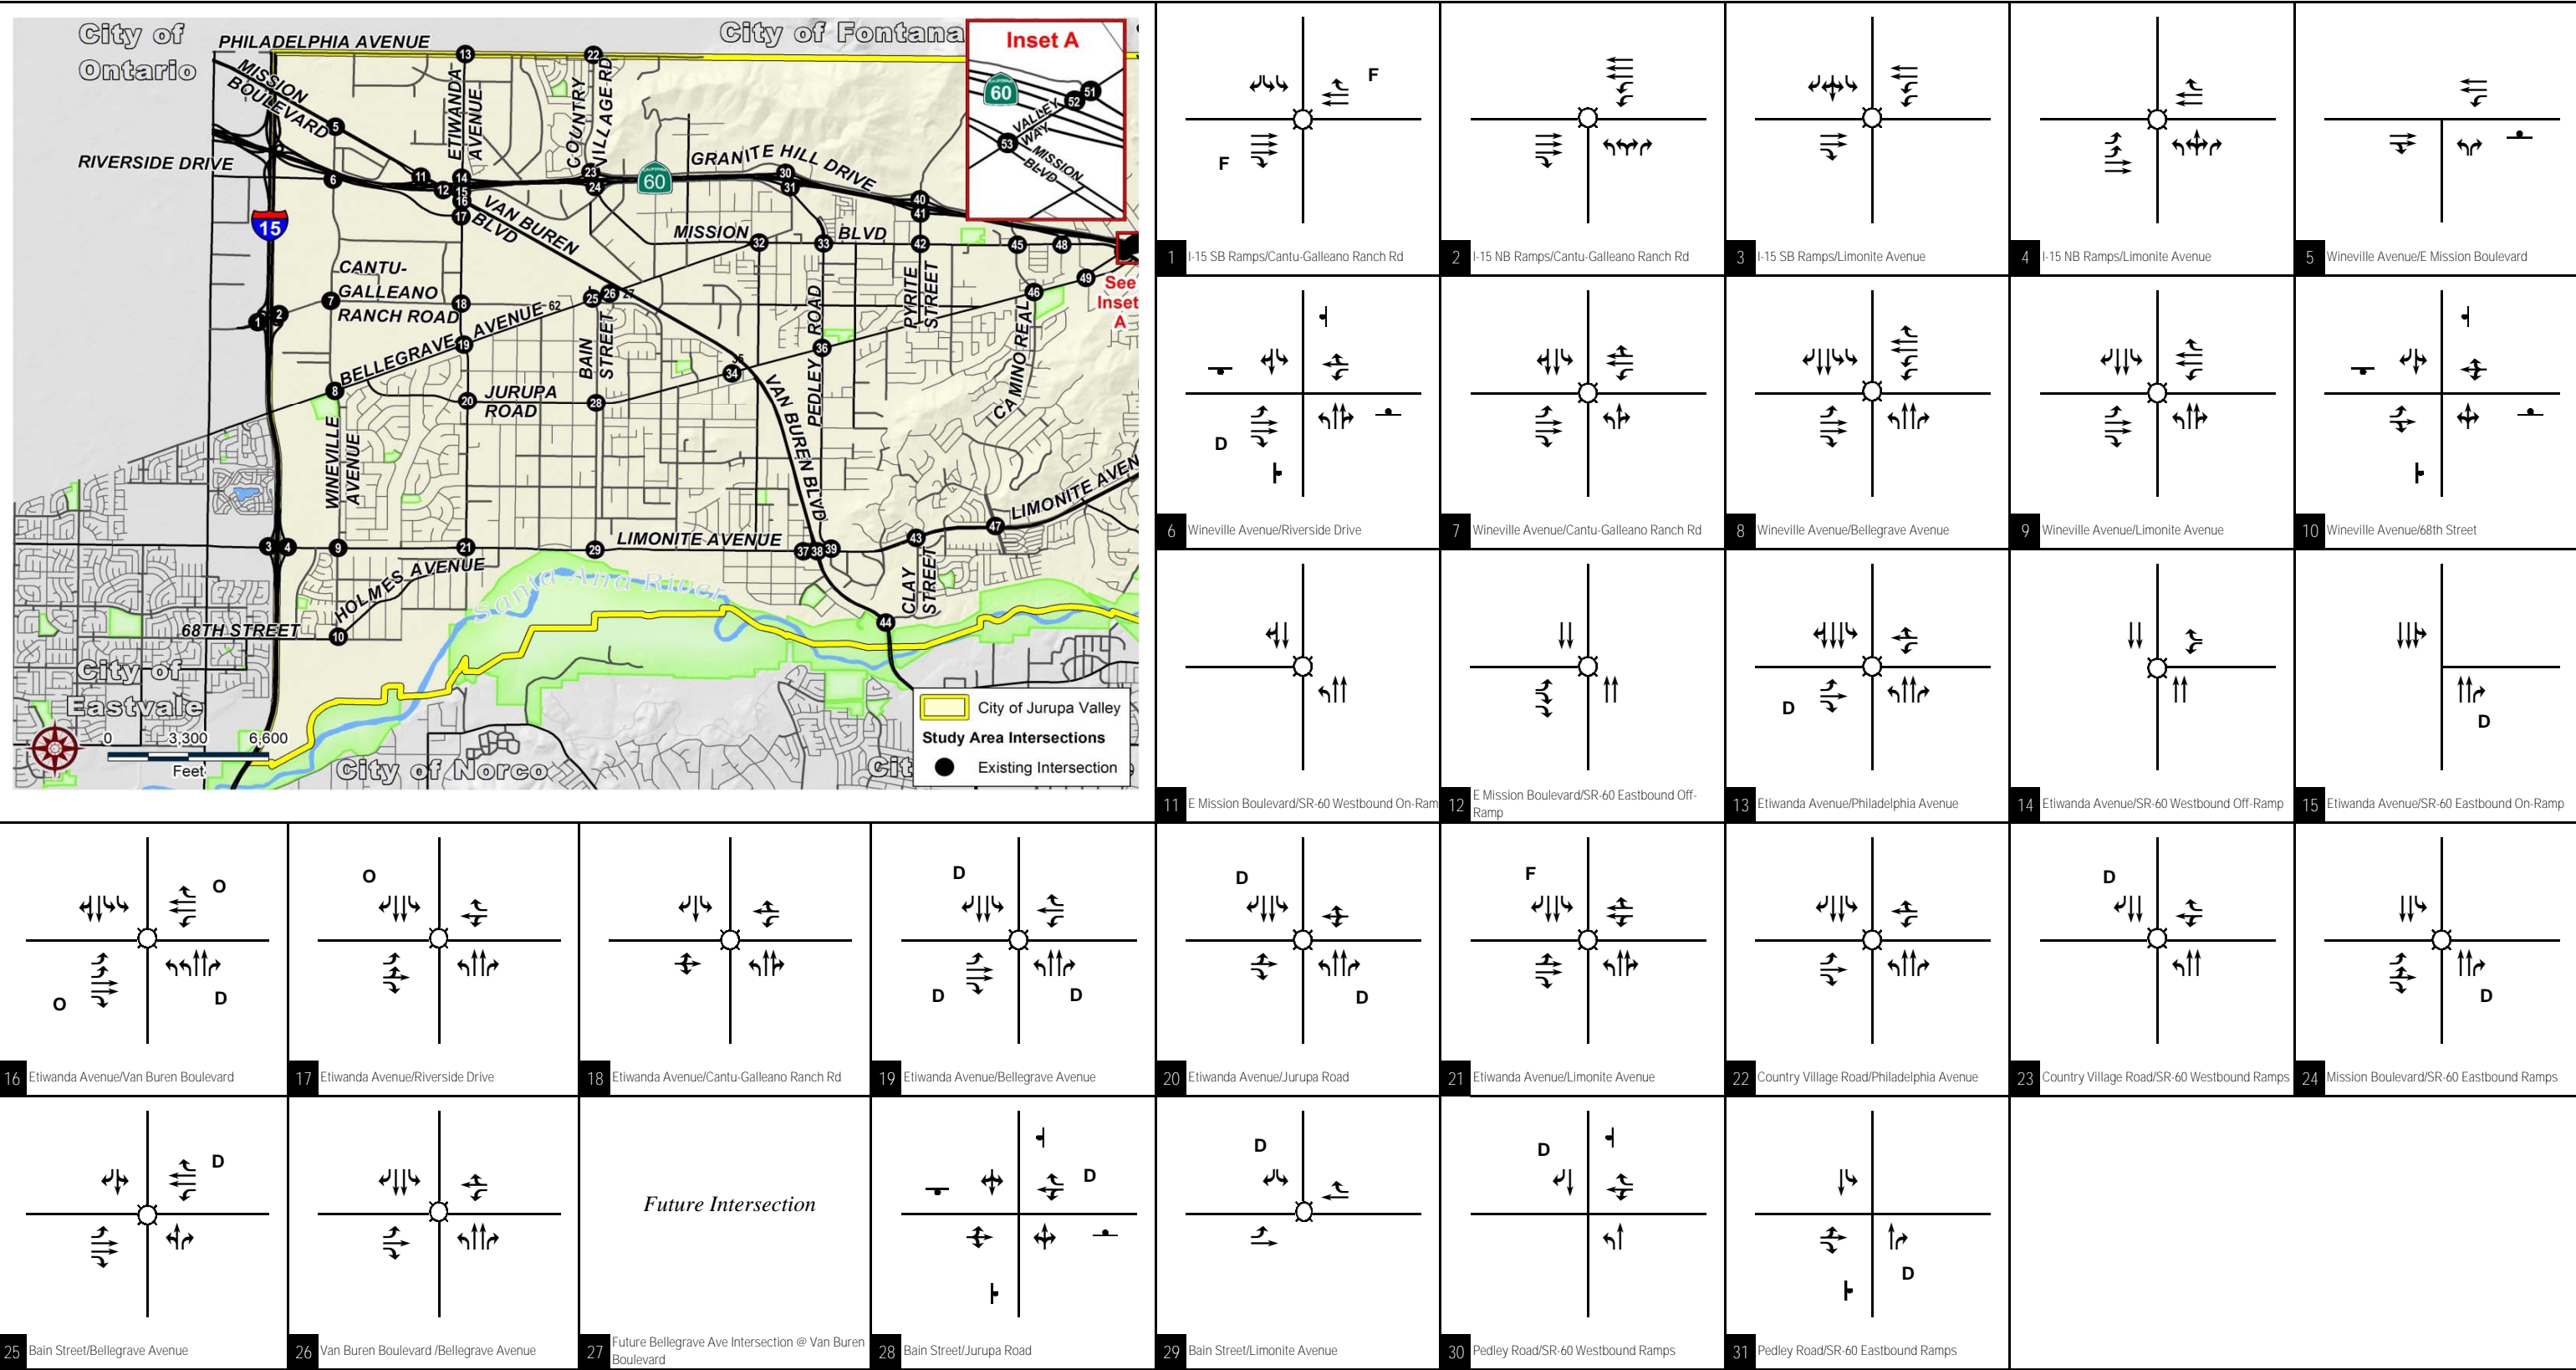

Figures 2.8-1 and 2.8-2 illustrate the locations of the study area intersections and corresponding a.m. and p.m. levels of service.

Existing Roadway Segment Levels of Service

A level of service analysis was conducted at study area roadway segments to determine current roadway segment performance. As shown in Table 2.D, all roadway segments are currently operating at

satisfactory levels of service, with the exception of the following nine roadway segments:

- Country Village Road from Philadelphia Avenue to SR-60 Westbound Ramps;
- Country Village Road from SR-60 Westbound Ramps to SR-60 Eastbound Ramps;
- Van Buren Boulevard from Etiwanda Avenue to Bellegrave Avenue;
- Van Buren Boulevard from Bellegrave Avenue to Jurupa Road;
- Van Buren Boulevard from Jurupa Road to Limonite Avenue;
- Van Buren Boulevard from Limonite Avenue to Clay Street;
- Limonite Avenue from I-15 Southbound Ramps to I-15 Northbound Ramps;
- Limonite Avenue from Etiwanda Avenue to Bain Street;
- Limonite Avenue from Bain Street to Collins Streets; and
- Market Street east of Rubidoux Boulevard.

Figure 2.9 illustrates the locations of the roadway segments and corresponding existing levels of service.

Truck Restrictions

Due to its location relative to major highways and urban centers, Jurupa Valley serves as a major logistics shipping and receiving center for Southern California. Along with that regional role comes significant commercial truck traffic using highway off-ramps and City streets. Connectivity with truck routes within the City to regional truck routes and access to freeways provides for an efficient, safe movement of goods.

Most commercial truck traffic is concentrated in the northern and eastern areas of the City, near the SR-60 corridor. The City does not

currently have designated truck routes, per se; however, based on information received from the City's Engineering Staff, there are truck restrictions on some of the roadways within the City. Figure 2.10 illustrates truck restrictions and shows the following roadway segments restrict truck access:

- Etiwanda Avenue from Riverside Drive to Cantu-Galleano Ranch Road;
- Etiwanda Avenue from Cantu-Galleano Ranch Road to Bellegrave Avenue;
- Jurupa Road from Camino Real to Valley Way;
- Valley Way-Armstrong Road from Jurupa Road to Mission Boulevard;
- Holmes Avenue from Wineville Avenue to Etiwanda Avenue. Etiwanda Avenue between Riverside Drive to Cantu-Galleano Ranch Road; and
- Between Riverside Drive and Cantu-Galleano Ranch Road

Bicycle Facilities

The City of Jurupa Valley has expressed a vision that encourages choice in travel modes and accommodates those without automobiles for safe mobility and healthy outcomes. A planned bicycle route system within the City of Jurupa Valley provides an important alternative to driving an automobile. A planned system guides the City and development on the orderly and planned implementation of the City's multi-modal transportation system.

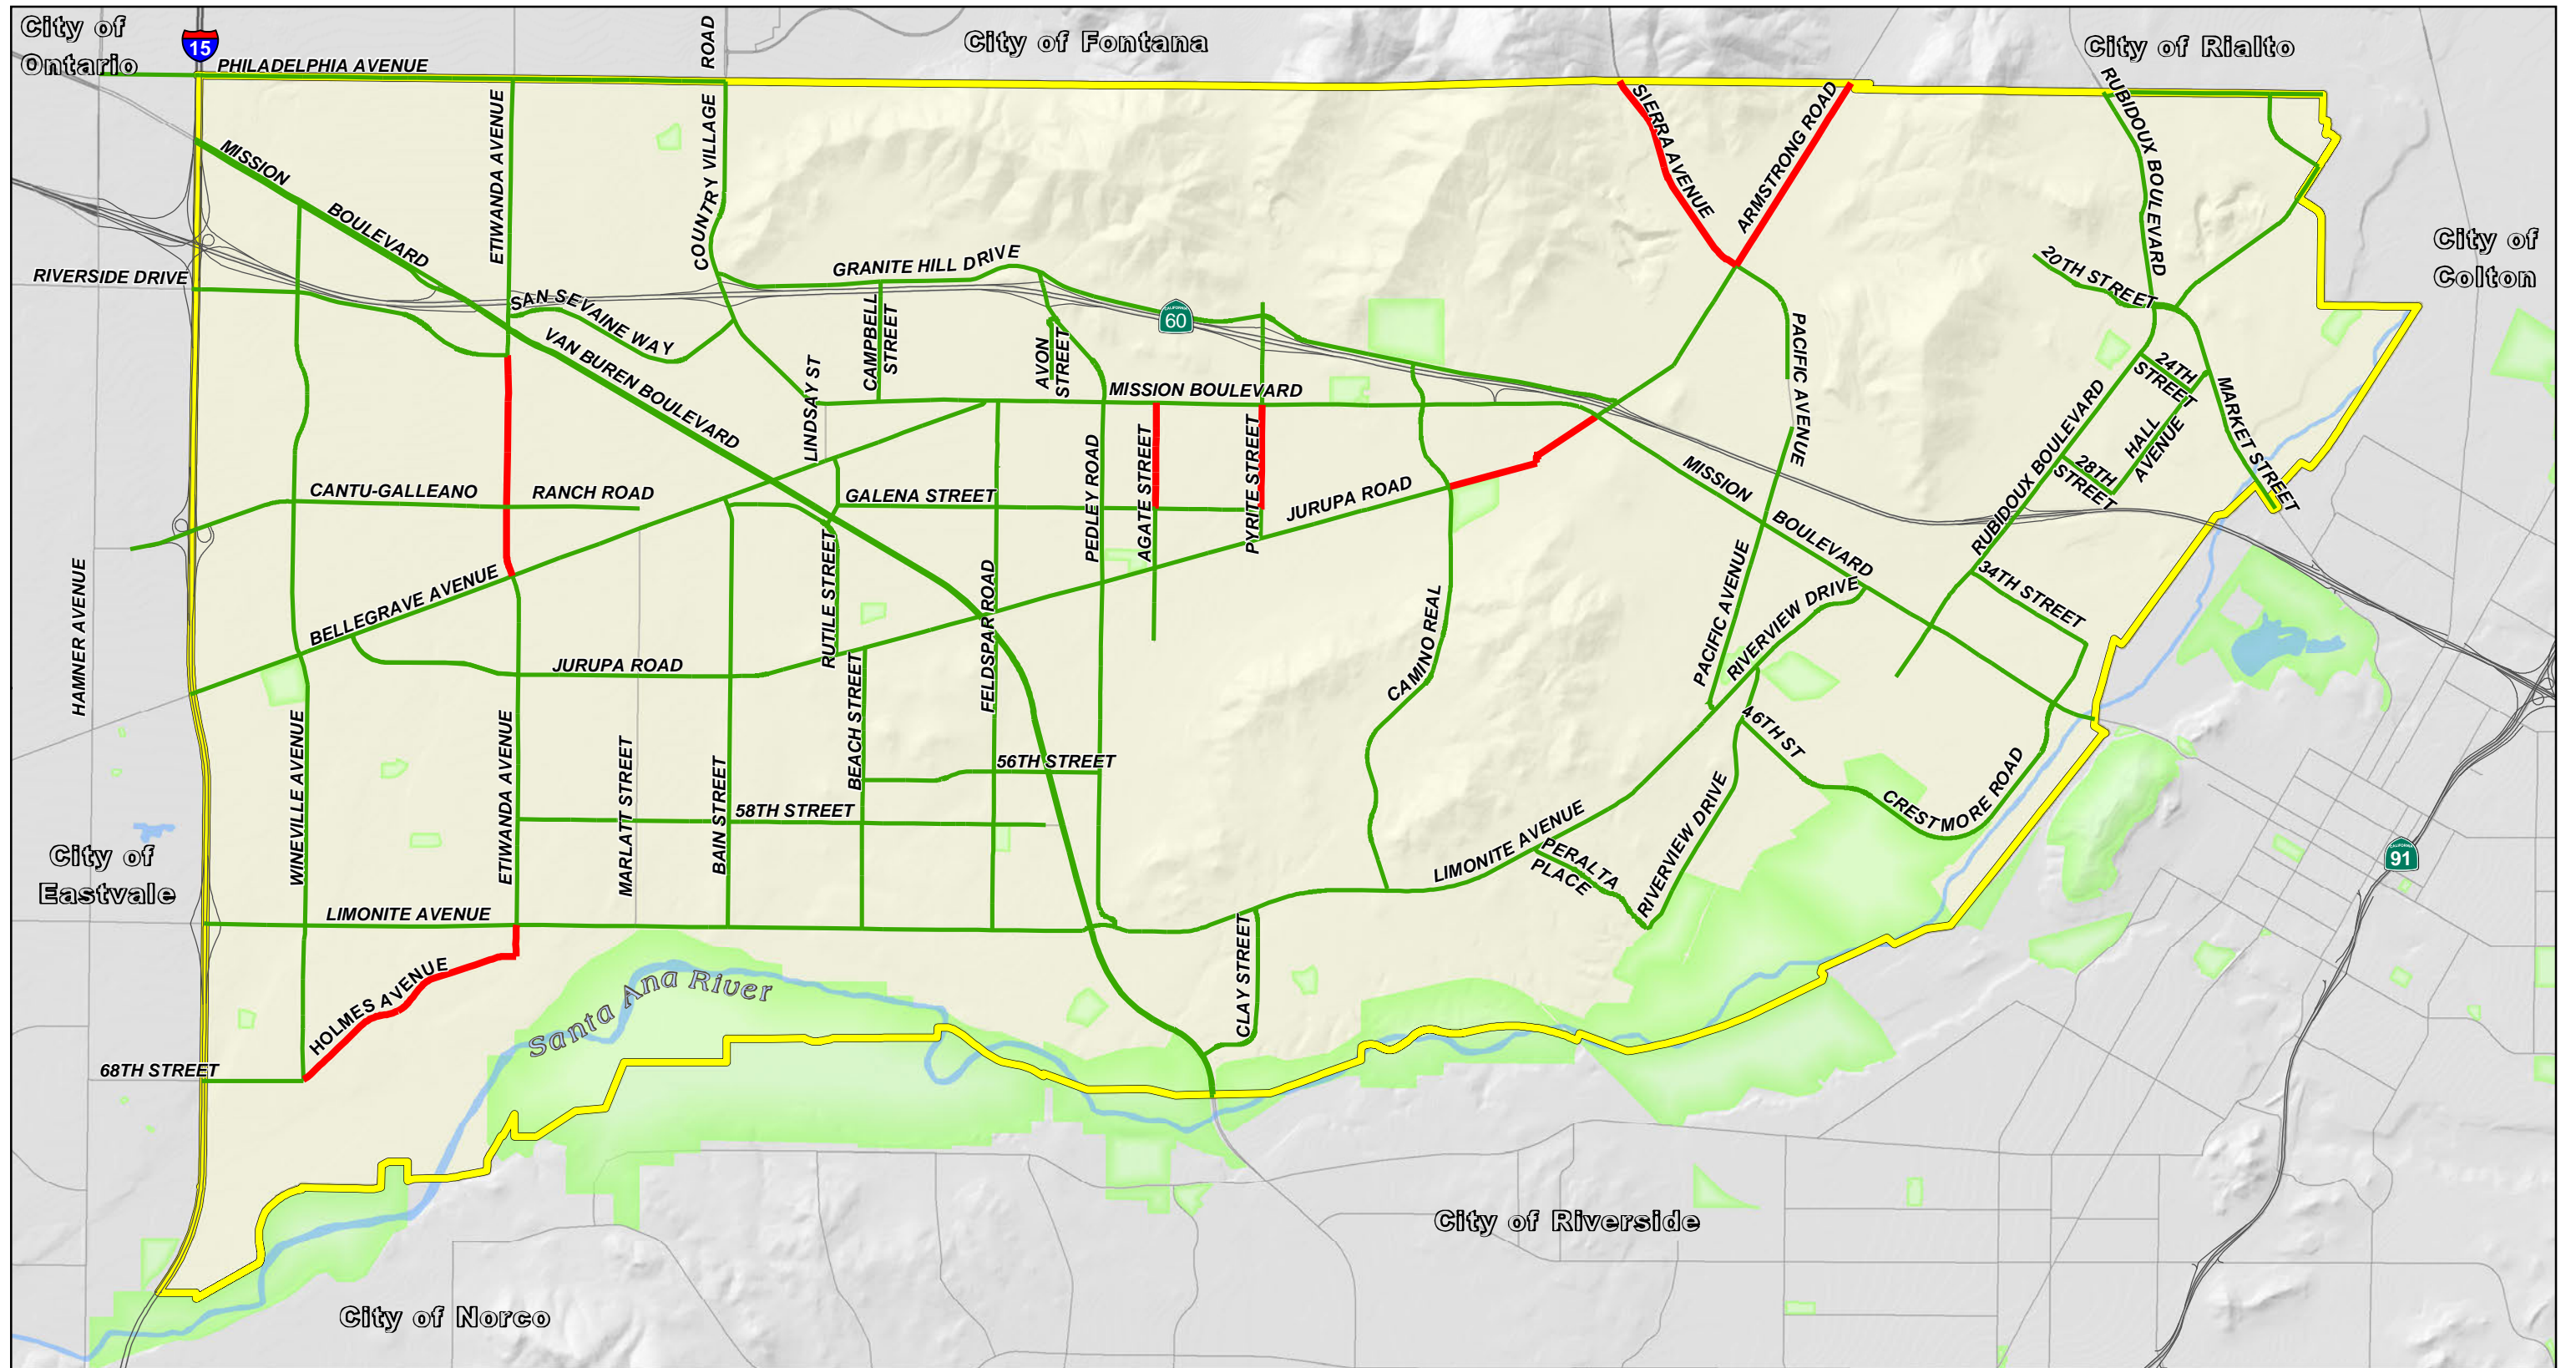

The key to successful bicycle mobility is connectivity. Bicyclists need to be able to travel seamlessly on the bicycle network and get to where they need to go. They also need to feel secure and safe when using the facilities by having sufficient separation from vehicles. The "Three Feet for Safety Act," which was incorporated into the California Vehicle Code

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

in September 2014, requires motorists overtaking or passing a bicycle in the same direction to leave a minimum distance of three feet between the motor vehicle and bicyclist.

Bicycle classifications include Class 1 bike paths, Class 2 bike paths, and Combination Trails (Regional/Class 1 bike paths). These facilities are described below. Each type of facility has certain characteristics and offers varying levels of safety, perceived or otherwise.

- Class 1: Provides a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross-flow minimized. The right-of-way for Class 1 bikeways may be substantial, separated from roadways by landscaped strips or other barriers. They may also be designed and signed to also permit golf carts.
- Class 2: Intended for preferential use by bicycles and are provided for within the paved areas of roadways. Bike lane pavement striping and other markings and bikeway signs are intended to promote an orderly flow of traffic by establishing demarcations between lanes designated for bicycles and lanes designated for motor vehicles.
- Combination Class 1 Bikeway/Regional Trails: Regional collectors linking the urban and rural communities and major water bodies and regional parks in the County and provide opportunities for long-distance users to take advantage of this system for long one-way or loop-type trips. These facilities may also include pedestrian and equestrian uses.

Based on a survey of major City streets, no designated bicycle facilities currently exist within the City. This existing deficiency of bicycle facilities poses a safety concern for bicyclists because they share the road with motor vehicles without the proper separation to feel secure. Bicyclists also use sidewalks, which can increase the risk of accidents with pedestrians. The County of Riverside General Plan has a proposed network of bicycle facilities. As part of this General Plan, a comprehensive bicycle network will be proposed that promotes a safe and efficient network that provides connectivity within the City and to

the networks of adjacent jurisdictions. This connectivity may be developed with nodes connected by paths. These nodes may include bike stations, water facilities, and other desirable amenities for bicyclists. Safety can also be considered in the General Plan context based on design of facilities that may include 3-foot buffers in the striping plan. Safety will also be a consideration of this General Plan in the development of policies related to education and enforcement. The purpose of this development via addition of intermediate rest points and destinations is to encourage commuter travel by bicycle. Development of General Plan policies may consider following the 5 E's as described by The League of American Bicyclists (Engineering, Education, Enforcement, Encouragement, and Evaluation) as a guide to the City's successful implementation of a bicycle plan.

Trails

The City of Jurupa Valley has a strong equestrian heritage that dates back hundreds of years. In 1742, the Anza Party traveled on trails through Jurupa Valley on its historic journey to Alta California, prior to the development of California's 21 missions. Trails continue to be an important part of both the heritage and the transportation system of Jurupa Valley. They are part of what gives the City its unique character and help promote its casual, healthy equestrian lifestyle.

Jurupa Valley offers pedestrian, bicycle, equestrian and multi-purpose trails that link urban, rural, and natural areas. These trails accommodate hikers, bicyclists, equestrians and others as an integral part of the County's circulation system. These trails serve both as a means of connecting the unique communities and activity centers within the City to adjacent communities, and as an effective alternate mode of transportation. In addition to transportation, the trail system also serves as a community amenity by providing recreation and leisure opportunities.

The City's trail network is currently planned and implemented through the City's development review process by the Jurupa Valley Community

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

Recreation and Parks District. Jurupa Valley can be found in the following locations:

- On the east side of Bain Street, between Bellegrave Avenue and Limonite Avenue.
- On the west side Etiwanda Avenue between Bellegrave Avenue and Limonite Avenue.
- On the north and south sides of Bellegrave Avenue, from Etiwanda Avenue to Wineville Avenue.
- On the east side of Wineville Avenue, between Limonite Avenue and 68th Street.
- On the east side of Wineville Avenue between Bellegrave Avenue and Redbud Street.
- On the south side of Cantu-Galleano Ranch Road between Calle Del Sol and Etiwanda.
- On the north side of Limonite Avenue, between Wineville Street and Etiwanda Avenue.
- On the south side of 68th Street between I-15 and Lucretia Street.
- On the east side of Lucretia Street between 66th and 68th Streets.
- On the south side of 66th Street between Lucretia Street and Etiwanda Avenue.

The City currently has one developed trail that it maintains, the Santa Ana River Trail. The Santa Ana River Trail is part of a planned regional trail extending across multiple jurisdictions from the Pacific Ocean in Orange County to the San Bernardino Mountains in San Bernardino County. Some communities have trails built and maintained by another entity such as a homeowners' association, a community service area, or a local park and recreation district. These trails lack connectivity to other parts of the County trail system, resulting in a fragmented system. Providing connectivity between City trails and between County trails

and state and federal trails, historic trails, and trails in other jurisdictions will be instrumental in creating a usable trail system. The City has four general types of multi-use, recreational trails:

- **Parkway Trails** are located in, along, or adjacent to a stream's floodplain. Ordinarily it extends the length of the stream but may be broken into segments. Road and trailside parks are part of a parkway.
- **Regional Trails** are the main trails within the County, generally maintained and operated by the County of Riverside's Parks and Open Space District. They are designed to eventually provide linkages between areas that could be quite distant from each other. They are also designed to connect with state and federal trails as well as trails within Jurupa Valley, other cities, and unincorporated areas. Regional trails will have an easement of 14 to 20 feet wide and a trail width of 10 feet.
- **Community Trails** are designed to link areas of a community to the regional trail system and to link areas of a community with each other, as further described below. Such trails are typically maintained and operated by a local parks and recreation district. Typically, community trails have an easement width of 10 to 14 feet wide and a trail width of 4 to 8 feet.
- **Historic Trails** are designated historic routes that recognize the rich history of Jurupa Valley and Riverside County. In Jurupa Valley, the Juan Bautista de Anza National Historic Trail is one segment of a planned 1,200-mile trail connecting historic, cultural, and recreation sites from Nogales, Arizona to the San Francisco Bay Area. Historic trail route designations are graphical representations of the general locations of these historic routes and do not necessarily represent a planned regional or community trail. In some case, the trails have more detailed planning documents that describe interpretive routes for autos and/or non-motorized modes of transportation. There generally are regional or community trail designations that either follow or parallel these routes, thus providing opportunities to

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

recognize the historic significance of these routes and allowing the possibility of developing interpretive signage and visitor facilities.

Freight

Commercial rail operations, while not as prevalent as they once were, are still common in Jurupa Valley. The Union Pacific (UP) and the Burlington Northern Santa Fe (BNSF) Railroads provide freight service in Riverside County, connecting the County with major markets within California and other destinations north and east. A railroad spur track traverses several large areas of Jurupa Valley and still provides valuable railroad access for a wide variety of commercial and industrial uses, thereby reducing dependence on trucking and air transport. With the increase in residential development in Jurupa Valley, railroad compatibility with adjacent uses is a key land use issue. Stack and rail noise, vibration, and the potential for derailling calls for special planning and design considerations where development is proposed adjacent to or near railroads.

Pedestrian Facilities

Walking is a form of non-motorized transportation that provides health benefits, enhances air quality, reduces traffic congestion, and increases community cohesion by keeping a pedestrian level of activity. Walking is often a primary form of transportation for children, the elderly, and those who cannot afford other transportation modes.

Sidewalks provide safe passage for pedestrians by creating a right-of-way that is separate from vehicular traffic. They are particularly important in, to, and from activity areas around the City, such as shopping districts, schools, recreation centers, and government buildings. Sidewalks encourage pedestrian activity, which is a defining element of community and neighborhood identity. In addition, good pedestrian connections are imperative for transit service because most transit trips begin and end with a pedestrian trip. Lack of sidewalks discourages pedestrian transportation.

The typical pedestrian system could be described as a grid system of streets with sidewalks on both sides that provide easy and direct connections between the trip origin and destination. It should also provide for convenient and safe street crossings and include sidewalks separated from streets and provide shade from trees.

The existing pedestrian facilities were evaluated using five pedestrian measurements described below.

- **Directness:** The directness measure represents the actual pedestrian distance from trip origin to destination. Since pedestrian trips are highly dependent on trip length, the pedestrian infrastructure's ability to provide the shortest and most direct route is critical. The ideal pedestrian network is the grid system, since curved street patterns add distance to the potential trip. Barriers can also affect pedestrian travel. Freeways, rivers, and railroads can divide a community and restrict direct connections between one another except at a limited number of street over/under crossings.
- **Continuity:** Continuity measures the completeness of the pedestrian system. A continuous sidewalk system not only allows the pedestrian to make an uninterrupted trip, it may also be required for a stroller or wheelchair user to utilize the sidewalks. Gaps in continuity can come in the form of missing segments, broken or overgrown vegetation, or physical barriers such as discontinuous streets or fences. Continuity is measured by the completeness of the sidewalk/walkway system and by identifying whether or not gaps exist. Other aspects of continuity are whether there are sidewalks along one or both sides of the street and whether there exists an overall continuity of sidewalk that provides a line of sight from block to block.
- **Street Crossings:** The Achilles heel of pedestrian and equestrian systems is the intersections where they must cross streets. Intersections are where the pedestrian and equestrian must interface with automobiles, which can be especially dangerous for equestrians, since response times may be slower, which can result

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

in safety concerns. As streets get wider and carry higher volumes of traffic, potential uses by pedestrians are avoided as safety becomes a concern. There are many factors that affect the pedestrian's real and perceived comfort and safety in crossing the street ranging from traffic control, crosswalks, number and width of travel lanes, travel speeds, and traffic volumes. Major arterial roadways can significantly affect a pedestrian's safety in crossing a street.

- **Visual Interest and Amenity:** This measure of the pedestrian system's attractiveness and appeal is the most difficult to quantify and compare, and the most likely to change as an area matures. Some aspects of this measure are related to facilities that enhance the comfort of the user. These include elements such as shade trees, street lighting, benches, distance from sidewalk or trail to traffic lanes, relationship to buildings and street furniture, existence of curbside parking, and speed of traffic. The latter may be particularly important to pedestrians with mobility or visual impairments. Other elements are important to the visual appeal such as landscaping, planter boxes, trash receptacles, and public art.
- **Pedestrian Security:** The pedestrian environment must feel like a safe place for people to walk. The key pedestrian security facility element is whether the pedestrian is clearly visible to other pedestrians or activities. Whereas this measurement is more appropriate at a site level, one can begin to identify areas where security might be an issue at the neighborhood level. Pedestrians require a sense of security, both through visual line of sight with others and separation from vehicles. Pedestrians feel safer if there is adequate distance from adjacent travel lanes, curbside parking, and minimal conflicts with vehicles exiting driveways. They also require well-lighted pathways and sidewalks for night use.

Figure 2.11 illustrates the existing sidewalks within the City of Jurupa Valley and Table 2.F lists the roadway segments without and with pedestrian facilities. As shown in Figure 2.11, there are many gaps in continuity of sidewalks that would prevent pedestrians from making

uninterrupted trips within the City. Also, Van Buren Boulevard, Jurupa Road, Camino Real, Limonite Avenue, and Mission Boulevard have curves that add distance to potential pedestrian trips. Amenities such as shade trees, street lighting, and benches, occur on few segments and have many gaps in continuity. Therefore, the City lacks a comprehensive pedestrian network that connects all areas of the City to parks, libraries, schools, and other local destinations.

Transit

The Riverside Transit Agency (RTA) provides numerous public transportation opportunities for residents and visitors in Jurupa Valley. These public transportation opportunities include fixed-route transit, intercity transit, paratransit, senior transit, rural transit, and private transit services.

Fixed-Route and Demand-Response Services

Transit, paratransit, and private provider services are characterized as being either a fixed-route or demand-response systems. The Community Transit Association of America (CTAA) defines fixed-route service to include any transit service in which vehicles run along an established path at preset times. Demand-response service is any non-fixed-route system of transporting individuals that requires advanced scheduling by the customer including services provided by public entities, non-profits, and private providers.

RTA operates fixed routes providing public transit service throughout western Riverside County and coordinates transit services throughout a 2,500-square mile service area. RTA provides local and regional services throughout the region with 35 fixed routes, eight CommuterLink routes, and Dial-A-Ride services.

CHAPTER 2 – EXISTING TRANSPORTATION SYSTEM

CommuterLink routes provide express bus routes to Riverside, Orange, San Diego, and San Bernardino Counties and include RTA's newest generation of express buses.

Dial-A-Ride is an origin to destination reservation transportation service for seniors and persons with disabilities. Dial-A-Ride vehicles travel to areas within three-quarters of a mile of an RTA local fixed-route.

Figure 2.12 illustrates the fixed-route transit services and previously referenced Table 2.F lists the roadway segments without and with transit services in the City. As shown in Figure 2.12, RTA currently provides five fixed routes that operate within and through the City on most major roadways. Adequate connectivity exists on most major roadways; however, there are existing deficiencies on Van Buren Boulevard from Limonite Avenue to the northwestern City limits, Bellegrave Avenue from the western City limits to Mission Boulevard, Jurupa Road from Van Buren Boulevard to Mission Boulevard, Camino Real from Mission Boulevard to Limonite Avenue, and Etiwanda Avenue from Jurupa Road to the northern City limits.

The composition of the existing transit facilities will require change over time due to existing deficiencies and changes in demographics, land use, and population. Because transit facilities within the City are currently operated by RTA, the City should develop goals and policies in the General Plan that encourages more coordination and collaboration with RTA to provide residents with additional mode choices including an expanded transit system.

Commuter Rail

Although railroads are independent operations, the interaction between rail and other modes of transportation does affect the transportation system. Motorized vehicles, pedestrians, and freight movement are all

affected by delay caused by trains at at-grade crossings.

Commuter rail service through the City of Jurupa Valley is provided by Metrolink and is illustrated in Figure 2.13. The Pedley Metrolink Station is located on Pedley Road in Jurupa Valley and connects to the Riverside-Downtown station to the east and the East Ontario station to the west. RTA fixed route 29 provides a transit connection to the Pedley Metrolink station.

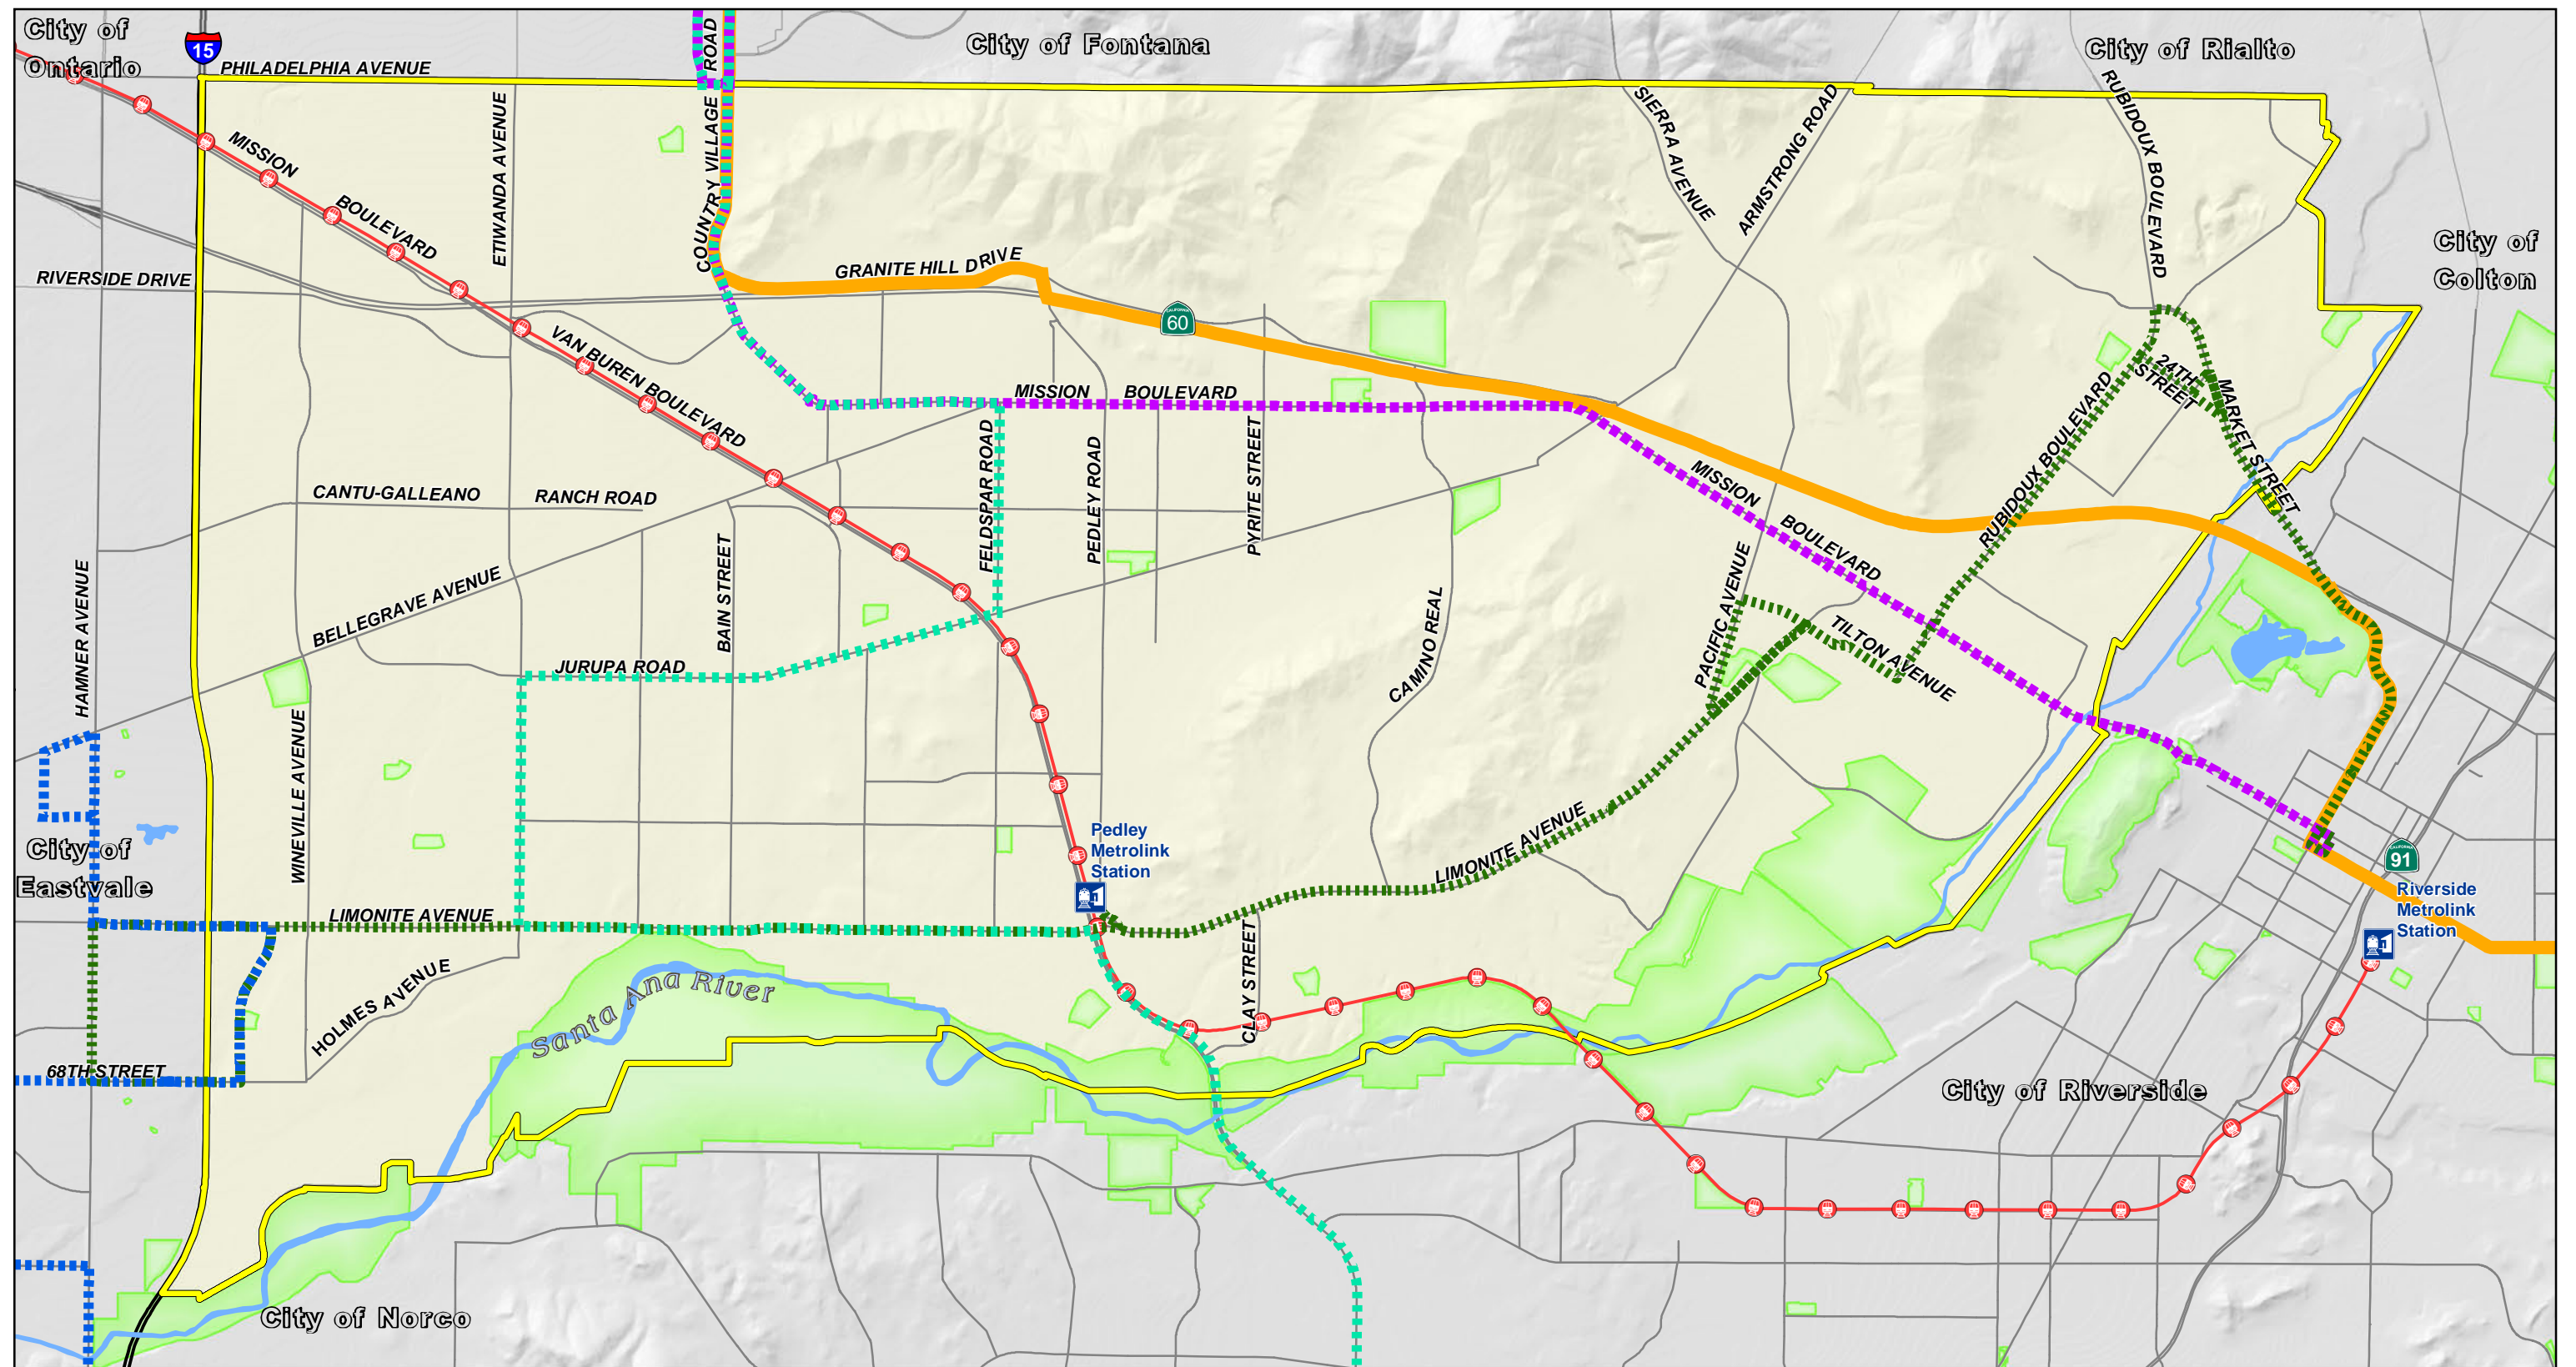

The Pedley Metrolink Station is served by Metrolink's Riverside Line, which provides rail service from Riverside to Downtown Los Angeles. The Riverside line includes stops at Downtown Riverside, Pedley, East Ontario, Downtown Pomona, City of Industry, Montebello, and Downtown Los Angeles. Figure 2.13 illustrates Metrolink's Riverside Line.

Airports

There is one airport located within the City of Jurupa Valley and six regional airports in the vicinity. Previously referenced Figure 2.1 illustrates the airports. Flabob Airport and Riverside Municipal Airport offer general aviation facilities and Ontario International Airport provides scheduled commercial service.

CHAPTER 3 – GENERAL PLAN BUILD-OUT TRAFFIC

The City of Jurupa Valley’s long-term mobility system goals and policies are closely correlated to the Land Use Element. These goals and policies are intended to provide a balance between the City’s future growth and land use development, roadway size, and traffic levels of service. This chapter describes the roadway network traffic volumes under forecast build-out conditions.

CHAPTER CONTENTS

- Analysis Scenarios
- Future No Project Conditions
- General Plan Build-out Conditions

Analysis Scenarios

To provide the transportation infrastructure and describe the future transportation conditions, two General Plan scenarios were evaluated; Future No Project and General Plan Build-out conditions. The Future No Project scenario includes land use data and the roadway network from the County of Riverside’s Circulation Element adopted in 2003 through the Riverside County Integrated Project (RCIP). The General Plan Build-out includes the land use data and roadway network from the City of Jurupa Valley Land Use Element. For both scenarios, build-out conditions are assumed for year 2035.

Future No Project

To forecast future traffic volumes within the City of Jurupa Valley, a travel demand model (TDM) was applied. The Riverside County Transportation Analysis Model (RivTAM) is a focused model developed using the Southern California Association of Governments (SCAG) Regional Model and refined to include updates such as additional zones, roadways, and transit networks. RivTAM was used to forecast the Future No Project traffic volumes using data including population, households, school enrollments, household income, employment, and the roadway network adopted in the County of Riverside’s Circulation Element. This data were then converted to socioeconomic data and input into the model prior to running the four-step modeling process

(trip generation, trip distribution, mode choice, and trip assignment) to develop future no project traffic volumes.

General Plan Build-out

The General Plan Build-out was conducted using future traffic projections from RivTAM. In consultation with City staff, RivTAM was refined to include data from the City of Jurupa Valley Land Use Element, which was converted into socioeconomic data and input to the RivTAM General Plan Build-out conditions. The Traffic Analysis Zone (TAZ) structure within the City of Jurupa Valley was refined to include updated zone boundaries based on current and future land uses, and existing and future roadways. The refined forecasts were used to conduct a citywide analysis to determine areas of congestion, and levels of service.

Future No Project Conditions

Roadway Network

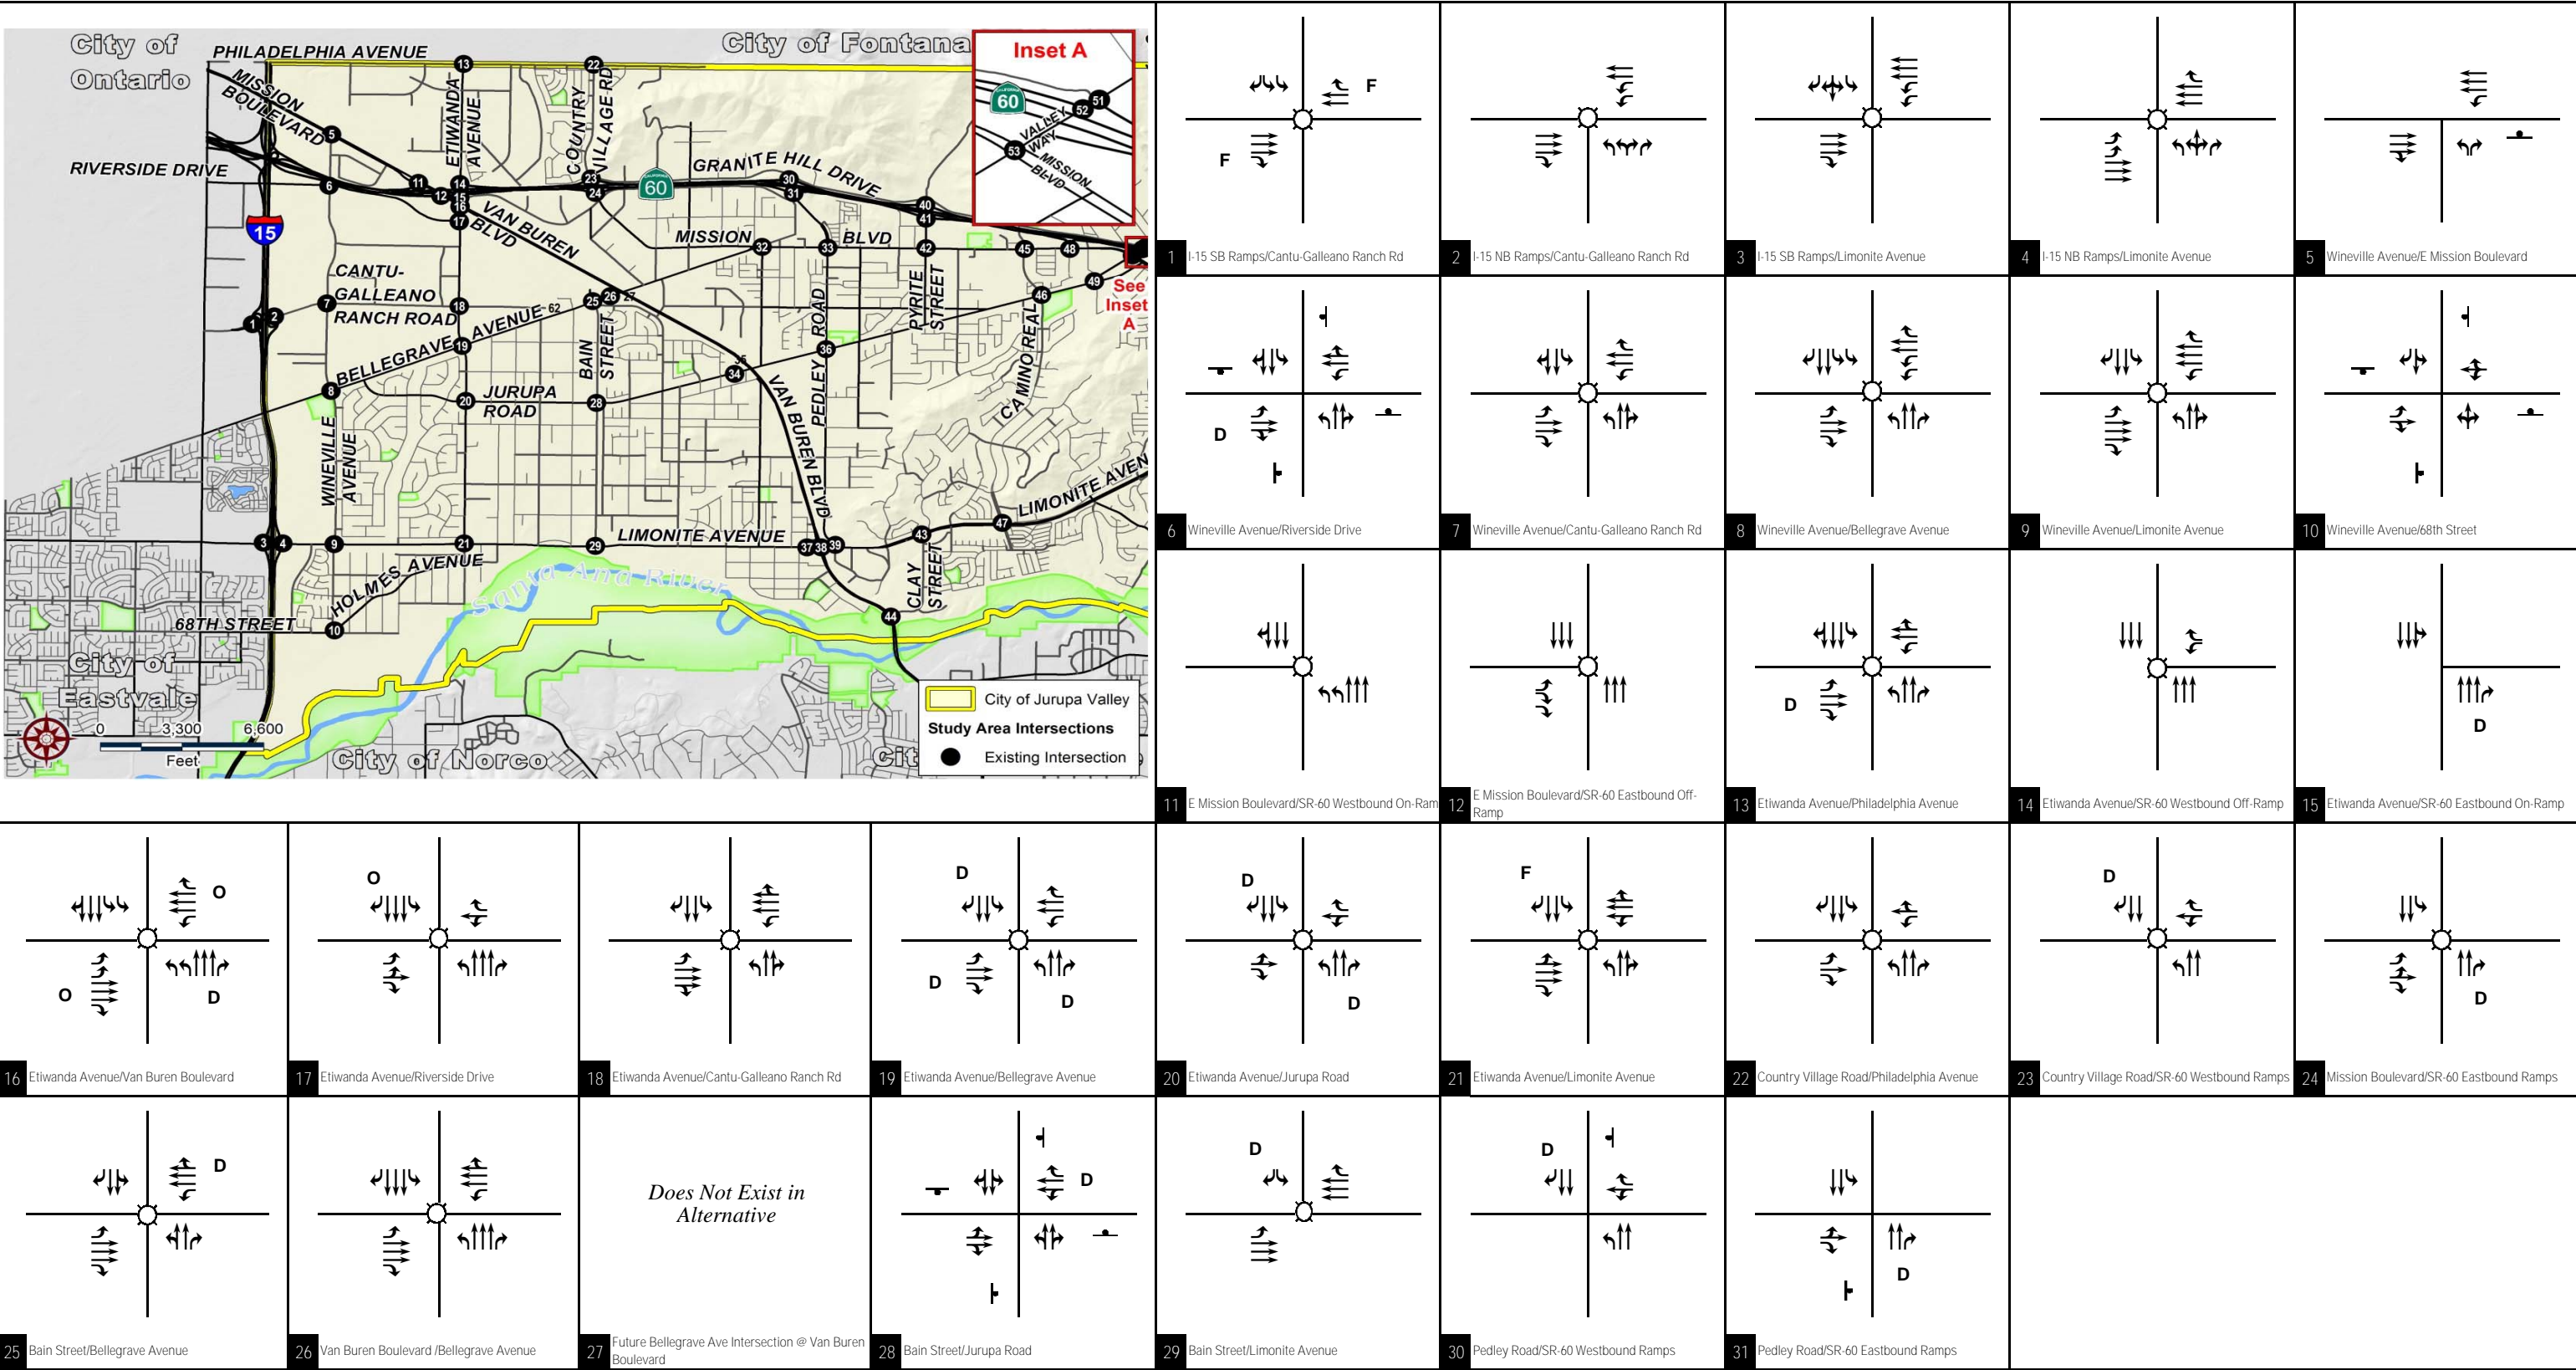

The Future No Project scenario roadway network incorporates all roadways shown in the Riverside County Circulation Element and included in the RivTAM network. Figures 3.1-1 and 3.1-2 illustrate the Future No Project intersection geometrics and stop control.

Intersection Traffic Volumes

The intersection traffic volumes for Future no Project conditions were developed using the RivTAM base year and future year model networks. Raw traffic model data from RivTAM base and future year model runs were post-processed using National Cooperative Highway Research Program (NCHRP) 255 methodologies to develop peak-hour turning movement volumes at each study area intersection and roadway segments. The following describes the methodology used to post-process model volumes to develop peak hour intersection volumes for Future No Project conditions:

CHAPTER 3 – GENERAL PLAN BUILD-OUT TRAFFIC

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 3 – GENERAL PLAN BUILD-OUT TRAFFIC

1. The difference between the modeled 2007 and 2035 peak period directional arterial traffic volumes in PCEs (for each intersection approach and departure) was identified from loaded network plots. This difference defines growth in traffic over the 28-year period.
2. The incremental growth in peak period approach and departure volumes between 2007 and 2035 was factored to develop the incremental change in peak-hour volumes. RivTAM uses a three-hour a.m. peak period and a four-hour p.m. peak period. The Southern California Association of Governments (SCAG) has established that the a.m. peak hour comprises 38 percent of the peak period and the p.m. peak hour comprises 28 percent of the peak period. Therefore, the incremental changes in peak period volumes were multiplied by the appropriate factors to develop incremental changes in peak-hour volumes.
3. The incremental growth in approach and departure volumes between 2007 and 2035 was factored to reflect the forecast growth between the year of the ground counts (2015) and 2035. For this purpose, linear growth between the 2007 base condition and the forecast 2035 condition was assumed. As the increment between existing (2015) and build-out (2035) is 20 years of the 28-year time span, a factor of 0.71 (i.e., 20/28) was used.
4. The forecast growth in approach and departure volumes through build-out year (2035) conditions was added to the 2015 ground counts, resulting in “post-processed” build-out year (2035) link volumes.
5. Forecast year 2035 turn volumes were developed using existing (2015) turn volumes and the future approach and departure volumes, based on the methodologies contained in *National Cooperative Highway Research Program Report (NCHRP) 255: Highway Traffic Data for Urbanized Area Project Planning and Design* (Transportation Research Board, December 1982).

Detailed volume development worksheets are contained in Appendix B. The Future No Project a.m. and p.m. peak hour intersection traffic volumes are illustrated in Figures 3.2-1 and 3.2-2.

Roadway Segment Traffic Volumes

The roadway segment volumes for Future No Project were developed using the same methodology described under “Intersection Traffic Volumes.” Table 3.A illustrates the Future No Project daily traffic volumes at study area roadway segments. Volume development worksheets are contained in Appendix B.

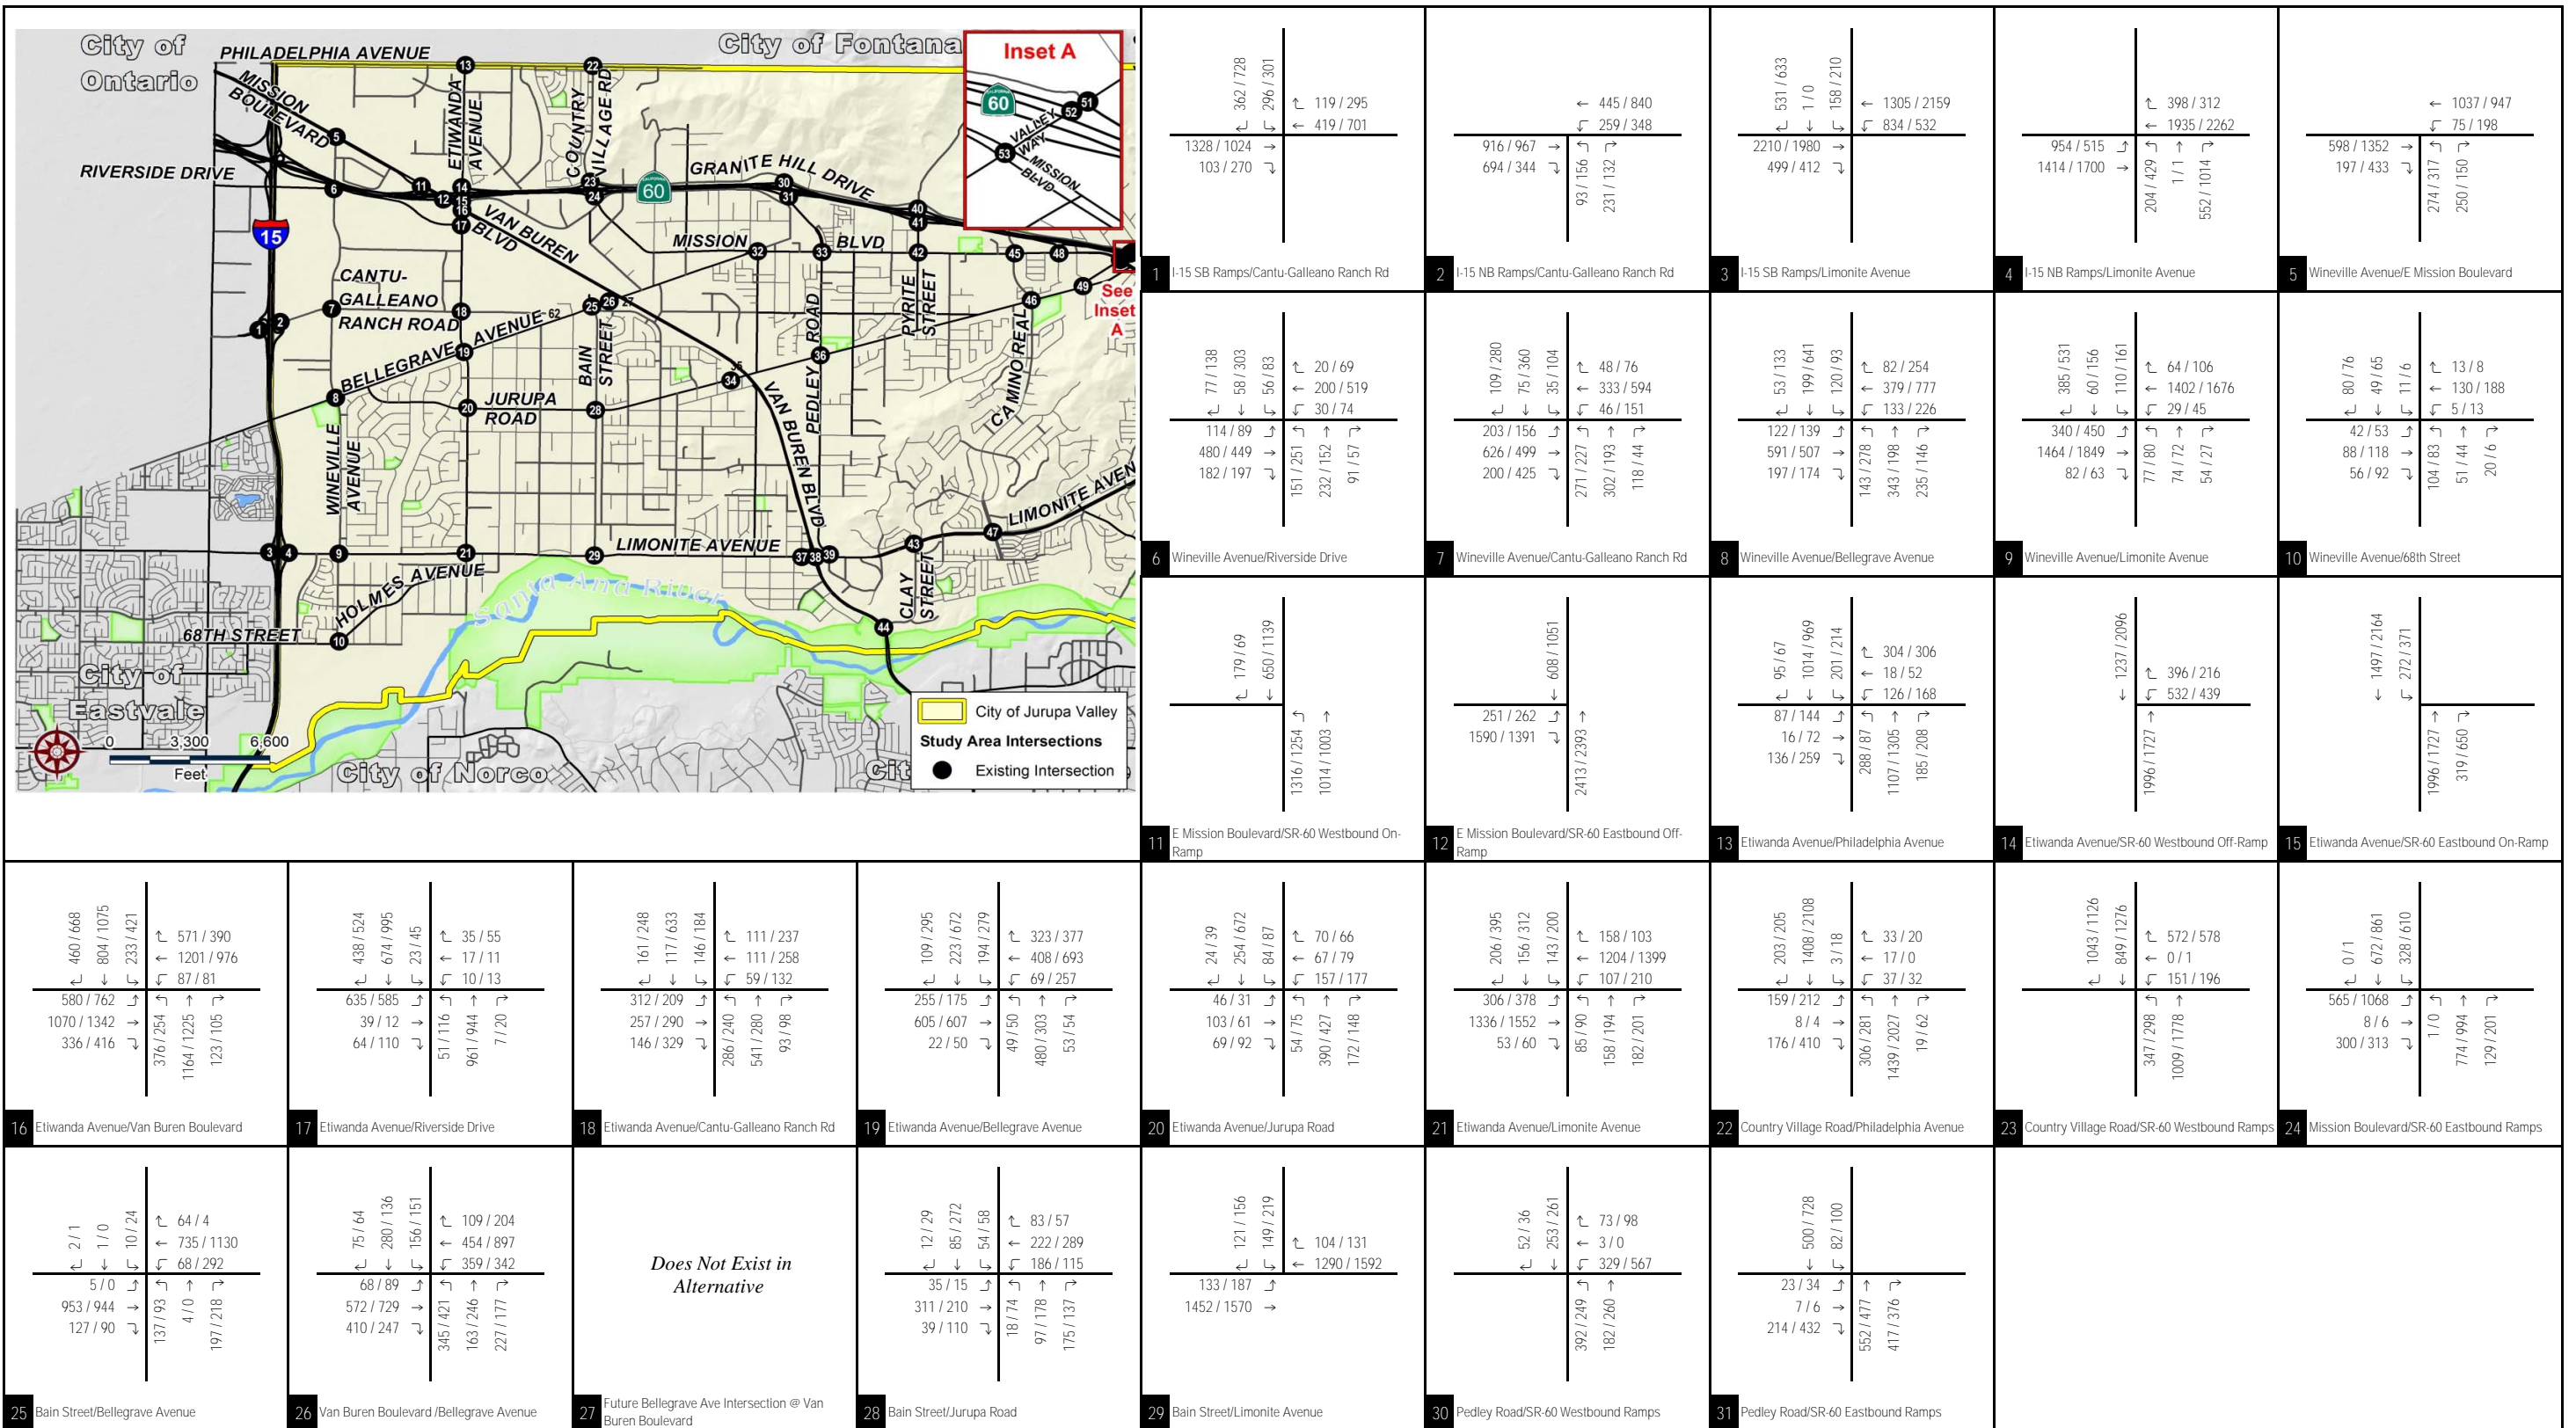

Intersections Levels of Service

A level of service analysis for Future No Project was conducted at study area intersections to determine the projected intersection performance. Table 3.B illustrates the results of this analysis and shows that all intersections are projected to operate at satisfactory levels of service (D or better), with the exception of the following intersections:

- I-15 Northbound Ramps/Limonite Avenue (p.m. peak hour);
- Wineville Avenue/Mission Boulevard (a.m. and p.m. peak hours);
- Wineville Avenue/Riverside Drive (p.m. peak hour);
- Wineville Avenue/Road/Cantu-Galleano Ranch Road (p.m. peak hour);
- Wineville Avenue/Limonite Avenue (p.m. peak hour);
- Mission Boulevard/SR-60 Eastbound Off-Ramp (a.m. and p.m. peak hours);
- Etiwanda Avenue/SR-60 Eastbound On-Ramp (a.m. and p.m. peak hours);
- Etiwanda Avenue/Van Buren Boulevard (a.m. and p.m. peak hours);
- Etiwanda Avenue/Bellegrave Avenue (a.m. and p.m. peak hours);

- Rubidoux Boulevard/Mission Boulevard (a.m. and p.m. peak hours).

Figures 3.3-1 and 3.3-2 illustrate the locations of the study area intersections and corresponding a.m. and p.m. levels of service under Future No Project conditions. LOS worksheets are included in Appendix C.

Roadway Segment Levels of Service

A level of service analysis was conducted at study area roadway segments to determine the projected roadway segment performance under Future No Project conditions. As shown in previously referenced Table 3.A, all roadway segments are projected to operate at satisfactory levels of service (D or better), with the exception of the following roadway segments:

- Country Village Road from Philadelphia Avenue to SR-60 Westbound Ramps;
- Country Village Road from SR-60 Westbound Ramps to SR-60 Eastbound Ramps;
- Clay Street from Limonite Avenue to Van Buren Boulevard;
- Van Buren Boulevard from Etiwanda Avenue to Bellegrave Avenue;

- Mission Boulevard east of Rubidoux Boulevard;
- Bellegrave Avenue from Etiwanda Avenue to Cantu-Galleano Ranch Road;
- Bellegrave Avenue from Cantu-Galleano Ranch Road to Van Buren Boulevard;
- Valley Way from SR-60 Eastbound On-Ramp to SR-60 Westbound Ramps;
- Valley Way from SR-60 Westbound Ramps to Sierra Avenue;
- Limonite Avenue from I-15 Southbound Ramps to I-15 Northbound Ramps;
- Limonite Avenue from I-15 Northbound Ramps to Wineville Avenue; and
- Sierra Avenue west of Armstrong Road.

Figure 3.4 illustrates the locations of the roadway segments and corresponding levels of service under Future No Project conditions.

General Plan Build-out Conditions

Roadway Network

The General Plan Build-out scenario includes modifications to the existing roadway network based on input from the City of Jurupa Valley

to reflect the Jurupa Valley Mobility goals. Following are recommended improvements to the City's roadway network:

Etiwanda Avenue: The roadway segment south of Limonite Avenue is proposed to include a two-lane Secondary roadway bridge extension from 66th Street over the Santa Ana River to Arlington Avenue.

Van Buren Boulevard: The roadway segments from Etiwanda Avenue to Clay Street are proposed to be widened from a four-lane Urban Arterial to an eight-lane Expressway. The intersection of Van Buren Boulevard/Bellegrave Avenue is proposed to realign to the south with a new connector at Van Buren Boulevard/Van Buren Connector. Also, the intersection of Van Buren Boulevard/Jurupa Road is proposed to realign to the north with a new connector at Van Buren Boulevard/Van Buren Connector.

Cantu-Galleano Ranch Road: The roadway segments between Etiwanda Avenue and Van Buren Boulevard are proposed to be widened from four-lane Major roadways to six-lane Urban Arterials. The roadway segment east of Etiwanda Avenue is proposed to align with Bellegrave Avenue and create a new intersection at Bellegrave Avenue/Cantu-Galleano Ranch Road.

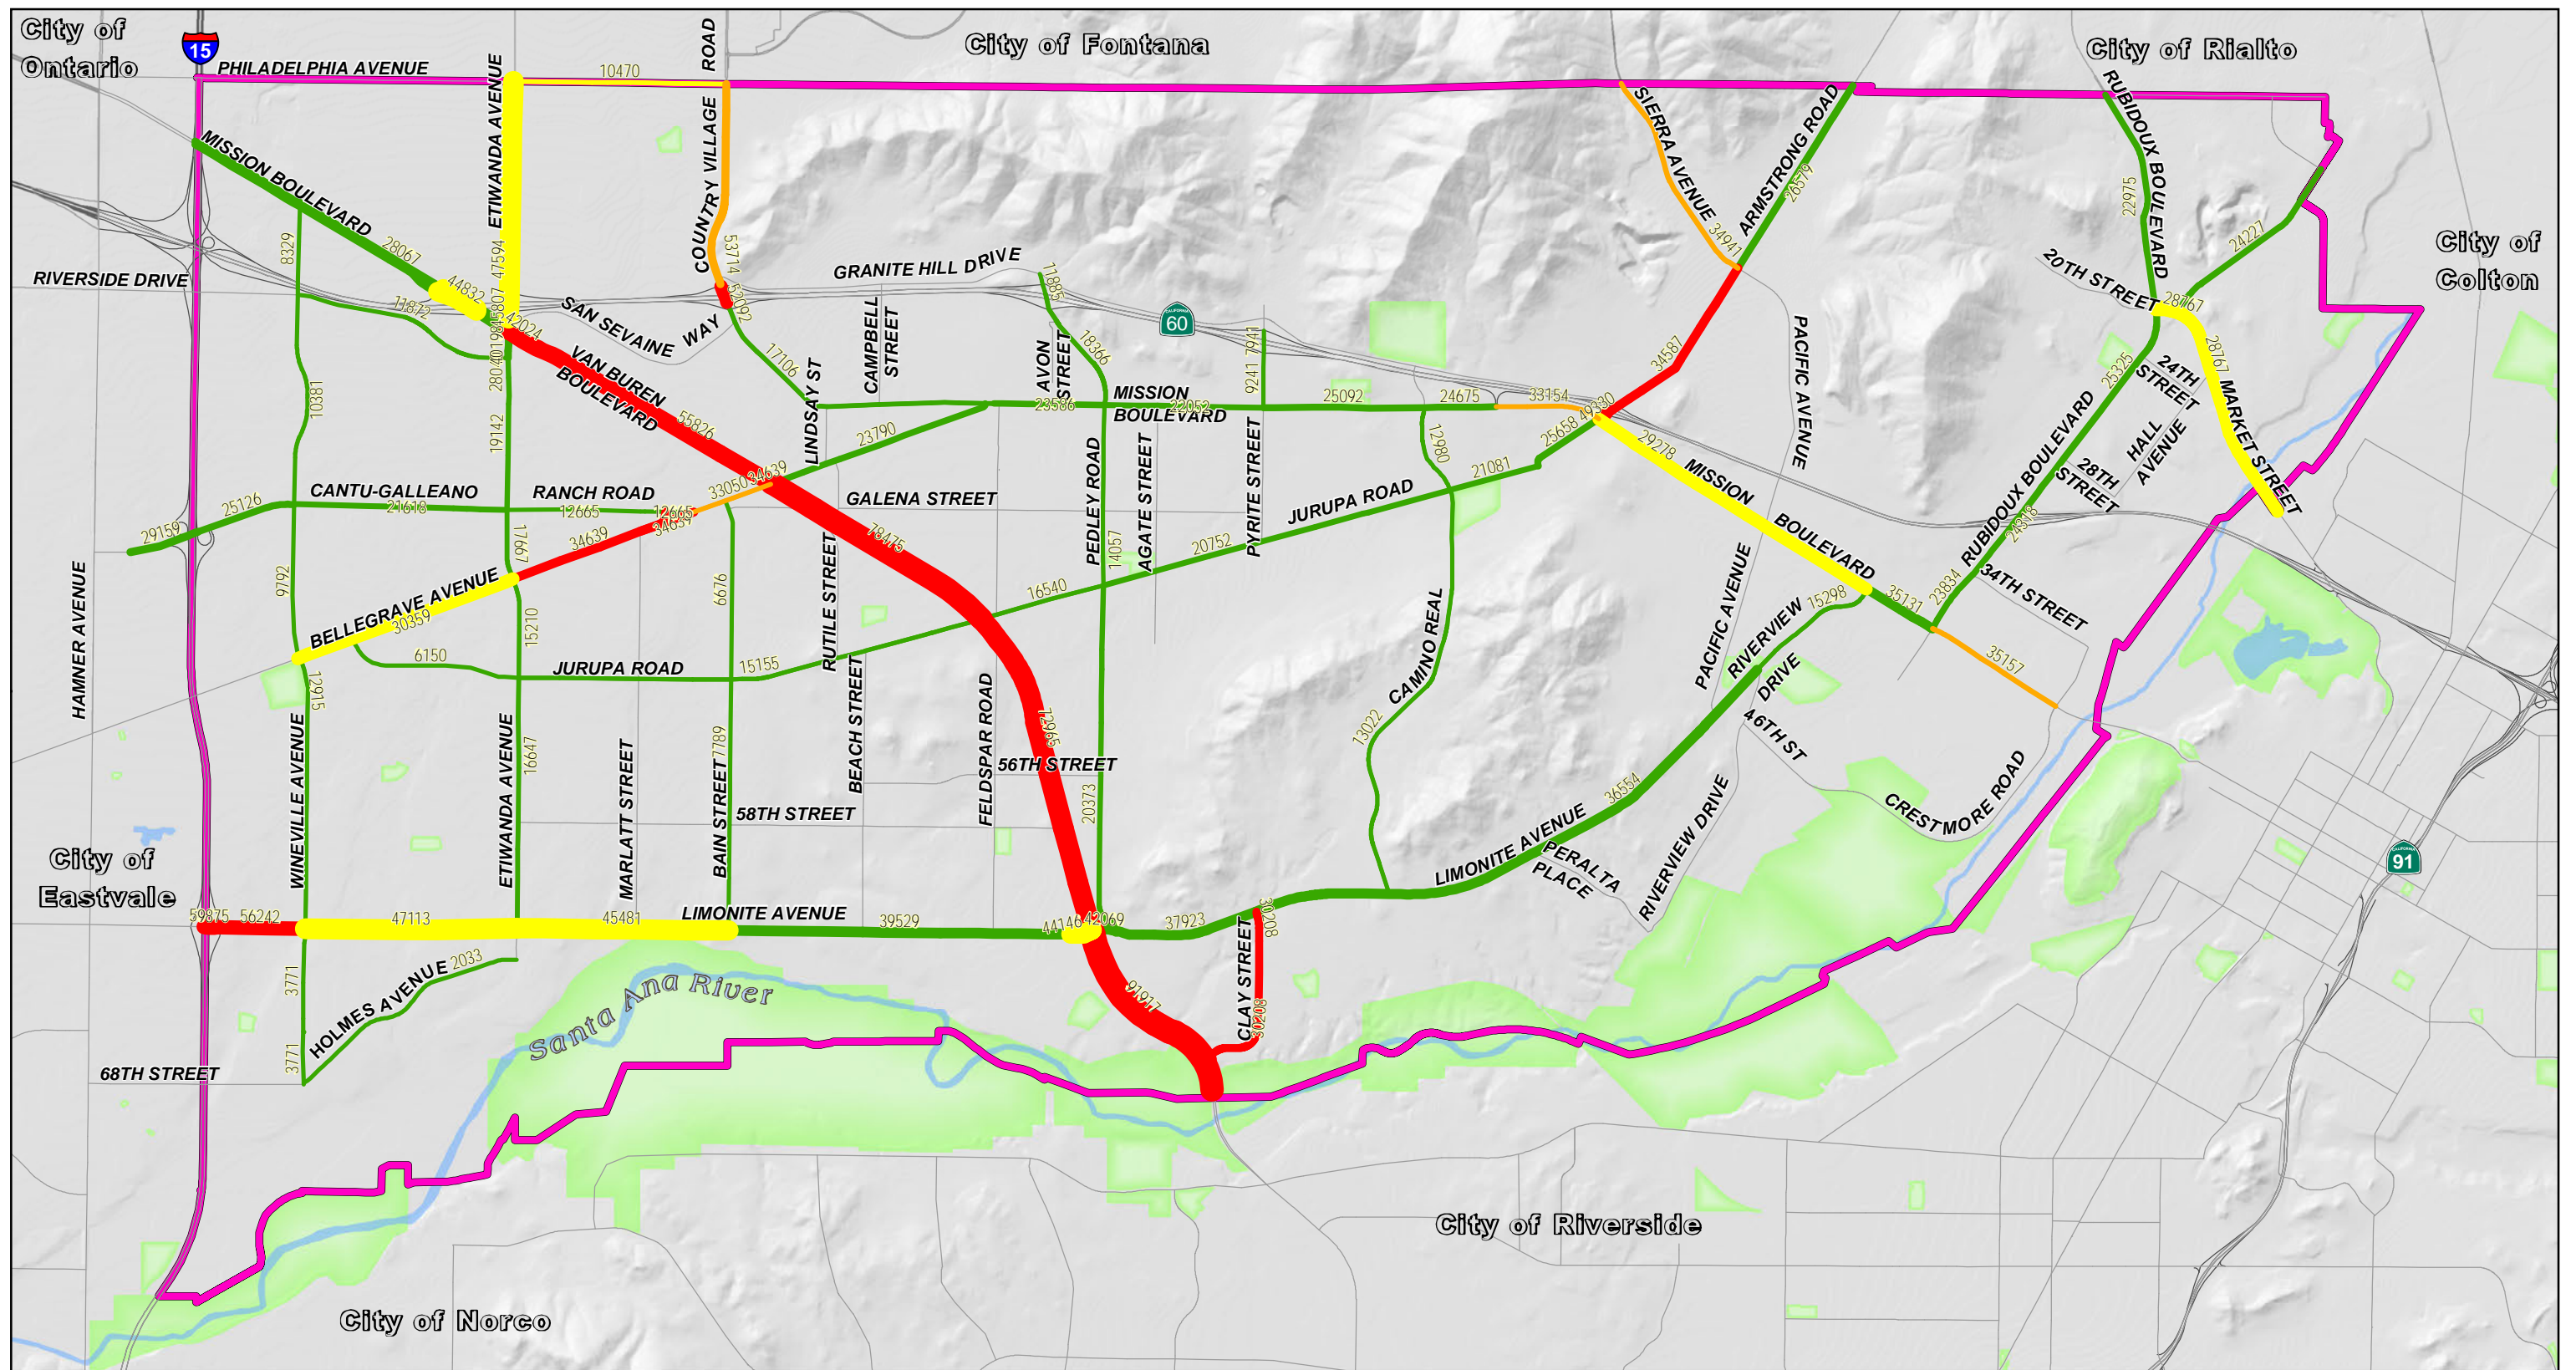

Bellegrave Avenue: The roadway segment between Marlatt Street and Dodd Street is proposed to realign with Cantu-Galleano Ranch Road and end at the new intersection of Bellegrave Avenue/Cantu-Galleano Ranch Road. A new intersection west of Bain Street is proposed to connect at Van Buren Connector/Bellegrave Avenue.

Market Street: The roadway segment east of Rubidoux Boulevard is proposed to be widened from a two-lane Arterial to a three-lane Major Roadway.

Figures 3.5-1 and 3.5-2 illustrate the General Plan Build-out intersection geometrics and stop control with the proposed roadway modifications.

CHAPTER 3 – GENERAL PLAN BUILD-OUT TRAFFIC

Intersection Traffic Volumes

The development of future intersection traffic volumes for General Plan Build-out conditions is similar to the Future No Project conditions with the exception of the roadway network modifications that were described previously for General Plan Build-out. These modifications are not considered significant enough to divert or reroute traffic in large volume. Therefore, the same volume development methodology used for Future No Project conditions was used for General Plan Build-out.

Detailed volume development worksheets are contained in Appendix B. The General Plan Build-out a.m. and p.m. peak hour intersection traffic volumes are illustrated in Figures 3.6-1 and 3.6-2.

Roadway Segment Traffic Volumes

The roadway segment volumes were developed using the same methodology described under “Intersection Traffic Volumes.” Table 3.C illustrates the General Plan Build-out daily traffic volumes at study area roadway segments.

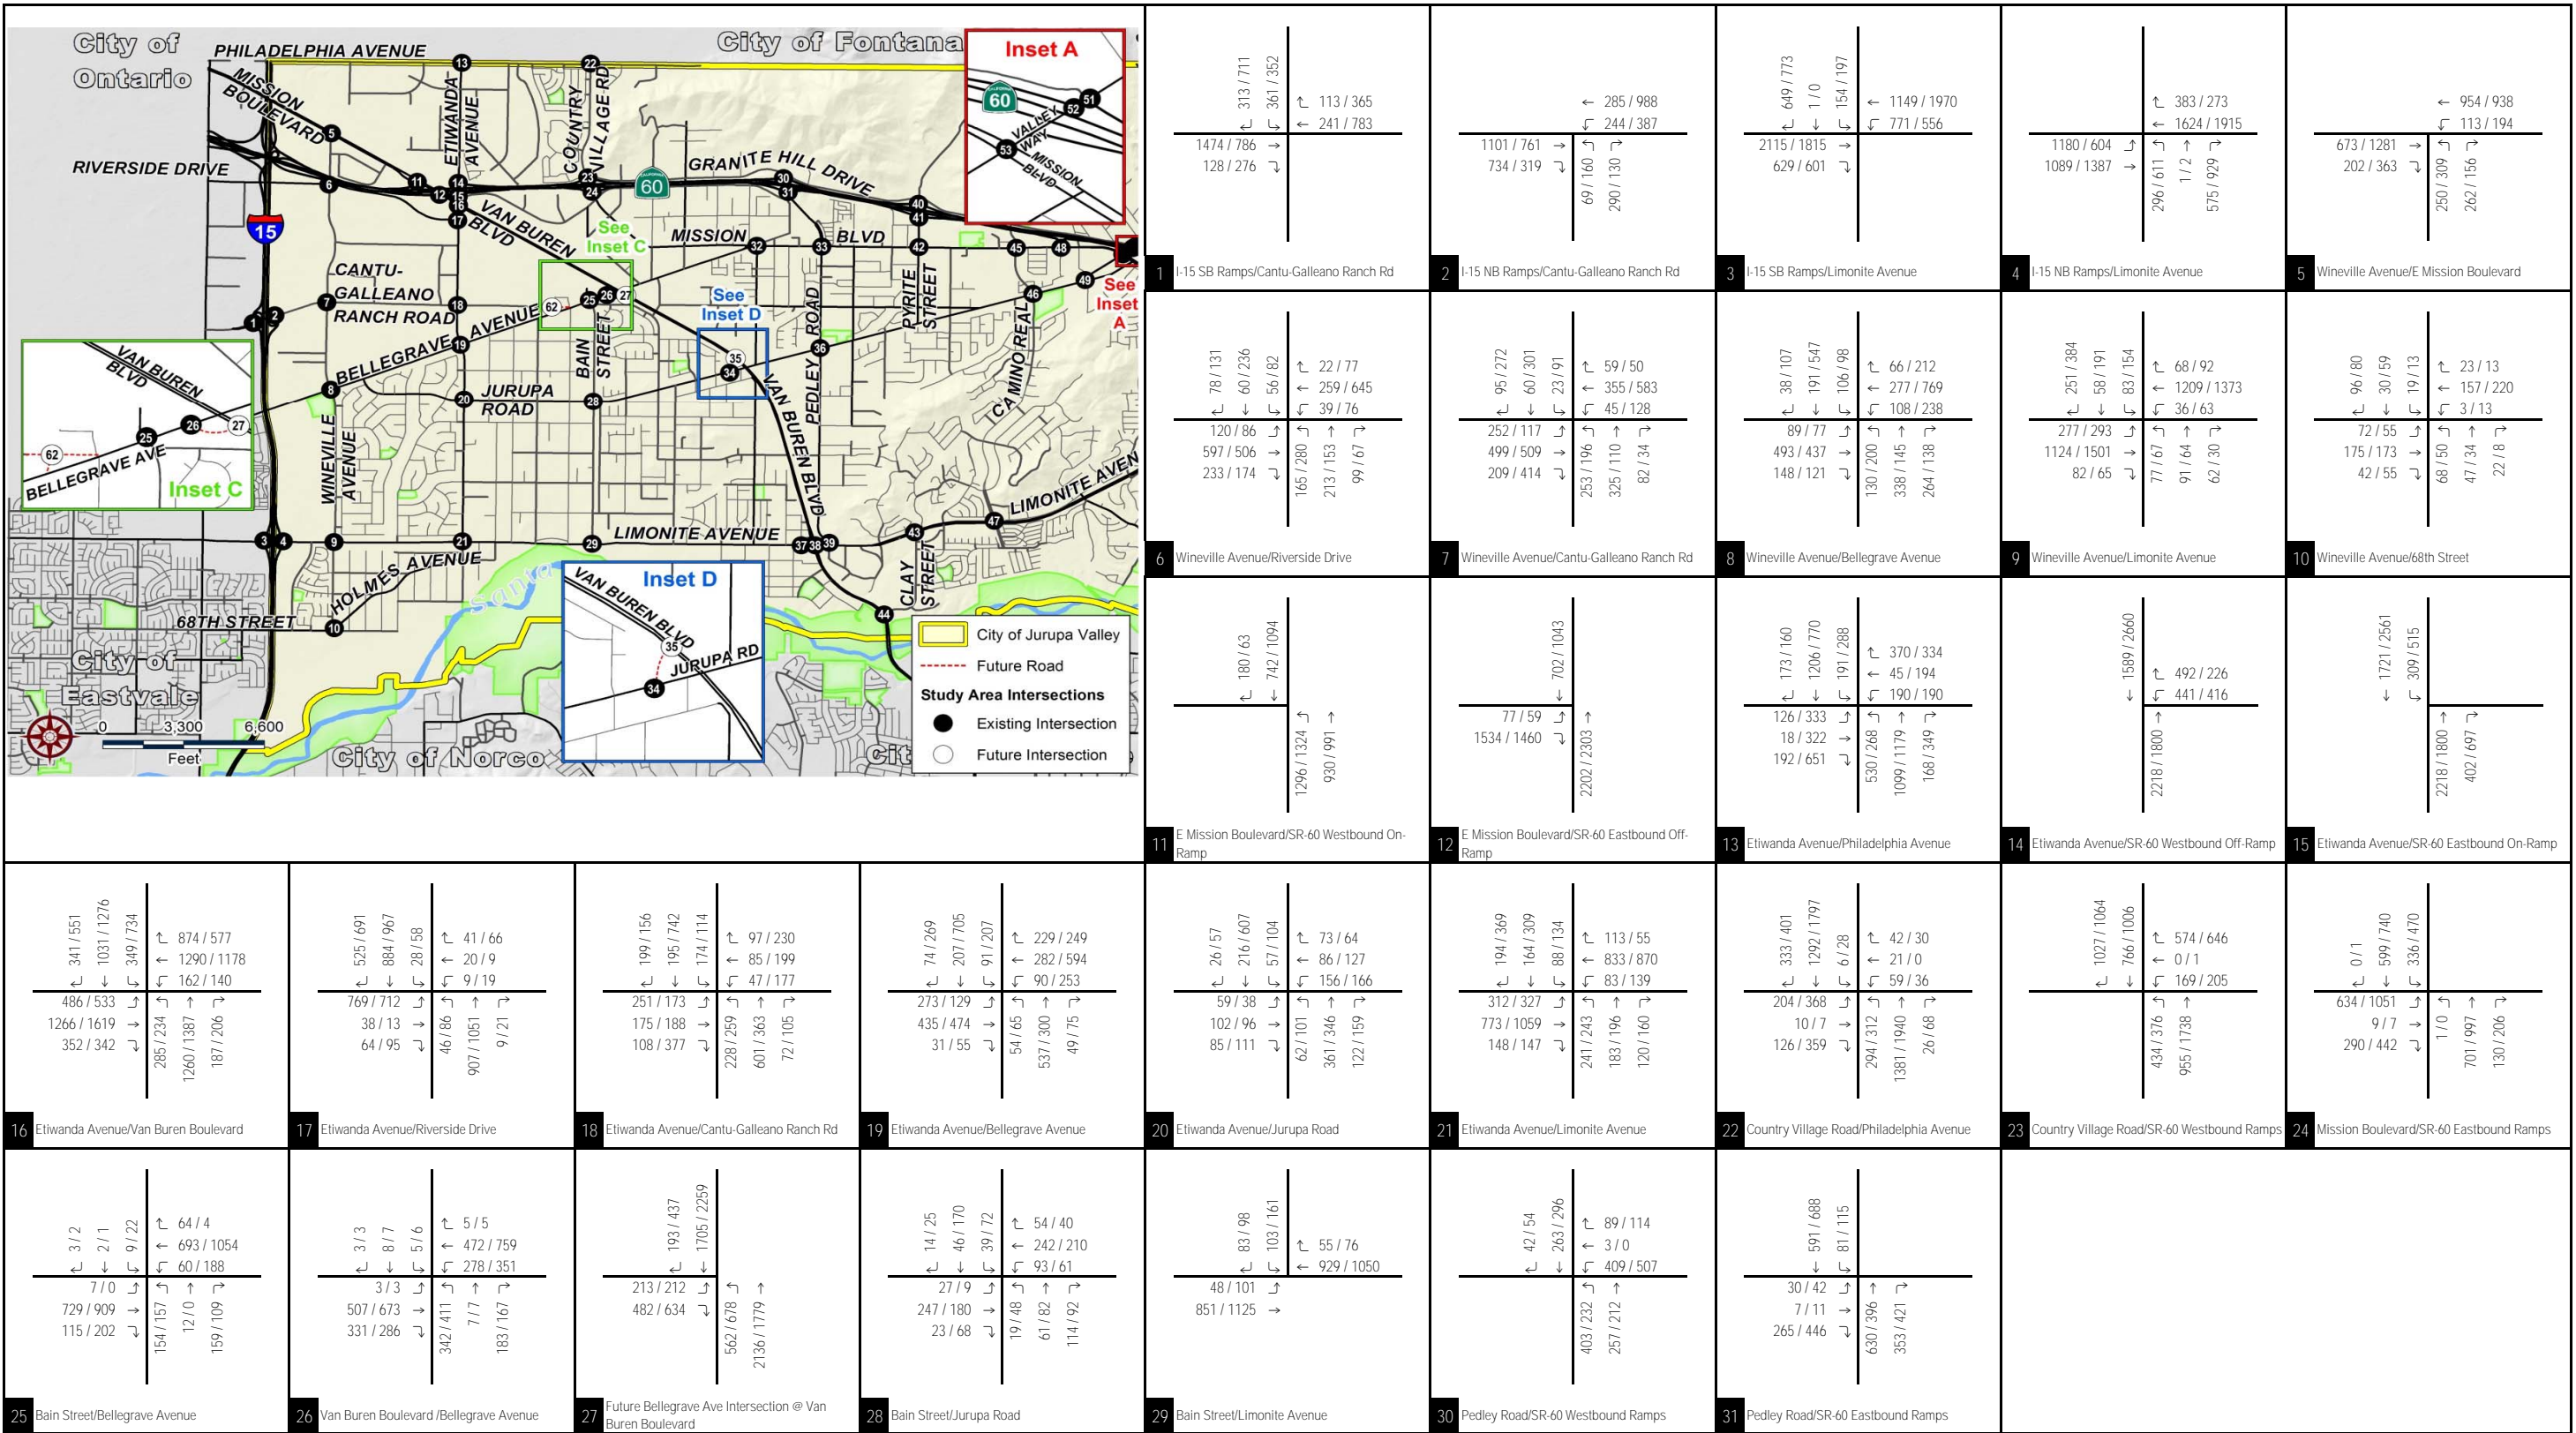

Intersection Levels of Service

A level of service analysis for General Plan Build-out was conducted at study area intersections to determine the projected intersection performance. Table 3.D illustrates the results of this analysis, and shows that all intersections are projected to operate at satisfactory levels of service D or better, with the exception of the following intersections:

- I-15 Southbound Ramps/Limonite Avenue (p.m. peak hour);
- I-15 Northbound Ramps/Limonite Avenue (p.m. peak hour);
- Wineville Road/Mission Boulevard (a.m. and p.m. peak hours);
- Wineville Road/Riverside Drive (p.m. peak hour);
- Wineville Avenue/Road/Cantu-Galleano Ranch Road (p.m. peak hour);
- Mission Boulevard/SR-60 Eastbound Off-Ramp (a.m. and p.m. peak hours);
- Etiwanda Avenue/Philadelphia Avenue (a.m. and p.m. peak hours);
- Etiwanda Avenue/SR-60 Eastbound On-Ramp (a.m. and p.m. peak hours);
- Etiwanda Avenue/Van Buren Boulevard (a.m. and p.m. peak hours);
- Etiwanda Avenue/Bellegrave Avenue (a.m. peak hour);
- Etiwanda Avenue/Limonite Avenue (a.m. and p.m. peak hours);
- Country Village Road/Philadelphia Avenue (p.m. peak hour);
- Country Village Road/SR-60 Westbound Ramps (a.m. and p.m. peak hours);
- Van Buren-Bellegrave Connector/Bellegrave Avenue (a.m. and p.m. peak hours);
- Van Buren Boulevard/Van Buren-Bellegrave Connector (a.m. and p.m. peak hours);
- Pedley Road/SR-60 Westbound Ramps (a.m. and p.m. peak hours);
- Jurupa Road/Van Buren-Jurupa Connector (a.m. and p.m. peak hours);
- Van Buren Boulevard/Van Buren-Jurupa Connector (a.m. and p.m. peak hours);
- Pedley Road/Jurupa Road (a.m. and p.m. peak hours);

AWSC = All-Way Stop Control

TWSC = Two-Way Stop Control

Delay = Average control delay in seconds (For TWSC intersections, reported delay is for worst-case movement).

LOS = Level of Service

Shaded Rows Exceed LOS Standard

CHAPTER 3 – GENERAL PLAN BUILD-OUT TRAFFIC

- Van Buren Boulevard/Clay Street (p.m. peak hour);
- Camino Real/Jurupa Road (a.m. and p.m. peak hours);
- Camino Real/Limonite Avenue (a.m. and p.m. peak hours);
- Byrne Road-SR-60 Eastbound Ramps/Mission Boulevard (p.m. peak hour);
- Valley Way/Jurupa Road (a.m. and p.m. peak hours);
- Armstrong Road/Sierra Avenue (a.m. and p.m. peak hours);
- Valley Way/SR-60 Westbound Off-Ramp-Granite Hill Drive (a.m. and p.m. peak hours);
- Valley Way/SR-60 Westbound On-Ramp (a.m. and p.m. peak hours);
- Valley Way/Mission Boulevard (a.m. and p.m. peak hours);
- Riverview Drive/Mission Boulevard (a.m. and p.m. peak hours);
- Rubidoux Boulevard/Market Street (a.m. and p.m. peak hours);
- Rubidoux Boulevard/SR-60 Eastbound Ramps (a.m. and p.m. peak hours);
- Rubidoux Boulevard/Mission Boulevard (a.m. and p.m. peak hours); and
- Bellegrave Avenue/Cantu-Galleano Ranch Road (a.m. and p.m. peak hours).

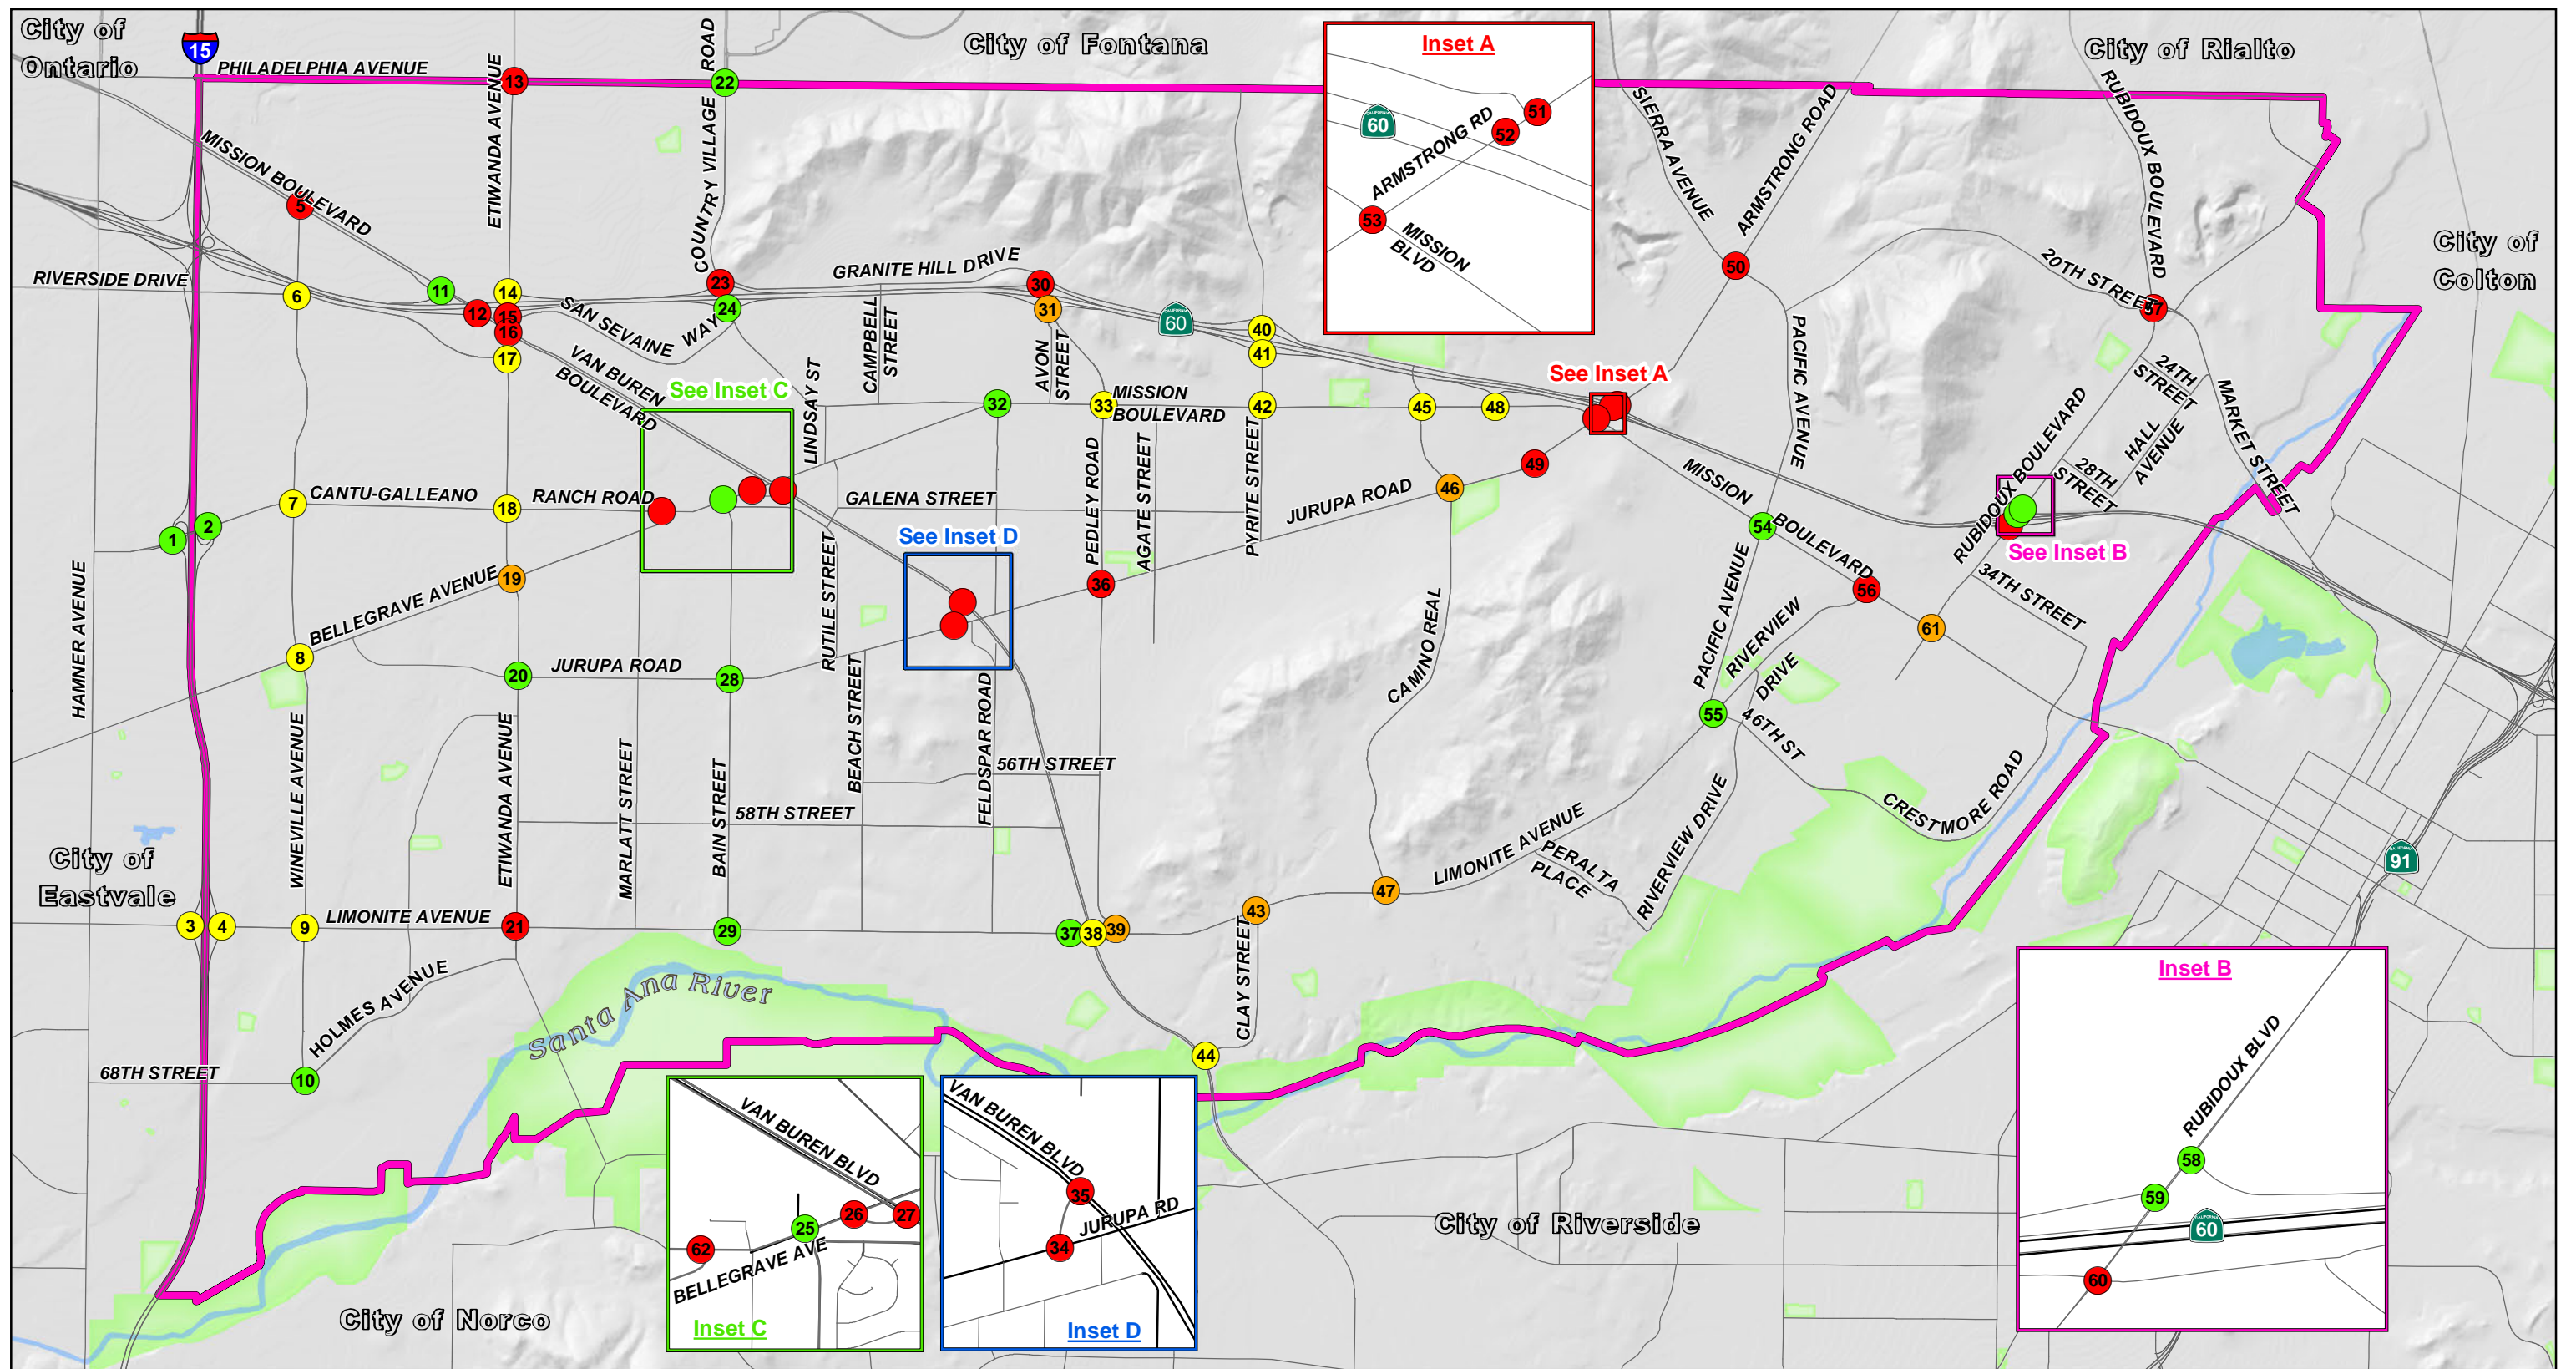

Figures 3.7-1 and 3.7-2 illustrate the locations of the study area intersections and corresponding a.m. and p.m. levels of service under General Plan Build-out conditions. LOS worksheets are in Appendix C.

Roadway Segment Levels of Service

A level of service analysis was conducted at study area roadway segments to determine the projected roadway segment performance under General Plan Build-out conditions. As shown in previously referenced Table 3.C, all roadway segments are projected to operate at

satisfactory levels of service (D or better), with the exception of the following roadway segments:

- Etiwanda Avenue from Philadelphia Avenue to SR-60 Westbound Off-Ramp;
- Etiwanda Avenue from SR-60 Westbound Off-Ramp to SR-60 Eastbound On-Ramp;
- Etiwanda Avenue from SR-60 Eastbound On-Ramp to Van Buren Boulevard;
- Etiwanda Avenue from Van Buren Boulevard to Riverside Drive;
- Etiwanda Avenue from Limonite Avenue to Holmes Avenue;
- Etiwanda Avenue south of Holmes Avenue;
- Country Village Road from Philadelphia Avenue to SR-60 Westbound Ramps;
- Country Village Road from SR-60 Westbound Ramps to SR-60 Eastbound Ramps;
- Van Buren Boulevard from SR-60 Westbound On-Ramp to SR-60 Eastbound Off-Ramp;
- Van Buren Boulevard from Eastbound Off-Ramp to Etiwanda Avenue;
- Van Buren Boulevard from Bellegrave Avenue to Jurupa Road;
- Van Buren Boulevard from Jurupa Road to Limonite Avenue;
- Van Buren Boulevard from Limonite Avenue to Clay Street;
- Mission Boulevard from SR-60 Eastbound Ramps to Valley Way;
- Jurupa Road from Bain Street to Van Buren Boulevard;
- Jurupa Road from Van Buren Boulevard to Pedley Road;
- Jurupa Road from Pedley Road to Camino Real;

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

One of the City of Jurupa Valley's primary mobility goals is *"To create a multi-modal mobility network which is attractive and provides all users with safe connections to homes, jobs, schools, commercial areas, public facilities and recreation areas, and which protects Jurupa Valley's semi-rural character and lifestyle, and reduces dependence on the use of single-occupant automobiles."* To achieve this goal, it is important to design and implement a multi-modal transportation system that will serve projected future travel demand, minimize congestion, minimize cut-through traffic, maintain the rural character of the City, and address future growth and development. Therefore, this section describes the proposed circulation network improvements and explores strategies that could help reduce the anticipated congestion while attempting to minimize cut-through traffic on main corridors throughout the City. It is recognized that these two objectives may mutually exclusive.

Cut-Through Traffic Analysis

A significant portion of Jurupa Valley's motor vehicle traffic is "cut-through" traffic; that is, trips where the origin and destination are both outside of the City limits. The City of Jurupa Valley would like to minimize cut-through traffic on main corridors such as Van Buren Boulevard and Cantu-Galleano Ranch Road as much as feasibly possible. Table 4.A shows the percentage of the total traffic volume on selected

local street segments with projected levels of service of D, E, or F under General Plan Build-out preferred alternative conditions. As shown in Table 4.A, 49 percent of traffic on major thoroughfares is cut-through, bypassing the main highways I-15, SR-60, and the Van Buren expressway.

Generally, strategies to reduce cut-through traffic involve capital improvements to slow, divert, or dissuade motorists from traveling along particular corridors. This has the initial effect of creating greater congestion until a new equilibrium is established. That new equilibrium may in fact create congestion on new routes. Road diets, chokers, speed tables, and other devices/strategies will affect vehicular traffic flow, decreasing speed and increasing congestion. Therefore, strategies to address cut-through traffic may be mutually exclusive and contradictory to a goal of mobility congestion relief. However, the objective of congestion relief and achieving LOS D conditions is sought in the subsequent analysis. If solely charged with LOS improvement, it may result in conflicts with cut-through traffic reduction or implementation of complete streets and multi-modal mobility systems.

Potential Transportation System Improvements to Reduce Congestion

As new land uses build out locally and regionally, additional traffic will be added to the local circulation network, resulting in more congestion and more roadways and intersections exceeding City LOS standards. As noted earlier, much of the existing and projected future congestion is the result of cut-through traffic from regional (i.e., non-City) sources, which will also increase in the future. The following improvements will reduce the anticipated traffic congestion.

Intersection Improvements

Based on the threshold of acceptability for levels of service within the City of Jurupa Valley, 38 intersections will not meet the minimum level

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Table 4.A: Select Link Analysis for High Volume Roadway Corridors under General Plan Build-Out Conditions

| Roadway Segment | | Functional Classification | % of Traffic Internal to the City | % of Traffic External to the City (Cut-through Traffic) |
|---|--|---------------------------|-----------------------------------|--|
| Segments on Etiwanda Avenue | | | | |
| 6 | Philadelphia Avenue to SR-60 WB Off-Ramp | 6-Lane Urban Arterial | 57% | 43% |
| Segments on Country Village Road | | | | |
| 16 | Philadelphia Avenue to SR-60 WB Ramps | 4-Lane Major | 46% | 54% |
| Segments on Van Buren Boulevard-East Mission Boulevard | | | | |
| 32 | Bellegrave Avenue to Jurupa Road | 8-Lane Expressway | 21% | 79% |
| Segments on Mission Boulevard | | | | |
| 46 | Valley Way to Riverview Drive | 4-Lane Arterial | 81% | 19% |
| Segments on Bellegrave Avenue | | | | |
| 50 | Wineville Avenue to Etiwanda Avenue | 4-Lane Major | 60% | 40% |
| Segments on Valley Way-Armstrong Road | | | | |
| 63 | SR-60 WB Ramps to Sierra Avenue | 4-Lane Major | 66% | 34% |
| Segments on Limonite Avenue | | | | |
| 67 | Wineville Avenue to Etiwanda Avenue | 4-Lane Major | 58% | 42% |
| Segments on Rubidoux Boulevard | | | | |

| 80 | West of Armstrong Road | 4-Lane Secondary | 42% | 58% |
| Segments on Market Street | | | | |
| 81 | East of Rubidoux Boulevard | 2-Lane Major | 50% | 50% |

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

of service standard. To support the current Land Use Element, the following improvements to the intersections are recommended:

- **I-15 Southbound Ramps/Limonite Avenue:** Optimize the signal timing.
- **I-15 Northbound Ramps/Limonite Avenue:** Optimize the signal timing.
- **Wineville Road/Mission Boulevard:** Install a traffic signal.
- **Wineville Road/Riverside Drive:** Install a traffic signal.
- **Wineville Avenue/Road/Cantu-Galleano Ranch Road:** Optimize the signal timing.
- **Mission Boulevard/SR-60 Eastbound Off-Ramp:** Optimization of the signal timing improves operations. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Etiwanda Avenue/Philadelphia Avenue:** Stripe eastbound right-turn lane and add overlap phasing. Add westbound right-turn lane with overlap phasing. Add second northbound left-turn lane. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the p.m. peak hour.
- **Etiwanda Avenue/SR-60 Eastbound On-Ramp:** Install a traffic signal. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the p.m. peak hour.
- **Etiwanda Avenue/Van Buren Boulevard:** Southbound right-turn lane with overlap phasing and optimization of signal timing improves operations. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Etiwanda Avenue/Bellegrave Avenue:** Optimize the signal timing.
- **Etiwanda Avenue/Limonite Avenue:** Add an eastbound left-turn lane and westbound left-turn lane. Add protected phasing to the eastbound/westbound approaches.
- **Country Village Road/Philadelphia Avenue:** Optimize the signal timing.
- **Country Village Road/SR-60 Westbound Ramps:** Add a second westbound right-turn lane; this will require modification of the westbound off-ramp. Stripe a southbound right-turn lane, and restripe the southbound through lane to a through/right-turn lane.
- **Van Buren Boulevard-Bellegrave Connector/Bellegrave Avenue:** Install a traffic signal. Add a westbound left-turn lane and restripe the southbound approach to include a southbound left-turn lane and through/right-turn lane. Restripe the northbound approach to include a northbound left-turn lane and a through/right-turn lane.
- **Van Buren Boulevard/Van Buren-Bellegrave Connector:** Install a traffic signal, add two northbound left-turn lanes, a second eastbound right-turn lane, and a southbound right-turn lane.
- **Pedley Road/SR-60 Westbound Ramps:** Install a traffic signal.
- **Pedley Road/SR-60 Eastbound Ramps:** Install a traffic signal. Although this intersection operates satisfactorily, a signal has been added due to the addition of a signal at Pedley Road/SR-60 Westbound Ramps.
- **Jurupa Road/Van Buren-Jurupa Connector:** Install a traffic signal. Add an eastbound left-turn lane.
- **Van Buren Boulevard/Van Buren-Jurupa Connector:** Install a traffic signal. Add two northbound left-turn lanes.
- **Pedley Road/Jurupa Road:** Install a traffic signal.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

- **Pedley Road-Morton Avenue/Limonite Avenue:** Optimize the signal timing.
- **Pyrite Street/SR-60 Westbound Ramps:** Install a traffic signal.
- **Pyrite Street/SR-60 Eastbound Ramps:** Install a traffic signal.
- **Clay Street/Limonite Avenue:** Add overlap phasing to the northbound right-turn lane.
- **Van Buren Boulevard/Clay Street:** Optimize the signal timing.
- **Camino Real/Jurupa Road:** Add a northbound right-turn lane with overlap phasing.
- **Camino Real/Limonite Avenue:** Add overlap phasing to the southbound right-turn lane.
- **Byrne Road-SR-60 Eastbound Ramps/Mission Boulevard:** Add a southbound left-turn lane. This improvement will require modification to the off-ramp.
- **Valley Way/Jurupa Road:** Install a traffic signal. Add an eastbound left-turn lane.
- **Armstrong Road/Sierra Avenue:** Add overlap phasing to the eastbound right-turn lane. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Valley Way/SR-60 Westbound Off-Ramp-Granite Hill Drive:** Restripe the north leg to separate the southbound left-turn lane and right-turn lane. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Valley Way/SR-60 Westbound On-Ramp:** This intersection may be combined with Valley Way/SR-60 Westbound Off-Ramp-Granite Hill Drive as a five-legged intersection with one signal controller. This will require Caltrans review. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Valley Way/Mission Boulevard:** Optimize the signal timing. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the a.m. and p.m. peak hours.
- **Riverview Drive/Mission Boulevard:** Add a second northbound right-turn lane and add overlap phasing to the northbound right-turn lane and eastbound right-turn lane. Restripe the north leg approach to the southbound left-turn lane and through/right-turn lane. Change the northbound/southbound signal phasing from split-phasing to protected phasing. No other improvements are feasible due to right-of-way constraints.
- **Rubidoux Boulevard/Market Street:** Add overlap phasing to the northbound right-turn lane, reduce the median on the east leg to accommodate a separate westbound left-turn lane. Restripe the westbound through/left-turn lane to a through lane. Change the eastbound/westbound signal phasing from split phase to protected phasing. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient LOS in the p.m. peak hour.
- **Rubidoux Boulevard/SR-60 Eastbound Ramps:** Add a northbound right-turn lane and an eastbound left-turn lane. The eastbound left-turn lane will require widening of the eastbound off-ramp and will require Caltrans review.
- **Rubidoux Boulevard/Mission Boulevard:** Restripe the south leg to accommodate separate northbound left-turn lane and through/right-turn lane. Change the northbound/southbound signal phasing from split phase to protected phasing. Add overlap phasing to the southbound and westbound right-turn lane.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

- **Bellegrave Avenue/Cantu-Galleano Ranch Road:** Install a traffic signal. Add a westbound left-turn lane and overlap phasing to the northbound right-turn lane.

Table 4.B illustrates the General Plan Build-out conditions with the recommended intersection improvements. Level of service worksheets are included in Appendix C. Figures 4.1-1 and 4.1-2 illustrate the resulting intersection geometrics. With implementation of the above improvements, 9 intersections will continue to operate at deficient LOS.

Roadway Segment Improvements

Based on the threshold of acceptability for levels of service within the City of Jurupa Valley, nine roadway segments will not meet the minimum level of service standard. Based on discussion with City staff, no additional improvements are recommended other than the ones listed in chapter 3 under General Plan Build-out conditions. This is due to right-of-way constraints and the City's endeavor to maintain its rural character as well as to discourage cut-through traffic on local streets.

Traffic Calming Measures

The City has expressed a goal of reducing cut-through volume and calming traffic on many corridors throughout the City. Traffic calming is defined as a "combination of mainly physical measures that reduce the negative effects of motor vehicle use, alter driver behavior, and improve conditions for non-motorized street users." The goals of traffic calming may include creating safe and attractive streets, helping to reduce the negative effects of motor vehicles on the environment, incorporating the preferences and requirements of the people using the streets/intersections, and promoting pedestrian, bicycle, and transit use. Traffic calming can slow speeds for motor vehicles, reduce collision frequency, reduce cut-through motor vehicle traffic, and increase access for all modes of transportation. These traffic calming measures can be physical, such as bulbouts or speed bumps, or can they can be programs to warn, guide, or inform. Some basic measures include:

- Safety Education Programs;
- High-Visibility Crosswalks;
- Pavement Striping;
- Gateways;
- High-Visibility Signs; and
- Bulbouts.

It is noted that implementation of these strategies and devices can slow speeds and increase congestion. Therefore, a balance needs to be determined by corridor on the primary objective; congestion reduction versus traffic calming.

Safety Education Programs

Safety education programs are an important component of a traffic calming program because they include efforts to make the public more aware of its own driving behavior and the impact it has on others. Pedestrian and bicycle safety programs alert and educate pedestrians and bicyclists on road safety. Driver safety information and education can help improve driver behavior.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

High Visibility Crosswalks

High Visibility Crosswalks include striped patterns, pavement lights, improved signing, and/or advance flashing beacons to improve the visibility of the crosswalk. These crosswalks are applicable on local streets where speed control and pedestrian crossing designation is desired. The benefits can include discouraging cut-through traffic since they may slow traffic and increase driver awareness of crosswalks; they also require minimal maintenance.

Pavement Striping

Pavement Striping is used to create narrow lanes, which gives the impression of a narrow street. This makes motorists feel restricted, which helps reduce speeds. Striping can be at curb end or in the middle of the street to create a median. It is most applicable to long, wide residential streets where speeding traffic could occur. Pavement striping is easy to install and modify with relatively low cost implementation.

Gateways

Gateways are special entrances that reduce the width of the travel way through the use of islands and are usually placed on roadways to narrow each direction of travel and interrupt the path along the center of the roadway. Gateways tend to be highly visible to motorists to notify a change in the roadway, may discourage cut-through traffic, and can help slow traffic.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

High Visibility Signs

High visibility signs may include larger speed limit signs on the streets to ensure visibility to motorists. This measure is a basic method aimed at slowing traffic through visual reminders of the speed limits or other regulations. They can be applied to most streets that may have speeding issues and provide context for enforcement efforts.

Bulbouts

Bulbouts can reduce traffic speed and improve pedestrian safety. Bulbouts are simply intersection curb extensions that extend past the parking lanes, but not into the bicycle or through lanes. Bulbouts provide an entry or gateway statement into activity areas or where high volumes of pedestrians are present. Entering an area where a bulbout is present provides a clear difference between the arterial function and a local pedestrian activity area.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Bulbouts also enhance the visibility of the pedestrian because they physically permit the pedestrian closer to the travel lanes, especially where parking is permitted, and allow the pedestrian to be seen more easily by the driver. They also constrict traffic flow through reduced lateral clearance. This reduction affects travel speed along the corridors and improves safety for both pedestrians and vehicles.

Bulbouts change the turning radius at the intersection, which reduces turning speed and vehicle and pedestrian conflicts. They also reduce the time it takes pedestrians to cross from curb to curb. This reduction in pedestrian crossing time consequently reduces the time the pedestrian is exposed to moving vehicles.

Bulbouts can be an extremely positive visual and aesthetic enhancement. Features such as pedestrian lighting, planters, and benches create a focal point for pedestrian activity and change the character of the intersection from automobile to pedestrian. It should be noted that care must be taken when aesthetically enhancing bulbouts so that the enhancements do not block sight distances and create accident problems.

Speed Reduction Measures

Speed Reduction measures are traffic control devices and roadway design features primarily designed to slow traffic. They are employed when the use of basic measures cannot effectively address speeding issues. Speed reduction measures are often used in conjunction with basic measures, and may have a limited effect on traffic volume as well.

Some speed reductions measures include:

- Speed Humps;
- Raised Crosswalks;
- Raised Intersections;

- Roundabouts;
- Mid-Block Chokers;
- Medians;
- Major Bulbouts; and
- Chicanes.

Speed Humps

Speed Humps are areas of pavement raised 3–4 inches in height over a minimum of 12 feet in length. The combination of different heights, lengths, and approach ramps will affect the speed a vehicle can comfortably go over the hump. Speed humps are marked with signs and pavement markings. Speed humps are applicable on local streets where speed control is desired or where cut-through traffic is to be discouraged and can help slow traffic. Speed humps are not recommended for use on streets designated as primary response routes for emergency vehicles.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Raised Crosswalks

Raised crosswalks are flat-topped speed humps, built as pedestrian crosswalks, with vehicle ramps on the approaches. This type of crosswalk is applicable to local streets where speed control and pedestrian crossing designation are desired. It can be an effective safety tool near schools and recreation facilities and can also be used to discourage cut-through traffic. Raised crosswalks are well-marked and may contain special paving or textures.

Raised Intersections

Raised intersections are flat-topped speed humps built over the entire area of intersecting streets at curb height, creating a flat surface over the entire intersection area. Raised intersections are constructed with ramps on all vehicle approaches. They are often constructed with textured materials on the flat sections and approach ramps are commonly used in area-wide traffic calming installations. Raised intersections can be applicable to arterial and collector streets where speed control and pedestrian crossing designation are desired. They can be an effective safety tool near schools and recreation facilities and can also be used to discourage cut-through traffic.

Roundabouts

The use of roundabouts as an alternative to conventional stop and signal control intersections is becoming increasingly popular in the United States. Studies conducted by the insurance industry have determined that these types of intersections result not only in a significant decrease in automobile traffic at an intersection, but also a reduction in pedestrian accidents as well.

At a conventional intersection, the pedestrian faces four potential vehicle conflicts:

- Crossing movements on red (typically high-speed, illegal);
- Right turns on green (legal);
- Left turns on green (legal for protected-permitted or permitted left-turn phasing); and
- Right turns on red (typically legal).

Pedestrians at roundabouts, on the other hand, face two conflicting movements on each approach:

- Conflict with entering vehicle; and
- Conflict with exiting vehicle.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

The crossing of the roundabout is relatively simple. The pedestrian waits for a gap in traffic and crosses from the curb to the splitter island that provides protection, and then crosses from the splitter island to the far curb when another gap in traffic occurs. Crossing in two steps halves the vehicle exposure for each segment. In addition, safety is improved because the vehicles are forced to go slower through the roundabout than at a conventional intersection. The modern roundabout pedestrian crosswalk treatment consists of:

- ADA Compliant Ramps;
- Conventional Crosswalk Striping;
- Raised Splitter Island Pedestrian Pass Through and Refuge;
- Pedestrian Crossing Sign;
- Yield Street Markings; and
- Yield Signs.

Modern Roundabout Pedestrian Crosswalk Treatment

Typically, the crosswalk is placed approximately one car length from the yield bar to permit the pedestrian to safely walk behind a vehicle that is awaiting a merge into the roundabout when traffic permits.

Mid-Block Chokers

Chokers are raised islands in the parking zone that can be detached from the curb line to allow for drainage. Mid-block chokers narrow the roadway and are most applicable on wide streets with speeding and cut-through traffic concerns.

Medians

Medians are raised islands in the center of the roadway that separate traffic directions. Medians are used on wide streets to narrow the travel lanes and slow vehicle speeds, interrupt sight distances down the center of the roadway, and ease pedestrian crossings.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Chicanes

Chicanes are curb extensions that alternate from one side of the street to the other, forming S-shaped curves. To prevent drivers from taking a straight line through the feature, it is recommended to shift the alignment of at least one lane width and to have deflection angles of at least 45 degrees. This type of alignment can be applied to any street where speed control is desired, provided the street is wide enough to accommodate the curvilinear design.

Volume Control Measures

Volume Control Measures are traffic control devices and roadway design features primarily designed to discourage residential street cut-through traffic. They are used when it has been found that traffic volumes exceed established thresholds. Volume reduction devices can be used by themselves or in conjunction with basic and/or speed measures. Some common volume reduction measures include:

- Diverters;
- Partial Closures; and
- Full Street Closures.

Diverters

Diverters are raised barriers placed diagonally across an intersection blocking through movement. They are usually staggered to create circuitous routes through neighborhoods. Diverters are most applicable to local streets where cut-through traffic is a major concern.

Partial Closures

Partial closures are barriers that block travel in one direction for a short distance on otherwise two-way streets. They are used in sets to make

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

travel through neighborhoods with gridded streets circuitous rather than direct. That is, they are not lined up along a border that would preclude through movement, but instead are staggered, which leaves through movement possible but less attractive than alternative routes.

Full Street Closures

Full street closures are barriers to close the street completely to through traffic, with access limited to pedestrians and bicyclists. They are usually called cul-de-sacs or dead ends and can consist of landscaped islands, walls, gates, or other obstructions that leave an opening smaller than the width of a car. Street closures are most commonly used for eliminating cut-through traffic, but can have an adverse effect on emergency response.

Intelligent Transportation Systems (ITS)

ITS are technology improvements that improve traffic flow and minimize disruptions to travel. ITS type projects can include sophisticated traffic signal systems designed to manage speed, dynamic message signs, incident management cameras, weather stations, highway advisory radio, transit automatic vehicle location, and video surveillance.

Adaptive Traffic Control Systems (ATCS)

Improving traffic operations on major thoroughfares within the City of Jurupa Valley through implementation of ITS could help alleviate traffic congestion. ATCS attempts to modify the coordination of many traffic signals to prevailing traffic conditions in real-time. All techniques rely on traffic-detection equipment and a central computer monitoring station that uses the collected data to optimize traffic signal coordination and timings to provide more efficient cycle-lengths and green-times.

Several jurisdictions nationwide have implemented their own ATCS in recent years. The most notable implementation in Southern California is the system developed by Los Angeles Department of Transportation (LADOT) for the City of Los Angeles. The ATCS automatically adjusts traffic signal timing at 375 intersections within the City of Los Angeles in

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

response to real-time traffic demands. The evaluation results published by LADOT show that the ATCS reduced travel time by 12.7 percent, decreased average stops by 31 percent, and lowered average delay by 21.4 percent (*Preliminary Evaluation Study of Adaptive Traffic Control System, Banerjee, Frances T, City of Los Angeles Department of Transportation, July 2001*). ATCS can be used by the City of Jurupa Valley for improvement of traffic congestion along major thoroughfares within the City.

Transportation Demand Management

Transportation Demand Management (TDM) is a strategy to increase the efficiency of a transportation system by encouraging a shift from single-occupant vehicle (SOV) trips to non-SOV modes, or shifting auto trips out of peak periods. The goal of TDM is to reduce auto trips by increasing travel options through incentives to encourage individuals to modify their travel behavior. The cumulative impact of TDM strategies can have an impact on travel behavior, system efficiency, and SOV rates. TDM programs can be implemented by employers or public agencies. Employer based TDM strategies can reduce vehicle trips by providing employees with incentives, information, and additional transportation options to commute through other modes than SOV, to commute during off-peak times of day, or eliminate certain work trips altogether. Employer based strategies may include:

- Instituting parking charges;
- Unbundling free or subsidized parking from employee benefits;
- Providing free days of parking for employees who carpool/vanpool;
- Transit Subsidies: Provision of subsidized transit passes/vanpool fares, or shuttle services;
- Bike/Walk Facilities: Secure workplace parking for bikes, and shower and locker facilities;

- Preferred Parking for Carpools: Provision of preferred parking spaces for Carpool/Vanpool vehicles;
- Vanpools, Shuttles, and Car-sharing: Provision of free vanpool vehicles, shuttle services, or car sharing programs for employees to reduce private vehicles;
- Telecommuting: Allow employees to work from home or a non-office location one or more days a week;
- Compressed Workweek: Enabling employees to compress regularly scheduled hours into fewer work days per week; and
- Flexible Schedule: Allowing employees to offset work hours from the typical 9–5 standard and shift commute travel to off-peak hours.

Establishment of a trip reduction ordinance by the City could encourage non-SOV modes such as public transit, vanpools, carpools, and bicycles, rather than SOV. Also, a trip reduction ordinance could encourage alternate work hours that serve to reduce the typical peak demand upon the street network, parking facilities, and transit systems. The trip reduction ordinance could apply to non-residential development projects, which would be required to reserve and designate preferential parking spaces for carpool vehicles, provide employees with commuter-matching services and trip reduction information, and provide bicycle parking facilities and other non-automobile enhancements.

Transit Pass Programs

A growing number of transit agencies have been teaming with employers, universities, developers, and residential neighborhoods to provide universal transit passes. These passes provide unlimited rides on local or regional transit providers for low monthly fees, often absorbed by employers, schools, or developers. This strategy could increase the number of transit ridership and reduce SOV and congestion.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Safe Routes to School

The Safe Routes to School program focuses the development of safe, convenient, and fun opportunities for children to bicycle and walk to and from schools, thereby reducing vehicle traffic during the peak pick-up/drop-off times throughout the City. The City can work with local school districts to identify potential safe routes to schools and establish safe drop-off/pick-up zones. The City could also inform and involve local residents to aid in researching the most viable routes and inventorying existing facilities to identify deficiencies and safety problems. The result is the identification of public improvements to enhance safe and effective walking and bicycling activity to and from each school and can include the maps for each school that shows the preferred routes.

Complete Streets

A complete street is one that works for all travel modes, including motorists, transit, bicyclists, and pedestrians. A complete street policy ensures that the entire right-of-way is routinely designed and operated to enable safe access for all users. While the definition of a complete street is universally applicable, the design of complete streets is variable. Each street has unique characteristics that make it distinctive from another. Therefore, a complete street in a rural area will look quite different from a complete street in a highly urban area. However, both streets are designed to balance safety and convenience for everyone using the road.

Elements that may be found on a complete street include sidewalks, bike lanes, crosswalks, wide shoulders, medians, bus pullouts, special bus lanes, raised crosswalks, audible pedestrian signals, sidewalk bulbouts, and more. The following outlines the characteristics of “typical” complete streets in an urban and rural setting.

- **Rural.** Rural roadways provide unique design challenges to develop complete streets. Rural streets typically have low traffic volume and the traffic lanes serve as multi-modal pathways often

accommodating pedestrians, bicyclists, and motorists. These types of streets typically lack sidewalks and few pedestrians use these routes. Streets may be striped in order to provide the best use of the right-of-way and not limit mobility. Rural complete streets provide adequate shoulders (at least 5 feet) for use by bicyclists. Ideally, the shoulder should be 8 feet wide to allow a vehicle to pull off the roadway in an emergency.

- **Urban.** Urban streets are utilized to access mixed use and commercial areas. These streets typically carry a higher volume of traffic and have more pedestrians and bicyclists present. Transit is an active component of these areas and intermodal connections are prioritized.

There are many different types of streets found in urban settings. Recommended standards for different types of urban streets are outlined below. These standards include provisions for narrow street widths where low speeds are appropriate, detached sidewalks, bicycle facilities, and shorter block lengths.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Local Streets

- The maximum width of local residential streets is 30–32 feet (two 7-foot parking lanes and two 8–9 foot travel lanes) depending on the expected travel volume.
- Landscape strips, separating curb from the sidewalk, are required on local residential streets.
- Maximum block length is 600 feet for low-volume residential streets and 800 feet for medium-volume residential streets.
- Six-inch vertical curbs are required.

Collector Streets

- Landscape strips, separating curb from the sidewalk, would be required on most new streets.
- Maximum block length is 1,000 feet for collector streets.
- On streets with on-street parking, bulbouts are encouraged at intersections to reduce the crossing distance for pedestrians and discourage speeding through intersections.
- Roundabouts should be considered where residential streets intersect and ultimate combined volume will exceed 1,000 vehicles daily or where the unimpeded distance on any of the approaches not subject to stop control exceeds 600 feet.
- Bicycle lanes should be provided on all collector streets.

Arterial Streets

- Bulbouts would be encouraged at some intersections to reduce the crossing distance for pedestrians and discourage speeding through intersections.
- Maximum block length is 1,320 feet (four intersections per mile). This could be lengthened if bike/pedestrian paths shorten the effective block length for non-auto users.
- Raised medians with turn pockets should be provided.
- Bicycle lanes should be provided on all arterial streets.

Street designs should also take into account the context of the street, that is, the adjacent land uses. Some basic designations include:

- **Commercial Streets:** These streets are typically dominated by autos maneuvering into and out of parking lot driveways in conflict with other flows. The design goal should be to keep these movements orderly by separating the flows using detached sidewalks and marked crosswalks, bicycle lanes and medians with turn pockets.
- **Mixed-Use Streets:** These slower streets have wider sidewalks and parking lanes.
- **Main Streets:** The design goal of these streets is to make pedestrians comfortable so as to encourage them to make use of adjacent land uses.
- **Residential Streets:** The design goal is to allow people to feel comfortable in their neighborhoods. This means keeping speeds low while allowing motorists to get to and from their houses without undue delay.
- **Industrial Streets:** These streets are designed for the movement of trucks and so require wider travel lanes than residential or other roads.

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

Transit Strategies

One of the City of Jurupa Valley's goals is to provide an integrated land use and multi-modal transportation system that meets sustainable regional growth expectations, supports economic vitality, and improves quality of life. To achieve this goal, transit must play a much greater role in providing travel choice within the City. It is recognized that transit service per capita must increase as the region's population increases. Future transit goals within the City should address needs such as increased service frequency and expanded coverage.

The frequency of transit service (the time between buses) is often referred to as headway. The headway for most current transit service in the City is approximately 45 minutes to one hour. With one hour headways, there are very few options for those people who choose to take transit over driving a car. Instead, current transit service primarily serves only the transit dependent, those who do not have any other means of travel. To capture choice riders, the frequency of service must increase to a minimum of half hour headways during peak periods, and preferably 15 minute headways for high demand corridors. If service is direct and available every 15 minutes, then shifts in mode from automobile to transit are likely to occur.

Extended Service Hours

Currently, transit service is available from 6:30 a.m. to 8:00 p.m. on Route 21 and from 5:30 a.m. to 8:30 p.m. on Route 29 during weekdays. Many jobs in the region begin at 6:00 a.m. or earlier. These workers do not have the option to take transit on specific routes. Furthermore, transit-dependent workers may not be able to accept jobs that start early in the morning. Conversely, there are many who work and need transit service after 8:00 p.m. A person may be asked to stay late and not be able to because of the transit schedule. Based on transit service in other cities, extended hours of service from 5:00 a.m. to 10:00 p.m. would be desirable for weekdays. Extending hours to midnight on Friday would also be desirable.

Equestrian/Multi-Purpose Trails

Due to need for a citywide, regionally-integrated trails system, the City intends to prepare a Master Trails Plan following General Plan adoption. This effort will involve a broad cross-section of the community, including other key agencies, such as Riverside County, Jurupa Area Recreation and Parks District (JARPD), Riverside County Flood Control, and the National Park Service. It will build upon an existing vision for a citywide trails system.

A vision has been developed for a Jurupa Valley Multi-Purpose Community Trails System. The system is anticipated to be a network of pedestrian, equestrian and bicycle trails that link Jurupa Valley's eight distinct communities and its many neighborhoods with open space areas, schools, recreation facilities, regional trail connections and local landmarks (e.g., The Discovery Center, Mt. Rubidoux). This vision has been shaped by many community groups and individuals, including the GPAC, Jurupa Valley residents and property owners, the City of Jurupa Valley decision-makers and staff, JARPD, Riverside County Regional Park and Open-Space District, Riverside County Flood Control and Water Conservation District, Inland Empire Resource Conservation District, and others. This vision was initially described by the JARPD, as shown in Appendix 16.0 and includes the following general goals as identified by the JARPD:

- a. Review, maintain, and expand community multi-purpose trails system;
- b. Develop a safe and interconnected area-wide network of trails that link together destinations and people both locally and regionally;
- c. Develop a trails network that provides facilities and programs designed to expand and encourage active recreation and alternative transportation;
- d. Enhance, protect, and preserve the environmental quality of open space, waterways, and wildlife habitats;

CHAPTER 4 – FUTURE CIRCULATION NETWORK STRATEGIES

- e. Conserve and tell the story of local culture, history, and heritage through interpretive signage;
- f. Stimulate economic growth through increased tourism and real property value by developing a region-wide trails network;
- g. Promote agency coordination among JARPD and the Cities of Jurupa Valley and Eastvale;
- h. Identify street intersections where vehicular traffic and trail user (equestrian/hiking/trail biking) conflicts are present;
- i. Coordinate safety solutions for trail street crossings with City of Jurupa Valley Traffic Engineering and Planning Departments;
- j. Create an “equestrian friendly” environment the maintains Jurupa Valley’s “equestrian lifestyle;”
- k. Identify residential neighborhoods where streets are narrow with equestrian trails, and designate them as “equestrian routes” where horses have priority and utilize the street as a trail;
- l. Designate trails as two types: Recreational Use trails owned by public agencies and Equestrian Routes that are not developed trails but have been historically used as such;
- m. Establish public trail designation through on-site signage program that identifies trail alignments throughout the community by posting signs for all multi-purpose trails, as appropriate;
- n. Establish natural trails interpretive signage program;
- o. Adopt a Community Multi-Purpose Trails Development Ordinance;
- p. Create a trail maintenance and operations program; and
- q. Establish a separate funding account for Multi-Purpose Community Trails development.

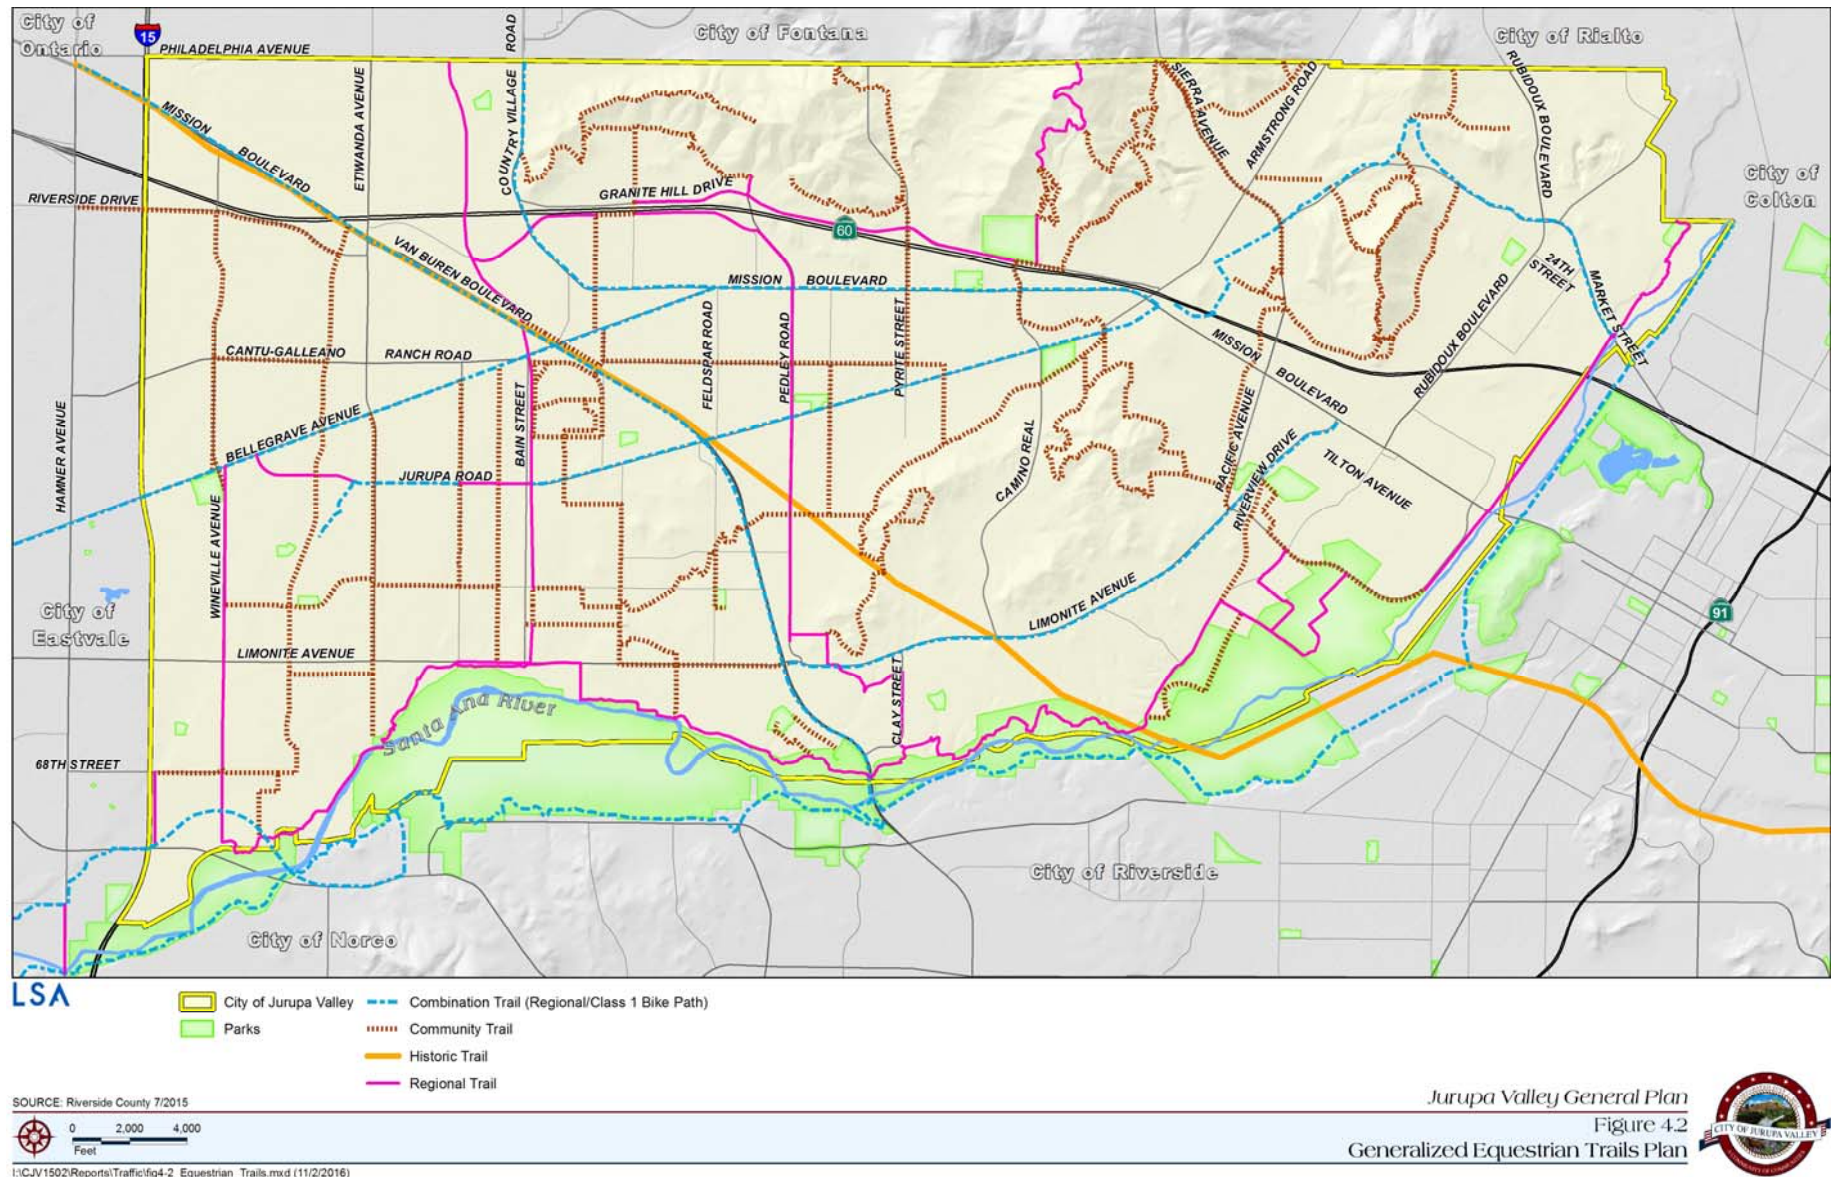

Figure 4.2 illustrates the Equestrian Trails Plan.

Truck Traffic

Due to its location relative to major highways and urban centers, Jurupa Valley serves as a major logistics shipping and receiving center for Southern California. Along with that regional role comes significant commercial truck traffic using highway off-ramps and City streets.

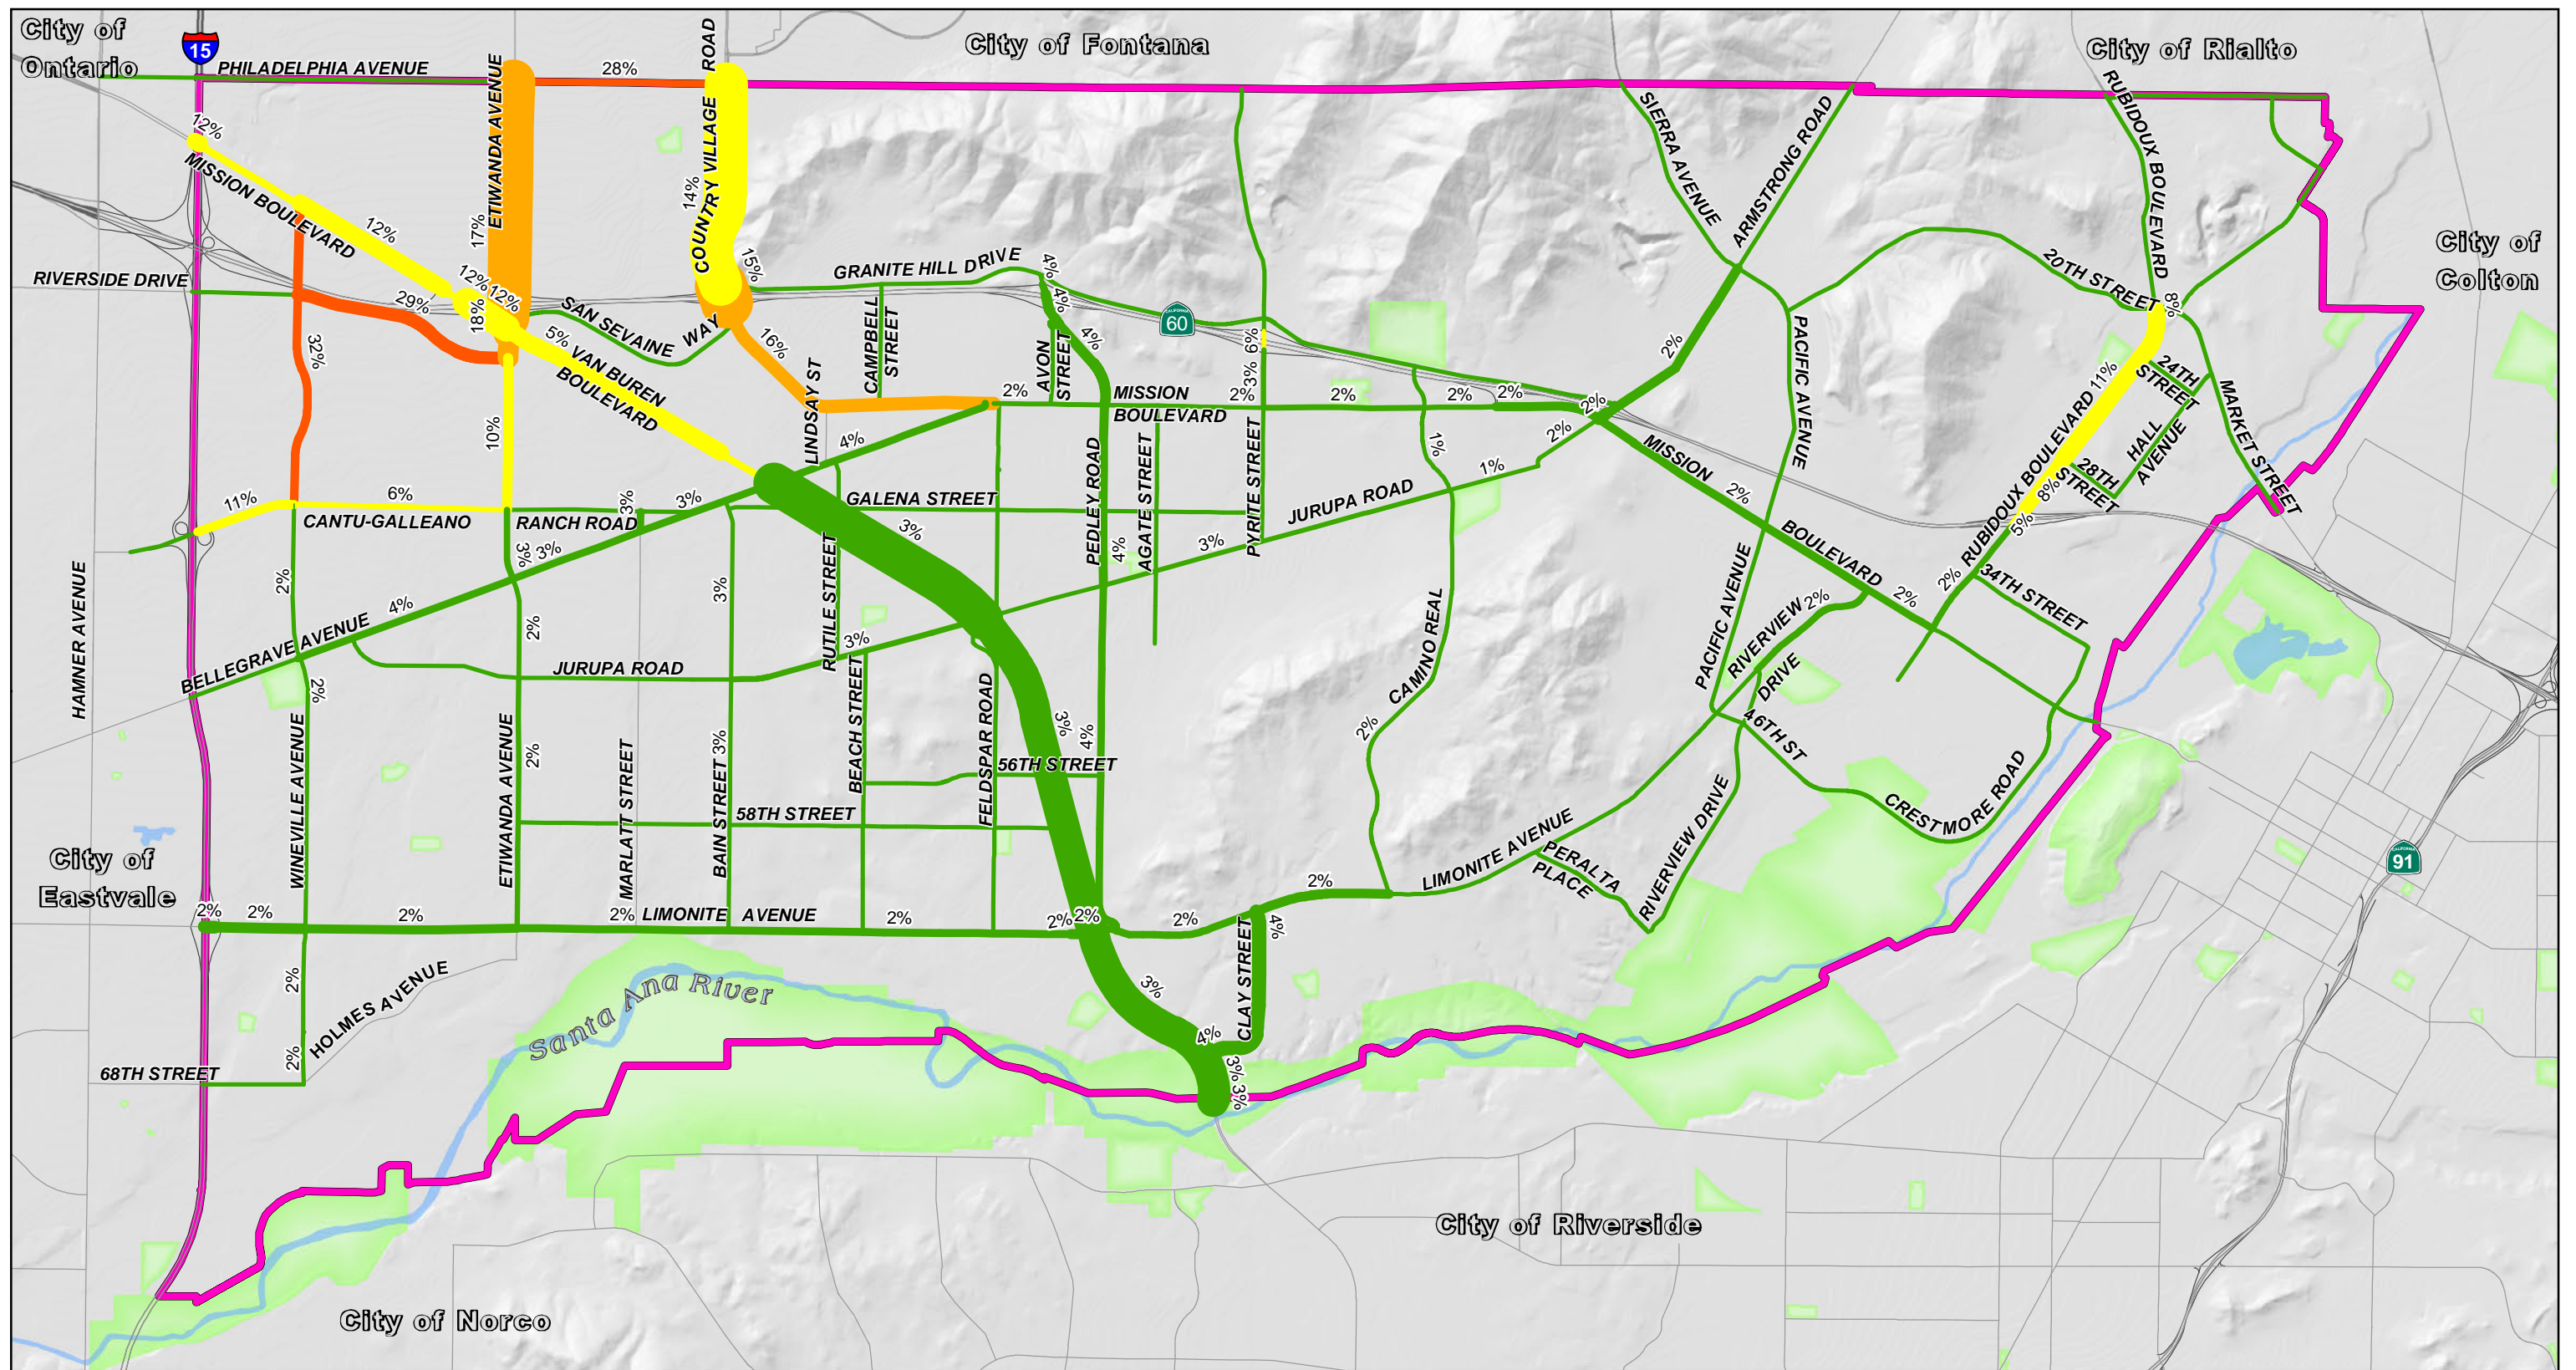

Figure 4.3 illustrates the existing daily truck traffic on major corridors within the City and shows most of the truck traffic within the City is located in the northern and eastern areas of the City, near the SR-60 corridor. It is anticipated that this trend will likely continue into General Plan Build-out conditions due to the Land Use Element’s continued support of heavy industrial areas in the northwestern part of the City. The City is responsible for maintaining an extensive network of low-volume streets and roads in industrial and semi-rural areas to accommodate the transport and delivery of goods.

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

The proposed Jurupa Valley General Plan Build-out roadway network includes the infrastructure that is feasible to accommodate the vision of the Land Use Element. Figure 5.1 illustrates the City's

recommended General Plan Build-out Circulation System based on the General Plan Build-out Traffic Study. Due to constraints that have been identified earlier in this report, improvement to the roadway network has been limited to five major roads as described below.

CHAPTER CONTENTS

- General Plan Build-out Roadway Recommended Improvements
- Recommended General Plan Build-Out Circulation

General Plan Build-out Recommended Roadway Improvements

The General Plan Build-out scenario includes roadway modifications to the existing roadway network based on input from the City of Jurupa Valley to reflect the Jurupa Valley Mobility goals. Following are recommended improvements to the City's roadway network:

- **Etiwanda Avenue:** The roadway segment south of Limonite Avenue is proposed to include a two-lane Secondary roadway bridge extension from 66th Street over the Santa Ana River to Arlington Avenue.
- **Van Buren Boulevard:** The roadway segments from Etiwanda Avenue to Clay Street are proposed to be widened from a four-lane Urban Arterial to an eight-lane Expressway. The intersection of Van Buren Boulevard/Bellegrave Avenue is proposed to realign to the south with a new connector at Van Buren Boulevard/Van Buren Connector. Also, the intersection of Van Buren Boulevard/Jurupa Road is proposed to realign to the north with a new connector at Van Buren Boulevard/Van Buren Connector.
- **Cantu-Galleano Ranch Road:** The roadway segments between Etiwanda Avenue and Van Buren Boulevard are proposed to be widened from four-lane Major roadways to six-lane Urban Arterials.

The roadway segment east of Etiwanda Avenue is proposed to align with Bellegrave Avenue and create a new intersection at Bellegrave Avenue/Cantu-Galleano Ranch Road.

- **Bellegrave Avenue:** The roadway segment between Marlatt Street and Dodd Street is proposed to realign with Cantu-Galleano Road and end at the new intersection of Bellegrave Avenue/Cantu-Galleano Ranch Road. A new intersection west of Bain Street is proposed to connect at Van Buren Connector/Bellegrave Avenue.
- **Market Street:** The roadway segment east of Rubidoux Boulevard is proposed to be widened from a two-lane Arterial to a three-lane Major Roadway.

Based on discussion with City staff, no additional improvements are recommended other than the ones listed in Chapter 3 under General Plan Build-out conditions. This is due to right-of-way constraints and the City's endeavor to maintain its rural character as well as to discourage cut-through traffic on local streets.

Recommended General Plan Build-Out Circulation

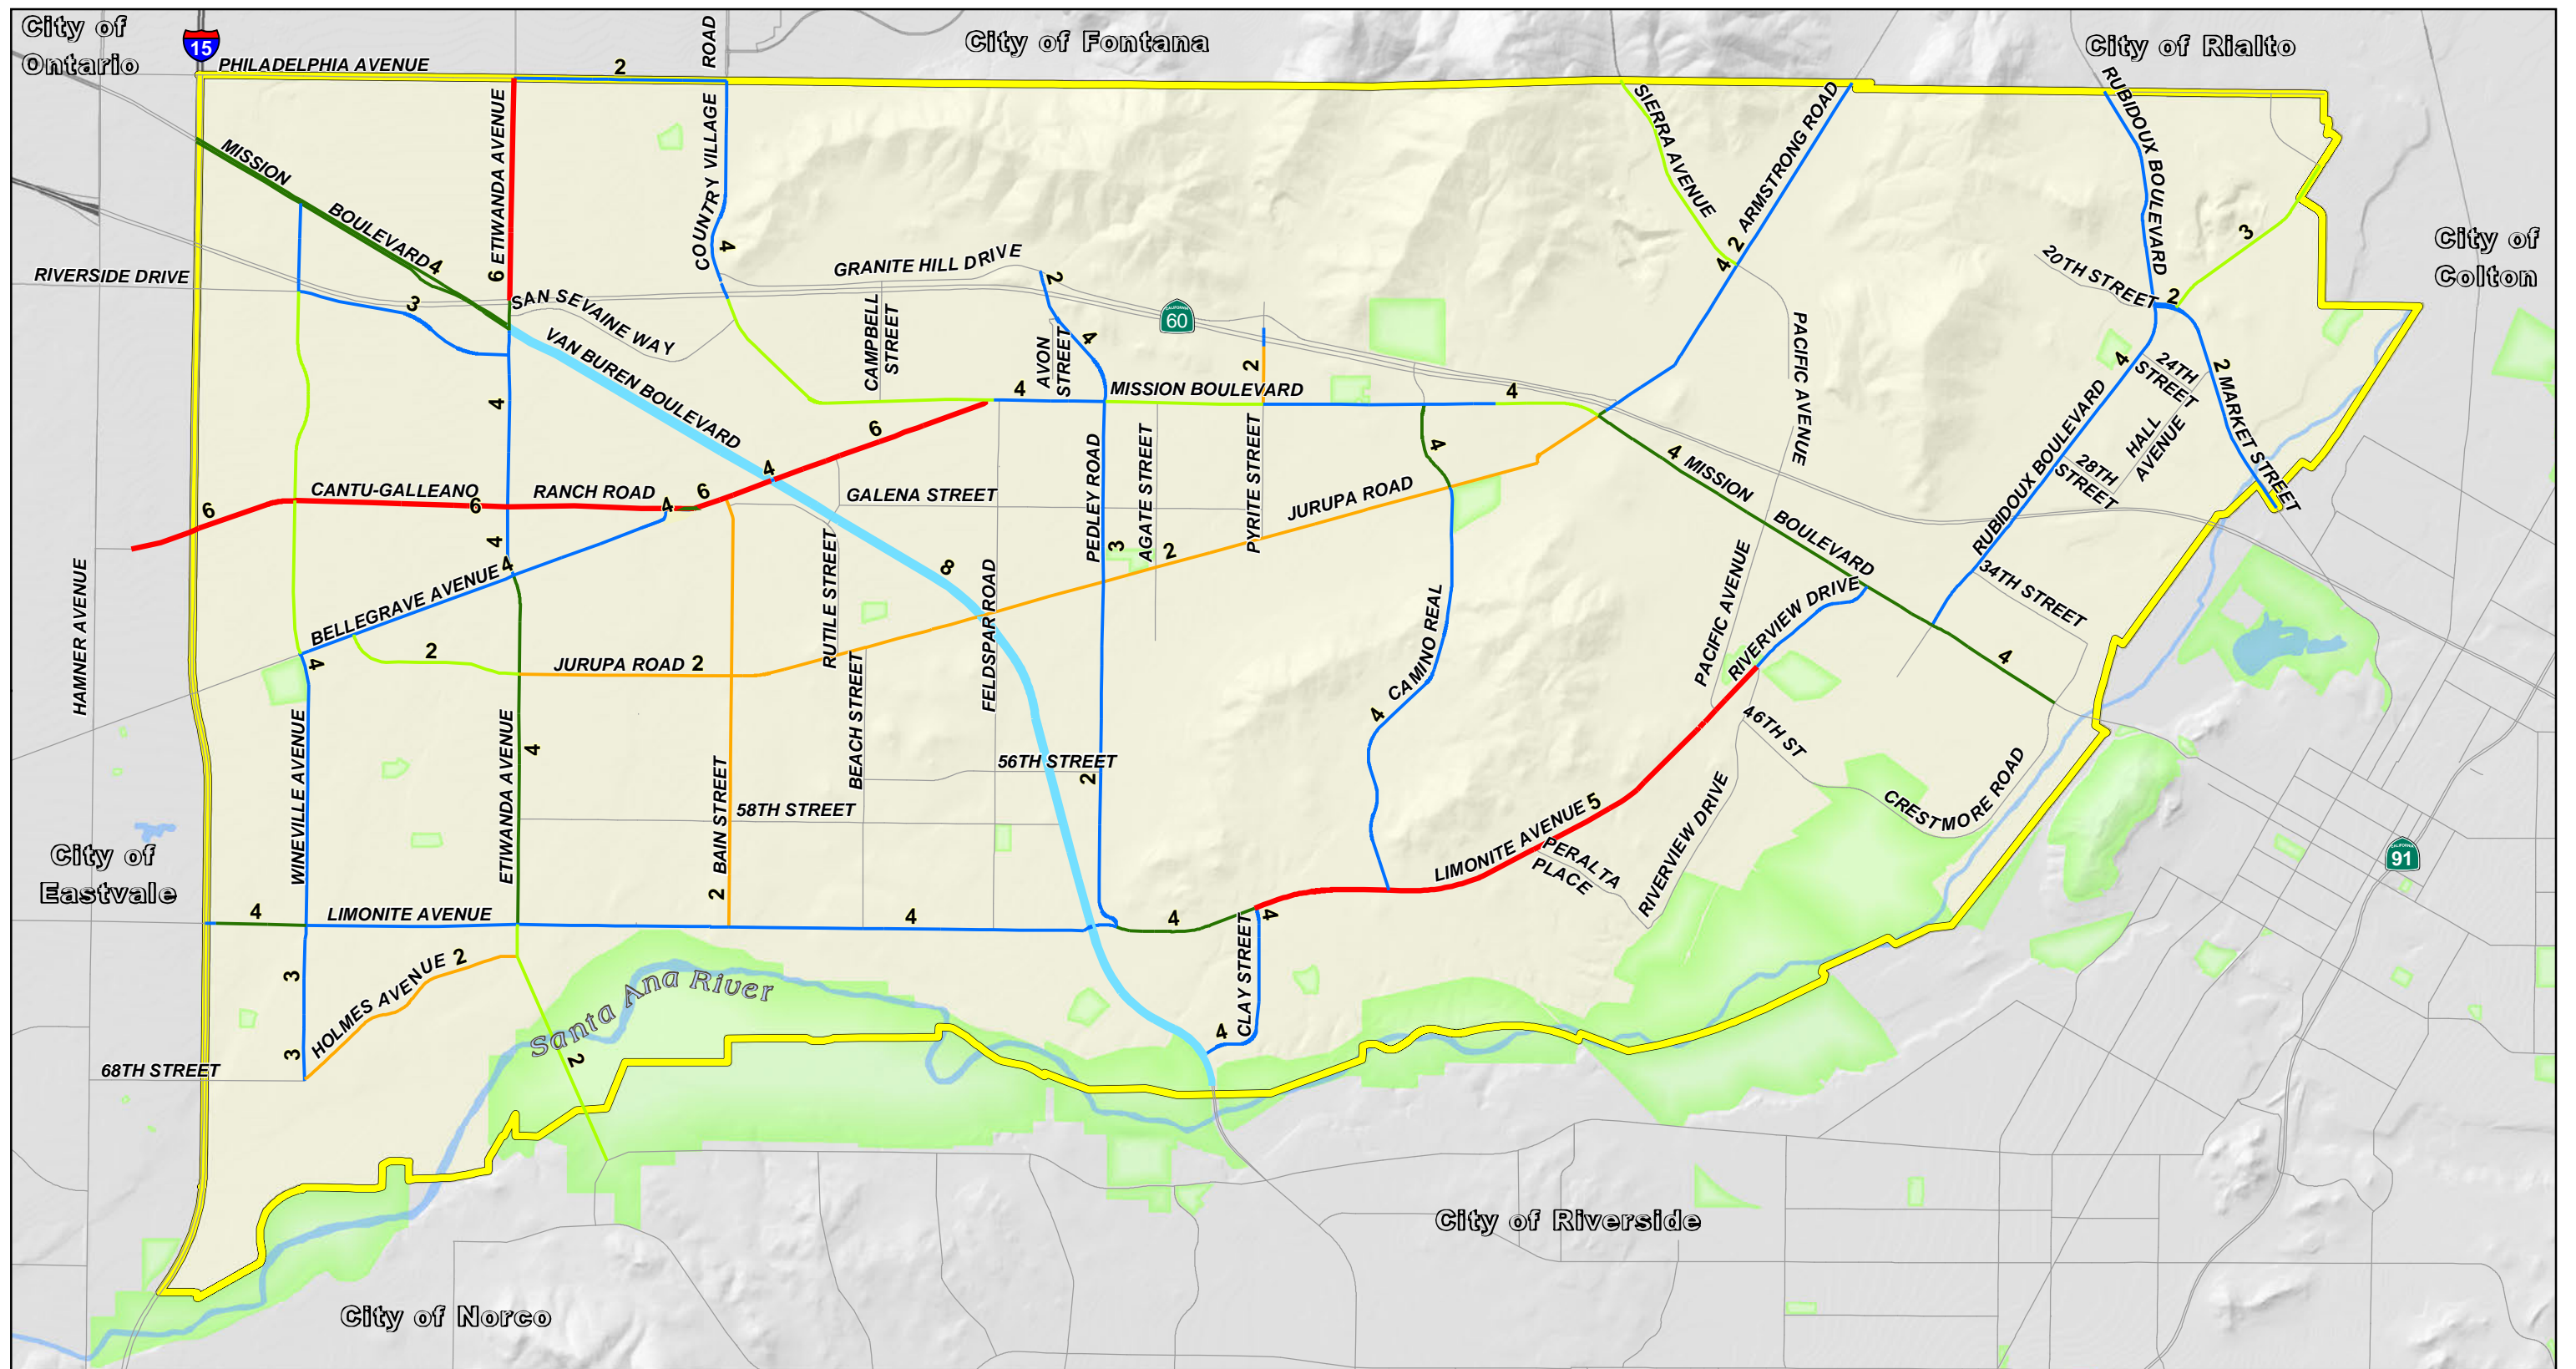

Roadway Segments

Figure 5.1 illustrates the City's recommended General Plan Build-out Circulation System based on the General Plan Build-out Traffic Study. Following is a description of recommended roadway configuration under General Plan Build-out conditions for all major roadways within the City:

Wineville Avenue/Road is oriented in a north-south direction. Wineville Road from Mission Boulevard to Riverside Drive is a four-lane Major roadway and from Riverside Drive to Bellegrave Avenue is a four-lane Secondary roadway. From Bellegrave to Limonite Avenue, Wineville Avenue is a four-lane Major roadway and from Limonite Avenue to 68th Street it is a three-lane Major roadway.

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

THIS PAGE INTENTIONALLY LEFT BLANK

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

Etiwanda Avenue is oriented in a north-south direction and is a six-lane Urban Arterial from the northern City limits to SR-60, from SR-60 to Van Buren Boulevard is a four-lane Arterial roadway, from Van Buren Boulevard to Bellegrave Avenue is a four-lane Major roadway, from Bellegrave Avenue to Limonite Avenue is a four-lane Arterial roadway, and from Limonite Avenue to Holmes Avenue is a two-lane Secondary roadway.

Bain Street is oriented in a north-south direction and is a two-lane Collector roadway from Bellegrave Avenue to Limonite Avenue.

Country Village Road is oriented in a north-south direction and is a four-lane Major roadway from Philadelphia Avenue to SR-60.

Pedley Road is oriented in a north-south direction and is a two-lane Major roadway from SR-60 Westbound Ramps to SR-60 Eastbound Ramps, from SR-60 Eastbound Ramps to Mission Boulevard is a four-lane Major roadway, from Mission Boulevard to Jurupa Road is a three-lane Major roadway, and from Jurupa Road to Limonite Avenue is a two-lane Major roadway.

Pyrite Street is oriented in a north-south direction and is a two-lane Major roadway from SR-60 Westbound Ramps to SR-60 Eastbound Ramps, from SR-60 Eastbound Ramps to Mission Boulevard is a four-lane Major roadway, from Mission Boulevard to Jurupa Road is a three-lane Major roadway, and from Jurupa Road to Limonite Avenue is a two-lane Major roadway.

Clay Street is oriented in a north-south direction from Limonite Avenue to General Road and transitions to an east-west direction from General Road to Van Buren Boulevard. Clay Street is a four-lane Major roadway.

Camino Real is oriented in a north-south direction and is a four-lane Arterial roadway from Mission Boulevard to Jurupa Road, and from Jurupa Road to Limonite Avenue is a four-lane Major roadway.

Philadelphia Avenue is oriented in an east-west roadway and is a two-lane Major roadway from Etiwanda Avenue to Country Village Road.

Van Buren Boulevard is oriented in a north-south direction and is a four-lane Arterial roadway from Wineville Avenue to Etiwanda Avenue, and from Etiwanda Avenue to Clay Street is an eight-lane Expressway.

Riverside Drive is oriented in an east-west direction and is a three-lane Major roadway from Wineville Road to Etiwanda Avenue.

Cantu-Galleano Ranch Road is oriented in an east-west direction and is a six-lane Urban Arterial from the I-15 Northbound Ramps to Bellegrave Avenue.

Mission Boulevard is oriented an east-west direction and is a four-lane Secondary roadway from SR-60 Eastbound Ramps to Bellegrave Avenue, from Bellegrave Avenue to Pedley Road is a four-lane Major roadway, from Pedley Road to Pyrite street is a four-lane Secondary roadway, from Pyrite Street to SR-60 Eastbound Ramps is a four-lane Major roadway, from SR-60 Eastbound Ramps to Valley Way is a four-lane Secondary roadway, and from Valley Way to Rubidoux Boulevard is a four-lane Arterial roadway.

Bellegrave Avenue is oriented in an east-west direction and is a four-lane Major roadway from west of Wineville Avenue to Cantu-Galleano Ranch Road, and from Cantu-Galleano Ranch Road to Mission Boulevard is a six-lane Urban Arterial roadway.

Jurupa Road is oriented in an east-west direction and is two-lane Secondary roadway from Bellegrave Avenue to Etiwanda Avenue, and from Etiwanda Avenue to Valley Way is a two-lane Collector roadway.

Valley Way is oriented in a north-south direction and is two-lane Collector roadway from Jurupa Road to Mission Boulevard, from Mission Boulevard to SR-60 is a four-lane Arterial roadway, from SR-60

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

Westbound Ramps to Sierra Avenue is a four-lane Major roadway, and north of Sierra Avenue is a two-lane Major roadway.

Limonite Avenue is oriented in an east-west direction and is a four-lane Major roadway from I-15 Southbound Ramps to I-15 Northbound Ramps, from I-15 Northbound Ramps to Wineville Avenue is a four-lane Arterial roadway, from Wineville Avenue to Etiwanda Avenue is a four-lane Major roadway, from Etiwanda Avenue to Bain Street is a two-lane Major roadway, from Bain Street to Pedley Road is a four-lane Major roadway, from Pedley Road to Clay Street is a four-lane Arterial roadway, from Clay Street to Riverview Drive is a five-lane Urban Arterial roadway, and from Riverview Drive to Mission Boulevard is a four-lane Major roadway.

Rubidoux Boulevard is oriented in a north-south direction and is a four-lane Major roadway from Mission Boulevard to Market Street.

Intersections

As discussed in Chapter 4, the following improvements to the intersections are recommended to support the City's General Plan Land Use Element:

- **I-15 Southbound Ramps/Limonite Avenue:** Optimize the signal timing.
- **I-15 Northbound Ramps/Limonite Avenue:** Optimize the signal timing.
- **Wineville Road/Mission Boulevard:** Install a traffic signal.
- **Wineville Road/Riverside Drive:** Install a traffic signal.
- **Wineville Road/Cantu-Galleano Ranch Road:** Optimize the signal timing.
- **Mission Boulevard/SR-60 Eastbound Off-Ramp:** Optimization of the signal timing improves operations. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Etiwanda Avenue/Philadelphia Avenue:** Stripe eastbound right-turn lane and add overlap phasing. Add westbound right-turn lane with overlap phasing. Add a second northbound left-turn lane. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the p.m. peak hour.
- **Etiwanda Avenue/SR-60 Eastbound On-Ramp:** Install a traffic signal. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the p.m. peak hour.
- **Etiwanda Avenue/Van Buren Boulevard:** Southbound right-turn lane with overlap phasing and optimization of signal timing improvements operations. No additional feasible mitigation is possible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Etiwanda Avenue/Bellegrave Avenue:** Optimize the signal timing.
- **Etiwanda Avenue/Limonite Avenue:** Add an eastbound left-turn lane and westbound left-turn lane. Add protected phasing to the eastbound/westbound approaches.
- **Country Village Road/Philadelphia Avenue:** Optimize the signal timing.
- **Country Village Road/SR-60 Westbound Ramps:** Add a second westbound right-turn lane; this will require modification of the westbound off-ramp. Stripe a southbound right-turn lane, and restripe the southbound through lane to a through/right-turn lane.
- **Van Buren Boulevard-Bellegrave Connector/Bellegrave Avenue:** Install a traffic signal. Add a westbound left-turn lane and restripe the southbound approach to include a southbound left-turn lane

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

and through/right-turn lane. Restripe the northbound approach to include a northbound left-turn lane and a through/right-turn lane.

- **Van Buren Boulevard/Van Buren-Bellegrave Connector:** Install a traffic signal, add two northbound left-turn lanes, a second eastbound right-turn lane, and a southbound right-turn lane.
- **Pedley Road/SR-60 Westbound Ramps:** Install a traffic signal.
- **Pedley Road/SR-60 Eastbound Ramps:** Install a traffic signal. Although this intersection operates satisfactorily, a signal has been added due to the addition of a signal at Pedley Road/SR-60 Westbound Ramps.
- **Jurupa Road/Van Buren-Jurupa Connector:** Install a traffic signal. Add an eastbound left-turn lane.
- **Van Buren Boulevard/Van Buren-Jurupa Connector:** Install a traffic signal. Add two northbound left-turn lanes.
- **Pedley Road/Jurupa Road:** Install a traffic signal.
- **Pedley Road-Morton Avenue/Limonite Avenue:** Optimize the signal timing.
- **Pyrite Street/SR-60 Westbound Ramps:** Install a traffic signal.
- **Pyrite Street/SR-60 Eastbound Ramps:** Install a traffic signal.
- **Clay Street/Limonite Avenue:** Add overlap phasing to the northbound right-turn lane.
- **Van Buren Boulevard/Clay Street:** Optimize the signal timing.
- **Camino Real/Jurupa Road:** Add a northbound right-turn lane with overlap phasing.
- **Camino Real/Limonite Avenue:** Add overlap phasing to the southbound right-turn lane.
- **Byrne Road-SR-60 Eastbound Ramps/Mission Boulevard:** Add a southbound left-turn lane. This improvement will require modification to the off-ramp.
- **Valley Way/Jurupa Road:** Install a traffic signal. Add an eastbound left-turn lane.
- **Armstrong Road/Sierra Avenue:** Add overlap phasing to the eastbound right-turn lane. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Valley Way/SR-60 Westbound Off-Ramp-Granite Hill Drive:** Restripe the north leg to separate the southbound left-turn lane and right-turn lane. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Valley Way/SR-60 Westbound On-Ramp:** This intersection may be combined with Valley Way/SR-60 Westbound Off-Ramp-Granite Hill Drive as a five-legged intersection with one signal controller. This will require Caltrans review. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Valley Way/Mission Boulevard:** Optimize the signal timing. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the a.m. and p.m. peak hours.
- **Riverview Drive/Mission Boulevard:** Add a second northbound right-turn lane and add overlap phasing to the northbound right-turn lane and eastbound right-turn lane. Restripe the north leg approach to the southbound left-turn lane and through/right-turn lane. Change the northbound/southbound signal phasing from split-

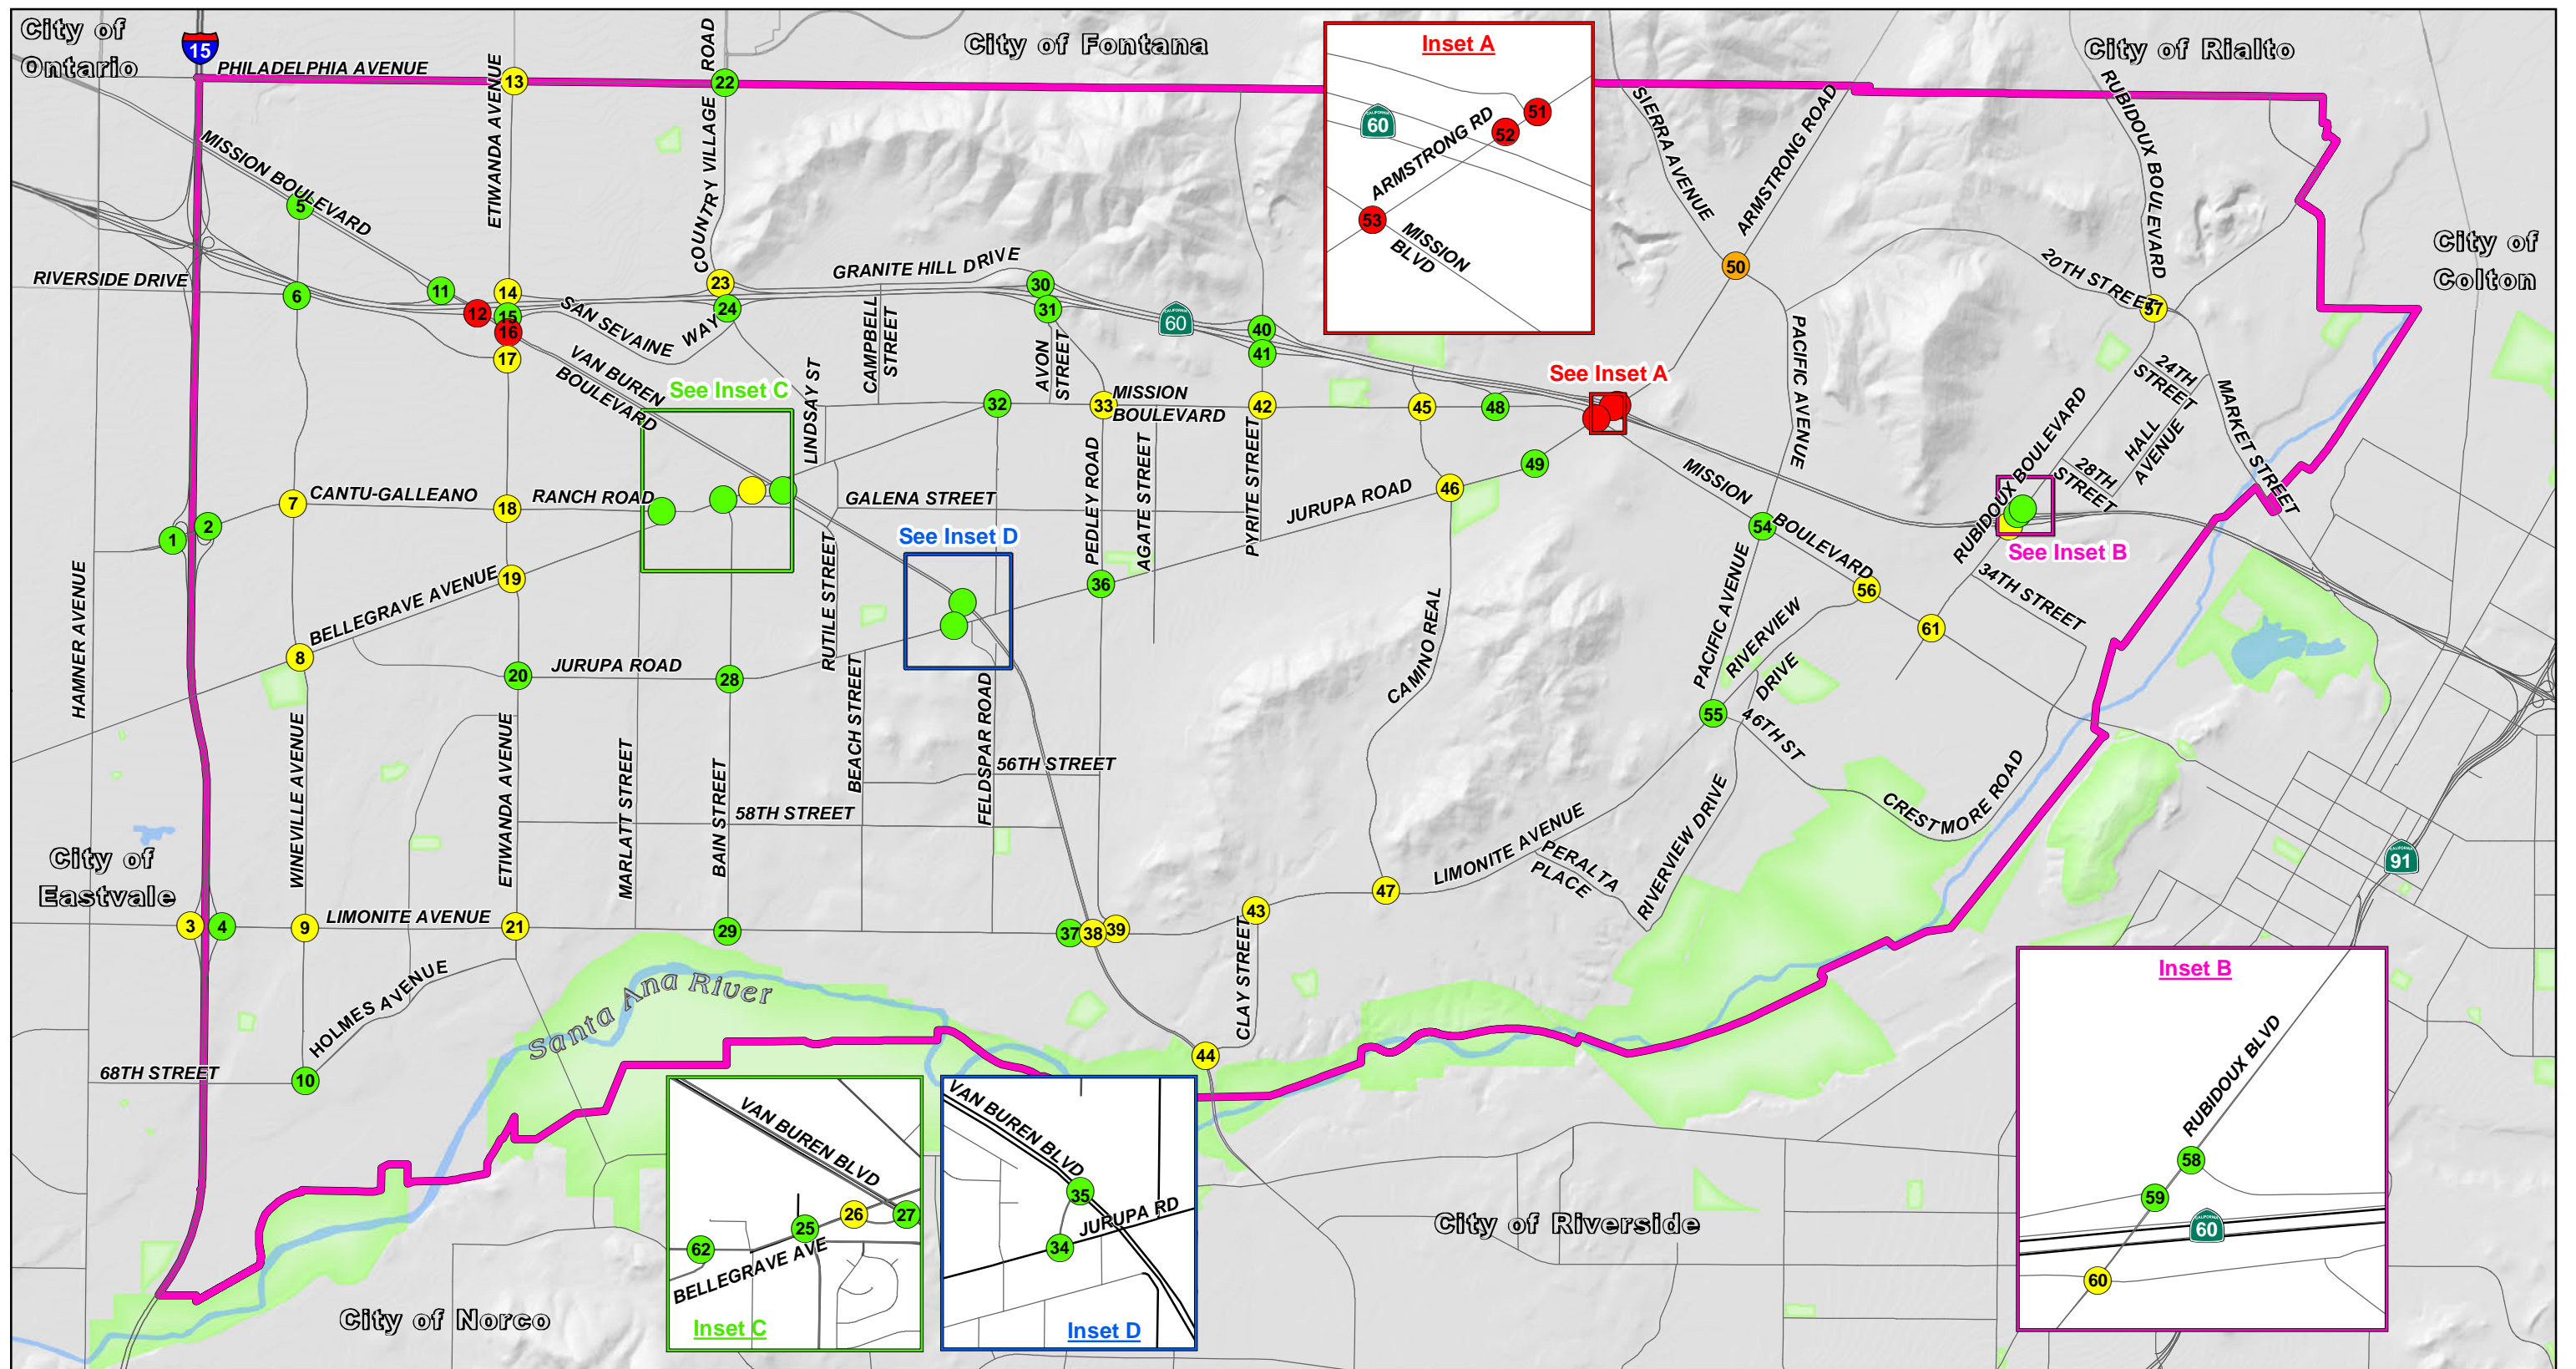

CHAPTER 5 – CIRCULATION SYSTEM STRATEGIES

phasing to protected phasing. No other improvements are feasible due to right-of-way constraints.

- **Rubidoux Boulevard/Market Street:** Add overlap phasing to the northbound right-turn lane and reduce the median on the east leg to accommodate a separate westbound left-turn lane. Restripe the westbound through/left-turn lane to a through lane. Change the eastbound/westbound signal phasing from split phase to protected phasing. No other improvements are feasible due to right-of-way constraints. Therefore, this intersection is forecast to continue operating at a deficient Level of Service in the p.m. peak hour.
- **Rubidoux Boulevard/SR-60 Eastbound Ramps:** Add a northbound right-turn lane and an eastbound left-turn lane. The eastbound left-turn lane will require widening of the eastbound off-ramp and will require Caltrans review.
- **Rubidoux Boulevard/Mission Boulevard:** Restripe the south leg to accommodate separate northbound left-turn lane and through-right-turn lane. Change the northbound/southbound signal phasing from split phase to protected phasing. Add overlap phasing to the southbound and westbound right-turn lane.
- **Bellegrave Avenue/Cantu-Galleano Ranch Road:** Install a traffic signal. Add a westbound left-turn lane and overlap phasing to the northbound right-turn lane.

Previously referenced Table 4.B illustrates the General Plan Build-Out conditions with the recommended intersection improvements.

Previously referenced Figures 4.1-1 and 4.1-2 illustrate the resulting intersection geometrics. Figure 5.2-1 and 5.2-2 illustrate the resulting intersection levels of service with the addition of the above listed improvements at study intersections. With implementation of the above improvements, 9 intersections will continue to operate at deficient LOS.

Jurupa Valley Interim General Plan

Figure

Proposed General Plan Land Use

I:\CJV1502\Reports\GP\figX_Proposed_GPLU.mxd (7/7/2016)

CITY OF JURUPA VALLEY

DRAFT PROPOSED GENERAL PLAN LAND USE AMENDMENTS

Overview

Two types of proposed land use changes are discussed below: 1) Basic or “integrated” land use changes to be adopted with the new Interim General Plan, and 2) “Program” land use changes to be implemented following General Plan adoption. In the first type of amendments, the underlying land use designations are proposed to change, as described for each amendment. In the second type, future changes to General Plan land use designations are anticipated. The second type of amendment is indicated by a “Community Development Overlay” (CDO) zoning. Land Use Amendments **LUA-1** and **LUA-10** are of this type. In these areas, staff proposes that the City *retain existing General Plan land use designations* until it can engage property owners and residents in more detailed land use discussions and hearings, following General Plan adoption. The other LUAs are basic land use changes.

LUA-1. Etiwanda Residential Infill Corridor

Figure 1

A. **What:** Initiate a change in the land use designation of approximately 100 acres from Retail Commercial (C-R) to Retail Commercial – Community Development Overlay (CR-CDO), *Figure 1*.

B. **Where:** Along entire east side of Etiwanda, between Bellegrove and Limonite, in the community of Mira Loma.

C. **Why:** Implement General Plan program to preserve residential uses along Etiwanda, to accommodate Neighborhood Commercial uses at street corners and to discourage “strip commercial” development. This approach is consistent with General Plan Advisory Committee (GPAC) recommendations to protect large lot and equestrian properties, and to encourage residential property upkeep and improvement.

D. **Discussion:** In the map area shown, the City is considering adding a “Community Development Overlay” to the existing “Retail Commercial” land use map designation (CR). This would do two things: 1) it would provide an incentive for residential development by allowing owners of parcels of five acres or larger,

except on corner lots, to request rezoning to allow Medium Density Residential development (allows up to 5 dwelling units per acre). This rezoning would then be allowed under the new General Plan; and 2) it would indicate the City intends to work with property owners in the future, after the new General Plan is approved, to conduct public outreach to determine whether the General Plan should continue to allow for Retail Commercial uses in this area, and if so, where. Existing, legal uses could continue under this approach.

The area consists of mostly deep lots, 1-5 acres, occupied by rural residential and commercial uses. Etiwanda is a two-lane arterial, planned for eventual widening to four lanes. Approximately 35 percent of the parcels include commercial uses. The entire length of Etiwanda's east side, between Limonite and Bellegrave is designated Retail-Commercial. The west side of Etiwanda consists of mostly Low- and Medium-Density housing. The existing configuration could result in development of "strip commercial" retail uses with many one-half acre lots, considered too small for efficient Retail-Commercial development that is compatible with the adjacent residential neighborhoods. GPAC encouraged preservation of large lot, equestrian-oriented residential properties in areas substantially committed to that use. The proposed designation would encourage the preservation of equestrian- and semi-rural residential uses by setting a framework for future public outreach and land use changes to implement the Interim General Plan.

- E. **Alternative:** Change CR designation to Medium Density Residential (MDR, up to 5 dwelling units per acre, or "du/A") to encourage additional housing infill with single family detached and attached residences, with limited agricultural, equestrian and animal keeping, with Commercial Neighborhood (CN) uses allowed at street intersections. This approach would require additional outreach with multiple property owners and could have budget implications for the existing General Plan work, unless it were included as a follow-up General Plan Implementation Program.

LUA-2. Business Park and Historic Galleano Winery

- A. **What:** Change approximately 150 acres of Business Park (BP) designation to Business Park – Specific Plan (BP-SP),

Figure 2

- B. **Where:** Bounded by Harrel Street, Wineville Road, Cantu-Galleano Ranch Road and I-15, in Mira Loma.

C. **Why:** The requirement for a Specific Plan will set framework for more detailed land use planning for this large site, which is adjacent to I-15 and may be well suited for business or leisure-travel hotel, conference, restaurant and other visitor- and business-serving uses; and to preserve a historic winery as an important part of City's heritage and tourist destination.

D. **Discussion:** City has ample Business Park (BP) and Industrial designated land; however virtually no CT (Commercial-Tourist) land is designated in the City. This area already designated for business park development. 150 acres is large enough to accommodate a wide range of uses, including Business Park, commercial recreation, quality hotel with conference facilities, restaurants, retail,

visitor-serving uses and open space – conservation/historic uses (Winery). With ideal highway visibility and access, a combination of Business Park, retail, visitor serving and historic uses would be compatible with and supportive of adjacent Business Park and Industrial uses. Existing agricultural, winery and related uses – now, non-conforming uses - - could then continue as legal, *conforming* uses. Property owners would need to prepare a Specific Plan to determine the mix and arrangement of future land uses. This approach follows GPAC recommendations to encourage visitor-serving uses such as a hotel or conference center and to preserve historic resources.

- E. **Alternative:** Maintain BP designation on approximately one-half of the site; designate remainder for CT uses (portion of site adjacent to I-15 and Cantu Galleano Ranch Road). Designate Historic Galleano Winery as Agriculture-Historic (AG-H) to preserve historic property and allow winery use to continue as legal, conforming use.

LUA-3. Pyrite-Granite Hill Commercial-Tourist Area

- A. **What:** Change approximately 35 acres of Light Industrial (LI) and Retail Commercial (CR) to Commercial Tourist (CT), *Figure 3*. A portion of the site near intersection of Pyrite and Granite Hill is developed with tourist- and truck-serving commercial uses. The remainder of the site is undeveloped, with remnant foundations of past development.
- B. **Where:** Between Pyrite and Agate St. along Granite Hill Dr. and CA-60, in the Sunnyslope area.
- C. **Why:** Site is adjacent to major interstate; an ideal location for traveler services (fueling station, restaurant, lodging, commercial recreation and other tourist-serving uses); avoids extending warehousing or business park/light industrial uses outside of Mira Loma and surrounding area and within view of highway; possibly preserve lower hillside area as open space (possible Transfer of Development Credit site). Would encourage redevelopment and site clean-up.
- D. **Discussion:** City has ample BP and Industrial designated land; virtually no CT land is designated in City. This area already has a fueling station, car wash and mini-mart and is heavily used by commercial truckers. It also has some remnant building foundations, off road motorcycle trails, and some unsightly dump areas. The site is not suitable for residential use due to its location near Stringfellow Remediation Site. Proposed land uses are subject to State review for consistency with safety and remediation plans. Easy on-easy off location adjacent to CA-60, at base of scenic hillside. Warehouse development project previously approved by County for this site. Previous approvals have expired. This approach is consistent with GPAC recommendations to encourage visitor-serving uses and to limit the expansion of industrial uses and warehousing within the City.
- E. **Alternative:** Change Light Industrial (LI) designation to Commercial Retail (CR), with the possibility of dedicating the westerly portion of site as Open Space/Conservation (OS-C).

Figure 3

LUA-4. Pyrite-Granite Hill Commercial-Tourist Area

- A. **What:** Change approximately 19 acres of Light Industrial (LI) and Commercial Retail (CR) to Commercial Tourist (CT), *Figure 4*.
- B. **Where:** Between Pyrite and Agate St. along Granite Hill Dr. and CA-60, in the Sunnyslope area. The site is located just east of *LUA-3*.
- C. **Why:** Site is adjacent to major interstate; ideal location for traveler services (fueling station, restaurant, lodging, commercial recreation and other tourist-serving uses); avoids extending warehousing or light industrial uses outside of existing areas committed to those uses and within view of highway; preserves lower portion of hillside area as open space (possible transfer of development options site).
- D. **Discussion:** This area is a vacant, gently sloping terrace, located adjacent to areas designated for Commercial Retail, Light Industrial and Rural Residential. Not suitable for residential uses (near auto recyclers and adjacent to Stringfellow Remediation Site). Proposed uses subject to State approval for consistency with remediation plans. Easy on-easy off location adjacent to CA-60, at base of scenic hillside. This approach is consistent with GPAC recommendations to encourage visitor-serving uses and to limit the expansion of industrial uses and warehousing within the City.
- E. **Alternative:** Change Light Industrial (LI) designation to Commercial Retail (CR), with the possibility of dedicating the upper portions of site as Open Space/Conservation (OS-C).

Figure 4

LUA-5. 3760 Pyrite St. – Hillside Portion of Heavy/Light Industrial Site

- A. **What:** Change approximately 110 acres of Light Industrial (LI) to Open Space – Conservation (OS-C), *Figure 5*.
- B. **Where:** At the terminus of Pyrite Street, at the base of, and including a portion of the Jurupa Hills ridgeline, adjacent to the Stringfellow Remediation site, in the Sunnyslope area. The large hillside site includes a level area at the base of the hills occupied by Hillside Truck and Auto Recyclers, at 3760 Pyrite Street. Under the proposed change, the entire auto recycle property would remain Heavy Industrial and could, in consideration of an open space dedication, continue as a legal, conforming use.

Figure 5

C. **Why:** This large property is surrounded by open space and is located in one of the most scenic viewsheds of the City. It is a designated wildlife habitat area. The proposed land use change would recognize that the long-standing, existing auto recycling yard use could continue, while extending open space protection to the uphill portions of the site which are not suitable for development due to steep slopes, wildfire danger, habitat value and visual sensitivity.

D. **Discussion:** City has ample Light and Heavy Industrial designated land. Undeveloped open space areas adjacent to urbanized land are limited and merit protection for environmental health and to preserve City's incredibly scenic setting and semi-rural character. Much of the roughly 130 acre site consists of steep hillsides

and canyons that are unsuitable for urban development. Open space designation would bring this property into conformance with adjacent hillside parcels and would be consistent with GPAC recommendations to preserve open space and outstanding views of the Jurupa Hills.

- E. **Alternative:** Designate entire site Open Space/Conservation. Under this approach, the auto recycler use could continue legally but could not expand in area or be significantly changed. If the use were discontinued for an extended period, it could not be re-established.

LUA-6. 5302 El Rio Avenue

- A. **What:** Change 1.85 acres of Heavy Industrial (HI) to Medium Density Residential (up to 5 du/A), *Figure 6*.
- B. **Where:** At the end of El Rio Avenue, adjacent to Medium High Density Residential properties and two other properties designated for HI use but used for non-industrial uses, proposed amendments LUA-7 and LUA-8. The property has a house and several accessory buildings. Street access is available from El Rio Avenue. The site is in the community of Belltown.
- C. **Why:** This parcel is essentially surrounded by residential uses and is too small for most industrial uses. Its current use is Very Low Density Residential. Although near Agua Mansa and industrial uses along Market Street, the parcel is in a neighborhood which is committed to residential uses and features mostly single-family houses on relatively small parcels (10,000 square feet (SF) or less). The City intends to minimize or avoid the presence of Industrially-designated properties immediately adjacent to residential uses. Re-designating this property for Medium Density residential would achieve this and make the existing use legal, conforming.
- D. **Discussion:** City has ample Heavy Industrial designated land. This neighborhood is primarily residential with a few, randomly located and small industrial sites. This land use change is intended to protect residential uses and establish reasonable separation between residential and industrial land and is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts.
- E. **Alternative:** Designate the parcel as Medium High Density Residential (MHDR, up to 8 du/A.), consistent with the designation of adjacent parcels.

Figure 6

LUA-7. 5288 Bell Avenue

- A. **What:** Change approximately 30,000 SF of Heavy Industrial (HI) to Medium Density Residential (MDR, up to 5 du/A), *Figure 7*.
- B. **Where:** Vacant, landlocked parcel adjacent to 5288 Bell and part of a single-family residential use, the community of Belltown. Adjacent to residential uses designated MHDR, MDR, and PF (Public Facility) on a large vacant site planned for a solar energy generation facility.
- C. **Why:** This parcel is essentially surrounded by residential uses and is too small for most industrial uses. It's used for vehicle parking in connection with the house. Although near Agua Mansa and industrial uses along Market Street, it is in a neighborhood which is committed to residential uses and features mostly single-family houses on relatively small parcels (10,000 SF or less). The City intends minimize or avoid the presence of Industrially-designated properties immediately adjacent to residential uses. Re-designating this property for Medium Density residential would achieve this and make the existing use legal, conforming.
- D. **Discussion:** City has ample Heavy Industrial-designated land. This neighborhood is primarily residential with a few, randomly located and small industrial sites. This land use change is intended to establish reasonable separation between residential and industrial land and is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts.
- E. **Alternative:** Designate the parcel as Medium-High Density Residential, consistent with the designation of adjacent parcels. MHDR allows a residential density of up to 8 du/A.

Figure 7

LUA-8. 5286 Bell Avenue, Adams Motorsports Park

- A. **What:** Change 7.7 acres of Heavy Industrial (HI) to Commercial Tourist (CT), *Figure 8*.
- B. **Where:** Large parcel along Market Street at the Santa Ana River and Market Street Bridge, in the community of Belltown. The site is adjacent to residential uses, open space, and heavy industrial uses across Market Street. It is improved with small commercial buildings, a race track, parking and related facilities.
- C. **Why:** This parcel's location is at the edge of residential and industrial districts, and is a long-standing recreational use (go-kart racing and training). The Heavy Industrial designation does not accurately describe the existing use; Commercial Tourist more closely applies to commercial recreation uses. Although near Agua Mansa and industrial uses along Market Street, it is in a neighborhood which consists mostly of single-family houses on parcels of 10,000 SF or less. The City intends minimize or avoid the presence of Industrially-designated properties immediately adjacent to residential uses. If the current use were discontinued, the current HI land use designation would allow a heavy industrial use to be established immediately adjacent to housing. Designating this property for Commercial Tourist use recognizes a long-standing community attraction, makes the existing use legal, conforming and precludes the possibility of an expansion of industrial uses immediately adjacent to residential uses.
- D. **Discussion:** City has ample Heavy Industrial designated land. Commercial Tourist and commercial recreation uses are uncommon in Jurupa Valley and this facility help meets diverse recreational needs. This approach is consistent with GPAC recommendations to preserve this community recreation feature and to encourage visitor-serving uses.
- E. **Alternative:** Designate the parcel for Medium-High Density Residential, consistent with the designation of adjacent parcels.

*Figure 8*

LUA-9. 1500 Rubidoux Boulevard, Riverside Cement Holdings Company

- A. **What:** Change approximately 370 acres of Heavy Industrial (HI) to Business Park – Specific Plan Overlay (BP-SP), *Figure 9*, on the following page.
- B. **Where:** Multiple parcels bordered by Rubidoux Boulevard, El Rivino, Hall Avenue, Agua Mansa and Market Street, near the City's northeast limits. The area has multiple industrial uses, largest of which is the Riverside Cement Plant. The plant no longer mines aggregate or produces concrete mix on site. It is now primarily used for offices, sales and product distribution. The site abuts Low Density Residential Uses along El Rivino, and Public Facility uses on Rubidoux Boulevard, across from the Plant. The property is located in the Agua Mansa Specific Plan Area, County Plan No. 210, contains a denuded hill and includes offices, manufacturing facilities, railroad tracks, warehouses and outdoor storage areas, settling pond, undeveloped vacant areas, and other features.
- C. **Why:** This area's large size, topography, easy access and location near the border of Riverside and San Bernardino counties makes it ideally suited for a variety of commercial, institutional or business park uses that require large sites. Due to its location near residential uses and past complaints regarding air quality impacts, full scale cement manufacturing is no longer conducted at this plant. This area is identified by the City's economic consultant as an "opportunity site" that may help meet General Plan goals to attract specialized uses such as research and development campus, regional retail, expanded health services, college campus or career training, sport facilities or other large scale uses. The City intends to minimize or avoid the presence of industrially-designated properties immediately adjacent to housing. If and when the current use is discontinued, the proposed "Specific Plan Overlay" clearly indicates the City's intent to require a Specific Plan to plan for and encourage clean-up and redevelopment of the site to better meet community needs, address environmental concerns and attract quality development to the area.
- D. **Discussion:** City has ample Light and Heavy Industrial designated land. This HI-designated site has a long history as a cement plant, but over time, residential development in surrounding neighborhoods and more stringent air quality and noise requirements make continued concrete production here doubtful. As part of the Agua Mansa Specific Plan area and as one of the largest potential development sites in the City, it merits a new long-term plan for the site's eventual development to help implement General Plan policies and programs in this area. The Agua Mansa Specific Plan is outdated and needs substantial revision or possibly repeal. The proposed amendment is consistent with GPAC recommendations to promote redevelopment of this site with a use that provides major benefits to the community and that is more compatible with its surroundings. Possible uses discussed include campus-like research and development Business Park, hospital/medical center, college campus or job training center, or major sports facility.
- E. **Alternative:** Designate the area for Light Industrial use with a requirement for a Specific Plan to set a planning framework to encourage redevelopment with a range of light industrial and service commercial uses as an extension of existing light industrial uses in the surrounding area, but with special features to buffer nearby residential uses and provide retail and commercial services.

LUA-10. Mission Boulevard East Residential Infill Corridor

- A. **What:** Change approximately 20 acres of Retail Commercial (C-R) to Retail Commercial, Community Development Overlay (CR-CDO), Figure 10.
- B. **Where:** On the south side of Mission Blvd., between Formosa Street and Valley Way, in the community of Glen Avon. The area consists of multiple parcels with mostly residential development, but also includes diverse service-commercial and assembly uses, such as a building materials, feed store, upholstery, church, mini-market, insurance office, and drive-thru restaurants near Valley Way. About one-half of the parcels are vacant or nearly so. The area abuts residential uses to the south and larger lot Retail Commercial to the north, across Mission.

Figure 10

- C. **Why:** Mission Boulevard is a major connection between Jurupa Valley and the City of Riverside. Historically, Mission was a primary entry to “West Riverside” and evolved into a mix of residential and relatively small commercial lots and businesses fronting on a major arterial Street. For most of its length, both sides of the Boulevard are designated for Commercial Retail (CR), although the predominant use in this area is residential, with single family detached housing adjacent to the street. This older, auto-oriented pattern can result in inefficient and unsightly retail “strip commercial” which makes economically viable commercial development difficult. Such development can result in sites being dominated by paving, excessive driveway cuts along the arterial street, and unsightly development patterns.
- D. **Discussion:** The City seeks a balance of larger scale commercial sites for general retail sales and services to meet Citywide or regional needs, plus smaller scale, neighborhood-serving commercial areas. Under this approach, existing commercial and residential uses would continue to be legal, conforming land uses, but encouraged to redevelop and infill with compatible high-quality residential and commercial uses. Applying the “CDO” overlay to the base CR would help achieve that balance by encouraging redevelopment and combining lots to attract reinvestment, promote new housing and business opportunities, and beautify an

older commercial corridor. This approach is consistent with GPAC recommendations to encourage high quality development of mixed residential and commercial uses in certain corridor areas.

E. Alternatives:

- 1) Designate vacant parcels and parcels with residential uses for Medium High Density Residential (MHDR, up to 8 du/A) and apply the Mixed Use Overlay (MUO) to encourage the development of multi-family housing, allow existing residential and commercial uses to continue as conforming uses, and to allow the development of a diverse, more intensive residential and commercial corridor with an emphasis on higher density residential infill near CA-60. This approach would require additional outreach with multiple property owners and could have budget implications for the existing General Plan work, unless it were included as a follow-up General Plan Implementation Program, or,
- 2) Designate only vacant or underdeveloped parcels for Medium-Density Residential use, with density incentives to encourage lot assembly.

LUA-11. Avalon Housing Expansion Area

- A. **What:** Change approximately 45 acres of Light Industrial (LI) to Medium Density Residential (MDR, 2-5 du/A), *Figure 11*.

Figure 11

- B. **Where:** In Belltown, on the northwest side of Avalon Street between Alta and Lakewood Streets, just north of CA-60 and adjacent to the base of the WB off-ramp. Canal Street provides access to the rear of the site. The vacant area consists of four parcels and abuts Medium-Density Residential on two sides, Open Space in the Jurupa Hills to the northwest, and vacant Light Industrial to the south. It is transitional between the industrially-oriented Agua Mansa area and the more residentially-oriented Rubidoux area. A large Retail Commercial area is nearby, to the south along Mission Boulevard.

- C. **Why:** The Belltown community has enough vacant land to accommodate significant residential growth. Its location near the cities of Fontana and Riverside, near the CA-60, make it well-suited for additional low-medium density single-family housing near local job centers.

The site borders open space and land developed with Medium-Density housing.

- D. **Discussion:** The City seeks to avoid locating new Light- and Heavy Industrial uses adjacent to existing residential uses. The City already has large areas of LI- and HI designated land in Mira Loma, Sunnyslope and Agua Mansa, and needs additional new housing near jobs and Village Centers. Applying the MDR designation to this area would achieve these objectives and help meet the City's Regional Housing Needs. The area is the subject of a development applications, Emerald Ridge North and South, a 282-unit residential project. This approach is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts and to encourage compatible residential infill.

- E. **Alternatives:** Designate the area for Medium-High or High Density Residential (MHDR, 5-8 du/A or HDR, 8-14 du/A) to accommodate condominiums, and smaller attached and detached single-family homes.

DRAFT

LUA-12. High Density Housing at CA-60 and Avalon

- A. **What:** Change approximately 10 acres of vacant Light Industrial to High Density Housing (HDR, 8-14 du/A) to encourage the development of single-family attached and detached dwellings, including townhouses, stacked flats, courtyard homes, and patio homes near open space, *Figure 12*.
- B. **Where:** On the NW side of Avalon, adjacent to the CA-60, in the community of Belltown. The site is accessed from Avalon, which dead ends at the highway, and has easy on- and off-highway access from 30th Street. Canal Street provides thru access to the rear of the site. Highway noise will require special design and construction features in dwelling units. The area abuts vacant LI land to the northeast and existing Medium Density housing to the northeast, along both sides of Avalon.
- C. **Why:** Avalon Street's dead end adjacent to the CA-60, and the site's location near existing residential make it less suitable for Industrial uses than other properties located in nearby Agua Mansa. The site's location at the base of the Jurupa Hills allows for open space recreation uses and minimal surface street traffic along the Avalon Street frontage.

Figure 12

- D. **Discussion:** As with site LUA-11, the City seeks to avoid locating new Light- and Heavy Industrial uses adjacent to existing residential uses. The City already has large areas of LI- and HI designated land in Mira Loma, Sunnyslope and Agua Mansa, and needs additional new housing near jobs and Village Centers more than it needs additional Industrial and warehouse uses. Applying the HDR designation to this area would achieve these objectives and help meet the City's Regional Housing Needs. This approach is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts and to encourage compatible, higher density housing near highway corridors.

- E. **Alternative:** Designate the area for Medium High Density Residential (MHDR, 5-8 du/A) to provide multi-family housing opportunities.

DRAFT

LUA-13. Hidden Valley Open Space Area

- A. **What:** Change approximately 44 acres of vacant Light Industrial (LI) to Open Space, Recreation (OS-R), *Figure 13*.
- B. **Where:** Three parcels bordered by the Santa Ana River to the south, railroad tracks and Low Density Residential to the north, developed and undeveloped Light Industrial and Open Space, in the Pedley area. The site is near Clay Street and Van Buren Boulevard, but has no direct access to a public street. The nearest public right-of-way serves the adjacent parcel at 6580 General Road. Most of the site is owned by Riverside County Recreation and Parks District and is located at a wide bend in the Santa Ana River and within the Hidden Valley Wildlife Area. The center portion of the site is owned by the Metropolitan Water District (MWD) for utilities access.

Figure 13

- C. **Why:** Due to its location near residential neighborhoods and environmentally-sensitive riparian habitat, and the lack of public street access, LI and HI uses are not appropriate here. The site is recommended to be designated for Open Space, Recreation (OS-R) to be consistent with the large, adjacent River front parcel to the east. The site is located in the Riverside Airport Influence Area Zone D, which limits the types of uses that can be developed. Light Industrial and Business Park could also be suitable, however the parcels' lack of street access, hilly topography, and setting make Open Space a logical land use designation. Future trail connections along the River are planned.
- D. **Discussion:** This LI-designated site includes several river front properties that due to their location and special development constraints, merit a different land use. Historically, there were several Industrial uses in the vicinity of Clay Street and the River. Over time, the largest of these closed and residential development expanded, "sandwiching" the Industrial uses between the surrounding neighborhoods and the River, making traditional Industrial development and resource extraction uses less suitable here than it was under County land use controls. This approach is consistent with GPAC recommendations to preserve open

space, protect environmentally sensitive areas in and along the Santa Ana River floodway, and encourage recreation uses.

- E. **Alternative:** The site is located in the Riverside Airport Influence Area Zone D, which limits the types of uses that can be developed here. Light Industrial, Business Park, and Commercial Office, may also suitable, if access can be provided.

DRAFT

LUA-14. Clay Street Opportunity District

- A. **What:** Change approximately 80 acres of vacant Light Industrial (LI) to Medium High Density Residential (MHDR, 5-8 du/A) with Commercial Neighborhood (CN) along the east side of Clay Street, *Figure 14*.
- B. **Where:** Multiple parcels bordered by railroad tracks to the south, Business Park to the north and west, Medium- and Medium-High Density Residential to the east, and Light Industrial to the south and southeast, in the Pedley area. The Santa Ana River is about ¼ mile from Clay Street to the south. Much of the district was formerly occupied by industrial uses and the north portion of the site contains a narrow, wooded stream canyon which drains several hillside neighborhoods and a golf course to the north, across Limonite. The site has good access from Clay Street and Pedley Road.

Figure 14

Figure 14

- C. **Why:** This area's location near housing, key cross-town connecting streets, the Metrolink station, De Anza Commercial Plaza and the Spectrum Center, Clay's Park and Linares Avenue School make this area well suited for both residential and commercial uses. Due to its location near the Pacifica Senior Living development on Clay and Low- and Medium-Density Residential nearby, LI and HI uses are no longer appropriate here. Changing the land

use designation from Light Industrial to allow Residential uses, with offices and neighborhood-serving commercial uses along the Clay Street frontage reduces the potential for noise, vibration, odor, dust and other industrial-related impacts to adjacent residential uses and neighborhoods. Redevelopment of the site could also help address the littering, illegal dumping and camping occurring on the site, and help provide economic incentive to maintain and improve the adjacent, partially vacant De Anza Commercial Center.

- D. **Discussion:** This LI-designated site may have been more appropriate at a time when parcels along the River were commonly used for resource extraction activities and manufacturing, before residential uses were developed nearby. LI uses such as warehousing, outdoor storage and repairs, auto sales, warehousing/distribution facilities, assembly and light manufacturing uses would not be compatible with nearby residential uses. The site has excellent access, is close to public transportation and near retail sales and services in commercial centers along Limonite. By applying Medium High Density Residential and the Neighborhood Commercial designation (on the east side of Clay Street), this site will help provide starter and workforce housing, close to jobs, recreation opportunities, Metrolink, and neighborhood-serving commercial uses along Clay and Limonite. This approach is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts and to encourage compatible residential infill, and with Airport Land Use Commission rules requiring a residential density of greater than five dwelling units per acre.
- E. **Alternative:** Designate the area for Business Park to provide job-rich professional, administrative or research and development type uses in a well-landscaped, campus-like setting. Commercial, Industrial, Business Park, Office, Open Space and other relatively low intensity uses are generally suitable; however, due to the site's location within the Riverside Airport Influence Area Zone D, residential uses are limited to either one dwelling per five acres or less, or to densities of greater than five dwellings per acre (MHDR).

LUA-15A, 15B and 15C. Change Light Industrial to Medium-Density Residential and Retail Commercial, SR-60 near Mission Avenue

- A. **What:** Change the General Plan designation of three areas totaling approximately 59 acres, from Light Industrial (LI) to Medium Density Residential (MDR) north of SR-60 (LUA 15A), and to Retail Commercial south of SR-60 (LUA-15B and LUA-15C, as described below. Both areas are developed with light industrial and service-commercial uses, such as storage and construction materials sales, vehicle and construction materials.
- B. **Where:** In three subareas, generally located in the vicinity of the intersection of Jurupa Road, Mission Boulevard, and SR-60, in the Sunnyslope community, as shown in *Figure 15*. *LUA-15A* is north of the highway, near the intersection of Florine Avenue and 33rd Street. It consists of two parcels designated Light Industrial, covers about 28 acres and consists mainly of paved areas used for vehicle storage. It is bordered by Medium-Density Residential. A proposed 300-unit “Highland Park” residential subdivision is planned on adjacent parcels to the northeast. *LUA-15B* is south of the highway, located near the intersection of Jurupa Road and Mission Boulevard. It consists of multiple parcels, is designated Light Industrial, covers about 26 acres and includes various service-commercial uses, such as construction materials storage and sales, recycling yard and auto sales.

Figure 15

LUA-15C is located south of Mission Boulevard, with Medium-Density Residential land to the west and south, General Commercial to the east, and Light Industrial to the north. It consists of multiple parcels covering about five acres and is bordered by Golden West Avenue on the west, Stobbs Way on the east, and Rustic Lane Elementary School on the south. It's near the Rubidoux Drive-In and is about one mile from the Rubidoux Village Area. The three areas are zoned "Manufacturing/Service-Commercial" (M-SC) on the City's Official Zoning Map.

- C. **Why:** County land use decisions resulted in a number of areas throughout the City where "islands" of Industrial land abut residential uses. In addition, the City already has large areas designated for warehousing and industrial uses and seeks a more balanced land use pattern. A key City objective in the new General Plan is to reduce and/or prevent conflicts between land uses, particularly between industrial land uses and housing. Medium-Density housing would be more compatible with existing land uses north of SR-60; Retail Commercial (C-R) would be more compatible with adjacent land uses south of SR-60 and promote retail uses in an area already substantially committed to that use, from Golden West Avenue, east to Rubidoux Village.
- D. **Discussion:** To achieve General Plan objectives, it is proposed that the City consider changing some areas designated "Industrial" to a different General Plan land use designation which, over time, will encourage development of more compatible uses. With such a change, the existing Industrial/Service-Commercial uses could continue as allowed, non-conforming uses, as provided in the City's Zoning regulations, or changed to the new land use, at the property owners' option. On February 16, 2012, the City Council initiated a General Plan Amendment from Open Space and Medium-High Density Residential to Medium-Density Residential for the Highland Park residential subdivision, in the area of LUA-15A. Council was concerned that future industrial uses at this location may be incompatible with the existing residential neighborhoods and the proposed new subdivision, which is currently in the City for discretionary Planning review. This approach is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts and to encourage quality retail uses in areas substantially committed to that land use.
- E. **Alternative:** Designate LUA-15B and 15C for a new Residential/Commercial Corridor (RCC) land use designation which allows mixed commercial and residential uses, allowing residential density of up to 8-14 du/A, thereby encouraging multi-family housing opportunities close to jobs, shopping and freeway access. LUA 15A would change to Medium Density Residential (MDR).

LUA-16. Mission Boulevard West – Glen Avon Village Center

- A. **What:** Change approximately 45 acres of Retail Commercial (CR) and High Density Residential (HDR) to Retail Commercial with Village Center Overlay (CR-VCO), *Figure 16*.
- B. **Where:** On both sides of Mission Blvd., between Feldspar and Pedley Road. The area consists of multiple parcels with a mix of small and large lot commercial and residential development, with several vacant parcels. The area abuts residential uses to the south, with larger lot Retail Commercial and Medium High, High, and Highest Density Residential to the north, across Mission. The area is one of three historic community or “village” centers (along with Rubidoux and Pedley centers) and can function as a commercial and social center for the Glen Avon community.

Figure 16

- C. **Why:** For most of its length, both sides of Mission Boulevard are designated for Commercial Retail. However, the resulting land use pattern is characterized by many relatively small commercial lots fronting on a major arterial. This older, auto-oriented pattern can result in inefficient and unsightly retail “strip commercial” which makes economically viable commercial development difficult. Such development can result in sites being dominated by paving with limited parking and loading spaces, and can impact the economic viability of older commercial areas. The area now has a mix of commercial and residential uses. The proposed VC Overlay would allow parcels to be developed with either retail commercial or residential uses. The existing retail-, service-commercial and residential uses would continue to be permitted, conforming uses. As property owners chose to develop or redevelop their property, the VC Overlay designation would encourage lot assembly and high-quality redevelopment by allowing a range of densities and FARs, depending upon parcel size. Larger lots would allow increased residential density or FAR, subject to specific development standards to ensure compatibility with adjacent uses. This will increase development options, *avoid creating non-*

conforming uses, increase property values and encourage redevelopment and infill with new commercial uses and high quality, multi-family housing.

- D. **Discussion:** The City seeks a balance of larger scale commercial sites for general retail sales and services to meet Citywide or regional needs, plus smaller scale, neighborhood-serving commercial areas. Under this approach, existing commercial and residential uses would continue to be legal, conforming land uses, but encouraged to redevelop and infill with compatible high-quality residential and commercial uses. Applying the VC Overlay helps achieve that balance by encouraging redevelopment and combining lots to attract reinvestment, promote new housing and business opportunities, and beautify an older commercial corridor. This approach is consistent with GPAC recommendations to encourage community centers and to encourage mixed use where appropriate.
- E. **Alternative:** Designate the area for High Density Residential (HDR, 8-14 du/A) or Very High Density Residential (14-20 du/A) to allow multi-family housing opportunities. This approach would require additional outreach with multiple property owners and could have budget implications for the existing General Plan work, unless it were included as a follow-up General Plan Implementation Program.

LUA-17. Bellegrave Low Density Residential Infill

- A. **What:** Change approximately 10 acres of Light Industrial to Low Density Residential to allow single-family detached residences on ½ acre lots, *Figure 17*.
- B. **Where:** On the south side of Bellegrave, between Marlatt and Dodd Streets, in the Mira Loma Community. South of Bellegrave is designated as Low Density Residential and consists mainly of large-lot residential uses with animal-keeping. North of Bellegrave is mainly Business Park and Light Industrial uses. Open Space – Recreation (Community Park) is directly across Bellegrave, with schools and neighborhood commercial nearby.
- C. **Why:** Just over six of the 10 acres is vacant; the remaining acreage is developed with a mix of single-family residential and accessory commercial uses. The area's location makes it more suitable for large lot residential than for Industrial development.
- D. **Discussion:** With this Interim General Plan, the City seeks to protect residential areas from impacts of Industrial development, and to provide greater separation between residential and industrial uses. The City has large areas devoted to Light- and Heavy Industrial uses (LI and HI) in Mira Loma, Sunnyslope and Agua Mansa, and needs additional new housing near jobs and Village Centers more than it needs additional Industrial and warehouse uses. Applying the LDR designation to this area would encourage compatible residential development, in

Figure 17

keeping with the character of much of Mira Loma and Pedley. This approach is consistent with GPAC recommendations to protect residential neighborhoods from industrial use impacts and to encourage compatible residential infill.

- E. **Alternative:** Change designation of all parcels fronting onto Bellegrave, between Dodd Street and Etiwanda, to "Residential Commercial Corridor (RCC), to allow mixed use development with residential and commercial land uses.

This approach would require additional public outreach with multiple property owners and could have budget implications for the existing General Plan work, unless it were included as a follow-up General Plan implementation program.

LUA-18. Pedley Low-Density Residential Infill

- A. **What:** Change approximately 80 acres of Business Park (BP) to Low Density Residential (LDR, 2 du/A) to allow large lot single-family detached residences and animal keeping, consistent with the adjacent properties to the east, *Figure 18*.
- B. **Where:** Between Van Buren and Pedley Road, on interior lots from Jurupa Road to 56th Street, in the community of Pedley. Most of the properties in this area are designated as “Rural Community – Low Density Residential” at a density of 2-5 du/A., and consisting of large-lot residential uses with equestrian properties and animal-keeping on both sides of Pedley Road. Along Jurupa Road between Van Buren and Pedley are several older industrial uses and outdoor storage.
- C. **Why:** Most of the area is low density residential, with a predominantly equestrian and agrarian character. The existing industrial uses are concentrated along Jurupa Road, adjacent to the railroad tracks. The area’s location makes it more suitable for residential use than for Industrial or Business Park uses. Consequently, the residential integrity of this area should be maintained and no further industrial or business park type uses allowed to encroach in this neighborhood. Existing industrial uses would be “grandfathered” and permitted to continue as legal, non-conforming uses.

Figure 18

D. **Discussion:** With this Interim General Plan, the City seeks to protect residential area from impacts of Industrial development, and to provide greater separation between residential and industrial type uses. The City has large areas devoted to Business Park, Light- and Heavy Industrial uses (LI and HI) in Mira Loma, Sunnyslope and Agua Mansa, and needs additional new housing near jobs and Village Centers more than it needs additional Industrial and warehouse uses. Expanding the LDR designation to this area would encourage compatible residential development, in keeping with the semi-rural character of much of Mira Loma and Pedley.

E. **Alternative:** Designate the parcels with existing industrial uses from BP to Light Industrial (LI) to reflect actual uses; and designate the remainder of BP to Low Density Residential (LDR).

LUA-19. West Limonite Residential/Equestrian Area

- A. **What:** Change approximately 30 acres of Light Industrial (LI) and Agriculture (AG) to Very Low Residential Density (VLDR), *Figure 19*.
- B. **Where:** Three large parcels between Limonite Avenue and the Santa Ana River, in the community of Pedley. The westerly parcels are designated Light Industrial and adjacent to Public Facility use (Jurupa Community Services District) but were once developed and used for agricultural uses (poultry). The westerly parcel is designated Agriculture (AG) is currently used for agricultural/equestrian uses. Paradise Knolls Golf Course abuts the site on the east. The City has received a Planning application to convert the Golf Course to a 300-unit residential subdivision. The Santa River and Hidden Valley Wildlife Area abut the site on the south. Low Density Residential with agricultural uses border the site on the north, across Limonite Avenue.

*Figure 19*

- C. **Why:** Light Industrial and Agricultural uses may no longer be compatible with nearby existing and planned residential uses. However the site's location adjacent to Santa Ana River, past

farming and equestrian use, and the large-lot, equestrian oriented neighborhood north of Limonite may make very-low density residential uses particularly appropriate. At a density of one unit per acre, the site could accommodate large-lot, high quality housing, animal keeping and equestrian facilities, such as stables, training areas, and riding trails linking to planned trails along the River, comparable to some of the large lot residential areas on Crestmore Road and Riverview Road in Rubidoux. Some agriculturally-related commercial uses may also be appropriate along Limonite.

- D. **Discussion:** These LI- and AG-designated parcels, due to their location, special development constraints, and possible changes in area land use, may merit a different land use. Limonite is planned for widening from two to four lanes, and a large residential subdivision is proposed to replace the Paradise Knolls Golf Course, now designated as Open Space-Recreation (OS-R). A change to Very Low Density Residential would help maintain Jurupa Valley's historic semi-rural, equestrian character and be compatible with existing and proposed uses. It would allow existing light industrial and agricultural uses to continue until such time as the owners chose to redevelop their properties. And it could accommodate an area of "above moderate" income housing which would help meet the City's range of housing needs. Residential uses should be buffered from Limonite Avenue by a horizontal separation, landscaping, or other means. This approach is consistent with GPAC recommendations to avoid land use conflicts between Industrial and Residential land uses, preserve Jurupa's semi-rural character, encourage equestrian uses, and protect environmentally sensitive areas in and along Santa.
- E. **Alternatives:** 1) Designate the site as Low Density Residential (LDR, at two du/A); or 2) change the Light Industrial designation to Agriculture to maintain the entire site in its historic agricultural use. This approach would allow a wide range of agricultural related and equestrian uses, and one dwelling per 10 acres.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

November 20, 2015

Draft Land Use Plan

The Land Use Plan focuses on preserving the unique features in the Jurupa area, guiding the City's growth and improvement, and on preserving and enhancing its citizens' quality of life. To accomplish this, the City intends to update and refine the current General Plan land use designations that were originally applied by Riverside County before Jurupa's incorporation as a City. The updated land uses are described in Section XX, below.

The Jurupa Valley Land Use Plan, Figure 3 (to be added), depicts the geographic distribution of planned land uses. The Plan is organized around 24 land use designations and seven land use overlays. *Table 1, Land Use Designations Summary*, outlines the development intensity, density, typical allowable land uses, and general characteristics for each of the land use designations. Section XX contains more detailed descriptions and policies for of the General Plan's plan land use designations.

Jurupa Valley's rich heritage of rural living continues to be accommodated in areas committed to that lifestyle, and its environmental and economic sustainability are reinforced by strong commitments to open space preservation and urban development, as provided in this Interim General Plan.

The proposed land use designations represent a wide range of uses that respond to community needs, natural characteristics of the land, and the economic potential to accommodate a range of compatible uses. Many factors led to the designation of land use patterns. Among the most influential were: previous county plans, established land use patterns, public input, transportation plans and needs, conservation and habitat plans, citizen input, and Planning Commission and City Council guidance. The result of these considerations is shown in Figure 3, which portrays the location and extent of proposed land uses. Table 2, Statistical Summary of the Interim General Plan, provides a summary of the projected development capacity

of the plan if all uses are built as proposed. This table includes dwelling unit, population, and employment capacities.

Overall Land Use Concept

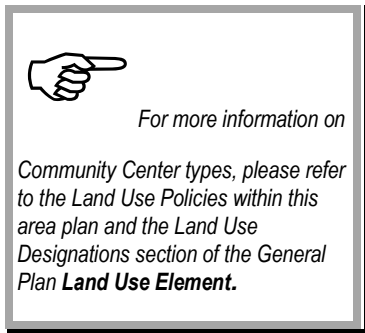

The Interim General Plan continues to provide for substantial areas devoted to semi-rural, suburban and equestrian uses, as allowed by the Estate Density and Low Density Residential designations. The land use plan also allows for more conventional urban residential densities as reflected by the Medium Density, Medium High Density, High Density, Very High Density and Highest Density Residential Designations. Complementing these residential land uses are several Commercial Retail corridors, Commercial Tourist and a new Commercial Neighborhood designation. In addition, there are seven Overlay designations that, when used in combination with based designations like "LDR" or "CR", help meet special community needs or address special planning concerns.

For example, the Community Development Overlay allowing multiple use options to encourage the eventual conversion of older land uses to more compatible, high quality land uses. The Plan also retains several large Open Space-Conservation and Recreation areas, large swaths of Open Space-Conservation Habitat land in the Santa Ana River corridor and the Jurupa Mountains, and an abundance of employment opportunities within the Light Industrial and Business Park

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

designations along Interstate 15, State Route 60, and Van Buren Boulevard. Heavy Industrial designations are also provided at Agua Mansa and in the vicinity of the Stringfellow Reclamation Site. Mining uses are also identified within the Jurupa Mountains.

Several older “strip commercial corridors” have a mix of residential, light industrial/service-commercial, and commercial uses. These corridors include portions of Mission Boulevard and Etiwanda Avenue. To encourage redevelopment with residential and commercial uses in selected areas, a Specific Plan overlay is applied to encourage more detailed planning in these areas, with the possibility of encouraging lot consolidation and redevelopment under the new Residential/Commercial Corridor designation. This designation allows commercial and residential uses on adjacent lots, with a range of residential densities and floor area ratios (FAR) is allowed, depending upon lot size. As an incentive to encourage more attractive development and fewer driveways, this designation allows Medium, Medium-High to High Density Residential uses on lot ranging from 20,000 square feet, 1 acre, and 2 acres respectively. Commercial retail, service-commercial and light industrial is also permitted, where appropriate, with a range of FARs allowed, depending upon parcel sized. One existing single-family dwelling continues to be allowed on legal, conforming parcels of any size.

The Village Center Overlay is applied at key existing community centers, namely the Glen Avon area along West Mission Boulevard, the Pedley/Limonite area, and the Rubidoux Village Center along northeast Mission Boulevard. These areas are intended to function as pedestrian-oriented Village Centers, in keeping with their historic uses in Jurupa Valley. These areas are encouraged to develop with a mixture of high-quality residential, retail, office and public uses in close proximity. The strategic location of these centers offers compelling reasons to focus attention on such a valuable economic resource. The Village Center Overlay in Rubidoux takes advantage of the existing pattern of development on Mission Boulevard by allowing for residential units next to commercial uses, thereby increasing the development feasibility and economic value of this area.

The Interim General Plan provides for major employment centers at the Interstate 15/State Route 60 junction, along Van Buren Boulevard, and in the Agua Mansa area. Typical employment uses within Business Park and Light Industrial designated areas include research and development, manufacturing, assembling, research institutions, academic institutions, medical facilities, and support commercial uses. Heavy Industrial designated areas would accommodate the most intensive types of industrial activities, including heavy manufacturing and processing plants. Warehousing is limited to the area north of Galena Avenue and west of San Sevaine Channel.

The proximity to a major freeways, Metrolink services and railroad tracks provide an opportunity for regional multi-modal transportation connections. Combined with the relatively compact activities envisioned in the Village Centers, these highly valuable access facilities offer the long term potential to accommodate improved transit access. Future multi-modal transportation options are a part of this Plan because of the need to ultimately take some of the pressure from the highway and freeway systems. This is particularly critical here because of the extensive truck traffic, which complicates vehicle flow despite its obvious importance to economic development.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

Large swaths of open space line the Santa Ana River corridor, providing an expansive natural buffer between Jurupa and the City of Riverside. Portions of the Jurupa Mountains also contain Open Space designations intended to preserve the rugged nature of this area and protect sensitive habitat areas. Recreational open space areas designed for active recreational uses, such as golf courses and athletic fields, are located throughout Jurupa Valley.

The pattern and types of land uses described above are an extension of the existing land use patterns for Jurupa Valley and consequently, help maintain the identity and character of its eight distinctive communities. Selective additions to the land use choices refine the potential here without changing the basic character of these local communities. Additionally, preserving the natural features and unique landscape helps to distinguish this area from surrounding communities.

Jurupa Valley **GENERAL PLAN LAND USE DESIGNATIONS**

Table 1: Land Use Designations Summary

| Land Use Designation | Building Intensity Range (Min. parcel size/du) or Floor Area Ratio) ^{1, 2,3} | Notes |
|-----------------------------------|---|--|
| Agriculture and Open Space | | |
| Agriculture (AG) | 10 ac min. | <ul style="list-style-type: none"> Agricultural land including row crops, groves, nurseries, dairies, poultry farms, processing plants, and other related uses. One single-family residence allowed per 10 acres except as otherwise specified by a policy or an overlay. |
| Conservation (OS-C) | N/A | <ul style="list-style-type: none"> Protection of open space for natural hazards, cultural resource preservation, wildlife and habitat, and natural and scenic resources. Existing agricultural uses are permitted. |
| Water (OS-W) | N/A | <ul style="list-style-type: none"> Includes bodies of water and natural or artificial drainage corridors. Extraction of mineral resources subject to conditional use permit (CUP). May be permissible provided that flooding hazards are addressed and long term habitat and riparian values are maintained. |
| Recreation (OS-R) | 20 ac min. | <ul style="list-style-type: none"> Recreational uses including parks, trails, athletic fields, and golf courses. Neighborhood parks are permitted within residential land uses. |
| Rural (OS-RUR) | 20 ac min. | <ul style="list-style-type: none"> One single-family residence allowed per 20 acres. Extraction of mineral resources subject to CUP may be permissible provided that scenic resources and views are protected. |
| Mineral Resources (OS-MR) | N/A | <ul style="list-style-type: none"> Mineral extraction and processing facilities conditionally allowed. Includes areas held in reserve for future mineral extraction and processing. |
| Commercial/Industrial | | |
| Commercial Retail (CR) | 0.20 - 0.35 FAR | <ul style="list-style-type: none"> Local and regional serving retail and service uses. Applied to shopping centers of 5 acres or more. |

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

| | | |
|--|-------------------------------|--|
| *Residential/Commercial Corridor (RCC) | 5 – 20+ du/ac Max. 1.0 FAR | <ul style="list-style-type: none"> Allows a mix of residential, retail and neighborhood commercial, office and other compatible uses. Flexible residential density and development standards are applied to encourage compatible, attractive, high-quality development. |
| *Commercial Neighborhood (CN) | 0.25 - 0.60 FAR | <ul style="list-style-type: none"> Uses providing goods and services to meet the frequent shopping needs of people living nearby, typically within a one-half mile radius of residences served. Allowed uses include small grocery stores, cleaners, laundromats, drug stores, restaurants, small specialty stores, feed and tack, and other neighborhood convenience uses. Applied to smaller commercial centers, generally less than 5 acres in area. |
| Commercial Tourist (CT) | 0.20 - 0.35 FAR | <ul style="list-style-type: none"> Tourist related commercial including hotels, restaurants, conference and meeting facilities, theaters, museums, golf courses, and recreation/amusement activities. |
| Commercial Office (CO) | 0.35 - 1.0 FAR | <ul style="list-style-type: none"> Variety of office and office-related uses including financial, legal, medical, dental, real estate, insurance and other office services. |
| Light Industrial (LI) | 0.25 - 0.60 FAR | <ul style="list-style-type: none"> Industrial, service-commercial and related uses including warehousing/distribution, research and development, assembly and light manufacturing, repair facilities, and supporting retail uses. |
| Heavy Industrial (HI) | 0.15 - 0.50 FAR | <ul style="list-style-type: none"> More intense industrial activities, such as manufacturing, materials processing, and any related industrial activity that generate significant impacts such as excessive noise, dust, and other nuisances. |
| Business Park (BP) | 0.25 - 0.60 FAR | <ul style="list-style-type: none"> Employee intensive uses, including research and development, technology centers, corporate offices, clean industry and supporting retail uses. |
| Residential | | |
| Estate Density Residential (EDR) | 2 ac. min. | <ul style="list-style-type: none"> Single-family detached residences on large parcels of at least 2 acres. Limited agriculture, intensive equestrian and animal keeping uses are expected and encouraged. |
| Very Low Density Residential (VLDR) | 1 ac. min. | <ul style="list-style-type: none"> Single-family detached residences on large parcels of 1 to 2 acres. Limited agriculture, intensive equestrian and animal keeping uses are expected and encouraged. |
| Low Density Residential (LDR) | 1/2 ac. min. | <ul style="list-style-type: none"> Single-family detached residences on large parcels of 1/2 to 1 acre. Limited agriculture, intensive equestrian and animal keeping uses are expected and encouraged. |

Jurupa Valley **GENERAL PLAN LAND USE DESIGNATIONS**

| Land Use Designation | Building Intensity Range (du/ac or Floor Area Ratio) ^{1, 2,3} | Notes |
|--|--|--|
| Medium Density Residential (MDR) | Up to 5 du/ac. | <ul style="list-style-type: none"> Single-family detached and attached residences with a density range of 2 to 5 dwelling units per acre. Limited agriculture and animal keeping is permitted, however, intensive animal keeping is discouraged. Lot sizes range from 5,500 to 20,000 sq. ft. |
| Medium High Density Residential (MHDR) | Up to 8 du/ac | <ul style="list-style-type: none"> Single-family attached and detached residences with a density range of 5 to 8 dwelling units per acre. Lot sizes range from 4,000 to 5,500 sq. ft. |
| High Density Residential (HDR) | Up to 14 du/ac | <ul style="list-style-type: none"> Single-family attached and detached residences, including townhouses, stacked flats, courtyard homes, patio homes, and zero lot line homes. |
| Very High Density Residential (VHDR) | Up to 20 du/ac | <ul style="list-style-type: none"> Single-family attached residences and all types of multi-family dwellings. |
| Highest Density Residential (HHDR) | 20+ du/ac | <ul style="list-style-type: none"> Multi-family dwellings, includes apartments and condominium. Multi-level (3+) structures are allowed. Max. density set by City Council. |
| Other | | |
| Public/Institutional (PF) | Max. 1.0 FAR | <ul style="list-style-type: none"> Civic uses and facilities providing academic, medical, governmental or similar services to the public, including health care facilities, social services, cultural and public recreational uses, compatible businesses (provided they do not displace public uses), and other public and |
| Railroad/Utility Corridor | N/A | <ul style="list-style-type: none"> Applied to areas dedicated for railroads, public utilities or other specialized uses. |
| Overlays | | |
| Community Development Overlay (CDO) | N/A | <ul style="list-style-type: none"> Encourages new development and land use changes to be applied through future General Plan Amendments. Applied to Opportunity sites and areas where land use changes are anticipated or encouraged. May include development incentives, such as flexible development standards or transfer of development potential. Incentives may require minimum site area. |

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

| Land Use Designation | Building Intensity Range (du/ac or Floor Area Ratio) ^{1, 2,3} | Notes |
|-------------------------------------|--|--|
| *Village Center Overlay (VCO) | N/A | <ul style="list-style-type: none"> Applied to three historic core areas, namely Rubidoux Village, Pedley Village and Glen Avon Village. Promotes infill and improvement of established town centers a more urbanized, pedestrian-oriented mix of residential, commercial, office, entertainment, civic, transit, educational, and/or recreational uses, or other uses is encouraged. |
| Specific Plan (SP) | N/A | <ul style="list-style-type: none"> Requires preparation of a specific plan before an area can be further developed. Typically applied to large undeveloped or underdeveloped areas. Special land use and development standards may apply. (See Land Use Element and specific plans for detailed information). |
| *Equestrian Lifestyle Overlay (ELO) | N/A | <ul style="list-style-type: none"> Defines areas in which the long-term character, safety and viability of equestrian uses are specifically protected from encroachment by incompatible uses, activities and public facilities. |
| Mixed Use Overlay (MPO) | N/A | <ul style="list-style-type: none"> This designation is applied to areas where a mixture of residential, commercial, office, entertainment, educational, and/or recreational uses, or other uses is planned, allowing either vertical or horizontal mixed use. |
| Business Park Overlay (BPO) | N/A | <ul style="list-style-type: none"> Applies to areas where a clear separation of industrial and business park uses from residential uses is desired. |
| *Historic Overlay (HO) | N/A | <ul style="list-style-type: none"> Allows use of flexible development standards, incentives and building codes to encourage preservation of historically-designated properties and districts, such as Mills Act and the Historic Building Code. |

NOTES:

***Asterisk indicates new land use designation**

¹FAR = Floor Area Ratio, which is the measurement of the amount of non-residential building square footage in relation to the size of the lot. Du/ac = dwelling units per acre, which is the measurement of the amount of residential units in a given acre.

²The building intensity range noted is exclusive, that is the range noted provides a minimum and maximum building intensity.

³Clustering is encouraged in all residential designations. The allowable density of a particular land

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

use designation may be clustered in one portion of the site in smaller lots, as long as the ratio of dwelling units/area remains within the allowable density range associated with the designation. The rest of the site would then be preserved as open space or a use compatible with open space (e.g., agriculture, pasture or wildlife habitat).

⁴Policy Areas are specific geographic districts that contain unique characteristics that merit detailed attention and focused policies. These policies may impact the underlying land use designations. Policy Areas accommodate several locally specific designations, such as the Equestrian Protection Area and the Rubidoux Village, and correspond to an adopted Area or Community plan. Consult the applicable Area Plan or Policy Area text for details

Land Use Designations to be Removed

Several existing land use designations are proposed to be removed from the previously adopted General Plan, either because they were associated with Riverside County land use designations and are no longer needed or relevant, or because they are redundant with other land use designations in the Interim General Plan. They are:

- 1) **Foundation Components:** Agriculture Foundation Component, Rural Foundation Component, Open Space Foundation Component, and Community Development Foundation Component.
- 2) **Rural Residential**
- 3) **Rural Mountainous**
- 4) **Rural Desert**
- 5) **Community Center** - Name changed to “Village Center Overlay” and moved to Overlays.
- 6) **Mixed Use Planning Area** (Name changed to “Mixed Use Overlay” and moved to Overlays.
- 7) **Commercial Retail Overlay**
- 8) **Community Center Overlay**

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

Policy Areas

A policy area is a portion of an area plan that contains special or unique characteristics that merit detailed attention and focused policies. The location and boundaries are shown on Figure 4, Policy Areas (to be added), and are described in detail below.

Eight policy areas have been designated within Jurupa. Many of these policies derive from citizen involvement over a period of years in planning for the future of this area. In some ways, these policies are even more critical to the sustained character of the Jurupa area than some of the basic land use policies because they reflect deeply held beliefs about the kind of place this is and should remain. Their boundaries, shown on Figure 4, Policy Areas, are approximate and may be interpreted more precisely as decisions are called for in these areas. This flexibility, then, calls for considerable sensitivity in determining where conditions related to the policies actually exist, once a focused analysis is undertaken on a proposed project.

| Policy Areas ⁴ | |
|---|--|
| Mission Boulevard | Mission Boulevard corridor includes vacant and/or aging buildings along with numerous vacant lots are scattered throughout many of the commercially designated commercial corridors in Jurupa, including those along Mission Boulevard in Glen Avon. This policy area is intended to facilitate optimum development of these infill properties and stimulate economic development of the adjacent communities. |
| Equestrian Preservation Area | Intended to protect the long-term character, safety and viability of equestrian uses from encroachment by incompatible uses, activities and public facilities. |
| Mira Loma Warehousing Distribution Center | Within the Business Park, Light Industrial, and Heavy Industrial land use designations, warehousing and distribution uses, and other goods storage facilities, shall be permitted only in a defined area in Mira Loma. |
| Business Park | Intended to maintain the integrity of business park uses and protect the residential areas that surround these industrial and business park uses from the introduction of new incompatible industrial uses, industrial truck traffic and dangerous traffic congestion at railroad grade crossings. |
| Stringfellow Reclamation Area/Pyrite Canyon | Applies to a recognized as a hazardous waste disposal reclamation site which is subject to an abatement and reuse plan to be prepared and implemented by the appropriate authorities. |
| Limonite Avenue | Applies to a property designated Light Industrial located easterly of a sewage treatment facility on the south side of Limonite Avenue, easterly of Bain Street, to maintain compatibility with adjacent uses. |
| Rubidoux Village | The Rubidoux Village Policy Area is a significant and identifiable component of the Interim General Plan and is subject to special standards and development/public improvement programs to enhance its overall character and economic vitality. |
| Santa Ana River | The Santa Ana River is an integral part of the City and region's multipurpose open space system, watershed, wildlife habitat, and recreation resources. Special policies apply to this critically important resource. |

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

| | |
|--|--|
| Jensen-Alvarado Ranch | Special policies apply to this historic/cultural landmark to preserve its character and historic/architectural integrity and to prevent encroachment by incompatible uses and/or activities. |
| Flabob Airport Influence Area | Special policies apply to this area to minimize land use conflicts with adjacent uses and to maintain consistency with the Western Riverside County Airport Land Use Plan. |
| Riverside Municipal Airport Influence Area | Special policies apply to this area to minimize land use conflicts with adjacent uses and to maintain consistency with the Western Riverside County Airport Land Use Plan. |

1 - Mission Boulevard

Vacant and/or aging buildings along with numerous vacant lots are scattered throughout many of the commercially designated commercial corridors in Jurupa, including those along Mission Boulevard in Glen Avon. This policy area is intended to facilitate optimum development of these infill properties and stimulate economic development of the communities served by Mission Boulevard.

Policies:

- PA 1.1 Adhere to policies found in the Redevelopment Plan for the Jurupa Valley Project Area.
- PA 1.2 Consider allowing the development of housing on vacant and underutilized nonresidential parcels along the Mission Boulevard corridor.
- PA 1.3 Provide incentives for lot consolidation and other strategies to promote cohesive, unified planning of development.

2 - Equestrian Preservation Area

Equestrian uses are commonplace in Jurupa, particularly in the communities of Mira Loma and Glen Avon. These are located within and defined by the Equestrian Lifestyle Overlay. The purpose of the following policies is to protect the equestrian character of areas throughout Jurupa.

Policies:

- PA 2.1 Establish an assessment district or other funding mechanism for the acquisition of rights-of-way and the construction and maintenance of multi-purpose trails within the Policy Area.
- PA 2.2 Establish traffic control along those streets designated as part of the multi-purpose trail system within the Policy Area.
- PA 2.3 Provide special signals on those designated streets for equestrian crossing use.
- PA 2.4 Discourage the encroachment of incompatible land uses into the Policy Area.

3 - Mira Loma Warehouse/Distribution District

The Mira Loma Warehouse/Distribution District (MLWD) is an area substantially committed to warehousing, shipping, trucking and other similar uses. In this area, uses are concentrated close to major highways and access routes and generally away from residential neighborhoods. It is the City's

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

policy to restrict such uses to the (MLWD) and other designated locations and to not new uses or expansion of these types of existing uses outside City-designated areas.

Policies:

PA 3.1 Requires that in the Business Park, Light Industrial, and Heavy Industrial land use designations within the Interim General Plan, warehousing and distribution uses, and other goods storage facilities, shall be permitted only in the following area: the area in Mira Loma defined and enclosed by these boundaries: San Sevaine Channel from Philadelphia Street southerly to Galena Street on the east, Galena Street from the San Sevaine Channel westerly to Wineville Road on the south, Wineville Road northerly to Riverside Drive, then Riverside Drive westerly to Milliken Avenue, then Milliken Avenue north to Philadelphia Street on the west, and Philadelphia Street easterly to the San Sevaine Channel on the north, unless otherwise provided in a City-adopted specific plan.

This policy shall not apply to firms which only store goods that are manufactured or assembled on-site. In such a case, the use shall be evaluated based on the underlying general plan land use designation, and any potential impacts on the community from diesel and other hazardous emissions, traffic generation, local existing land use compatibility and other environmental and socioeconomic concerns. Any manufacturing project proposal outside of the aforementioned area that is in excess of 200,000 square feet in size shall be required to obtain a Conditional Use Permit from the County of Riverside. No warehouses, distribution centers, intermodal transfer facilities (railroad to truck), trucking terminals or cross dock facilities shall be allowed outside of the aforementioned area.

4 - Business Park

The Business Park Policy Area is intended to maintain the integrity of business park uses and protect the residential areas that surround these industrial and business park uses from the introduction of new incompatible industrial uses, industrial truck traffic and dangerous traffic congestion at railroad grade crossings. Besides ensuring compatibility between residential and industrial uses, the additional landscaping requirements for new development or expansion of existing uses are intended to enhance community identity within the area, particularly along Van Buren Boulevard, Bellegrave Avenue, Galena Street, Jurupa Road, Felspar Street, and Clay Street.

Policies:

PA 4.1 Truck terminals, as well as draying, freight and trucking operations, or other industrial/manufacturing uses which could be expected to generate substantial truck traffic, shall not be allowed in areas designated Business Park on the Interim General Plan land use map.

PA 4.2 Require appropriate setback and landscape buffering standards per the Riverside County Land Use Ordinance.

5 - Stringfellow Remediation Area/Pyrite Canyon

The area, also known as the Stringfellow Acid Pits, (designated Open Space-Mineral Resources) is a former hazardous waste disposal site which is being cleaned up, pursuant to a remediation plan prepared by various government agencies. The Open Space-Mineral Resources designation was selected for this site because it does not allow residential uses (except for on-site caretakers). The remainder of the Policy Area is designated for commercial or industrial uses, or Open Space-Rural. When all significant hazards have been abated, the City, in coordination with County, State and Federal agencies, will determine if a different designation and land use change are appropriate.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

Policies:

PA 5.1 In addition to the commercial and industrial development policies within this text, development proposals within the Policy Area must meet the following requirements:

- Piped water and domestic sewer service shall be provided.
- Clearance from the State Health Department must be provided and must indicate that all significant hazards have been abated and the proposed project can occur without jeopardizing public health and safety, or that any proposed clean-up plans have been determined adequate by the State Health Department to permit development of the site.
- In general, only commercial and industrial uses which do not consist of a high concentration of people shall be permitted within this area. A residence for an onsite caretaker shall not be permitted without clearance from the State Health Department.

6 - Limonite Avenue

The Limonite Avenue Policy Area applies to a property designated Light Industrial located easterly of a sewage treatment facility on the south side of Limonite Avenue, easterly of Bain Street. The Light Industrial designation reflects existing use of the property; however, there are no other properties designated for industrial uses along the segment of Limonite Avenue easterly of Wineville Road and westerly of Van Buren Boulevard. Therefore, care must be taken to provide for compatibility with the surrounding neighborhood.

Policies:

PA 6.1 Semi-truck traffic generated by uses within this Policy Area shall be limited to a maximum of 15 trucks per day, Monday through Friday.

PA 6.2 Proposed development applications, or applications to bring existing uses into conformity with City requirements, shall provide for improvements to Limonite Avenue, which may include, but are not limited to, street widening in accordance with General Plan right-of-way width, access limitations (not more than one driveway), provision of right-of-way for sidewalks/multi-purpose trails, bike lanes, street trees, street lighting, paving and striping, and other required improvements.

7 - Rubidoux Village

The Rubidoux Village Policy Area is a significant and identifiable component of the Interim General Plan area and in the recent past, was targeted to receive specific assistance in terms of redevelopment and public improvement plans. To continue the area's economic revitalization and improvement, the following land use policies are established. To further implement the policies, the Rubidoux Village Commercial Zone, a Rubidoux Village Sign Program, and specialized shared parking provisions have been established. In addition, the "Rubidoux Village Design Workbook" has been produced to provide a set of guidelines intended to improve the architectural aesthetics of downtown Rubidoux, in support of the area's economic development strategy as originally outlined in the Jurupa Valley Redevelopment Plan.

Policies:

PA 7.1 The Rubidoux Village Policy Area is intended to be redeveloped with a variety of intense compact commercial and service uses appropriate for a community center.

PA 7.2 The entire Rubidoux Village Policy Area shall be subject to an architectural theme as illustrated in the Rubidoux Village Design Workbook.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

- PA 7.3 To revitalize the commercial area, infill development of vacant and deteriorated properties and the expansion and improvement of existing businesses shall receive the highest priority.

The concept of the Rubidoux Village Policy Area as a downtown center has been further developed by dividing the area into three distinct planning sub-areas (East Village, Village Center and West Village). Each planning sub-area has been determined to be suitable for specific uses given the intent of the Jurupa Valley Redevelopment Plan. The types of community characteristics that have been used to define the sub-areas are as follows:

- The intensity of development in adjoining areas;
- The nature of the Mission Boulevard landscaping;
- The nature and intensity of traffic flows;
- The availability of alleys; and
- The uses and facilities existing in the area.

Refer to the Rubidoux Village Design Workbook for further specific design requirements.

- PA 7.4 All signage within the Rubidoux Village Policy Area shall be subject to the Rubidoux Village Sign Program prepared specifically for the area. The sign program shall be implemented through the City Zoning Ordinance.
- PA 7.5 Provide special consideration for parking through the establishment of a shared parking program designed specifically for the Rubidoux Village Policy Area as outlined in the City's Zoning Ordinance.
- PA 7.6 Require projects adjacent to residential lots to provide mitigation measures so as to buffer the impacts of the commercial development from the residential uses. These mitigation measures shall include, but not be limited to, landscaping, noise berms, and reasonable limits on hours of operation.
- PA 7.7 Permit modification of development standards stated in the design workbook for architectural features when a project applicant can demonstrate that, due to the design of the existing building(s) and/or structure(s), it would be infeasible architecturally or structurally to incorporate the specific architectural design(s). Modifications shall be subject to the approval of the Planning Director.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

8 - Santa Ana River Corridor

A watershed is the entire region drained by a waterway that drains into a lake or reservoir. It is the total area above a given point on a stream that contributes water to the flow at that point, and the topographic dividing line from which surface streams flow in two different directions. Clearly, watersheds are not just water. A single watershed may include combinations of forests, glaciers, deserts, and/or grasslands.

The Santa Ana River watershed, which receives an average annual rainfall of about 13 inches, covers over 2,650 square miles of widely varying terrain.

The Santa Ana River is an integral part of the City and region's multipurpose open space system. It includes the Santa Ana River Trail, a national recreation trail designated within this corridor that, when completed, will incorporate 110 miles of trail system from San Bernardino County in the north to Orange County in the south. Beyond that, it is the centerpiece of a massive, 2,650 square mile watershed that involves major portions of three counties. The river drains southwest toward Prado Dam, and serves as a prominent natural buffer between the City and the cities of Riverside and Norco. Several natural and channelized drainage courses connect with the river. In addition to their fundamental water related functions, these watercourses provide important wildlife corridors through developed land and link open spaces. They also provide foraging, nesting and watering areas for many wildlife species. The following policies preserve and protect this important natural and recreational feature.

Policies:

- PA 8.1 Protect the multipurpose open space attributes of the Santa Ana River Corridor through adherence to flood policies in the Safety Element, the Multiple Species Habitat Conservation Plans section in the Conservation and Open Space Element and the land use policies in the Land Use Element.
- PA 8.2 Require development, where allowable, to be set back an appropriate distance from the top of bluffs, in order to protect the natural and recreational values of the river and to avoid public responsibility for property damage that could result from soil erosion or future floods.
- PA 8.3 Encourage future development that borders the Policy Area to design for common access and views to and from the Santa Ana River.
- PA 8.4 Minimize the disruption of sensitive vegetation and species.
- PA 8.5 Preserve areas subject to erosive flooding in a natural state.
- PA 8.6 Encourage recreation development, such as parks and golf courses along the river banks above and outside of flood zones.

Santa Ana River in Jurupa Valley

- PA 8.7 Establish trails and related facilities for riding, hiking, and bicycling for the entire reach of the river connecting to the state- and nationally-designated Orange County and San Bernardino Santa Ana River trails and connected with the local and countywide

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

system of trails.

- PA 8.8 Provide for recreational trail use under bridge structures crossing the river, where feasible.
- PA 8.9 Require private development along the river to provide for riding, hiking, and biking trails and for connection to the countywide system of trails.
- PA 8.10 Require the placement and design of roads to be compatible with the natural character of the river corridor.
- PA 8.11 Coordinate with the California Department of Transportation (Caltrans) on future freeway expansions to ensure compatibility with the natural character of the river corridor.
- PA 8.12 Discourage the addition of local road crossings. If any additional crossing is allowed, careful consideration shall be given to location, design, and landscaping to take advantage of the scenic character of the river and to avoid destruction of natural values.
- PA 8.13 Discourage utility lines within the river corridor. If approved, lines shall be placed underground where feasible and shall be located in a manner to harmonize with the natural environment and amenity of the river.
- PA 8.14 Prohibit recreational uses that restrict stream flows in the river in order that such flows will be adequate year round for the maintenance of fish and wildlife.
- PA.8.15 Participate in the regional planning of the Santa Ana River through the Santa Ana River Watershed Planning Authority and the Santa Ana River Watershed Group.

9 - Flabob Airport Influence Policy Area

Flabob Airport has enjoyed a long and storied history in the Jurupa area, and continues to serve an important role providing aviation services and community events for local residents. To minimize land use conflicts with adjacent uses, much of the remaining undeveloped area surrounding the airport is designated as Estate Density Residential.

Policies:

- PA 9.1 Should the airport discontinue flight operations, staff shall review the Flabob Airport Influence Policy Area to determine appropriate amendments to the Land Use Map.
- PA 9.2 There are three safety zones associated with the Flabob Airport Influence Area. These safety zones are shown in Figure 5, Riverside Municipal Airport and Flabob Airport Influence Policy Area. Properties within these zones are subject to regulations governing such issues as development intensity, density, height of structures, and noise. Within Flabob Airport imaginary approach surfaces and Areas of Additional Safety Concerns, residential lot sizes smaller than two and one-half acres are not allowed. These land use restrictions are fully set forth in Appendix L and are summarized in Table 4, Land Use Compatibility Guidelines for Airport Safety Zones for March, Flabob, Bermuda Dunes, Chino, and Skylark Airports, and land use proposals shall be evaluated for appropriateness within these safety zones. For more information on these zones and additional airport policies, refer to Appendix L and the Land Use, Circulation, Safety and Noise Elements of the Riverside County General Plan.

Jurupa Valley **GENERAL PLAN LAND USE DESIGNATIONS**

PA 9.3 To provide for the orderly development of Flabob Airport and the surrounding area, comply with the Airport Land Use Compatibility Plan for Flabob Airport as fully set forth in Appendix XX and as summarized in Table 4, as well as any applicable policies related to airports in the Land Use, Circulation, Safety and Noise Elements of the Interim General Plan.

Table 4: Land Use Compatibility Guidelines for Airport Safety Zones for Flabob Airport^{1,2}

| Safety Zone | Maximum Population Density | Maximum Coverage by Structures | Land Use |
|-------------|---|---|--|
| Area I | | 0 ³ | No significant obstructions ⁴ No petroleum or explosives No above-grade powerlines |
| Area II | <p>Uses in Structures:⁵ 25 persons/ac. OR 150 persons/bldg. (see text in the source document for the Comprehensive Land Use Plan for explanation)</p> <p>Uses not in structures: 50 persons/ac.</p> <p>Residential 2.5 Acre minimum lots</p> <p>Uses in Structures:⁵ 75 persons/ac. or 300 persons/bldg. (see text in the source document for the Comprehensive Land Use Plan for</p> | <p>25% of net area</p> <p>50% of gross area or 65% of net area whichever is greater</p> | <p>No residential No hotels, motels No restaurants, bars No schools, hospitals, government services No concert halls, auditoriums No stadiums, arenas No public utility stations, plants No Public communications facilities No uses involving, as the primary activity, manufacture, storage, or distribution of explosives or flammable materials.⁶</p> |
| Area III | Not Applicable | 50% of gross area or 65% of net area whichever is greater | <p>Discourage schools, auditoriums, amphitheaters, stadiums Discourage uses involving, as the primary activity, manufacture, storage, or distribution of explosives or flammable materials.⁶</p> |

NOTES:

1. The following uses shall be prohibited in all airport safety zones:
2. Any use which would direct a steady light or flashing light of red, white, green, or amber colors associated with airport operations toward an aircraft engaged in an initial straight climb following takeoff or toward an aircraft engaged in a straight final approach toward a landing at an airport, other than an FAA-approved navigational signal light or visual approach slope indicator.
3. Any use which would cause sunlight to be reflected towards an aircraft engaged in an initial straight climb following takeoff or towards an aircraft engaged in a straight final approach towards a landing at an airport.
4. Any use which would generate smoke or water vapor or which would attract large concentrations of

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

birds, or which may otherwise affect safe air navigation within the area.

5. Any use which would generate electrical interference that may be detrimental to the operation of aircraft and /or aircraft instrumentation.
6. Avigation easements shall be secured through dedication for all land uses permitted in any safety zones.
7. No structures permitted in the ETZ or ISZ zones.
8. Significant obstructions include but are not limited to large trees, heavy fences and walls, tall and steep berms and retaining walls, non-breakaway street light and sign standards, billboards.
9. A structure includes fully enclosed buildings and other facilities involving fixed seating and enclosures limiting the mobility of people, such as sports stadiums, outdoor arenas, and amphitheaters. This does not apply to service stations involving retail sale of motor vehicle fuel if fuel storage tanks are installed underground.
 - This does not apply to service stations involving retail sale of motor vehicle fuel if fuel storage tanks are installed underground.
 - Within the TPZ safety zone, a variety of land uses are to be discouraged from being developed. When development of these uses is proposed, the Airport Land Use Commission shall require the applicant to show that alternative locations have been considered and are not feasible. The applicant shall then be directed to consider a development plan that will minimize the exposure to hazard as much as possible. This might involve reducing structure heights, reducing lot coverage, or reducing the overall scale of the project, considering satellite locations for some of the proposed functions of the facility.
 - Land uses described as uses to be discouraged, which were lawfully established prior to the adoption of the Comprehensive Land Use Plan, shall be permitted to be modified or enlarged provided that avigation easements are granted to Riverside County.

Table 5: Land Use Compatibility Guidelines for Riverside Municipal Airport

| Safety Zone | Maximum Population | Maximum Coverage | Land Use |
|--------------------------------|---|------------------|---|
| ETZ - Emergency Touchdown Zone | 0 ¹ | 0 ¹ | No significant obstructions ² |
| ISZ - Inner Safety Zone | 0 ¹ | 0 ¹ | No petroleum or explosive No above-grade powerlines |
| OSZ - Outer Safety Zone | Uses in structures ³ : 25 persons/ac. (see text in the source document for the Comprehensive Land Use Plan for explanation) Uses not in structures: 50 persons/ac. | 25% of net area | No residential No hotels, motels No restaurants, bars No schools, hospitals, government services No concert halls, auditoriums No stadiums, arenas No public utility stations, plants No public communications facilities No uses involving, as the primary activity, manufacture, storage, or distribution of explosives or flammable materials. |

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

| | | | |
|---------------------------------------|--|---|---|
| ERC - Extended Runway Centerline Zone | 3 du/net acre Uses in structures ³ : 100 persons/ac.(see text in the source document for explanation) | 50% of gross area or 65% of net area whichever is greater | No uses involving, as the primary activity, manufacture, storage, or distribution of explosives or flammable materials. ⁴ |
| TPC - Traffic Pattern Zone | Not Applicable | 50% of gross area or 65% of net area whichever is greater | Discourage schools, auditoriums, amphitheaters, stadiums ⁵ Discourage uses involving, as the primary activity, manufacture, storage, or distribution of explosives or flammable materials. ^{4,5} |

NOTES:

1. The following uses shall be prohibited in all airport safety zones:
 2. Any use which would direct a steady light or flashing light or red, white, green, or amber colors associated with airport operations toward an aircraft engaged in an initial straight climb following takeoff or toward an aircraft engaged in a straight final approach toward a landing at an airport, other than an FAA approved navigational signal light or visual approach slope indicator.
 3. Any use which would cause sunlight to be reflected toward an aircraft engaged in an initial straight climb following takeoff or toward an aircraft engaged in a straight final approach toward a landing at an airport.
 4. Any use which would generate smoke or water vapor or which would attract large concentrations or birds, or which may otherwise affect safe air navigation within the area.
 5. Any use which would generate electrical interference that may be detrimental to the operation of aircraft and/or aircraft instrumentation.
 6. Avigation easements shall be secured through dedication for all land uses permitted in any safety zone.
 7. No structures permitted in the ETZ or ISZ zones.
 8. Significant obstructions include, but are not limited to, large trees, heavy fences and walls, tall and steep berms and retaining walls, non-breakaway street lights and sign standards, billboards.
 9. Structures include fully enclosed buildings and other facilities involving fixed seating and enclosures limiting the mobility of people, such as sports stadiums, outdoor arenas, and amphitheaters.
- This does not apply to service stations involving retail sale of motor vehicle fuel if fuel storage tanks are installed underground.
 - Within the TPZ safety zone, a variety of land uses are to be discouraged from being developed. When development of these uses is proposed, the Airport Land Use Commission shall require the applicant to show that alternative locations have been considered and are not feasible. The applicant shall then be directed to consider a development plan that will minimize the exposure to hazard as much as possible. This might involve reducing structure heights, reducing lot coverage, or reducing the overall scale of the project, considering satellite locations for some of the proposed functions of the facility.

Jurupa Valley GENERAL PLAN LAND USE DESIGNATIONS

- Land uses described as uses to be discouraged, which were lawfully established prior to the adoption of the Comprehensive Land Use Plan, shall be permitted to be modified or enlarged provided that aviation easements are granted to Riverside County.

Riverside Municipal Airport Influence Policy Area

The boundary of the Riverside Municipal Airport Influence Area is shown on Figure 4, Policy Areas. There are four safety zones associated with the Airport Influence Area. These safety zones are shown in Figure 5, Riverside Municipal Airport and Flabob Airport Influence Policy Area. Properties within these zones are subject to regulations governing such issues as development intensity, density, height of structures, and noise. These land use restrictions are fully set forth in Appendix XX and are summarized in Table 5, Land Use Compatibility Guidelines for Airport Safety Zones for Riverside Airport. For more information on these zones and additional airport policies, refer to Appendix XX and the Land Use, Circulation, Safety and Noise Elements of the Interim General Plan.

Policies:

PA 9.1 To provide for the orderly development of Riverside Municipal Airport and the surrounding area, City will comply with the Airport Land Use Compatibility Plan for Riverside Municipal Airport as fully set forth in Appendix L and as summarized in Table 5, as well as any applicable policies related to airports in the Land Use, Circulation, Safety and Noise Elements of the General Plan.

Specific Plans

Specific Plans are highly customized policy or regulatory tools that provide a bridge between the General Plan and individual development projects in a more area-specific manner than is possible with community-wide zoning ordinances. The specific plan is a tool that provides land use and development standards that are tailored to respond to special site assets, issues and community needs that apply to the area being proposed for development and/or conservation.

Specific Plans are identified in this section because detailed study and development direction is provided in each plan. Policies related to any listed specific plan can be reviewed at the Riverside County Planning Department. The five specific plans located in the Jurupa planning area are listed in Table 3, Adopted Specific Plans in Interim General Plan. Specific Plan No. 123 (Mission de Anza), Specific Plan No. 210 (Agua Mansa), Specific Plan No. 243 (Rio Vista) and Specific Plan No. 337 (Emerald Meadows Ranch) are determined to be Community Development Specific Plans. Specific Plan No. 125 (Sky Country) is determined to be a Rural Community Specific Plan

Table 3: Adopted Specific Plans in Interim General Plan ¹

City of Jurupa Valley

STAFF REPORT

DATE: FEBRUARY 18, 2016
TO: HONORABLE MAYOR AND MEMBERS OF THE CITY COUNCIL AND PLANNING COMMISSION
FROM: GARY S. THOMPSON, CITY MANAGER
BY: THOMAS G. MERRELL, AICP, PLANNING DIRECTOR
SUBJECT: AGENDA ITEM NO. **XX**
JOINT GENERAL PLAN STUDY SESSION ON THE GENERAL PLAN HOUSING ELEMENT: POTENTIAL HOUSING ISSUES, NEEDS, AND STRATEGIES

RECOMMENDATION

Receive an introduction on the Interim General Plan (IGP) Housing Element's key issues, needs and strategies, discuss and provide input as appropriate, and refer the item to the Planning Commission for further review.

PURPOSE OF MEETING

This evening, the City Council and Planning Commission will learn about the key housing factors in Jurupa Valley to be addressed in the Housing Element, including important housing issues that merit special discussion, and staff's thoughts on potential strategies to address those issues. This meeting is intended to *introduce* these topics for discussion and to provide comments to staff. No decisions or final actions will be taken. The draft Housing Element will be considered by the Planning Commission and the City Council later this year.

BACKGROUND

The City is updating its housing element. Originally prepared by the County of Riverside and adopted by the City when it incorporated in 2011, the current Element is out of date, not relevant to the young City's goals and needs, and is due for updating. Jurupa Valley's new Housing Element will set out the City's housing goals, policies and programs through the year 2021.

Simply stated, the housing element does two things: 1) it serves as the main policy guide for local decision-making on all housing matters, and 2) describes the City's demographic, economic and housing factors. Of the seven mandatory chapters, or "elements" in a general plan, the Housing Element is the most detailed and precisely defined by State law. Along with the Safety Element, it is one of only two elements that must be reviewed and approved by State

agencies. The Housing Element works in concert with the other General Plan elements to help achieve broad community goals.

Requirements of State Law

State law recognizes the vital role local governments play in the supply and affordability of housing. Housing element law, enacted in 1969, requires cities and counties to adequately plan to meet the existing and projected housing needs for all economic segments of the community. For the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems which provide opportunities for, and do not unduly constrain, housing development. As a result, California housing policy depends largely upon local general plans and, in particular, on local housing elements. Housing element law also requires the Department of Housing and Community Development (“HCD”) to review local housing elements for compliance with State law and to report its written findings to the local government and to certify housing elements that meet the law.

City of Jurupa Valley Perspective

As the City engages the subject of its housing element, it is important to keep the discussion of sensitive subjects in perspective. Meeting State requirements for housing will not be difficult to satisfy, and will not jeopardize the community values developed by the General Plan Advisory Committee. Thus, staff encourages the Commission and Council to keep the following factors in mind when considering the key housing issues:

1. The City’s land area is approximately 29,000 acres. Preliminary studies suggest that only about 18 acres of medium and high density zoning may needed to satisfy State requirements for affordable housing. If such zoning is located in several areas, it will have no significant effect on the community character of low density, small town with traditional neighborhoods and equestrian lifestyle.
2. The GPAC has considered the value of allowing medium and high density residential in a few areas of the City as a strategy to increase property values in distressed neighborhoods and provide the economic conditions to attract quality retail and dining uses.
3. A diversity of housing types is essential to the long term sustainability of any community.
4. Medium or high density does not automatically translate into rental apartments. Multiple dwelling residential projects can include townhomes, condominiums and other forms of home ownership. The result is new high quality, ownership neighborhoods that serve entry level housing needs for young adults that are newly entering the job market.
5. Residents of affordable housing are typically young adults, young families or senior citizens with steady incomes and ties to the local community.

KEY HOUSING ISSUES

Following is a description of key housing issues that need to be addressed in the new Housing Element. These issues merit discussion and may require changes to City General Plan and/or Zoning Codes. Staff has analyzed the City’s demographic picture, housing constraints, and vacant land resources for the construction of new housing. The preliminary results of these analyses provide the technical background on which the Housing Element’s policies and

programs will be based. And while the Housing Element must contain certain information to meet State law, it must also be consistent with the other General Plan elements and with the Community's values, hopes and aspirations as reflected in the adopted Community Value Statement. Staff has identified the following preliminary key housing issues:

1. Regional Housing Needs Allocation ("RHNA") Compliance.

What is "RHNA?" It is an abbreviation for the Regional Housing Needs Allocation, a statewide requirement that all cities and counties "accommodate" a share of their region's total housing need. This share, measured in terms of numbers of dwelling units, must be addressed in the jurisdiction's general plan housing element. Jurupa Valley's RHNA numbers for the current seven-year planning period are shown in Table 1.

Table 1: City of Jurupa Valley's Regional Housing Needs Allocation, 1/1/2014 – 10/1/21

| Income Level | Very Low | Low | Moderate | Above Mod | Total |
|-----------------------|----------|-----|----------|-----------|-------|
| No. of Dwelling Units | 409* | 275 | 307 | 721 | 1,712 |
| % of Total | 24% | 16% | 18% | 42% | 100% |
| Source: SCAG 2012 | | | | | |

To meet their RHNA requirement, cities typically identify adequate sites for residential development. Adequate sites includes the following:

- Vacant residentially zoned sites.
- Vacant non-residentially zoned sites that allow residential uses.
- Underutilized residentially zoned sites which are capable of being redeveloped/remodeled at a higher density.
- Non-residential zoned sites that can be redeveloped for, and/or rezoned for, residential use.

Briefly, RHNA is met when a jurisdiction shows that within the Planning Period, it has approved construction of sufficient housing units to meet its allocation, or has designated sufficient vacant land at appropriate densities for each income level. Housing developed at densities of at least 25 dwelling units per acre (du/A) is deemed to be "affordable" to lower income households.

Jurupa Valley has already met its RHNA requirement for Moderate and Above Moderate cost housing; however the City needs additional zoned land suitable for the development of at least 315 new, lower income dwellings at a density of 25 du/A, plus 102 new dwellings at a density of about 20 du/A for Moderate Income housing. Based on a preliminary analysis of Jurupa Valley's vacant land inventory, the City should consider two actions to comply with RHNA:

- 1) Amend the General Plan Land Use Map and rezone about 13 acres designated at 25 du/ac and about 5 acres designated at 20 du/ac to meet the RHNA numbers; and

- 2) Amend the General Plan and Zoning Ordinance to allow a residential density of at least 25 du/A in the Highest Residential Density (HHDR) General Plan land use designation and in the Residential Incentive (R-6) Zone.

The General Plan Advisory Committee (GPAC) felt that higher density, multi-family housing, including apartments and condominiums, should generally be located close to jobs, commercial centers, and major thoroughfares. Based on GPAC comments and staff's assessment, potential areas where higher residential densities may be appropriate include portions of Belltown, Industrial designated land south of 26th Street, neighborhoods adjacent to and south of CA-60, the Crestmore Project area, the Emerald Meadows Specific Plan area and in Country Village. The residential project proposed by the Riverside County Housing Authority south of the Mission Plaza site would satisfy most or all of the City's RHNA.

2. Affordable Housing.

There are many different interpretations of "affordable housing." As used in many cities' general plans and government-sponsored housing programs, affordable housing means housing that is sold or rented at costs that do not exceed a percentage of a Very Low, Low or Moderate Income household's budget – typically, 30 to 35 percent of the household's gross monthly income. To qualify as "affordable" under state or federal standards, such housing is subject to deed restrictions or other mechanism that ensures the housing remains affordable for a set period.

"Affordability" is tied to an area's median income ("AMI"), as published by the State of California on an annual basis. The five household income levels are "Above Moderate", with the annual income set at 120 percent or higher of AMI, "Moderate" with the income level from 80 and 119 percent of AMI, "Low" with the income level between 50 and 79 percent of AMI, "Very Low" with an annual income range of less than 50 percent AMI and "Extremely Low" income which is the higher of 30 percent of the Area Medium Income or the federal poverty level. Table 2 shows the 2015 State Income Limits for Riverside County:

Table 2: State Household Income Limits (\$), Riverside County, 2015

| Income Level | Household Size | | | | | |
|---------------|----------------|--------|--------|---------------|--------|--------|
| | 1 | 2 | 3 | 4 | 5 | 6 |
| Moderate | 54,600 | 62,400 | 70,200 | 78,000 | 84,250 | 90,500 |
| Median | 45,500 | 52,000 | 58,500 | 65,000 | 70,200 | 75,400 |
| Low | 37,550 | 42,900 | 48,250 | 53,600 | 57,900 | 62,200 |
| Very Low | 23,450 | 26,800 | 30,150 | 33,500 | 36,200 | 38,900 |
| Extremely Low | 14,100 | 16,100 | 20,090 | 24,250 | 28,410 | 32,570 |

The City's Housing Profile shows Jurupa Valley's 2011 median household income ranged from \$45,600 to \$68,300, depending upon the community. A preliminary evaluation of the City's housing needs showed that in 2015, a significant portion of households in Jurupa Valley had a cost burden greater than 30 percent. Cost burden is the fraction of a household's total gross

income spent on housing costs. For renters, housing costs include rent paid by the tenant plus utilities. For owners, housing costs include mortgage payment, taxes, insurance, and utilities.

Among renters, 56 percent of Jurupa households spent more than 30 percent of their income on housing costs. About 29 percent of renters spent more than 50 percent of their income on housing costs, which is often referred to as a severe housing cost burden. Cost burden rates were also high among Jurupa Valley homeowners. Almost 42 percent of owner-households spent more than 30 percent of their income on housing, and 19 percent spent more than 50 percent of their income on housing. From this and other available housing data, it is evident that many of our own residents would benefit by more diversity and affordability of housing in Jurupa Valley. Much of the City's most affordable housing is in older neighborhoods where many units have deferred maintenance or do not meet current building and zoning codes.

During the process of developing a Housing Element, we must determine the best means of encouraging housing that meets an entire range of housing needs and budgets, including large equestrian properties and multi-family housing. Even with relatively "affordable" sales and rental prices when compared with coastal areas, Jurupa's new housing is priced too high for many seniors, veterans, disabled persons, young families, and adult children hoping to continue to live in the communities in which they grew up. These and other lower income households must sometimes move outside Jurupa Valley to find apartments or condominiums at a lower price point that meets their budget. Properly designed and located, new affordable housing can be designed to complement nearby market-rate housing, and enhance a neighborhood's appearance and quality of life, consistent with its overall character. Distressed neighborhoods, in particular, can benefit from the additional investment and new construction that affordable housing development can bring.

Cities use various tools to encourage affordable housing, including zoning, density incentives, "inclusionary housing incentives" (requiring a percentage of new housing be developed as "affordable"), state and federal grants, and cooperative programs with housing agencies and non-profit housing providers, such as the Riverside County Housing Authority, Habitat for Humanity and others. The City's Housing Element will include programs to address constraints to housing production and to promote the full range of housing types and needs, including affordable housing.

3. Homeless Shelter and SB 2 Compliance.

Housing for homeless persons is one type of "special needs housing" that must be addressed in all housing elements. According to a 2015 Point-In-Time Homeless Count Report prepared by Riverside County, there were 168 unsheltered homeless persons living in the City in 2015, or about 11 percent of the 1587 total unsheltered persons living in Riverside County. The Report notes that of Riverside County's cities and unincorporated areas, the City of Jurupa Valley is second in terms of highest number of unsheltered homeless persons, behind the City of Riverside with 399 persons, and followed by the cities of Palm Springs and Hemet with 118 and 117 unsheltered homeless persons, respectively.

SB 2 is a state law intended to encourage the construction of emergency shelters to provide temporary housing for homeless persons. It requires cities and counties to designate at least one zone where emergency shelters are allowed as a permitted use, without requiring

discretionary approval. SB 2 does not require cities and counties to actually build, fund or provide emergency shelters. The Housing Element must describe how the City intends to meet this requirement.

Jurupa Valley's Municipal Code addresses the SB 2 requirement by allowing homeless shelters in the Industrial Park zone (I-P), subject to the approval of a Site Development Permit. It establishes basic standards that include minimum floor areas for various use areas, off-street parking, outdoor lighting and on-site management. This language was originally prepared by the County of Riverside and adopted by the City upon incorporation in 2011. According to the recent Vacant Land Inventory, the City has about 290 acres of vacant land zoned "I-P." There may be two potential problems with this approach:

- 1) *Discretionary Approval Required.* Jurupa Valley's Zoning Ordinance requires approval of a homeless shelter through approval of a Site Development Permit. SB 2 requires that the emergency shelter use be allowed with only a building permit issuance and provided that the minimum required shelter standards are met. If the existing City process is deemed inconsistent with SB 2, standards for this use can be amended to provide for compatibility and other concerns that would otherwise be addressed through a Site Development Permit; and
- 2) *Environmental Justice Element.* Locating emergency shelters in an Industrial zone may not be consistent with the EJ Element policy EJ-2.5, which requires that "the Zoning Regulations provide adequate separation and buffering of residential and industrial uses." This provision may be addressed by a) including a modification to the homeless shelter standards to address the need for a land use buffer (building setbacks, landscaping, fencing), to the extent allowed by SB 2; or b) by designating a non-industrial zone where a homeless shelter would be allowed. Other zones where the homeless shelter use may be appropriate are the Regulated Development Zone (R-D) and the Residential Incentive zone (R-6). Both zones are non-industrial and allow a wide range of residential multi-family uses, assembly and commercial uses. The City has about 17 acres of R-D zoned land and about 32 acres of R-6 zoned land.

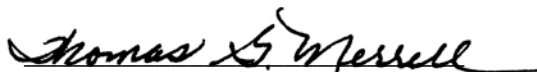

DISCUSSION

Staff requests that the City Council and Planning Commission discuss and where appropriate, provide input on the key housing issues. Specifically, input is requested on the following:

1. Diversity of housing types.
2. Encourage affordable housing that provides entry level ownership.
3. Options to address homeless shelter needs.
4. Are there additional significant housing issues that should be addressed in the Housing Element?

Draft SCAG Data/Map Book

for the Development of 2016-2040 Regional Transportation Plan/
Sustainable Communities Strategy (RTP/SCS)

City of Jurupa Valley

OUR VISION

An international and regional planning forum trusted for its leadership and inclusiveness in developing plans and policies for a sustainable Southern California.

OUR MISSION

Under the guidance of the Regional Council and in collaboration with our partners, our mission is to facilitate a forum to develop and foster the realization of regional plans that improve the quality of life for Southern Californians.

Funding:

The preparation of this document was financed in part through funds from the Federal Highway Administration and Federal Transit Administration. Additional financial assistance was provided by the California Department of Transportation.

Acknowledgments

Introduction

SB 375 (Steinberg), also known as California's Sustainable Communities Strategy and Climate Protection Act, is a state law that calls for the integration of transportation, land use, and housing planning and the reduction of greenhouse gas (GHG) emissions as one of the main goals for regional planning. Effective on January 1, 2009, the law requires SCAG as the Metropolitan Planning Organization, working together with subregional council of governments and the county transportation commission, to prepare a Sustainable Communities Strategy (SCS) as part of the Regional Transportation Plan (RTP) (or an Alternative Planning Strategy (APS), if necessary). Also, SCAG is required to integrate planning processes to be consistent with the SCS. SB 375 also emphasizes a substantial public participation process involving all stakeholders.

To meet the requirements under SB 375, SCAG prepares and provides a set of data/GIS maps to subregions and local jurisdictions for their review. These data/GIS maps are identified in SB 375 as required to be considered in SCS development. It should be noted that all data and maps provided here are to initiate dialogue among stakeholders to address the requirements of SB 375 and its implementation. Data/GIS maps will be further reviewed and updated through the local input process.

The list of data/GIS maps included in this book:

| | |

| <u>Land Use</u> General Plan Zoning Existing Land Use | <u>Major Stops & High Quality Transit Corridors</u> <u>Transit Priority Area</u> |
| <u>Resource Areas & Farmland</u> Endangered Species and Plants Flood areas Natural Community & Habitat Conservation Open Space and Parks Farmland | <u>Geographical boundaries</u> City Boundary & Sphere of Influence Census Tract Boundary Transportation Analysis Zone (TAZ) Boundary <u>Socioeconomic Data</u> 2012 Base Year Socioeconomic Estimates 2020, 2035 and 2040 Socioeconomic Forecast |

The SCAG Data/Map Book is designed to help local planners and those who are interested in SCAG's datasets better understand the sources, methodologies, and contents of each dataset. This book is prepared for each jurisdiction in the SCAG region and is used to collect input and comments from subregions and local jurisdictions.

This book begins with the brief descriptions of the datasets. This is followed by the data/GIS maps for each jurisdiction. Upon request, the maps can be provided in larger sizes for detailed review. SCAG may not be authorized to release certain datasets depending on the access/release constraints applied to each dataset. PDF maps and GIS shapefiles can be downloaded from [ftp://scag-data:\\$cag424@data.scag.ca.gov/Data_Map_Book](ftp://scag-data:$cag424@data.scag.ca.gov/Data_Map_Book). For more information or to request data and/or maps, please contact Frank Wen at (213) 236-1854, or wen@scag.ca.gov.

Land Use

SCAG staff prepared four sets of land use maps at the parcel level as follows:

- Adopted General plan land use based on city's general plan codes
- Adopted General plan land use based on 2012 SCAG General Plan Land Use Codes
- Adopted Zoning codes
- Existing land use (2012)

The current version of the land use data reflects each jurisdiction's input received by October 18, 2013. It should be noted that the datasets will be further reviewed and updated through the local input process which will end in May 2014.

General Plan Land Use & Zoning

Beginning in March 2013, SCAG communicated with local jurisdictions to collect local general plan and zoning information. Through the process of collecting general plan and zoning documents, SCAG staff made every effort to ensure the data reflects the most current general plan and zoning data. The information included in this book reflects each jurisdiction's input received by October 18, 2013. Comments and corrections will be incorporated as they are received.

The general plan and zoning documents, maps, and/or GIS shapefiles collected were coded into GIS shapefiles at the parcel level. Parcel boundary data were acquired from Digital Map Products (DMP). General plan and zoning data are shown at the parcel level and depict a local agency's adopted documents. However, the data shown in some areas may be generalized, because the parcel level database representing general plan data does not support multiple uses or designations on a single parcel (either splitting the parcel or representing overlays). Due to this limitation, if site specific data is necessary, users should always reference a local agency's adopted documents or field surveys to determine actual land use designations.

At the jurisdiction level, both general plan land use and zoning maps are prepared with local land use or zoning codes, consistent with those used in each local jurisdiction. In addition, another version of the general plan land use map is prepared with SCAG's standardized General Plan codes. For detailed information on the standardized codes, please refer to Table 1: 2012 SCAG General Plan Land Use Codes Table.

Existing Land Use

The base year of the 2016-2040 RTP/SCS is 2012. To develop the base year existing land use data, SCAG has used property land use information acquired from DMP and SCAG's 2008 existing land use data. Using a correspondence between DMP land use codes and SCAG's standardized 2012 Existing Land Use Codes, DMP land use codes were converted to SCAG's standardized Existing Land Use code system. Beginning in August 2013, the 2012 existing land use maps were

reviewed by local jurisdictions and revised based on the local input and comments. The information included in this book reflects the local inputs received by October 18, 2013. It should be noted that the datasets will be further reviewed and updated through the local input process.

As noted for General Plan and Zoning data, Existing Land Use data are shown at the parcel level and, in some areas, data may be generalized, because SCAG's parcel level database does not support multiple uses on a single parcel. Due to this limitation, if site specific data is necessary, users should always reference a local agency's adopted documents or field surveys to determine actual land use designations.

The Anderson Land Use Classification was used as the standardized land use code system. For more detailed information on the land use code system, refer to Table 2: 2012 SCAG Existing Land Use Codes Table.

**Table 1:
2012 SCAG General Plan Land Use Codes - Legend**

| Legend | Land Use Description |
|---|--|
|  Single Family Residential | 1110 Single Family Residential |
|  Multi-Family Residential | 1120 Multi-Family Residential |
|  Mobile Homes and Trailer Parks | 1130 Mobile Homes and Trailer Parks |
|  Mixed Residential | 1140 Mixed Residential 1100 Residential |
|  General Office | 1210 General Office Use |

Resource Areas & Farmland

SB 375 identifies as one of the guidelines on developing an SCS to “gather and consider the best practically available scientific information regarding resource areas and farmland in the region as defined in subdivision (a) and (b) of Section 65080.01.” The definitions of Resource areas and Farmland specified in Section 65080.01 are as following:

- (a) *“Resource areas” include*
 - (1) *all publicly owned parks and open space;*
 - (2) *open space or habitat areas protected by natural community conservation plans, habitat conservation plans, and other adopted natural resource protection plans;*
 - (3) *habitat for species identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies or protected by the federal Endangered Species Act of 1973, the California Endangered Species Act, or the Native Plant Protection Act;*
 - (4) *lands subject to conservation or agricultural easements for conservation or agricultural purposes by local governments, special districts, or nonprofit 501(c)(3) organizations, areas of the state designated by the State Mining and Geology Board as areas of statewide or regional significance pursuant to Section 2790 of the Public Resources Code, and lands under Williamson Act contracts;*
 - (5) *areas designated for open-space or agricultural uses in adopted open-space elements or agricultural elements of the local general plan or by local ordinance;*
 - (6) *areas containing biological resources as described in Appendix G of the CEQA Guidelines that may be significantly affected by the sustainable communities strategy or the alternative planning strategy; and*
 - (7) *an area subject to flooding where a development project would not, at the time of development in the judgment of the agency, meet the requirements of the National Flood Insurance Program or where the area is subject to more protective provisions of state law or local ordinance.*
- (b) *“Farmland” means farmland that is outside all existing city spheres of influence or city limits as of January 1, 2008, and is one of the following:*
 - (1) *Classified as prime or unique farmland or farmland of statewide importance.*
 - (2) *Farmland classified by a local agency in its general plan that meets or exceeds the standards for prime or unique farmland or farmland of statewide importance.*

To comply with the guidelines, SCAG prepared the relevant datasets of Endangered species and plants, Flood areas, Natural habitat, Open space and park, and Farmland from various sources.

To provide input on these datasets, please notify SCAG as well as the agencies listed as the primary owner of the database, discussed in detail here.

Endangered species and plants

SCAG obtained the California Natural Diversity Database (CNDDDB)¹ July 2013 version developed by the California Department of Fish and Wildlife's Biogeographic Data Branch (BDB). The CNDDDB is a library of the location and condition of species of rare and sensitive plants, animals, and natural communities in California. It is updated on a continuous basis to be consistent and current, but cannot be an exhaustive and comprehensive inventory of rare species and natural communities. Field verification for the absence and presence of sensitive species is required by the end users.

The dataset is shown on the map is based on the combination of the three data fields; element type, accuracy and element occurrence count. Other fields in CNDDDB describe the listing status, ranking, location, site description and source references, to name a few.

The types of elements (ELMTYPE) are specified as four categories of plant, animal, terrestrial community, and aquatic community.

| Value | Definition |
|-------|--|
| 1 | Plant (ELMCODEs beginning with "P" or "N") |
| 2 | Animal (ELMCODEs beginning with "A" or "I") |
| 3 | Terrestrial community (ELMCODEs beginning with "CT") |
| 4 | Aquatic community (ELMCODEs beginning with "CA", "CE", "CL", "CM" or "CR") |

The precision or accuracy level (ACC_CLASS) represents spatial uncertainty on a scale of one to ten, indicating both accuracy type and accuracy value.

| Value | Definition |
|-------------|--|
| 80 meters | 1: Specific bounded area with an 80 meter radius |
| Specific | 2: Specific bounded area |
| Nonspecific | 3: Non-specific bounded area |
| 1/10 mile | 4: Circular feature with a 150 meter radius (1/10 mile) |
| 1/5 mile | 5: Circular feature with a 300 meter radius (1/5 mile) |
| 2/5 mile | 6: Circular feature with a 600 meter radius (2/5 mile) |
| 3/5 mile | 7: Circular feature with a 1000 meter radius (3/5 mile) |
| 4/5 mile | 8: Circular feature with a 1,300 meter radius (4/5 mile) |
| 1 mile | 9: Circular feature with a 1,600 meter radius (1 mile) |
| 5 miles | 10: Circular feature with a 8,000 meter radius (5 miles) |

The element occurrence count (EOCOUNT) represents how many occurrences share the same spatial feature. An EOCOUNT greater than one indicates the presence of a "multiple."

For more information on the CNDDDB, please refer to their website (<http://www.dfg.ca.gov/biogeodata/cnddb/>). The CNDDDB is offered on a yearly subscription basis, and is prohibited from

¹ The CNDDDB is a "natural heritage program" and is part of a nationwide network of similar programs overseen by NatureServe (formerly part of The Nature Conservancy). All natural heritage programs provide location and natural history information on special status plants, animals, and natural communities to the public, other agencies, and conservation organizations. The data help drive conservation decisions, aid in the environmental review of projects and land use changes, and provide baseline data helpful in recovering endangered species and for research projects.

being distributed to anyone outside the subscribing organizations. The data can be ordered online at <http://www.dfg.ca.gov/biogeodata/cnddb/mapsanddata.asp>. Also, the web-based CNDDDB Quick Viewer which shows information only to the 7.5' quadrangle or county level is available at http://imaps.dfg.ca.gov/viewers/cnddb_quickviewer/app.asp.

Flood Areas

The flood area maps are based on the Digital Flood Insurance Rate Map (DFIRM), obtained from Federal Emergency Management Agency (FEMA) in October, 2013. The DFIRM Database is a digital version of the FEMA Flood Insurance Rate Maps (FIRM)² that is designed for use with digital mapping and analysis software. The FIRM is created by FEMA for the purpose of floodplain management, mitigation, and insurance activities for the National Flood Insurance Program (NFIP).

FEMA prepares the flood maps to show the extent of flood hazard in a flood prone community by conducting engineering studies called "Flood Insurance Studies (FISs). From the study, FEMA delineate Special Flood Hazard Areas (SFHAs), which are subject to inundation by a flood that has a 1 percent or greater chance of being equaled or exceeded during any given year. This type of flood is commonly referred to as 'the 100-year flood' or base flood. The 100-year flood has a 26 percent chance of occurring during a 30 year period, the length of many mortgages. The 100-year flood is a regulatory standard used by Federal and most State agencies to administer floodplain management programs.

The FIRM includes data on the 100-year (1% annual chance of occurring) and 500-year (0.2% annual chance of occurring) floodplains. The flood maps developed by FEMA are primary tools for state and local governments to mitigate the effects of flooding in their communities. The data are available to the public at FEMA's Map Service Center (<http://www.msc.fema.gov>). You may also request the related documents or other maps, such as FIS result report, or a Flood Boundary and Floodway Map (FBFM). For more information on the FIRM, refer to their website at <http://www.fema.gov/hazard/map/firm.shtm>. More details on the DFIRM Database and a detailed database specification are available at: http://www.fema.gov/plan/prevent/fhm/dfm_dfhm.shtm.

The map included in this book is prepared at the county level for better presentation of the flood areas, which is normally not constrained to city limits.

Natural Community & Habitat Conservation Plan

The data on natural community and habitat conservation plan are from the Natural Community Conservation Planning (NCCP) program of California Department of Fish and Wildlife. With partnerships with public and private organizations, NCCP is an effort for the protection and

² The FIRM is the official map of a community on which FEMA has delineated both the special hazard areas and the risk premium zones applicable to the community. Since 1970s, the FEMA has created and updated the flood hazard maps for National Flood Insurance Program (NFIP). NFIP was created by the US Congress in 1968 to reduce future damage and to provide protection for property owners from potential loss through an insurance mechanism.

perpetuation of biological diversity, while allowing compatible and appropriate economic activity. The NCCP program started in 1991 under the State's Natural Community Conservation Planning Act, which has broader orientation and objectives than the previous laws limited to the protection of species already declined in number significantly.

The primary objective is to conserve natural communities at the ecosystem level, while accommodating compatible land use. By considering the long-term stability of wildlife and plant communities, and including key interests in the planning process, it aims at anticipating and preventing the controversies in the surrounding areas of the species.

A local agency is in charge of monitoring the development of a conservation plan in cooperation with landowners, environmental organizations and other interest parties. The Department of Fish and Wildlife provides necessary support, direction, and guidance to NCCP participants.³ For more information on the NCCP phases and guidance, refer to their website at <http://www.dfg.ca.gov/habcon/nccp>.

Open Space and Park

For the 2016-2040 RTP/SCS, "all publicly owned" open spaces need to be considered as prescribed in SB 375. Data on publicly owned open space and parks comes from the California Protected Areas Database (CPAD), a GIS inventory of all publicly owned protected open space lands in the State of California through fee ownership. GreenInfo Network has prepared CPAD by aggregating and cross-checking various open space data from state, local and other agencies.

For a clear understanding of the database, it is important to understand two basic definitions of the database. First, the "protected" status in CPAD does not refer to a specific level of conservation for biodiversity values, but a general commitment to maintain the property for open space uses. Second, by fee ownership mechanism, it means that 1) the lands in CPAD are defined based on the agencies that owns the fee title to the property, not the managing parties, and 2) CPAD is not the database of all public lands, but that of all "publicly owned" open space. The owning agencies include public and non-profits, but currently the private owners and properties under the use of easements are excluded. Open space lands maintained other than ownership mechanisms (easement or related less-than-fee mechanisms) are provided in a separate database developed by GreenInfo Network. For more details on the inclusion criteria, see the CPAD manual from their website at http://www.calands.org/download/CPAD_Manual_June2010.pdf

The database is prepared into three feature classes; Holdings, Units, and Super Units. Holdings are the parcel level open space information, which correspond to assessor or tax parcel boundaries. Units and Super Units are the aggregated features for the cartographic representation. (Units: the aggregation of Holdings into specific parks and reserves/ Super Units:

³ Department of Fish and Game sponsors two grant programs for NCCP/HCPs: Local Assistance Grants (LAG) with the state funds for urgent tasks associated with implementing approved NCCPs or NCCPs anticipated to be approved within 12 months of grant application, and ESA SECTION 6 GRANTS program through the federal grant from the U.S. Fish and Wildlife Service (FWS).

the aggregation of federal and state Holdings regardless county boundaries) All classes of data are downloadable through their website at <http://www.calands.org/uses>. For user constraints, refer to the License Agreement. GreenInfo Network has released several versions of the CPAD since March, 2008. The most up-to-date version is 1.9, which was released in March, 2013. For more information on CPAD update histories and changes, see their website at <http://www.calands.org/data>

The map included in this book is presented by ownership. The lands in CPAD range from huge national forests to very small urban parks. Federal, state, county, city, special district and non-governmental agency holdings are included and have been mapped at the high levels of accuracy.

Farmland

Farmland information was obtained from the Farmland Mapping & Monitoring Program (FMMP) in the Division of Land Resource Protection in the California Department of Conservation. Established in 1982, the FMMP is to provide consistent and impartial data and analysis of agricultural land use and land use changes throughout the State of California.⁴

SCAG obtains the Important Farmland Map created by FMMP. The study area is in accordance to the soil survey developed by NRCS (National Resources Conservation Service) in the United States Department of Agriculture. Important Farmland Map is biennially updated based on a computer mapping system, aerial imagery, public review, and field interpretation.

The minimum land use mapping unit is 10 acres. The classification system of the map was developed by combining technical soil rating and current land use. For more information, refer to the website at <http://www.consrv.ca.gov/dlrp/fmmp/overview/Pages/index.aspx>.

| | |
|--------------------------------------|---|
| PRIME FARMLAND (P) | Farmland with the best combination of physical and chemical features able to sustain long term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date. |
| FARMLAND OF STATEWIDE IMPORTANCE (S) | Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date. |
| UNIQUE FARMLAND (U) | Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the four years prior to the mapping date. |
| FARMLAND OF LOCAL | Land of importance to the local agricultural economy as |

⁴ The FMMP was signed by the Legislature in 1982, and the first Important Farmland Maps were produced in 1984, covering 30.3 million acres. Through 12 biennial mapping cycles, data has expanded to 48.1 million acres as modern soil surveys were completed by USDA.

| | |
|-----------------------------|--|
| IMPORTANCE (L) | determined by each county's board of supervisors and a local advisory committee. |
| GRAZING LAND (G) | Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres. |
| URBAN AND BUILT-UP LAND (D) | Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. This land is used for residential, industrial, commercial, institutional, public administrative purposes, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, water control structures, and other developed purposes. |
| OTHER LAND (X) | Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines, borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land. |
| WATER (W) | Perennial water bodies with an extent of at least 40 acres. |
| NOT SURVEYED (Z) | Large government land holdings, including National Parks, Forests, and Bureau of Land Management holdings are not included in FMMP's survey area. |

The map included in this book is prepared based on the guidelines in (b) of Section 65080.01.

(b) "Farmland" means farmland that is outside all existing city spheres of influence or city limits as of January 1, 2008, and is one of the following:

- (1) Classified as prime or unique farmland or farmland of statewide importance.
- (2) Farmland classified by a local agency in its general plan that meets or exceeds the standards for prime or unique farmland or farmland of statewide importance.

Transit Priority Project

According to SB 375, 'a transit priority project' can be exempt from, or subject to a limited review of CEQA (the California Environmental Quality Act). The implementation of the SCS only includes 'a transit priority project' that is 'consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy, for which the State Air Resources Board, pursuant to subparagraph (H) of paragraph (2) of subdivision (b) of Section 65080 of the Government Code, has accepted a metropolitan planning organization's determination that the sustainable communities strategy or the alternative planning strategy would, if implemented, achieve the greenhouse gas emission reduction targets.' [Section 2115. (a)]

The bill specifically states that the transit priority project should:

- (1) *contain at least 50 percent residential use, based on total building square footage and, if the project contains between 26 percent and 50 percent nonresidential uses, a floor area ratio of not less than 0.75;*
- (2) *provide a minimum net density of at least 20 dwelling units per acre; and*
- (3) *be within one-half mile of a major transit stop or high-quality transit corridor included in a regional transportation plan. A major transit stop is as defined in Section 1064.3, except that, for purposes of this section, it also includes major transit stops that are included in the applicable regional transportation plan. For purposes of this section, a high-quality transit corridor means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours. A project shall be considered to be within one-half mile of a major transit stop or high-quality transit corridor if all parcels within the project have no more than 25 percent of their area farther than one-half mile from the stop or corridor and if not more than 10 percent of the residential units or 100 units, whichever is less, in the project are farther than one-half mile from the stop or corridor. [Section 2115. (b)]*

A transit priority project, which meets all the requirements of subdivision (a) and (b), and one of the requirements of subdivision (c) in Section 21155.1, can be declared by the legislative body of the jurisdiction, after conducting a public hearing, to be a Sustainable Communities Project (SCP). Once the project is designated as SCP, it can benefit from CEQA streamlining. For detailed information on SCP, refer to [Appendix 1: Sustainable Communities Project \(SCP\) Criteria](#).

[Major Stops & High Quality Transit Corridors](#)

To assist in identifying transit priority project areas, SCAG identifies major stops and high-quality transit corridors, and their surrounding areas in one-half mile radius distance, as specified in Section 2115. (b) (3). Major transit stops and high-quality transit corridors are extracted from 2035 planned year data in the 2012-2035 RTP/SCS Amendment #1.

The definitions of major transit stops and high quality transit corridors are as follows:

| | |
|--------------------------------------|---|
| Major transit stop | A site containing a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (CA Public Resource Code Section 21064.3). It also includes major transit stops that are included in the applicable regional transportation plan. |
| High-quality transit corridor | A corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours. |

Transit Priority Area (Defined by SB 743)

Senate Bill (SB) 743, signed into law on 9/27/2013, provides opportunities for California Environmental Quality Act (CEQA) exemption and streamlining to facilitate transit-oriented development. Specifically, certain types of projects within the “transit priority areas” could benefit from a CEQA exemption if it is also consistent with an adopted specific plan and the regional Sustainable Communities Strategy. In addition, aesthetic and parking impacts of certain infill projects within a transit priority area shall not be considered significant impacts on the environment. The State Office of Planning and Research (OPR) is required to develop guidelines for streamlined CEQA analysis for transportation impacts of projects within transit priority areas (draft by July 1, 2014). Finally, SB 743 also provides congestion management plan relief for a larger infill opportunity zone. SB 743 focuses the CEQA exemption and other streamlining opportunities in areas with good transit access, i.e. “Transit Priority Areas (TPAs).”

As defined in SB 743, “Transit Priority Area” means an area within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations. To assist in identifying the transit priority areas, SCAG identifies the major transit stops and their surrounding areas in one-half mile radius distance. Major transit stops are extracted from 2012 planned year data in the 2012-2035 RTP/SCS Amendment #1.

The definition of major transit stops is as follows:

Major transit stop

A site containing a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (CA Public Resource Code Section 21064.3). It also includes major transit stops that are included in the applicable regional transportation plan.

Please note that this map is still in draft form and may undergo changes as SCAG continues to update its transportation network. Updates to this information will be forthcoming as information becomes available.

Geographical Boundaries

City boundary & Sphere of Influence

City boundary and sphere of influence information are from each County's Local Agency Formation Commissions (LAFCO). The information included here are as of July 2012, the base year for the 2016-2040 RTP/SCS. SCAG uses the data directly from LAFCO as the legitimate source based on the legal requirement of SB 375. For inaccuracy or changes in city boundaries or sphere of influences, local jurisdictions need to contact LAFCO to reflect the most accurate city and sphere boundaries.

Census tract boundary (For Information Only)

The census tract boundaries are the 2010 TIGER/Line Shapefiles version, downloaded from U.S. Census, TIGER (Topologically Integrated Geographic Encoding and Referencing) Products website (<http://www.census.gov/geo/maps-data/data/tiger.html>).

TAZ boundary

SCAG developed the Transportation Analysis Zones (TAZ) for the SCAG Region, based on the 2010 Tiger Census Block. This is used to facilitate Travel Demand and Land Use Modeling needs at SCAG.

Socioeconomic Data

SCAG prepares the integrated growth forecasts at multiple geographic levels and for multiple years. By refining and maintaining the regional and small area socioeconomic forecasting/allocation models, the Forecasting Section at SCAG is responsible for producing the socioeconomic estimates and projections, used for the federal and state mandated long-range planning effort.

The socioeconomic data presented in this document is prepared for the 2016-2040 RTP/SCS. The data includes 2012 base year estimates and 2020, 2035 and 2040 forecasts. Among the various levels of geographic units, the city level and Traffic Analysis Zone (TAZ) level data are summarized in this document.

An important part of the RTP/SCS development process is establishing a framework for CEQA streamlining under SB 375. For example, this can involve delineating uses, densities, and intensities such that subsequent development projects can be found consistent with the SCS. SCAG invites local jurisdictions to provide input to the RTP/SCS growth and land use assumptions (scenario plan) for this purpose, with the clear understanding that land use information should be developed in a voluntary, bottom up process, based on interest and participation at the option of each jurisdiction.

The chart below shows city level socioeconomic data.

Socioeconomic estimates and projection by TAZ (split by City boundary)

| TAZ | POP12 | POP20 | POP35 | POP40 | HH12 | HH20 | HH35 | HH40 | EMP12 | EMP20 | EMP35 | EMP40 |

Appendix 1: Sustainable Communities Project (SCP) Criteria

(Extracted from Senate Bill No. 375 Chapter 728)

Chapter 4.2. Implementation of the Sustainable Communities Strategy

21155.1. If the legislative body finds, after conducting a public hearing, that a transit priority project meets all of the requirements of subdivisions (a) and (b) and one of the requirements of subdivision (c), the transit priority project is declared to be a sustainable communities project and shall be exempt from this division.

(a) The transit priority project complies with all of the following environmental criteria:

(1) The transit priority project and other projects approved prior to the approval of the transit priority project but not yet built can be adequately served by existing utilities, and the transit priority project applicant has paid, or has committed to pay, all applicable in-lieu or development fees.

(2)

(A) The site of the transit priority project does not contain wetlands or riparian areas and does not have significant value as a wildlife habitat, and the transit priority project does not harm any species protected by the federal Endangered Species Act of 1973 (16 U.S.C. Sec. 1531 et seq.), the Native Plant Protection Act (Chapter 10 (commencing with Section 1900) of Division 2 of the Fish and Game Code), or the California Endangered Species Act (Chapter 1.5 (commencing with Section 2050) of Division 3 of the Fish and Game Code), and the project does not cause the destruction or removal of any species protected by a local ordinance in effect at the time the application for the project was deemed complete.

(B) For the purposes of this paragraph, "wetlands" has the same meaning as in the United States Fish and Wildlife Service Manual, Part 660 FW 2 (June 21, 1993).

(C) For the purposes of this paragraph:

(i) "Riparian areas" means those areas transitional between terrestrial and aquatic ecosystems and that are distinguished by gradients in biophysical conditions, ecological processes, and biota. A riparian area is an area through which surface and subsurface hydrology connect waterbodies with their adjacent uplands. A riparian area includes those portions of terrestrial ecosystems that significantly influence exchanges of energy and matter with aquatic ecosystems. A riparian area is adjacent to perennial, intermittent, and ephemeral streams, lakes, and estuarine-marine shorelines.

(ii) "Wildlife habitat" means the ecological communities upon which wild animals, birds, plants, fish, amphibians, and invertebrates depend for their conservation and protection.

(iii) Habitat of "significant value" includes wildlife habitat of national, statewide, regional, or local importance; habitat for species protected by the federal Endangered Species Act of 1973 (16 U.S.C. Sec. 1531, et seq.), the California Endangered Species Act (Chapter 1.5 (commencing with Section 2050) of Division 3 of the Fish and Game Code), or the Native Plant Protection Act (Chapter 10 (commencing with Section 1900) of Division 2 of the Fish and Game Code); habitat identified as candidate, fully protected, sensitive, or species of special status by local, state, or federal agencies; or habitat essential to the movement of resident or migratory wildlife.

(3) The site of the transit priority project is not included on any list of facilities and sites compiled pursuant to Section 65962.5 of the Government Code.

(4) The site of the transit priority project is subject to a preliminary endangerment assessment prepared by a registered environmental assessor to determine the existence of any release of a hazardous substance on the site and to determine the potential for exposure of future occupants to significant health hazards from any nearby property or activity.

(A) If a release of a hazardous substance is found to exist on the site, the release shall be removed or any significant effects of the release shall be mitigated to a level of insignificance in compliance with state and federal requirements.

(B) If a potential for exposure to significant hazards from surrounding properties or activities is found to exist, the effects of the potential exposure shall be mitigated to a level of insignificance in compliance with state and federal requirements.

(5) The transit priority project does not have a significant effect on historical resources pursuant to Section 21084.1.

(6) The transit priority project site is not subject to any of the following:

(A) A wildland fire hazard, as determined by the Department of Forestry and Fire Protection, unless the applicable general plan or zoning ordinance contains provisions to mitigate the risk of a wildland fire hazard.

(B) An unusually high risk of fire or explosion from materials stored or used on nearby properties.

(C) Risk of a public health exposure at a level that would exceed the standards established by any state or federal agency.

(D) Seismic risk as a result of being within a delineated earthquake fault zone, as determined pursuant to Section 2622, or a seismic hazard zone, as determined pursuant to Section 2696, unless the applicable general plan or zoning ordinance contains provisions to mitigate the risk of an earthquake fault or seismic hazard zone.

(E) Landslide hazard, flood plain, flood way, or restriction zone, unless the applicable general plan or zoning ordinance contains provisions to mitigate the risk of a landslide or flood.

(7) The transit priority project site is not located on developed open space.

(A) For the purposes of this paragraph, "developed open space" means land that meets all of the following criteria:

(i) Is publicly owned, or financed in whole or in part by public funds.

(ii) Is generally open to, and available for use by, the public.

(iii) Is predominantly lacking in structural development other than structures associated with open spaces, including, but not limited to, playgrounds, swimming pools, ballfields, enclosed child play areas, and picnic facilities.

(B) For the purposes of this paragraph, "developed open space" includes land that has been designated for acquisition by a public agency for developed open space, but does not include lands acquired with public funds dedicated to the acquisition of land for housing purposes.

(8) The buildings in the transit priority project are 15 percent more energy efficient than required by Chapter 6 of Title 24 of the California Code of Regulations and the buildings and landscaping are designed to achieve 25 percent less water usage than the average household use in the region.

(b) The transit priority project meets all of the following land use criteria:

- (1) The site of the transit priority project is not more than eight acres in total area.
- (2) The transit priority project does not contain more than 200 residential units.
- (3) The transit priority project does not result in any net loss in the number of affordable housing units within the project area.
- (4) The transit priority project does not include any single level building that exceeds 75,000 square feet.
- (5) Any applicable mitigation measures or performance standards or criteria set forth in the prior environmental impact reports, and adopted in findings, have been or will be incorporated into the transit priority project.
- (6) The transit priority project is determined not to conflict with nearby operating industrial uses.
- (7) The transit priority project is located within one-half mile of a rail transit station or a ferry terminal included in a regional transportation plan or within one-quarter mile of a high-quality transit corridor included in a regional transportation plan.

(c) The transit priority project meets at least one of the following three criteria:

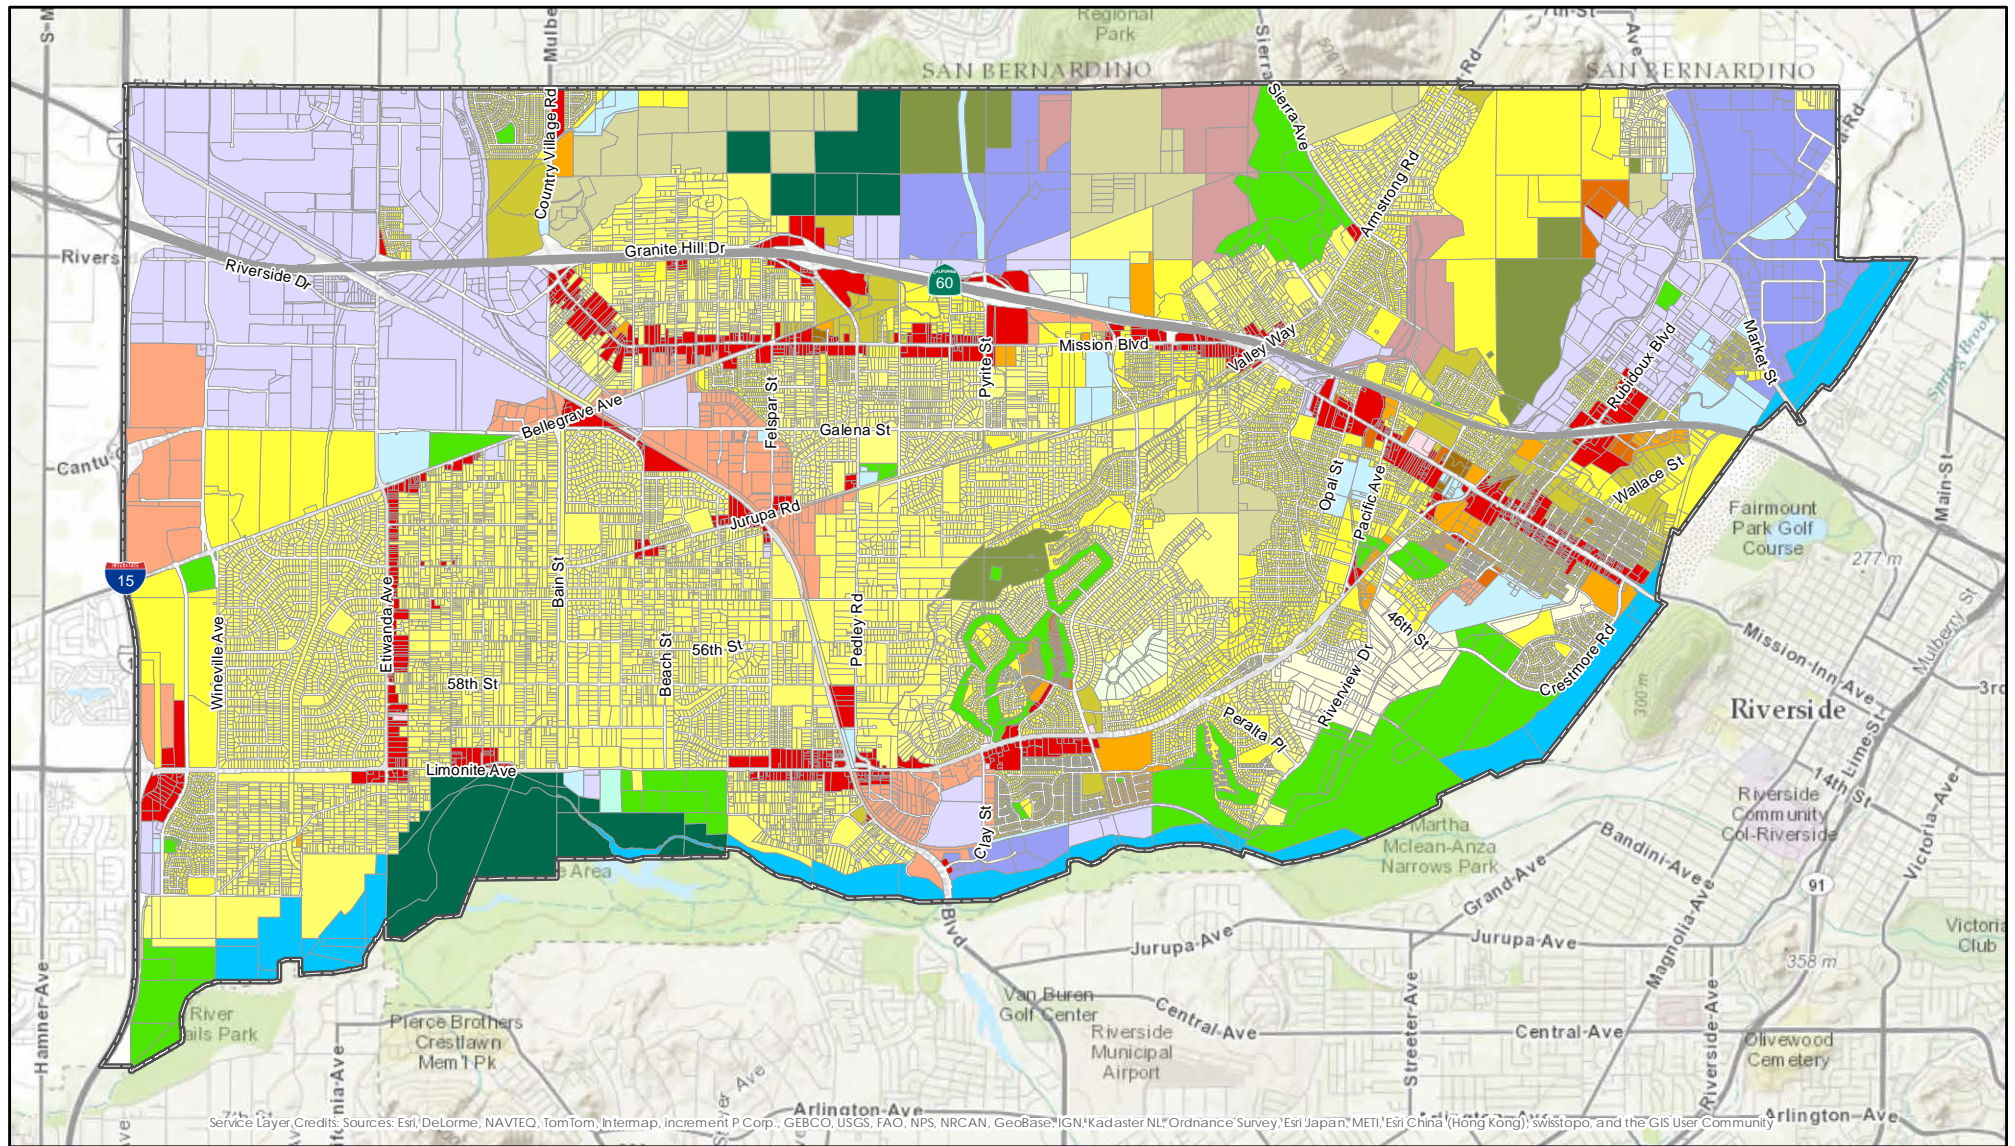

- (1) The transit priority project meets both of the following:
 - (A) At least 20 percent of the housing will be sold to families of moderate income, or not less than 10 percent of the housing will be rented to families of low income, or not less than 5 percent of the housing is rented to families of very low income.
 - (B) The transit priority project developer provides sufficient legal commitments to the appropriate local agency to ensure the continued availability and use of the housing units for very low, low-, and moderate-income households at monthly housing costs with an affordable housing cost or affordable rent, as defined in Section 50052.5 or 50053 of the Health and Safety Code, respectively, for the period required by the applicable financing. Rental units shall be affordable for at least 55 years. Ownership units shall be subject to resale restrictions or equity sharing requirements for at least 30 years.
- (2) The transit priority project developer has paid or will pay in-lieu fees pursuant to a local ordinance in an amount sufficient to result in the development of an equivalent number of units that would otherwise be required pursuant to paragraph (1).
- (3) The transit priority project provides public open space equal to or greater than five acres per 1,000 residents of the project.

Maps

The list of GIS maps included:

- General Plan Land Use (Based on City's General Plan Codes)
- General Plan Land Use (Based on 2012 SCAG General Plan Land Use Codes)
- Zoning
- Existing Land Use (Based on 2012 SCAG Existing Land Use Codes)
- Endangered, Threatened, and Rare Plant and Animal Species
- Federally Designated Flood Hazard Zones
- Natural Community & Habitat Conservation Plans
- Protected Open Space
- Farmland
- Major Stops & High Quality Transit Corridors
- Transit Priority Areas
- Sphere of Influence

City of Eastvale Bicycle Master Plan

February 2016

ACKNOWLEDGMENTS

The City of Eastvale Bicycle Master Plan was prepared under the guidance of:

Michele Nissen, City Manager

George Alvarez, City Engineer

Ruben Castaneda, Assistant Engineer

Additional project support was provided by the following stakeholders:

Eric Norris, Planning Director, City of Eastvale

Cathy Perring, Assistant Planning Director, City of Eastvale

Steven Ellis, Coordinator, Corona-Norco Unified School District

Ted Rozzi, Assistant Superintendent, Corona-Norco Unified School District

Scott Forbes, Lieutenant and Assistant Police Chief, City of Eastvale

Richard Welch, Director of Parks and Community Affairs, Jurupa Community Services District

This plan was prepared by KTU+A Planning + Landscape Architecture:

John Holloway, Candidate Principal, PLA, ASLA, LEED Green Associate, LCI

Joe Punsalan, Candidate Senior Associate, GISP, PTP, LCI

Alison Moss, Mobility Planner

Beth Chamberlin, Senior Planner

Jacob Leon, Senior Planner

Juan Alberto Bonilla, Planner

Kristin Bleile, GIS Analyst

Diana Smith, GIS Analyst

Public input was provided by community workshop participants.

This is a project for the City of Eastvale with funding provided by the Southern California Association of Governments (SCAG) Sustainability Program. The Sustainability Program is a key SCAG initiative for implementing the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), combining Compass Blueprint assistance for integrated land use and transportation planning with new Green Region Initiative assistance aimed at local sustainability and Active Transportation assistance for bicycle and pedestrian planning efforts. Sustainability Projects are intended to provide SCAG-member jurisdictions the resources to implement regional policies at the local level, focusing on voluntary efforts that will meet local needs and contribute to implementing the RTP/SCS, reducing greenhouse gas (GHG) emissions, and providing the range of local and regional benefits outlined in the RTP/SCS.

The preparation of this report has been financed in part through grant(s) from the Federal Transit Administration (FTA) through the U.S. Department of Transportation (DOT) in accordance with the provisions under the Metropolitan Planning Program as set forth in Section 104(f) of Title 23 of the U.S. Code.

The contents of this report reflect the views of the author who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of SCAG, DOT or the State of California. This report does not constitute a standard, specification or regulation. SCAG shall not be responsible for the City's future use or adaptation of the report.

Chapter 1:

INTRODUCTION

PROJECT SCOPE

This Bicycle Master Plan was prepared for the City of Eastvale, consistent with California Streets and Highways Code Section 891.2. This plan was made possible through the Southern California Association of Governments' (SCAG) Sustainability Grant Program. This Bicycle Master Plan incorporates other applicable plans' goals, objectives and policies, including SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), Western Riverside Council of Governments' (WRCOG) Non-motorized Transportation Plan, and adjacent cities' bicycle master plans.

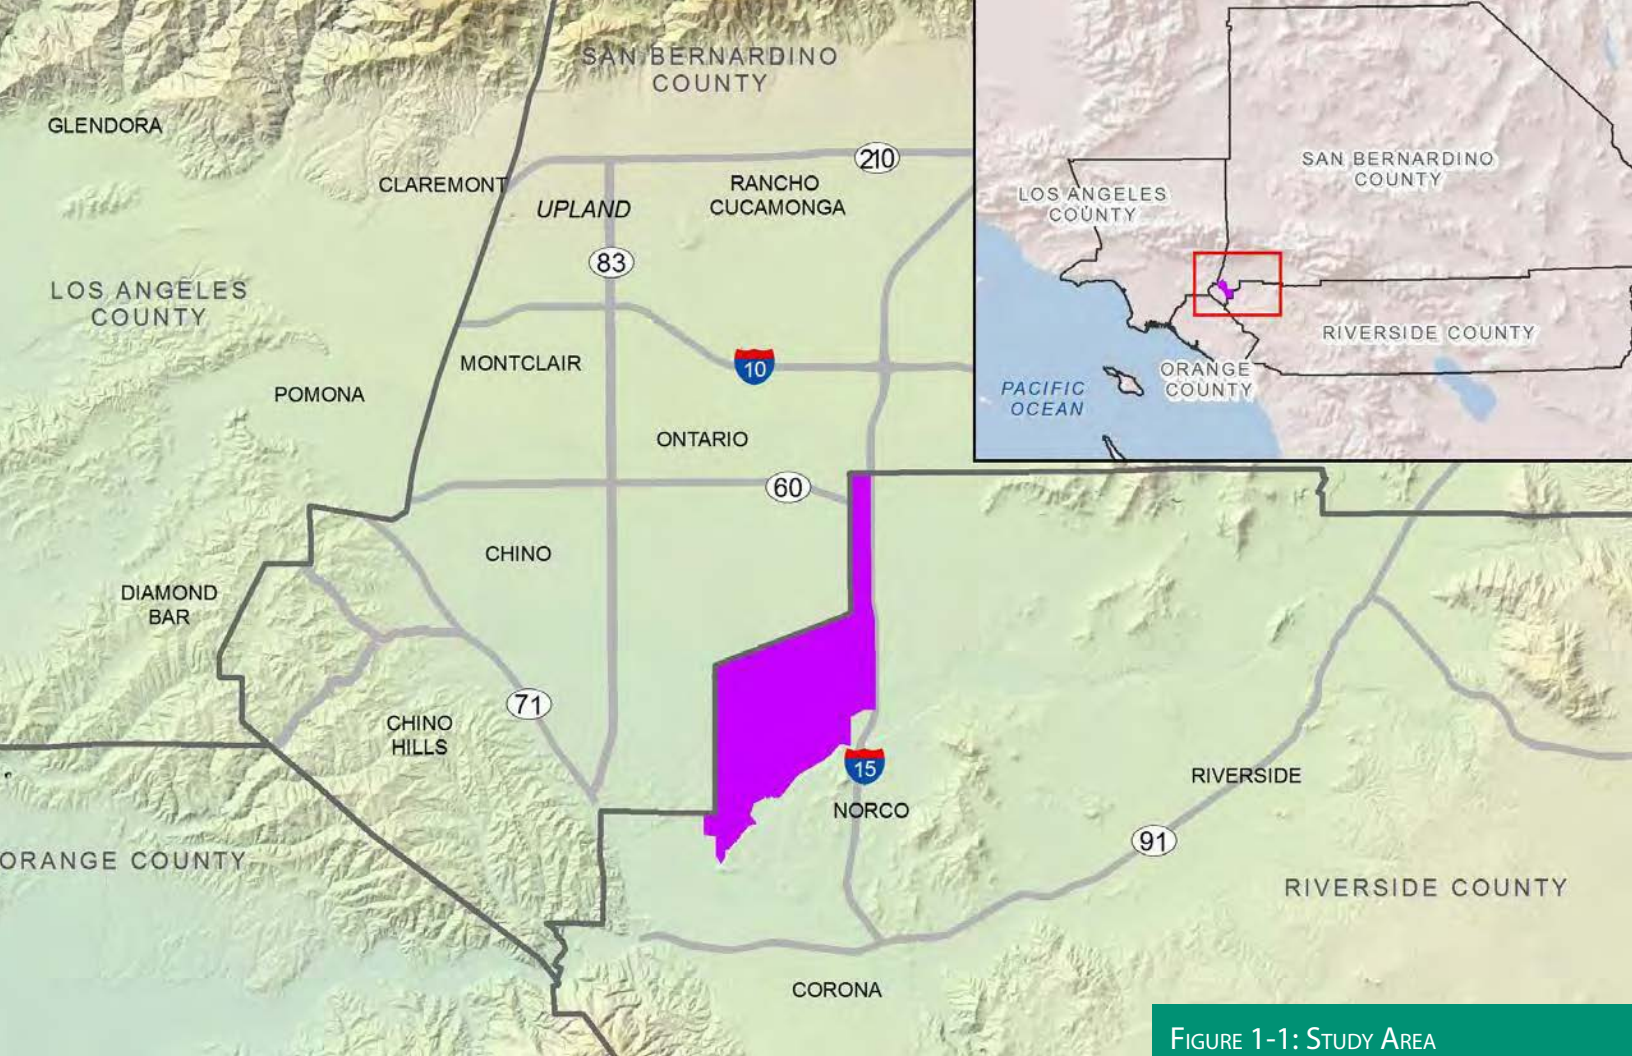

The project's scope included developing a citywide bicycle network and a menu of supportive programs. To this end, the scope called for strong emphases on the following: Agency and Public Participation; a Bicyclist Needs and Demand Analysis; Education, Enforcement and Encouragement Recommendations; and an Implementation Plan. Because this is Eastvale's first dedicated Bicycle Master Plan, and the "state of practice" in bicycle planning is rapidly evolving, this report relies heavily on 3D models, maps, photographs and other graphics to illustrate proposed facilities and concepts.

STUDY AREA

Eastvale is located in northwestern Riverside County, within southern California's Inland Empire region, between Los Angeles and Orange Counties and accessible by Interstate 15 and California State Routes 91, 60 and 71. Locally, its boundaries are Hellman Avenue to the west, Bellegrave Avenue to the north, the Santa Ana River and the City of Norco to the south, and Interstate 15 to the east, as shown in Figure 1-1.

The Eastvale area had been predominately agricultural, particularly dairy farming. By the late 1990s, the area began to suburbanize to accommodate people from neighboring Orange and Los Angeles Counties seeking affordable housing. Despite significant development since its 2010 incorporation, Eastvale remains a "commuter town." The overwhelming majority of commute trips are by single-occupancy vehicle with 92 percent of the employed population driving a vehicle to work. The online application Walk Score categorizes Eastvale as a "Car-Dependent City," earning a 23/100 walkability score. Although a bike score for Eastvale is not available, it would probably be slightly higher than the walk score based on longer distances reasonably covered by bike.

With a 2010 census population of 53,668 within 11.45 square miles, Eastvale’s population density is 4,689 people per square mile. Eastvale’s racial make-up is approximately half white, a quarter Asian and ten percent African American. In addition, 40 percent of the population identifies as Hispanic or Latino. Eastvale’s population is young, with a 30.9 year median age and over 95.3 percent of residents under the age of 65. Eastvale also has a high household percentage with children under the age of 18 (62.7 percent). Eastvale is a middle class community with a median household income of \$109,841, and housing units are 82.7 percent owner-occupied. As demonstrated by strong participation in the projects’ online survey, Eastvale is a highly connected or “tech savvy” community.

PROJECT GOALS AND APPROACH

This project's overall goal was to create a bicycle master plan for the City of Eastvale. Bicycle master plan adoption and implementation can help achieve important community health, environmental and economic benefits, and plays an increasingly important role in meeting state mandates regarding the environment, health, safety and social equity. The most successful bicycle master plans – those that achieve community benefits and meet legal mandates – reflect important changes in bicycle facilities' "state of practice."

The following paragraphs highlight the most relevant benefits attributable to bicycling, as well as applicable legislation. They also offer further insight into bicycle facility planning's "state of practice" and brief facility type descriptions consistent with that state of practice and recommended by this plan. The section concludes with a brief discussion of the methodology used to determine both facility and program recommendations.

BENEFITS OF CYCLING

Numerous environmental, health and economic benefits are attributable to cycling, especially as a substitute for driving a vehicle.

ENVIRONMENTAL BENEFITS

Increased bicycling reduces fossil fuel emissions. In California, 40 percent of carbon dioxide (CO₂) emissions are produced by the transportation sector. While CO₂ is not the most harmful greenhouse gas, it is the most abundant. Even after accounting for the other greenhouse gases' global warming potentials (comparing them in terms of CO₂), 95 to 99 percent of vehicle emissions are CO₂. The Environmental Protection Agency (EPA) found that the average vehicle emits 0.95 pounds of CO₂ per mile, meaning that almost 10 pounds of carbon dioxide emissions could be avoided each day if an individual with a five mile (each way) commute switched from driving to an active transportation mode like bicycling.

HOW CAN CYCLING HELP THE ENVIRONMENT?

0.95 lb

VEHICLES PRODUCE APPROXIMATELY
0.9LBS OF CO₂/PASSENGER/MILE
TRAVELED.

0.05 lb

BICYCLING PRODUCES ONLY 0.05LB OF
CO₂/PASSENGER/MILE TRAVELED.

HEALTH BENEFITS

Despite dramatic strides in recent decades through regulations and technological improvements, vehicle emissions still pose a significant threat to air quality and human health. Vehicle-generated air pollution contains harmful greenhouse gas emissions, including carbon dioxide, carbon monoxide, methane, nitrous oxide and volatile organic compounds. These pollutants and irritants can cause asthma, bronchitis, pneumonia and decreased resistance to respiratory infections. Taking steps to reduce these emissions is particularly important in the United States, which leads the world in petroleum consumption. Converting vehicular trips to bicycling trips is an opportunity to help reduce emissions and improve public health.

In addition to the universal public health benefits, such as improved air quality described above, bicycling has the potential to positively impact personal health. A significant percentage of Americans are overweight or obese and recent projections indicate that 42 percent of the population will be obese by 2030. To combat this trend and prevent a variety of diseases and their associated societal costs, the Centers for Disease Control and Prevention (CDC) suggest 30 minutes of moderate intensity physical activity five days per week minimum. Not only does bicycling qualify as “moderate intensity activity,” it can also be seamlessly integrated into daily routine, especially for utilitarian purposes like commuting or running errands.

Other health benefits associated with moderate activity, such as bicycling, include improved strength and stamina through better heart and lung function. Regular exercise reduces the risk of high blood pressure, heart attacks and strokes. In addition to heart disease, regular exercise can also help to prevent other health problems such as non-insulin dependent diabetes, osteoarthritis and osteoporosis. Lastly, exercise has been shown to improve mental health by relieving depression, anxiety and stress symptoms.

3 HOURS OF BIKING
PER WEEK CAN
REDUCE
YOUR RISK OF
HEART DISEASE BY
50%

A 30-MINUTE
BIKE RIDE CAN
BURN
215-500
CALORIES

13 LBS
AVERAGE
WEIGHT
LOSS IN
FIRST YEAR BIKING TO WORK

ECONOMIC BENEFITS

Cycling infrastructure and programs has increasingly been shown to deliver economic benefits to both individuals and society at large. Bicycling benefits may, in fact, outweigh its costs. Bicycling, and utilitarian bicycling in particular, offers somewhat obvious savings to individuals. Beyond the up-front vehicle operating costs are additional maintenance, insurance, and often parking costs. According to the American Automobile Association, the annual cost of owning a car and driving it 15,000 miles a year is now over \$9,000 (See graphic below).

More bicycling has also been tied to increases in commercial and residential property values and retail sales. Shoppers who reach their destination by bicycle have been shown to make smaller purchases, but shop more often and spend more money overall. Shoppers who arrive by bicycle, by virtue of their more limited range, are also more likely to support local businesses, and do not require a vehicle parking spot. Perhaps more compelling than reducing greenhouse gas (GHG) emissions or combating the obesity epidemic are bicycling's quality of life benefits. Bicycling, and especially utilitarian riding, is increasingly seen as a fun, low-cost, healthy and sustainable way to get around. How then, can we make it easier for any person to choose a bicycle for his or her daily trips?

APPLICABLE LEGISLATION

Several pieces of legislation support increased bicycling in the State of California. Much of the legislation concerns greenhouse gas (GHG) reduction and employs bicycling as a means to achieve GHG reduction targets. Other legislation highlights bicycling's intrinsic worth and treats safe and convenient bicyclist accommodation as a matter of equity. The most relevant legislative acts for bicycle policy, planning, infrastructure and programs include:

Federal Legislation

- Safe Streets Act (S-2004/HR-2468)

State Legislation and Policies

- AB-32 Global Warming Solutions Act
- SB-375 Redesigning Communities to Reduce Greenhouse Gases
- AB-1358 Complete Streets Act
- AB-1581 Bicycle and Motorcycle Traffic Signal Actuation
- AB-1371 Passing Distance/Three Feet for Safety Act
- SB-743 CEQA Reform
- AB-1193 Bikeways
- Caltrans' Deputy Directive 64-R1

BICYCLE FACILITY STATE OF PRACTICE

In an effort to re-position bicycling as a safe and common transportation mode and increasing the number of people bicycling, attention needs to be shifted away from creating “cyclists” and toward making it easier for any person to choose bicycling for their everyday trips. Research shows a strong latent interest in bicycling among those who identify as “interested, but concerned.”

These individuals do not identify themselves as “cyclists,” but they do not necessarily need to do so to benefit from programs to encourage bicycling. While all population segments may be encouraged to ride, it is through the encouragement of this largest “interested, but concerned” segment that the greatest gains in mode share will be made. The field of bicycle planning is being redefined to serve this target audience.

 **1%** STRONG AND FEARLESS

 **7%** ENTHUSED AND CONFIDENT

 **60%** INTERESTED BUT CONCERNED

WHAT KIND OF CYCLIST ARE YOU?

RIDING IS A STRONG PART OF MY IDENTITY AND I AM UNDETERRED BY TRAFFIC SPEED AND VOLUME, OR OTHER ROADWAY CONDITIONS.

I AM COMFORTABLE SHARING THE ROAD WITH MOTOR VEHICLES, BUT GIVEN A CHOICE, I PREFER TO USE BIKE LANES AND BOULEVARDS.

I LIKE RIDING A BIKE, BUT I DON'T RIDE MUCH. I WOULD LIKE TO FEEL SAFER WHEN I DO RIDE, WITH LESS TRAFFIC AND SLOWER SPEEDS.

I DON'T RIDE AT ALL DUE TO INABILITY, FEAR FOR MY SAFETY, OR SIMPLY A COMPLETE AND UTTER LACK OF INTEREST.

 **33%** No Way, No How!

BIKEWAY FACILITY TYPES

This plan includes three low-stress bikeway facility categories: off-street, on-street and shared street. These broad categories include more specific bikeway types. The category and facility type recommended depends on the context, including street type and its vehicle traffic speed and volume.

OFF-STREET FACILITIES

Off-street bicycle facilities include open space, shared used paths (i.e. Caltrans Class I facilities) and roadside shared use paved paths or “urban trails.” These facilities are recommended where a recreational experience is desired, where a route is desired and no street exists, and where exceedingly high speed and volume vehicular traffic warrants substantial separation.

FIGURE 1-2: OFF-STREET BICYCLE FACILITIES

Paths in Active Railroad Corridors

Paths in Abandoned Railroad Corridors

Local Neighborhood Access to Paths

ON-STREET FACILITIES

On-street facilities include striped bike lanes (i.e. Caltrans Class II facilities), buffered bike lanes and protected bike lanes (i.e. Class IV facilities). These facilities are recommended where the desired bicycling route follows an existing street and where traffic speeds and volumes are low enough to permit an adjacent facility, but high enough to preclude a “shared” facility. As a simple rule for low-stress bike lanes, the greater the separation from vehicle traffic, the better. Buffered bike lanes are recommended anywhere roadway space allows. Protected bike lanes, separated from vehicle lanes by vertical physical barriers, are recommended where vehicle speeds and volumes are high.

Protected Bike Lanes

Buffered Bike Lanes

Striped Bike Lanes

FIGURE 1-3: ON-STREET BICYCLE FACILITIES

SHARED-STREET FACILITIES

Shared-street facilities include bicycle routes (i.e. Caltrans Class III facilities) and bicycle boulevards or “neighborhood greenways.” These facilities are recommended only where vehicle speeds and volumes are low enough for bicyclists and motorists to truly “share the road.” In the case of bicycle boulevards, traffic calming and bicyclist priority measures may be included.

Bike Route

Neighborhood Greenway

FIGURE 1-4: SHARED STREET FACILITIES

DESIGN GUIDELINES FOR BIKEWAY FACILITIES

These high-level facility descriptions and graphic representations are supplemented with more detailed design guidance in “Appendix A: Toolbox - Design Guidelines” on page A-1. They borrow heavily from the American Association of State Highway and Transportation Officials (AASHTO) Guide to Bicycle Facilities and the National Association of City Transportation Officials (NACTO) Urban Bikeway and Urban Street Design Guides, particularly for guidance on “innovative” facilities. The Federal Highway Administration (FHWA) supports using these resources to further develop non-motorized transportation networks, particularly in urban areas. Bicycle master plan compliance with applicable guidelines and standards is also required by California Street and Highways Code Section 891.2 and most grant applications.

AASHTO GUIDE FOR THE DEVELOPMENT OF BICYCLE FACILITIES

This memorandum expresses the FHWA’s support for taking a flexible approach to bicycle and pedestrian facility design. The AASHTO bicycle and pedestrian design guides are the primary national resources for planning, designing, and operating bicycle and pedestrian facilities. The NACTO Urban Bikeway Design Guide and the Institute of Transportation Engineers (ITE) Designing Urban Walkable Thoroughfares guide builds upon the flexibilities provided in the AASHTO guides, which can help communities plan and design safe and convenient facilities for pedestrians and bicyclists.

NACTO URBAN BIKEWAY AND URBAN STREET DESIGN GUIDES

The NACTO guides represent the industry standard for innovative bicycle and streetscape facilities and treatments in the United States. In 2014, the California Department of Transportation (Caltrans) followed AASHTO and officially endorsed the NACTO Urban Bikeway Design Guide. It is important to note that all but two of its design treatments are permitted under the federal Manual of Uniform Traffic Control Devices (MUTCD), the national standard for signs, signals and pavement markings.

Caltrans also officially endorsed the NACTO Urban Street Design Guide as a valuable toolkit for designing and constructing safe, attractive local streets. (At the time, Caltrans was only the third State transportation agency to officially endorse the Guides.)

METHODOLOGY

This project's process included conventional planning methods, such as evaluating existing conditions, collecting stakeholder feedback on draft recommendations, and refining the recommendations based on the feedback received, but the process also included several unique methods related to public outreach, analysis, project alternatives and stakeholder involvement, as described in the following sections.

PUBLIC OUTREACH

This project's outreach strategy relied heavily on non-traditional approaches, particularly "piggybacking" on other popular community events and by creating a strong online presence. This approach was informed by City staff input, who felt there would likely be low turnout at more traditional, stand-alone planning events. The online survey received almost 500 responses.

GIS MODELING

A new GIS methodology was developed to reveal "low stress" neighborhood routes within Eastvale's traditionally suburban street "loops and lollipops" network of arterials and cul-de-sacs to connect residential neighborhoods with parks, schools and retail centers. This method and its results are further described in the Recommendations Chapter.

MULTIPLE FACILITY SCENARIOS

Many of Eastvale's streets are wider than they need to be, a relatively uncommon problem. This excess asphalt allowed for a novel bicycle planning approach, one in which multiple, alternative solutions could be considered.

CLOSE STAKEHOLDER COLLABORATION

Due to Eastvale's relatively recent incorporation and its subsequent rapid development, data regarding existing conditions and future projects were sometimes lacking. Stakeholder input, particularly from City staff, was indispensable throughout the project process to ensure that recommendations were appropriate for current and future contexts.

PUBLIC & STAKEHOLDER INPUT

Local residents and public officials are a good source for obtaining knowledge, concerns and ideas related to specific areas within the city. Their input is critical to confirming preliminary information gathered from fieldwork, research and GIS modeling. The public and stakeholder input process for the City of Eastvale was designed to gather information and perceptions from a broad range of local residents and experts through a series of general public and stakeholder meetings. The process also employed a successful online and social media outreach program. Community involvement was instrumental in analyzing existing conditions, collecting ideas and formulating master plan recommendations.

WEBSITE AND ONLINE SURVEY

Take advantage of Eastvale's reputation as a "connected community;" a project website was created to provide project information and collect public input. The website included information for each of the public meetings as well as an online survey. This survey was advertised via the City website and social media outlets. Online surveys are a valuable tool in collecting public input as they allow respondents more time to compose their responses. The survey method often results in a greater number of comments and provides more site-specific insights than what is provided at public meetings alone. Almost 500 people completed the online survey, demonstrating a high level of engagement by Eastvale residents.

PUBLIC INPUT MEETINGS

Three public input meetings were held throughout the planning process. Each meeting included a presentation followed by an open house. The open house included a mix of displays with project informational and small-group discussions. Maps of existing and proposed conditions, along with depictions of potential bicycle facility types, were provided to help residents identify issues and potential solutions within the planning area. In addition, large aerial maps were provided at tables to engage residents in small-group discussions regarding the local cycling environment. These table maps were the focal point of the meeting and encouraged participants to discuss their views on bicycle facilities in Eastvale.

The first meeting was held on June 29, 2014 as part of a regular Town Hall Meeting. Following a brief PowerPoint presentation about the project, participants were encouraged to provide feedback either through written comments or the small-group discussions. Participants were asked to comment on where they currently did or did not ride and why, where there were gaps or other deficiencies, and where they would like to see additional facilities. Discussion groups formed around the graphics and table maps, resulting in substantial brainstorming and feedback.

The second public meeting on November 10, 2014 included a brief presentation followed by small-group discussions. Participants provided feedback on the draft plan, prioritization of the proposed bike facilities, and suggested programs and policies. Graphics were provided to demonstrate how the various bikeway types would be implemented in Eastvale. This strategy helped participants understand what could be proposed as part master plan recommendations.

The third public meeting was held on July 14, 2015 to collect feedback on the final recommendations for the bicycle master plan. The meeting began with a presentation summarizing the planning process and how the recommendations were developed. Table maps were provided for participants to review the final recommendations and give feedback. Along with citizens, several cycling advocacy group members attended the meeting and provided feedback.

STAKEHOLDER PARTICIPATION

The stakeholder group included representatives from the school district, county sheriff's office as well as city administrators, planners, and engineers. This group participated in a series of three meetings in June 2014, January 2015 and April 2015. The meetings took advantage of the group's familiarity and experience with Eastvale to review goals and objectives, suggest policies and actions, and review draft documents. The stakeholders were instrumental in directing the master plan, providing guidance on appropriate analyses, Eastvale's future planning and development, and prioritizing project and program recommendations.

A major outcome of the stakeholder input process was the format for the initial public meeting. The group felt that a conventional public meeting may not attract a satisfactory audience for collecting useful feedback. As a result, the first public meeting was scheduled in concurrence with Eastvale's regularly scheduled quarterly Town Hall Meetings, which have been well attended.

“

WE CAN SHOW A DREAM ABOUT WHAT BICYCLING COULD BE...SIMPLE AND LIBERATING, SOCIABLE AND RELAXING. THE TARGET MARKET FOR THIS DREAM IS THE PEOPLE WHO AREN'T ON BIKES.

THEY DO NOT THINK BRIGHTLY COLORED LYCRA COVERED WITH ADS IS COOL. THEY DON'T WANT TO CHANGE THEIR CLOTHES AND TAKE A SHOWER WHEN THEY GET TO WORK. THEY DO NOT WANT TO BELONG TO A BICYCLING SUBCULTURE. WE JUST WANT THEM TO GET ON THEIR BIKES AND RIDE, WITH THE LEAST POSSIBLE IMPACT TO THEIR CULTURAL IDENTIFICATION AND DAILY ROUTINE.”

- ZANE SELVANS, [HTTP://FLATIRONBIKE.COM](http://FLATIRONBIKE.COM)

A faint, light blue illustration of a bicycle is visible in the background, spanning across the page. It shows the front wheel, handlebars, and part of the frame.

Chapter 2:

EXISTING CONDITIONS

Understanding existing conditions of Eastvale and the surrounding region is imperative to planning for its future. This chapter includes sections on Existing Plans, City Codes and Existing Facilities and Programs. Rather than merely summarizing what exists, this chapter aims to provide meaningful discussions on each of the aforementioned topics, including how they support or impede bicycle facility development within the city of Eastvale.

EXISTING PLANS

Several existing plans – from Eastvale and beyond – are relevant to this Bicycle Master Plan. Most relevant from Eastvale is the General Plan and its elements. Others include transportation plans from neighboring jurisdictions (e.g. the cities of Chino, Corona, Jurupa Valley and Ontario), Riverside County and the Southern California Association of Governments (SCAG). This section summarizes the most salient points from the aforementioned plans. In Recommended Standards, Codes and Policy Changes (Section 5.8, Ch. 5), the General Plan is revisited and analyzed as required by project scope of work “to determine if it adequately supports bicycle facility development within Eastvale.”

CITY OF EASTVALE GENERAL PLAN

Eastvale’s General Plan contains several elements relevant to this Bicycle Master Plan including Circulation and Infrastructure; Land Use; Parks, Recreation and Open Space; Healthy Community; and Air Quality and Conservation. Relevant information from each General Plan element is summarized in the following sections.

CIRCULATION AND INFRASTRUCTURE ELEMENT

The Circulation and Infrastructure Element retains the primacy of the automobile while providing strong support for developing alternative modes of transportation (i.e. walking, biking and public transit). This dual focus is evident in the opening quotation (seen below), the overall circulation framework and in the supporting goals and policies.

In addition, this Element provides roadway classifications, seen in Table 2-1, which are defined by the amount of vehicle traffic anticipated on each roadway segment (but do not account for pedestrian, bicycle or transit use). For each type of roadway, there are basic design parameters (e.g. an arterial roadway would be expected to have 4–6 travel lanes, a raised center median, dedicated turn lanes, and parking lanes on both sides). Most important to these roadways, however, is the vehicle traffic they carry in relation to their capacity, also known as Level of Service (LOS).

“ACCESS TO PROPERTY IS ESSENTIAL. AND WHILE THE PRIMARY MODE OF TRANSPORTATION FOR MOST PEOPLE REMAINS THE AUTOMOBILE, DESIGN OF STREETS TO INCLUDE OPTIONS TO THE AUTOMOBILE WOULD IMPROVE TRAVEL AND CIRCULATION, ALONG WITH REDUCING NOISE AND AIR POLLUTION. THIS CIRCULATION AND INFRASTRUCTURE CHAPTER PROVIDES AN OUTLINE OF EXISTING AND PLANNED ROADWAYS, AS WELL AS ALTERNATIVES TO THE USE OF PRIVATE VEHICLES. THIS “MULTI-MODAL” APPROACH ENSURES THAT ALL TYPES OF TRANSPORTATION ARE CONSIDERED AND THAT THE CITY CAN MEET THE CIRCULATION NEEDS OF DEVELOPMENT ACCORDINGLY.”

- City of Eastvale General Plan,
Opening Paragraph

TABLE 2-1: ROADWAY CLASSIFICATION AND LEVEL OF SERVICE

| Roadway Classification | # of Lanes | Minimum Right-of-Way Width Required | Service Level C | Service Level D | Service Level E |
|------------------------|------------|-------------------------------------|-----------------|-----------------|-----------------|
| Local Road | 2 | 56 Feet | Varies | Varies | Varies |
| Secondary Collector | 2 | 74-100 Feet | 10,400 | 11,700 | 13,000 |
| Major Collector | 2 | 100-118 Feet | 14,400 | 16,200 | 18,000 |
| Arterial | 4 | 128-152 Feet | 28,700 | 32,300 | 35,900 |
| Urban Arterial | 4 | 128-152 Feet | 28,700 | 32,300 | 35,900 |
| Urban Arterial | 6 | 128-152 Feet | 43,100 | 48,500 | 53,900 |

Guidance provided regarding LOS is complex. The element acknowledges the fact that the LOS standard favors the automobile and sets fairly conservative default thresholds for acceptable level of service on Eastvale's streets, as seen in Table 2-1. But it also allows for flexibility in meeting the stated threshold, in cases of overriding considerations, such as where a bike facility is desired, but there is no available ROW, or where the community wants a commercial development, but the roadway cannot be widened to accommodate projected traffic.

The Circulation and Infrastructure Element discusses the role of non-motorized transportation, with special sub-topics for Pedestrian and Bikeways. The Pedestrian section includes discussion of pedestrian infrastructure elements, the role of pedestrian facilities and issues affecting pedestrian accommodation. The Bikeways section is more limited, noting only that "Eastvale does not have an independent system of bike paths, but is included as part of the County's bikeway circulation system." It also notes that Class II bike lanes are the only existing facility type.

"THE LEVEL OF SERVICE STANDARDS CURRENTLY ONLY ADDRESS THE CIRCULATION NEEDS OF THE AUTOMOBILE.

A MORE **COMPLETE STANDARD** WOULD TAKE INTO ACCOUNT LAND USE PATTERNS, **PEDESTRIAN ACCESS, TRANSIT, AND BICYCLE PATHS."**

The discussion of future planning efforts provides strong support for multi-modal improvements for Eastvale. The lack of bicycle and pedestrian connectivity, as well as an overemphasis on (costly) truck routes are mentioned as primary challenges for the City's transportation (and fiscal) future. Improving non-motorized connections, including regional truck routes, and overhauling the City's auto-centric Level of Service Standards are suggested future planning efforts.

The goals presented in this element address all aspects of circulation and infrastructure. They call for a flexible, multi-modal transportation system that maximizes the use of existing infrastructure and interagency collaboration to produce the most effective system possible. These goals are further defined by policies, but these policies relate only to the automobile. Policies related to non-motorized circulation are provided separately. Circulation policies include strict metrics to assess the performance of vehicular transportation systems (mainly compliance with LOS thresholds), while non-motorized transportation policies prescribe no such metrics. Separate policies are also provided for future planning efforts. Policies related to this plan include:

POLICY C-30: The City will seek to develop a comprehensive bike and trail plan that would connect existing neighborhoods, schools, and commercial and employment centers.

POLICY C-31: The City will evaluate its level of service and roadway width standards to determine if there is an ability to use narrower roadways and existing right-of-way to provide for pedestrian facilities, trails, bike lanes, and additional landscaping in medians and parkways. This may include establishing a comprehensive level of service threshold that includes non-motorized, transit, mixed use, and vehicle access.

LAND USE ELEMENT

Eastvale's current land use designations have led to a suburban pattern, characterized by low-medium density residential development and a strong separation of uses.

A bedroom community, Eastvale's largest land use is residential. Residential use accounts for 62 percent of all land use. In contrast, potential employment centers and other activity centers constitute only 18 percent (Light Industrial: 8 percent; Business Park: 5 percent; Commercial Retail: 3 percent and Agriculture: 1 percent; and Public Facilities: 1 percent). Undeveloped land – including Conservation, Open Space Recreation and Water – accounts for 18 percent of all land use. As a further indication of Eastvale's status as a "commuter town," Freeways account for 2 percent of all land uses.

Since Residential is Eastvale's primary land use, residential densities provide a good indication of overall density. The highest density residential development is 8-14 dwelling units per acre and comprises only 5 percent of all land use. In contrast, medium-density residential is 2-5 dwelling units per acre and accounts for 50 percent of all land use.

Eastvale maintains a relatively strong segregation of uses. As can be seen in Figure 2-1, the non-residential land uses that do exist (e.g. Commercial Retail) are evenly distributed throughout the City. These uses, however, are not finely mixed (i.e. retail is organized into shopping centers, rather than live/work units and Eastvale does not have a "mixed-use" land use designation.) Furthermore, much of the non-residential land use is confined to major roadway intersections (arterials and urban arterials). While an even dispersal of non-residential uses creates shorter trips and generally supports non-motorized travel, both coarse land use mix and the orientation of non-residential uses to major arterials can be barriers to biking and walking. In contrast, several schools and parks located within residential neighborhoods are accessible by local streets, making them more likely to be accessed by bike and on foot.

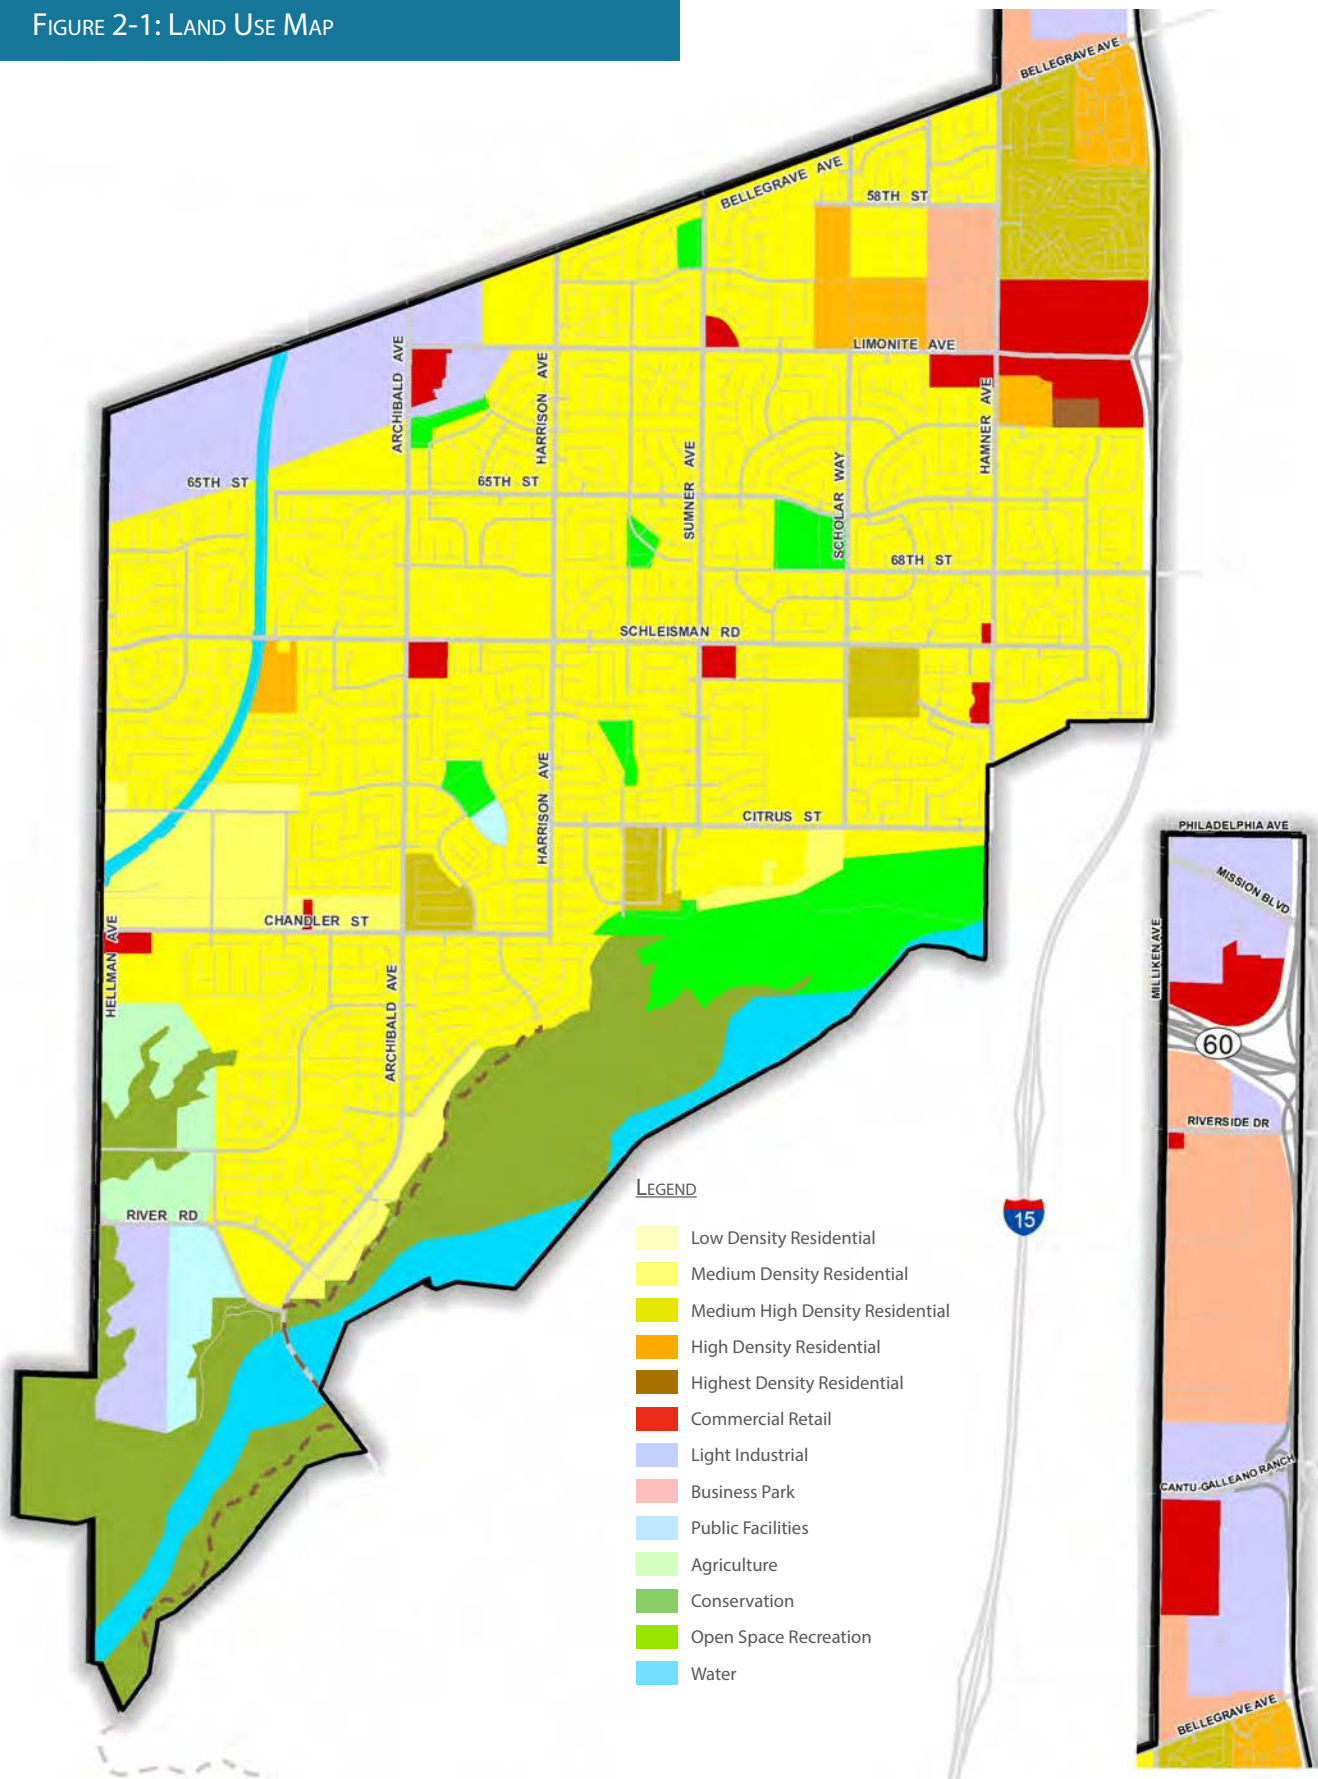

FIGURE 2-1: LAND USE MAP

The following list provides land use goals and policies relevant to this plan:

Land Use Goals & Policies

- GOAL LU-5: A “downtown” or “city center” for Eastvale containing a mix of civic, office, retail, and residential uses.
- GOAL LU-7: Land use patterns and transportation systems that encourage physical activity, promote healthy living, and reduce chronic illnesses.
- POLICY LU-11: Development should be located to capitalize on multi-modal transportation opportunities and promote compatible land use arrangements that reduce reliance on the automobile.
- POLICY LU-12: The Land Use Map should provide for land use patterns which reduce the number and length of motor vehicle trips.
- POLICY LU-23: Provide sufficient commercial and industrial development opportunities in order to increase local employment levels and reduce vehicle trips.
- POLICY LU-28: The Land Use Map should provide for land use arrangements that reduce reliance on the automobile and improve opportunities for pedestrian, bicycle, neighborhood electric vehicle, and transit use in order to minimize congestion and air pollution.
- POLICY LU-29: Employment and service uses should be located in areas that are easily accessible to existing or planned transportation facilities.
- POLICY LU-30: Commercial uses should be located near transportation facilities and include facilities to promote the use of public transit (such as bus turnouts, bus shelters, etc.).
- POLICY LU-39: The City encourages shared parking and reduced parking standards in Town Center developments.

In contrast, the following policies may contradict these goals and hinder active transportation. Potential contradictions are highlighted in bold and further described in the following paragraph.

POLICY LU-6: Calculations of the potential intensity of development on any site shall be based on gross acreage. As noted in Policy LU-5, a variety of constraints may affect a site’s development potential, including land required for right-of-way for collector and arterial streets shown on the Circulation Map; public parks (as defined in the Parks, Recreation, and Open Space Chapter); public facilities such as schools, fire stations, and police facilities; floodways or floodplains; protected biological habitats; location within an Airport Compatibility Zone; and other unique constraints applicable to the property as determined by the City.

POLICY LU-16: The City will allow mixed-use projects to develop in commercially designated areas in accordance with the guidelines of the Town Center land use designation and with special consideration of impacts to adjacent uses.

POLICY LU-26: Require setbacks and other design elements to buffer residential units to the extent possible from the impacts of abutting agricultural, roadway, commercial, and industrial uses.

POLICY LU-36: The City shall require that new public facilities protect sensitive uses, such as schools and residences, from the impacts of noise, light spillover, fumes, odors, vehicular traffic, parking, and operational hazards.

POLICY LU-40: Development in the Town Center designation shall be designed to mitigate potential conflicts between uses, considering such issues as noise, lighting, security, trash, and truck and automobile access.

Policies LU-6 and LU-16 have the potential to negatively impact active transportation because they rely on the City's existing definition of transportation "impacts" (i.e. automobile-oriented Level of Service), which relate increased commercial and residential densities with increased vehicle trips. This narrow definition can inhibit the increased densities needed to reduce automobile dependency and to make walking and biking viable modes of transportation. Policies LU-26, LU-36 and LU-40 have the potential to negatively impact active transportation because they indiscriminately mandate a separation between uses, regardless of actual impact. While this policy has roots in the very reasonable goal of separating potentially incompatible uses, it may preclude the compact, human-scaled environments required to support active transportation.

AIR QUALITY AND CONSERVATION ELEMENT

Eastvale's General Plan ties vehicle miles traveled to both air quality and conservation issues. Threats to air quality include both stationary and mobile pollution sources. Vehicle miles traveled (VMT) are identified as the greatest factor for stationary sources. VMT are also seen to impact conservation indirectly, through damage caused to air and water quality, and directly, through damage caused to habitat (e.g. for roadway construction, roadway widening and the sprawling land use pattern that accompanies auto-centric planning). The Air Quality and Conservation Element states that "transportation management is one of the primary ways in which Eastvale intends to meet its air quality targets" and includes several policies aimed at reducing VMT and increasing the use of non-motorized modes. Relevant goals and policies include:

Air Quality Goals & Policies

GOAL AQ-1: Air quality that meets or exceeds all state and federal standards.

GOAL AQ-2: Meet or exceed all current and future state-mandated targets for reducing emissions of greenhouse gases.

POLICY AQ-3: Reduce vehicle miles traveled and motor vehicle emissions through local job creation.

POLICY AQ-4: Attain performance goals and/or VMT reductions which are consistent with SCAG's Growth Management Plan.

POLICY AQ-30: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles, and design structures to promote mass transit, bicycle, and pedestrian use.

POLICY AQ-31: The City encourages urban design measures that support alternatives to private automobile use.

HEALTHY COMMUNITY ELEMENT

As discussed in Chapter 1, the link between the built environment (and its support of active transportation) and community health is well documented. Eastvale's Healthy Community Element includes policies supportive of a built environment that promotes physical activity and calls for land use and transportation planning that makes walking and biking to everyday destinations easy choices. It does so by "requiring, where appropriate, compact development patterns that are pedestrian and bicycle friendly." Relevant policies include:

- Healthy Community Policies**
- POLICY HC-2: Promote an understanding of the connections between the built environment and health.
 - POLICY HC-3: The City encourages a built environment that promotes physical activity and access to healthy foods, while reducing driving and pollution.
 - POLICY HC-4: Promote increased physical activity, reduced driving and increased walking, cycling and public transit by:
 - Requiring, where appropriate, the development of compact development patterns that are pedestrian and bicycle friendly.
 - Increasing opportunities for active transportation (walking and biking) and transit use.
 - POLICY HC-8: Neighborhood retail, service, and public facilities should be located within walking distance of residential areas.

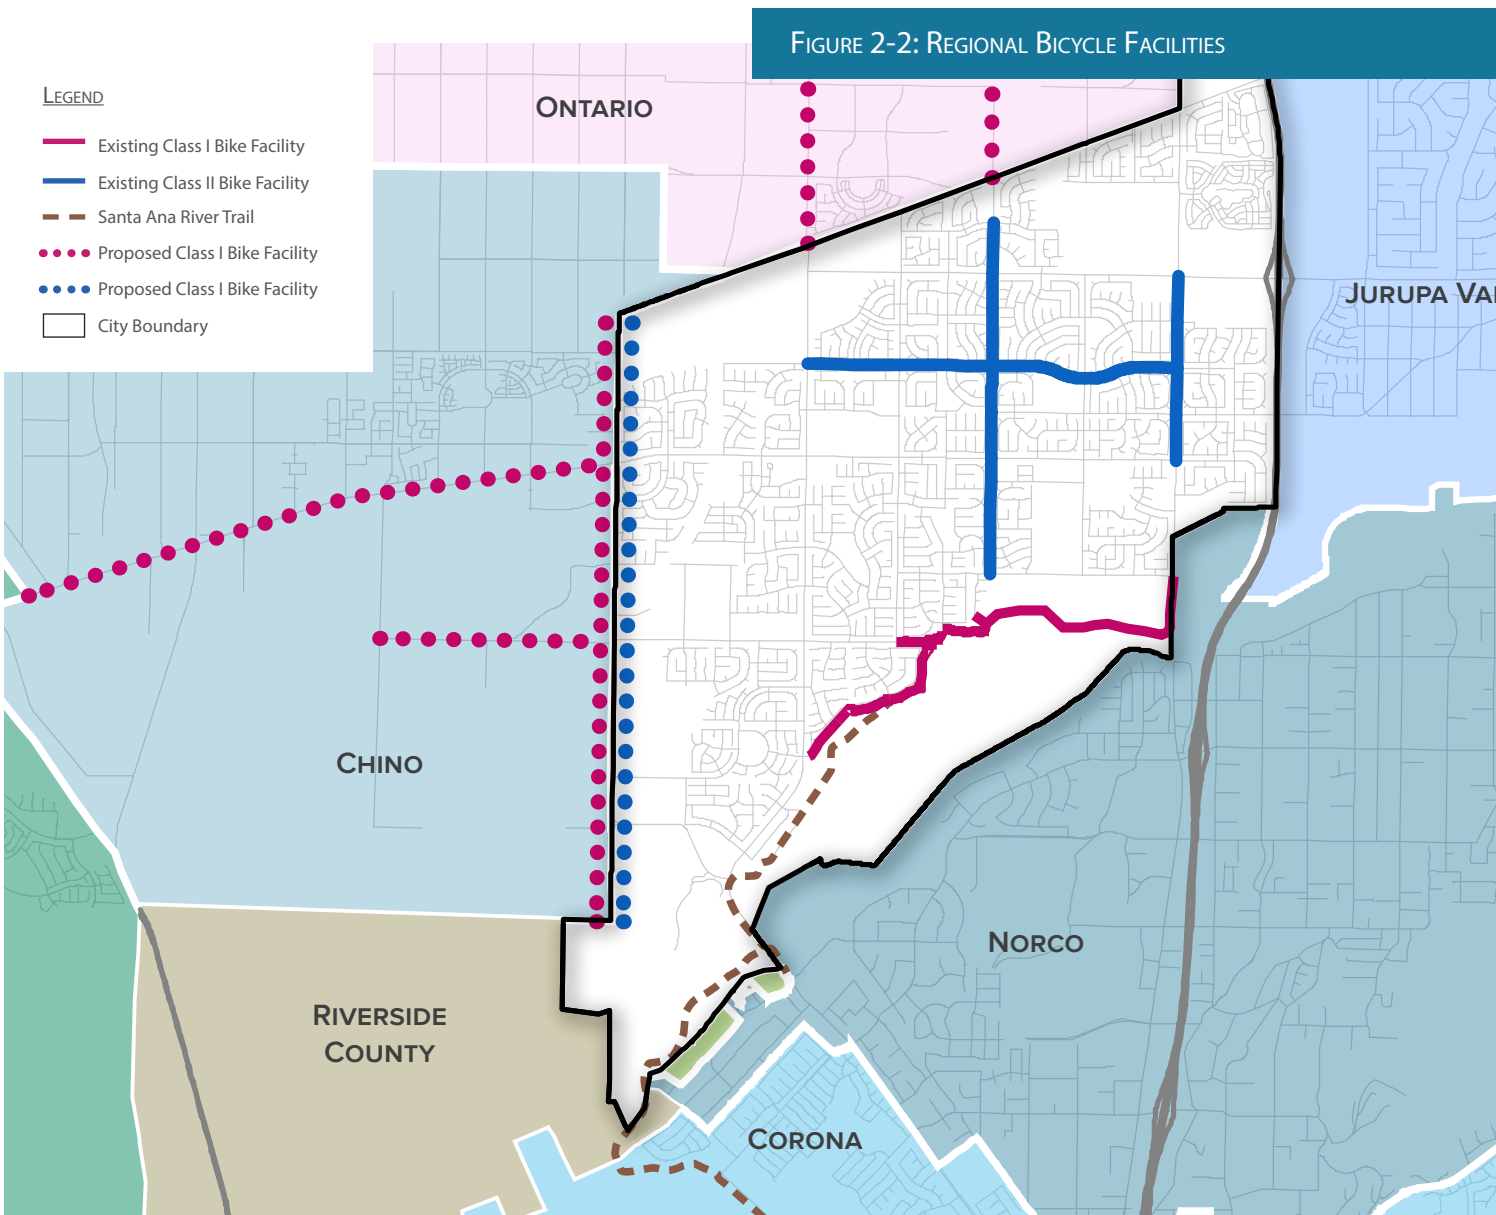

PARKS, RECREATION AND OPEN SPACE ELEMENT

This Element includes several goals relevant to, and supported by, the recommendations of this plan. Those most pertinent are excerpted below:

- Parks, Recreation, & Open Space Policies**
- GOAL OS-1: Expand outdoor recreation opportunities for all residents.
 - GOAL OS-2: Provide active and passive park facilities and recreation programs that satisfy the leisure time and recreation needs of all residents.
 - GOAL OS-3: Develop a citywide trails system that provides safe, convenient, and attractive off-street opportunities for residents to travel, recreate, and exercise.
 - GOAL OS-4: Maintain the Santa Ana River corridor as an important resource for open space, recreation, wildlife, and scenic beauty.
 - POLICY OS-7: The trails system in Eastvale should provide for connectivity, so that all trails are linked to the extent possible for greater use as recreational and travel routes. The following features should be included in the trails system:
 - Trails should link residential areas with parks, commercial and office areas, and other destinations.
 - Trails along major roadways should avoid meanders or other design features which make bicycle use less convenient or safe.
 - Trails should be located off-street to the extent possible.
 - Easements such as access roads should be placed in joint use as trails.
 - POLICY OS-8: Trails should be designed with the safety of users and adjacent property owners in mind. To the extent possible, the bicycle trails system should provide safe, off-street options suitable for use by children and less-experienced riders.

LOCAL BICYCLE PLANNING EFFORTS (SURROUNDING CITIES)

The neighboring communities of Chino, Corona, Jurupa Valley, Norco and Ontario have all engaged in bicycle planning efforts that include routes relevant to this plan. Chino is currently concluding a Bicycle and Pedestrian Master Plan that includes a Class I path on Pine Avenue (Schleisman Road in Eastvale), a Class I path on Chino Corona Avenue (Chandler Street in Eastvale) and a combination of Class I path and Class II bike lane on Hellman Avenue. The City of Corona's Bicycle Master Plan, adopted in 2001, includes a Class II bike lane on River Road, but this facility is not yet built. The City of Jurupa Valley has not yet completed a Bicycle Master Plan, but has recently secured funds to do so. In its current General Plan Circulation Element, Jurupa Valley identifies trail and bikeway standards, as well as important connections to make to the Riverside County trail network, but does not identify specific trails or bikeways within the City. The City of Norco does not have a bicycle plan, but does have some bicycle facilities including a segment of the Santa Ana River Trail (SART) running alongside River Road. The City of Ontario has a Multipurpose Trails and Bikeway Corridor Plan incorporated in its General Plan Circulation Element. Routes most relevant to this plan include multi-purpose trails on Haven Avenue (Sumner Avenue in Eastvale) and Archibald Avenue.

REGIONAL BICYCLE PLANNING EFFORTS

SANTA ANA RIVER TRAIL

This multi-use pathway currently stretches 30 miles along the Santa Ana River from the Pacific Ocean at Huntington Beach to the Riverside County line in Corona. Design is nearing completion for a seven mile segment from there through the cities of Corona, Eastvale and Norco with construction expected to begin in early 2016. The project is part of the planned 75 mile route from the Pacific Ocean to the San Bernardino National Forest. This segment was designed to minimize impacts to the river, river-related habitat, wildlife corridors, flood control and other facilities while maximizing trail user experience. It will include parallel natural surface trails and paved paths.

Within Eastvale, this new segment will closely follow the river from the River Road bridge to connect at Dearborn Street to an existing trail segment running between Grapewin Street and Riverwalk Park at the south end of Soaring Bird Court. Completion of this segment will establish a continuous off-street route connecting Eastvale with the Pacific Ocean. In a subsequent phase, the trail will continue eastward along the river around Eastvale Community Park and under Interstate 15 into Norco.

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS (SCAG) REGIONAL TRANSPORTATION PLAN

The following vision statements and goals, excerpted from the SCAG's RTP, are most relevant to Eastvale's Bicycle Master Plan:

- 1) Align the plan investments and policies with improving regional economic development and competitiveness
- 2) Maximize mobility and accessibility for all people and goods in the region
- 3) Ensure travel safety and reliability for all people and goods in the region
- 4) Preserve and ensure a sustainable regional transportation system
- 5) Maximize the productivity of our transportation system
- 6) Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking)
- 7) Actively encourage and create incentives for energy efficiency, where possible
- 8) Encourage land use and growth patterns that facilitate transit and non-motorized transportation

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS (SCAG) ACTIVE TRANSPORTATION PLAN

The SCAG's Active Transportation Plan is written to "demonstrates the agency's strong commitment to Active Transportation and, importantly, legitimizes walking and cycling as travel modes that may actually be chosen over driving, thereby reducing congestion and air pollution. Further, it states that, in conjunction with supportive land use, these modes will increase in popularity." Its focus is intended to help the "region work towards reducing congestion and air pollution, walking and bicycling," as SCAG sees this "will become more essential to meet the future needs of (it's) residents." It states that "as the population in the SCAG region grows and matures, and as parts of the region move towards denser, mixed-use, and transit oriented development, the demand and use of active transportation will increase." The strategies established by the Active Transportation Plan has the following goals:

- Goal 1: Increase dedicated funding for bicycle and pedestrian infrastructure.
- Goal 2: Increase accommodation and planning for bicyclists and pedestrians.
- Goal 3: Increase transportation options, particularly for trips less than three miles.
- Goal 4: Significantly decrease bicycle and pedestrian fatalities and injuries.

CITY CODES (THE ZONING CODE)

Eastvale's Zoning Code provides increased specificity to the guidance offered by the Land Use Element of the General Plan. The zoning code is meant to ensure predictability and quality development. Like the General Plan Elements, the Zoning Code is also revisited and analyzed per project scope of work "to determine if it adequately supports bicycle facility development within Eastvale" in Recommended Standards, Codes and Policy Changes (Chapter 5).

SUMMARY

The zoning code further refines the General Plan Land Use Element by providing development standards (regulations) for each land use designation including the following:

- 1) Permitted, conditionally permitted, and prohibited land uses
- 2) Setbacks
- 3) Building heights
- 4) Site coverage
- 5) Parking
- 6) Provision of open space
- 7) Grading
- 8) Design guidelines, including site planning, architectural, and landscaping guidelines specific to the project
- 9) Signs
- 10) Nonconforming uses, structures, and signs

Of these topics, setbacks, building heights, site coverage and parking have the greatest impact on active transportation. While there are too many land use designations to summarize zoning regulations for each, a more general summary is provided. Eastvale's Zoning Code combines land use designations into the following broad categories: Residential and Agricultural; Commercial and Industrial. For both categories, it provides the following development standards:

- Setbacks are defined in terms of minimums.
- Building heights are provided in terms of maximums.
- Site coverage is not defined for either category by the Zoning Code, but density is. For Residential and Agricultural uses, density is defined in terms of maximum dwelling units per acre (DUAs), as prescribed in the Land Use Element of the General Plan. For Commercial and Industrial uses, density is defined in terms of maximum floor area ratios (FARs).
- Parking standards vary based on particular land use, but are defined in terms of minimums for all land uses.

In general, the Zoning Code setback, building height, site coverage and parking standards demonstrate a bias against the type of compact, human-scaled development known to support active transportation. Figure 2-3 and Figure 2-4 demonstrate the impact of zoning code on bike- and walkability. The impacts of Zoning Code specifications on active transportation, as well as potential means of mitigating these impacts will be discussed further in Chapter 5, Recommendations.

EXISTING FACILITIES AND PROGRAMS

Though this is Eastvale's first Bicycle Master Planning effort, the City already has some bicycle facilities and programs. Understanding these existing conditions is an essential first step in recommending facility and program improvements.

EXISTING BICYCLE FACILITIES

Eastvale's currently has only a few bicycle facilities evenly dispersed throughout the City, including three Class II bike lanes and one Class I multi-use path. The bike lanes are located on Sumner Avenue (from Blossom Way to Citrus Street), Hamner Avenue (from Limonite Avenue to Schleisman Road) and 65th Street (from Archibald Avenue to Hamner Avenue). The multi-use path runs along the southern end of the City, near the Santa Ana River Trail (SART) and extends approximately from Archibald Avenue to Hamner Avenue. The four routes described above provided a foundation – albeit small – for this plan to build upon (See Figure 2.6).

EXISTING BICYCLE PROGRAMS

Bicycle programs are typically recommended, in conjunction with bicycle projects, to maximize ridership, safety and the impact of broader bicycle programs. Traditionally, bike programming has been organized into specific topics under the umbrellas of the "5 Es": Engineering, Education, Encouragement, Enforcement and Evaluation & Planning.

As seen in the list of programs, the City currently has few programs that fall under the categories Education and Enforcement and none under the categories Engineering and Evaluation & Planning. Even so, what programs do exist can be expanded and made more robust. A suite of recommended programs for Eastvale, for all Es, is included in Chapter 5, Recommended Programs and Policies.

CURRENT BICYCLE PROGRAMS IN EASTVALE

EDUCATION

- Street Smarts Classes

ENFORCEMENT

- Targeted Enforcement

ENCOURAGEMENT

- Bike Month (Promoted by Inland Empire Bike Alliance)
- Safe Routes to School Program
- Traditional TDM – Employer Incentives (Through RCTC)
- Bike Month (Promoted by Inland Empire Bike Alliance)
- Walking School Bus & Bicycle Train
- Walk and Bike to School Day

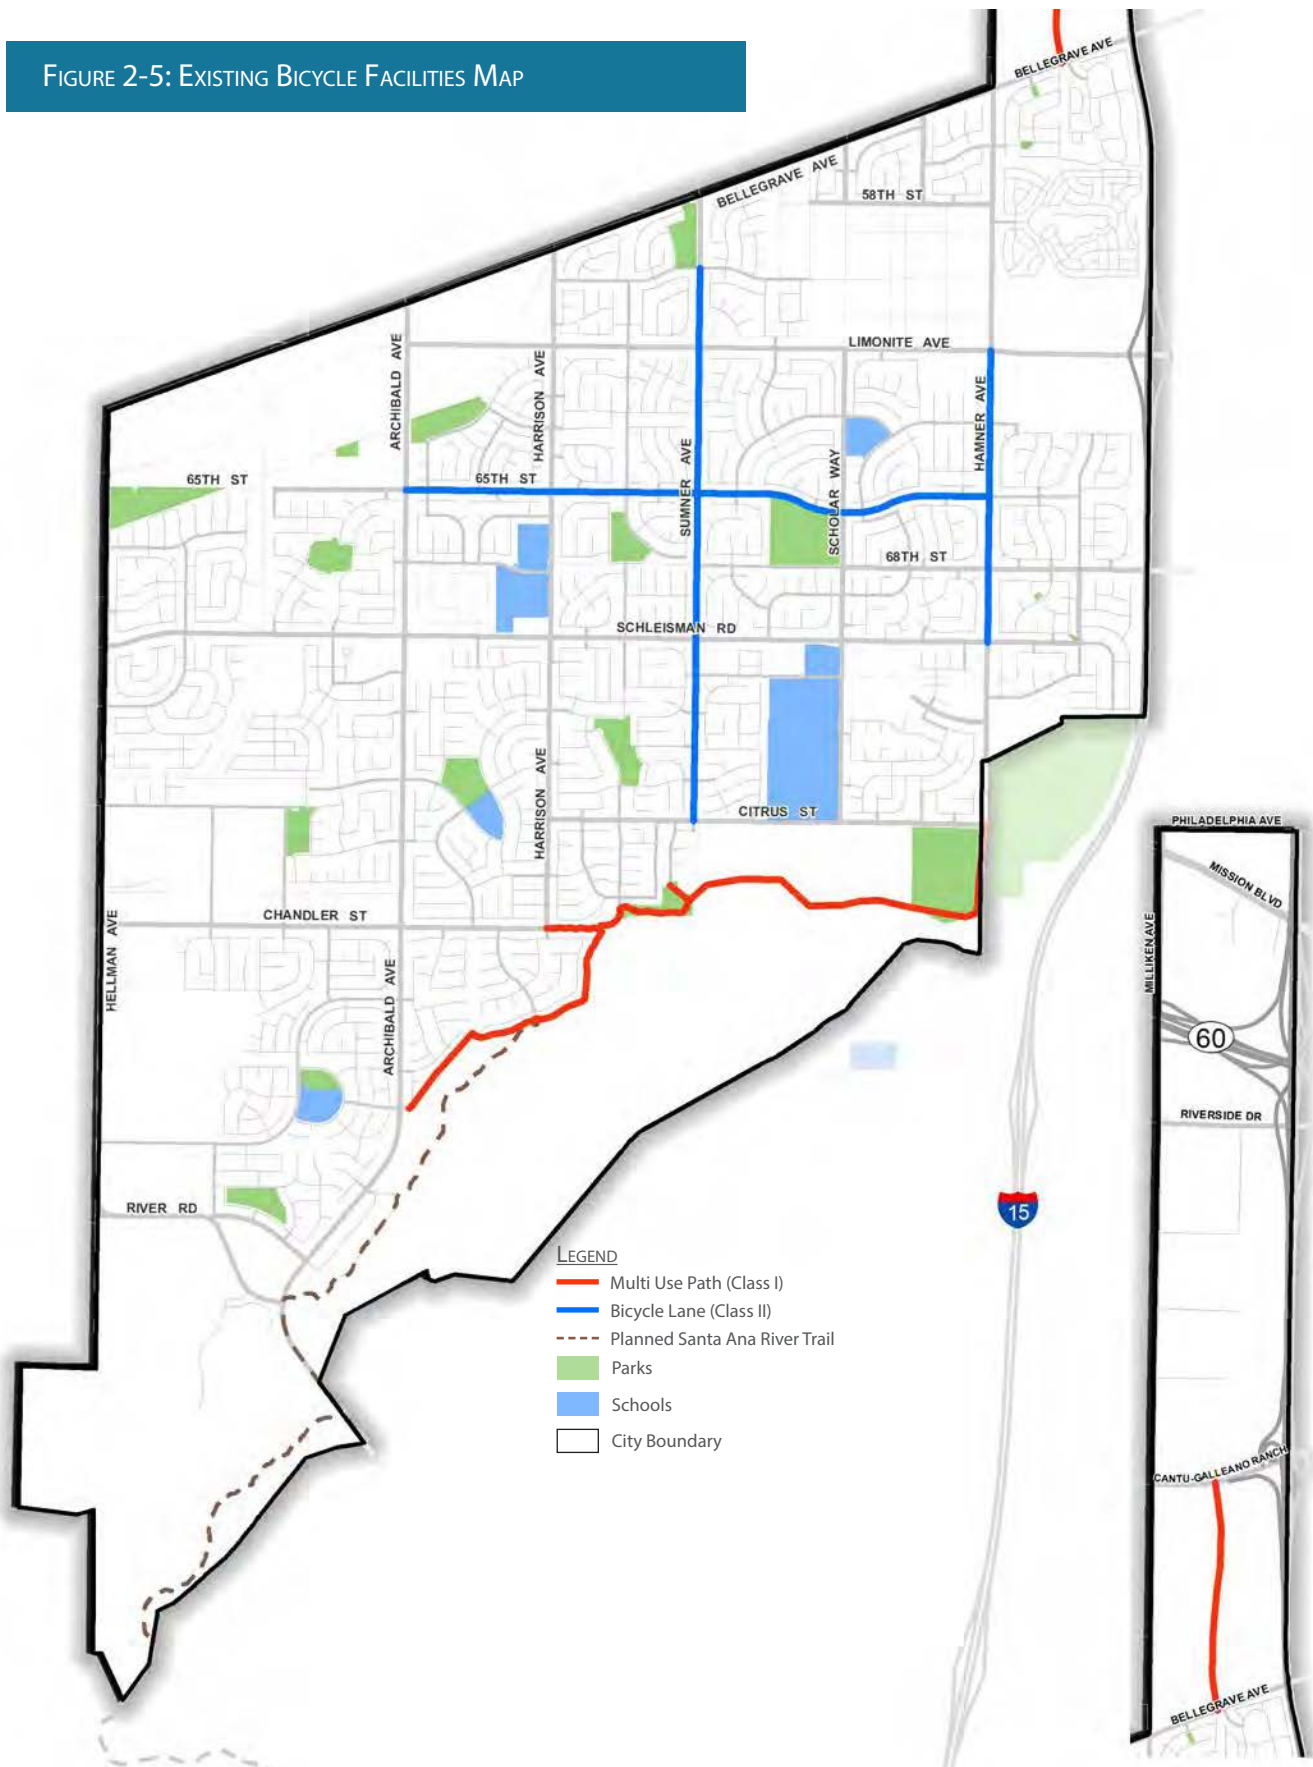

FIGURE 2-5: EXISTING BICYCLE FACILITIES MAP

A stylized, light-colored bicycle silhouette is positioned on the left side of the page, facing right. The background is a solid dark purple. The bicycle features a large front wheel with many spokes, a smaller rear wheel, a handlebar with grips, and a seat. The frame is simple and elegant.

Chapter 3:

ANALYSIS

ANALYSIS OVERVIEW

Analysis – of existing and future conditions, as well as latent demand – is an essential step in any transportation project planning process. For this project, analysis included spatial (GIS) analysis, fieldwork and community and stakeholder input. This multi-pronged approach allowed for maximal data capture and cross-referencing of findings. For example, bicycle safety concerns were analyzed through collision data, including locations, frequencies and causes. Cross-referencing these collision data with public input helped to confirm safety issues and identify areas for new or improved facilities.

This chapter is primarily concerned with explanations and discussions of the various spatial analyses employed in this project. Brief discussions of the role of fieldwork and community/stakeholder input are provided below, while the remainder of the chapter is devoted to spatial analysis.

FIELDWORK

The project team conducted fieldwork, using measuring tools and geo-referenced photos, on several occasions. Fieldwork was conducted at project kick-off (to better understand existing conditions) and during project development (to verify data obtained from GIS and community/stakeholder input).

COMMUNITY/STAKEHOLDER INPUT

Community and stakeholder input played a very important role in developing facility and program recommendations. A summary of community and stakeholder input obtained and its impact on project recommendations is included at the end of Chapter 1.

SPATIAL (GIS) ANALYSIS

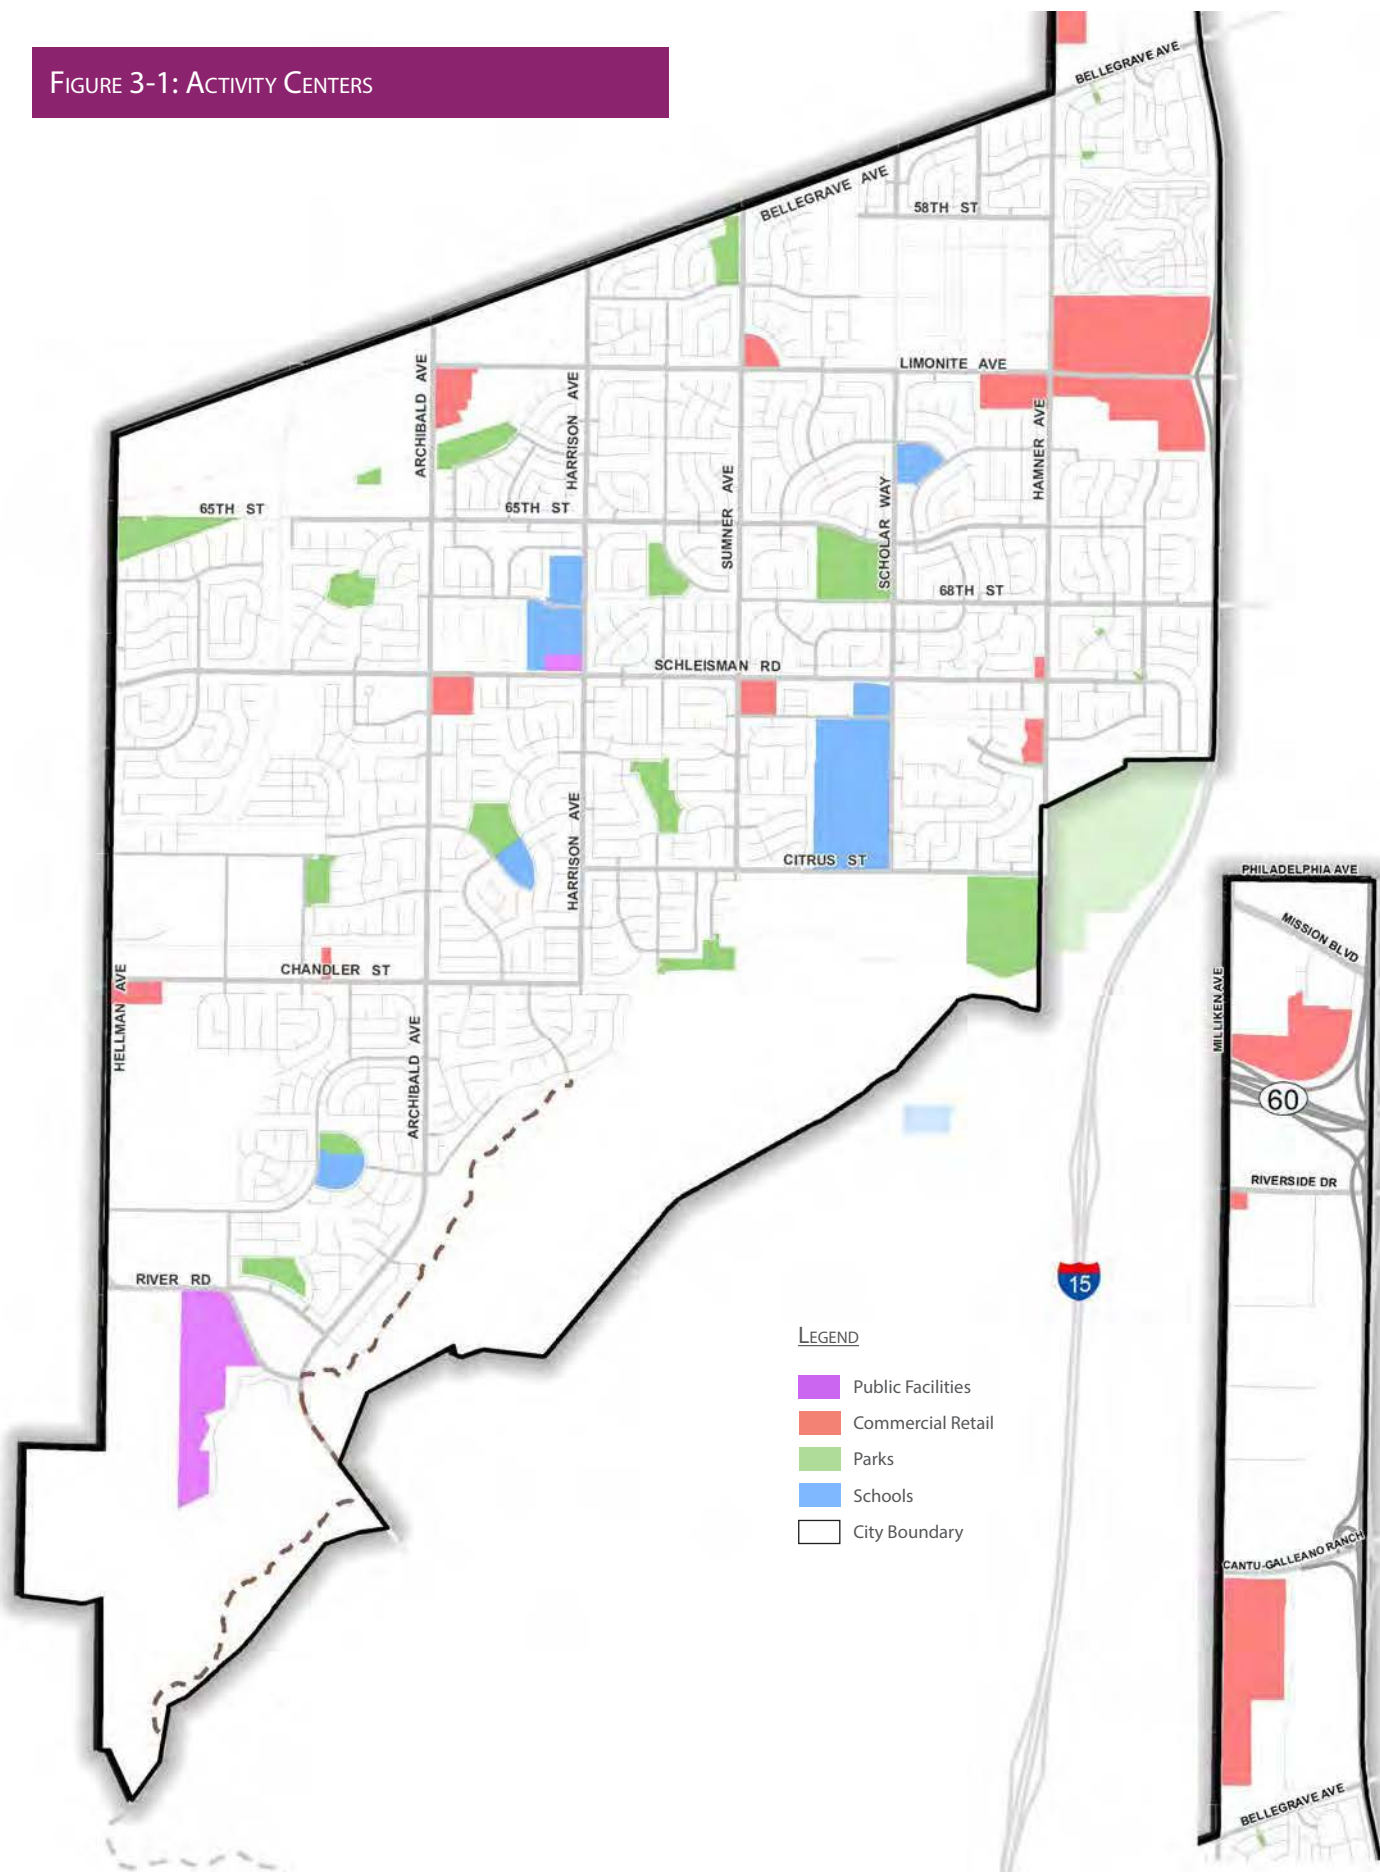

Spatial analysis included simple, data-driven analyses and more complex analyses, requiring evaluations of layered information and multiple inputs. Data-driven topics include activity centers, population/employment density, posted speed limits, and transit routes. Topics requiring more complex analysis included safety/collisions and bicycle boulevard routing. Each of these topics are discussed in more detail throughout this chapter.

ACTIVITY CENTERS

Activity centers include employment hubs, industrial sites, government sites, retail centers, hospitals, schools, colleges, parks, open spaces and other attractions. (Most of these activity centers are required to be considered under California's bicycle planning enabling legislation.) Identifying these centers, and their draw for the community, is essential to creating a useful bicycle transportation network. It is important to create facilities that connect the places people actually want to frequent, rather than where convenient, as is often the case.

Eastvale's primary activity centers include public facilities, commercial/retail facilities, parks and schools. Since Eastvale is a commuter community and lacks a strong employment base of its own, parks and schools are relatively strong attractors. For the most part, parks and schools are evenly dispersed and generate comparable levels of activity. Eastvale also has the following specific attractors: the Community Center, Riverwalk Park, the Santa Ana River Trail and the Eastvale Gateway Mall.

FIGURE 3-1: ACTIVITY CENTERS

POPULATION AND EMPLOYMENT DENSITY

Suburban Eastvale's population density is relatively low (less than five people per acre) and fairly uniform throughout the City. This reflects Eastvale's overall land use pattern, predominated by single family housing. Eastvale's employment density, which is also uniform across the city, is also less than five people per acre. Given Eastvale's "commuter community" character, the low employment density is not surprising. What employment does exist in Eastvale likely falls in the service sector or public sector (This is inferred from available land use data. American Community Survey (ACS) data provide information on employment, by sector, for Eastvale residents, but do not indicate whether jobs are located within Eastvale or beyond). The low, but uniform population and employment densities indicate a need for bicycle facilities throughout Eastvale, rather than concentrating them in particular areas.

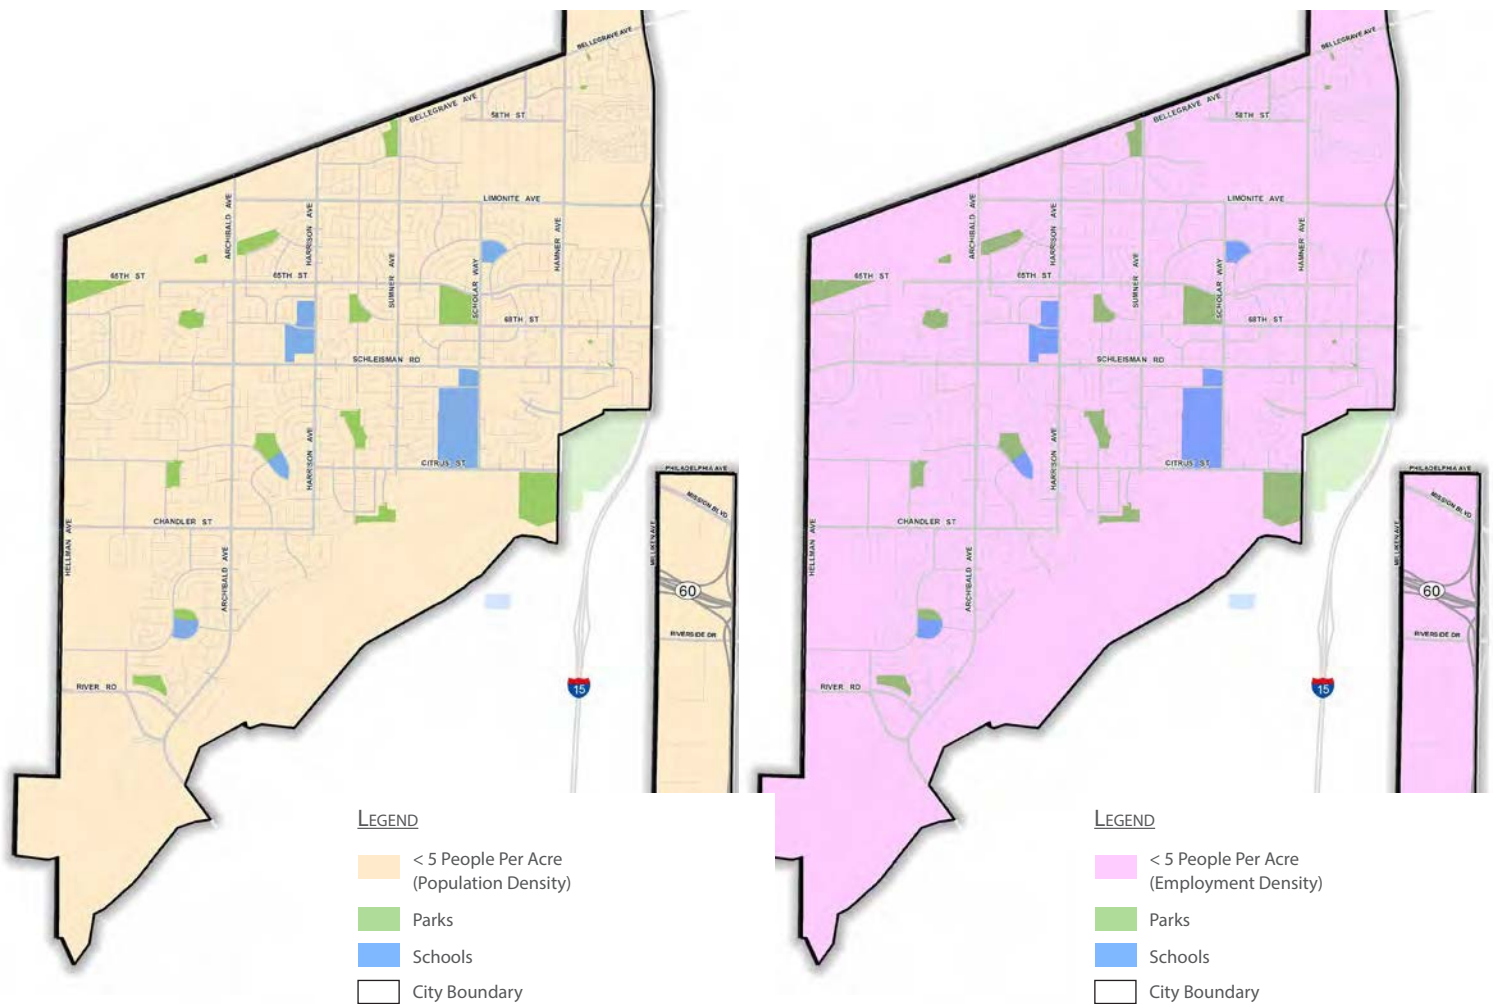

FIGURE 3-2: POPULATION & EMPLOYMENT DENSITY

POSTED SPEED LIMITS

A majority of Eastvale's streets (69 percent) have posted speed limits of 25 miles per hour (mph). These streets are followed – in quantity – by those of unknown posted speed (22 percent), those with posted speeds of 45 mph (five percent), those with posted speeds of 40 mph (two percent) and those with posted speeds of 30 and 35 mph (one percent each). Though the vast majority of Eastvale's streets are low-speed, they are almost entirely confined within "superblocks" defined by high-speed arterial streets. For cross-city travel by bike, this renders the network of 25 mph streets practically useless and makes higher speed arterials the only option.

FIGURE 3-3: POSTED SPEED LIMITS

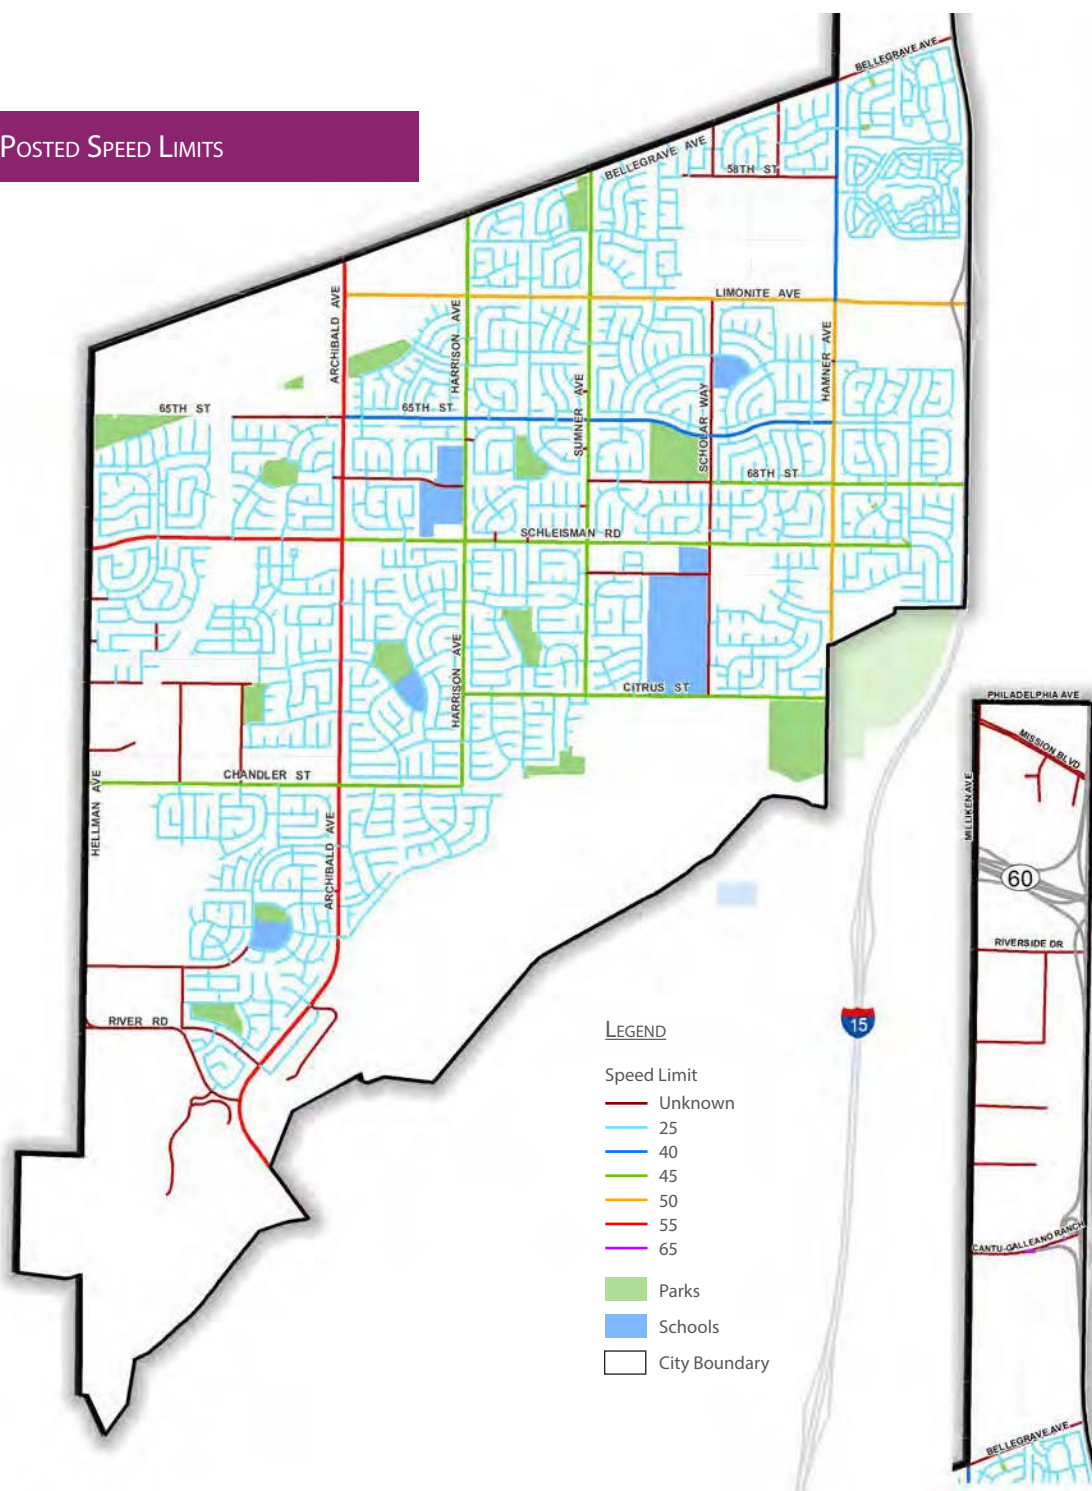

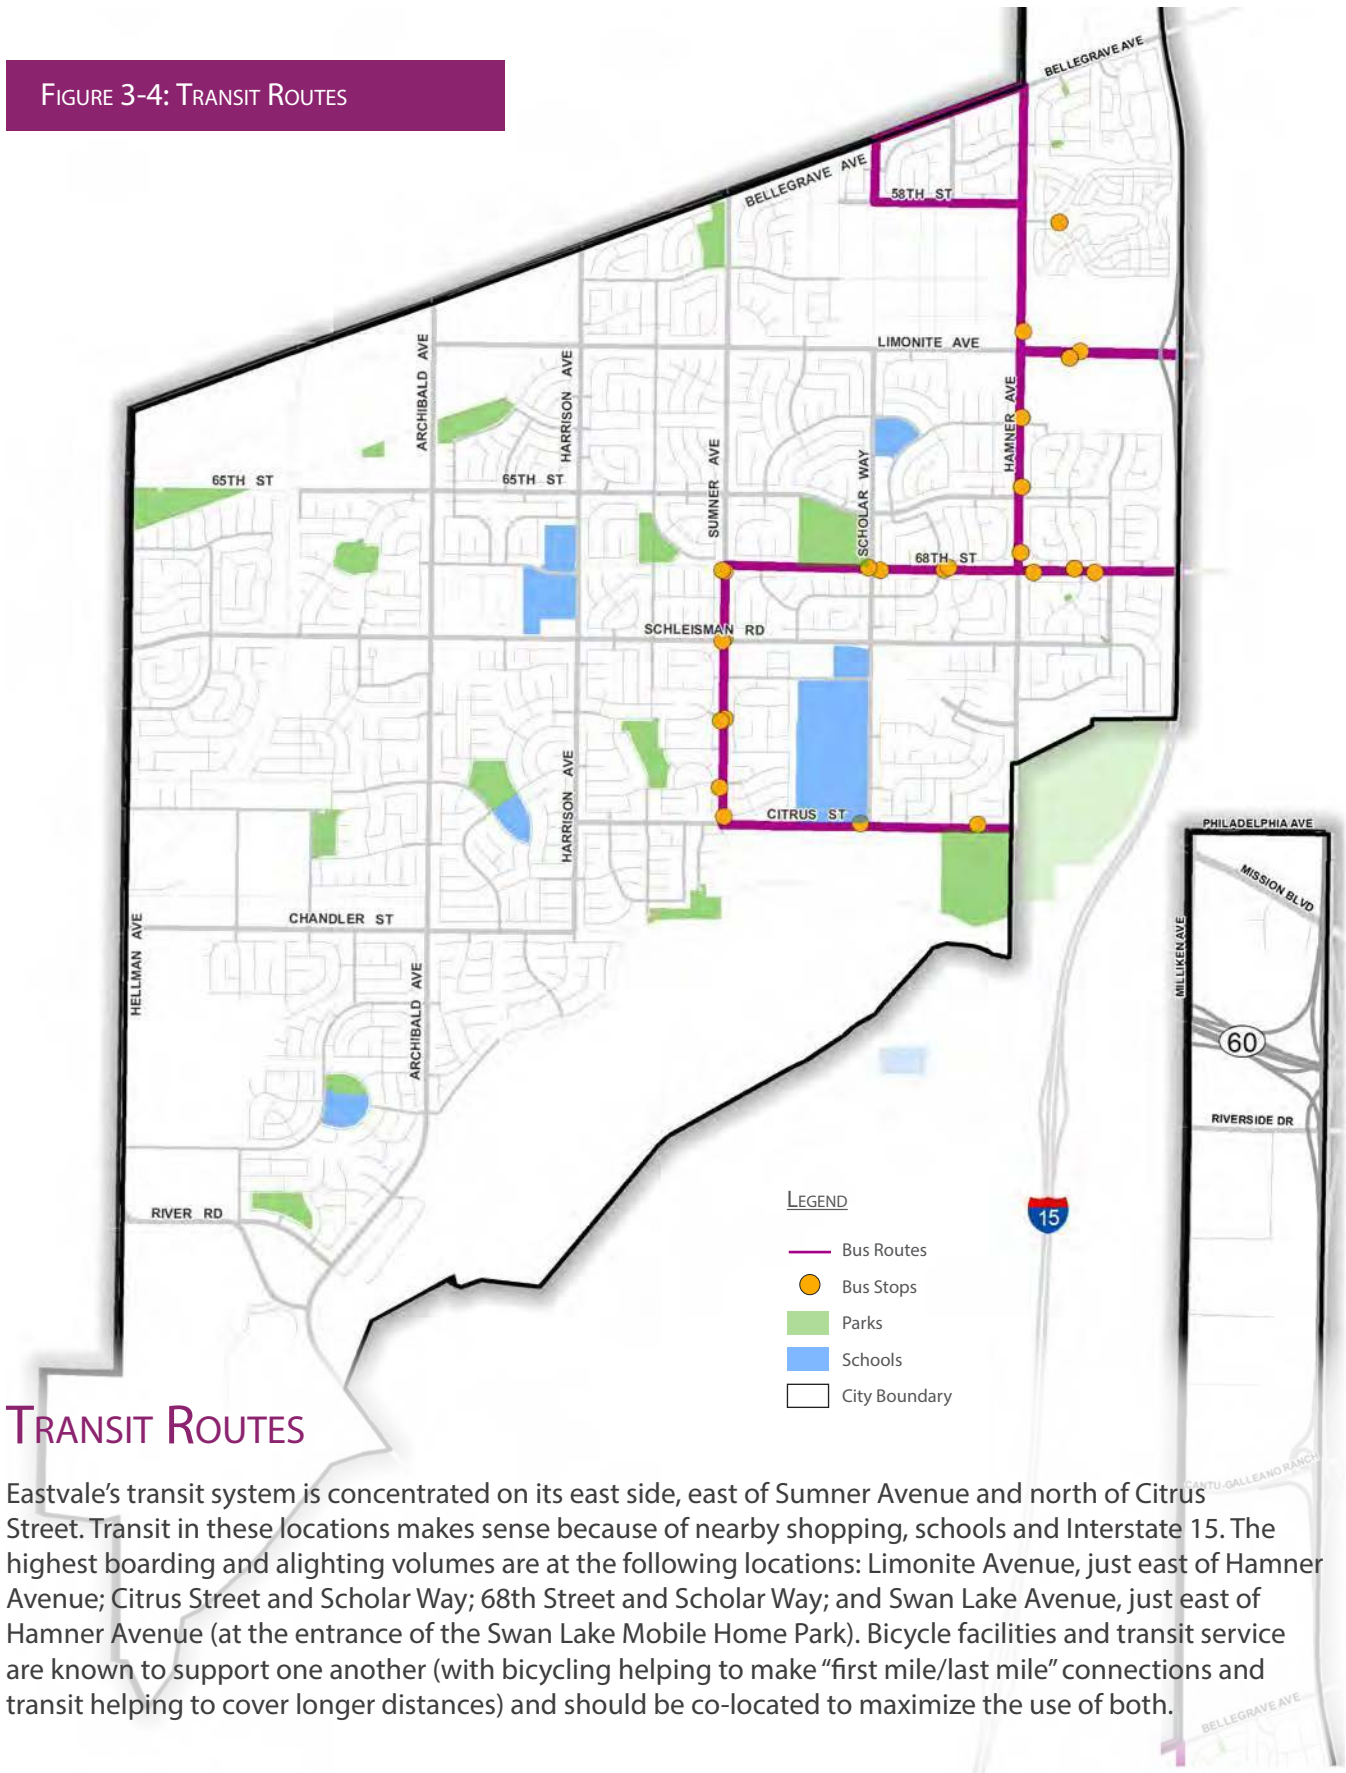

FIGURE 3-4: TRANSIT ROUTES

TRANSIT ROUTES

Eastvale's transit system is concentrated on its east side, east of Sumner Avenue and north of Citrus Street. Transit in these locations makes sense because of nearby shopping, schools and Interstate 15. The highest boarding and alighting volumes are at the following locations: Limonite Avenue, just east of Hamner Avenue; Citrus Street and Scholar Way; 68th Street and Scholar Way; and Swan Lake Avenue, just east of Hamner Avenue (at the entrance of the Swan Lake Mobile Home Park). Bicycle facilities and transit service are known to support one another (with bicycling helping to make "first mile/last mile" connections and transit helping to cover longer distances) and should be co-located to maximize the use of both.

SAFETY ANALYSIS

Safety analysis entails the use of bicycle collision data to better understand collisions, including where they occur, why they occur and how they might be prevented. Typically, collision data is gleaned from the Statewide Integrated Traffic Records System (SWITRS) data sets. However, since Eastvale's Sheriff's office had more current and detailed data, this project used that source instead. (Eastvale contracts with the Riverside County Sheriff's Department for law enforcement.) Sheriff's Department data covers the years 2012-2014 and includes descriptions of incidents and assignments of fault. Summaries of collision data – by year, month, severity, intersection type, street, incident details and assignment of fault – are provided in the following section. These data were used to identify trends, develop project recommendations, and help prioritize recommended projects. The data do include several limitations:

- Collisions on off-street paths are not included in the data.
- Collisions involving cyclists, whether they involve vehicles, other cyclists, or pedestrians, are generally under-reported, so bicycle collisions are likely to have occurred that were not included as part of this data - some estimates are as high as two unreported incidents for each reported incident.

23

BICYCLE COLLISIONS
FROM 2012-2014

BICYCLE COLLISIONS BY YEAR

23 collisions were recorded between 2012 and 2014. Of these, 11 occurred in 2012, five in 2013 and seven in 2014. Because of the small sample size, no trend by year can be inferred.

BICYCLE COLLISIONS BY MONTH

Bicycle collisions by month were also analyzed for trends. While the data do not portray a strong trend, the highest concentration occurred in May and collisions appear somewhat more frequent in the spring and summer than winter months. This slight trend may simply be correlated with higher levels of ridership in the spring and summer.

BICYCLE COLLISIONS BY SEVERITY

The overwhelming majority of bicycle collisions led to injuries.

These were followed by three incidents resulting in no injury and one incident resulting in fatality (hit-and-run driver later arrested through the efforts of the Sheriff's Department). The majority of injuries occurred because of right-of-way violation, many of which occurred at intersections.

BICYCLE COLLISIONS BY INTERSECTION TYPE

Nearest intersections were used as location references for collisions involving bicycles. Bicycle collisions most commonly occurred at intersections of two "Arterial/Collector" streets.

Collisions occurred to a lesser extent at the intersections of "Arterial/Collector and Local" streets and "Local" streets. These findings make

sense in light of the following points: (a) Eastvale's suburban grid requires the use of "Arterial/Collector" streets for cross-city travel and (b) "Arterial/Collector" streets are characterized by high traffic speeds and volumes and complex turning motions.

BICYCLE COLLISIONS BY STREET

As discussed in the previous section on Intersection Types, collisions were far more common on "Arterial/Collector" streets than on "Local" streets, representing nine out of ten of the top collision locations. The top four collision streets – Hamner Avenue, Schleisman Avenue, Limonite Avenue and Scholar Way – are well traveled by all transportation modes and have relatively high posted speed limits: 50 mph, 50 mph, 45 mph and 35 mph, respectively. Even among the bicycle collisions on "Local" streets, the majority of them occurred at their intersection with "Arterial/Collector" streets. These findings indicate the need for enhanced facilities (e.g. separated bicycle facilities along "Arterial/Collector" streets and traffic calming along "Local" streets) and targeted education and enforcement efforts.

BICYCLE COLLISIONS BY CAUSE

The overwhelming majority of bicycle collisions was caused by right-of-way violation (18 of 23). Many of these incidents occurred at large intersections and were likely exacerbated by complex intersection operations. Two incidents were caused by more than one violation (e.g. a cyclist riding the wrong way and driver using his/her mobile phone). The one collision resulting in fatality was caused by a hit-and run driver. The cause of the single remaining collision was unknown due to lack of cooperation of both parties.

BICYCLE COLLISIONS BY FAULT ASSIGNED

There was complete parity between cyclists and drivers in terms of fault assigned. Cyclists and drivers were also equally guilty in violating each another's right-of-way. Primary differences in fault occurred with wrong way riding and drunk driving. Wrong way riding is often addressed through facility improvements, which direct cyclists to safe crossings with reduced crossing distances. All causes of collisions should also be addressed through education and enforcement efforts.

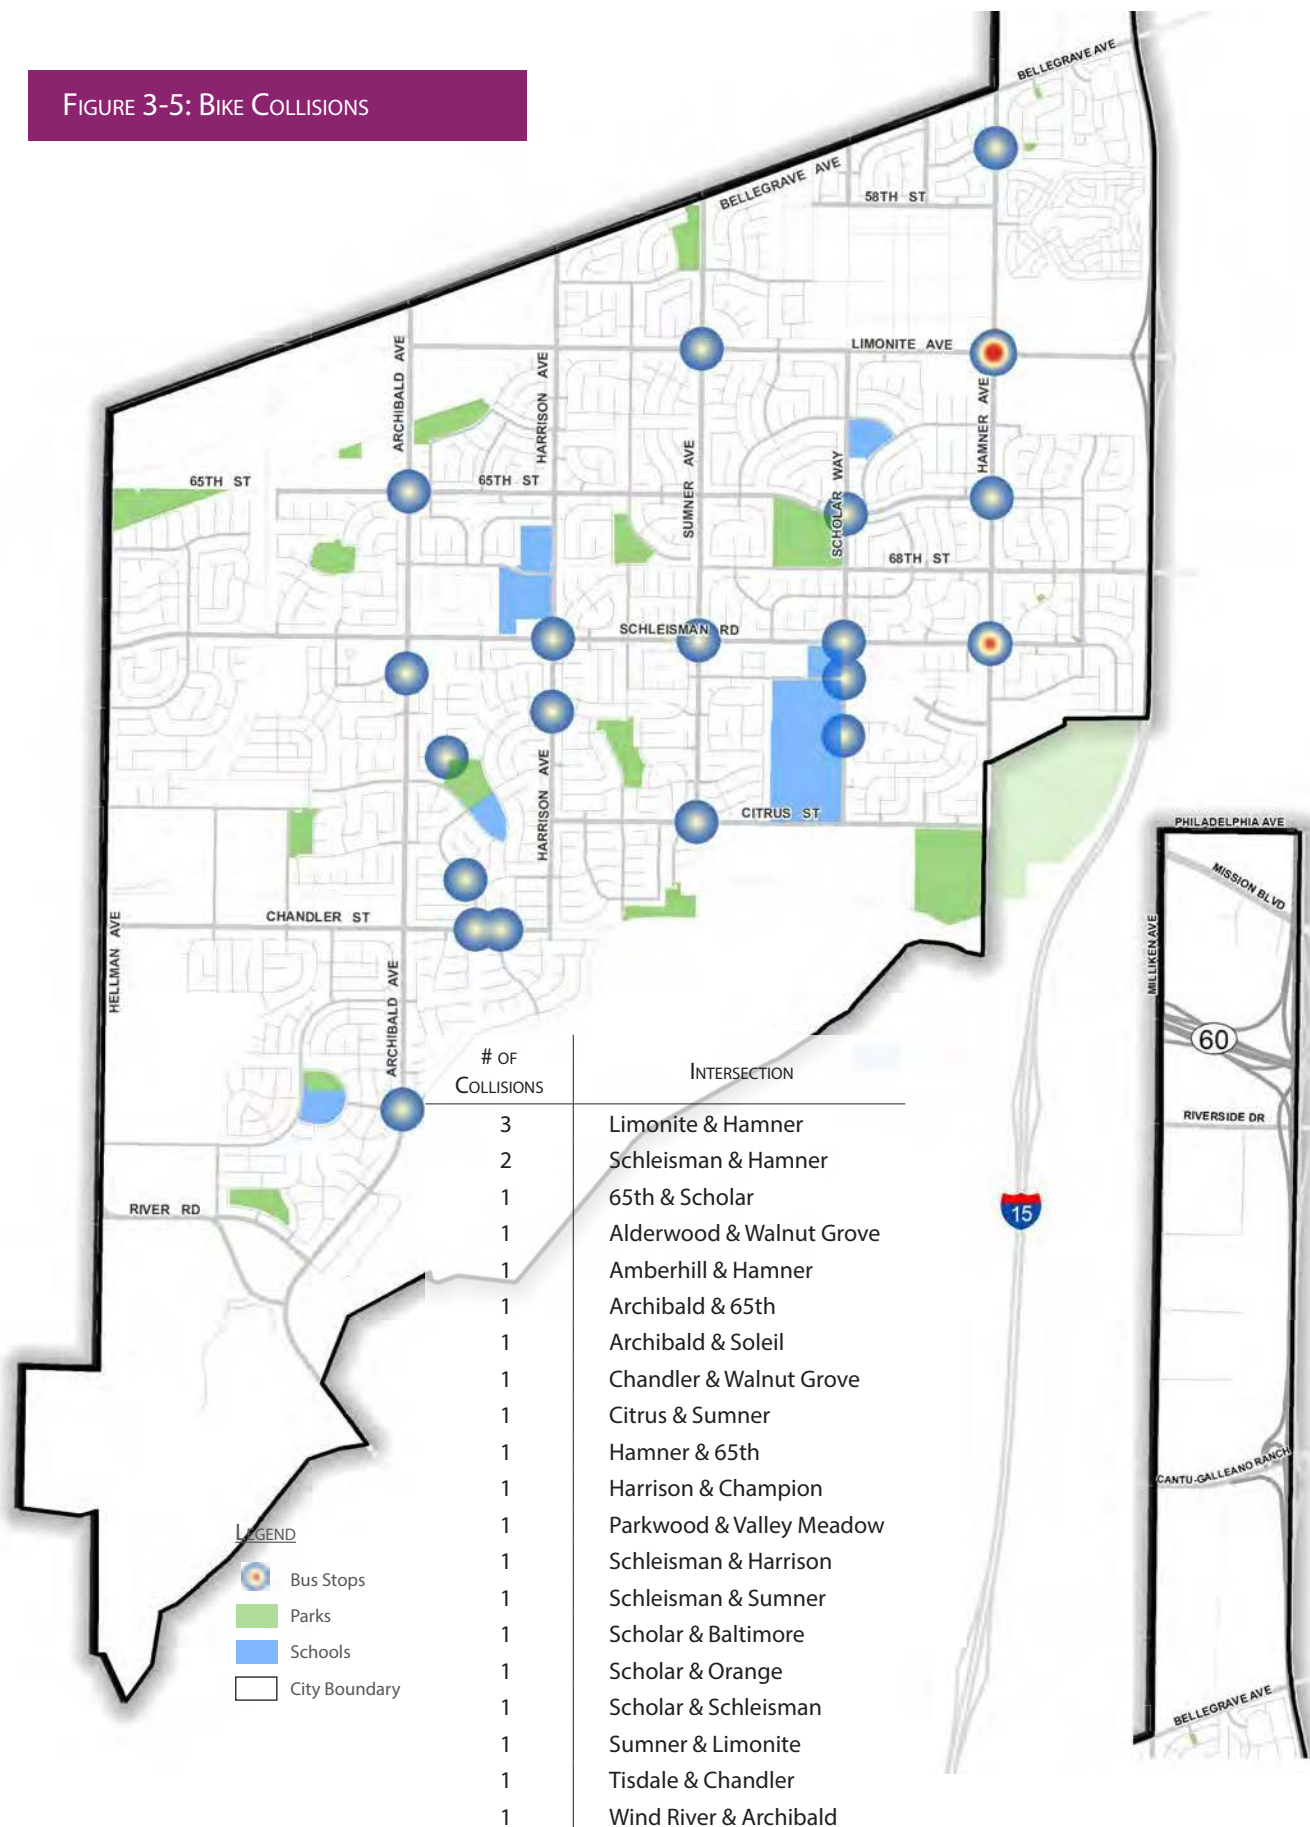

FIGURE 3-5: BIKE COLLISIONS

BICYCLE BOULEVARD ROUTING ANALYSIS

BACKGROUND

A bicycle boulevard is a bicycle priority route, generally located on calm residential streets, parallel to busier arterials and collectors. They are used by bicyclists seeking “low-stress” experiences to access destinations. Candidate bicycle boulevard streets may vary in the amount of traffic calming (i.e. speed and volume reduction) and other interventions required, but are alike in requiring comprehensive wayfinding treatments. (Many cities are now referring to bicycle boulevards as “neighborhood greenways” to better emphasize their traffic calming features that improve pedestrian safety, as well as encourage bicycling.)

In communities with conventional street grids, strong bicycle boulevard candidates are often easy to identify. In fact, public input often reveals that residential streets parallel to busier streets are already used as defacto bicycle boulevards.

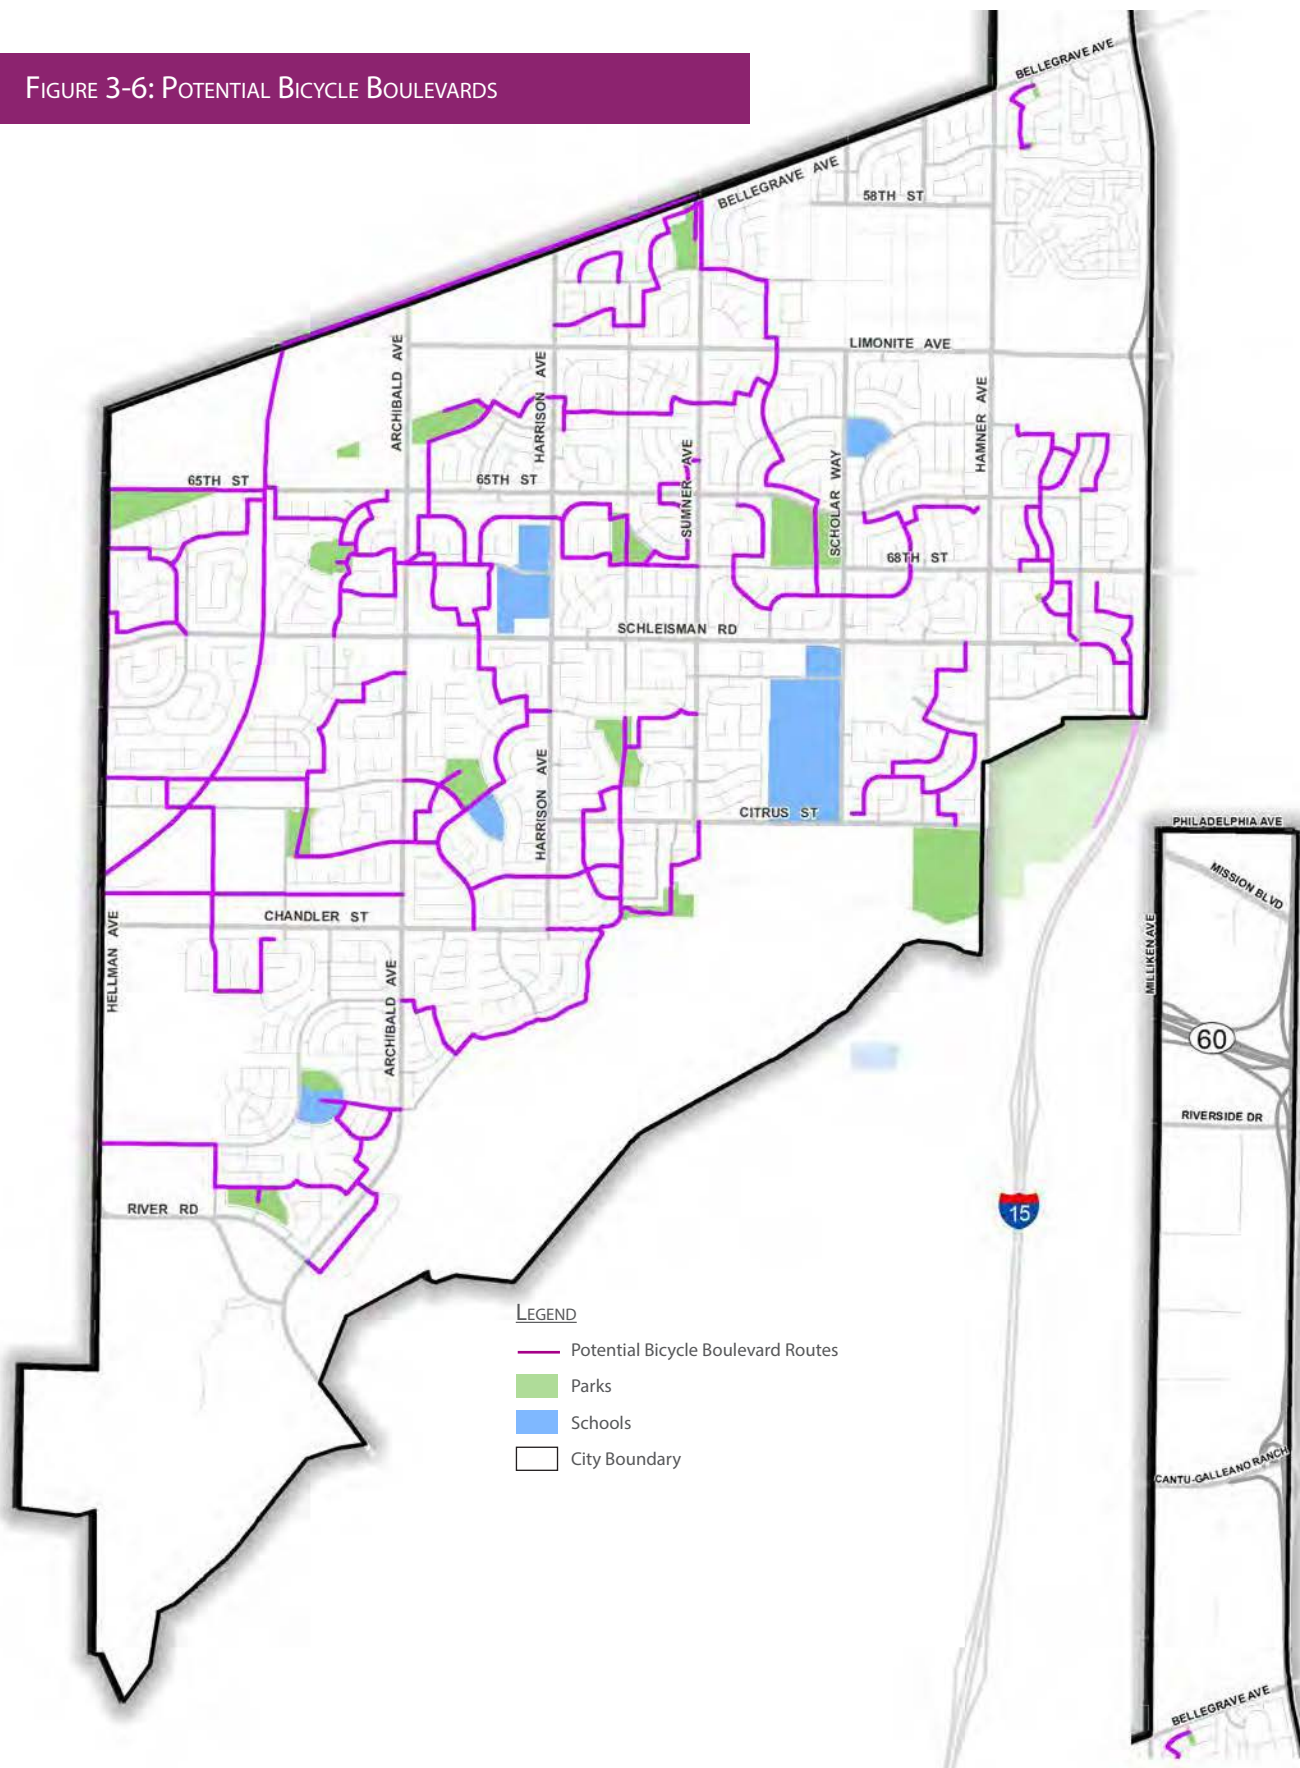

In communities with typically suburban street grids (i.e. those characterized superblocks and cul-de-sacs), bicycle boulevard candidates are much more difficult to identify. Cul-de-sac streets seldom offer bicycle and pedestrian connections and, even when they do, often meander to the point of inconvenience. Still, nearly all communities, including Eastvale, have some bicycle boulevard potential.

APPROACH

For Eastvale’s Bicycle Master Plan, knowledge of bicycle boulevard design was paired with GIS analysis to improve efficiency and maximize positive identification of bicycle boulevard candidates. Using GIS, a network analysis was performed to identify a system of suitable bicycle boulevards based on project-specific inputs and parameters.

The primary input was the existing street network, which was augmented with both existing and potential Class I facilities, as well as small sidewalk connections. Such additions served to close gaps and better represent existing conditions, therefore effectively increasing the amount of bicycle boulevard candidates. Parameters included streets designated as “Local” and those with speeds appropriate for bicycle boulevards (≤ 25 mph). Segment length was also included as a parameter to guide selection of the shortest possible routes. Parks, schools and major intersection crossings were integrated into the network as origins and destinations between which the network analysis was run.

FIGURE 3-6: POTENTIAL BICYCLE BOULEVARDS

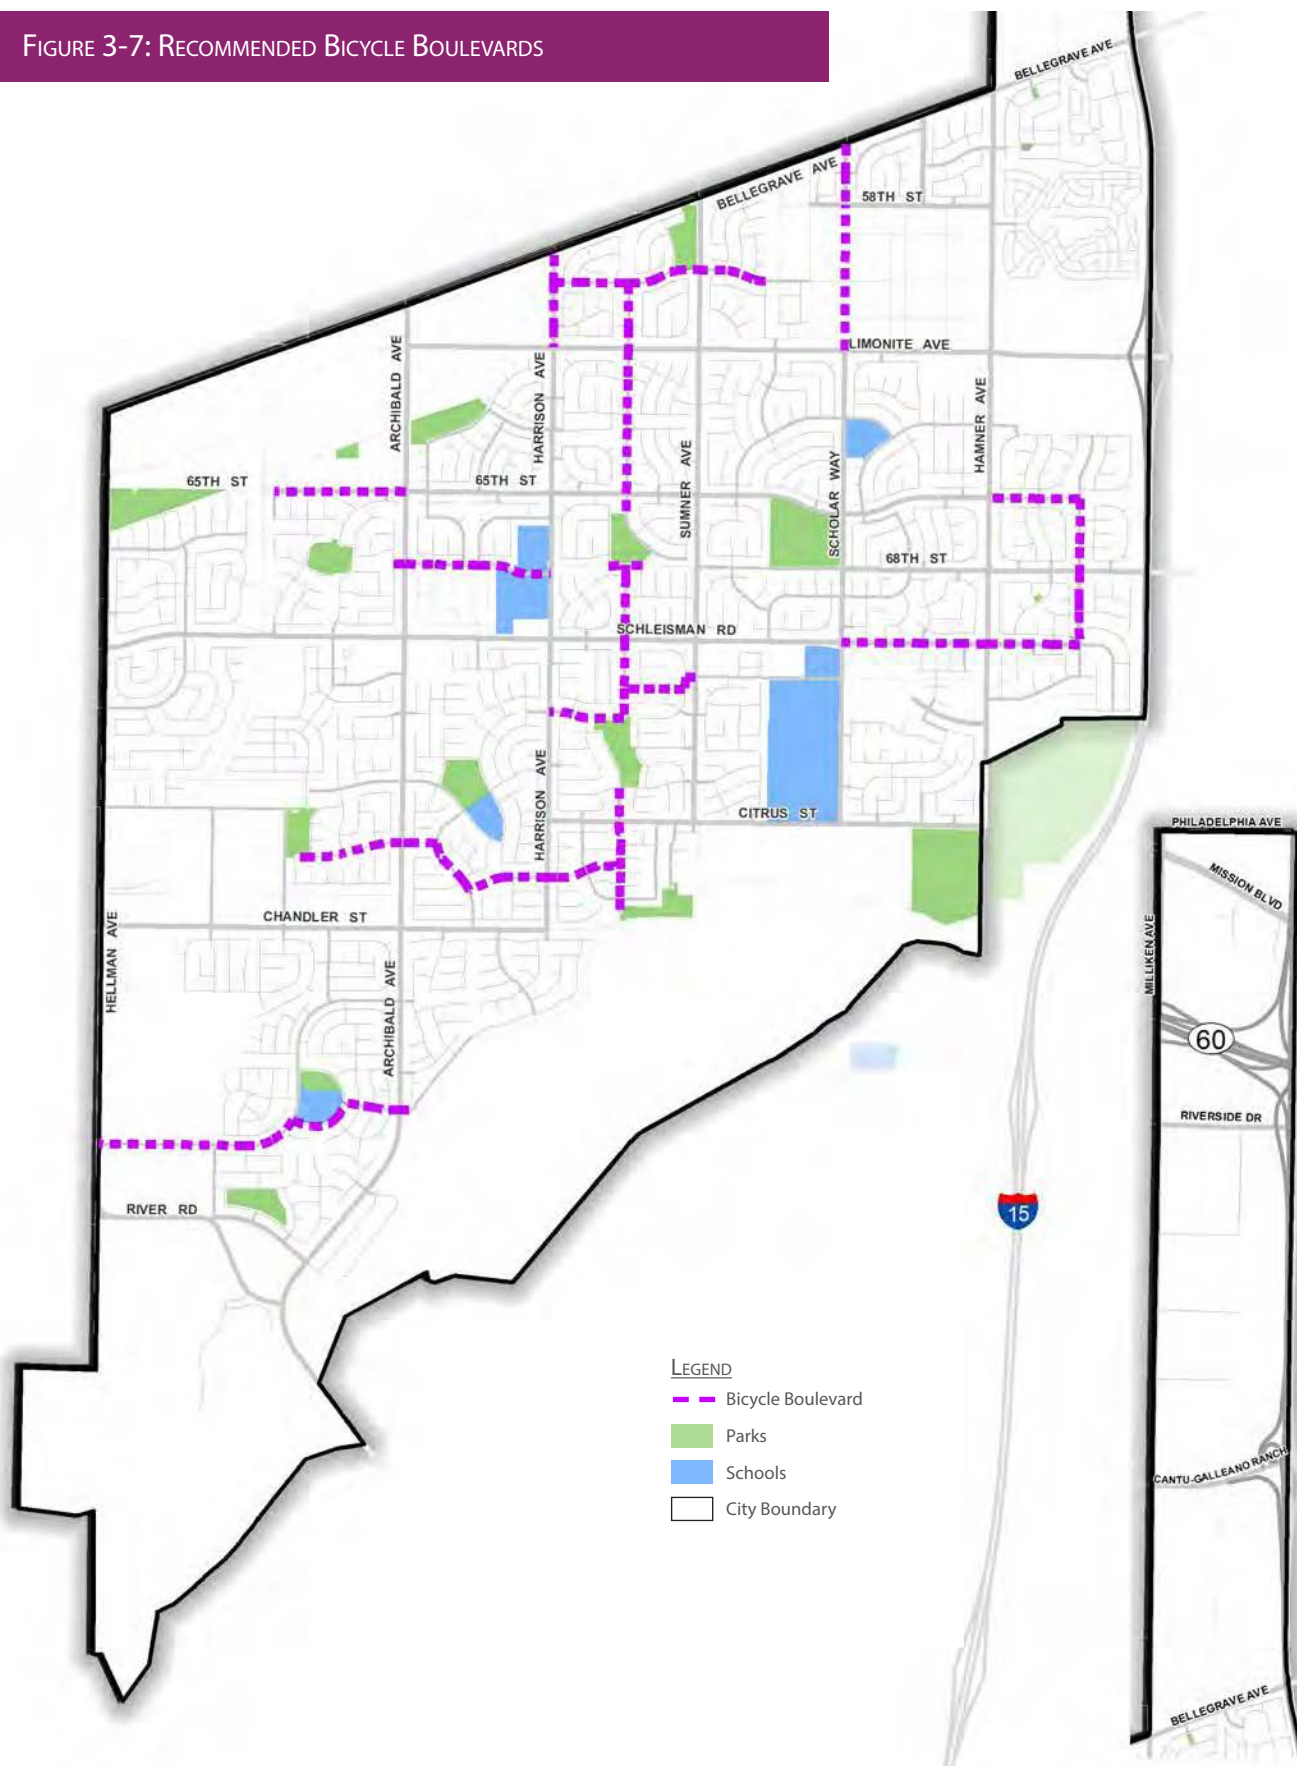

RESULTS

Preliminary results, depicted in Figure 3-6, were derived from the method described above. The GIS results are, however, not the final product. Knowledge of best practices was used to eliminate disjointed segments. These were segments that fit the required parameters, but did not serve the intended purpose. Conversely, professional judgment was used to more closely evaluate and incorporate segments that appeared to be strong candidates, but which were excluded by the analysis due to the strict parameters (e.g. vehicular speeds ≤ 25 mph). As mentioned above, some candidate routes require more intervention than others to become true bicycle boulevards.

Lastly, an analysis of connectivity was performed, as recommended by the Mineta Transportation Institute's 2012 document *Low-Stress Bicycling and Network Connectivity*. The connectivity analysis measures out-of-direction travel and is used to validate bicycle boulevard routes. Out-of-direction travel is determined by comparing each bicycle boulevard route to the corresponding direct route for the same origin and destination. Bicycle boulevards with additional length in excess of 25 percent were considered "intolerable" and removed from the results.

Interestingly, despite the apparently circuitous nature of several of the candidate bicycle boulevards, none exceeded the 25 percent length threshold identified by the Mineta Institute's report. The greatest increase in length was 16 percent and the vast majority of candidates entailed an increase in length of less than 10 percent. Still, drawing from professional and personal experience, several routes were deemed unacceptable bicycle boulevard candidates due to the number of turns they entailed, especially left turns. Routes that jog excessively, but still provide low-stress connectivity, were reclassified as Class III Bicycle Routes. The remaining candidate routes were retained as bicycle boulevards and are shown along with other bicycle facility types in Figure 3-7.

FIGURE 3-7: RECOMMENDED BICYCLE BOULEVARDS

A faint, light blue line drawing of a bicycle is visible in the background, spanning across the page. It shows the frame, handlebars, a large front wheel with many spokes, and a smaller rear wheel.

Chapter 4:

RECOMMENDED FACILITIES

RECOMMENDATIONS

This chapter presents and discusses the projects, programs and standards/codes/policies recommended to improve bicycling in the City of Eastvale.

The City recognizes that improving bicycling will require a multi-faceted approach consisting of a complementary menu of recommended bicycle projects and programs, as well as suggested changes to existing standards, codes and policies.

Recommended projects, or Engineering, is one of the most powerful methods to improve bicycling. According to the League of American Bicyclists (LAB), “The most visible and perhaps most tangible evidence of a great place for bicycling is the presence of infrastructure that welcomes and supports it. Survey after survey shows that the physical environment is a key determinant in whether people will get on a bike and ride.” This chapter begins with a discussion of how bike projects were developed and assessed for feasibility. It then presents specific recommendations for bike projects and “future opportunities” and more general recommendations for Safe Routes to Transit and bike parking.

The success of recommended projects is closely tied to programs and adopted standards, codes and policies. Education, Encouragement, Enforcement and Evaluation and Planning programs to help maximize investments in bike projects. Similarly, the effectiveness of bike programs is maximized by actual project implementation. Likewise, changes to City standards, codes and policies may be needed to implement bike facilities, and project implementation may, in turn, facilitate changes to City standards, codes and policies.

BICYCLE PROJECT DEVELOPMENT AND FEASIBILITY ASSESSMENT

Bicycle projects were developed according to the goal of creating a comprehensive and low-stress bicycle network. Project development considered the following factors:

- Existing and Future Conditions
- Public and Stakeholder Input
- Analysis of Activity Centers, Population and Employment Density, Posted Speed Limits, Transit Routes, Safety/Collisions, Bicycle Boulevard Routing, Benefit/Cost
- Level of Traffic Stress (i.e. anticipated stress, based on vehicle speeds and volumes, as well as type of bicycle facility provided)
- Feasibility (e.g. available right-of-way, project cost, etc.)
- Network Density (i.e. a sufficiently dense network, but not redundant)

Facility types were recommended for specific streets and street segments. Recommended bike facility types include Multi-Use Paths (Class I), Buffered Bike Lanes (enhanced Class II), Bike Routes (Class III), Cycle Tracks (soon to be designated Class IV) and Bike Boulevards (referred to in this report as Class V). Further information on project development, by facility type, is provided in the following sections.

CLASS 1 MULTI-USE PATHS

Multi-use paths were typically recommended along utility easements, flood control channels or through undeveloped areas, such as parks, “paper” streets, etc., to provide connections between otherwise disjointed on-street bike facilities. In only one case, along Harrison Road, was a multi-use path (essentially a widened sidewalk) recommended alongside an existing roadway. This roadside path was recommended due to: (a) the importance of Harrison Road as a bike route, (b) the existing “high-stress” cycling conditions, and (c) the lack of available curb-to-curb right-of-way to provide a low-stress, on-street facility.

The minimum width for a multi-use path was considered to be 10 feet for this plan, with at least two feet of clearance from obstructions on each side. Considering the existing conditions, most were relatively unconstrained. For projects on roadway segments where there appeared to be constraining factors, horizontal clearance was measured using high-resolution aerial photos. This data collection was then supplemented with on-site field work and consultation with City staff. (Typical costs per mile can vary a great deal due to potential right-of-way acquisition, bridges and other possible major expenses such as grading due to hilly topography and facility width.)

CLASS 2 BUFFERED BICYCLE LANES AND CYCLE TRACKS

Buffered bike lanes and cycle tracks were recommended along collector and arterial streets, where anticipated use (by all transportation modes), as well as stress levels, would be higher and where available right-of-way existed. Buffered bike lanes and cycle tracks require the following minimum widths: 5+ feet (ideally, 6-7 feet) and 8 feet, respectively.

The decision to recommend a cycle track versus buffered bike lane was driven primarily by need, such as the need for increased separation to provide a low-stress cycling experience, but was also driven by feasibility, often available right-of-way. (For more information, see the explanation of Delta values in Section 5.2 Recommended Bikeway Projects). Because many collector and arterial streets in Eastvale are excessively wide and unconstrained, decisions about which type to recommend were generally based on need, rather than feasibility. This allowed for more cycle track than buffered bike lane recommendations.

Class 1 Multi-Use Path

Cycle Track

CLASS 3 BICYCLE ROUTES

Bicycle routes recommended for Eastvale were developed with assistance from the Bicycle Boulevard Routing methodology (for more information, see Chapter 3, Analysis). These routes were identified using the Bicycle Boulevard methodology because they met its criteria. They are local streets, have low posted speeds (≤ 25 mph), connect parks, schools and major intersections, and they minimize “out-of-direction travel. However, despite meeting these criteria, because these routes changed direction excessively, they do not provide the convenience of a bike boulevard. Still, these low-stress neighborhood routes were seen as valuable components of the overall bike network and retained as bike routes since they would be useful for short distance travel, such as families going to parks and schools.

Shared Lane Markings or “Sharrows” can be installed along these routes, provided actual speeds are less than 35 mph. Additional considerations, such as adjacent land use, on-street parking, connecting bicycle facilities and traffic volumes should also be considered when applying this treatment. The installation of Sharrows has proven most effective when accompanied by education and encouragement campaigns. For instance, many cyclists and drivers do not know that Sharrow placement (at approximately the center of the lane) is intended to promote safer sharing by:

- Making cyclists more visible
- Guiding cyclists away from the “door zone”
- Directing drivers to make safer/wider passes

BICYCLE BOULEVARDS

Similar to the Class III bike routes described above, bicycle boulevards recommended for Eastvale were developed with assistance from the Bicycle Boulevard Routing methodology (for more information, see Chapter 3, Analysis). They met methodology criteria of being local streets, with low speeds, connecting parks/schools/intersections and involving minimal out-of-direction travel. Unlike the bike routes, recommended bike boulevards provided – mostly – straight and intuitive routes that paralleled busier arterial streets. Some routes are so intuitive that they are likely already used as low-stress neighborhood routes by Eastvale residents, such as the Cedar Creek Road corridor.

Bicycle boulevards, sometimes called “Neighborhood Greenways,” require additional planning and engineering prior to implementation. Example issues to be addressed by further study include, but are not limited to, bicycle and pedestrian safety improvements at intersections and crossings, signage and wayfinding, traffic calming measures, impacts to vehicular traffic flow, and right-of-way acquisition. Education and enforcement related to these facilities is also recommended to maximize their (safe) use.

RECOMMENDED BIKEWAY PROJECTS

Taken together, the previously described projects form a comprehensive, low-stress network, including bicycle facilities on every major (arterial) street and several smaller (local) streets as well. This master plan recommends a total of 59.23 miles of new bikeways (30 projects). Of these, 33 percent are cycle tracks, 26 percent are bike routes, 16 percent are multi-use paths, 15 percent are bike boulevards and 10 percent are buffered bike lanes.

While the breakdown of recommended facilities may seem atypical for a city of its size and composition, it is not entirely surprising considering existing conditions in Eastvale. In other words, in light of Eastvale's suburban street grid characterized by a majority of (low-speed) local streets within "superblock" of (high-speed) arterial streets, it is not surprising that cycle tracks and bike routes are the top two recommended facility types. Similarly, Eastvale's irregular suburban street pattern within the superblocks make bike boulevards and bike lanes unlikely recommendations.

All projects were ranked according to cumulative scores derived from the following criteria:

- Gap Closure
- Reported Collisions
- Economic Efficiency
- Required ROW
- Proximity to Schools
- Community Input

More information on these inputs can be found in "Appendix B: Project Prioritization" on page A-66 and "Appendix C: Benefit-Cost Analysis" on page A-69. Once ranked, projects were sorted by rank and divided into three tiers to assist in implementation.

Recommended projects are presented in the following pages and are organized by tier (and ranked within each tier). For each tier, there is a map highlighting the projects contained and a table providing helpful, supplemental information. Items contained in the table include project rank, project length, project extent and "Delta" value (for bike lanes and cycle tracks). Delta values provide an indication of available right-of-way (ROW) to install a given facility type while preserving vehicle travel lanes, turn lanes, medians and parking. A positive Delta value, color-coded green, indicates a ROW surplus. A negative Delta value, color-coded red, indicates a ROW deficit. A neutral Delta value, color-coded blue, indicates sufficient ROW.

| | |
|-----|--|
| 6 | Green = Feasible |
| -3 | Red = Infeasible |
| 2 | Blue = Value within four feet of minimum |
| N/A | N/A = Not applicable for this recommendation |

FUTURE OPPORTUNITIES

Future opportunities are long-term potential project recommendations developed with input from the City and stakeholders. In general, future opportunity projects are seen as valuable additions to a City's bicycle network, but infeasible at the time of the bicycle master planning effort for various reasons, such as constrained right-of-way, limited funds or significant inter-jurisdictional cooperation. Future opportunity projects are neither (formally) recommended, nor ranked. Even so, identifying projects as future opportunities is important because it establishes precedent for considering certain projects and alignments, and allows for a discussion of their associated opportunities and constraints.

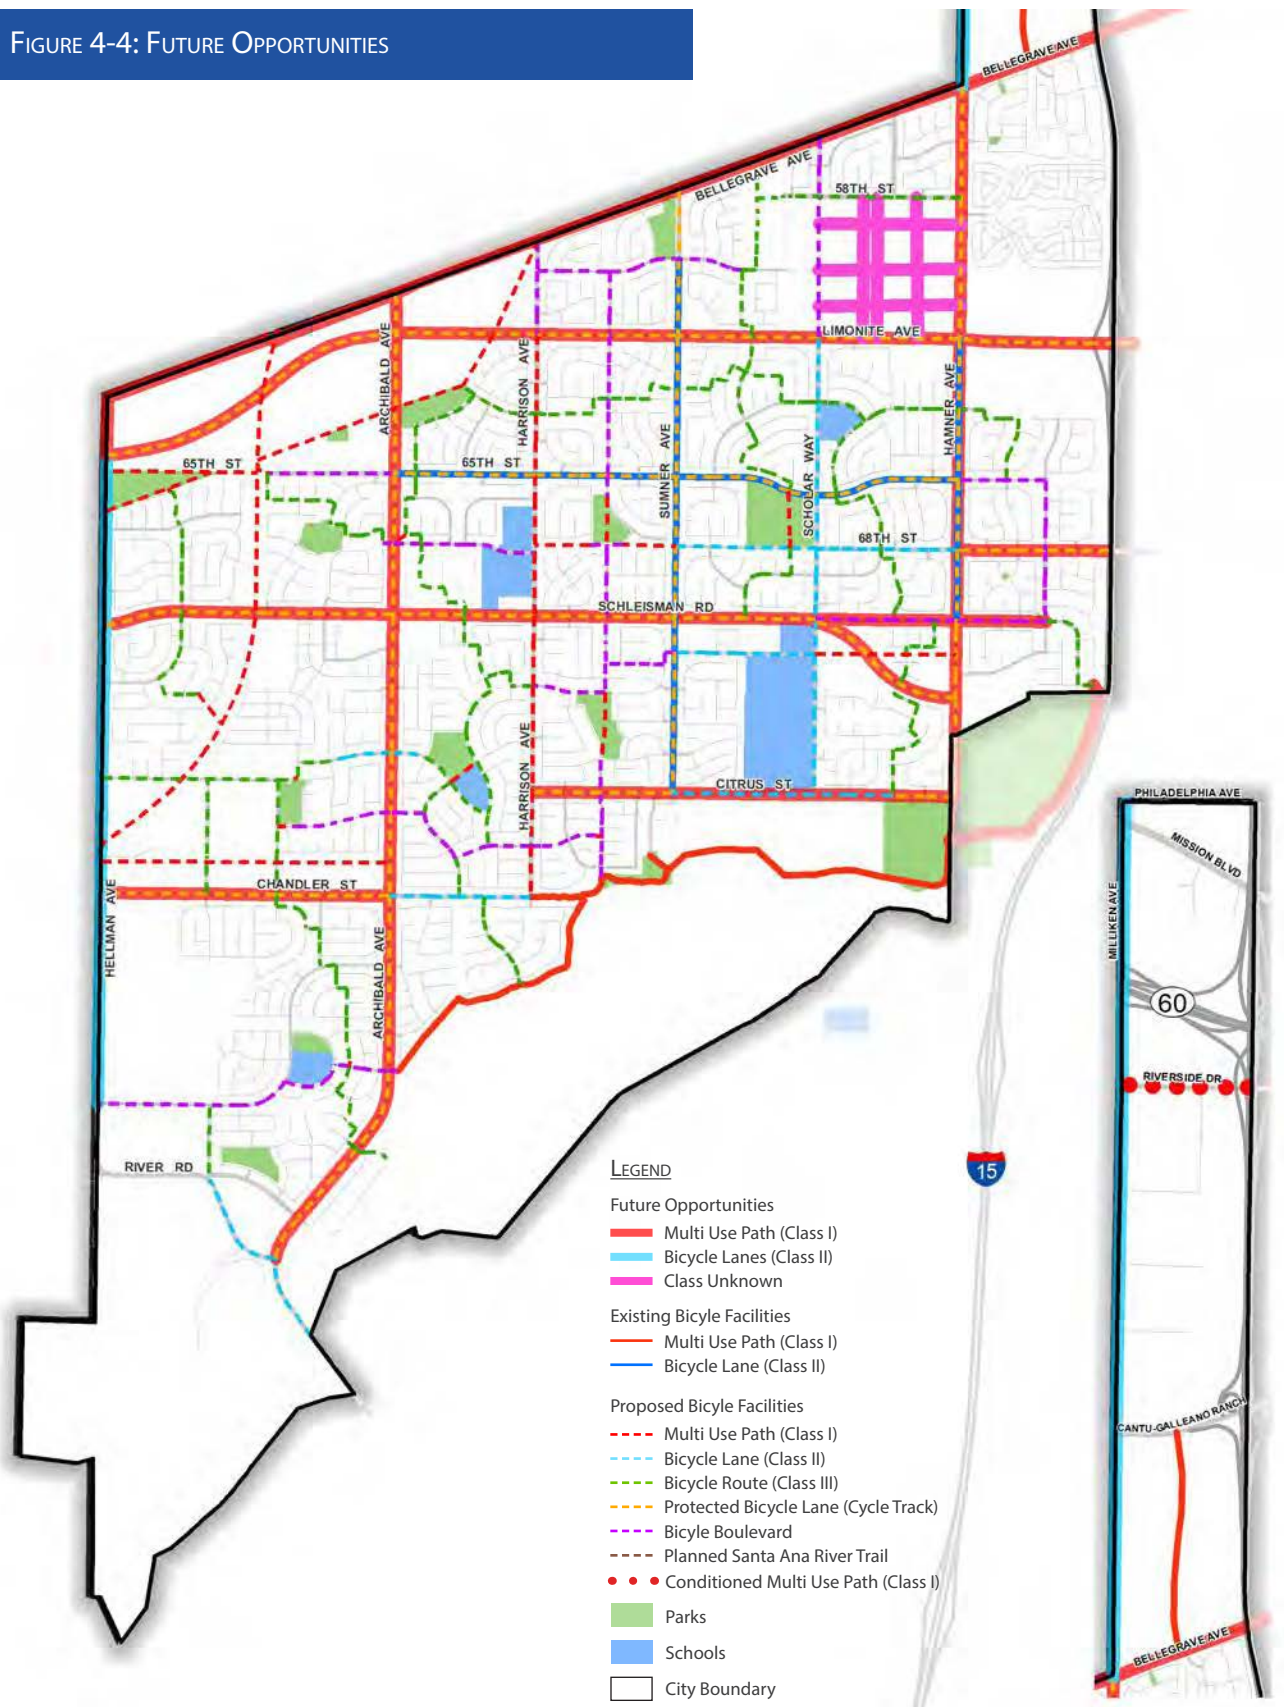

In many cities, future opportunity projects represent downgrades, such as projects that were formerly recommended and ranked, but relegated to "future opportunities." In Eastvale, very few future opportunity projects were downgraded. Instead, the majority were upgrades of projects already recommended.

Altogether, ten projects were recommended as future opportunities, of which seven were recommendations to upgrade cycle tracks along major arterial streets to roadside multi-use paths or "urban trails." These suggested upgrades were based on City and stakeholder preference for lower-stress, grade-separated facilities on major arterials and for designs that helped reduce landscaping (and irrigation) in the public right-of-way. The remaining projects were bike lanes (two) and a multi-use path along the City boundary, both requiring inter-jurisdictional cooperation to implement. For more information about future opportunities, see the following table and Figure 4-4.

TABLE 4-4: FUTURE OPPORTUNITY PROJECTS

| Facility | Segment | From (N/W) | To (E/S) | Notes |
|--------------------|---------------------|---------------------|----------------------------------|--|
| Multi-Use Path | 68 th St | Hamner Ave | Eastern City limit | Opportunities: lower stress facility; landscape removal (water/cost savings) Constraints: cost; existing policy and standards |

FIGURE 4-4: FUTURE OPPORTUNITIES

SAFE ROUTES TO TRANSIT

Providing safe non-motorized routes to and from transit is a fundamental requirement of a multi-modal transportation network. Many trips entail distances too long to be covered by bike or on foot, but easily covered by transit. Many trips also entail short distances (“first-mile”/“last mile”) to and from a transit center, distances that could be covered by bike or on foot. Improving bicycle access to and from transit helps to expand the sphere of influence of both cycling and transit.

As discussed in Chapter 3 (Analysis), Eastvale’s transit system is concentrated on its east side with bus stops on Limonite Avenue, 68th Street, Citrus Street, Sumner Avenue and Hamner Avenue. This master plan recommends low-stress, bicycle facilities on all transit-serving streets (see Figure 3-4). In turn, these direct bicycle connections are also linked to an entire, citywide network of low-stress bicycle facilities. Safe Routes to Transit, however, is about more than just connecting bicycle and transit facilities. It is also about how they are connected.

Safe Routes to Transit improvements should consider best practices in transit, bicycle and pedestrian facility design and should also acknowledge the trade-offs between modes. In general, walking – as the dominant and most vulnerable mode – should be given priority in Safe Routes to Transit. Cycling should follow walking in priority and driving should be subordinate to all other modes. In practice, this hierarchy should translate into the following design features:

- Curb cuts and ramps between bicycle facilities and transit stops (Curb cuts or ramps should be designed to create a – comfortable and safe – transition between cycling and pedestrian space)
- Secure bike parking (Secure bike parking should be provided at transit stops, particularly where commuters might be expected to leave bikes during the workday)
- Bike accommodation on transit vehicles (Transit vehicles should be equipped with front-mounted bike racks or other storage mechanisms)

Note: The City of Eastvale’s transit system is currently minimal, consisting of two bus lines and no rail service. Further development of Eastvale’s transit system, particularly the inclusion of rail service, would merit additional design features and measures such as priority bike travel and parking at stations, full service bike stations, station wayfinding, elevators/escalators/stairs that accommodate bikes, and a bike share program.

Bicycle Lane Approaching Transit Stop
Seattle, WA

“Share the Road” Sign
San Clemente, CA

BICYCLE PARKING

Vehicle drivers expect convenient and secure parking to be provided at all destinations. Similar, if not greater, accommodation should be made for bicycle parking. Bicycle parking should be provided routinely, at all destinations where cyclists are expected, such as at shopping centers, work places, parks, apartment buildings, etc. Bike parking should be conveniently located, near the main entrances of buildings or other destinations and no further from the entrance than the closest vehicle parking space. Bicycle parking should also be well-lit and secure, which increases confidence in longer-term bike storage, and may encourage more bicycle commuting (to work and school). The provision of convenient bike parking may make bicycle trips, particularly short ones, more attractive than driving.

BIKE RACK DESIGN

Good bike rack design is an essential component of bike parking. The most important element of good design is the ability to properly lock a bike, specifically the ability to secure the frame, the front wheel and the bike rack within a typically sized U-lock. Racks that support the bicycle, but either provide no way to lock the frame or require awkward lifting to enable locking, are not acceptable unless security is provided by other means, such as a locked enclosure or monitoring by attendants. See the Association of Pedestrian and Bicycle Professionals (APBP) Bike Parking Guidelines for more detailed information on bicycle parking design and placement. Bicycle racks must be designed so that they:

- Do not bend wheels or damage other bicycle parts
- Accommodate high security U-shaped bicycle locks
- Accommodate securing the frame and wheels
- Do not trip pedestrians
- Are easily accessed yet protected from vehicles
- Are covered if users will leave their bicycles for long periods

Custom racks that lend added aesthetic or placemaking value may also be encouraged, so long as they provide adequate security. Bicycle racks can be customized to incorporate an area's aesthetics, or designed to complement a specific building or business. For example, the City of Long Beach maintains a program funded by the American Recovery and Investment Act to help business owners install bicycle racks. Their program allows for businesses to choose from a range of existing designs or to design their own.

Offset Bike Racks Require Small Footprint
Park-A-Bike

Custom Bike Racks
Huntington Beach, CA

BICYCLE CORRALS

Bike corrals are groupings of bike racks, typically located in former vehicle parking stalls. Most bike corrals are located on streets, in former parallel parking spots, but some also exist within shopping center parking lots. Corrals can accommodate up to 20 bicycles per former vehicle parking space. On-street bicycle corrals provide the following benefits to businesses, pedestrians, cyclists and drivers:

- Businesses - Corrals provide a high customer to parking space ratio and advertise “bicycle friendliness.” They also permit increased outdoor seating for restaurants by moving the bicycle parking off the sidewalk. Some cities have instituted programs that allow local businesses to sponsor or adopt a bicycle corral to improve bicycle parking in front of their business.
- Pedestrians - Corrals clear the sidewalks and those installed at corners also serve as curb extensions.
- Cyclists - Corrals increase cycling’s visibility and greatly expand bicycle parking options.
- Vehicle drivers - Corrals improve visibility at intersections by preventing large vehicles from parking at street corners and blocking sight lines.

Bike Corral
Long Beach, CA

BICYCLE LOCKERS

Bike lockers provide increased security for bicycles, their easily removable parts and attached accessories, such as lights, pump, tools and bags. Bike lockers are long-term parking facilities, intended for situations where bicycles are left unattended for long periods of time: apartments and condominium complexes, schools, places of employment and transit stops.

CALCULATING DEMAND FOR BICYCLE PARKING

While the provision of parking should be standard, the amount of parking should be tailored to context. Typically, one of three ratios are used to determine appropriate bicycle parking amounts (by land use): a) a percentage based on car parking requirements, b) the square footage of each land use, or c) using specific units, such as the number of bedrooms or employees. Each method has benefits and drawbacks. Because of this, a variety of methods is often used. Descriptions of each method, including summaries of benefits and drawbacks include:

- Method “a” sets the percentage of bike parking spots according to the desired bike mode share. For example, if a 10 percent mode share is desired, bike parking should constitute 10 percent of overall parking). This method has the benefit of being easy to calculate, but has several drawbacks. First, it is based on vehicle parking minimums, which are often inflated. Secondly, it directly links vehicle and bike parking, so that a decrease in vehicle parking would necessarily lead to a decrease in bike parking. Lastly, it may overgeneralize and underestimate bike parking demand based on land use.
- Method “b” links the amount of bicycle parking to building square footage. This method has the advantage of being detached from vehicle parking and linked instead to floor area and land use. In this way, uses expected to generate more bike trips would include greater amounts of bike parking. The primary drawback of this method is that even projections based on use involve significant guesswork.
- Method “c” calculates bike parking demand according to the specific units within a building. The primary advantage of this method is that it links actual people (and potential cyclists) to parking demand, rather than space, which may or may not contain people. Like method “b,” this method has the disadvantage of projecting bike parking demand based on scant evidence.

The background is a solid teal color. A faint, light-colored silhouette of a bicycle is overlaid on the background, positioned diagonally from the bottom left towards the top right. The bicycle's frame, handlebars, front wheel with spokes, and rear wheel are visible.

Chapter 5:

RECOMMENDED PROGRAMS & POLICIES

There has been a shift away from the traditional, compartmentalized “Five Es” approach developed by the League of American Bicyclists (Engineering, Education, Encouragement, Enforcement and Evaluation and Planning) and toward a more fully integrated and complementary menu of initiatives. By offering a menu rather than a prescriptive list, bicycle programming can more accurately address existing conditions and the desired outcomes of a given context. This approach allows for increased targeting of the “interested, but concerned” population of would-be cyclists and provides the greatest return on investment.

The programs recommended for the City of Eastvale are organized into three categories:

1. Education/Encouragement/Marketing
2. Education/Enforcement
3. Monitoring and Evaluation

These categories are not definitive. They are merely intended to offer a level of organization to the many program initiatives, the majority of which fall into more than one category.

EDUCATION/ENCOURAGEMENT/MARKETING PROGRAMS

SMART TRIPS PROGRAM BUNDLE

Smart Trips is a generic name for community-based transportation demand management (TDM) programs that provide tools and incentives to make cycling (and other modes) the preferred mode for particular trips. Smart Trips are intended to complement efforts aimed at commute behavior by targeting other household trips. This is important because while many people find the prospect of commuting by bicycle daunting, they may be enticed to try riding for shorter trips around their neighborhood. Smart Trip programs have been shown to result in two to 14 percent reduction in drive-alone car trips and a significant increase in cycling.

Implementation of a variety of initiatives, leveraged as part of a Smart Trips program and delivered as a “bundle,” has been important to the success of Smart Trips programs in other cities. The bundled delivery of Smart Trips initiatives allows for the saturation of a target audience and has been instrumental in maximizing limited outreach dollars.

STREET SMARTS CLASSES AND BICYCLE AMBASSADORS

This initiative promotes safe bicycling through community-based outreach, which helps bridge the gap between people who want to start riding and the availability of opportunities to help people learn to bicycle safely. Ideally, safety would be taught through bicycle safety courses delivered at the Cycling Education Center (described below) and on city streets, as appropriate. A Bicycle Ambassador program has recently been initiated by the Inland Empire Biking Alliance. The City should support this program through funding or, at least, in-kind contributions.

BICYCLE FRIENDLY BUSINESSES AND DISTRICTS

The City can promote the League of American Bicyclists' (LAB) Bicycle Friendly Business program among local businesses to encourage cycling by their employees and customers. Businesses then use their bicycle friendliness as part of marketing. Benefits to employees often include attractive and secure bicycle parking, locker rooms, showers and reimbursement for trips made by bicycle, via the Bicycle Commuter Benefit Act. Under this Act, companies can reimburse employees on a tax-free basis for "reasonable expenses" incurred as a bicycle commuter. This can include the purchase of a bicycle and almost any type of accompanying equipment and accessories such as lights, racks and clothing, up to the annual limit of \$240, or however much a company chooses to offer. Benefits to customers can include secure parking and discounts. Bicycle Friendly Business Districts combine the efforts of individual businesses to offer a more supportive and coherent cycling environment.

COMMUNITY BICYCLE PROGRAMS

Community bicycle programs, also known as Bike Kitchens, are commonly formed as grass roots initiatives by community members within low income and underserved communities to provide bicycles, helmets, maintenance help and safety instruction to people as a means of expanding their transportation options and providing people better access to work and services. The City of Eastvale should support the creation of a Bike Kitchen within its boundaries and leverage its resources in coordination with the bicycle facilities prioritized in the bicycle master plan. This combination will help to encourage an increase in cycling mode share, serve as a missing link in the public transit system, reduce GHG emissions and provide additional "green" jobs related to system management and maintenance.

EXPAND TRADITIONAL TDM – EMPLOYER INCENTIVES

Existing TDM measures within the City of Eastvale include the Inland Empire Commuter Incentives offered by the Riverside County Transportation Commission (RCTC). Incentives offered are available to those switching from single occupancy vehicle trips to alternative modes and include both short-term and long-term perks (\$2 per day for the first three months and premium coupon booklets for continuing participants, respectively). The City should work with the RCTC and local major employers to expand the reach and marketing of its existing program.

In addition to marketing to major employers, the City could deliver targeted marketing of available TDM benefits along corridors where new bicycle facilities are implemented. The existing incentives program could also be used to leverage participation in special challenges and competitions hosted by the City and regional planning agencies, such as Bike to Work/School Challenges. Lastly, the City should work with the RCTC to ensure the provision of appropriate TDM end-of-trip amenities for cycling like safe and secure bicycle parking and Safe Routes to Transit.

EVENTS - BIKE MONTH

Have the Mayor continue to proclaim May as Bike Month and participate in Bike to Work Week events. Host pit stops during Bike to Work Weeks and Days. To increase encouragement, host Bike to Work days more often, such as monthly. Promote Bike Month or monthly Bike to Work days heavily within Smart Trips target areas and among target populations.

SAFE ROUTES TO SCHOOL

DEVELOP A SAFE ROUTES TO SCHOOL PROGRAM

Inactivity, and even obesity, among school-aged children is among the greatest public health crises in America. Encouraging children to walk or bicycle to school is one important means of combating this epidemic and has the potential to instill lifelong healthy habits. Successful Safe Routes to Schools (SRTS) programs not only provide encouragement and support for walking and cycling, but address legitimate safety concerns of many parents. SRTS programs tackle safety issues through education and infrastructure improvements. Wherever possible, SRTS efforts should be integrated into the larger processes of planning and project implementation.

Best practices in SRTS education programs combine more traditional print media and classroom tactics with experiential courses and clinics. For example, the Alameda County SRTS program provides an array of education and safety programs including Educator Guides, Skills Drills Bicycle Safety Course, Bicycle Clinics, Bicycle Safety Certification Program and Bikemobile, a mobile repair clinic (<http://alamedacountysr2s.org/>).

Ideally, the SRTS program could partner with a regional Traffic Garden to offer more comprehensive traffic safety education, teaching children the fundamental rules and responsibilities of all modes. Participating schools could make attendance for field trips to the regional Traffic Garden compulsory and recurring, a component of Physical Education, with activities tailored to age groups. Barring the availability of a local Traffic Garden, a makeshift streetscape could be created with chalk, for example. Supplemental exercises in the mechanics of actually riding a bike, from basic to advanced bicycle handling skills, could be provided as needed at the Cycling Education Center.

SRTS efforts at infrastructure improvement are unique in their incorporation of youth perspectives. Youth are encouraged to participate at all phases and even to serve as a Safe Routes to School liaison. Further funding may be available through Safe Routes to Schools grants, available at both the federal and State level. This funding can be used for a variety of activities including site-specific evaluation and planning, infrastructure costs and education programs. Assistance with funding applications and program facilitation is available from local non-profits. More information can be found at: <http://www.saferoutesinfo.org>.

PROMOTE THE WALKING SCHOOL BUS AND BICYCLE TRAIN

These are volunteer-based programs in which children chaperoned by adults as in they walk or bicycle to school. Parents often cite safety concerns for their reluctance to allow their children to walk or ride to school. Providing adult supervision may alleviate these concerns. The Temecula Bike Train, led by Inland Empire Biking Alliance Board Member Zak Schwank, is one highly successful Riverside County example. This Bike Train occurs every Friday with 25 to 100 schoolchildren (<https://www.facebook.com/BikeTrain>).

CONTINUE TO PARTICIPATE IN WALK AND BIKE TO SCHOOL DAY

This one-day October event in more than 40 countries celebrates the many benefits of safely walking and cycling to school.

Walking and rolling to school embodies the two main goals of First Lady Michelle Obama's Let's Move! Campaign: to increase children's physical activity and to empower parents to make these kinds of healthy choices. The National Center for Safe Routes to School, which serves as the clearinghouse for the federal Safe Routes to School (SRTS) program, coordinates online registration efforts and provides technical support and resources for Walk to School Day. For more information, go to www.walktoschool.org.

CYCLING EDUCATION CENTER

Create a Cycling Education Center that would serve as a clearinghouse for cycling educational materials, electronic and printed, and host a variety of courses. Course material would be bicycle-specific and, in the case of the Traffic Garden (described below), cover general mobility. Bicycle-specific areas would include:

- Handling skills (balance, starting, maneuvering, stopping)
- Riding in traffic skills (riding predictably, signaling, merging, obeying applicable laws)
- Safety gear (helmets, lights, visible clothing)
- Other (basic maintenance, locking your bicycle)

Teaching skills courses will require the training of licensed cycling instructors (e.g. the League of American Bicyclists' Cycling Instructor program). In the case of a Traffic Garden, detailed knowledge of laws related to all modes would be required. For this reason, the City's designated law enforcement liaison may be the most suitable referee.

An ideal Cycling Education Center location would be central and served by existing or planned bicycle facilities, may even be an existing public property (a park, school or civic center) that can simply be enhanced. The success of a Cycling Education Center would be the result of significant coordination between the Engineering and Planning Departments, Riverside County Sheriff Department, local volunteers, advocates and cyclists.

MAPS AND SIGNAGE

PRODUCE AN UPDATED BICYCLE FACILITY MAP

The bicycle system, built and planned, could be promoted through a publicity campaign and a user-friendly map that illustrates available utilitarian and recreational routes and their connection to regional routes. In addition to route location and distances, this map should include other essential information such as key destinations and rules of the road. While bicycle maps have traditionally included designations of facility type (Class 1, 2 and 3), the utility of this for the general public is increasingly questioned. Instead, information more directly related to preferred user experience, such as topography, traffic stress, the scenic or direct quality of a route, which varies from user to user, is seen as valuable.

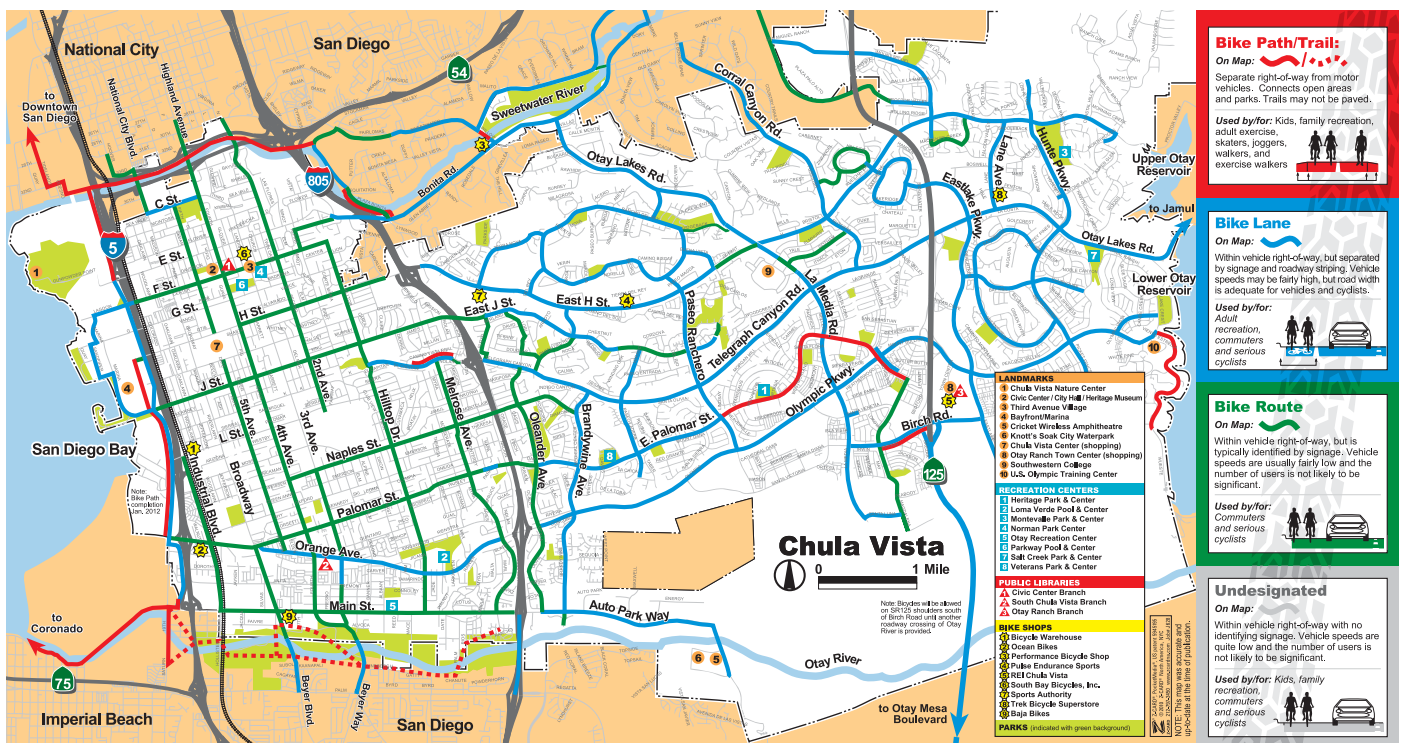

The flip side of the map is an excellent place to locate education materials and sponsorship information. If printing costs are prohibitive, seeking funding through grants and sponsorship is recommended. The cartography and graphic design work of the map may be taken on by students of a local GIS or design class. The map should be made available in both hardcopy and digital format, with the latter available for download via the City website. Lastly, it is critical to update the map as new bicycle facilities are implemented or facilities are changed.

Zmap
Folding

Maps

This proprietary folding map technology allows users to quickly unfold and refold a map into an easy-to-carry pocket size package between cardstock covers.

Example Bicycle System Map (<http://www.chulavistaca.gov/clean/conservation/climate/alternative.asp>)

PARTNER WITH GOOGLE TO PROVIDE BETTER BICYCLE DIRECTIONS

Consistent with the effort to make cycling an easy choice for a broad range of people, bicycle maps should “break out of the cyclist silo” and become an integrated component of general mobility wayfinding. Google Maps is chief among general wayfinding applications, and currently includes the option of selecting bicycling for travel directions, but is limited in its utility. While driving directions and transit directions include a menu of options for preferred user experience (“avoid highways, avoid tolls, shortest travel time, fewest connections, etc.”), there are none for cycling. As suggested previously, tailored cycling directions, based on preferred user experience, offer the greatest value to the range of people who cycle. Eastvale may choose to share data generated for this bicycle master plan, such as stress level, network connectivity, etc., with Google to improve the interface and to promote cycling. This pilot project could serve to catalyze a nationwide upgrade of Google Maps.

DEVELOP AND IMPLEMENT A WAYFINDING SYSTEM

Directional signage allows new cyclists and tourists alike to find their way to their destination or nearby landmark via a recommended route. Wayfinding signage directs people and provides information about destinations, directions and/or distances. A highly legible and well-executed wayfinding system has the potential to increase comfort and safety, through even diverse and chaotic environments. Wayfinding systems can also achieve community objectives, such as the promotion of a local attractions and the resultant benefit of economic development. When applied on a regional level, wayfinding can link adjacent communities.

People are the single most important component in developing a wayfinding strategy. Public input on preferred routes, important destinations and the signage itself has proven invaluable. In designing a wayfinding strategy or system, the following questions need to be considered:

- What user types are likely to use the wayfinding system?
- Where are these users going?
- What do the users or visitors want to see and hear?
- What is the primary goal: navigation, directional information, orientation, location information, or interpretation?
- Is a clear message being sent by the signage?
- Based on the expected user types, what are the safest or most logical paths or routes?

There is considerable variation in wayfinding signage legibility and utility. Wayfinding system development for Eastvale should begin with a thorough examination of best practices and should conclude with a clear set of guidelines related to actual signage design and design of the signage system.

Street/Bicycle Boulevard Signage
Vancouver, B.C.

Bicycle Wayfinding Signage
San Antonio, TX

INSTALL ADVISORY SIGNAGE ALONG POPULAR ROUTES

Alert drivers to the presence of cyclists, particularly on a shared facility, or where there is no dedicated bicycle facility. The message should serve to both advise motorists and legitimize the presence of cyclists. Cycling is an important component of the transportation system and should be respected by other modes. While the “Bikes May Use Full Lane” Sign (R4-11) is commonly accepted and generally conveys the intended message, current discourse suggests the use of stronger language (“Shared Road”) – and accompanying education – where appropriate. This phrasing is powerful because it is a statement of fact and implies legal consequence for violators, whereas “Bikes May Use Full Lane” and “Share the Road” sound more like pleading cautions. Regardless of the exact language used, this type of sign should accompany any Shared Lane Markings used. Ample education and marketing should be provided to explain all new signage.

Bicycle Wayfinding Sign
Portland, OR

PROFESSIONAL DEVELOPMENT

Develop or facilitate the development of an Active Transportation Professional Development program for the Riverside County region. The program would be oriented toward professionals, advocates, and the members of the public who wish to further their education in bicycle and pedestrian planning and design. Professional affiliations to target for the program include engineers, planners, bicycle advisory committees, health professionals, teachers and school administrators and law enforcement. Program coursework could provide continuing education units (CEUs) to some professionals. The curriculum could include the following courses:

- Transportation Planning
- Bicycle Data Capture and Analysis
- Bicycle Planning
- Bicycle Facility Design
- Pedestrian Data Capture and Analysis
- Pedestrian Planning
- Pedestrian Facility Design
- Best Practices in Active Transportation Policies
- Instituting “Complete Streets” and “Routine Accommodation” Policies

The program could be developed in a largely self-sufficient manner, with student fees covering a majority of the costs.

MARKETING CAMPAIGNS

Build awareness and general appeal of cycling as a safe and common mode of transportation. Marketing is about more than advertising. Communication and promotion play important roles. To get people to see cycling as a desirable mode choice, and to pay attention to safety, they must be engaged through effective marketing. Lessons from the field of marketing point to the proven effectiveness of positive messages that inspire people and get out more to ride. The objective is not to get everybody to ride bicycles all of the time, but rather to target those most ready to change.

Bicycle Campaign Poster - University of Nebraska Lincoln, NE

Bicycle Safety Campaign Poster Pittsburgh, PA

Messages should inspire people to move from “might” to “sometimes” and from “sometimes” to “often.” For example, a targeted message might be one directed at people who currently solely ride for recreation and have never considered a short errand trip within their neighborhood, but would be open to the suggestion. Other messages might target the market of people ready to improve their riding techniques or even those who may never ride, but who might be encouraged to treat cyclists with more care and civility.

HOST A CICLOVIA AND OTHER SIGNATURE EVENTS

A Ciclovía (also ciclovía or cyclovía in English) is a Spanish word that translates into “bicycle path” and is used to describe either a permanently designated bicycle route or a temporary event where the street is closed to vehicles for use by people and non-motorized transportation. Ciclovía events are celebrations of livable streets and communities, encouraging citizens and businesses to get out in the street and enjoy their city through active participation. While Bogotá, Colombia is often credited with starting ciclovías, they have gained considerable popularity in the United States in the past five years.

While all Ciclovía events are alike in their creation of a people-oriented, car-free space, they are otherwise unique. In some cities, the event occurs once or twice a year, while in others it occurs every Saturday or Sunday throughout the entire summer. Some cities re-use routes, while others, like Portland and Chicago, host the events in different locations around the city each weekend. Some routes form a circuitous route, while others are linear. Most include parks or other open public spaces. Most include music, performance, games and other activities, some of which is scripted and some spontaneous. Ciclovías often have a theme of health, exercise and active transportation and include groups promoting free, healthy activities stationed along the route. Ciclovía routes can incorporate and highlight new bikeways and preferred routes, encouraging their use and maximizing investment.

In addition to Ciclovías, the City can promote cycling through more sport-oriented events such as road and cyclocross rides and races. By joining forces with a local bicycle coalition (Inland Empire Biking Alliance or IEBA) or club, the City can maximize resources and participation. Events focused on the sport of cycling are important because they promote health and wellness, but also introduce people to cycling. Those who cycle recreationally may consider cycling for everyday, utilitarian trips and, in doing so, make positive societal contributions (e.g. to air quality, transportation expenses, health care expenses, local economy, etc.).

EDUCATION/ENFORCEMENT PROGRAMS

EDUCATE ALL LAW ENFORCEMENT STAFF REGARDING CYCLING ISSUES AND CONCERNS

If the ultimate aim is to promote cycling as a legitimate form of transportation, all officers should receive some form of bicycle training and should be offered LCI training, if possible.

DESIGNATE A LAW ENFORCEMENT LIAISON RESPONSIBLE FOR CYCLING ISSUES AND CONCERNS

This liaison would be the main contact for Eastvale residents concerning bicycle-related incidents. This liaison would perform the important function of communication between law enforcement and cyclists. The liaison would be in charge of the supplemental education of fellow officers regarding bicycling rules, etiquette and behavior. The liaison could be the same person as the referee for the Traffic Garden and should be LCI certified, as well as ride a bicycle while on duty, as appropriate. Allocate funding for the training and support of this duty, as well as for necessary bicycle equipment.

TARGETED ENFORCEMENT

The Riverside County Sherriff Department uses targeted enforcement to educate motorists and cyclists about applicable traffic laws and the need to share the road. These efforts are an effective way to expand motorist and cyclist education. Targeted enforcement should be expanded to warn and educate motorists and cyclists about laws, rules of the road and safety procedures. This could be in the form of a brochure or tip card explaining each user's rights and responsibilities. Targeted enforcement may help mitigate the following traffic safety problems:

- Speeding in school zones
- Illegal passing of school buses
- Parking violations – bus zone, crosswalks, residential driveways, time zones
- Risks to cyclists during drop-off and pick-up times
- Lack of safety patrol/crossing guard operations
- Unsafe cycling practices
- Other school zone traffic law violations

Police Bicycle Patrol
Easley, SC

Riverside County Sheriff Traffic Enforcement
Moreno Valley, CA

This approach has been successful in Los Angeles where four officers, one for each of its police department traffic divisions, have been dedicated solely to bicycle safety and outreach. In nearby Moreno Valley, the Riverside County Sheriff Department garnered national attention with its “Gingerbread Man” crossing enforcement sting program. Its purpose is to educate drivers about the crosswalk laws and to make them more aware of the dangers of speeding and inattention, especially near schools. (<http://blog.pe.com/breaking-news/2013/09/26/moreno-valley-gingerbread-man-helps-nab-crosswalk-violators/>)

IMPLEMENT A BICYCLE DIVERSION PROGRAM

A Bicycle Diversion Program allows for adult cyclists who commit traffic violations to receive reduced fines in exchange for taking a bicycle education class. On September 21, 2015, California’s Governor Jerry Brown signed Assembly Bill 902 to create such a program. This legislation has been touted as a boost for both equity and encouragement in cycling. It is expected to promote equity because, in reducing fines, it effectively makes cycling more affordable. It is expected to encourage cycling by treating violations as opportunities to educate people and impart confidence and skills. AB 902 will go into effect on January 1, 2016, but it will be up to each city and its law enforcement department to adopt diversion programs.

DISTRIBUTE LIGHTS AND HELMETS TO CYCLISTS

If law enforcement officers observe a cyclist riding at night without the proper reflectors or lights, they may give the cyclist a light along with a note or friendly reminder about the light requirement and its importance. This provides a positive and educational interaction rather than a punitive one. This program could be funded through a safety-oriented grant. Many cities have targeted the end of daylight savings as an ideal time to perform this function.

Helmet giveaway programs are another opportunity for positive education and interaction. Law enforcement departments have conducted public events to hand out helmets, as well as distributing them in the community during the course of patrol when an officer sees a child riding helmetless.

Helmet Giveaway
San Diego, CA

MONITORING AND EVALUATION

CREATE CITY STAFF BICYCLE COORDINATOR POSITION

The creation of a Bicycle Coordinator position would demonstrate the City's commitment to cycling and "Complete Streets." A bicycle coordinator or program manager can help coordinate between City departments to ensure projects planning consistency and cooperation. A bicycle coordinator would manage programs and implement projects listed in the bicycle master plan, and would be responsible for updating the plan in a timely manner. This includes maintaining a prioritized list of improvements, updating cost estimates and identifying appropriate funding sources. This investment in staff is often returned since this position usually is responsible for securing State and federal funding for bicycle projects.

BICYCLE PEDESTRIAN ADVISORY COMMITTEE

A Bicycle Advisory Committee (BAC) assists the City with implementation of plan projects, policies and programs. The BAC allows City staff, volunteers and bicycle advocates to continue efforts to improve cycling throughout the City. This group acts as a community liaison and addresses issues concerning local cycling. The BAC can review the implementation and regularly evaluate the progress of improvements in the Bicycle Master Plan. City support is imperative for creating the committee, budgeting time and resources for City staff and elected officials to attend and to support these meetings. Some cities have developed bicycle and pedestrian or active transportation advisory committees.

COUNT CYCLISTS AND REVIEW COLLISION DATA

Conduct regular cyclist counts throughout the City to determine baseline mode share and subsequent changes. Gathering cyclist counts would allow the City to collect information on where the most cycling occurs. This assists in prioritizing and justifying projects when funding is solicited and received. Counts can also be used to study cycling trends throughout the City. Analysis that could be conducted includes:

- Changes in volumes before and after projects have been implemented
- Prioritization of local and regional projects
- Research on clean air change with increased bicycle use

Counts should be conducted at the same locations and at the same times every year. Conducting counts during different seasons within the year may be beneficial to understanding the differences in bicycle traffic volumes based on weather. In addition, bicycle counts should be collected as part of any existing traffic counts. Results of the number of cyclists should be regularly recorded for inclusion in the bicycle report card (See section 17).

The Riverside County Sheriff Department should continue to collect and track collision data. Regular reports of traffic collisions should be presented at the Bicycle Advisory Committee. Traffic collisions involving cyclists could be reviewed and analyzed regularly to develop plans to reduce their frequency and severity. Any such plans should include law enforcement involvement and should be monitored to determine their effectiveness. Results of the number of bicycle-related traffic collisions should be recorded in the bicycle report card.

LAW ENFORCEMENT REFERRAL PROCESS

Design a communication process that encourages students and parents to notify the school and law enforcement of the occurrence of a crash or near-miss during school commute trips involving auto, bus, pedestrian or bicycle transportation. Include not only law enforcement, but also the Public Safety Commission, the Planning Department and SRTS stakeholders in this reporting system to help better use data generated. Enlist the help of law enforcement with a number of traffic safety duties:

- Enforcement of traffic and parking laws through citations and warnings.
- Targeted enforcement of problem areas – an intensive, focused effort during the first two weeks of school, as well as a strategy for the rest of the year.
- Participation in traffic safety programs: Traffic Garden, SRTS Task Force, etc.

Los Angeles has a successful program called the LA Bike Map that allows cyclists to submit incidents, see them displayed instantly, and study the overall pattern, dynamically, in one place.

DEVELOP A BICYCLE REPORT CARD

The City could develop a bicycle report card, a checklist used to measure the success of plan implementation, as well as effort made, within the City. The report card could be completed annually and used to identify the magnitude of accomplishments in the previous year and general trends. The bicycle report card could include, but not be limited to, keeping track of user counts, bicycle related collisions and system completion.

The City can use the report card to track trends, placing more value on relative than absolute gains (in system completion, mode share and safety). For example, an upward trend in travel by bicycle would be viewed as a success, regardless of the specific increase in the number of cyclists. Safety should be considered relative to the increase in cyclists. Sometimes crash numbers go up simply because cycling increases, at least initially. Instead, measure crashes as a percentage of an estimated overall mode share count. A major portion of the bicycle report card would be an evaluation of system completion. An upward trend would indicate that the City is progressing in its efforts to complete the bicycle network identified in this document.

Key Findings in San Francisco Bicycling for 2011

- Since 2006, counts have increased an impressive 71% and are up 7% since 2014.
- A sample of 10,139 riders (September) were manually counted in the peak 90 minutes; approximately 75,000 bike trips occur each day out of 2.2 million total trips across all modes
- SFMTA survey data in 2011 indicate that 3.5% of all trips in San Francisco are made by bicycle, a 75% increase mode in Share since 2000 when bicycling was 2% of daily trips
- Late September has 18% more riders than early August
- 94% of riders use bicycle facilities as designated

TOTAL MANUAL COUNTS

Since 2006, counts have increased an impressive 71% and are up 7% since 2014. The count trend since 2006 during the 5:00 p.m. – 6:30 p.m. peak continues to rise.

*These counts represent a sample of, not total daily ridership

**Approximately 18% of the 2011 increase (shown in red) is attributed to shifting the count from early August to late September

The report card is not intended to be an additional task for City staff, but rather a means of documenting and publicizing the City's efforts related to bicycle planning. If a Bicycle Advisory Committee is appointed, it can be a task of the committee to review the report cards and adjust future plans and goals accordingly. In addition to quantifying accomplishments related to the bicycle plan, the City should strive to quantify its efforts. These may be quantified as money spent, staff hours devoted or other in-kind contributions. The quantified effort should be submitted as a component of the bicycle report card. Some cities publish their bicycle report cards online.

APPLY FOR BICYCLE FRIENDLY COMMUNITY/NEIGHBORHOOD DESIGNATION

Bicycle Friendly Community/Neighborhood Designation is part of an official program offered by the League of American Bicyclists intended to provide communities with guidance on becoming more bicycle friendly and to offer recognition for their achievements. Like the report card described above, applying for Bicycle Friendly Community/Neighborhood Designation provides a standard by which Eastvale can measure its progress.

“THE BICYCLE FRIENDLY COMMUNITY (BFC) PROGRAM PROVIDES A ROADMAP TO IMPROVE CONDITIONS FOR BICYCLING AND THE GUIDANCE TO MAKE YOUR DISTINCT VISION FOR A BETTER, BIKEABLE COMMUNITY A REALITY. A COMMUNITY RECOGNIZED BY THE LEAGUE AS BICYCLE FRIENDLY WELCOMES BICYCLISTS BY PROVIDING SAFE ACCOMMODATION FOR CYCLING AND ENCOURAGING PEOPLE TO BIKE FOR TRANSPORTATION AND RECREATION.”

- League of American Bicyclists

RECOMMENDED POLICIES

Supportive policies are essential to the development of bicycle facilities in the city of Eastvale. Without them, bicycle facility development may stagnate or – worse – be actively impeded. Recognizing this, the City of Eastvale has included an assessment of its adopted General Plan and Zoning Code (“to determine if they adequately support bicycle facility development”) within this Bicycle Master Plan.

The General Plan and Zoning Code contain a wealth of policies that support bicycle facility development. The General Plan even includes a policy calling for the development of a comprehensive bike and trail plan (this plan). But while supportive policies exist, they may be overridden by other less supportive or even impeding policies. Examples of unsupportive policies include those that retain automobile priority, irrespective of context, and those that hinder the compact, mixed-use development needed to support increased walking and biking.

This section discusses the strengths and weaknesses of Eastvale’s bicycle-related policies and suggests policy changes to better support the development of bicycle facilities within the City.

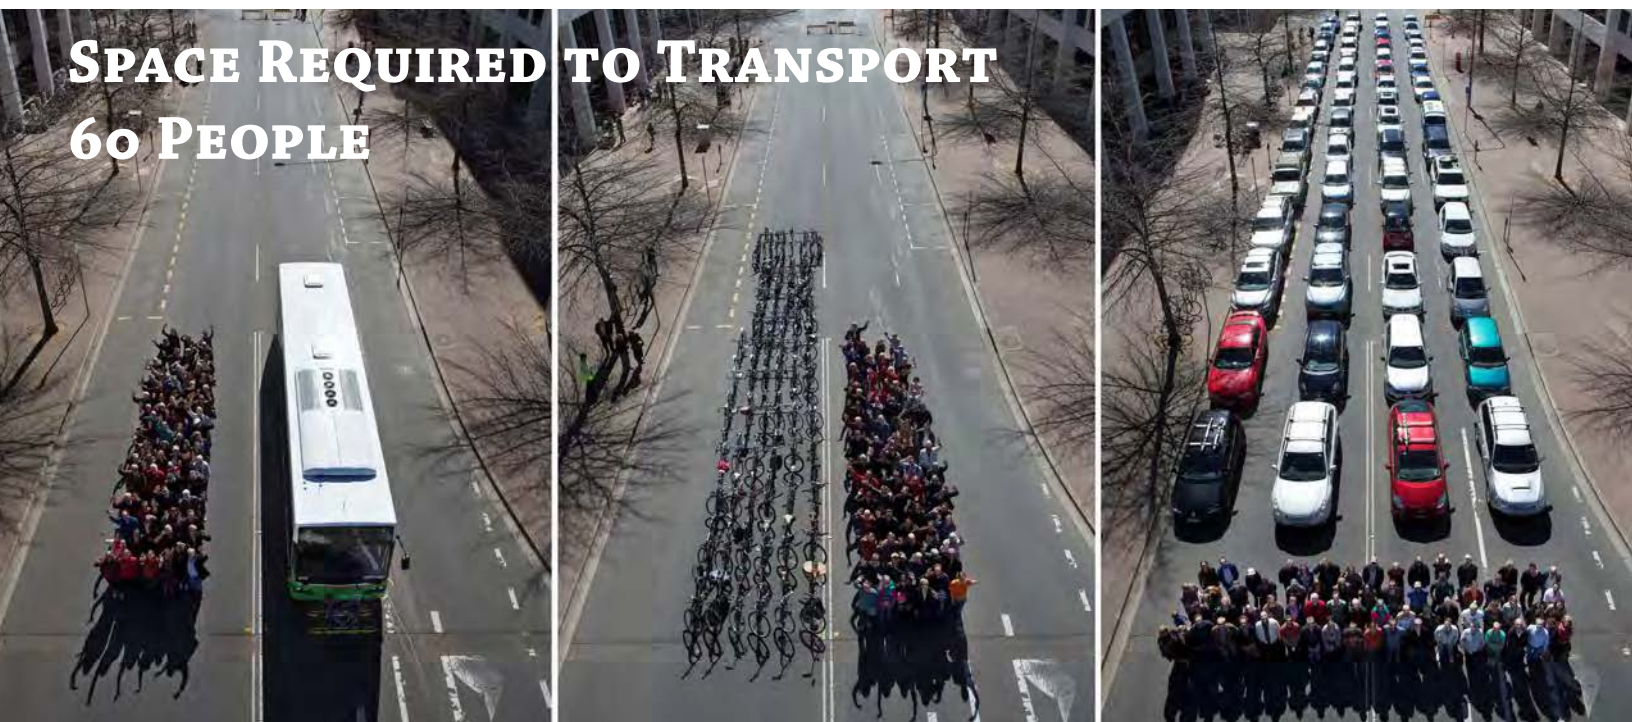

CITY OF EASTVALE GENERAL PLAN

CIRCULATION AND INFRASTRUCTURE ELEMENT

The Circulation Element provides the most direct policy guidance related to the development of bicycle facilities. As discussed in Chapter 2 (Existing Conditions), the Circulation Element contains many supportive policies, but also contains policies – and an overall structure – that are problematic from the perspective of bicycle facility development.

The Circulation Element places bicycles in a silo, apart from general Circulation (i.e. automobile) policies. Because bicycles, automobiles and other transportation modes are treated separately, their trade-offs cannot be adequately assessed. Similarly, there are no common metrics by which to assess the different transportation modes. In fact, the Circulation Element contains no measures of bicycle facility development and performance, but provides very clear measures of automobile performance (namely, Level of Service).

SPACE REQUIRED TO TRANSPORT 60 PEOPLE

The Circulation Element acknowledges these shortcomings, stating that “the level of service standards currently only address the circulation needs of the automobile” and that “a more complete standard would take into account land use patterns, pedestrian access, transit, and bicycle paths.” Policy C-31 even directs the city to evaluate its level of service and roadway width standards and – possibly – establish a “comprehensive level of service threshold that includes non-motorized, transit, mixed use, and vehicle access.”

This plan recommends that the City implement Policy C-31 and evaluate its LOS and roadway width standards. It also recommends the development of a multi-modal level of service threshold. These steps would signify an important shift in Eastvale’s transportation planning, where bicycling (and other ‘alternative’ modes) are considered legitimate modes of transportation and are provided for accordingly.

LAND USE ELEMENT

Policies contained in the Land Use element have a less direct, but no less important influence on bicycle facility development in the city of Eastvale. As discussed in Chapter 2 (Existing Conditions) Eastvale’s Land Use policies have led to a suburban development pattern, characterized by residential development, low-medium density, and a strong separation of uses. These traits are underpinned by policies that dictate minimum Level of Service thresholds, minimum setbacks for all buildings and minimum buffers between different uses. The aforementioned development patterns and related land use policies do not tend to support bicycling.

To better support bicycle use in Eastvale, this plan recommends the following land use policy changes:

1. Allow for greater diversity in land use designations: a greater mix will allow more people to meet their daily needs locally, by bicycle.
2. Permit “fine grain” mixed-use development: the City currently has no “mixed-use” land use designation. What commercial, civic or other non-residential uses exist within the City are grouped together, in large automobile-oriented complexes. Mixed use, at a “human scale” will promote more cycling, walking and transit use.
3. Allow for increased flexibility in density: compact development supports cycling, while sparse development does not. Determine areas or corridors prioritized for cycling/walking/transit and support density there.
4. Permit increased flexibility in building setbacks: the City’s current policy of maintaining minimum setbacks reinforces a suburban style of development. In contrast, maximum setbacks support cycling, and especially walking, by reducing distances traveled and increasing visual interest. Determine areas or corridors prioritized for cycling/walking/transit and support maximum setbacks there.
5. Allow for a more context sensitive separation of uses: the City’s general plan states that “Even the simple task of walking to school, shopping, or work can be made more difficult because of the lack of connectivity.” This plan recommends a focus on increased connectivity along low-stress (i.e. non-arterial) routes. At best, schools, shopping and civic buildings would be oriented towards Eastvale’s neighborhoods. At a minimum, the aforementioned should be accessible from Eastvale’s neighborhoods.

AIR QUALITY ELEMENT/HEALTHY COMMUNITY ELEMENT/PARKS, RECREATION AND OPEN SPACE ELEMENT

Not surprisingly, the above General Plan Elements lend significant supportive to the recommendations of this Bicycle Master Plan. Bicycling is a means of combating air pollution (by providing an alternative to driving), a means of achieving health goals (through exercise) and a means of creating recreation opportunities and, in the case of bicycle boulevards, even “linear parks.” But while the above elements provide high-level support for bicycling, their support could be made stronger by including more metrics, with clear targets for cycling and walking.

Example metrics may include, but are not limited to, the following:

- Mode Share Goal: ___% of all trips will be made by bicycle in the city of Eastvale by the year 20__
- Obesity and Overweight Goal: Obesity will be reduced to ___% and over weight to ___% by the year 20__
- Fitness Goal: ___% of Eastvale residents will get the recommended 20 minutes of daily exercise by the year 20__
- Traffic Safety Goal: All traffic-related fatalities are reduced by ___% by the year 20__; All traffic-related fatalities are eliminated by the year 20__ (i.e. a “Vision Zero” policy)
- Park and Open Space Goal: ___% of residents will live within a half mile of a trail by the year 20__

CITY ZONING CODE

As mentioned in Existing Conditions (Ch.2), the zoning code is intended to provide further definition to the policies included the Land Use Element. Also, as mentioned, the Zoning Code standards for setbacks, building heights, site coverage and parking demonstrate a bias against the type of compact, human-scaled development known to support active transportation. This section provides further discussion of the more problematic Zoning Code standards (vis-à-vis active transportation) and how they might be amended to better support bicycle facility development in the city of Eastvale.

To better support bicycle use in Eastvale, this plan recommends the following zoning code changes:

1. Provide more flexibility in setbacks, particularly for corridors designated for bicycle travel: Setbacks are defined by the zoning code in terms of minimums (i.e. buildings must be at least X feet from the street and sidewalk, where X is dependent on land use designation). Setback minimums equate to longer distances for bicyclists and pedestrians to travel to reach their final destinations. This not takes more physical effort, but also provides less reward (i.e. less visual interest in the form of vibrant store fronts, sidewalk cafes, etc.). In contrast, providing setback maximums brings everyday destinations (schools, parks and retail) and residential areas closer together, decreasing distance barriers for biking and walking.
2. Increase flexibility in building heights and site coverage, especially for corridors designated for bicycle travel: Buildings heights and site coverage, though they may address different building dimensions (vertical and horizontal), are strongly related. Building heights are defined by the zoning code in terms of maximums (i.e. buildings may be no higher than X feet, where X is dependent on land use designation). Site coverage, which uses density – as prescribed in the General Plan’s Land Use Element – as a proxy, is also defined by maximums (i.e. maximum “dwelling units per acre” or “floor area ratios”). Like setback minimums, the use of maximums in building heights and site coverage increases travel distances and serves as a barrier to active transportation. Although less literal than with minimum setbacks, these standards do impede compact development and therefore active transportation.

3. Explore parking maximums, shared parking and parking tailored to actual expected use: Parking is defined by the zoning code in terms of minimums (i.e. buildings must provide X parking spaces, where X is determined by land use designation). Parking minimums are problematic, from the perspective of active transportation, for several reasons. First and foremost, parking minimums serve as a sort of self-fulfilling prophecy. Parking minimums assume that nearly all travelers will be arriving by car and nearly none by bike or on foot. In doing so, they make driving attractive and biking and walking unattractive. Beyond promoting driving (over other modes), parking minimums also create barriers for those who do choose to bike or walk. Lastly, there are additional externalities associated with parking minimums that may or may not impact bicycle facility development: they significantly increase the cost of development (even development that aims to be sustainable); they cause environmental damage; they are often a waste of space (only nearing capacity for a few days out of the year). For instance, developments that are mixed-use, transit oriented or active transportation oriented should not have the same vehicle parking standards as conventionally suburban developments.

ELECTRIC BIKES

A new law, AB-1096: Electric Bicycles, went into effect on January 1, 2016 that clarifies electric bicycle status in California. It defines electric bicycles, or e-bikes, as those with fully operable pedals and an electric motor of less than 750 watts. It establishes three classes of electric bicycles based on their motor speed and level of electric assist:

- Class 1 e-bike, or low-speed pedal-assisted electric bicycle, is equipped with a motor that provides assistance only when the rider is pedaling and that stops providing assistance when the bicycle reaches 20 mph.
- Class 2 e-bike, or low-speed throttle-assisted electric bicycle, is equipped with a motor that can exclusively propel the bicycle and that cannot provide assistance when the bike reaches 20 mph.
- Class 3 e-bike, or speed pedal-assisted electric bicycle, is equipped with a motor that provides assistance only when the rider is pedaling and stops providing assistance when the bicycle reaches 28 mph. Operators of Class 3 e-bikes must be 16 or older and wear a helmet. While Classes 1 and 2 are considered legal on streets and trails, Class 3 e-bikes are prohibited from paths, lanes and trails unless specifically authorized by a local ordinance.

The bill prohibits tampering with or modifying electric bicycles to change their speed capability, unless the classification label also is changed. E-bike operators do not need a driver's license, registration or license plate to ride them, though they do need to abide by existing traffic laws.

Chapter 6:

IMPLEMENTATION & FUNDING

IMPLEMENTATION

Bikeway facility implementation is generally not governed by a specific timeline since the availability of funds for implementation is variable and tied to the priorities of the City's capital projects. Plan implementation is also necessarily multi-faceted. Besides adoption of goals and policies, it often includes carrying out programs and pursuing project funding, whether through the City's capital improvements project process or grant funding. The plan addresses goals, policies, programs and projects that may not be feasible to implement immediately, but are included to inspire long-term actions.

Following plan adoption, the next tasks will be to get the programs into the City's or appropriate school district's budget, grant writing to fund projects and programs, amending City standards and design guidelines for consistency, including projects in the City's ongoing capital improvements programs, and implementing goals and policies in the everyday City and law enforcement management processes, whether in site plan review, street engineering decisions or traffic enforcement. Recommendations include education and outreach programs that can be implemented by the City, schools, volunteers and law enforcement, but implementation ultimately rests on the community and City's desire to make this plan's recommendations a reality.

IMPLEMENTATION STEPS

Implementation of some bikeways, such as multi-use paths, bicycle boulevards and other innovative techniques described in this plan, will require a capital improvement project process, including identifying funding, a public and environmental review process and plan preparation. Other bikeway improvements can be integrated into planned construction, such as resurfacing, reconstruction, or utility work.

The majority of bikeway facilities are provided on streets in the form of shared roadways or bicycle lanes. Shared roadways usually require little change to existing roadways, except for directional signs, pavement markings and minor changes in traffic control devices. Each project will need a varying level of additional study and analysis before installation. Depending upon the project's complexity, some can be done by City staff or more complex projects can be contracted out to consultants.

Potential Implementation Steps include:

- 1) Preliminary design and/or technical traffic studies
- 2) Parking study if parking removal is recommended
- 3) Construction drawings and detailed cost estimates
- 4) Funding (CIP, grant, etc.)
- 5) Recommendations for further environmental studies
- 6) Construction

PROJECT PHASING

Projects listed as short-term are those relatively easy to implement. These projects typically have low construction costs, would not necessitate the acquisition of right-of-way, and/or would require only a categorical exemption under the California Environmental Quality Act (CEQA) guidelines. An example of a potential short-term project could include restriping a roadway to include a buffer to remedy a door zone bicycle lane or creating accessible connections to an existing facility like the Santa Ana River Trail.

Mid-term projects are projects that will require a small amount of further study or a higher cost than projects that require only typical resurfacing and striping. The long-term projects involve pursuing grant funding opportunities or further study for the implementation of larger, and potentially costlier improvements. Examples of long-term projects include some of the Class 1 multi-use path recommendations.

PROGRAM PHASING

Program phasing can be addressed in phases in a similar manner. Each program is equally feasible for implementation, but some will require more time and funding investment from City staff, school districts and/or public volunteers. Short-term programs can be implemented without significant additional costs, staff or policy change. Mid-term programs may require budgetary considerations or significant volunteer involvement. Long-term programs will require additional staff, significant volunteer involvement, and additional funding through grants or budget additions.

POTENTIAL FUNDING SOURCES

Federal, State and local government agencies invest billions of dollars every year in the nation's transportation system. Only a fraction of that funding is used in development projects, policy development and planning to improve conditions for cyclists. Even though appropriate funds are limited, they are available, but desirable projects sometimes go unfunded because communities may be unaware of a fund's existence, or may apply for the wrong type of grants. Also, the competition between municipalities for the available bikeway funding is often fierce.

Whenever federal funds are used for bicycle projects, a certain level of State and/or local matching funding is generally required. State funds are often available to local governments on the similar terms. Almost every implemented bicycle program and facility in the United States has had more than one funding source and it often takes a good deal of coordination to pull the various sources together.

According to the publication by the Federal Highway Administration (FHWA), *An Analysis of Current Funding Mechanisms for Bicycle and Pedestrian Programs at the Federal, State and Local Levels*, where successful local bicycle facility programs exist, there is usually a full time bicycle coordinator with extensive understanding of funding sources. Cities such as Seattle, Washington, Portland, Oregon and Tucson are prime examples. Bicycle coordinators are often in a position to develop a competitive project and detailed proposal that can be used to improve conditions for cyclists within their jurisdictions. Some of the following information on federal and State funding sources was derived from the previously mentioned FHWA publication.

FEDERAL SOURCES

The previous federal transportation funding authorization, MAP-21 (Moving Ahead for Progress in the 21st Century), has ended and been replaced with a new funding mechanism. In late 2015, Congress passed a five year, \$305 billion transportation bill, called the Fixing America's Surface Transportation (FAST) Act, which President Obama signed into law. It is the first law enacted in over 10 years that provides long-term funding certainty for surface transportation, meaning States and local governments can move forward with critical transportation projects.

Notably, the bill requires all design for National Highway System roadways to take into account access for all modes of transportation. It also makes NACTO's Urban Design Guide one of the U.S. Department of Transportation's roadway design standards, as well as permits local governments to use their own adopted design guides if they are the lead project sponsor, even if it differs from their state guidelines.

SAFE ROUTES TO SCHOOL PROGRAMS

Caltrans administers two separate Safe Routes to School programs. The first is the State-legislated program referred to as "SR2S" and the second is the Federal Program referred to as "SRTS." Both programs are intended to achieve the same basic goal of increasing the number of children walking and biking to school by making it safer for them to do so. SR2S is now a part of the Active Transportation Grant program (ATP) described in the "State Sources."

The SRTS Program funds non-motorized facilities that improve access to schools through the Caltrans Safe Routes to School Coordinator. Eligible applicants include State, local, and regional agencies experienced in meeting federal transportation requirements. Nonprofit organizations, school districts, public health departments, and Native American Tribes must partner with a city, county, MPO, or RTPA to serve as the responsible agency for their project. Eligible projects include stand-alone infrastructure or non-infrastructure projects. Projects must be completed within four years after project is amended into FTIP. Targeted beneficiaries are children in grades K-8. No local match is required. For more information visit the following link: <http://www.dot.ca.gov/hq/LocalPrograms/saferoutes/saferoutes.htm>.

DEPARTMENT OF THE INTERIOR - LAND AND WATER CONSERVATION FUND (LWCF)

The U.S. Recreation and Heritage Conservation Service and the California Department of Parks and Recreation (CDPR) jointly administer this funding source. The Land and Water Conservation Fund is a 50 year old budget neutral program that reinvests a portion of the royalties from offshore oil and gas leasing into recreation and conservation priorities. The program has a tremendous track record of success and broad bipartisan support, and has been used to expand protected areas and improve recreation facilities in every state. Projects acquired or developed under the LWCF program must be primarily for recreational use and not transportation purposes, and the lead agency must guarantee to maintain the facility in perpetuity for public recreation.

Applications are evaluated using criteria including priority status within the State Comprehensive Outdoor Recreation Plan (SCORP). The CDPR selects which projects to submit to the National Park Service (NPS) for approval. Final approval is based on the amount of funds available that year, which is determined using a population-based formula. Trails are the most commonly approved project.

Though it was allowed to expire at the end of September, 2015, widespread public outcry is credited with helping to goad Congress into voting to reauthorize the LWCF with almost 200 co-sponsors in December, 2015. It is now funded for three years at \$450 million, 50 percent more than previously.

TABLE 6-1: SAFE ROUTES TO SCHOOL PROGRAMS COMPARISON

| | SR2S (State Program) | SRTS (Federal Program) |
|--|---|--|
| Legislative Authority | Streets & Highways Code Section 2330-2334 | FAST Act |
| Expiration Date | AB-57 extended program indefinitely | Upon FAST Act reauthorization |
| Eligible Projects | Infrastructure projects | Stand-alone infrastructure or non-infrastructure projects |
| Eligible Applicants | Cities and counties | State, local, and regional agencies experienced in meeting federal transportation requirements; Non-profit organizations, school districts, public health departments, and Native American Tribes must partner with a city, county, MPO, or RTPA to serve as the responsible agency for their project. |
| Local Match | 10 percent minimum required | None |
| Project Completion Deadline | Within 4½ years after project funds are allocated to the agency | SRTS - Within 4 ½ years after project is amended into FTIP |
| Restriction on Infrastructure Projects | Must be located in the vicinity of a school | Infrastructure projects must be within two miles of a grade school or middle school |
| Targeted Beneficiaries | Children in grades K-12 | Children in grades K-8 |
| Funding | \$24.25M annual funding | \$23M annual funding |

RIVERS, TRAILS, AND CONSERVATION ASSISTANCE PROGRAM (RTCA)

This program is the National Park Service's community assistance arm. The RTCA provides technical assistance to communities to preserve open space and develop trails. RTCA funds can not be used for infrastructure. Assistance is specifically for construction plans, engaging public participation and identifying other sources of funding for conservation and outdoor recreation projects. A local example is the Murrieta Creek Regional Trail, for which the NPS is a prime partner agency.

OTHER BICYCLE INFRASTRUCTURE FUNDING OPTIONS

The American Recovery and Reinvestment Act of 2009 is commonly referred to as the “stimulus” or the “stimulus package” and targets infrastructure development and enhancement. In 2011, the original expenditure estimate of \$787 billion was increased to \$840 billion to be in line with the President’s 2012 budget and with scoring changes made by the Congressional Budget Office since the enactment of the Recovery Act. There was no end date written into the Recovery Act because, while many of its projects were focused on jumpstarting the economy, others are expected to contribute to economic growth for many years.

States must use 18.2 percent of their funding for public safety and government services. An eligible activity under this section is to provide funding to K-12 schools and institutions of higher education to meet green building standards. This is particularly applicable for active transportation and Safe Routes to School projects because the Leadership in Energy and Environmental Design (LEED) Green Building Rating System, developed by the U.S. Green Building Council (USGBC), addresses green standards for schools that include bicycle and pedestrian facilities providing safe access to schools.

Another \$5 billion is provided for the Energy Efficiency and Block Grant Program. This provides formula funding to cities, counties and states to undertake a range of energy efficiency activities and an eligible use is bicycle and pedestrian infrastructure.

STATE SOURCES

STATE HIGHWAY ACCOUNT

Section 157.4 of the Streets and Highways Code requires Caltrans to set aside \$360,000 for the construction of non-motorized facilities that will be used in conjunction with the State highway system. The Office of Bicycle Facilities also administers the State Highway Account fund. Funding is divided into different project categories. Minor B projects (less than \$42,000) are funded by a lump sum allocation by the CTC and are used at the discretion of each Caltrans District office. Minor A projects (estimated to cost between \$42,000 and \$300,000) must be approved by the CTC. Major projects (more than \$300,000) must be included in the State Transportation Improvement Program and approved by the CTC. Funded projects have included fencing and bicycle warning signs related to rail corridors.

CALTRANS ACTIVE TRANSPORTATION PROGRAM (ATP)

This program was created to encourage increased use of active modes of transportation, such as biking and walking. The ATP consolidates existing federal and State transportation programs, including the Transportation Alternatives Program (TAP), Bicycle Transportation Account (BTA), and State Safe Routes to School (SR2S), into a single program with a focus to make California a national leader in active transportation. The ATP is administered by the Division of Local Assistance, Office of Active Transportation and Special Programs. This is a competitive program to increase biking and walking trips, safety and mobility, to support regional agency GHG reduction, enhance public health, benefit disadvantaged communities, and include a broad spectrum of projects. As of March 2015, no local match is required.

The SR2S component of the ATP addresses eligible city and county infrastructure projects. Projects must be infrastructure projects within two miles of a grade school or middle school and be completed within four years after project funds are allocated to the agency. Targeted beneficiaries must be children in grades K-12.

TRANSPORTATION DEVELOPMENT ACT ARTICLE 3 (SB-821)

TDA funds are based on State sales tax, with revenues made available primarily for transit operating and capital purposes. By law, the County Auditor's office estimates the apportionment for the upcoming fiscal year.

TDA Article 3 funds may be used for activities related to the planning and construction of bicycle and pedestrian facilities such as engineering expenses leading to construction, right-of-way acquisition, and construction or reconstruction. This can include a number of activities, such as retrofitting existing bicycle and pedestrian facilities to comply with ADA requirements, route improvements like signal controls for cyclists, bicycle loop detectors and rubberized rail crossings. Also eligible are the purchase and installation of facilities such as intersection improvements, bicycle parking, benches, drinking fountains, rest rooms, showers adjacent to paths, employment centers, park-and-ride lots, and/or transit terminals accessible to the general public.

LOCAL SOURCES

DEVELOPER IMPACT FEES

As a condition for development approval, municipalities can require developers to provide certain infrastructure improvements, which can include bikeway projects. These projects have commonly provided Class 2 facilities for portions of on-street, previously planned routes. They can also be used to provide bicycle parking or shower and locker facilities. The type of facility that should be required to be built by developers should reflect the greatest need for the particular project and its local area. Legal challenges to these types of fees have resulted in the requirement to illustrate a clear nexus between the particular project and the mandated improvement and cost.

NEW CONSTRUCTION

Future road widening and construction projects are one means of providing on-street bicycle facilities. To ensure that roadway construction projects provide bicycle lanes where needed, it is important that the review process includes input pertaining to consistency with the proposed system. Future development in the City will contribute only if the projects are conditioned.

OTHER SOURCES

Local sales taxes and fees may be implemented as new funding sources for bicycle projects. However, either of these potential sources would require a local election. Volunteer programs may be developed to substantially reduce the cost of implementing some routes, particularly multi-use paths. For example, a local college design class may use such a multi-use route as a student project, working with a local landscape architectural or engineering firm. Work parties could be formed to help clear the right of way for the route. A local construction company may donate or discount services beyond what the volunteers can do. A challenge grant program with local businesses may be a good source of local funding, in which the businesses can “adopt” a route or segment of one to help construct and maintain it.

PRIVATE SOURCES

Private funding sources can be acquired by applying through the advocacy groups such as the League of American Bicyclists and the Bikes Belong Coalition. Most of the private funding comes from foundations wanting to enhance and improve bicycle facilities and advocacy. Grant applications will typically be through the advocacy groups as they leverage funding from federal, State and private sources. The tables on the following pages summarize many of the numerous funding sources available.

TABLE 6-2: FEDERAL FUNDING SOURCES

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|---|---|---|---------------|--|---|
| Land and Water Conservation Act of 1965 (LWCF) | \$450 million federal; \$3.6 million CA (2012) | National Parks Service/ California Department of Parks and Recreation | Dec-Jan | 50% + 2-6% admin. surcharge | LWCF funds subject to north/south split (60% for southern California). LWCF grants may be used for statewide outdoor recreational planning and for acquiring and developing recreational parks and facilities, especially in urban areas. Fund provides matching grants to state and local governments for land acquisition and development for outdoor recreation use. |
| Surface Transportation Program (STP) | \$10 billion Federal; \$888 million CA (pre-set-aside, pre-penalty) | FHWA/Caltrans | June 1 | 20% | STP funds wide variety of bicycle and pedestrian improvements, including on-street bicycle facilities, off-street trails, sidewalks, crosswalks, bicycle and pedestrian signals, parking and other ancillary facilities. May be exchanged for local funds for non-federally certified local agencies. No match required if project improves safety. |
| Transportation Alternatives Program (TAP) Includes Trails and SRTS Programs | \$820 million Federal; \$72.5 million CA | FHWA/Local MPO | Annual | 20% | TAP funds construction, planning and design of facilities for pedestrians, bicyclists and other non-motorized forms of transportation. |
| Recreational Trails Program | \$5.75 million guaranteed set-aside from TAP (\$65 million in 2013) | FHWA, Regional agency may also contribute | Annual | Federal and regional must not exceed 95% | Provides funds to develop and maintain recreational trails and trail-related facilities for both non-motorized and motorized recreational trail uses. Percentage of TAP funding allocated to Recreational Trails Program at discretion of State. |

TABLE 6-2: FEDERAL FUNDING SOURCES (CONT.)

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|---|--|----------------------------|---------------|------------------------------|--|
| National Highway Performance Program | \$1.9 billion (pre-set-aside, pre-penalty) | FHWA/Caltrans | Not available | Federal 80-100%; State 0-20% | Program provides funding for construction and maintenance projects located on newly expanded National Highway System (NHS), including those related to bicycle and pedestrian infrastructure. Certain safety projects may have a federal cost share of up to 100%. |
| Highway Safety Improvement Program (HSIP) | \$2.4 billion Federal; \$197 million CA (pre-set-aside, pre-penalty) | FHWA/Caltrans | | Federal 90%; State 10% | Projects must address safety issues and may include education and enforcement programs. Program includes Railroad-Highway Crossings and High Risk Rural Roads programs. Bicycle projects must provide high degree of safety. |
| Congestion Mitigation and Air Quality (CMAQ) | \$464 million CA (pre-set-aside, pre-penalty) | FHWA/Caltrans | April | 20% | Amount of CMAQ funds depends on state's population share and on degree of air pollution |
| Safe Routes to School Program (SRTS) | \$21 million (2012); See remarks for more information | FHWA/Caltrans and then MPO | | 80% Federal; 20% State | Caltrans proposed funding SRTS from a \$21 million set aside in STP, approved by CTC as one year policy. Future funding for SRTS will be determined through the FAST Act implementation process. |
| Rivers, Trails and Conservation Assistance Program (RTCA) | | National Park Service | August | | Expenditures include bikeway plans, corridor studies and trails assistance |

TABLE 6-2: FEDERAL FUNDING SOURCES (CONT.)

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|---|---|--|---------------|---------------|--|
| Energy Efficiency and Block Grant Program | \$3 million | Department of Energy | | | Provided formula funding for cities, counties and states to take part in energy efficient activities |
| Community Development Block Grants (CDBG) | \$3 million | HUD and CA Dept of Housing and Community Development | Ongoing | 10% | Funds improve land use and transportation infrastructure in low-income neighborhoods or citywide for accessibility improvements. |
| Federal Lands Highway Program | \$611 million 2008-10 | FLH/FHWA | Ongoing | Varies | May be used to build bicycle and pedestrian facilities in conjunction with roads and parkways at discretion of grantee. |
| Pilot Transit-Oriented Development Planning Program | \$10 million | Federal Transit Administration | Not Available | Not available | Provides funding to advance planning efforts that seek to increase access to transit hubs for pedestrian and bicycle traffic. |
| Partnership for Sustainable Communities | \$409 million in grants and/or assistance in 2010 | HUD/DOT/EPA | Ongoing | Not available | Funding for preparing or implementing regional plans for sustainable development. |
| Community Transformation Grants (CTG) | \$35 million in 2012 | Regional health and planning agencies | Not Available | N/A | Funds to implement broad, sustainable strategies to reduce health disparities and expand preventive health care services. |

TABLE 6-2: FEDERAL FUNDING SOURCES (CONT.)

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|--|--|---------------------------------------|---------------|--|---|
| Associated Transit Improvements | 1% of Urbanized Area Formula Grant; for FY2014 would be 1% of 4.5 billion (~ \$45 million) | Federal Transit Administration/ MPO | Not Available | 80% Federal Assistance (Capital); 50% Federal Assistance (Operational) | Recipients of Section 5307 (Urbanized Area Formula Grants) must certify they are spending no less than 1 percent of their federal transit funds on associated transit improvements (formerly transit enhancements). Typical projects have included bicycle lockers and parking near transit stations and stops. |
| Partnership for Sustainable Communities | \$409 million in grants and/or assistance in 2010 | HUD/DOT/EPA | Ongoing | Not available | Funding for preparing or implementing regional plans for sustainable development. |
| Community Transformation Grants (CTG) | \$35 million in 2012 | Regional health and planning agencies | Not Available | N/A | Funds to implement broad, sustainable strategies to reduce health disparities and expand preventive health care services. |
| Transportation Investment Generating Economic Recovery Program (TIGER) | \$474 million Federal; \$31 million CA (2013) | US DOT | October | 80% Federal; 20% State | Can be used for innovative, multi-modal and multi-jurisdictional transportation projects (including bicycle and pedestrian projects) that promise significant economic and environmental benefits to an entire metropolitan area, region or the nation. Minimum project cost is \$10 million. |
| Bus and Bus Facilities Program: State of Good Repair | \$2.17 billion Federal (2014) | Federal Transit Administration | March | 80% Federal; 20% State | Can be used for projects to provide bicycle access to public transportation facilities. More specifically, funds are used for shelters for people, bicycle parking amenities and accommodating bicycles on transit. |

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|--|---|--------------------------------|--|--|---|
| Bus Livability Initiative | \$125 million (2012) | Federal Transit Administration | March | 90% Federal; 10% State | Can be used for bicycle and pedestrian support facilities, such as bicycle parking, bicycle racks on buses, pedestrian amenities and educational materials. |
| Federal Lands Transportation Program, Category 3, "Alternative Transportation" | \$3.38 million for Pacific West Region (2013) | FHWA | Varies, generally October; programmed through 2017 | None | Funds transportation modes that reduce congestion and pollution in parks and public lands. Formerly the Paul S. Sarbanes Transit in Parks Grant Program. |
| Local Highway Bridge Program | \$300 million | FHWA/Caltrans | Ongoing | 88.53% Federal match for Local Highways; 100% for Federal Highways | Funds to replace or rehabilitate public highway bridges over waterways, other topographical barriers, other highways, or railroads. |
| Section 5310 | \$20-35 million | Federal Transit Administration | Annually | 11.47% | Funds provide transportation services to meet needs of seniors and persons with disabilities for whom public transportations services are otherwise unavailable, insufficient or inappropriate. |

TABLE 6-3: STATE FUNDING SOURCES

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|---|----------------------------|---------------------------------------|---|-------|---|
| State Highway Account (SHA): Bicycle Transportation Account (BTA) | Varies | Caltrans | March application deadline. Consult Local Assistance Office | 10% | Must have an adopted Bicycle Transportation Plan. Funding available for all phases of projects. |
| Active Transportation Program | \$124 million | Caltrans | Two-year cycle | 12% | Consolidates BTA, Transportation Alternatives and Safe Routes to School funding. 60% awarded by State, 40% by MPOs. |
| Transportation Development Act (TDA) Section 99234 | \$149 million (2014) | Local MPO or CTC | Annually | None | 2% of TDA total, funds for bicycle and pedestrian projects. |
| Regional Improvement Program (STIP) | \$3.4 billion over 5 years | Caltrans | Every two years | | Capital improvement projects (planning and rideshare activities). |
| AB-2766 Vehicle Registration Funds | \$30 million (2010) | SCAQ | February | None | Competitive program for projects that benefit air quality. |
| Vehicle Registration Surcharge Fee (AB-434) RCF | | APCB | July | None | Competitive program for projects that benefit air quality. |
| Vehicle Registration Surcharge Fee (AB-434) PMF | 40% from grant source | APCB | April | None | Funds distributed to county communities based on population. |
| Developer Fees or Exactions | Project-specific | Cities | Ongoing | None | Mitigation required during land use approval process. |
| State Gas Tax (local share) | | Allocated by State Auditor-Controller | Monthly allocation | None | Major Projects, >\$300,000. |

TABLE 6-3: STATE FUNDING SOURCES (CONT.)

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|---|-------------------------------|--|----------------------|----------------------------|--|
| State and Local Transportation Partnership Program (SLPP) | Est. \$200 million state-wide | Caltrans | Summer | 50% | Road projects with bicycle lanes are eligible, requires developer or traffic fee match. |
| Caltrans Minor Capital Program | Varies | Caltrans | Ongoing after July 1 | None | Projects must be on state highways; such as upgraded bicycle facilities. |
| Environmental Enhancement and Mitigation Program (EEM) | \$10 million state-wide | State Resources Agency | October annually | None required, but favored | Individual grants limited to \$350K. |
| Petroleum Violation Escrow Account (PVEA) | Varies | Caltrans, CA Community Services and Development, Air Resources Board | March | None | Projects must save energy, provide public restitution and be approved by CA Energy Commission and US DOE. |
| Community Based Transportation Planning Demonstration Grant Program | \$3 million | Caltrans | November | 20% | Projects must have a transportation component or objective. |
| Habitat Conservation Fund Grant Program (HCF) | \$2 million | CA Dept of Park and Recreation | October | 50% | Available until July 1, 2020. |
| Office of Traffic Safety Program (OTS) | Varies | Office of Traffic Safety | January | None | Goal to reduce vehicle fatalities and injuries through safety program to include education, enforcement and engineering. |
| Safe Routes to School Program (SR2S) | \$24 million (2009) | Caltrans | April | 10% | Eligible for projects in vicinity of a school and grades K-12. |

TABLE 6-3: STATE FUNDING SOURCES (CONT.)

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|--|----------------------------|--|---------------|-----------------------------|--|
| State Transportation Improvement Program (STIP) | Varies | Caltrans | Every 4 years | None | Gives metropolitan regions more control over state transportation fund investment. |
| California Conservation Corps (CCC) | | California Conservation Corps | | | CCC provides emergency assistance and public service conservation work. |
| Environmental Justice (EJ) Planning Grants | \$9 million (2010) | Caltrans | Annually | 10% | Engage low-income and minority communities in transportation projects to ensure equity and positive social, economic and environmental impacts. |
| California River Parkways | Varies | CA Natural Resources Agency | October | None | Create or expand trails for walking, bicycling and/or equestrian activities compatible with other conservation objectives. |
| Safe Routes to School (AB-1475) | \$21-25 million | Caltrans | June | 10% | Increase the number of children who walk or bicycle to school through funding of programs that remove barriers from doing so |
| Land and Water Conservation Fund | \$2.3 million in CA (2009) | NPS, CA Department of Parks and Recreation | March | 50% + 2-6% admin. surcharge | Provides funding for the development of river-adjacent bicycle facilities. |
| Environmental Enhancement and Mitigation Program | \$10 million | California Natural Resources Agency | October | None | Support projects that offset environmental impacts of modified or new public transportation facilities. |
| Tire-Derived Product Grant Program | Varies | CA Department of Resources Recycling and Recovery (CalRecycle) | Varies | Not applicable | Funds to purchase materials for bicycle and pedestrian projects, including sidewalks/pathways, accessibility ramps, and traffic safety products. |

TABLE 6-4: LOCAL FUNDING SOURCES

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|-------------------------------|--------------|---|---------------|-----------|---|
| Parking Meter Districts | | City | Annual Budget | N/A | Parking Meter Districts can use parking meter revenues for streetscape improvements such as pedestrian facilities, landscaping and lighting. |
| Transient Occupancy Tax (TOT) | | City | Annual Budget | None | Created to cover expenses and improvements related to tourism and to encourage more tourists to visit. Fund may be appropriate in areas of heavy tourism such as along waterfronts, major parks and historic neighborhoods. |
| SB-821 | Varies | Riverside County Transportation Commission (RCTC) | Annually | Up to 25% | Eligible projects include sidewalks, bicycle paths, lanes and routes, and access ramps or curb cuts. |
| SCAG Sustainability Program | Varies | SCAG | Annually | None | Direct funding of innovative planning initiatives for member agencies through Compass Blueprint Demonstration Projects. |
| SCAG Active Transportation | Varies | SCAG | Annually | 11.47% | New division intended to assist bicycle and pedestrian planning efforts. Program will focus on voluntary efforts to meet local needs and contribute to implementing SCS, reducing greenhouse gas (GHG) emissions. |

TABLE 6-5: PRIVATE FUNDING SOURCES

| Grant Source | Annual Total | Agency | Funding Cycle | Match | Remarks |
|--|------------------|------------------------------|--------------------|-------|--|
| Surdna Foundation | Project-specific | Surdna Foundation | Ongoing | | Surdna Foundation makes grants to nonprofit organizations in areas of environment, community revitalization, effective citizenry, arts, and the nonprofit sector. |
| Bikes Belong | \$180,000 | Bikes Belong Coalition | Three times a year | 50% | Community grants focus on funding facilities and programs. |
| Kaiser Permanente Community Health Initiatives | \$54 million | Kaiser Permanente | Ongoing | None | Numerous programs to support Healthy Initiatives. |
| Health Foundations | Project-specific | Various foundations | Ongoing | | Focus active transportation improvements for an obesity prevention strategy. Examples include California Wellness Foundation, Kaiser and California Endowment. |
| Rails to Trails Conservancy | Project-specific | Rails to Trails Conservancy | | | Provides technical assistance for converting abandoned rail corridors to use as multi-use trails. |
| Donations | Project-specific | Depends on nature of project | Ongoing | | Corporate or individual donations, sponsorships, merchandising or special events. |
| In-kind Services | Project-specific | Depends on nature of project | Ongoing | | Donated labor and materials for facility construction or maintenance such as tree planting programs or trail construction and maintenance. |
| People for Bikes Community Grant Program | Up to \$10,000 | People for Bikes | Twice a year | None | Focuses most grant funds on bicycle infrastructure projects such as bicycle paths, lanes, trails and bridges, mountain bike facilities, bike parks and pump tracks, BMX facilities, end-of-trip facilities such as bicycle racks, parking and storage. |

City of Eastvale Bicycle Master Plan

Appendices

February 2016

APPENDIX A: TOOLBOX - DESIGN GUIDELINES

This appendix is intended to assist in the selection and design of bicycle and trail facilities through illustrating best practices by facility type from public agencies and municipalities nationwide. Design treatments are addressed within a single sheet tabular format relaying important design information and discussion, example photos, schematics (if applicable) and existing summary guidance from current or upcoming draft standards.

Existing standards are referenced throughout and should be the first source of information when seeking to implement any of the treatments featured here. Several agencies and organizations provide bike and pedestrian facilities design standards for the US, including the most commonly used manuals shown below.

NATIONAL STANDARDS

The Federal Highway Administration's Manual on Uniform Traffic Control Devices (MUTCD) defines the standards used by roadway managers nationwide to install and maintain traffic control devices on all public streets, highways, bikeways and private roadways open to public traffic. The FHWA MUTCD forms the basis of the California MUTCD.

To further clarify the MUTCD, the FHWA created a table of contemporary bicycle facilities that lists various bicycle related signs, markings, signals and other treatments and identifies their official status, such as whether it can be implemented or is currently experimental. See Bicycle Facilities and the Manual on Uniform Traffic Control Devices.

Bikeway treatments not explicitly covered by the MUTCD are often subject to experiments, interpretations and official rulings by the FHWA. The MUTCD Official Rulings is an online resource that allows website visitors to obtain information about these supplementary materials. Copies of various documents (such as incoming request letters, response letters from the FHWA, progress reports and final reports) are available on this website.

American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities, updated in June 2012 provides guidance on dimensions, use and layout of specific bicycle facilities. The standards and guidelines presented by AASHTO provide basic information, such as minimum sidewalk widths, bicycle lane dimensions, detailed striping requirements and recommended signage and pavement markings.

The National Association of City Transportation Officials' (NACTO) 2014 Urban Bikeway Design Guide is the newest publication of nationally recognized bikeway design standards and offers guidance on current design state of the practice. Its intent is to offer substantive guidance for cities seeking to improve bicycle transportation in places where competing demands for the use of the right-of-way present unique challenges. All of the NACTO Urban Bikeway Design Guide treatments are in use internationally and in many cities around the US.

Meeting the requirements of the Americans with Disabilities Act (ADA) is an important part of any bicycle and pedestrian facility project. The United States Access Board's proposed Public Rights-of-Way Accessibility Guidelines (PROWAG) and the 2010 ADA Standards for Accessible Design (2010 Standards) contain standards and guidance for the construction of accessible facilities. This includes requirements for sidewalk curb ramps, slope requirements and pedestrian railings along stairs.

Some of these treatments are not directly referenced in the current versions of the AASHTO Guide or the MUTCD, although many of the elements of these treatments are found within these documents. In all cases, engineering judgment is recommended to ensure that the application makes sense for the context of each treatment, given the many complexities of urban streets.

FHWA Bicycle Facilities and Manual on Uniform Traffic Control Devices, 2011.

MUTCD Official Rulings, FHWA.

STATE STANDARDS AND GUIDELINES

CALIFORNIA HIGHWAY DESIGN MANUAL (HDM) (2012)

This manual establishes uniform policies and procedures to carry out highway design functions for the California Department of Transportation. The 2012 edition incorporated Complete Streets focused revisions to address the Department Directive 64 R-1.

COMPLETE INTERSECTIONS: A GUIDE TO RECONSTRUCTING INTERSECTIONS AND INTERCHANGES FOR BICYCLISTS AND PEDESTRIANS (2010)

This California Department of Transportation reference guide presents information and concepts related to improving conditions for bicyclists and pedestrians at major intersections and interchanges. The guide can be used to inform minor signage and striping changes to intersections, as well as major changes and designs for new intersections.

MAIN STREETS: FLEXIBILITY IN DESIGN & OPERATIONS (2005)

This Caltrans booklet is an informational guide that reflects many of the recent updates to the Caltrans manuals and policies that improve multimodal access, livability and sustainability within the transportation system. The document will help users locate information about standards and procedures described in the Caltrans Highway Design Manual (HDM), the California Manual on Uniform Traffic Control Devices (California MUTCD) and the Project Development Procedures Manual (PDPM).

NEW LEGISLATION ALLOWING SAFETY STANDARDS OTHER THAN CALTRANS HDM

AB-1193, signed into law in September 2014, allows local agencies to adopt, by resolution, safety standards for bikeways other than Caltrans' Highway Design Manual. According to the Legislative Analyst, AB-1193 "allows local governments to deviate from state criteria when designing bikeways, but does not give them complete control. Cities and counties that elect to use design criteria not contained within the HDM would have to ensure that the alternative criteria have been reviewed and approved by a qualified engineer, are adopted by resolution at a public meeting and adhere to guidelines established by a national association of public agency transportation officials, such as the National Association of City Transportation Officials." The bill also expands the definition of bikeways to include cycle tracks or separated bikeways, also referred to as "Class IV bikeways," which promote active transportation and provide a right-of-way designated exclusively for bicycle travel adjacent to a roadway and which are protected from vehicular traffic. Types of separation include, but are not limited to, grade separation, flexible posts, inflexible physical barriers, or on-street parking.

NCHRP LEGAL DIGEST 53: LIABILITY ASPECTS OF BIKEWAYS (2010)

This digest is a useful resource for city staff considering innovative engineering solutions to localized issues. The document addresses the liability of public entities for bicycle collisions on bikeways as well as on streets and highways. The report will be useful to attorneys, transportation officials, planners, maintenance engineers and all persons interested in the relative rights and responsibilities of drivers and bicyclists on shared roadways.

BICYCLE FACILITY STANDARDS COMPLIANCE

Some of these bicycle facilities covered by these guidelines are not directly referenced in the current versions of the AASHTO Guide or the California MUTCD, although many of the elements of these treatments are found within these documents. An "X" in the following table identifies the inclusion of a particular treatment within the national and state design guides. No marking indicates a treatment is not specifically mentioned, but is allowable assuming MUTCD-compliant signs and markings are used. In all cases, engineering judgment is recommended to ensure that the application makes sense for the context of each treatment, given the potential complexities of any specific site.

| Facility Type | California MUTCD (2014) | Guide for the Development of Bicycle Facilities (2012) | Urban Bikeway Design Guide (2014) |

| Pedestrian Hybrid Beacons | X | X | X |

MULTIMODAL LEVEL OF SERVICE

DESCRIPTION

Multimodal Level of Service (MMLOS) methods are used to inventory and evaluate existing conditions, or to forecast future conditions for roadway users under different design scenarios. While automobile-oriented LOS measures vehicle delay, Bicycle, Pedestrian and Transit LOS is oriented toward user comfort. MMLOS scores different modes independently, but their results are interdependent, allowing an understanding of trade-offs between modes for different street designs. A compatible A-F scoring system makes comparison between modes simple.

There are a variety of Multimodal or Bicycle/Pedestrian LOS tools available for use. Different tools require different data and may present different or conflicting results. Despite potential limitations of MMLOS methodology, the results help jurisdictions better plan for all road users.

GUIDANCE

MMLOS modeling is an emerging practice and current methods continue to be improved and revised. Local resident and planner knowledge should be used to verify MMLOS model results. The current standard for MMLOS calculation is described in the 2010 Highway Capacity Manual (HCM 2010). This method has limitations, particularly for Bicycle LOS modeling (See Discussion). An alternative MMLOS method/tool should be considered if HCM 2010 is not appropriate for the community. Other multimodal “Service Quality” tools include:

- Florida DOT LOSPLAN
- LOS+
- Mineta Level of Traffic Stress (LTS) Analysis (Bicycle-only scoring)

DISCUSSION

HCM 2010 model for Bicycle LOS calculation limitations include:

- Calculations do not address gradients.
- Contemporary facility types included in this guide, such as shared lane markings, bike boxes or cycle tracks, are not included in the HCM (Florida LOSPLAN update does feature cycle tracks).
- Scoring is for a “typical” adult bicyclist and heavily weighs the presence of bike lanes. Results may not be appropriate in communities that seek to encourage bicycle travel by people of varying ages and abilities where bike lanes may not be adequate.

BICYCLE FACILITY SELECTION

There are no “hard and fast” rules for determining the most appropriate type of bicycle facility for a particular location – roadway speeds, volumes, right-of-way width, presence of parking, adjacent land uses and expected bicycle user types are all critical elements of this decision. Studies find that the most significant factors influencing bicycle use are motor vehicle traffic volumes and speeds. Additionally, most bicyclists prefer facilities separated from motor vehicle traffic or located on local roads with low motor vehicle traffic speeds and volumes. Because off-street pathways are physically separated from the roadway, they are perceived as safe and attractive routes for bicyclists who prefer to avoid motor vehicle traffic. Consistent use of treatments and application of bikeway facility standards allows users to anticipate whether they would feel comfortable riding on a particular facility and plan their trips accordingly. This section provides guidance on various factors that affect the facility types that should be provided.

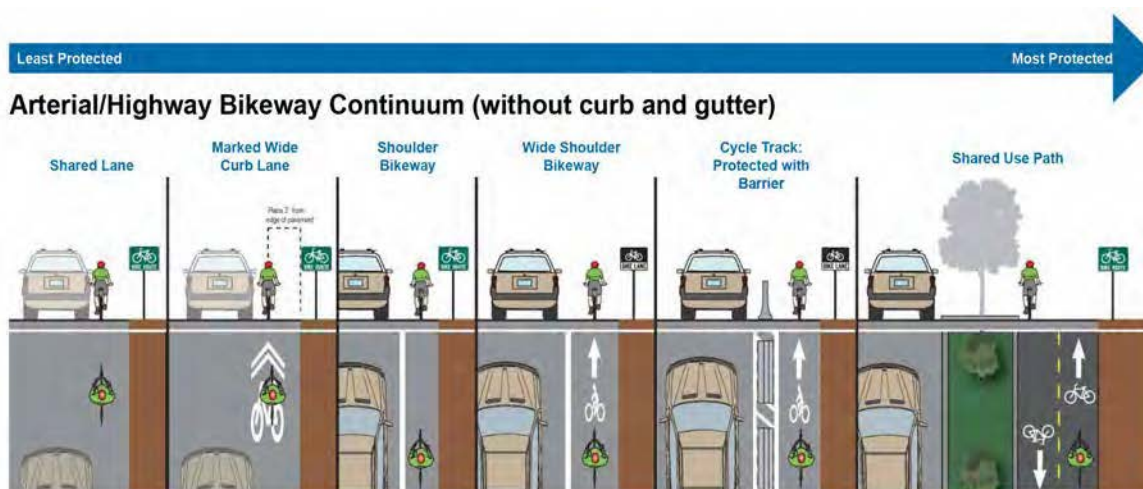

Facility Classification

Facility Continua

FACILITY CONTINUA

The following continua illustrate the range of bicycle facilities applicable to various roadway environments, based on the roadway type and desired degree of separation. Engineering judgment, traffic studies, previous municipal planning efforts, community input and local context should be used to refine criteria when developing bicycle facility recommendations for a particular street. In some corridors, it may be desirable to construct facilities to a higher level of treatment than those recommended in relevant planning documents in order to enhance user safety and comfort. In other cases, existing and/or future motor vehicle speeds and volumes may not justify the recommended level of separation and a less intensive treatment may be acceptable.

**Arterial/Highway Bikeway Continuum (with curb and gutter)****Collector Bikeway Continuum**

FACILITY CLASSIFICATION

DESCRIPTION

Consistent with bicycle facility classifications throughout the United States, these design guidelines identify the following facility classes by degree of separation from motor vehicle traffic.

Shared Roadways (No bikeway designation) are bikeways where bicyclists and cars operate within the same travel lane, either side by side or in single file depending on roadway configuration. In some instances, streets may be fully adequate and safe without bicycle specific signing and pavement markings.

Class III (Bike Routes) are Shared Roadways configured with pavement markings, signage and other treatments including directional signage, traffic diverters, chicanes, chokers and /or other traffic calming devices to reduce vehicle speeds or volumes. Such enhanced treatments often are associated with Bicycle Boulevards.

Class II (Bike Lanes) use signage and striping to delineate the right-of-way assigned to bicyclists and vehicle drivers. Bike lanes encourage predictable movements by both bicyclists and drivers.

Class IV (Cycle Tracks) are exclusive bike facilities that combine the user experience of a separated path with the on-street infrastructure of conventional bike lanes.

Class I (Multi-use Paths) are facilities separated from roadways for use by primarily bicyclists and pedestrians, as well as other users.

SHARED ROADWAYS

On shared roadways, bicyclists and motor vehicles use the same roadway space. These facilities are typically on roadways with low speeds and traffic volumes, but they can be used on higher volume roads with wide outside lanes or shoulders. A vehicle driver will usually have to cross over into the adjacent travel lane to pass a bicyclist, unless a wide outside lane or shoulder is provided.

Typical shared roadways often employ a variety of treatments, primarily signage and lane markings. Bicycle boulevards are a special class of shared roadways designed for a broad spectrum of bicyclists. They are low-volume local streets where drivers and bicyclists share the same travel lane. Bicycle boulevards treatments are selected as necessary to support appropriate vehicle volumes and speeds and to provide safe crossing opportunities of busy streets. Bicycle boulevards usually employ more complex treatments than other shared roadways, including traffic diverters, chicanes, chokers and other traffic calming devices to reduce vehicle speeds or volumes. See Pages 14-15 for examples.

SIGNED SHARED ROADWAY

DESCRIPTION

Class III facilities are generally located on roadways with lower speeds and traffic volumes. Class III facilities are designated as roadways with no striped bicycle lanes, but include signage to indicate the roadway is a bicycle route. Shared roadways can be used on higher volume roads with wide outside lanes or shoulders. A vehicle driver will usually have to cross over into the adjacent travel lane to pass a bicyclist, unless a wide outside lane or shoulder is provided.

GUIDANCE

“BIKE ROUTE” - This sign (D11-1) is intended for use where no unique route designation is desired. However, when used alone, this sign conveys very little information. Directional changes should be signed with appropriate arrow sub-plaques (D1-1b) or directional signage.

“BICYCLES MAY USE FULL LANE” (BMUFL) - This sign (R4-11) sign may be used:

- On roadways without bicycle lanes or adjacent shoulders usable by cyclists and where travel lanes are too narrow for cyclists and motor vehicles to safely operate side-by-side.
- In locations where it is important to inform all road users that cyclists may occupy the travel lane.

DISCUSSION

A BICYCLE MAY USE FULL LANE sign (R4-11) may be used on a lane too narrow for a bicycle and an automobile to share the road side by side within the same lane).

MATERIALS AND MAINTENANCE

Maintenance needs for bicycle wayfinding signs are similar to other signs and will need periodic replacement due to wear and fading.

SHARE THE ROAD plaque (W16-1p) may be used in conjunction with bicycle warning sign (W11-1) to warn drivers to watch for slower forms of transportation

ADDITIONAL REFERENCES AND GUIDELINES

California MUTCD, 2014.

MARKED SHARED ROADWAY

DESCRIPTION

The shared lane marking (SLM) or “Sharrow” is commonly used where vehicle parking is provided adjacent to the travel lane. The center of the marking should be located a minimum of 11 feet from the curb face or edge of the road. If used on a street without on-street parking that has an outside travel lane less than 14 feet wide, the centers of the Shared Lane Markings should be at least four feet from the face of the curb, or from the edge of the pavement where there is no curb. (Note that these criteria are evolving and that it is now common practice to place SLMs in the center of the rightmost travel lane.)

GUIDANCE

Shared lane markings may be considered in the following situations:

- On roadways with speeds of 40 mph or less (CA MUTCD).
- On constrained roadways too narrow to stripe with bicycle lanes.
- To delineate space within a wide outside lane where cyclists can be expected to ride.
- On roadways where it is important to increase vehicle driver awareness of cyclists.
- On roadways where cyclists tend to ride too close to parked vehicles.

DISCUSSION

Bike lanes should be considered on roadways with outside travel lanes wider than 15 feet, or where other lane narrowing or removal strategies may provide adequate road space. SLMs can not be used in shoulders, designated bike lanes, or to designate bicycle detection at signalized intersections. (MUTCD 9C.07)

MATERIALS AND MAINTENANCE

Placing SLMs between vehicle tire tracks will increase the life of the markings and minimize the long-term cost of the treatment.

BICYCLE BOULEVARD

DESCRIPTION

Bicycle boulevards are low-volume, low-speed streets modified to enhance bicyclist comfort by using treatments such as signage, pavement markings, traffic calming and/or traffic reduction and intersection modifications. These treatments allow through movements of bicyclists while discouraging similar through-trips by non-local motorized traffic.

GUIDANCE

- Signs and pavement markings are minimum treatments necessary to designate a street as a bicycle boulevard.
- Bicycle boulevards should have a maximum posted speed of 25 mph. Use traffic calming to maintain an 85th percentile speed below 22 mph.
- Implement volume control treatments based on bicycle boulevard context, using engineering judgment. Target motor vehicle volumes range from 1,000 to 3,000 vehicles per day.
- Intersection crossings should be designed to enhance safety and minimize delay for bicyclists.

Shared lane markings are MUTCD compliant and widely used to mark bicycle boulevards.

Enhanced Crossings:
Use signals, beacons and road geometry to increase safety at major intersections.

Signs identify street as a bicycle priority route.

MUTCD D11-1

Partial closures and other volume management tools limit the number of cars traveling on the bicycle boulevard.

DISCUSSION

The term “bicycle boulevard” implies a facility that encourages bicycle usage while reducing motor vehicle volumes and/or speeds to a greater extent than on a typical Class III route. Methods used may include preferential treatment such as turn restrictions, contra-flow access through one-way streets, exclusive traffic signal phases, or the reorientation of stop sign control to favor the bicycle boulevard. Traffic calming techniques may include curb extensions, chokers, traffic circles, roundabouts, speed humps, turn restrictions or barricades.

MATERIALS AND MAINTENANCE

Vegetation should be regularly trimmed to maintain visibility and attractiveness.

Curb Extensions:
Shorten pedestrian crossing distance.

Mini Traffic Circles: Slow drivers
in advance of intersections.

SEPARATED BIKEWAYS

Designated exclusively for bicycle travel, separated bikeways are segregated from vehicle travel lanes by striping (Class II - Bicycle Lane), or physical measures such as bollards or curbs (Class IV - Cycle Tracks). Separated bikeways are most appropriate on arterial and collector streets where higher traffic volumes and speeds warrant greater separation. Separated bikeways can increase safety and promote proper riding by:

- Defining road space for bicyclists and drivers, reducing the possibility that drivers will stray into the bicyclists' path.
- Discouraging bicyclists from riding on the sidewalk.
- Reducing the incidence of wrong way riding.
- Reminding drivers that bicyclists have a right to the road.

Bicycle Lane

Bicycle Lanes and Diagonal Parking

Buffered Bicycle Lanes

Cycle Tracks

BICYCLE LANE

DESCRIPTION

This facility provides an exclusive lane for one-way bicycle travel on a street or highway, installed along streets in corridors where there is significant bicycle demand and where there are distinct needs that can be served by them. On streets with on-street parking, bicycle lanes are located between the parking area and the traffic lanes and used in the same direction as motor vehicle traffic.

Many bicyclists, particularly less experienced riders, are more comfortable riding on a busy street if it has a striped and signed bikeway than if they are expected to share a lane with vehicles.

GUIDANCE

Provide five foot minimum width for bicycle lanes located between parking and traffic lanes. Six feet desired.

- Provide four foot minimum width if no gutter exists. With a normal two foot gutter, minimum bicycle lane width is five feet.
- 14.5 feet preferred from curb face to edge of bike lane (12 foot minimum).
- Seven foot maximum width for use adjacent to arterials with high travel speeds. Greater widths may encourage motor vehicle use of bike lane.

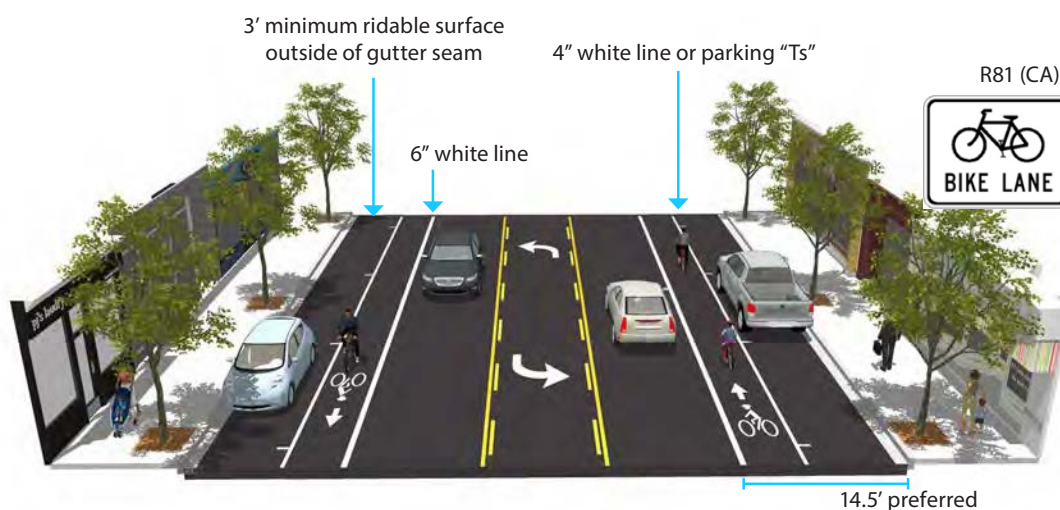

When approaching an intersection with right turn only lanes, the bike lane should be transitioned to a through bike lane to the left of the right turn only lane.

DISCUSSION

Wider bicycle lanes are desirable in certain situations such as on higher speed arterials (45 mph+) where use of a wider bicycle lane would increase separation between passing vehicles and bicyclists. Consider buffered bicycle lanes when further separation is desired.

MATERIALS AND MAINTENANCE

Paint can wear more quickly in high traffic areas.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

 Caltrans California HDM, 2012.
 California MUTCD, 2014.

BICYCLE LANES AND DIAGONAL PARKING

DESCRIPTION

The back-in/head-out parking is considered safer than conventional head-in/back-out parking due to better visibility when leaving. This is particularly important on busy streets or where vehicle drivers may find their views blocked by large vehicles or tinted windows in adjacent vehicles. The presence of raised median islands helps prevent drivers from using a back-in stall for head-in parking.

GUIDANCE

Based on existing dimensions from test sites and permanent facilities, provide 16 feet from curb edge to inner bicycle lane stripe and a five foot bicycle lane.

DISCUSSION

Test the facility on streets with existing head-in angled parking and moderate to high bicycle traffic. Additional signs to direct vehicle driver in how the back-in angled parking works is recommended.

MATERIALS AND MAINTENANCE

Paint can wear more quickly in high traffic areas.

Back-in/Head-out Angle Parking, Nelson/Nygaard Consulting Associates, 2005.
City of Los Angeles Bicycle Plan Update, City of Los Angeles.

BUFFERED BICYCLE LANE

DESCRIPTION

Buffered bike lanes are defined in the Urban Bikeway Guide as “conventional bike lanes paired with a buffered space separating the bike lane from the adjacent motor vehicle travel lane and/or parking lane.” Buffered bike lanes are allowed per California 2014 MUTCD guidelines for buffered preferential lanes (Section 3D-01).

Conventional bike lanes typically provide 5 to 6 foot wide space between the curb and travel lane. However, many bicyclists are uncomfortable riding this close to moving traffic particularly on higher speed and/or higher volume roadways. A recent Portland State University study titled “Evaluation of Innovative Bicycle Facilities,” shows that bicyclists feel a lower risk of being “doored” in a buffered bike lane and nearly nine in ten bicyclists prefer buffered lanes to standard lanes. Seven in ten bicyclists indicated they would go out of their way to ride on a buffered bike lane over a standard lane.

The NACTO Urban Bikeway Design guides list several advantages of buffered lanes including:

- Providing “shy” distance between motor vehicles and bicyclists.
- Providing space for bicyclists to pass another bicyclist without encroaching into the adjacent motor vehicle travel lane.
- Encouraging bicyclists to ride outside the door zone when buffer is between parked cars and the bike lane.
- Providing a greater space for bicycling without making the bike lane appear so wide that it might be mistaken for a travel or parking lane.
- Appealing to a wider cross-section of bicycling users.
- And encouraging bicycling by contributing to the perception of safety among users of the bicycle network.

There are three types of buffers:

- Parking or side or curb buffer
- Travel lane side buffer
- Combined side or double buffer

PARKING SIDE OR CURB BUFFERS

Parking or curb side buffers provide space between the bicyclist and parked cars or the gutter pan. This (1) reduces the potential for a bicyclist to strike a car door being opened by a driver, (2) eliminates use of the gutter pan as part of the bike lane and (3) moves the bicyclist out of the blind spots of drivers approaching on the side streets or driveways. The limitation to the parking side or curb side buffer is that they do not provide the “shy space” that makes bicyclists feel more comfortable, but they do reduce the risk of dooring and the use of the gutter pan as part of the bike lane.

TRAVEL SIDE BUFFER

Travel side buffers provide space between the bicyclist and motor vehicles in the travel lane. High speed, high volume roadways make many bicyclists uncomfortable. Recent studies from the Portland State have shown that a simple buffer substantially increases the level of comfort for most bicyclists.

COMBINED SIDE OR DOUBLE SIDED BUFFER

The combined side or double sided buffer offers the advantage of guiding the bicyclists away from the door zone while providing a perceived safer distance between the bicyclist and the motor vehicles.

GUIDANCE

According to California MUTCD 2014 Section 3D, buffered bike lanes are considered “allowable” treatments. Signage and dimensional guidelines are the same as for Class II bicycle lanes. Additional guidance is included in the NACTO Urban Bikeway Design Guide.

- Bike lane word and/or symbol shall be used (MUTCD Figure 9C-3).
- The buffer shall have interior diagonal cross hatching or chevron markings if it is three feet in width or wider.
- The buffer shall be marked with two white lines. California MUTCD 2014 standards (Section 3D.01) indicate that for a bicyclist to be allowed to cross a double white line, it must be dashed (these are the same standards applied to buffered HOV Lanes). Therefore, it is recommended that the inside line be dashed instead of solid.
- Buffers should be at least 24 inches wide.

DISCUSSION

Add diagonal striping on the outer buffer adjacent to the traffic lanes every 10 feet. However longitudinal spacing should be determined by engineering judgment considering factors such as speed and desired visual impacts.

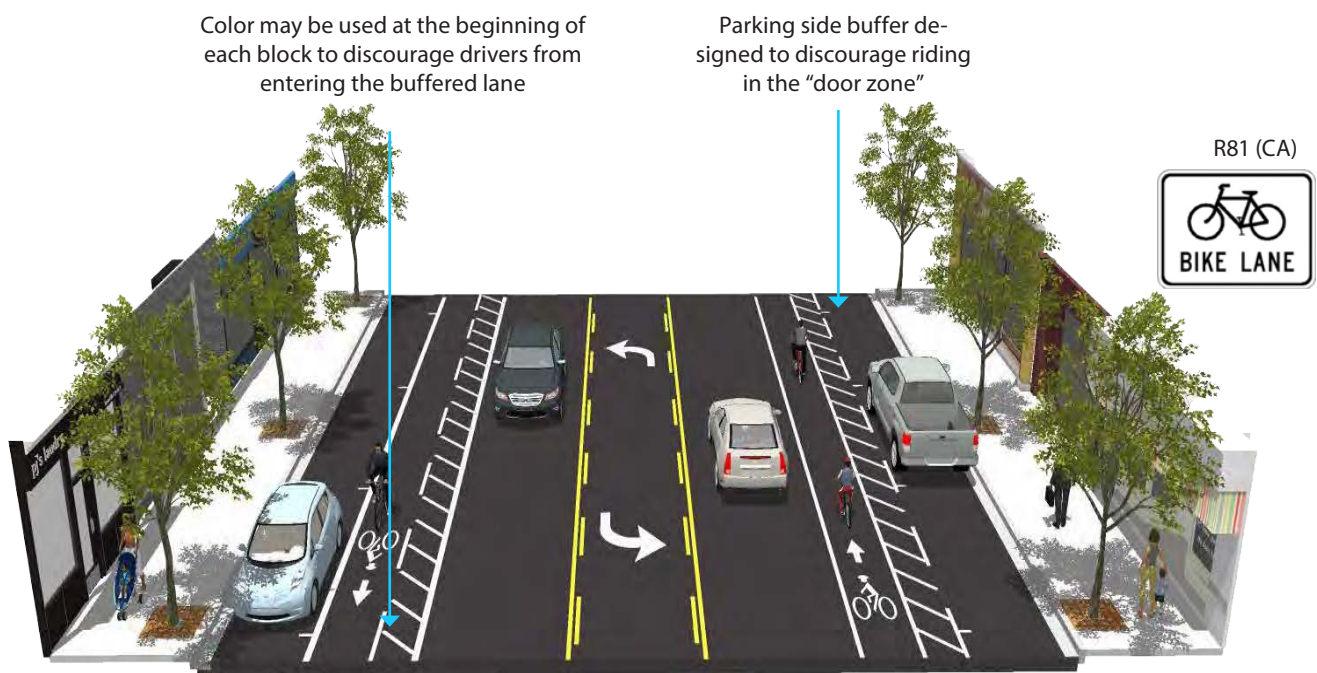

- On-street parking remains adjacent to the curb.
- A travel lane may need to be eliminated or narrowed to accommodate buffers.

MATERIALS AND MAINTENANCE

Paint can wear more quickly in high traffic areas.

ADDITIONAL REFERENCES AND GUIDELINES

NACTO Urban Bikeway Design Guide, 2014.
CA MUTCD, 2014.

Travel side (left) and parking side (right) buffers

CYCLE TRACK

DESCRIPTION

Cycle tracks, which were recently officially designated as Class IV bikeway facilities in California, are an exclusive bike facility that combines the user experience of a separated path with the on-street infrastructure of a conventional bike lane. Cycle tracks are physically separated from motor traffic and distinct from the sidewalk. They differ from buffered lanes in that the bicyclist is separated from travel lanes by a physical barrier.

Cycle tracks have different forms but all share common elements. They provide space exclusively or primarily used by bicycles and are separated from motor vehicle travel lanes, parking lanes and sidewalks. Raised cycle tracks may be at the level of the adjacent sidewalk or set at an intermediate level between the roadway and sidewalk to separate the cycle track from the pedestrian area.

Over the past five years, more than 100 new separated bike facilities have been added in the US. This relatively new type of facility has been shown to be effective in increasing the number of bicyclists using the street, increasing safety for bicyclists, pedestrians and drivers and increasing access to local businesses (Lessons from the Green Lanes: Evaluating Protected Bike Lanes in the US, National Institute for Transportation and Communities, 2014)

Separated bikeways can increase safety and promote proper riding by:

- Defining road space for bicyclists and drivers, reducing the possibility that drivers will stray into the bicyclists' path.
- Discouraging bicyclists from riding on the sidewalk.

GUIDANCE

Cycle tracks should ideally be placed along streets with long blocks and few driveways or mid-block motor vehicle access points.

ONE-WAY CYCLE TRACKS

NACTO Guidelines recommend seven foot minimum width to allow passing and five foot minimum in constrained locations. Note: In accordance with AB-1193, local agency must pass a resolution to adopt NACTO Guidelines in lieu of Caltrans Highway Design Manual if one-way cycle track width is less than nine feet.

- One way cycle tracks can be either conventional flow (go the same direction as the adjacent traffic) or contra-flow (opposite direction of adjacent traffic flow, such as to the left side of traffic on a one-way street).

TWO-WAY CYCLE TRACKS

- Cycle tracks on one-way streets have fewer potential conflict areas than those on two-way streets.
- 12 foot recommended minimum for two-way facility. Eight foot minimum in constrained locations.
Note: In accordance with AB-1193, local agency must pass resolution to adopt NACTO Guidelines in lieu of Caltrans Highway Design Manual if two-way cycle track is less than 12 feet wide.

DISCUSSION

Special consideration should be given at transit stops to manage bicycle and pedestrian interactions. Driveways and minor street crossings are unique challenges to cycle track design. Parking should be prohibited within 30 feet of the intersection to improve visibility.

MATERIALS AND MAINTENANCE

Depending on the width, barrier-separated and raised cycle tracks may require smaller sweeping equipment.

R81 (CA)

SEPARATED BIKEWAYS AT INTERSECTIONS

Intersections are junctions at which different modes of transportation meet and facilities overlap. Intersection facilitate the interchange between bicyclists, drivers, pedestrians and other modes to advance traffic flow in a safe and efficient manner. Designs for intersections with bicycle facilities should reduce conflict between bicyclists (and other vulnerable road users) and vehicles by heightening the level of visibility, denoting clear right-of-way and facilitating eye contact and awareness with other modes. Intersection treatments can improve both queuing and merging maneuvers for bicyclists and are often coordinated with timed or specialized signals. The configuration of a safe intersection for bicyclists may include elements such as color, signage, medians, signal detection and pavement markings.

Intersection design should take into consideration existing and anticipated bicyclist, pedestrian and driver movements. In all cases, the degree of mixing or separation between bicyclists and other modes is intended to reduce the risk of crashes and increase bicyclist comfort. The level of treatment required for bicyclists at an intersection will depend on the bicycle facility type used, whether bicycle facilities are intersecting and the adjacent street function and land use.

Bike Boxes

Bike Lanes and Right Turn Only Lanes

Colored Bike Lanes in Conflict Areas

Combined Bike Lane/Turn Lane

Intersection Crossing Markings

BIKE BOX

DESCRIPTION

A bike box is a designated area located at the head of a traffic lane at a signalized intersection that provides bicyclists with a safe and visible space to get in front of queuing motorized traffic during the red signal phase. Motor vehicles must queue behind the white stop line at the rear of the bike box.

GUIDANCE

Bike boxes are currently experimental treatments and require more data before an official ruling is made by the FHWA. Obtaining experimental approval is a 4-6 week process and evaluation of the treatment is performed for a minimum of one year.

- 10-16 foot depth. Deeper boxes help to prevent motor vehicle encroachment.
- "STOP HERE ON RED" sign should be post mounted at stop line to reinforce stop line observance.
- "YIELD TO BIKES" sign should be post-mounted in advance of and in conjunction with an egress lane to reinforce that bicyclists have the right-of-way going through the intersection.
- An ingress lane should be used to provide access to the box.
- Supplemental "WAIT HERE" legend can be provided in advance of stop bar to increase visibility.
- Requires permission to experiment from Federal Highway Administration.

DISCUSSION

Bike boxes should be placed only at signalized intersections and motor vehicle right turns on red shall be prohibited. Bike boxes should be used in locations that have a large volume of bicyclists and are best utilized in central areas where traffic is usually moving more slowly.

MATERIALS AND MAINTENANCE

Because the effectiveness of markings depends entirely on their visibility, maintaining markings should be a high priority.

ADDITIONAL REFERENCES AND GUIDELINES

NACTO Urban Bikeway Design Guide, 2014.

FHWA MUTCD Interpretations, Experimentations, Changes and Interim Approval (IA-14), 2011.

BIKE LANES AT RIGHT TURN ONLY LANES

DESCRIPTION

The appropriate treatment at right-turn lanes is to place the bike lane between the right-turn lane and the right-most through lane or, where right-of-way is insufficient, to use a shared bike lane/turn lane. The design (right) illustrates a bike lane pocket, with signage indicating that drivers should yield to bicyclists through the conflict area.

Colored pavement may be used in the transition area to increase visibility and awareness of potential conflict

GUIDANCE

At auxiliary right turn only lanes (add lane):

- Continue existing bike lane width; standard width of 5 to 6 feet (4 feet in constrained locations).
- Use signage to indicate that drivers should yield to bicyclists through the conflict area.
- Consider using colored conflict areas to promote visibility of the mixing zone. Where a through lane becomes a right turn lane:
- Do not define a dotted line merging path for bicyclists.
 - Drop bicycle lane in advance of merge area.
 - Use shared lane markings to indicate shared use of the lane in the merging zone.

DISCUSSION

For other potential approaches to providing accommodations for bicyclists at intersections with turn lanes, please see combined bike lane/turn lane, bicycle signals and colored bike facilities.

MATERIALS AND MAINTENANCE

Because the effectiveness of markings depends entirely on their visibility, maintaining markings should be a high priority.

 Caltrans Complete Intersections, 2010.

COLORED BIKE LANES IN CONFLICT AREAS

DESCRIPTION

The Federal Highway Administrative (FHWA) has granted the State of California approval for optional use of green colored pavement in marked bicycle lanes and in extensions of bicycle lanes through intersections and other traffic conflict areas. It should be noted that the green colored pavement as described under this approval is used for two different situations:

- To denote a lane exclusively for bicyclists.
- To advise drivers and bicyclists that they are sharing the same patch of pavement and should be aware of each other's presence.

Local agencies have adopted different philosophies on the usage of green colored pavement. Some agencies use green colored pavement only for Class II lanes where bicyclists have exclusive use and leave the conflict zones uncolored. Other agencies use the green colored pavement only in conflict zones, such as the weave shown in the figure below.

GUIDANCE

Jurisdictions must notify Caltrans where the treatment is being installed as part of FHWA's conditions to maintain an inventory list.

At auxiliary right turn only lanes (add lane):

- Continue existing bike lane width; standard width of 5 to 6 feet (4 feet in constrained locations).
- Use signage to indicate that drivers should yield to bicyclists through the conflict area.
- Consider using colored conflict areas to promote visibility of the mixing zone. Where a through lane becomes a right turn lane:
 - Do not define a dotted line merging path for bicyclists.
 - Drop the bicycle lane in advance of the merge area.
 - Use shared lane markings to indicate shared use of the lane in the merging zone

DISCUSSION

The best practices for green colored pavement are still evolving. As of this date, more agencies use green colored pavement for conflict zones than for exclusive bicyclist lanes. The amount of green paint used by such agencies varies dramatically. Some agencies fill the entire conflict zone with solid green paint, while others use a pattern of green stripes. Some agencies use green colored pavement across every driveway, alley and cross streets, while others reserve the use of green colored pavement for conflict zones that merit special attention. The precise design of green colored pavement remains at the discretion of the local agencies.

It should be noted that combining a shared lane marking ("sharrow") within green colored pavement is no longer approved for new experimentation by the FHWA. However, the FHWA may accept for experimentation the use of green colored pavement as a "background conspicuity enhancement."

MATERIALS AND MAINTENANCE

Because the effectiveness of markings depends entirely on their visibility, maintaining markings should be a high priority.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

California MUTCD, 2014

NACTO Urban Bikeway Design Guide, 2014.

Caltrans California HDM, 2012.

Caltrans Complete Intersections, 2010.

COMBINED BIKE LANE/TURN LANE

DESCRIPTION

The combined bicycle/right turn lane places a standard-width bike lane on the left side of a dedicated right turn lane. A dotted line delineates the space for bicyclists and drivers within the shared lane. This treatment includes signage advising drivers and bicyclists of proper positioning within the lane. This treatment is recommended at intersections lacking sufficient space to accommodate both a standard through bike lane and right turn lane.

GUIDANCE

The FHWA has disallowed the experimental use of combined bike lane/turn lane markings. Previously, installations were as follows: Maximum shared turn lane width is 13 feet; narrower is preferable.

- Bike lane pocket should have a minimum width of 4 feet with 5 feet preferred.
- Dotted 4 inch line and bicycle lane marking should be used to clarify bicyclist positioning within the combined lane, without excluding cars from the suggested bicycle area.
- "RIGHT TURN ONLY" sign with an "EXCEPT BICYCLES" plaque may be needed for through bicyclists to legally use a right turn lane.

Short length turn pockets encourage slower motor vehicle speeds

DISCUSSION

Unless the FHWA resumes granting permission to experiment with a combined bike lane/turn lane, this treatment will not be recommended.

MATERIALS AND MAINTENANCE

Because the effectiveness of markings depends on their visibility, maintaining markings should be a high priority.

ADDITIONAL REFERENCES AND GUIDELINES

NACTO Urban Bikeway Design Guide, 2014.
AASHTO Guide for the Development of Bicycle Facilities, 2012.

INTERSECTION CROSSING MARKINGS

DESCRIPTION

Bicycle pavement markings through intersections indicate the intended path of bicyclists through an intersection or across a driveway or ramp. They guide bicyclists on a safe and direct path through the intersection and provide a clear boundary between the paths of through bicyclists and either through or crossing motor vehicles in the adjacent lane.

DISCUSSION

Additional markings such as chevrons, shared lane markings, or colored bike lanes in conflict areas are strategies currently in use in the United States and Canada. Cities considering the implementation of markings through intersections should standardize future designs to avoid confusion.

MATERIALS AND MAINTENANCE

Because the effectiveness of marked crossings depends entirely on their visibility, maintaining marked crossings should be a high priority.

GUIDANCE

- See MUTCD Section 3B.08: "dotted line extensions"
- Crossing striping shall be at least six inches wide when adjacent to motor vehicle travel lanes.
- Dotted lines should be two-foot lines spaced two to six feet apart.
- Chevrons, shared lane markings, or colored bike lanes in conflict areas may be used to increase visibility within conflict areas or across entire intersections.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
 California MUTCD, 2014.
 NACTO Urban Bikeway Design Guide, 2014.

TWO-STAGE TURN BOX

DESCRIPTION

Many bicyclists are reluctant to cross traffic lanes to turn left. Two-stage turn boxes offer bicyclists a safe way to make left turns at multi-lane signalized intersections from a right side cycle track or bike lane. Bicyclists continue straight while the traffic signal displays green for the original direction of travel during the first stage of a traffic signal and then wait for the second stage when the cross street receives a green light to complete the move.

DISCUSSION

While two stage turns may increase bicyclist comfort in many locations, it results in higher average signal delay for bicyclists versus a vehicular style left turn maneuver.

MATERIALS AND MAINTENANCE

Paint can wear more quickly in high traffic areas or in winter climates.

ADDITIONAL REFERENCES AND GUIDELINES

NACTO Urban Bikeway Design Guide, 2014.

GUIDANCE

- Two-stage turn box to facilitate jughandle turn at T-intersection is presently allowed in the Federal and California MUTCDs.
- Two-stage turn box for use other than for jughandle turn at T-intersection is experimental. Required design elements include bicycle symbol pavement marking, a pavement marking turn or through arrow, full-time turn on red prohibition for the cross street and passive detection of bicycles if the signal phase that permits bicyclists to enter the intersection during the second stage of their turn is actuated.
- Green colored pavement is optional.

Turns from a bicycle lane may be protected by an adjacent parking lane or crosswalk setback.

BIKE LANES AT DIVERGING RAMP LANES

DESCRIPTION

Some arterials may include high speed freeway-style design, such as merge lanes and exit ramps, which can create difficulties for bicyclists. These entrance and exit lanes typically have intrinsic visibility problems because of low approach angles and high speed differentials between bicyclists and motor vehicles. Strategies to improve safety focus on increasing sight distances, creating formal crossings and minimizing crossing distances.

GUIDANCE

ENTRANCE RAMP:

Angle bike lane to increase approach angle with entering traffic. Position crossing to draw drivers' attention prior to being focused on upcoming merge.

EXIT RAMP:

Use a jug handle turn to increase bicyclists approach angle with exiting traffic and add yield striping and signage to the bicycle approach.

Colored pavement within bicycle lane increases facility visibility and reinforces bicyclists' priority in conflict areas.

DISCUSSION

Green colored pavement is optional.

MATERIALS AND MAINTENANCE

Paint can wear more quickly in high traffic areas or in winter climates. Locate crossing markings out of wheel tread when possible to minimize wear and maintenance costs.

ADDITIONAL REFERENCES AND GUIDELINES

California MUTCD, 2014.

AASHTO Guide for the Development of Bicycle Facilities, 2012.

Caltrans Complete Intersections, 2010.

FREEWAY INTERCHANGE DESIGN

DESCRIPTION

Freeway Interchanges can be significant obstacles to bicycling if they are poorly designed. Travel through some interchange designs may be particularly challenging for youth bicyclists. Key design features at conflict areas through interchanges should be included to improve the experience for bicyclists.

GUIDANCE

Entrance Ramps:

- Right-turn lane should be configured with a taper as an “add-lane” for drivers turning right onto the freeway entrance ramp.
- Bike lane should be provided along left side of right turn lane. Dotted through bike lane striping provides clear priority for bicyclists at right turn “add lane” on-ramps.

EXIT RAMPS:

- Drivers existing freeway and turning onto crossroad should be controlled by a stop sign, signal, or yield sign, rather than allowing free flowing movement.

DISCUSSION

The on-ramps should be configured as a right-turn-only “add lane” to assert through bicyclist priority. Designs that function for bicycle passage typically encourage slowing or require motor vehicle traffic to slow or stop. Designs that encourage high-speed traffic movements are difficult for bicyclists to negotiate.

MATERIALS AND MAINTENANCE

Locate crossing markings out of wheel tread when possible to minimize wear and maintenance costs.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
California MUTCD, 2014.
Caltrans Complete Intersections, 2010.

SIGNALIZATION

Determining which type of signal or beacon to use for a particular intersection depends on a variety of factors. These include speed limits, Average Daily Traffic (ADT), anticipated bicycle crossing traffic and the configuration of planned or existing bicycle facilities. Signals may be necessary as part of the construction of a protected bicycle facility such as a cycle track with potential turning conflicts, or to decrease vehicle or pedestrian conflicts at major crossings. An intersection with bicycle signals may reduce stress and delays for a crossing bicyclist and discourage illegal and unsafe crossing maneuvers.

BICYCLE DETECTION AND ACTUATION

LOOP DETECTORS OR VIDEO DETECTORS

For signalized intersection movements that do not normally receive a green light unless actuated by a car or pedestrian, the California Vehicle Code requires installation of detectors capable of detecting bicyclists at the limit line. This is most commonly done with either inductive loop detectors or video detection. Traffic actuated signals should be sensitive to bicycles, should be located in the bicyclist's expected path and stenciling should direct the bicyclist to the point where the bicycle will be detected. This allows the bicyclist to stay within the lane of travel without having to maneuver to the side of the road to trigger a push button.

PUSH BUTTON ACTUATION

A bicyclist pushbutton may be used to supplement the required limit line detectors. These buttons should be mounted in a location that permits their activation by a bicyclist without having to dismount.

REMOTE TRAFFIC MICROWAVE SENSOR DETECTION (RTMS)

RTMS uses radio signals to detect objects and marks the detected object with a time code to determine its distance from the sensor. The RTMS system is unaffected by temperature and lighting, which can affect standard video detection.

DISCUSSION

Bicycle detection should meet two primary criteria:

- Accurately detect bicyclists.
- Provide clear guidance to bicyclists on how to actuate detection (e.g., what button to push, where to stand).

Requirement for bicycle detection at all new and modified approaches to traffic signals is included in 2014 California MUTCD.

MATERIALS AND MAINTENANCE

Signal detection and actuation for bicyclists should be maintained with other traffic signal detection and roadway pavement markings.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

NACTO Urban Bikeway Design Guide, 2014.

California MUTCD. 2014.

Caltrans Complete Intersections, 2010.

BICYCLE SIGNAL HEADS

DESCRIPTION

The California MUTCD authorizes bicycle signal heads only at locations that meet Caltrans Bicycle Signal Warrants. FHWA's Interim Approval IA-I6 specifies a more detailed application of bicycle signal indications. Bicycle signal heads may be used for a movement not in conflict with any simultaneous motor vehicle movements at a signalized intersection, including right or left turns on red. The bicycle movement may not be modified by lane-use signs, turn prohibition signs, pavement markings, separate turn signal indications, or other traffic control devices. The signal lens size may be 4 inches, 8 inches, or 12 inches, with 4 inch lens size reserved only for supplemental near-side mountings.

DISCUSSION

For improved visibility, smaller (4 inch lens) near-side bicycle signals should be considered to supplement far-side signals.

MATERIALS AND MAINTENANCE

Bicycle signal heads require the same maintenance as standard traffic signal heads, such as lamp replacement and responding to power outages.

GUIDANCE

California MUTCD Bicycle Signal Warrant is based on bicyclist volumes, collision history, or geometric warrants:

- Those with high peak hour bicyclist volumes.
- Those with high bicycle/motor vehicle collision numbers, especially those caused by turning vehicle movements.
- Where a multi-use path intersects a roadway.
- At locations to facilitate a bicycle movement not permitted for a motor vehicle.
- Bicycle signals must utilize appropriate detection and actuation.

ADDITIONAL REFERENCES AND GUIDELINES

FHWA Interim Approval IA-I6, 2013.
California MUTCD, 2014.

ACTIVE WARNING BEACONS

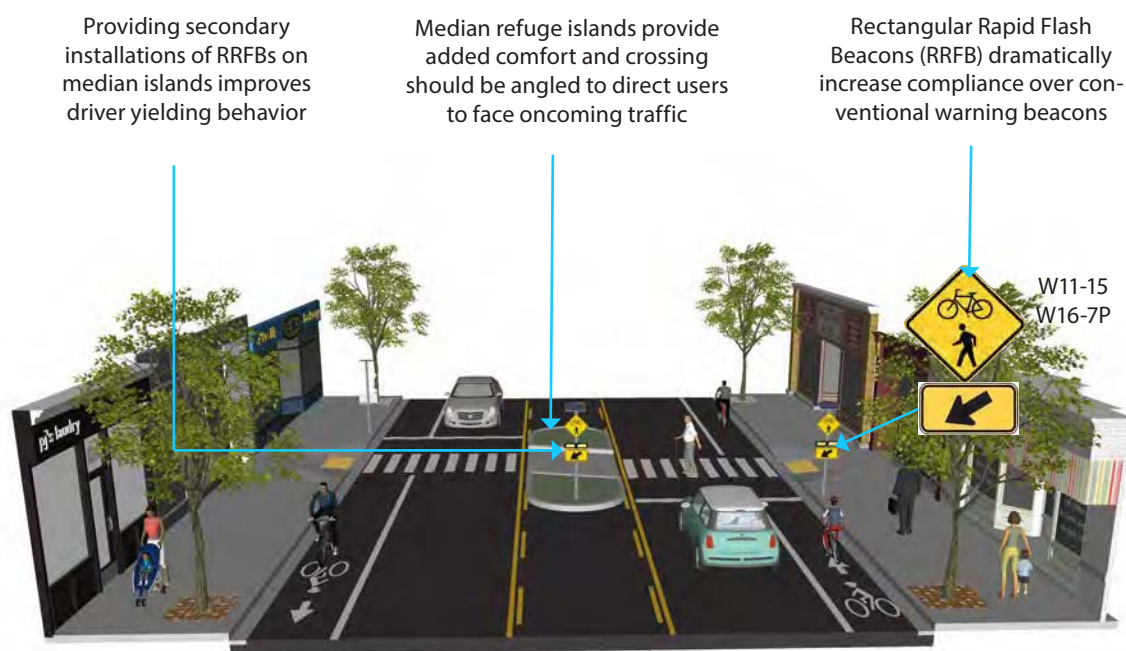

DESCRIPTION

Active warning beacons are user actuated illuminated devices designed to increase motor vehicle yielding compliance at crossings of multi lane or high volume roadways. Types of active warning beacons include conventional circular yellow flashing beacons, in roadway warning lights, or Rectangular Rapid Flash Beacons (RRFB). RRFBs have blanket approval in California per FHWA MUTCD IA11.

GUIDANCE

Warning beacons shall not be used at crosswalks controlled by YIELD signs, STOP signs or traffic signals.

- Warning beacons shall initiate operation based on pedestrian or bicyclist actuation and shall cease operation at a predetermined time after actuation or, with passive detection, after the pedestrian or bicyclist clears the crosswalk.

DISCUSSION

Rectangular rapid flash beacons have the highest compliance of all warning beacon enhancement options. A study of the effectiveness of going from a no-beacon arrangement to a two-beacon RRFB installation increased yielding from 18 percent to 81 percent. A four-beacon arrangement raised compliance to 88 percent.

MATERIALS AND MAINTENANCE

Depending on power supply, maintenance can be minimal. Solar-powered RRFBs can operate for years without issue.

ADDITIONAL REFERENCES AND GUIDELINES

NACTO Urban Bikeway Design Guide, 2014.
California MUTCD, 2014.
FHWA Interim Approval (IA-11), 2008.
Caltrans Complete Intersections, 2010.

PEDESTRIAN HYBRID BEACONS

DESCRIPTION

A pedestrian hybrid beacon (PHB), previously known as a high-intensity activated crosswalk (HAWK), consists of a signal head with two red lenses over a single yellow lens on the major street and pedestrian and/or bicycle signal heads for the minor street. There are no signal indications for motor vehicles on the minor street approaches.

Pedestrian hybrid beacons are used to improve non-motorized crossings of major streets in locations where side-street volumes do not support installation of a conventional traffic signal or where there are concerns that a conventional signal will encourage additional motor vehicle traffic on the minor street. Hybrid beacons may also be used at mid-block crossing locations.

GUIDANCE

Pedestrian hybrid beacons may be installed without meeting traffic signal control warrants. The need should be considered on the basis of an engineering study that considers speed, major-street volumes and gaps:

- If installed within a signal system, signal engineers should evaluate the need for the pedestrian hybrid beacon to be coordinated with other signals.
- Parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the marked crosswalk.

DISCUSSION

An alternative to a pedestrian hybrid beacon is a standard signal face that displays a flashing red indication during the pedestrian clearance phase. The advantage of a standard signal face is that it displays no dark indications that could be interpreted by a driver to be a symptom of a power outage that requires coming to a stop.

MATERIALS AND MAINTENANCE

Signing and striping need to be maintained to help users understand any unfamiliar traffic control.

ADDITIONAL REFERENCES AND GUIDELINES

California MUTCD, 2014.

RETROFITTING EXISTING STREETS TO ACCOMMODATE BIKEWAYS

Most major streets are characterized by high vehicle speeds and/or volumes for which dedicated bike lanes are the most appropriate facility to accommodate safe and comfortable riding. Although opportunities to add bike lanes through roadway widening may exist in some locations, many major streets have physical and other constraints that would require street retrofit measures within existing curb-to-curb widths. As a result, much of the guidance provided in this section focuses on effectively reallocating existing street width through striping modifications to accommodate dedicated bike lanes.

Although largely intended for major streets, these measures may be appropriate for any roadway where bike lanes would be the best accommodation for bicyclists.

LANE NARROWING ("LANE DIET")

DESCRIPTION

Lane narrowing utilizes roadway space that exceeds minimum standards to provide the needed space for bike lanes. Many roadways have existing travel lanes wider than those prescribed in local and national roadway design standards, or which are not marked. Most standards allow for the use of 11 foot and sometimes 10 foot wide travel lanes to create space for bike lanes.

GUIDANCE

VEHICLE LANE WIDTH

- Before: 10-15 feet
- After: 10-11 feet

BICYCLE LANE WIDTH

- Bicycle lane guidance applies to this treatment.

DISCUSSION

Special consideration should be given to the amount of heavy vehicle traffic and horizontal curvature before the decision is made to narrow travel lanes. Center turn lanes can also be narrowed in certain situations to provide space for bike lanes.

MATERIALS AND MAINTENANCE

Repair rough or uneven pavement surface.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
 AASHTO A Policy on Geometric Design of Highways and Streets, 2004.
 Caltrans California HDM, 2012.
 Caltrans Main Streets, 2005.

LANE RECONFIGURATION (“ROAD DIET”)

DESCRIPTION

The removal of a single travel lane will generally provide sufficient space for bike lanes on both sides of a street. Streets with excess vehicle capacity provide opportunities for bike lane retrofit projects.

GUIDANCE

Width depends on project. No narrowing may be needed if a lane is removed.

BICYCLE LANE WIDTH:

- Bicycle lane guidance applies to this treatment.

DISCUSSION

Depending on a street's existing configuration, traffic operations, user needs and safety concerns, various lane reduction configurations may apply. For instance, a four-lane street (with two travel lanes in each direction) could be modified to provide one travel lane in each direction, a center turn lane and bike lanes.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
 FHWA Evaluation of Lane Reduction “Road Diet” Measures on Crashes, 2010.
 Caltrans Main Streets, 2005.

MATERIALS AND MAINTENANCE

Repair rough or uneven pavement surface.

SHARED USE PATH

Shared-use paths allow for two-way, off-street bicycle use and also may be used by pedestrians, skaters, wheelchair users, joggers and other non-motorized users. These facilities are frequently found in parks, along rivers, beaches and in greenbelts or utility corridors where there are few conflicts with motorized vehicles. Path facilities can also include amenities such as lighting, signage and fencing (where appropriate).

Key features of greenways include:

- Frequent access points from the local road network.
- Directional signs to direct users to and from the path.
- Limited number of at-grade crossings with streets or driveways.
- Terminating path where it is easily accessible to and from the street system.
- Separate treads for pedestrians and bicyclists when heavy use is expected.

General Design Practices

Paths in River and Utility Corridors

Local Neighborhood Accessways

GENERAL DESIGN PRACTICES

DESCRIPTION

Shared-use paths can provide a desirable facility, particularly for recreation and for users of all skill levels preferring separation from traffic. Paths should generally provide directional travel opportunities not provided by existing roadways.

DISCUSSION

AASHTO Guide for the Development of Bicycle Facilities generally recommends against development of shared use paths along roadways.

MATERIALS AND MAINTENANCE

Asphalt is the most common surface for Class I paths, but concrete has proven to be more durable over the long term.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
California MUTCD, 2014.
Caltrans California HDM, 2012.

GUIDANCE

Width

- 9 feet is minimum allowed by HDM for one-way Class I multi-use path consisting of a five foot paved width with two foot shoulders.
- 12 feet is minimum allowed by HDM for two-way Class I multi-use path consisting of two four foot lanes and two foot shoulders. On structures, Class I multi-use path clear width between railings shall not be less than 10 feet.

Lateral Clearance

- Minimum separation between edge of pavement of one-way or a two-way multi-use path and edge of travel way of parallel road or street shall be five feet plus standard shoulder width. Prior to 2012, the Highway Design Manual allowed narrower separation if a physical barrier was included. Since 2012, however, physical barrier would not result in reduced separation.

Overhead Clearance

- Minimum vertical clearance allowed by HDM to obstructions across width of multi-use path is eight feet and seven feet over shoulders.

Striping

- When striping is required, use a four inch dashed yellow centerline stripe with four inch solid white edge lines.
- Solid centerlines can be provided on tight or blind corners and on the approaches to roadway crossings.

PATHS IN RIVER AND UTILITY CORRIDORS

DESCRIPTION

Utility and waterway corridors often offer excellent shared-use path development and bikeway gap closure opportunities. Utility corridors typically include power line and sewer corridors, while waterway corridors include canals, drainage ditches, rivers and beaches. These corridors offer excellent transportation and recreation opportunities for bicyclists of all ages and skills.

DISCUSSION

Similar to railroads, public access to flood control channels or canals is undesirable by all parties. Appropriate fencing may be required to keep path users within the designated travel way. Creative design of fencing is encouraged to make the path facility feel welcoming to the user.

MATERIALS AND MAINTENANCE

For paths susceptible to flooding or ponding, permeable pavement is an option to reduce water collection, but will require additional regular maintenance to maintain effectiveness.

GUIDANCE

Shared-use paths in utility corridors should meet or exceed general design practices and must conform to the Caltrans Highway Design Manual if designated as a Class I multi-use path. If additional width allows, wider paths and landscaping are desirable.

ACCESS POINTS

Any access point to the path should be well-defined with appropriate signage designating the pathway as a bicycle and pedestrian facility and prohibiting motor vehicles.

PATH CLOSURE

Public access to the path may be prohibited during the following events:

- Canal/flood control channel or other utility maintenance activities
- Inclement weather or the prediction of storm conditions

LOCAL NEIGHBORHOOD ACCESSWAYS

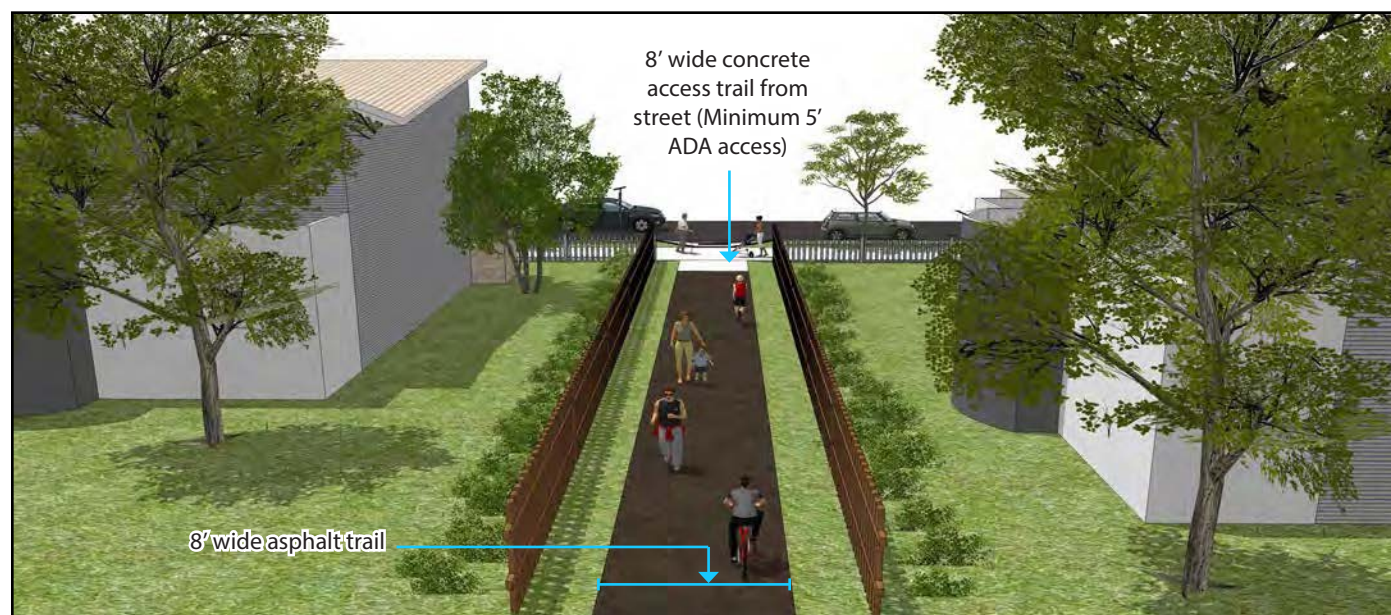

DESCRIPTION

Neighborhood accessways provide residential areas with direct bicycle and pedestrian access to parks, trails, green spaces and other recreational areas. They most often serve as small trail connections to and from the larger trail network, typically having their own rights-of-way and easements.

Additionally, these smaller trails can be used to provide bicycle and pedestrian connections between dead-end streets, cul-de-sacs and access to nearby destinations not provided by the street network.

GUIDANCE

- Neighborhood access should remain open to the public
- Trail pavement should be at least 8 feet wide to accommodate emergency and maintenance vehicles, meet ADA requirements and be considered suitable for multi-use
- Trail widths should be designed to be less than 8 feet wide only when necessary to protect large mature native trees over 18 inches in caliper, wetlands or other ecologically sensitive areas.
- Access trails should slightly meander whenever possible to take advantage of available right-of-way space.

DISCUSSION

Neighborhood access should be designed into new subdivisions wherever possible.

MATERIALS AND MAINTENANCE

For paths susceptible to flooding or ponding, permeable pavement is an option to reduce water collection, but will require additional regular maintenance to maintain effectiveness.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
California MUTCD, 2014.
Flink, C. Greenways, 1993.

PATH/ROADWAY CROSSING

At-grade roadway crossings can create potential conflicts between path users and drivers, but well-designed crossings can mitigate many operational issues and provide a higher degree of safety and comfort for path users. This is evidenced by the thousands of successful facilities around the United States with at-grade crossings. In most cases, at-grade path crossings can be properly designed to provide a reasonable degree of safety and can meet existing traffic and safety standards.

Path facilities that cater to bicyclists require additional considerations due to the higher travel speed of bicyclists versus pedestrians. In addition to guidance presented in this section, see previous entries for active warning beacons and pedestrian hybrid beacons (PHBs) for other methods for enhancing trail crossings.

MARKED/UNSIGNALIZED MID BLOCK CROSSINGS

DESCRIPTION

Marked/unsignalized mid block crossings typically consist of a marked crossing area, signage and other markings to slow or stop traffic. Designing crossings at mid-block locations depends on an evaluation of vehicular traffic, line of sight, pathway traffic, use patterns, vehicle speed, road type, road width and other safety issues such as proximity to major attractions.

When space is available, using a median refuge island can improve user safety by providing pedestrians and bicyclists space to safely cross one side of the roadway at a time.

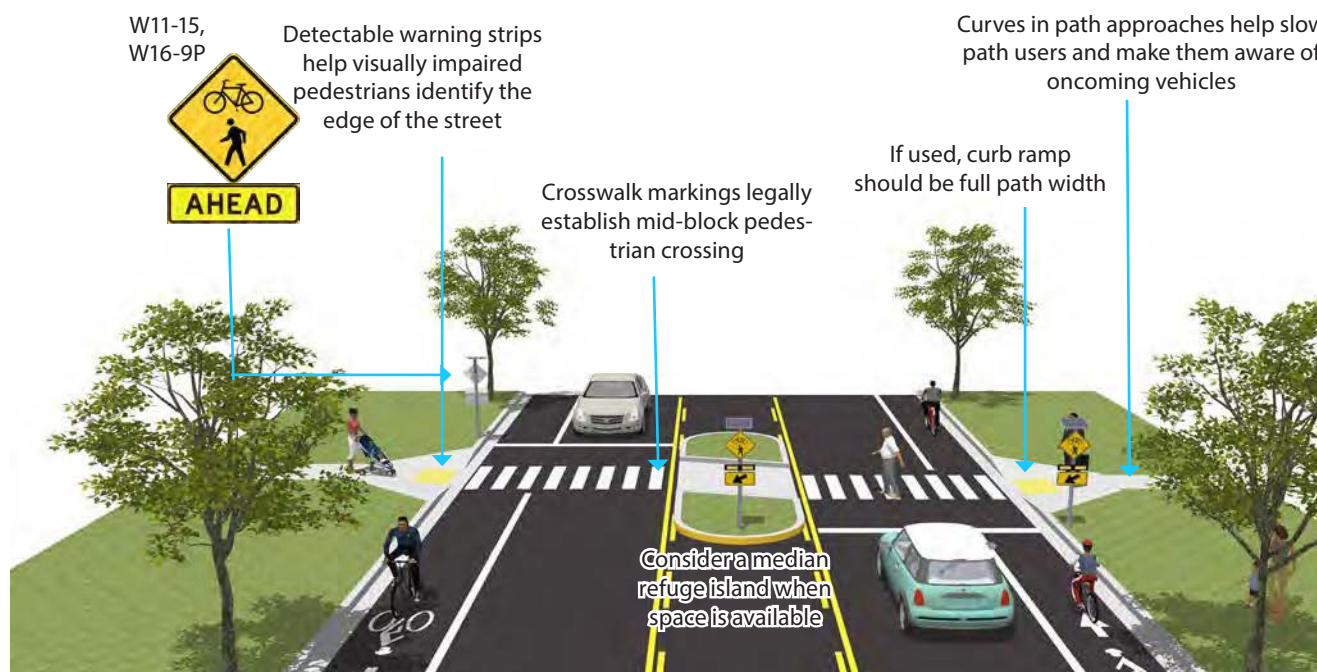

GUIDANCE

MAXIMUM TRAFFIC VOLUMES

- <9,000-12,000 Average Daily Traffic (ADT) volume
- Up to 15,000 ADT on two-lane roads, preferably with a median
- Up to 12,000 ADT on four-lane roads with median
- Maximum travel speed: 35 mph

MINIMUM LINE OF SIGHT

- 25 mph zone: 155 feet
- 35 mph zone: 250 feet
- 45 mph zone: 360 feet

DISCUSSION

Unsignalized crossings of multi-lane arterials over 15,000 ADT may be possible with features such as sufficient crossing gaps (more than 60 per hour), median refuges and/or active warning devices like rectangular rapid flash beacons.

MATERIALS AND MAINTENANCE

Locate markings out of wheel tread when possible to minimize wear and maintenance costs.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012
 California MUTCD, 2014
 Caltrans California HDM, 2012

OVERCROSSINGS

DESCRIPTION

Bicycle/pedestrian overcrossings provide critical non-motorized system links by joining areas separated by barriers such as deep canyons, waterways or major transportation corridors. In most cases, these structures are built in response to user demand for safe crossings where they previously did not exist.

Grade-separated crossings may be needed where existing bicycle/pedestrian crossings do not exist, where ADT exceeds 25,000 vehicles and where 85th percentile speeds exceed 45 miles per hour.

DISCUSSION

Overcrossings for bicycles and pedestrians typically fall under the Americans with Disabilities Act (ADA), which strictly limits ramp slopes to 8.33 percent (1:12) with landings every 30 feet. Title 24 of the California Code of Regulations requires gradients up to five percent (1:20) with five foot landings at 400 foot intervals.

MATERIALS AND MAINTENANCE

Potential vandalism may be addressed with sacrificial coatings.

GUIDANCE

- 10 foot minimum width between railings, 14 feet preferred. If overcrossing has any scenic vistas additional width should be provided to allow for stopping. A separate 5 foot pedestrian area may be provided for facilities with high bicycle and pedestrian use.
- 10 foot headroom on overcrossing; clearance below will vary depending on feature being crossed.
- Roadway: 17 feet
- Freeway: 18.5 feet
- Heavy Rail Line: 23 feet

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

AASHTO Guide for the Planning, Design and Operation of Pedestrian Facilities, 2004.

SIGNALIZED CROSSINGS

DESCRIPTION

Path crossings within approximately 300 feet of an existing signalized intersection with pedestrian crosswalks are typically diverted to the intersection to avoid traffic operation problems when located so close to an existing signal. For this restriction to be effective, barriers and signing may be needed to direct path users to the signalized crossing. If no pedestrian crossing exists at the intersection, modifications should be made.

GUIDANCE

Mid block crosswalks shall not be signalized if they are located within 300 feet of the nearest traffic control signal and should not be controlled by a traffic control signal if the crosswalk is located within 100 feet from side streets or driveways controlled by STOP signs or YIELD signs. If possible, offset the path to the intersection.

DISCUSSION

In the US, the minimum distance a marked crossing can be from an existing signalized intersection varies from approximately 250 to 660 feet. Engineering judgment and location context should be taken into account when choosing the appropriate allowable setback.

MATERIALS AND MAINTENANCE

If a sidewalk is used for crossing access, it should meet ADA guidelines.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
 AASHTO Guide for the Planning, Design and Operation of Pedestrian Facilities, 2004.
 California MUTCD, 2014.

BICYCLE SUPPORT FACILITIES

BICYCLE PARKING

Bicyclists expect a safe, convenient place to secure their bicycle when they reach their destination. This may be short-term parking of two hours or less, or long-term parking for employees, students, residents or commuters.

ACCESS TO TRANSIT

Safe and easy access to bicycle parking facilities is necessary to encourage commuters to access transit via bicycle. Providing bicycle access to transit and space for bicycles on buses and rail vehicles can increase the feasibility of transit in lower-density areas, where transit stops are beyond walking distance of many residences. People are often willing to walk only a quarter-to half-mile to a bus stop, but they may bike as much as two or more miles to reach a transit station.

BICYCLE RACKS

DESCRIPTION

Secure bicycle parking at likely destinations is an integral part of a bikeway network. Adequate bicycle parking should be incorporated into any new development or redevelopment project. Bicycle parking should be given a balanced level of importance when considering car parking improvements or development. In commercial areas where bicycle traffic is more prevalent, as well as parks and shopping centers, increased bicycle parking is recommended.

Bicycle rack type plays a major role in the utilization of the bicycle racks. Only racks that support the bicycle at two points and allow convenient locking should be used. The Association for Pedestrian and Bicycle Professionals (APBP) recommends selecting bicycle racks that:

- Supports the bicycle in at least two places, preventing it from falling over.
- Allow locking of the frame and one or both wheels with a U-lock.
- Are securely anchored to ground.
- Resist cutting, rusting, bending or deformation.

GUIDANCE

Acceptable racks:

- Do not bend wheels or damage other bicycle parts
- Accommodate high security U-locks.
- Accommodate securing the frame and wheels.
- Do not trip pedestrians.
- Are easily accessed yet protected from motor vehicles.
- Are covered if users will leave their bicycles for long periods.
- Are located where cyclists are most likely to travel.

DISCUSSION

Where bicycle parking is very limited, an occasional parking space could be converted into a bicycle corral to increase the attraction of cycling to the commercial district instead of driving there. See bike corrals.

MATERIALS AND MAINTENANCE

Use proper anchors to prevent vandalism or theft.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

APBP Bicycle Parking Guide 2nd Edition, 2010.

Loop may be attached to retired parking meter posts to formalize meter as bicycle parking

BICYCLE LOCKERS

DESCRIPTION

Bicycle parking facilities intended for long-term parking must protect against theft of the entire bicycle and its components and accessories.

Three common ways of providing secure long-term bicycle parking are:

- Fully enclosed lockers accessible only by the user, either coin-operated, or by electronic, on-demand locks operated by “smartcards” equipped with touch-sensitive imbedded RFID chips.
- A continuously monitored facility that provides at least medium-term type bicycle parking facilities generally available at no charge
- Restricted access facilities in which short-term type bicycle racks are provided and access is restricted only to the owners of the bicycles stored there

Perhaps the easiest retrofit is the bicycle locker. Generally, they are as strong as the locks on their doors and can secure individual bicycles with their panniers, computers, lights, etc, left in place. Some bicycle locker designs can be stacked to double the parking density.

DISCUSSION

Long-term parking facilities are more expensive to provide than short-term facilities, but are also significantly more secure. Although many bicycle commuters would be willing to pay a nominal fee to guarantee the safety of their bicycle, long-term bicycle parking should be free wherever automobile parking is free.

MATERIALS AND MAINTENANCE

Regularly inspect moving part function and enclosures. Change keys and access codes periodically to prevent access by unapproved users.

GUIDANCE

- Minimum dimensions: width (opening) 2.5 feet; height four feet; depth six feet.
- Four foot side and six foot end clearance.
- Seven foot minimum distance between facing lockers.
- Locker designs that allow visual inspection are recommended for security.
- Access controlled by a key or access code.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.

APBP Bicycle Parking Guide 2nd Edition, 2010.

ON-STREET BICYCLE CORRAL

DESCRIPTION

Bicycle corrals are generally former vehicle parking stalls converted to bicycle parking. Most have been on-street conversions, but they are now being incorporated into shopping center parking lots as well. Corrals can accommodate up to 20 bicycles per former vehicle parking space. On-street bicycle corrals provide many benefits where bicycle use is high and/or growing:

- **Businesses** - Corrals provide a much higher customer to parking space ratio and advertise “bicycle friendliness.” They also allow more outdoor seating for restaurants by moving the bicycle parking off the sidewalk. Some cities have instituted programs that allow local businesses to sponsor or adopt a bicycle corral to improve bicycle parking in front of their business.
- **Pedestrians** - Corrals clear sidewalks and those installed at corners also serve as curb extensions
- **Cyclists** - Corrals increase cycling visibility and greatly expand bicycle parking options
- **Vehicle drivers** - Corrals improve visibility at intersections by preventing large vehicles from parking at street corners and blocking sight lines

GUIDANCE

See bicycle rack guidelines section.

- Bicyclists should have an entrance width from the roadway of 5–6 feet.
- Desirable to put bicycle corrals near intersections.
- Can be used with parallel or angled parking.
- Parking stalls adjacent to curb extensions are good candidates for bicycle corrals since the concrete extension serves as delimitation on one side.

Lockers can be custom designed and fabricated to complement specific locations.

MATERIALS AND MAINTENANCE

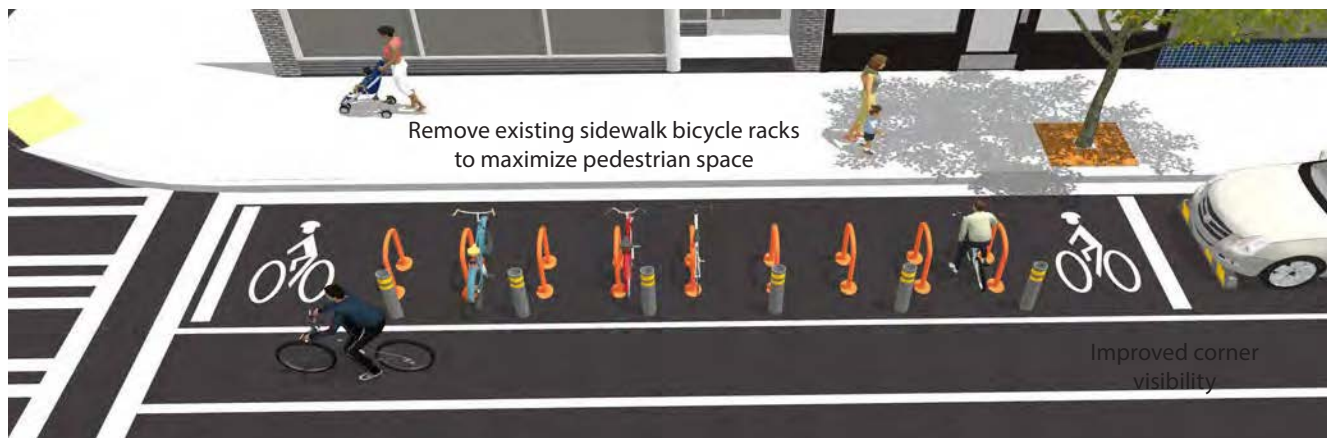

Physical barriers may obstruct drainage and collect debris. Establish a maintenance agreement with neighboring businesses.

DISCUSSION

In many communities, the installation of bicycle corrals is driven by requests from adjacent businesses and is not a city-driven initiative. In other areas, the city provides corrals and business associations take responsibility for maintenance.

ADDITIONAL REFERENCES AND GUIDELINES

APBP Bicycle Parking Guide 2nd Edition, 2010.

SECURE PARKING AREAS (SPA)

DESCRIPTION

A Secure Parking Area for bicycles, also known as a Bike SPA or Bike & Ride (when located at transit stations), is a semi-enclosed space that offers a higher level of security than ordinary bike racks. Accessible via key-card, combination locks, or keys, Bike SPAs provide high-capacity parking for 10 to 100 or more bicycles. Increased security measures create an additional transportation option for those whose biggest concern is theft and vulnerability.

GUIDANCE

Key features may include:

- Closed-circuit television monitoring
- Double high racks and cargo bike spaces
- Bike repair station with bench
- Maintenance item vending machine
- Bike lock “hitching post” – allows people to leave bike locks
- Secure access for users

DISCUSSION

Long-term parking facilities are more expensive to provide than short-term facilities, but are also significantly more secure. Although many bicycle commuters would be willing to pay a nominal fee to guarantee the safety of their bicycles, long-term bicycle parking should be free wherever automobile parking is free.

MATERIALS AND MAINTENANCE

Regularly inspect moving part function and enclosures. Change keys and access codes periodically to prevent access by unapproved users.

ADDITIONAL REFERENCES AND GUIDELINES

AASHTO Guide for the Development of Bicycle Facilities, 2012.
APBP Bicycle Parking Guide 2nd Edition, 2010.

BIKE FIX-IT STATIONS

DESCRIPTION

A bike fix-it station is a public work stand complete with tools to perform basic bike repairs and maintenance including fixing a flat to adjusting brakes. While there are several stand designs, they all provide an ergonomic work environment for any rider. The tools are attached to the stand via stainless steel gauge cables to prevent theft. Hanging the bike from the arm hangar allows the pedals and wheels to move freely while making adjustments to the bike.

DISCUSSION

Stations employ universal bike mounting and should be ADA compliant. Common bike tools are tethered to the station by stainless steel cables. The stations' tubing are generally powder coated, galvanized or stainless steel anchored into concrete or another proper base material specified by vendor. Stations can be color customized from a variety of colors available by vendor. Many stations have a QR code with repair instructions should the rider need additional information.

MATERIALS AND MAINTENANCE

Stations are built for outdoor use and sealed from the elements. Some vendors provide a warranty for service and repair should vandalism or mechanical failure occur.

GUIDANCE

Stations are best placed in public areas with a significant amount of bicycle traffic or at popular trailheads.

WALL SETBACKS

- Minimum of 48 inches from side of station to wall or other objects
- Minimum of 12 inches from back of station to wall or other objects

STREET OR TRAIL SETBACK

- Minimum of 60 inches from perpendicular street/trail
- Minimum of 96 inches from parallel street/trail.

BICYCLE ACCESS TO TRANSIT

DESCRIPTION

Safe and easy access to transit stations and secure bicycle parking facilities is necessary to encourage commuters to access transit via bicycle. Bicycling to transit reduces the need to provide expensive and space consuming car parking spaces. Many people who ride to a transit stop will want to bring their bicycle with them on the transit portion of their trip, so buses and other transit vehicles should be equipped accordingly.

For staircases at bus or rail transit stations, bicycle access could be facilitated with bicycle staircase side ramps. These consist of narrow channels just wide enough to accommodate typical bicycle tires, installed below the handrails of staircases. Cyclists place their bicycle tires onto the side ramps and walk them up or down the stairs, so the bicycles roll within the channels.

DISCUSSION

Providing bicycle routes to transit helps combine the long-distance coverage of bus and rail travel with the door-to-door service of bicycle riding. Transit use can overcome large obstacles to bicycling, including distance, hills, riding on busy streets, night riding, inclement weather and breakdowns.

GUIDANCE

WAYFINDING

- Provide direct and convenient access to transit stations and stops from bicycle and pedestrian networks.
- Provide maps, wayfinding signage and pavement markings from bicycle network to transit stations.

BICYCLE PARKING

- Route from bicycle parking locations to station/stop platforms should be well-lit and visible.
- Signing should note bicycle parking location, rules for use and instructions, as needed.
- Provide safe and secure long-term parking such as bicycle lockers at transit hubs. Parking should be easy to use and well maintained.

MATERIALS AND MAINTENANCE

Regularly inspect the functioning of long-term parking moving parts and enclosures.

ADDITIONAL REFERENCES AND GUIDELINES

APBP Bicycle Parking Guide 2nd Edition, 2010.
FHWA University Course on Bicycle and Pedestrian Transportation.
Lesson 18: Bicycle and Pedestrian Connections to Transit, 2006.

BIKEWAY FACILITY MAINTENANCE

Regular bicycle facility maintenance includes sweeping, maintaining a smooth roadway, ensuring that the gutter-to-pavement transition remains relatively flat and installing bicycle-friendly drainage grates. Pavement overlays are a good opportunity to improve bicycle facilities. The following recommendations provide a menu of options to consider enhancing a maintenance regimen.

SWEEPING

DESCRIPTION

Bicyclists often avoid shoulders and bike lanes filled with gravel, broken glass and other debris; they will ride in the roadway to avoid these hazards, potentially causing conflicts with drivers. Debris from the roadway should not be swept onto sidewalks (pedestrians need a clean walking surface), nor should debris be swept from the sidewalk onto the roadway. A regularly scheduled inspection and maintenance program helps ensure that roadway debris is regularly picked up or swept.

GUTTER TO PAVEMENT TRANSITION

DESCRIPTION

On streets with concrete curbs and gutters, 1 to 2 feet of the curbside area is typically devoted to the gutter pan, where water collects and drains into catch basins. On many streets, bikeway is situated near the transition between gutter pan and pavement edge. This transition can be susceptible to erosion, creating potholes and a rough surface for travel. These areas can also be prone to standing water during and after rains.

GUIDANCE

Establish a seasonal sweeping schedule that prioritizes roadways with major bicycle routes.

- Sweep walkways and bikeways whenever there is an accumulation of debris on the facility.
- In curbed sections, sweepers should pick up debris; on open shoulders, debris can be swept onto gravel shoulders.
- Pave gravel driveway approaches to minimize loose gravel on paved roadway shoulders.
- Perform additional sweeping in the Spring to remove debris from the Winter.
- Perform additional sweeping in the Fall in areas where leaves accumulate.

Note: Some separated bike facilities (cycle tracks) that employ curbs or other physical barriers for separation may be too narrow for a standard street sweeper, which requires 10 foot clearance. If this is the case, smaller sweepers are available.

GUIDANCE

- Ensure that gutter-to-pavement transitions have no more than a ¼" inch vertical difference.
- Examine pavement transitions during every roadway project for new construction, maintenance activities and construction project activities that occur in streets.
- Inspect the pavement two to four months after trenching construction activities are completed to ensure that excessive settlement has not occurred.
- Provide at least three feet of pavement outside of the gutter seams.
- When adding new bike facilities such as separated lanes, roundabouts and traffic circles, check for potential drainage issues. Installing bioswales to capture runoff and avoid standing water in bike lanes is becoming a standard part of building bike facilities in bike-friendly communities.

ROADWAY SURFACE

DESCRIPTION

Bicycles are much more sensitive to changes in roadway surface than motor vehicles. Various materials are used to pave roadways and some are smoother than others. Uneven settlement after trenching can affect roadway surface nearest the curb where bicycles travel. If compaction is not achieved to a satisfactory level, uneven pavement surface can result due to settling. When resurfacing streets, use the smallest chip size and ensure that the surface is as smooth as possible for bicyclist safety and comfort.

GUIDANCE

- Maintain a smooth pothole-free surface.
- Ensure that on new roadway construction, the finished surface on bikeways does not vary more than $\frac{1}{4}$ inch.
- Maintain pavement so ridge buildup does not occur at the gutter-to-pavement transition or adjacent to railway crossings.
- Inspect the pavement two to four months after trenching construction activities are completed to ensure that excessive settlement has not occurred.
- If chip sealing is to be performed, use the smallest possible chip on bike lanes and shoulders. Sweep loose chips regularly following application.
- During chip seal maintenance projects, if bike lane pavement condition is satisfactory, it may be appropriate to chip seal the travel lanes only. However, use caution when doing so as not to create an unacceptable ridge between the bike lane and travel lane.

DRAINAGE GRATES

DESCRIPTION

Drainage grates are typically located in the gutter area near the curb of a roadway. Drainage grates typically have slots through which water drains into the municipal storm sewer system. Some older grates were designed with linear parallel bars spread wide enough for a tire to become caught so that if a bicyclist were to ride on them, the front tire could become caught in the slot, causing the bicyclist to go over the handlebars and sustain potentially serious injuries.

GUIDANCE

Require all new drainage grates be bicycle-friendly, including grates with horizontal slats to prevent bicycle and assistive device tires from falling through.

- Create a program to inventory all existing drainage grates and replace hazardous grates as necessary – temporary modifications such as installing re-bar horizontally across the grate should not be an acceptable alternative to replacement.

BIKEWAY MAINTENANCE AND OPERATIONS

DESCRIPTION

Motor vehicle traffic tends to “sweep” debris like litter and broken glass toward the roadways edges where it can accumulate in bicycle lanes. Maneuvering to avoid such hazards can cause a cyclist to fall. In this way, proper maintenance directly affects safety and street sweeping must be a priority on roadways with bicycle facilities, especially in curb lanes and along curbs themselves. Law enforcement can assist by requiring towing companies to fully clean up crash sites to prevent glass and debris from being left in place or simply swept to the curb or shoulder after collisions.

When any roadwork repairs are done by the city or other agencies, the roadway must be restored to satisfactory quality with particular attention to surface smoothness suitable for cycling. Striping must be restored to the prior markings, or new markings if called in for a project. Bicycle facilities also sometimes seem to “disappear” after roadway construction occurs. This can happen incrementally as paving repairs are made over time and are not promptly followed by proper re-striping. When combined with poor surface reconstruction following long periods of no service due to road work, bikeway facilities can be “lost”, which can discourage cycling in general. Construction projects that require the demolition and rebuilding of adjacent roadways can cause problems maintaining and restoring bikeway function.

Construction activities controlled through permits, such as driveway, drainage and utility work can have an important effect on roadway surface quality where cyclists operate in the form of mismatched pavement heights, rough surfaces or longitudinal gaps in adjoining pavements, or other pavement irregularities. Permit conditions should ensure that pavement foundation and surface treatments are restored to their pre-construction conditions, that no vertical irregularities will result and that no longitudinal cracks will develop. Strict specifications, standards and inspections designed to prevent these problems should be developed. A five year bond should be held to assure correction of any deterioration that might occur as a result of faulty reconstruction of the roadway surface.

Bicycle facilities should be swept regularly, at least twice a month and preferably more often for heavily traveled routes. Also, adjacent shrubs and trees should be kept trimmed back to prevent encroachment into the pathway or obstructing cyclists’ views.

GUIDANCE FOR COLORED PAVEMENTS:

WATERBORNE PAINTS

Over the past 10 years, transportation agencies in the United States have gradually replaced conventional solvent paints with waterborne paints that have low volatile organic compounds (VOC) and other newer pavement marking materials. Waterborne traffic paints are the most widely used and least expensive pavement marking material available. Glass beads are either pre-mixed into the paint or dropped onto the waterborne paint to provide retro-reflectivity. Waterborne paints generally provide equal performance on asphalt and concrete pavements, but have the shortest service life of all pavement marking materials. This paint type tends to wear off rapidly and lose retro-reflectivity quickly after being exposed to factors such as high traffic volumes. Although still a widely used material, waterborne paint is also used as an interim marking material until they can apply something more durable.

REGULAR SOLVENT PAINT

This type of paint can be used universally for any pavement needing paint and is the least expensive. Additives such as reflective glass beads for reflectivity and sand for skid resistance are widely used to mark road surfaces. This is typically considered a non-durable pavement marking and is easily worn by vehicle tires and often requires annual re-application.

DURABLE LIQUID PAVEMENT MARKINGS

Durable liquid pavement markings (DLPM) include epoxy and methyl methacrylate (MMA). Epoxy paint has traditionally been viewed as a marking material that provides exceptional adhesion to both asphalt and concrete pavements when the pavement surface is properly cleaned before application. The strong bond that forms between epoxy paints and both asphalt and concrete pavement surfaces results in the material being highly durable when applied on both pavement surfaces. These markings are highly durable and can be sprayed or extruded but generally require long no-track times.

THERMOPLASTICS

Thermoplastics are a durable pavement marking material composed of glass beads, pigments, binders (plastics and resins) and fillers. There are two types of thermoplastics: hydrocarbon and alkyd. Hydrocarbon thermoplastics are made from petroleum-derived resins; and alkyd thermoplastics are made from wood-derived resins. One of the added advantages of using thermoplastic is that the material can be re-applied over older thermoplastic markings, thereby refurbishing the older marking as well as saving on the costs of removing old pavement markings. Although thermoplastic materials usually perform very well on all types of asphalt surfaces, there have been mixed results when they have been applied on concrete pavements.

USE OF GREEN PAINT

A significant recent change is the FHWA's interim approval for the use of green colored pavement within bicycle lanes in mixing or transition zones, such as at intersections and in other potential conflict zones where motor vehicles may cross a bicycle lane. They are intended to warn drivers to watch for and to yield to cyclists when they encounter them within the painted area. FHWA studies have also shown that green bicycle lanes improve cyclist positioning as they travel across intersections and other conflict areas. Jurisdictions must notify Caltrans before proceeding with green bicycle lane projects because the agency is required to maintain an inventory, but since Caltrans has requested to participate in this interim approval, the process has been streamlined because FHWA experimental treatment protocol is no longer required.

PRODUCT LIFE ESTIMATES FOR PAINT

- 9-36 months
- Inexpensive
- Quick-drying
- Longer life on low-volume roads
- Easy clean-up and disposal
- Short life on high-volume roads
- Subject to damage from sand/abrasives
- Pavement must be warm or will not adhere

DURABLE LIQUIDS FOR PAVEMENT

MARKINGS:

Epoxy

- 4 years
- Longer life on low-volume roads
- More retro-reflective
- Slow drying
- Requires coning and/or flagging during application
- Heavy bead application-may need to be cleaned off of roadway
- High initial cost
- Subject to damage from sand/abrasives

THERMOPLASTIC

- 3-6 years
- Long life on low-volume roads
- Retro-reflective
- No beads needed
- Any temperature for application
- Recommended use for symbols and spot treatments
- Subject to damage from sand/abrasives
- Cost prohibited if used for large scale applications
- Shown to wear quickly in conflicts areas
- Life of pavement marking will depend on traffic volume, road condition and application time of year

ON-STREET BIKEWAY SIGNING

The following signage system guidelines specifically address on-street bicycle routes. Such signage is regulated by the Manual of Uniform Traffic Control Devices (MUTCD), which establishes national standards for traffic signs and related traffic control devices. This ensures MUTCD-compliant signs are familiar to all roadway users.

The MUTCD should therefore govern sign design and placement technical aspects, such as dimensions, font size and ground clearance. Its guidance is intended to improve cyclists' experience and to help encourage people to ride more frequently, or to begin riding.

The ability to navigate through a city's streets is informed by landmarks, natural features and other visual cues. Signs throughout the system should indicate:

- Travel direction
- Destinations locations
- Travel time/distance to those destinations

These signs will increase users' comfort and bikeway system accessibility.

Signage can serve both wayfinding and safety purposes including:

- Helping to familiarize users with the bicycle network
- Helping users identify the best routes to destinations
- Helping to address misconceptions about time and distance
- Helping overcome a "barrier to entry" for people who are not frequent bicyclists (e.g., "interested but concerned" bicyclists)

A community-wide bicycle wayfinding signage plan identifies:

- Sign locations
- Sign types – what information should be included and design features
- Destinations to be highlighted on each sign – key destinations for bicyclists
- May include approximate distance and travel time to each destination bicycle wayfinding signs also visually cue drivers that they are driving along a bicycle route and should use caution.
- Sign placement such as at key locations leading to and along bicycle routes, including intersection of multiple routes.

Too many road signs tend to clutter the right-of-way and it is recommended that these signs be posted at a level most visible to bicyclists rather than per vehicle signage standards.

On-Street Bikeway Signage

ON-STREET BIKEWAY SIGN TYPES

DESCRIPTION

A on-street bicycle wayfinding system consists of comprehensive signing and/or pavement markings to guide bicyclists to their destinations along preferred bicycle routes. There are three general on-street bikeway wayfinding sign types:

CONFIRMATION

- Indicate to bicyclists that they are on a designated bikeway.
- Make drivers aware of the bicycle route.
- May include destinations and distance/ time, but not arrows.

DECISION

- Mark junctions of two or more bikeways.
- Inform bicyclists of the designated bike route to access key destinations.
- Destinations and arrows are required, distances are optional, but recommended.
- Travel time is nonstandard, but recommended.

TURN

- Indicate where a bikeway turns from one street onto another street. Can include pavement markings.
- Include destinations and arrows.

DISCUSSION

There is no standard color for bicycle wayfinding signage. Section 1A.12 of the MUTCD establishes the general meaning for signage colors. Green is the color used for directional guidance and is the most common color of bicycle wayfinding signage in the US, including those in the MUTCD.

MATERIALS AND MAINTENANCE

Maintenance needs for bicycle wayfinding signs are similar to other signs and will need periodic replacement due to wear and fading, to which south-facing signs are especially prone.

Confirmation Sign

Decision Sign

Turn Sign

ON-STREET BIKEWAY SIGN PLACEMENT

GUIDANCE

Signs are typically placed at decision points along bicycle routes – typically at the intersection of two or more bikeways and at other key locations leading to and along bicycle routes.

DECISIONS SIGNS

- Near-side of intersections in advance of junction with another bicycle route.
- Along route to indicate nearby destination.

CONFIRMATION SIGNS

- Every two or three blocks along on-street bicycle facilities, unless another sign type is used (e.g., within 150 feet of a turn or decision sign).
- Should be placed soon after turns to confirm destination(s). Pavement markings can also be used for confirmation that a bicyclist is on a preferred route.

TURN SIGNS

- Near-side of intersections where bike routes turn (e.g., where the street ceases to be a bicycle route or does not go through). Pavement markings can also indicate the need to turn to the bicyclist.

DISCUSSION

A list of destinations on signs should be based on their relative distance to users from a particular sign's location. A particular destination's ranking in the hierarchy can be used to infer the physical distance from which the location is signed.

MATERIALS AND MAINTENANCE

Maintenance needs for bicycle wayfinding signs are similar to other signs and will need periodic replacement due to wear.

APPENDIX B: PROJECT PRIORITIZATION

OVERVIEW

The purpose of project prioritization is to determine which projects will provide the most benefit from among the list of projects defined within a master plan, and should therefore be expedited for implementation. Prioritizing projects is also a requirement of the State of California's bicycle master planning enabling legislation, Streets and Highways Code (SHC) Section 891.2, Items a-k. Bicycle master plans must be approved by Caltrans for the municipality to be eligible for future Bicycle Transportation Account (BTA) funding. Item j is written as follows:

A description of the projects proposed in the plan and a listing of their priorities of implementation.

Directly associated with this, it is becoming common for grant funding programs to require an explanation of a municipality's prioritization methodology as part of grant scoring inputs. This is intended to help verify that the municipality carefully considered and can therefore justify the specific project's priority relative to the rest of the municipality's projects listed in its bicycle master plan.

An important example is the State of California's recently developed Active Transportation Plan (ATP) Grant Program, which has the potential to be a significant source of future funding for the types of projects listed in this master plan. Item n of ATP Guidelines is worded very similarly to the SHC Section 891.2's Item j, but takes the prioritization requirement a substantial step further by requiring the applicant to not just list the projects by prioritization, but to describe the prioritization methodology:

A description of the projects and programs proposed in the plan and a listing of their priorities of implementation, including the methodology for prioritization and a proposed timeline for implementation.

METHODOLOGY

Project prioritization is primarily a data-driven process underpinned as much as possible by objective information. It is therefore subject to the availability of suitable data, supplemented with other information sources where applicable. Initial prioritization model results are generally ported to carefully designed spreadsheets where they are combined and evaluated with other available data types to yield the best results for a specific location and project type.

No matter what criteria are employed, the initial prioritization model run's results are evaluated to determine which criteria should continue to be employed in subsequent refinement. This is because analyzing the initial run often reveals that certain criteria did not help to differentiate between alternatives. Eliminating them streamlines the analysis process.

Once the criteria have been selected, they are differentially weighted relative to each other, primarily to take advantage of expert knowledge to help address specific local issues, conditions and values. For example, City of Eastvale staff felt that public input requesting specific facilities should be given high priority. In addition, the City agreed with a strong public preference that a facility's proximity to schools should also be given higher consideration and relative weighting compared to other criteria.

The following appendix section describes the six criteria determined to be most useful to prioritize recommended projects in Eastvale, with each one's normalized (rounded) score and its cumulative percent effect on the total of all six per facility.

Future facility ranking and implementation should be fine-tuned and adjusted accordingly based on any changing circumstances. Prioritized projects can be re-ranked within the State's mandated five year bicycle master plan update cycle, or at whatever interval best fits future funding cycles. Prioritization updates could be scheduled to take into consideration the availability of new information, new funding sources, updated crash statistics, updated CIP lists, etc.

GAP CLOSURE

This criterion addressed potential bicycle connectivity improvements by evaluating each recommended facility's overall contribution to system completeness.

- Closes gap in an existing bicycle facility = 3
- Upgrades facility to higher classification (ex. Class 3 bike route to Class bike lane) = 2
- New facility connecting existing and proposed bicycle facilities = 1

Normalized score: 1.0 of 6 points (17 percent of total)

REPORTED COLLISIONS

This criterion addressed safety through five years of collision data, normalized by collisions per mile of recommended facility. Compared to automobile collisions, the lower number of bike crashes and lack of robust, long term exposure data (i.e. number of bicyclists using each corridor) means that this dataset is not as statistically sound. However, it is still commonly reported and easily understood. Dataset was derived from the California Highway Patrol's Statewide Integrated Traffic Records System (SWITRS). This criteria uses collisions per mile and gives points to recommended facilities that have high collision rates along their segments.

Normalized score: 1.0 of 6 points (17 percent of total)

ECONOMIC EFFICIENCY

Economic efficiency measured the financial benefits associated with a corridor, normalized by the number of anticipated users (in turn a product of the facility type and length), and divided by the rough order construction cost estimates.

Using National Cooperative Highway Research Program (NCHRP) Report 552 methods, 1/4, 1/2 and one mile buffers were drawn around each corridor to obtain American Community Survey (ACS) population and journey to work mode share data. An extrapolation of all bicycle trips was made and estimates of potential ridership developed, based on multi-use path or bicycle lane attractiveness functions as defined by the NCHRP research. Using the existing and estimated ridership, annual mobility, health, recreation and reduced auto use, cost saving benefits were calculated. Economic efficiency is further explained through sample projects in Appendix C.

Normalized score: 0.25 of 6 points (4 percent of total)

REQUIRED VS. EXISTING WIDTH CONSTRAINTS

This criterion looked at the common constraint of existing right-of-ways for adding bicycle facilities, particularly for on-street bicycle lanes and cycle tracks. However, any recommendations that included adjacent shared-use off-street paths would also be affected.

- 0 feet needed = 4
- 1-4 feet needed = 3
- 5-9 feet needed = 2
- 10+ feet needed = 1

Normalized score: 0.5 of 6 points (8 percent of total)

PROXIMITY TO SCHOOLS

This criterion addressed the distance from schools for each recommended facility and was given the highest weighting based on strong community preference.

Normalized score: 1.75 of 6 points (29 percent of total)

PUBLIC OUTREACH INPUT

Public outreach conducted for this plan consisted of three public workshops and an online survey available throughout the course of the project. The survey was filled out by almost 500 respondents. In both the survey and at the public meetings, City staff and residents were asked to identify the projects they felt were most important by facility type. Like the previous criterion, this one was highly weighted based City on guidance.

- >6 points = 3
- 3-6 points = 2
- <3 points = 1

Normalized score: 1.5 of 6 points (25 percent of total)

APPENDIX C: BENEFIT-COST ANALYSIS

To illustrate the benefit-cost relationship, three sample projects representing high, moderate and low benefit-cost ratios are shown below. These are real projects selected from the 30 projects recommended by this plan (See "Table 9-2: Inputs - Benefit-Cost Analysis" on page A-70 for benefit-cost information for all projects). The high "benefit to cost" project (Sample Project 1) is a bike boulevard along Blossom Way; the moderate "benefit to cost" project (Sample Project 2) is a protected bike lane on Citrus Street; and the low "benefit to cost" project (Sample Project 3) is a multi-use path along the Cucamonga River/Flood Control Path.

While these benefit-cost ratios do provide some information about projects – and a means of comparison – it is important to note that they are relatively insensitive to facility type. On other words, they do not distinguish between facilities types other than multi-use paths (e.g. bike routes vs. protected bike lanes). For this reason, benefit-cost ratios have only a minor influence on overall project ranking, with reported collisions, proximity to schools and community input playing much larger roles.

*"Benefit" is a combination of several financial benefits associated with the given projects: mobility benefits, health benefits, recreation benefits and reduced automobile use.

TABLE 9-2: INPUTS - BENEFIT-COST ANALYSIS

| Project Number (Rank) | Total Population (Quarter Mile) | Total Population (Half Mile) | Total Population (One Mile) | Adult Population, 18+ (Quarter Mile) | Adult Population, 18+ (Half Mile) | Adult Population, 18+ (One Mile) | Workers 16+ (Quarter Mile) | Workers 16+ (Half Mile) | Workers 16+ (One Mile) | Bike Commuters (Quarter Mile) | Bike Commuters (Half Mile) | Bike Commuters (One Mile) | Combined Benefit* | Total Length of Existing Class 1 Facilities in Project (mi) | Total Length of Project (mi) | Estimated cost of project | Benefit Cost Ratio (BCR) |
|-----------------------|---------------------------------|------------------------------|-----------------------------|--------------------------------------|-----------------------------------|----------------------------------|----------------------------|-------------------------|------------------------|-------------------------------|----------------------------|---------------------------|-------------------|---|------------------------------|---------------------------|--------------------------|

* Combined benefit is a combination of several financial benefits associated with the given projects: mobility benefits, health benefits, recreation benefits and reduced automobile use. Combined benefits also uses a time series to account for forecasted benefits.

APPENDIX D: APPLICABLE LEGISLATION

OVERVIEW

Several pieces of legislation support increased cycling in the State of California. Much of the legislation concerns greenhouse gas (GHG) reduction and employs cycling as a means to achieve GHG reduction targets. Other legislation highlights the intrinsic worth of cycling and treats the safe and convenient accommodation of cyclists as a matter of equity. The most relevant legislative acts for bicycle policy, planning, infrastructure and programs are discussed below.

STATE LEGISLATION AND POLICIES

AB-32 Global Warming Solutions Act

This bill specifies greenhouse gas emissions reduction and codifies the 2020 emissions reduction goal. This act also directs the California Air Resources Board to develop specific early actions to reduce greenhouse gases while also preparing a scoping plan to identify how best to reach the 2020 limit.

AB-902 Diversion Programs

This bill was signed in September 2015 and sponsored by the California Bicycle Coalition. It allows local jurisdictions to create diversion programs that allow ticketed cyclists to have their tickets removed from their records if they successfully complete a bicycle training course. This type of program has been available for children for some time, but this legislation expands availability to adults. It also offers all cyclists, ticketed or not, more opportunities to learn the rules of the road and safe bicycle handling skills.

AB-1096 Redefine Electric Bikes

The bill was passed by the California Senate in September 2015 and awaiting the Governor's signature. It would replace California's existing vehicle law that does not allow motorized bicycles on non-motorized paths. The updated law splits e-bikes from other motorized bikes and divide them into three categories:

- Class I: pedal-assisted electric bike with a top assisted speed of 20mph
- Class II: pedal-assisted or propelled unassisted with a top motor-driven speed of 20mph
- Class III: pedal-assisted electric bike with a top assisted speed of 28mph

Of those three categories, the first two will now be allowed on any infrastructure where conventional bicycles are allowed, but the bill also provides local authorities the specific ability to limit or prohibit those uses. Class III electric bikes or any bikes with a non-electric motor would not be allowed on off-street paths, but could still be used on on-street bike lanes. The changes apply to the state's vehicle code and would not affect open space trails or public lands access rules.

AB-1193 Bikeways

This act amends various code sections, all relating to bikeways in general, specifically by recognizing a fourth class of bicycle facility, cycle tracks. However, the following may be even more significant to future bikeway development: Existing law requires Caltrans, in cooperation with county and city governments, to establish minimum safety design criteria for the planning and construction of bikeways, and requires the department to establish uniform specifications and symbols regarding bicycle travel and traffic related matters. Existing law also requires all city, county, regional and other local agencies responsible for the development or operation of bikeways or roadways to utilize all of those minimum safety design criteria and uniform specifications and symbols. This bill revises these provisions and required Caltrans to establish minimum safety design criteria for each type of bikeway and also authorizes local agencies to utilize different minimum safety criteria if adopted by resolution at a public meeting.

AB-1358 Complete Streets Act

This bill requires the legislative body of a city or county, upon revision of the circulation element of their general plan, to identify how the jurisdiction will provide for the routine accommodation of all users of the roadway including motorists, pedestrians, cyclists, individuals with disabilities, seniors and users of public transportation. The bill also directs the OPR to amend guidelines for the development of general plan circulation elements so that the building and operation of local transportation facilities safely and conveniently accommodate everyone, regardless of their mode of travel.

AB-1371 Passing Distance/3 Feet for Safety Act

This statute, widely referred to as the “3 Foot Passing Law,” requires drivers to provide at least three feet of clearance when overtaking cyclists. If traffic or roadway conditions prevent drivers from giving cyclists three feet of clearance, they must “slow to a speed that is reasonable and prudent” and wait until they reach a point where passing can occur without endangering the cyclist. Violations are punishable by a \$35 base fine, but drivers who collide with cyclists and injure them in violation of the law are subject to a \$220 fine.

AB-1581 Bicycle and Motorcycle Traffic Signal Actuation

This bill defines a traffic control device as a traffic-actuated signal that displays one or more of its indications in response to the presence of traffic detected by mechanical, visual, electrical or other means. Upon the first placement or replacement of a traffic-actuated signal, the signal would have to be installed and maintained, to the extent feasible and in conformance with professional engineering practices, so as to detect lawful bicycle or motorcycle traffic on the roadway. Caltrans has adopted standards for implementing the legislation.

SB-375 Redesigning Communities to Reduce Greenhouse Gases

This bill seeks to reduce vehicle miles traveled through land use and planning incentives. Key provisions require the larger regional transportation planning agencies to develop more sophisticated transportation planning models, and to use them for the purpose of creating “preferred growth scenarios” in their regional plans that limit greenhouse gas emissions. The bill also provides incentives for local governments to incorporate these preferred growth scenarios into the transportation elements of their general land use plans.

SB-743 CEQA Reform

Just as important as the pieces of legislation described in this section that support increases in cycling infrastructure and accommodation, is one that promises to remove a longstanding roadblock to cycling infrastructure and accommodation. That roadblock is vehicular Level of Service (LOS) and the legislation with the potential to remove it is SB-743. For decades, vehicular congestion has been interpreted as an environmental impact and has often stymied bicycle projects. Projections of degraded Level of Service have, at a minimum, driven up project costs and, at a maximum, precluded projects altogether.

SB-743 could completely remove LOS as a measure of car traffic congestion that must be used to analyze environmental impacts under the California Environmental Quality Act (CEQA). This is extremely important because adequately accommodating cyclists, particularly in built-out environments, often requires reallocation of right-of-way and the potential for increased vehicular congestion. The reframing of Level of Service as a matter of motorist inconvenience, rather than an environmental impact, will allow planners to assess the true impacts of transportation projects and will help support cycling projects that improve mobility for all roadway users.

According to the Association of Environmental Professionals 2014 CEQA Guidelines 229, a project involving only feasibility or planning studies for possible future actions that an agency has not approved, adopted or funded, does not require an EIR or Negative Declaration, but does require consideration of environmental factors. This has been supported by numerous cities and counties, as well as State agencies. Planning projects such as this bicycle master plan are therefore exempt from CEQA analysis since they are comprised of planning and conceptual recommendations. However, as individual recommendations move forward through design and implementation, the City will need to determine if there are impacts associated with them for which environmental review may be necessary.

Caltrans' Deputy Directive 64-R1

Deputy Directive 64-R1 is a policy statement affecting Caltrans mobility planning and projects requiring the agency to: "...provide for the needs of travelers of all ages and abilities in all planning, programming, design, construction, operations, and maintenance activities and products on the State highway system. The Department views all transportation improvements as opportunities to improve safety, access, and mobility for all travelers in California and recognizes bicycle, pedestrian, and transit modes as integral elements of the transportation system." The directive goes on to mention the environmental, health and economic benefits of more Complete Streets.

FEDERAL LEGISLATIONSafe Streets Act (S-2004/HR-2468)

HR2468 encourages safer streets through policy adoption at the state and regional levels, mirroring an approach already being used in many local jurisdictions, regional agencies and states governments. The bill calls upon all states and metropolitan planning organizations (MPOs) to adopt Safe Streets policies for federally funded construction and roadway improvement projects within two years. Federal legislation will ensure consistency and flexibility in road-building processes and standards at all levels of governance.

APPENDIX E: BTA REVIEWER CHECKLIST

For reviewer convenience, California Streets and Highways Code Section 891.2, items a-k code text and associated document sections and/or responses are listed below.

(a) The estimated number of existing bicycle commuters in the plan area and the estimated increase in the number of bicycle commuters resulting from implementation of the plan.

Current estimate of bicycle commuters is 662 using industry standard calculation methods. Expected increase as a result of this plan was based on other jurisdictions' experience with bikeway system development. This also addresses forecasted future employment increase of seven percent to 18,305, yielding 1,274 commuting cyclists, or 612 additional cyclists, a 92 percent increase resulting from implementation of this plan. This includes students and transit users.

This document recommends establishing a cycling activity baseline using annual count locations.

(b) A map and description of existing and proposed land use and settlement patterns which shall include, but not be limited to, locations of residential neighborhoods, schools, shopping centers, public buildings and major employment centers.

See Chapter 2 maps and tables.

(c) A map and description of existing and proposed bikeways.

See Chapter 4 maps and tables.

(d) A map and description of existing and proposed end-of-trip bicycle parking facilities. These shall include, but not be limited to, parking at schools, shopping centers, public buildings and major employment centers.

See Chapter 4 maps and tables.

(e) A map and description of existing and proposed bicycle transport and parking facilities for connections with and use of other transportation modes. These shall include, but not be limited to, parking facilities at transit stops, rail and transit terminals, ferry docks and landings, park and ride lots, and provisions for transporting cyclists and bicycles on transit or rail vehicles of ferry vessels.

See Chapter 2 maps and tables.

(f) A map and description of existing and proposed facilities for changing and storing clothes and equipment. These shall include, but not be limited to, locker, restroom and shower facilities near bicycle parking facilities.

See Chapters 2 and 4 maps and tables.

(g) A description of bicycle safety and education programs conducted in the area included in the plan, efforts by the law enforcement agency having primary traffic law enforcement responsibility in the area to enforce provisions of the Vehicle Code pertaining to bicycle operation, and the resulting effect on accidents involving cyclists.

The Eastvale Police Department, in conjunction with the Public Works Department and Corona-Norco Unified School District, provides parents and students with safety pamphlets that specifically address safe driving practices. In addition to the training brochures, police traffic team and School Resource Officers conduct traffic enforcement in school zones before and after school. Many violations are related to bicyclist and/or helmet violations. The City also posts driving safety tips on its website. Eastvale Police Department also pass out free “slurpee” coupons to students wearing bicycle helmets and cite those who are not.

Bike Month is promoted by the regional bicycle advocacy organization, Inland Empire Bike Alliance.

(h) A description of the extent of citizen and community involvement in development of the plan including, but not be limited to, letters of support.

See Appendix C, Community Input Summary.

(i) A description of how the bicycle transportation plan has been coordinated and is consistent with the local or regional transportation, air quality or energy conservation plans, including, but not be limited to, programs that provide incentives for bicycle commuting.

Encouraging bicycle commuting is addressed throughout the document, particularly Chapter 5: Recommended Programs and Policies.

(j) A description of the projects proposed in the plan and a listing of their priorities of implementation. See Chapter 4 maps, tables and recommendations text.

(k) A description of past expenditures for bicycle facilities and future financial needs for projects that improve safety and convenience for bicycle commuters in the plan area.

The City of Eastvale was only incorporated in 2010. This master plan is its inaugural bicycle planning effort and intended to be a comprehensive blueprint for future system development.

PUBLIC UTILITIES COMMISSION

505 VAN NESS AVENUE
SAN FRANCISCO, CA 94102-3298

To: State Clearinghouse, Responsible and Trustee Agencies, Property Owners, and Interested Parties

From: Jensen Uchida, Environmental Project Manager

Subject: NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT AND SCOPING MEETING: Riverside Transmission Reliability Project (A.15-04-013)

Date: January 25, 2017

Introduction

Southern California Edison (SCE) filed an application (A.15-04-013) on April 15, 2015 with the California Public Utilities Commission (CPUC) for a Certificate of Public Convenience and Necessity (CPCN) to construct and operate the 230-kV transmission line and 230-kV substation components of the Riverside Transmission Reliability Project (RTRP). The RTRP would provide energy to the Riverside Public Utilities (RPU) local electrical distribution system. The City of Riverside prepared an Environmental Impact Report (EIR) (State Clearinghouse No. 2007011113) for the RTRP in 2013, including SCE's proposed 230-kV transmission line and substation. The City of Riverside certified the RTRP EIR on February 5, 2013.

After the City of Riverside's decision to certify the EIR and approve the project, the City of Jurupa Valley approved residential and commercial developments within the RTRP alignment studied in the RTRP EIR. These developments are in various stages of construction. The new developments prompted SCE and several developers to enter into discussions seeking to resolve specific areas of conflict along the RTRP alignment. In September 2016, SCE reached a settlement agreement with Lennar of California, Inc. (Lennar) and Vernola Trust (Vernola) that includes modifications to the SCE proposed 230-kV transmission line to avoid conflicts with the Lennar Riverbend Community and Vernola Marketplace Apartment Community developments. These changes to the project were not considered in the EIR that was certified by the City of Riverside.

The CPUC, as the next-in-line permitting agency, has determined that a Subsequent EIR is necessary under CEQA (CEQA Guidelines Section 15162) to analyze potential impacts that may result from SCE's proposed changes in the RTRP location and design. The RTRP EIR is adequate to address the SCE elements of the RTRP that have not changed from those analyzed in the 2013 EIR.

This Notice of Preparation (NOP) is being sent to interested agencies and members of the public to inform the recipients that the CPUC is beginning preparation of a Subsequent EIR for the RTRP and to request comments from the public regarding the scope and content of the environmental document. This notice includes a description of the changes to the RTRP, a summary of environmental impacts, and information on how to provide comments to the CPUC.

PUBLIC UTILITIES CODE - PUC

DIVISION 9. AVIATION [21001 - 24451]

(Division 9 added by Stats. 1953, Ch. 151.)

PART 1. STATE AERONAUTICS ACT [21001 - 21707]

(Heading of Part 1 amended by Stats. 1961, Ch. 2071.)

CHAPTER 4. Airports and Air Navigation Facilities [21601 - 21690.29]

(Chapter 4 added by Stats. 1953, Ch. 151.)

ARTICLE 3.5. Airport Land Use Commission [21670 - 21679.5]

(Article 3.5 added by Stats. 1967, Ch. 852.)

21676.

(a) Each local agency whose general plan includes areas covered by an airport land use compatibility plan shall, by July 1, 1983, submit a copy of its plan or specific plans to the airport land use commission. The commission shall determine by August 31, 1983, whether the plan or plans are consistent or inconsistent with the airport land use compatibility plan. If the plan or plans are inconsistent with the airport land use compatibility plan, the local agency shall be notified and that local agency shall have another hearing to reconsider its airport land use compatibility plans. The local agency may propose to overrule the commission after the hearing by a two-thirds vote of its governing body if it makes specific findings that the proposed action is consistent with the purposes of this article stated in Section 21670. At least 45 days prior to the decision to overrule the commission, the local agency governing body shall provide the commission and the division a copy of the proposed decision and findings. The commission and the division may provide comments to the local agency governing body within 30 days of receiving the proposed decision and findings. If the commission or the division's comments are not available within this time limit, the local agency governing body may act without them. The comments by the division or the commission are advisory to the local agency governing body. The local agency governing body shall include comments from the commission and the division in the final record of any final decision to overrule the commission, which may only be adopted by a two-thirds vote of the governing body.

(b) Prior to the amendment of a general plan or specific plan, or the adoption or approval of a zoning ordinance or building regulation within the planning boundary established by the airport land use commission pursuant to Section 21675, the local agency shall first refer the proposed action to the commission. If the commission determines that the proposed action is inconsistent with the commission's plan, the referring agency shall be notified. The local agency may, after a public hearing, propose to overrule the commission by a two-thirds vote of its governing body if it makes specific findings that the proposed action is consistent with the purposes of this article stated in Section 21670. At least 45 days prior to the decision to overrule the commission, the local agency governing body shall provide the commission and the division a copy of the proposed decision and findings. The commission and the division may provide comments to the local agency governing body within 30 days of receiving the proposed decision and findings. If the commission or the division's comments are not available within this time limit, the local agency governing body may act without them. The comments by the division or the commission are advisory to the local agency governing body. The local agency governing body shall include comments from the commission and the division in the public record of any final decision to

overrule the commission, which may only be adopted by a two-thirds vote of the governing body.

(c) Each public agency owning any airport within the boundaries of an airport land use compatibility plan shall, prior to modification of its airport master plan, refer any proposed change to the airport land use commission. If the commission determines that the proposed action is inconsistent with the commission's plan, the referring agency shall be notified. The public agency may, after a public hearing, propose to overrule the commission by a two-thirds vote of its governing body if it makes specific findings that the proposed action is consistent with the purposes of this article stated in Section 21670. At least 45 days prior to the decision to overrule the commission, the public agency governing body shall provide the commission and the division a copy of the proposed decision and findings. The commission and the division may provide comments to the public agency governing body within 30 days of receiving the proposed decision and findings. If the commission or the division's comments are not available within this time limit, the public agency governing body may act without them. The comments by the division or the commission are advisory to the public agency governing body. The public agency governing body shall include comments from the commission and the division in the final decision to overrule the commission, which may only be adopted by a two-thirds vote of the governing body.

(d) Each commission determination pursuant to subdivision (b) or (c) shall be made within 60 days from the date of referral of the proposed action. If a commission fails to make the determination within that period, the proposed action shall be deemed consistent with the airport land use compatibility plan.

(Amended by Stats. 2003, Ch. 351, Sec. 3. Effective January 1, 2004.)

Acknowledgements

The Department of Public Social Services (DPSS) Director, Susan von Zabern, and Assistant Director, Lisa Shiner, along with the 2016 Point-In-Time Homeless Count (PIT Count) Planning Team would like to thank all of the individuals and agencies who contributed their time, money, staff, and effort toward this important event. Coordinating the Point-In-Time Homeless Count is a massive undertaking. We would not have been able to conduct this count and survey without the participation of many community-based organizations and agencies. This year's count involved 503 volunteers, which included 33 City Leaders from the community, eight DPSS Staff Site Coordinators, and two DPSS PIT Count Call Center Staff.

We extend our sincerest appreciation to the agencies that allowed their staff to volunteer for the PIT Count:

Thank you to all city leaders for working to increase public awareness about the Riverside County PIT Homeless Count. We express our deep gratitude to the individuals and organizations who donated money, personal care items, and services to the PIT Homeless Count, including, but not limited to:

County of Riverside Department of Public Health
Valley Restart
Anna Hause Elementary School (Beaumont)
Early Act Club & Friday Night Live Kids

Martha's Village & Kitchen
Susan Jeffries
San Geronimo Girl Scout Troop 176

These generous donations contributed to 2,000 incentive bags which included a pair of socks, a bar of soap, a resource card, and either a knit cap or pair of gloves. These incentive bags were given to homeless individuals who completed our survey during the unsheltered street-based and service-based counts on January 26, 2016.

Finally, we would like to thank: Members of the Continuum of Care (CoC) for their insightful comments and feedback regarding the preliminary PIT Count data; The Institute for Urban Initiatives for serving as an ad hoc consultant throughout the PIT Count process; Riverside County Information Technology for their incredible turnaround time generating maps that were distributed to volunteers during the PIT street-based count; and Riverside County DPSS Purchasing Department for quickly processing all PIT Count-related purchase requests.

A special thank you also to Riverside County DPSS, Adult Services Division, Homeless Programs Unit, who worked diligently to plan, coordinate, develop, and implement the 2016 PIT Homeless Count.

Executive Summary

The 2016 Point-In-Time Homeless Count and Survey, conducted on January 26, 2016, identified **1,351 unsheltered** and **814 sheltered** homeless people (**total = 2,165**) in Riverside County, California. **The total Point-In-Time Count decreased by 12% from 2015 to 2016.** Data collected during the count reflects a snapshot of Riverside County's homeless population at one particular point in time.

The total Point-In-Time Homeless Count decreased by 12% from 2015 to 2016.

The 2016 unsheltered count methodology consisted of a street-

The total unsheltered homeless people counted decreased by 15% in 2016 to 1,351.

based count, service-based count, and Riverside University Health System - Behavioral Health homeless outreach count. A total of 503 volunteers were deployed across Riverside County to successfully count and survey the unsheltered homeless population. PIT Count data was deduplicated using an algorithm to generate a unique ID for each individual counted which utilized several fields of information from the survey. This process allowed data analysts to easily identify and eliminate duplicate records using a statistical database program. Compared to the 2015 PIT Count, the number of unsheltered homeless people counted decreased by 15% in 2016 to 1,351.

Among the 1,351 unsheltered individuals counted in 2016, 1,042 were interviewed and 309 were observed.

The sheltered count methodology consisted of data extracted from the Homeless Management Information System (HMIS) to identify sheltered homeless individuals on the night of January 25, 2016. Compared to the 2015 PIT Count, the number of sheltered homeless people decreased by 8% in 2016 to 814. The decrease in the overall unsheltered 2016 Point-in-Time Count reflects a trend countywide that began in 2013. The County of Riverside Department of Public Social Services (DPSS) submits that this continued decrease may be attributed to the following:

The total sheltered homeless people counted decreased by 8% in 2016 to 814.

- HUD Continuum of Care (CoC) Program funding continues to prioritize the creation of new permanent housing beds for homeless individuals and families throughout the county. This includes a 79% increase in the number of new permanent housing beds since 2013¹. A majority of these beds have been "leased up" with unsheltered homeless people, including those who are chronically homeless.

¹ The 2013 Housing Inventory Chart (HIC) reported 862 permanent beds; in 2015, there were 1,547 permanent beds reported in the HIC. This included; HUD Permanent Supportive Housing, Rapid Rehousing, Veterans' Affairs Supportive Services for Veterans and VA Supportive Housing (HUD-VASH).

- A surge in funding by the U.S. Department of Veterans' Affairs (VA) to provide supportive services to veterans and their families. This includes increased funding for the Veterans Affairs Supportive Housing (HUD-VASH) program that provides rental assistance for homeless veterans and the Supportive Services for Veteran Families (SSVF) program that provides a range of supportive services to eligible Veteran families that are designed to promote housing stability.
- Further, in 2015 a targeted countywide effort to coordinate services to permanently house homeless people who are living in encampments began as part of a collaboration between key county and nonprofit agencies working on the frontlines to end homelessness. This enhanced partnership includes the Riverside County Sheriff's Department, DPSS Homeless Programs Unit, Housing Authority of the County of Riverside, The Riverside University Health System – Behavioral Health (formerly Department of Mental Health), the U.S. Department of Veterans' Affairs, Loma Linda Medical Center, Path of Life Ministries and other key nonprofit housing providers. This coordination effort has assisted in closing several homeless encampments and providing permanent housing for a majority of the people who were living in riverbeds, near freeways and other places not meant for human habitation.

On the day of the Point-In-Time Count, additional services were offered to our Veterans encountered during the street-based Count. Veterans who wanted to receive housing services were transported to either the Riverside Access Center or the Indio Workforce Development Office for immediate processing. VA and Housing Authority staff were available at these centers to complete VI-SPDATs (needs assessments), issue VASH vouchers and complete other eligibility services. Beds were reserved at Path of Life Ministries and the Coachella Valley Rescue Mission to offer emergency shelter for any veterans encountered on the day of the PIT Count. There were six veterans who received a Housing Choice Voucher through the HUD-VASH program on the day of the PIT Count.

Riverside County's Department of Public Social Services (DPSS), in partnership with the County of Riverside Continuum of Care continues to explore new and innovative strategies for conducting a successful PIT Count in 2017 and beyond.

Introduction

The Point-In-Time (PIT) Homeless Count is a count and survey of Riverside County's sheltered and unsheltered homeless population. Riverside County's Department of Public Social Services (DPSS), in partnership with County of Riverside Continuum of Care, is required to conduct this biennial count during the last 10 days in January. The Continuum of Care (CoC) is a network of private- and public-sector homeless service providers, designed to promote community-wide planning and the strategic use of resources to address homelessness.

The PIT Count is federally-mandated by the U.S. Department of Housing and Urban Development (HUD) to count and survey the homeless population in cities and counties throughout the nation, including Riverside County. Each count is planned, coordinated, and carried out locally. Data collected during the count reflects a *snapshot* of Riverside County's homeless population at one particular point-in-time and is required in order to: continue receiving federal funding for homeless assistance programs, develop strategies to end homelessness, help homeless individuals and families who are in need, and produce a full report to HUD regarding the homeless individuals in Riverside County. In 2015, Riverside City and County received a total of \$9.3 million by HUD for the Continuum of Care Program for homeless programs and services.

HUD defines a person who is homeless as: (a) living in a place not designed or ordinarily used as a regular sleeping accommodation for humans (i.e., abandoned buildings, cars, parks, under bridges, bus stops, etc.) and (b) living in emergency shelters and transitional housing projects². It is important to note that HUD's definition does not include households that are below the poverty line or those individuals that are near-homeless. In addition, HUD identifies people to exclude from the count³:

- (a) Persons counted in any location not listed on the CoC's Housing Inventory Count (HIC);
- (b) Persons residing in permanent housing (PH) programs, including persons housed using HUD Veterans Affairs Supportive Housing (VASH) vouchers;
- (c) Persons temporarily staying with family or friends (i.e., "doubled-up" or "couch surfing");
- (d) Persons residing in housing they rent or own (i.e., permanent housing), including persons residing in rental housing with assistance from a RRH project on the night of the count; and
- (e) Persons residing in institutions (e.g., jails, juvenile correction facilities, foster care, hospital beds, detox centers).

² 2014 Point-In-Time HUD Methodology Guide, p. 4

³ 2014 Point-In-Time HUD Methodology Guide, p. 30

Methodology

Overview

The 2016 Point-In-Time (PIT) Homeless Count unsheltered methodology consisted of three primary components:

- Street-based count on January 26, 2016 between 5:30 a.m. to 9:30 a.m.
- Service-based count on January 26, 2016 between 7:00 a.m. to 2:00 p.m.
- Riverside University Health System - Behavioral Health Homeless Outreach between January 26, 2016 – February 2, 2016 (seven-day period of time to cover unincorporated areas throughout Riverside County)

The 2016 PIT Count unsheltered methodology was the same as the 2015 PIT Count unsheltered methodology, with the exception of the separate Youth Count conducted in 2015. Even though a separate Youth Count was not conducted in 2016, youth were identified and counted during the street-based, service-based, and sheltered counts. See Table 1 below for a comparison of PIT Count methodologies.

Table 1. Comparison of PIT Count Unsheltered Methodology

| PIT Count Unsheltered Methodology | |
|---|---|
| 2015 | 2016 |
| Street-based count | Street-based count |
| Service-based count | Service-based count |
| Riverside University Health System - Behavioral Health homeless Outreach (seven-day period of time to cover the unincorporated areas) | Riverside University Health System - Behavioral Health homeless Outreach (seven-day period of time to cover the unincorporated areas) |
| Youth Count | |

Subsequent sections will further compare the 2015 and 2016 PIT Count unsheltered methodologies. In both 2015 and 2016, specific attention was given to city engagement and survey development as opportunities to increase the accuracy of the PIT Count.

City Engagement

The methods of city engagement used in 2016 paralleled the methods used in 2015. DPSS made efforts to engage city leaders and establish deployment centers in each city and a thorough list of unincorporated communities was incorporated into the street-based count. City leaders who requested further assistance were assigned a DPSS Site Coordinator to support PIT Count activities on the day of the PIT Count. These DPSS Site Coordinators worked in tandem with city leaders. Their role was primarily to assist the city leaders who were in charge at each deployment center during the street-based count. It is important to note that some city leaders elected not to use a DPSS Site Coordinator as they felt confident with their abilities and available resources to conduct the count. See Table 2 below for a comparison of city engagement.

Table 2: Comparison of City Engagement

| City Engagement | |
|--|--|
| 2015 | 2016 |
| Deployment centers attempted in each city (25 out of 29 cities had deployment centers) | Deployment centers attempted in each city (25 out of 29 cities had deployment centers) |
| Did NOT designate red zones, but rather attempted to engage every city | Did NOT designate red zones, but rather attempted to engage every city |
| Included 53 census designated places (unincorporated areas) | Included 53 census designated places (unincorporated areas) |
| 81% of the deployment centers had an assigned DPSS Site Coordinator | 20% of the deployment centers had an assigned DPSS Site Coordinator |

Survey Development

The survey that was selected for implementation was a slightly modified version of the 2015 Count and Survey tool based on the feedback from our volunteers to improve the previous version. The survey was pilot tested to assess whether prospective volunteers knew how to navigate the survey tool comfortably and whether prospective interviewees clearly understood the questions that were asked.

A total of 40 people piloted the survey tools including: DPSS Adult Services Division Administration staff, community members, and sheltered homeless individuals. In addition, general survey feedback was given by the Riverside University Health System - Behavioral Health homeless Outreach staff. The version that received the most positive feedback was selected for interviewing homeless individuals during the street-based count and the service-based count.

The primary goal for the PIT Count was to *interview* each homeless person. However, it was understood interviewing was not feasible under certain circumstances. Thus, an observational survey tool was developed to allow interviewers to record observational data (perceived gender, ethnicity, age, physical description, etc.) for individuals encountered during the street count who were suspected

to be homeless and were unable or unwilling to be engaged. This observational technique is acceptable according to HUD guidelines⁴. The following were reasons for volunteers to use an observational tool:

- there were barriers to enter the site;
- the site was unsafe to enter;
- the person refused to participate;
- the person was sleeping;
- there was a language barrier; or
- the person was unable to respond (i.e., mental issues, intoxication, etc.).

This observational tool was used during the general PIT street-based count.

Data Entry and Deduplication Method

A Microsoft Access application was created in order to consolidate and store the unsheltered homeless count survey data. Separate applications were created for the street-based interview surveys and street-based observational surveys. Five data entry volunteers entered this unsheltered homeless data into the Microsoft Access application during the month of February.

Since the 2016 PIT Count involved both street-based and service-based counts, a deduplication method was implemented to account for any individuals who may have been interviewed multiple times. The deduplication method for the interview surveys consisted of creating a unique identifier using several fields of information from the survey, such as: first initial, last initial, birth month, birth year, city born, state born, gender, race, and veteran status. The deduplication method for the observational surveys used the following fields to create a unique identifier: reason for observational tool, type of location, age observed, perceived gender, and perceived race. The creation of the unique identifier was conducted in a statistical database program (Microsoft Access), using an algorithm with the identified demographic information to generate a unique ID for each individual counted. This process allowed data analysts to easily identify and eliminate duplicate records.

Table 3 below shows that the total number of street-based (interview and observational tools) and service-based interview surveys returned to DPSS was 1,207 (940 interview surveys, 267 observational surveys). During the data entry process, several survey errors were discovered.

Surveys were rejected prior to data entry for the following reasons: (a) the survey was completely blank except for interviewer name and location; (b) the homeless individual indicated that they stayed in a place the night before that was not considered *unsheltered* according to HUD (house, apartment, emergency shelter, motel, etc.); or (c) the homeless individual indicated they had already been surveyed. There were 21 surveys that were rejected prior to being entered into the database. These criteria resulted in a new subtotal of 1,186 surveys. The PIT Count's analytic rationale was to include all records until there was clarity and certainty that they should be excluded. Once all data was entered and the deduplication method implemented, three surveys were rejected as duplicates,

⁴ 2014 Point-In-Time HUD Methodology Guide, p. 52

resulting in a final sample size of 1,183 surveys. See Table 3 below for the numeric breakdown and filtering process.

Table 3. Breakdown of PIT Count Surveys – Data Cleaning and Deduplication

| Total Surveys Returned | Rejected Surveys (Not Entered) | New Sub Total | Rejected Surveys (Duplicates) | Final Sample Size (total number of surveys)* |
|---|---|---|---|---|
| 1,207 (940 interview, 267 observational) | 21 (17 interview, 4 observational) | 1,186 (923 interview, 263 observational) | 3 (3 interview, 0 observational) | 1,183 (920 interview, 263 observational) |

Note: Some surveys included more than one person on them, thus the reason for the difference in the final sample size vs the total unsheltered count (1,183 vs. 1,351)

Since the observational surveys contained less information and therefore fewer fields to use in the deduplication process, it was challenging to rationalize the drop of any *potential* duplicates in this data. For example, if two different volunteers were instructed to record their observations regarding the same scenario, they would likely describe the scenario in two completely different ways. Thus, there would be no certainty that the individuals observed in the scenario were the same individual or different individuals. Therefore, it was decided to include all observational surveys. Throughout the rest of the report, the results will be discussed in terms of interview survey data versus observational survey data. It is important to make this distinction as the interview survey data is based on the respondent's own self-identification, while the observational survey data is based on the volunteer's perceptions.

Extrapolation techniques are not incorporated into this report. The 2016 PIT Count reflects only individuals who were counted (through direct observation or interviewed), rather than estimated based on tents or belongings.

It was not feasible to deduplicate the interview and observational data together because, again, the interview data was based on self-identification while the observational data was based on volunteer perception. Therefore, none of the fields from these two different surveys were identical, making it nearly impossible to deduplicate across survey types.

Volunteer Recruitment

There were a total of 503 volunteers, including 33 Key Leaders from the community, eight Department of Public Social Services (DPSS) Staff Site Coordinators, and two DPSS PIT Call Center Staff who contributed to the unsheltered PIT Count and survey.

Volunteers were recruited through the following methods: email blasts; outreach to faith-based organizations and local colleges and universities; press releases published in several print and online newspapers throughout Riverside County; volunteer trainings which ran from December 7, 2015 to January 25, 2016; and printed flyers distributed at various agencies and collaborative meetings. A web-based survey (SurveyMonkey) was used to keep track of volunteer registrations.

PIT Count Volunteers were able to provide assistance in the following ways:

- served as enumerators in the street-based count on January 26, 2016, between 5:30 a.m. and 9:30 a.m.;
- helped DPSS identify locations in Riverside County where homeless individuals and families were known to live and congregate; and
- donated items to be used in the incentive bags given to homeless individuals who were surveyed.

All volunteers were required to complete a 90-minute volunteer orientation where they received instructions on how to conduct the count and on important safety guidelines.

Unsheltered Homeless Count

Street-Based Count

The street-based count took place on January 26, 2016, between 5:30 a.m. and 9:30 a.m. A total of 533 volunteers were divided into groups of three and deployed across Riverside County to pre-identified locations where homeless people were known to live and/or congregate. Volunteers served as team leaders, lookouts, or counters and met at one of the deployment centers across the county to receive their team assignments, surveys, supplies, and maps.

In December 2015, Riverside County Information Technology (RCIT) developed a GIS mapping tool (Geoform) to track information on locations where homeless people were known to live and/or congregate and an assessment of safety of each location. This link was sent to City Leaders, Law Enforcement agencies, Code Enforcement agencies, PIT Count Volunteers, and other community organizations. RCIT generated maps for volunteers to take with them into the field. These maps covered smaller grids within each city (2.5 mile by 1.5 mile grid). While some sites used their own maps, added their own data points, or used their own color schemes, RCIT-generated maps were provided to any city or area that requested a map. Locations were categorized based on the safety assessment included in the mapping tool: unsafe (yellow), safe (green), and safety unknown (blue).

Service-Based Count

The service-based count took place on January 26, 2016, between 7:00 a.m. and 2:00 p.m. Several weeks prior to the count, DPSS staff compiled a list of agencies that provide services to homeless people throughout Riverside County. The list was compiled using several resources, including:

- a list of service agencies that the DPSS Homeless Programs Unit had on hand;
- an internet search; and
- Riverside County's Continuum of Care.

Though efforts were taken to compile a comprehensive list, this list is by no means exhaustive. Once the final list was completed, contact was attempted with each organization. The goal of contacting each organization was to verify the agency name, contact information, operational hours, and to assess each agency's interest level and how many estimated volunteers would be needed. All agencies that operated between the hours of 7:00 a.m. and 2:00 p.m. on Tuesdays were contacted or attempts were made. The remaining agencies were classified into four categories: information unconfirmed; willing to administer surveys with agency staff; willing to have volunteers administer surveys at facility; and not interested in participating.

Behavioral Health Homeless Outreach Count

Riverside University Health System – Behavioral Health Homeless Outreach (DBH) teams agreed to canvass non-city (unincorporated) areas in Riverside County. DBH performed their main unsheltered counts of non-city areas on the day of the Count, and also performed a follow-up sweep during the seven-day period after, as allowed by the HUD methodology.

"A survey of people at various social service locations or other public or private locations to identify people who were unsheltered, but not counted, on the night of the count--either because CoC's did not use a night of the count approach or because unsheltered people were missed on the night of the count. Service-based counts may only be conducted within the seven-day period after the designated count night."⁵

DBH used 34 staff volunteers teamed with six homeless volunteers to complete the count. The coverage they provided to the non-city areas included both (a) reconnaissance work to assess if particular areas had homeless people and (b) surveying the individuals they found during their reconnaissance at a later date. More specifically, six outreach teams canvassed the areas to assess the presence of homeless people. This reconnaissance work began the week of January 4-8th, 2016 and continued every day leading up to the Count. If absolutely no indication of homeless people was found in a particular area, DBH returned for one last round of reconnaissance two days prior to the Count. If DBH found, or knew of, suspected homeless individuals in a particular area, they returned on the day of the Count (or the seven day window afterward) to administer the survey. On the day of the Count, 12 teams surveyed the locations with known homeless, and four smaller outreach teams surveyed the remaining locations over the next seven days.

Sheltered Homeless Count

The shelter-based count involved counting homeless individuals who stayed in shelters on the night of January 25, 2016. The sheltered count was conducted in accordance with HUD's counting standards and methodology guidance. The primary data source for the sheltered count is the Homeless Management and Information System (HMIS) database. The sheltered count included counting homeless individuals and families who stayed in emergency shelters and transitional housing on the night of January 25, 2016.

⁵ 2014 Point-In-Time Methodology Guide, p. 19

In preparation for the count, a PowerPoint presentation was sent to HMIS participating agencies to provide an overview of the 2016 PIT and the requirements for data collection. In addition, an email was sent to each agency with instructions to ensure that all required data elements are complete, accurate, and that "Project Entry" and "Project Exit Dates" have been entered for participants who entered and exited on or before the night of the count. A copy of the PIT report taken from HMIS was included for each agency's verification.

For non-HMIS participating agencies and domestic violence providers, a survey form was provided to fill in demographic and household data. This information will be used to complete the population reporting requirement. To ensure data quality, accuracy and completeness, a staff was dedicated to focus on reviewing data quality as well as coordinate with HMIS participating agencies to complete any missing information.

Unsheltered Homeless Count Findings

There were a total of 1,351 individuals counted during the 2016 unsheltered homeless count. Table 4 displays the overall data by city or unincorporated area. When presenting any data below, please note that there is a distinction between observational data (based on volunteer perception) and interview data (based on respondent's self-identification), as discussed earlier in the report.

The total column for 2016 represents a summation of the interview and observational data. Both the total count for each city and the respective percentage of the total number of unsheltered homeless people in Riverside County are provided. Table 4 also compares the 2016 city counts to the 2015 city counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that this comparison does *not* take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless counts for each city or unincorporated area from 2015 to 2016.

Table 4. Unsheltered Homeless Count by City and Type of Data

| City or Unincorporated Area | General PIT Count | | Total Unsheltered | | | | Percent Change |
|--------------------------------|-------------------|---------------|-------------------|---------|-------|---------|-------------------|
| | Interview | Observational | 2015 | | 2016 | | |
| | | | Count | Percent | Count | Percent | |

| Grand Total | 1042 | 309 | 1587 | - | 1351 | - | -15% |

Of the 1,351 unsheltered homeless people, a majority (70%) of these individuals were men (n = 940). Only one of the unsheltered homeless population identified as transgender was counted. See Table 5 below for full details. Table 5 also compares the 2015 to the 2016 gender subpopulation counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that this comparison does not take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless gender counts from 2015 to 2016.

Table 5. 2015-2016 Unsheltered Homeless Count Comparison – Breakdown of Gender

| Gender | 2016 General PIT Count | | Total Unsheltered Comparison | | | | Percent Change |
|-----------------------|------------------------|---------------|------------------------------|---------|-------|---------|----------------|
| | Interview | Observational | 2015 | | 2016 | | |
| | | | Count | Percent | Count | Percent | |
| Female | 308 | 81 | 398 | 25% | 389 | 29% | -2% |
| Male | 728 | 212 | 1077 | 68% | 940 | 70% | -13% |
| Transgender | 1 | 0 | 8 | 1% | 1 | 0% | -88% |
| Don't Know or Refused | 0 | 13 | 70 | 4% | 13 | 1% | -81% |
| Blank | 5 | 3 | 34 | 2% | 8 | 1% | -76% |
| Total | 1042 | 309 | 1587 | 100% | 1351 | 100% | -15% |

*Note: Interview data is based on respondent's self-identification while observational data is based on volunteer perception.

Figure 1. 2016 Unsheltered Homeless Count – Breakdown of Gender

A majority of the unsheltered homeless population either identified or were observed as White ($n = 822$) (See Table 6 below). Approximately one fourth of the population either identified as or were observed as Hispanic or Latino. Ethnicity was assessed in a separate question than race as HUD considers Hispanic to be an ethnicity, not a race. See Table 6 for full details regarding race and ethnicity. Table 6 also compares the 2015 to the 2016 race subpopulation counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that this comparison does not take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless race counts from 2015 to 2016.

Table 6. 2015-2016 Unsheltered Homeless Count Comparison – Breakdown of Race and Ethnicity

| Race | 2016 General PIT Count | | Total Unsheltered Comparison | | | | Percent Change |
|-----------------------------------|------------------------|---------------|------------------------------|---------|-------|---------|----------------|
| | Interview | Observational | 2015 | | 2016 | | |
| | | | Count | Percent | Count | Percent | |
| American Indian or Alaska Native | 85 | 2 | 45 | 3% | 87 | 6% | 93% |
| Asian | 10 | 0 | 14 | 1% | 10 | 1% | -29% |
| Black or African American | 121 | 39 | 164 | 10% | 160 | 12% | -2% |
| Native Hawaiian, Pacific Islander | 12 | 0 | 6 | 0% | 12 | 1% | 100% |
| White | 650 | 172 | 943 | 59% | 822 | 61% | -13% |
| Multiple Races | 27 | 28 | 30 | 2% | 55 | 4% | 83% |
| Don't Know or Refused | 169 | 89 | 210 | 13% | 258 | 19% | 23% |
| Blank | 31 | 8 | 175 | 11% | 39 | 3% | -78% |
| Hispanic (ethnicity) | 312 | 60 | 388 | 24% | 372 | 28% | -4% |

*Note: Interview data is based on respondent's self-identification while observational data is based on volunteer perception.

Ethnicity was assessed in a separate question than race as HUD considers Hispanic to be an ethnicity, not a race.

Figure 2. 2016 Unsheltered Homeless Count – Breakdown of Race

The majority of the 2016 unsheltered homeless population was between the ages of 50-61 (n = 396) and 40-49 (n = 305). See Table 7 for full details regarding age. Table 7 also compares the 2015 to the 2016 age subpopulation counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that this comparison does not take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless age counts from 2015 to 2016.

Table 7. 2015-2016 Unsheltered Homeless Count Comparison – Breakdown of Age

| Gender | 2016 General PIT Count | | Total Unsheltered Comparison | | | | Percent Change |
|-------------|------------------------|---------------|------------------------------|---------|-------|---------|----------------|
| | Interview | Observational | 2015 | | 2016 | | |
| | | | Count | Percent | Count | Percent | |
| 0-5 | 1 | 0 | - | - | 1 | 0% | - |
| 17 or under | 13 | 0 | 12 | 1% | 13 | 1% | 8% |
| 18-24 | 58 | 24 | 116 | 7% | 82 | 6% | -29% |
| 25-29 | 64 | 37 | 112 | 7% | 101 | 7% | -10% |
| 30-39 | 180 | 76 | 256 | 16% | 256 | 19% | 0% |
| 40-49 | 241 | 64 | 330 | 21% | 305 | 23% | -8% |
| 50-61 | 341 | 55 | 446 | 28% | 396 | 29% | -11% |
| 62-69 | 75 | 19 | 107 | 7% | 94 | 7% | -12% |
| 70-79 | 17 | 5 | 20 | 1% | 22 | 2% | 10% |
| 80+ | 3 | 1 | 1 | 0% | 4 | 0% | 300% |
| Blank | 50 | 28 | 187 | 12% | 78 | 6% | -58% |
| Total | 1042 | 309 | 1587 | 100% | 1351 | 100% | -15% |

*Note: Interview data is based on respondent's self-identification while observational data is based on volunteer perception. 0-5 age group data was not collected on 2015 PIT Count Survey

Figure 3. 2016 Unsheltered Homeless Count – Breakdown of Age

Most of the unsheltered homeless individuals were not veterans. See Table 8 for a total count of veterans and chronically homeless veterans that were counted.

Table 8. 2016 Unsheltered Homeless Count – Veterans

| Population | # |
|---|-----|
| Unsheltered Homeless Veterans | 100 |
| Unsheltered Chronically Homeless Veterans | 36 |

Among the unsheltered homeless population, 29% were considered chronically homeless ($n = 299$); 21% were recently released from jail or prison ($n = 223$); and 25% were victims of domestic violence ($n = 265$). See Table 9 below for full details on these unsheltered subpopulations. Table 9 also compares the 2015 to the 2016 subpopulation counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that this comparison does not take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless subpopulation counts from 2015 to 2016.

Table 9. 2016 Unsheltered Homeless Count Comparison – Breakdown of Subpopulations

| Subpopulation | Total Unsheltered Comparison | | | | Percent Change |
|------------------------------------|------------------------------|---------|-------|---------|----------------|
| | 2015 | | 2016 | | |
| | Count | Percent | Count | Percent | |
| Chronically Homeless | 401 | 37% | 299 | 29% | -25% |
| Families with Children | 14 | 1% | 8 | 1% | -43% |
| Recently Released Incarceration | 225 | 21% | 223 | 21% | -1% |
| Recently Released Medical or Rehab | - | - | 135 | 13% | - |
| Veterans | 102 | 9% | 100 | 10% | -2% |
| Youth 24 or younger | 128 | 12% | 95 | 9% | -26% |
| Alcohol Use | 474 | 44% | 273 | 26% | -42% |
| Drug Use | 348 | 32% | 341 | 33% | -2% |
| PTSD | 179 | 17% | 200 | 19% | 12% |
| Mental Health Conditions | 322 | 30% | 275 | 26% | -15% |
| Physical Disability | 300 | 28% | 326 | 31% | 9% |
| Developmental Disability | 155 | 14% | 128 | 12% | -17% |
| Brain Injury | 159 | 15% | 201 | 19% | 26% |
| Victim of Domestic Violence | 243 | 23% | 265 | 25% | 9% |
| AIDS or HIV | 22 | 2% | 11 | 1% | -50% |

*Note: This information was only obtained from the interview surveys (not observational surveys).

Chronically homeless was defined according to HUD's definition if the person had been living in emergency shelter and/or on the streets (a) for the past year or more or (b) four or more times during the last three years and who may have a disability (HUD HEARTH Act Interim Rule, pgs. 53-54).

Recently released was defined as someone who was released from jail or prison within the past 12 months.

An individual could potentially be categorized into multiple or all subpopulations.

Recently released Medical or Rehab data was not collected on the 2015 PIT Count Survey.

Among the unsheltered homeless population, 26% reported using alcohol (n = 273), 33% reported using drugs (n = 341), 19% reported suffering from Post Traumatic Stress Disorder (PTSD) (n = 200), 26% reported having a mental health condition (n = 275), 31% reported having a physical disability (n = 326), 12% reported having a developmental disability (n = 128), and 19% reported suffering from a brain injury (n = 201). Among those individuals who reported experiencing these situations, almost half of them indicated that PTSD (53%), mental health conditions (52%), physical disabilities (58%), and developmental disabilities (46%) prevented them from obtaining stable housing or a steady job. It is important to note that an individual could potentially be categorized into multiple or all subpopulations. Table 10 also compares the 2015 to the 2016 subpopulation counts. In the final column on the right of the table is the percent change between 2015 and 2016. It should be noted that

this comparison does not take into account the total sample sizes for each year. The comparative data is presented this way in order to show the raw change in unsheltered homeless subpopulation counts from 2015 to 2016. See Table 10 below.

Table 10. 2016 Unsheltered Homeless Count Comparison – Breakdown of Subpopulations Preventing Housing

| Subpopulation | Total Unsheltered | | | | | | | | | |
|--------------------------|---|----------------------|-------|----------------------|----------------|--|----------------------|-------|----------------------|----------------|
| | Number of respondents who stated they have experienced... | | | | | Number of respondents who stated it prevents them from obtaining housing or work | | | | |
| | 2015 | | 2016 | | Percent Change | 2015 | | 2016 | | Percent Change |
| | Count | Percent [†] | Count | Percent [†] | | Count | Percent [†] | Count | Percent [†] | |
| Alcohol Use | 474 | 44% | 273 | 25% | -74% | 63 | 6% | 61 | 6% | -3% |
| Drug Use | 348 | 32% | 341 | 32% | -2% | 69 | 6% | 90 | 9% | 30% |
| PTSD | 179 | 17% | 200 | 19% | 11% | 79 | 7% | 106 | 10% | 34% |
| Mental Health Conditions | 322 | 30% | 275 | 26% | -17% | 144 | 13% | 144 | 14% | 0% |
| Physical Disability | 300 | 28% | 326 | 30% | 8% | 136 | 13% | 190 | 18% | 40% |
| Developmental Disability | 155 | 14% | 128 | 12% | -21% | 65 | 6% | 59 | 6% | -9% |
| Brain Injury | 159 | 15% | 201 | 19% | 21% | 58 | 5% | 82 | 8% | 41% |

*Note: This information was only obtained from the Interview surveys (not observational surveys).

† This percent (rounded) reflects the portion of people who experienced this criteria and who indicated it prevented them from obtaining housing and/or work. For example, 273 people reported using alcohol. Of those 273 people, 61 reported it prevented them from obtaining housing or work (22%). An individual could potentially be categorized into multiple or all subpopulations.

Table 11 below displays subpopulation data by city versus unincorporated area. This table provides a highlight of subpopulation information. A count for each city is provided, as well as its corresponding percentage of the total unsheltered sample that had subpopulation data available (n = 1,042). It is important to note that subpopulation information was not collected on the observational tool. Additional subpopulation information for the overall total amount of unsheltered homeless can be found in Table 9.

Table 11. Unsheltered Homeless Count – Subpopulation Data by City versus Unincorporated Area

| City or Unincorporated Area | Total Unsheltered Homeless Individuals | | Chronically Homeless | | Families with Children | | Recently Released Incarceration | | Recently Released Mental or Substance Abuse | | Veterans | | Alcohol Use | | Drug Use | | PTSD | | Mental Health Conditions | | Physical Disability | | Developmental Disability | | Brain Injury | | Victims of Domestic Violence | | At-Risk of HIV | |

[illegible]

Riverside County DPSS ASD HPU

2016 Point-In-Time Homeless Count Report

Sheltered Homeless Count Findings

A total of 814 homeless individuals were counted during the shelter count. These individuals stayed in emergency shelters (including domestic violence shelters and hotel/motel vouchers) and transitional housing. This represents an 8% decrease from the 2015 sheltered count (n = 883). See Table 12 below.

Table 12. Sheltered Homeless Count – Subpopulation Data

| Subpopulation | 2016 | |
|--------------------------------------|-------|---------|
| | Count | Percent |
| Chronically Homeless Individuals | 70 | 9% |
| HIV Positive/AIDS | 6 | <1% |
| Mental Health Problems | 209 | 26% |
| Substance Users | 166 | 20% |
| Minor Youth (under 18) | 166 | 20% |
| Accompanied Minor Youth (under 18) | 150 | 18% |
| Unaccompanied Minor Youth (under 18) | 16 | 2% |
| Youth (18-24) | 72 | 9% |
| Veterans | 111 | 14% |
| Victims of Domestic Violence | 108 | 13% |

Conclusions

There are several possible reasons for the overall decrease in the unsheltered homeless count from 2015 to 2016. Over the past several years, HUD continues to see a decrease in nationwide homelessness (especially in homeless veterans and chronically homeless)⁶. Thus, Riverside County's overall decline in 2016 is in line with declines on a national level. The PIT Planning team and our Continuum of Care community partners have identified the following factors that may have contributed to the decrease in Riverside County's homeless count since 2013.

1. In March 2014 the Obama administration and HUD set a national priority to end homelessness among veterans by the end of 2015 and end chronic homelessness by the end of 2017. A national campaign and infusion of funding and other resources to counties and cities has helped reduce the number of homeless veterans in the United States by 24%. In 2013, there were 57,849 homeless veterans throughout the country. This infusion of funding and services in Riverside County included:
 - a. An additional \$3 million in "surge" funding to nonprofit agencies to provide supportive services to veterans and their families the county received in 2014 from the U.S. Department of Veterans' Affairs (VA).
 - b. The funding helps with services to identify homeless and very low-income veterans to help them move from temporary or transitional housing to permanent housing. The funding offers outreach, case management, connection to VA benefits and programs, and financial assistance for housing. In addition, the county received increased funding for the Veterans' Affairs Supportive Housing (HUD-VASH) program that provides rental assistance for homeless Veterans with case management and clinical services provided by the Department of Veterans' Affairs (VA) and Supportive Services for Veteran Families (SSVF) program that provides a range of supportive services to eligible Veteran families that are designed to promote housing stability.
2. The County of Riverside Continuum of Care (CoC), a network of homeless service providers, has made an impact in helping to eliminate homelessness. Specifically, the CoC implemented programs that have shown promise in placing chronically homeless people into permanent housing first and then providing needed services that address barriers that can keep a person in homelessness. The CoC also strengthened coordination among the network of providers and increased funding focused on helping individuals and families who are homeless become "rapidly re-housed" through temporary, one-time assistance.
3. New funding resources and a shifting of existing HUD funding has resulted in a 79% increase in the number of new permanent housing beds for homeless individuals and families since 2013⁷. This includes the funding and resources for veterans listed above and an additional 92 permanent supportive housing beds for chronically homeless individuals were added through the CoC's permanent housing bonus funds awarded in 2014 to be used in 2015.

In addition to the above rationale, Riverside County's PIT Count numbers have been steadily decreasing since the PIT Count was first implemented in 2005. One exception in the steady decline of homeless individuals occurred during the 2011 PIT Count. In this particular year a multiplier methodology was used whereby survey respondents were asked to estimate how many people usually stay at that location at night. The only year that

⁶ http://portal.hud.gov/hudportal/HUD?src=/press/press_releases_media_advisories/2014/HUDNo_14-135

⁷ The 2013 Housing Inventory Chart (HIC) reported 862 permanent beds; in 2015, there were 1,547 permanent beds reported in the HIC. This included; HUD Permanent Supportive Housing, Rapid Rehousing, Veterans' Affairs Supportive Services for Veterans and VA Supportive Housing (HUD-VASH).

utilized this multiplier methodology was 2011, which may explain the sudden increase in homeless people in this particular year. See Figure 4 below.

Figure 4. 2016 Total Homeless Count Comparison – Year-Over-Year

Challenges, Limitations, & Recommendations

Street-Based Count

The DPSS PIT Count Planning Team and the various City PIT Leaders continue to increase public awareness, and refine their processes for conducting a successful PIT Count within Riverside County. Several city leaders of the PIT Count have reported that because of the increased publicity, many of the familiar homeless individuals seemed to relocate before the morning of the count. To address this concern, DBH Homeless Outreach teams performed their main unsheltered counts of non-city areas on the day of the Count, but also performed a follow-up count of various cities during the seven-day period after, as allowed by the HUD methodology.

During the 2016 Unsheltered PIT Count, the presence of law enforcement noticeably increased from the participation level during the 2015 PIT Count. A special thanks to the Riverside County Sheriff's Department and the various local police departments that collaborated in the planning and implementation of the PIT Count. Continued collaboration with the various law enforcement agencies in the 2017 PIT count and an even greater participation level will continue to improve future PIT Counts.

Service-Based Count

Several challenges were encountered with the service-based count. First, the list of service agencies was not comprehensive because this task was initiated in late December and thus not enough time was permitted to create an exhaustive list. Significant time and staff resources are needed to create such a comprehensive list. The next PIT Count Planning Team should consider eliciting assistance from DPSS Continuum of Care community partners in researching and creating a more comprehensive list of homeless service agencies in Riverside County. Additionally, a more thorough outreach to agencies well in advance of the PIT Count should be conducted.

Youth Count

The PIT Count Planning Team lacked adequate resources to conduct a separate Youth Count in 2016. Unaccompanied homeless youth are often difficult to find because they tend to: (a) congregate at different times and places than older adults, (b) refuse (or are unaware of) social service programs and agencies, and (c) do not want to be found as they may be fleeing abuse or the foster care system. In 2015, the Youth Count magnet events did not attract as many unaccompanied homeless youth as was projected; therefore, this strategy was not used for the 2016 Count.

Although a separate Youth Count was not conducted in 2016, the PIT Count Planning Team met with youth service agencies to identify locations of homeless youth. In 2017, HUD will require CoCs to conduct a separate Youth PIT Count. The PIT Count Planning Team recommends early and ongoing collaboration and planning with youth services agencies to facilitate the planning and implementation of a separate Youth PIT Count.

Shelter Count

The shelter count primarily consisted of extracting data from the HMIS database. However, not all shelters participate in HMIS (such as, providers for victims of domestic violence and hotel/motel vouchers). Some non-HMIS participating agencies do not use a database system to track their data. Instead, they rely on daily written logs and sign-in-sheets to provide the count demographics and household information. Additionally, there have been challenges in collecting the required information from the several non-HMIS agencies in a timely manner. The PIT Count Planning Team recommends that non-HMIS participating agencies continue to be encouraged to utilize the HMIS (except for the Domestic Violence agencies) database in order to collect the required information in a timely manner.

Appendix A: Survey Instruments

2016 PIT Count Interview Survey – Page 1

RIVERSIDE COUNTY CoC Unsheltered Street Count Form for Night of Count – Interview Tool JAN. 26, 2016

Location of Interview: _____ City _____ Zip Code _____
(street intersection/specific location) (Zip Code is required)

Interviewer Name _____ Time: _____ AM/PM

USE ONE FORM PER INDIVIDUAL OR FAMILY UNIT.

1. Where did you and your family unit sleep last night?
 Mark 1 to 13

| | |
|-------------------------|---------------------------------|
| 1 Street or sidewalk | 5 Vehicle (car, van, RV, truck) |
| 2 Abandoned building | 6 Bus, train station, airport |
| 3 Under bridge/overpass | 7 Woods or outdoor encampment |
| 4 Park (Specify) _____ | 8 Other (Specify) _____ |

| | |
|-------------------------|--------------------------------------|
| 9 Emergency shelter | 10 House or apartment |
| 11 Transitional housing | 12 Jail, hospital, treatment program |
| 13 Motel/hotel | |

****IF ANY OF THESE OPTIONS ARE SELECTED, STOP THE SURVEY****

2. Did another volunteer already ask you these same questions about where you stayed last night? YES NO

STOP *IF YES, STOP THE SURVEY*** STOP**

3. Including yourself, how many adults & children are there in your family unit, who slept in the same location with you last night?
 Adults (25+): _____ Adults (18-24): _____ Children (17 or under): _____

**4. A) What are your initials [and other people in your family, from oldest to youngest]?
 B) What is your relationship with person 2 through 5?**
 Mark 1 to 5

| | | |
|----------|-------------------------|---|
| Person # | 4A. First/Last Initials | 4B. What is your (Person 1's) relationship to Persons 2 – 5 |
| 1 | | Self |
| 2 | | 1 2 3 4 5 |
| 3 | | 1 2 3 4 5 |
| 4 | | 1 2 3 4 5 |
| 5 | | 1 2 3 4 5 |

5. What is the month and year of your birthday and other family members?

| | Month | Year |
|-----------|-------|------|
| Person 1: | | |
| Person 2: | | |
| Person 3: | | |
| Person 4: | | |
| Person 5: | | |

6. What CITY and STATE were you born in?

| | CITY | STATE |
|-----------|------|-------|
| Person 1: | | |
| Person 2: | | |
| Person 3: | | |
| Person 4: | | |
| Person 5: | | |

(WRITE COUNTRY IF NOT U.S.)

7. Are you male (M), female (F), or transgender (TG)?
 Person 1: M F TG
 Person 2: M F TG
 Person 3: M F TG
 Person 4: M F TG
 Person 5: M F TG

8. Are you Hispanic or Latino?
 Person 1: YES NO
 Person 2: YES NO
 Person 3: YES NO
 Person 4: YES NO
 Person 5: YES NO

9. What is your race? You can select one or more races.
(READ CATEGORIES)

| PERSON # | 1 | 2 | 3 | 4 | 5 |
|-----------------------------------|---|---|---|---|---|
| American Indian or Alaskan Native | | | | | |
| Asian | | | | | |
| Black or African American | | | | | |
| Native Hawaiian, Pacific Islander | | | | | |
| White | | | | | |
| Don't Know/Refused to Answer | | | | | |

10. Have you served active duty in the U.S Armed Forces?
 Person 1: YES NO
 Person 2: YES NO
 Person 3: YES NO
 Person 4: YES NO
 Person 5: YES NO

11. Have you ever received health care or benefits from a Veterans Administration medical center?
 Person 1: YES NO
 Person 2: YES NO
 Person 3: YES NO
 Person 4: YES NO
 Person 5: YES NO

12. During the past 12 months, were you released from jail or prison?
 Person 1: YES NO
 Person 2: YES NO
 Person 3: YES NO
 Person 4: YES NO
 Person 5: YES NO

13. During the past 6 months, have you completed a housing assessment (VI-SPDAT)?
 Person 1: YES NO Don't know
 Person 2: YES NO Don't know
 Person 3: YES NO Don't know
 Person 4: YES NO Don't know
 Person 5: YES NO Don't know

2016 PIT Count Interview Survey – Page 2

14. During the past 12 months, were you released from a medical or rehabilitation institution?

Person 1: ☐ YES ☐ NO
 Person 2: ☐ YES ☐ NO
 Person 3: ☐ YES ☐ NO
 Person 4: ☐ YES ☐ NO
 Person 5: ☐ YES ☐ NO

15. How long have you currently been homeless? *Only include most recent time spent staying in shelters and/or on the streets.*

Person 1: ___ Days ___ Weeks ___ Months ___ Years
 Person 2: ___ Days ___ Weeks ___ Months ___ Years
 Person 3: ___ Days ___ Weeks ___ Months ___ Years
 Person 4: ___ Days ___ Weeks ___ Months ___ Years
 Person 5: ___ Days ___ Weeks ___ Months ___ Years

16. Including this time, how many separate times have you been homeless (stayed in shelters or on the streets) in the past 3 years?

1 time 2-3 times 4 or more

Person 1: ☐ ☐ ☐
 Person 2: ☐ ☐ ☐
 Person 3: ☐ ☐ ☐
 Person 4: ☐ ☐ ☐
 Person 5: ☐ ☐ ☐

17. In total, how long have you been homeless in the past 3 years?
Only include time spent staying in shelters and/or on the streets.

Person 1: ___ Days ___ Weeks ___ Months ___ Years
 Person 2: ___ Days ___ Weeks ___ Months ___ Years
 Person 3: ___ Days ___ Weeks ___ Months ___ Years
 Person 4: ___ Days ___ Weeks ___ Months ___ Years
 Person 5: ___ Days ___ Weeks ___ Months ___ Years

READ: The next few questions are private and sensitive in nature. I apologize for the sensitive nature. These questions are not meant to make you feel uncomfortable, but rather are simply part of the survey. YOUR RESPONSES ARE VOLUNTARY.

18. If the person is 18 or older: Please tell me whether any of these situations apply to you:

| | PERSON #1 | PERSON #2 | PERSON #3 | PERSON #4 | PERSON #5 |
|---|--|--|--|--|--|
| a. Do you drink alcohol frequently or for long periods of time? | <input type="radio"/> Yes <input type="radio"/> No | <input type="radio"/> Yes <input type="radio"/> No | <input type="radio"/> Yes <input type="radio"/> No | <input type="radio"/> Yes <input type="radio"/> No | <input type="radio"/> Yes <input type="radio"/> No |

City of
Jurupa Valley
California

Draft 2017 General Plan

**Appendix 14.0
Housing Comments**

April 2017

Jurupa Valley Interim General Plan

Workshop 1 – January 10, 2015

35 Attendees:

Ben Alaniz, Linda Alaniz, Ron Anderson, Cathy Barnes, David Barnes, Karen Bradford, Janet Chavez, Rene Chavez, Jim Chism, Roy Collins, Chuck Cox, Don Davies, Maria Delia Ortiz, Wayne Emery, Sandy Emery, Ray Fine, Deborah Fine, Betty Folsom, Fredda Fox, Jolene Hancock, Kim Johnson, Mark Johnson, Donna Johnston, Victoria Kirilman, Edward Lee, Josie Pelayo, Gloria Roman, Frank Ruiz, Irene Salazar, Mario Silverio, Colleen Smethers, John Todd, Betsy Wenk, William Winans, Dave Zimmerman

Land Use

- Emerald Meadows – Is it happening?
- Future development on the side of the 60 FWY along the Santa Ana River
- More hiking trails
- Encourage existing horse boarding facilities for area
- Keep it rural
- Develop equestrian park at Horseshoe Park – put in permanent arena and parking
- Develop areas near freeway off-ramps for shopping
- Offer residents options for shopping “traffic” from Eastvale down Bellegrave to Van Buren – build shopping and food area with a drugstore
- Areas exist for youth centers
- Improve Park on Wineville
- Build field of dreams
- Improve Community Center on Pedley
- Add retail in more urban areas
- Build a tax-collecting resort
- The main plan was to keep interiors “open” and to bring development along freeways
- Control or limit certain businesses like pot shops
- Add more equestrian trails
- Build visitor center and improve commercial along 60 freeway for people traveling through Jurupa Valley
- Turn the Jurupa Mountains Discovery Center into a tourist stop like Hadley’s area
- Sales tax generators need to be attracted
- Better shopping options
- Need shopping on the west side of the city
- Attract public to Jurupa Discovery Center – maybe build a food court?
- Robertson land is where to build a college
- Bellegrave between Etiwanda and Van Buren – bring in more businesses like restaurants, drugstores, customers going to Field of Dreams, new home owners; shopping

Land Use

- Build a soccer park
- Improve Marlett Park
- Attract sports leagues
- Build better infrastructure
- Build more golf courses
- Regulate number of animals per lot/space
- More horse trails, walking trails and sidewalks
- Limit high density housing – no lots under 7,200 sq ft
- Monitor and notify public of any development
- Solicit commercial services for neighborhoods that don't have it
- Build off 60 FWY corridor – commercial, restaurants and anchor Discovery Mountain with restaurants and a hotel/motel
- Attract more industry/manufacturing versus warehousing
- Keep historic buildings
- Provide for better recreation areas throughout the city
- Provide notification and transparency regarding land use and open to public input
- Build an indoor recreation center
- Solicit more shopping opportunities
- Install a street light at 58th and Pedley
- Balance urban and rural
- Clean up properties
- Repair 58th Street off Pedley
- Provide more vocational training in schools or build private schools
- Eliminate land use conflicts – such as industrial land next to residential
- Keep the denser projects along the freeway “ring” and less dense projects in the middle of the city
- Designate “Big Rig” streets
- Develop retail along Bellegrave and Van Buren
- Develop equestrian trails along river and provide connectivity to them from the city

Circulation

- More community centers or “pockets” to provide for programs, exercises, arts and crafts – senior and youth centers
- Islands cause delay in emergency response
- Keep equestrian neighborhoods without sidewalks – streets are narrow and need dirt sidings for horse traffic
- Build or designate places for truckers to park their Rigs to include reasonable rates and security
- Need to facilitate to tie together the city permit actions with people who can provide truck rig/trailer parking space

Circulation

- Create bike lanes
- Provide trolley across town transportation
- Consolidate special districts and establish a city-wide landscape and lighting district so that it reduces the cost of utilities city-wide
- Work on 15 on-ramps – maybe Bellegrave and 65th or 68th streets
- Maintain rural lifestyle in certain areas, enforce codes, and do something about traffic safety on Mission Blvd
- Control warehouse development and add truck services and storage
- Provide for mass transportation to increase access and improve economic development
- Build bus shelters
- Build sidewalks – use split rails
- No Big Rigs in R-1
- Improve school traffic
- Use split rail fencing (i.e. Norco looks appealing and not run down)
- Encourage carpooling by cleaning up rideshare area
- Encourage bus riding – bus shelters should have posted schedules at stops

Housing

- Create a public planning process to solicit input
- Limonite Ave and Pedley Rd area – Keep equestrian with 1/2 acre minimum for housing development
- Update existing apartments and maybe build a few upscale ones along the 15 near existing condos
- Code enforcement on existing housing
- Develop self-contained housing development that includes stores, shopping inside the development
- Provide affordable housing opportunities for young adults just out of school
- Build mixed use – live/work housing with retail
- Keep housing mixed use
- No high density housing
- Limit high density housing
- Limit high density housing
- Keep housing in the interior and be sure there is access to parks with recreation facilities

Conservation

- Maintain existing equestrian areas
- Get rid of chickens and fighting cocks
- Traffic signals in appropriate places
- Maintain parks and new improvements
- Air quality
- What happened to the soccer field on Camino Real?
- Preserve bike trails, horse trails, sidewalks
- Install drought tolerant landscaping
- Where are the power lines going?
- Edison lines the substation?
- Maintain outsiders perception of our city from main streets
- More water conservation programs

Open Space

- Bear Valley Golf Course – is there a replacement?
- Developed housing of De Anza Golf Course (Paradise Knolls)
- Keep the hillside pristine – build walking trails
- Build bike trails, equestrian trails
- Install sidewalks in school areas
- Can the streets support new growth?
- Walking trails and parking in our own hills
- Add youth center area on west end
- More walking trails, horse trails on side of Santa Ana River
- Maintain current open space
- Keep open spaces in interior – put development along the freeways as indicated when we voted on cityhood
- Maintain our open areas and upgrade access to trails and river bottom
- Preserve the river bottom area
- Preserve Horseshoe Lake Park
- Preserve open spaces
- Develop open space for park and recreation usage – horses, hiking, biking
- Preserve hills as open space and for visual beauty

Noise

- Stop the noise
- Code enforcement a must!
- Improve quality of life
- Enforce NOISE regulations – increase fines to whatever they were in the county a few years ago
- Noise from blocks away plagues Sky Country – Let's get this under control by making it very expensive to be a repeat noise offender

Safety

- Minimize trucking
- People do not stop for stop signs – kids nor vehicles
- Improve air quality – reduce asthma in community
- More traffic lights
- City needs to own fire station and rent back to county
- Not enough law and code enforcement
- Relocate Mira Loma Village
- Belltown homeless issues and social services
- Jurupa/Pyrite street recently renovated, but storm drain is not working – it's flooding
- Jurupa/Pyrite – cars driving too fast on route to first
- Transportation artery development – cross town roads: Pedley, Pyrite, Opal
- Need bike trails/lanes
- Need cross walks
- Better traffic control at El Camino Elementary School
- Need crossing guard for Rustic Lane School
- Safety at Rustic Lane School – traffic goes too fast; parents don't respect traffic
- Stop endangering horses by riding them at night
- More sidewalks
- Traffic safety at schools
- More sidewalks
- More sidewalks
- Work on sidewalks and flooding
- More and safer pass-overs for horses across Limonite
- No sidewalks – need sidewalks
- Would like to see more street sweeping with set dates so cars are not on streets
- Homeless everywhere – looks bad, unsafe on riverbed on Mt. Roubidoux
- Graffiti issues
- More youth programs to prevent delinquency
- Develop homeless programs
- Homeless doggie gangs

Safety

- Private rodeos
- Control marijuana shops
- More law enforcement
- Eliminate shanty towns – use code enforcement
- Loose dogs – enforce microchip policy
- “I don’t want Jurupa Valley to be known as a town of marijuana and “vape” shops.”

Other

- Give Belltown a big uplift – sidewalks, beautification
- Allow zoning changes to be voted on
- Sales tax
- Build a Walmart at Pyrite and Mission
- Safety in Belltown – build sidewalks
- Beautification – lighting on Mission Blvd and Mission and Riverview
- City needs better efficiency and consolidation of services
- Power transmission lines (Riverside) West Commercial Zone
- Use Jurupa Community Plan as starting point
- To plan for the future, you need to understand the past – See Jurupa Community Plan Amended Effective Dec. 22, 1987
- Hold community cleanup events
- Improve School District Test Scores
- Do something about the stigma of Rubidoux – afraid to go to that area
- Overall financial rejuvenation to allow for community services
- One water district
- More bike trails and sidewalks
- More youth and senior services/programs – craft classes
- Opal-Rathke Dr storm drain gets blocked all the time – would like to see it cleaned more
- Perform a utility review
- What is the status of the Riverside Sewage Treatment Plant Lawsuit?
- Address poverty within the city
- Build a park with a water feature without costs to the residents – lake or pond
- Limit warehouse development – environmental concerns, traffic, and noise
- Do something about the homeless community
- Offer tax free incentives for a limited time for new industry jobs
- More redevelopment opportunities
- Cityhood – Is the city viable?
- More children’s activities – Boys/Girls Clubs, park department
- Maintain separate community identities and representation
- Better outreach/involvement/representation for Spanish community

Workshop 2 – January 12, 2015

26 Attendees:

Manuel Albarrah, Tono Albaarah, Mary Anderson, Mary Billimele, Angie Channual, Ernie Corral, Andy Degrood, Wayne Emery, Susan Fierro, Pat French, Wendy Hart, Kim Johnson, Mona Lara, Jackie Lee, Jeff Moroukian, Sharon Paisley, Vickie Ridgley, Winnie Salazar, Heather Salazar, Marjie Scott, Colleen Smethers, Judy Strickland, Richard Strickland, Dana Villerreal, Leon White, Morris Younathan

Land Use

- Create or build up “Main Streets”
- Develop area for special events/entertainment venues
- Build amphitheater
- Build sports complex
- Build hotels north of Hwy 60
- Provide venue for Farmer’s Market
- Create/zone multiple “Downtowns”
- Solicit sit-down family restaurants
- Solicit “classy bar” venues with live music
- Solicit Government Jobs, Medical Jobs, R&D industries
- Build more movie theaters
- Retain rural atmosphere/sense of place
- Address needs for homeless community
- Solicit bringing new businesses to the city
- Preserve mix of urban and rural
- Explore expansion and best use of Metrolink Station
- Create venues to attract/bring entertainment to city
- Maintain large lots
- Build restaurants near Metrolink Station
- Solicit Target
- Solicit a drive-thru Starbucks
- Expand economic development
- Preserve/keep existing businesses open
- No more warehouses: they cause traffic/air pollution
- Build more recreation areas for youth/more soccer fields
- Strategically locate housing. It’s starting to feel dense.
- Why hasn’t Riverside Plaza been developed? We need more jobs.
- Preserve hiking trails (top of Lakeside)
- Solicit businesses like Cardenas, El Super, Superior markets
- Support small businesses by placing big boxes away from small business areas
- Build community college or satellite campuses
- Need an Urgent Care!
- Solicit Chinese restaurants
- Build hotels or bed and breakfasts
- Solicit a Winco grocery store and/or Walmart Super Store
- We need a Chipotle and Chinese food

Workshop 2 – January 12, 2015

26 Attendees:

Manuel Albarrah, Tono Albaarah, Mary Anderson, Mary Billimele, Angie Channual, Ernie Corral, Andy Degrood, Wayne Emery, Susan Fierro, Pat French, Wendy Hart, Kim Johnson, Mona Lara, Jackie Lee, Jeff Moroukian, Sharon Paisley, Vickie Ridgley, Winnie Salazar, Heather Salazar, Marjie Scott, Colleen Smethers, Judy Strickland, Richard Strickland, Dana Villerreal, Leon White, Morris Younathan

Land Use

- Create or build up “Main Streets”
- Develop area for special events/entertainment venues
- Build amphitheater
- Build sports complex
- Build hotels north of Hwy 60
- Provide venue for Farmer’s Market
- Create/zone multiple “Downtowns”
- Solicit sit-down family restaurants
- Solicit “classy bar” venues with live music
- Solicit Government Jobs, Medical Jobs, R&D industries
- Build more movie theaters
- Retain rural atmosphere/sense of place
- Address needs for homeless community
- Solicit bringing new businesses to the city
- Preserve mix of urban and rural
- Explore expansion and best use of Metrolink Station
- Create venues to attract/bring entertainment to city
- Maintain large lots
- Build restaurants near Metrolink Station
- Solicit Target
- Solicit a drive-thru Starbucks
- Expand economic development
- Preserve/keep existing businesses open
- No more warehouses: they cause traffic/air pollution
- Build more recreation areas for youth/more soccer fields
- Strategically locate housing. It’s starting to feel dense.
- Why hasn’t Riverside Plaza been developed? We need more jobs.
- Preserve hiking trails (top of Lakeside)
- Solicit businesses like Cardenas, El Super, Superior markets
- Support small businesses by placing big boxes away from small business areas
- Build community college or satellite campuses
- Need an Urgent Care!
- Solicit Chinese restaurants
- Build hotels or bed and breakfasts
- Solicit a Winco grocery store and/or Walmart Super Store
- We need a Chipotle and Chinese food

Housing

- No small lot housing
- Increase code enforcement
- Pride of ownership
- Keep rural life style
- Homeless programs
- Homeless programs to help get them off the streets
- Provide for mixed use
- Build senior housing communities
- Develop empty lots into housing

Conservation

- Preserve the cross at hillside (it's a city landmark)
- Conserve our natural resources
- Increase water supply for development
- Preserve and highlight our historic sites
- Preserve regional parks and cultural centers

Open Space

- Preserve openness/open space
- Develop multiple regional parks
- Provide city incentives for blighted properties
- Keep the hills as open space
- Maintain large lots
- Maintain open space
- Add bike/walkways like those in Fontana
- Preserve open and rural space
- Parks with walking trails (i.e. regional park like Yorba Linda Regional Park)
- Beautification and landscaping
- City has too few amenities
- Build amphitheater on hillside
- Keep hillsides rural
- More open space for animal keeping
- Keep the hills undeveloped
- Split streets to have horse trail on one side and sidewalks on the other
- Develop recreation trails
- Develop mountain bike trails
- Retain ridgelines
- Protect mountain tops
- More dog parks

Noise

- City should provide more information regarding ordinances (i.e. noise)
- Do something about cars with loud music

Safety

- Reconfigure traffic going in and out of Walmart
- Cars driving too fast
- More speed limit signs
- Horses and riders in the dark are dangerous
- Need more speed bumps
- Need more lighting in parks (lighting with park extended hours will reduce obesity in children)
- The need for more medical offices and an Urgent Care
- Street islands slow emergency response
- Widening Limonite by old Waste Water
- No more warehouse trucks on local roads
- We need more traffic signals; especially at schools
- Kudos to the city for installing signals near Granite Elementary School
- Camino Real/Limonite curb needs light or reflectors – numerous vehicles hit curb and blind area
- Need an Urgent Care
- More sidewalks with lighting like the ones on Limonite
- Decrease violence
- Decrease city blight
- Neighborhood Market parking lot should be one-way or have yield to safely drive
- Need trash cans on walking trails and bus stops off Limonite, Ave Juan Bautista to Clay

Other

- Need trash receptacles on street corners
- Need a Farmer's Market
- Hold fairs and more community events
- Proud of city crime rates
- Law enforcement is good
- Safe city
- We have great pride in our schools
- Mail info to households to promote more citizen participation
- Bring the parks department under the city
- Consolidation of water districts
- Consolidation of services
- More special events to bring in local business: rodeo, concerts, festivals, art
- Sense of community could be improved with more citizens participating
- Create a "Preserving our Rural Lifestyle" committee for Jurupa Valley (Have a good person running it, clean, civil, etc.)

Other

- Adopt “Shop Local” campaigns to support city business and jobs
- Provide incentives for businesses to come and stay in shopping centers
- More communication in Spanish is needed from city
- Do something about the graffiti
- Build a youth center on the west end of town
- Increase the number of businesses
- Designate/build a rodeo area
- More parks
- Community center
- Increase businesses by offering tax incentives
- Develop our education to cover high end jobs coming to Jurupa Valley
- This is not a very involved community
- Keeping businesses open
- Art classes for adults and children
- Community Theater
- More affordability to visit Jurupa Regional Cultural Center - \$8 per person is too much

Jurupa Valley Interim General Plan

Workshop 3 Rubidoux High School– January 20, 2015

14 Attendees:

Betty Anderson; Stephen Andersen; Cristina Flores; Anna Gamble; Melissa Gamble; Angel Hernandez; Estaban Hernandez; Karina Hernandez; Monica Hernandez; Ross Leja; Maria Montolfo; Diego Nunez; Linda Rither; Mona Vasquez

Land Use

- Need a hospital.
- Need more community centers.
- Need nice office buildings to attract white collar jobs.
- Don't cover every square inch with small lot development.
- More single family housing/no apartments.
- More stores like Target; Walmart.
- Build more shopping centers.
- Consistent zoning.
- Mix of residential and industrial.
- More sidewalks.
- More infrastructure improvements.
- More businesses, office space, and manufacturing.
- Create parking at 30th and Avalon in Rubidoux near AM/PM.
- Fence empty lots.
- More dining restaurants.
- Affordable housing to get people off the street.
- Fence empty lots.
- More recreational activity area; improve Memorial Park.
- Keep agriculture.
- More parks and recreation areas.
- More parks.
- More sit-down dining; fewer fast food chains.

Circulation

- Build bike trails.
- Stop semi-truck parking on small streets.
- Build bike trails.
- Build better roads.
- Need safe bike routes and bike lanes.
- Build bike trails.
- Improve traffic.
- Improve street sweeping.
- Improve street lighting.
- Improve sidewalks.

- Improve traffic!!
- Build more sidewalks.
- Street safety!!
- More street sweeping.
- Eliminate truck traffic on residential streets.
- Better park maintenance.
- Add left turn arrow on 30th street.
- Traffic at entrance/exit at Roubidoux has lots of queuing.

Housing

- 7,200 sq ft minimum for housing lots for medium density.

Conservation

- Preserve Jurupa Cultural Discovery Center.
- Preserve Rancho Jurupa Park.
- Preserve Santa Ana River camping site.
- Preserve hills from development.
- Protect our historical sites and structures.
- Keep the river wild, but put in more trails.

Open Space

- Better walking trails.
- Better horse trails.
- Better parks.
- Build baseball parks.
- More parks.
- Build waterparks.
- We need more parks for our residents.
- We need more multi-use trails.
- We need more use of the parks and trails during the evening.
- More parks; especially in the older areas.

Noise

- Homeless making noise at night.
- Fines for loud music.

Safety

- More street lighting.
- Public safety – more lights.
- No way to get to Riverside by bike.
- Safety.
- Street lighting.
- Clean up the city.
- More streetlights.
- No police response to homeless.

Other

- City needs the ability to attract new businesses that will provide good jobs for the residents.
- Golf.
- Preserve the Santa Ana River and hills.
- Separate residential from pollutions.
- Ticket abandoned vehicles.
- Build housing developments that speak to the recreation and exercise needs of the various ages.
- Minimum 7,200 sq ft. lots.

Jurupa Valley Interim General Plan

Workshop 4 Indian Hills Elementary– January 24, 2015

Attendees:

Lucinda Skinner, Mark Skinner, Ed McManus, Teresa McManus

Land Use

- Additional Shopping outlets
- Neighbor is horse breeder – 10 horses on property – unsanitary, unhealthy and law needs to be enforced.
- Rules should remain the same moving forward with two horses max per property
- Don't allow new developments to be built and then change the rules on horse allowance
- Enforcement on no commercial business in areas zoned residential
- City fines homeowner and homeowner continue to pay fines; city generates and collects revenue on the fines, but surrounding homeowners are not being helped and served.
- Consider large shopping center 1-15 Fwy. On the JV city side where there is vacant land.
- Grocery shopping is good
- Downtown Rubidoux should be addressed – very run-down; needs improving
- No matter what type of developments (residential and commercial) is built, let rural communities stand – let rural be rural.
- Keep industrial where it is located today
- Can agriculture serve a purpose?
- Residents don't want to be like an "Eastvale or Irvine
- Don't build on hillsides – leave them pristine and open
- They like what Norco did – it was established as "horse country" and has remained that way
- All new developments should be required to install xeriscape and/or drought tolerant landscape
- All new development should be required to use recycled water for irrigation
- Land uses must work together
- Keep higher-density developments closer to the Fwy.
- Determine what to do w/United Concrete Pipe property where homeless are located – determine if grounds are contaminated.
- Attempt to recruit an anchor such as Costco or Winco – it would bring good jobs
- Nodes – good access points

Circulation

- Improve traffic flow
- More development and housing equals more traffic

- Residents want truck-route closer to 60 Fwy.
- Expand Limonite in both directions
- Freeway system does not flow..always congested
- Access in and out of the City is too congested
- Van Buren should be three lanes
- Build a bridge on Van Buren and Mission
- Owners of big rigs (trucks) can park on their own property but not street parking

Housing

- Neighbor is horse breeder – 10 horses on property – unsanitary, unhealthy and a fire hazard; people need to follow the rules and the city needs to be enforce the law
- Enforcement on no commercial business in areas zoned residential
- Homeless issues is both an environmental damaging issue as well as a social issue
- Indian Hills and Jurupa Hills – many people own their home – not a lot of rental properties
- Mira Loma has a lot of rental properties

Conservation

-

Open Space

- Don't build on hills...leave them open

Noise

-

Safety

-

Other

- Not enough jobs
- Work on lowering water bills
- Loss of rural character
- Enjoy the various ethnicities
- Likes the current restaurant line-up
- Likes Jurupa Discovery Center

- Folks are proud of the weather, the hills, it's pretty, it's NOT Riverside, sunsets, people are friendly, small town and small town feeling...keep it that way
- Look into satellite campuses from UCR or RCC

Jurupa Valley Interim General Plan

Workshop 5 Sky County Elementary- January 26, 2015

Attendance:

Stephen Anderson, Guadalupe Belmonte, Jeff Blakely, Keith Hughes, Suzanne Hughes, Kim Johnson, David Lin (faxed form), Martha Martinez, Susan Sims

Land Use

- Need for a senior center
- More parks
- Nature Center is an asset
- Separation of industrial vs. residential
- Better restaurants (larger family sit-down)
- More Tech schools
- More office buildings equals job creation
- Need a skate parks
- Need more doctors and medical facilities
- Need an Amphitheater
- Need Retail: Kohl's, Penney's, Costco/Sam's Club
- Wedding Facilities, banquet halls
- Need horse industries
- Maintain 7/ acre at Armstrong & Sierra Ave.
- Need equestrian centers
- Education institutes (public, private, vocational, schools, etc.)
- Performing arts theater, music hall
- Need more churches
- Prohibit high-density housing
- Free indoor gym for residents

Circulation

- Too much traffic
- Get rid of truck traffic which will make the air cleaner
- Safety "law" enforcement on horses after hours
- Need sidewalks
- Proud of horse trails as it equals peace
- Trail connectivity must be looked at citywide
- Better traffic control measures
- Link animals and plants to river and ecosystem
- Increase trails
- Keep the underpass trail at Bain for River trail access
- Safe assin of wildlife

- Add bike lanes to roadways
- Make bridges pedestrian friendly
- Increase connectivity of trails and bike trails along streets
- Fix pot-holes

Housing

- More housing with large yards
- More agricultural opportunities
- Add more housing where housing exists today
- Keep housing separate from non-compatible condition uses

Conservation

- Figure out what are our historic buildings and preserve them

Open Space

- Plan for open space for children
- Wildlife corridors
- Preserve hills -don't allow development on them
- Encourage open space or at least half acre lots at Paradise Knolls
- Proud of open space

Noise

-

Safety

- No lights
- No sidewalks
- Clean up our City -more code enforcement in commercial and industrial areas
- More police security
- Speed enforcement
- Need speed bumps
-

Other

- Small city-opportunity for growth
- City should promote itself-advertise the water park, drive-in, regional parks, etc.
- More training opportunities eo le

- Sense of community -Nature, wildlife, hills, mountains
- **Programs for children -respect nature**
- **Quality of life – don't sell the city out for money**
- Lack of senior services
- Bad economy has driven away business
- Hang City flags on light poles
- Zero tolerance for graffiti
- Horse industry is being driven out by City and County
- **Sense of community -keep out too much industrial**
- We enjoy the dark sky to enable to see the stars

Jurupa Valley Interim General Plan

Workshop 6 Rubidoux Library – January 31, 2015

Attendees: 12

Wes Andree, Ron Jones, Chriss Jones, Lynn LaMonk, Laura Mae Leach, Cathy Livoni, Chris Miller, Bob Miller, Betty Newsom, Irene Rose Rael, Christine Rich, Frank Rich,

Land Use

- More trails – walking and horse
- Need senior center on west side of town
- More trails and horse trails
- Preserve and improve Flabob Airport – make it a destination
- No billboards
- Shopping opportunities – help increase revenue to the city
- A regional park w/multi-purpose use
- No more warehouses
- Plan for aged infrastructure
- We voted to make Jurupa Valley as a City – Keep it RURAL!! This was promised.
- Continue to allow land use for horses, agriculture and farm animals
- Need medical center
- More stores and casual restaurants
- Need mixed use shopping
- Need financial institutions
- Shopping Centers (Target, Walmart, etc.)
- A destination shopping center
- Amenities for new development (tract)
- Designate a down town
- Warehouses badly reduce the amiability of the entire City – try to find other businesses outside of warehouses to move in
- Sewage treatment needs improving
- More money for water services

Circulation

- Exercise trails
- Bike paths
- All walking trails should lead to at least one library
-

Housing

- Homeless housing and shelters
- Need housing w/amenities

- No condos or apartments
- Need disabled housing
- Affordable housing for workforce for 20's age group
- Need more apartment complexes and include play areas
- Housing away from freeways
- Need senior housing
- Homeless "camp" at Alta & Avalon by 60 Fwy.= need homeless shelter
- Reduce high density housing
- Amenities for new housing communities

Conservation

- Maintain and defend agriculture use
- Preserve hillsides
- Delhi Sands flower-loving fly-endangered – still in open fields east of Muriel Drive and near Kit Fox also

Open Space

- More parks and developed outdoor use
- Clean up of abandoned
- Leave current open space and hills open as animals are being increasingly restricted to smaller and smaller areas due to overbuilding

Noise

- Off-road vehicles practicing motocross in the hills and showing no courtesy to hikers
- All night parties
- Animal noise

Safety

- Traffic
- More code enforcement
- Speed bumps on our streets and sidewalks
- Have Sheriffs be more proactive in information about establishing CERT training and teams
- Need disaster preparedness
- More animal control services
- Safe route for school kids
- Security
- Allocate more money for police and fire
- Traffic on Limonite will increase the more the City develops – need to plan for the increased traffic.
- Sidewalks

- Invite major hospital
- More community response teams
- Safety = emergency preparedness for senior safety

Other

- Water-wise landscaping
- Voting booths
- Need jobs
- Control City growth
- Address homeless problem
- Consider making City business-friendly so public services can be funded by city business taxes
- Economic disparity of families
- Address vacant land and homeless community
- Build pride as a community
- Address old infrastructure
- Address economic disparity and divide

Jurupa Valley Interim General Plan

Workshop 7 Jurupa Valley High – January 31, 2015

7 Attendees:

Betty Anderson, Stephen Anderson, Javier Garcia, Gricelda Sanchez, Nancy Rasner, Michele Rodriguez, Irene Whitney

Land Use

- Need a hospital
- Keep warehouses away from schools and homes
- Less warehousing and more shopping
- Big box retail (Home Depot, Walmart, Sam's, Winco, Costco, Target, Ralphs)
- Industrial uses should focus more on manufacturing vs. warehouses
- Trails and parks for recreation, transportation and exercise
- More trails
- More banks needed

Circulation

-

Housing

- Keep our yards ¼ acre or more
- 7,200 sq. ft. lot size minimums (more than ½ acre)
- Affordable housing for families
- Keep industrial zoning away from residential areas

Conservation

- Water conservation should be a priority
- Develop a City Green program

Open Space

- More parks or community centers especially in Mira Loma and Pedley
- Emerald Meadows needs to be mall or other area
- More land conservation for mountains and rivers
- More trails

- More banks

Noise

- Noise from recreational vehicles on mountainside is problematic

Safety

- More street lights
- Need police patrols of the city to stop trash dumping (Canal Ave.)
- Need help cleaning trash and bulky items from my community (Canal Ave.)
- Need sidewalks (Canal Ave.)
- Need to control homeless encampments in my neighborhood (Canal Ave.)
- Need horse rider safety precautions – more lighted horse trails
- Need police or rangers to patrol area parks
- Flooded streets in Pedley and Mira Loma – not good

Other

- Representatives of City Council should represent various communities and should better understand our community
- We need Spanish translators
- City should promote and organize community clean-up days
- Horse arena with family amenities
- Community center with basketball courts, inside gym, swimming pool, etc.
- Clean-up loitering, public drinking at Jurupa Dairy
- Close up pot shops
- Homeless encampments in our area are terrible
- Need afterschool program to increase academic development and character

GPAC MEETING NOTES from 9/28/15 Meeting: Table Report-Outs
ECONOMIC SUSTAINABILITY AND HOUSING: ASSETS, ISSUES AND NEEDS

ECONOMIC SUSTAINABILITY

Question #1 What special economic assets in Jurupa Valley should the city capitalize upon?

Johnston Team

1. Vacant buildings
2. Available land
3. Location, Freeways I-15 & I- 60
4. Proximity to job centers
5. Airport
6. Golf courses
7. Santa Ana River/Recreation/Parks
8. Warehouse jobs/manufacturing
9. Railroad center – auto distributions
10. Logistics

Roughton Team

1. Vernola Market Place
2. Jurupa Spectrum
3. Rubidoux Shopping
4. Location to Los Angeles/Orange County areas
5. Flabob Airport
6. Golf Courses
7. Open land for many uses
8. Close to Colleges
9. Hub of consumer goods (shipping)
10. Recreational opportunities

West Team

1. Excellent Freeway Access, I-15 & I-60 with many off ramps
2. Vacant land - develop to highest use
3. Golf courses (5)
4. Metro Link Station - use rail spurs, rails vs. rigs
5. Santa Ana River Campground and Nature Center

Zavala Team

1. Flabob Airport
2. Ample vacant land
3. Vacant storefronts
4. Golf - Rancho Jurupa, Cove
5. Excellent transportation corridor

GPAC Team and Individual Meeting Notes

September 28, 2015

Question #2 What special economic challenges or constraints does Jurupa Valley face?**Johnston Team**

1. Vacant buildings
2. State funding
3. Population density
4. Lack of hospitals
5. Lack of medical
6. Lot sizes (narrow & deep)
7. Local jobs
8. Local shopping
9. Lack of higher education

Roughton Team

1. Reliance on retail (no jobs – no purchases)
2. Lack of high paying jobs
3. No nice hotels
4. Few nice restaurants to support tourism
5. “Look” of the city – facades and lots need to be updated and/or improved

West Team

1. Lack of retail
2. Vacant un-developed land
3. Hodge-podge of new and older tracts

Zavala Team

1. Need attractions
2. General storefront appearance
3. Mismanaged County Plans
4. Infrastructure in older developments
5. Community has a lot of communities
6. Air pollution is high
7. Freeway views

GPAC Team and Individual Meeting Notes

September 28, 2015

Question #3 What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Johnston Team

Promote:

1. Tech jobs, teaching
2. Gas stations at freeways
3. Manufacturing
4. Markets
5. Big Box
6. Call centers
7. Point of sale businesses
8. Medical
9. Entertainment Centers
10. Sports Centers

Discourage:

1. Pot shops
2. Junk yards
3. Any that produce hazardous waste/air pollution
4. Bars/liquor stores
5. Adult Entertainment

Roughton Team

Promote:

1. High tech industries
2. Bio engineering/Medical
3. Sustainable Farming/Renewable Energy

Discourage:

1. Trucking and Big Box due to smog

West Team

Promote:

1. Tech schools, Community College campus
2. Medical Centers or Hospital
3. Hotels/Convention Center
4. Event Centers
5. Name chain restaurants

Discourage:

Page 3 of 37

*GPAC Team and Individual Meeting Notes**September 28, 2015*

1. No fast food restaurants
2. No mobile home parks

Zavala Team

Promote:

1. Medical facility
2. College/Tech Schools
3. Office suites
4. Data Centers
5. Eco Tourism, Green Businesses
6. Grocery Variety
7. Non-profit/Social Services

Discourage:

1. Warehouses
2. Pot shops and vice shops
3. Polluters

Question #4 What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

Johnston Team

1. Vacant land along 15 Freeway and 60 Freeway/Hotels
2. Emerald Meadows - shopping/mixed use
3. Pyrite/I-60 - shopping
4. Pedley/I-60
5. Camino Real/Mission
6. Mission/Crestmore
7. Mission Plaza - shopping and apartments
8. Pedley/Mission - Medical & shopping
9. River properties - parks

Roughton Team

1. Corridor along 15 Freeway and 60 Freeway
2. All Freeway exits
3. Emerald Meadows site
4. City Hall area
5. Mission Blvd. & Rubidoux

GPAC Team and Individual Meeting Notes

September 28, 2015

West Team

1. Push for development at Emerald Meadows Site (housing, shopping, restaurants, hotel and/or Medical Center or Hospital)
2. City Centers in each individual community

Zavala Team

1. Clay
2. Pedley and I-60
3. Cement Plant
4. I-60 corridor
5. I-15 corridor
6. Emerald Meadows
7. Dump/Landfill

Question #5 What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

Johnston Team

1. Habitat Partnership
2. Grants – such as Safe Routes to School
3. Solar partnerships/incentives
4. Private/Public partnerships
5. AB2 - infrastructure financing & community revitalization
6. Cap & Trade housing money

Roughton Team

1. Whatever the City can afford

West Team

1. Educate businesses
2. Tax incentives
3. Rehabilitation tax credits
4. Job creation tax credits (similar to Ontario's program)

Zavala Team

1. Discounted fees for High Need Industries
2. Occupational Housing incentives
3. Utilize CREA

GPAC Team and Individual Meeting Notes

September 28, 2015

Question #6 What should be the City's "brand" in terms of portraying the public and visitor image, attractions, overall character? How could the City help establish and promote this?

Johnston Team

1. Semi rural to Urban
2. Diversity
3. "Community of Communities" (golfing, equestrian, sports, Flabob airport)

Roughton Team

1. City of Adventure
2. Big City attractions
3. Home town appeal (golf courses, winery, airport)
4. Advertise – AAA Tour Book, videos, web sites, travel agencies, YouTube, tri-folds
5. Visitor Center

West Team

1. Farm Town to Big City, Rural meets Urban
2. Combination – nature, city, equestrian, home grown feel, and easy living
3. Regular activities – art, music, farmers market

Zavala Team

1. Outdoor/Nature Leisure
2. Opportunity for growth

Question #7 What are the City's principal housing assets?

Johnston Team

1. Diverse housing stock

Roughton Team

1. Lots of available land
2. Big lots – equestrian existing
3. Scenic
4. New Development
5. Hometown Jurupa Hills
6. Bravo
7. Old Plantation

GPAC Team and Individual Meeting Notes

September 28, 2015

West Team

1. Single Family Residential
2. New Development - Limonite at Pats Ranch Road, I-15 and Santa Ana River, Bellegrave at I-15
3. Very high end homes (Hilltops at Indian Hills)

Zavala Team

1. Diverse mix
2. Large lots

Question #8 What are the City's main housing needs?

Johnston Team

1. Senior Housing
2. Replacement of aging homes
3. Estate Homes
4. New housing - both affordable and in a nice area
5. Rentals/apartments, townhomes, condos
6. T.O.D. – Transit Oriented Development

Roughton Team

1. Update old ugly housing
2. Affordable entry level housing
3. Affordable housing for families
4. Dedicated zones to preserve equestrian/animal keeping

West Team

1. Affordable Senior Housing
2. Affordable apartments
3. Low density patio homes with full amenities

Zavala Team

1. Multifamily type
2. Large common areas
3. Near Retail

Question #9 What types of multi-family housing could best fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

Johnston Team

1. Multi Family Housing
2. Apartments accessible to freeways and major thoroughfares
3. Townhomes and condos – close to shopping centers

Page 7 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

4. Garden Home Community near parks

Roughton Team

1. Mix new smaller housing in areas with existing small lots
2. Near commercial and retail centers
3. Near work centers

West Team

1. Granite Hill/Pyrite
2. Limonite/Etiwanda and Wineville
3. Affordable Senior Housing
4. Affordable apartments
5. Low density patio homes with full amenities

Zavala Team

1. Multifamily types with large common areas and near retail

Question #10 How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with single parent households, and homeless persons and families? In what areas should these housing needs be located?

Johnston Team

1. Multigenerational 2nd units – a few within each development
2. Senior Housing with accommodations for disabled transportation
3. Homeless (?)
4. Safe housing for single female head of households – apartments, condos, HOA, maintenance

Roughton Team

1. Tax credit for affordable housing for families
2. Entry level single family homes
3. Homeless – create opportunities for housing for those who desire help – work with Social Services and Non-profit groups
4. Set goals for a specific percentage of apartments to be for special needs

West Team

1. Add more high end independent living and assisted living centers
2. More housing near and around shopping centers

Zavala Team

1. Special Needs – children - not segregated

GPAC Team and Individual Meeting Notes

September 28, 2015

Question #11 Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

Johnston Team

1. Metrolink area
2. Freeway access areas
3. Mission Blvd.

Roughton Team

1. Work/live units in downtown Rubidoux and Glen Avon
2. Emerald Meadows
3. Vernola Marketplace
4. Mission and Riverview Center (old Metro site)
5. Lots along Avalon Street
6. Area near city border off Rubidoux

West Team

1. Along Mission Blvd (similar to Market in downtown Riverside)
2. In areas of new development where housing needs are required

Zavala Team

1. Mixed Use
2. Along Mission in Rubidoux

JH, 11/4/15

**Individual Comments/Notes 9/28/15 Meeting
(Grouped by Committee Member name)**

ECONOMIC SUSTAINABILITY AND HOUSING: ASSETS, ISSUES AND NEEDS

ECONOMIC SUSTAINABILITY

Joe Forgiarini

- 1. What special economic assets in Jurupa Valley should the city capitalize upon?**
 - a) Freeway access/Metrolink/airport/rail corridor
 - b) Available land/vacant buildings/warehouses
 - c) Proximity to job centers and airport (Riverside, San Bernardino, Ontario etc.)
 - d) Golf Courses/Santa Ana River
 - e) Auto off-load center/distribution – Mira Loma Logistics
- 2. What special economic challenges or constraints does Jurupa Valley face?**

Page 9 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- a) Low average income
- b) Shape and distribution of available land
- c) Low population/density
- d) Empty buildings and age of housing
- e) Lack of medical facilities
- f) Local vs. commute employment
- g) Lack of retail/hospitality
- h) Lack of higher education facilities

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Transportation
- b) Manufacturing/automotive
- c) Education
- d) Retail/Entertainment
- e) Housing construction
- f) Medical
- g) Technology/Call Centers

Discourage:

- a) Hazardous waste
- b) Junk yards
- c) Pot shops
- d) Bars

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Sites near key transportation corridors such as:
Stringfellow manufacturing, Mission/Rubidoux and Mission/Crestmore,
Riverview, Riverside Cement manufacturing, Pedley/ I-60 (shopping),
Pyrite/I-60 (shopping)
- b) Cove redevelopment – Mission/Camino (entertainment)
- c) Pedley/Mission (medical, retail)
- d) Emerald Meadows (shopping/mixed use)

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Auto industry – stop railing them here
- b) Build them here – Grants not sustainable /restrictive
- c) Habitat partnership
- d) Safe Routes to Schools

Page 10 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- e) Solar installations
- f) Public promote partnership
- g) AB2 Redevelopment reintroduced
- h) Cap and trade

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Best mix of urban and rural
- b) Horse community
- c) Golf communities
- d) Be clear about what goes where
- e) Bedroom community

7. What are the City's principal housing assets?

- a) Nil
- b) Needs major reinvestment over time

8. What are the City's main housing needs?

- a) Senior Housing
- b) Need major reinvestment over time
- c) Aging housing stock
- d) More maintenance
- e) Rentals/apartments/townhouses/condos

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Must go only on/near key transportation corridors
- b) Apartments
- c) Senior Housing

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Must go on key transportation corridors
- b) Near retail/medical facilities
- c) Improve economy and reduce need for some of these

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

Page 11 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- a) Full length of Mission Blvd.
- b) Limonite at Metrolink/Van Buren
- c) Freeway access

Diana Fox

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Development of tourism from natural assets
- b) River, canyons, hills, eco-tourism, art
- c) Connectivity to freeways and Metrolink
- d) Open land
- e) Re-focus warehousing to green technologies

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Overbuild warehousing
- b) Education levels
- c) Out-going migration to go to work each day
- d) Air Quality
- e) No connectivity/walkability/bikeability to shopping
- f) Dangerous high-speed street traffic that discourages commerce

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Promote:

- a) Eco-tourism
- b) ARS
- c) Green business
- d) Non profits and Social Services
- e) Technology/IT
- f) Medical facilities, Colleges/Satellite campuses

Discourage:

- a) Polluters
- b) Substance use, head shops, smoke shops, overconcentration of alcohol and marijuana

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Major retailers at Van Buren & Clay – and other off ramps at I-60 and I-15
- b) Costco & Sam's and restaurants – master planned
- c) Car dealerships (new cars) or used car super stores (CarMax) for tax base
- d) Along nature routes - promote Jurupa Valley as eco-destination - inviting

Page 12 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- people to play here when going to Ontario or Riverside
- e) Need hotel development

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Under the new CRIA's look at all applications and stay away from eminent domain unless for extraordinary purposes.
- b) Attract more office space with widest array of tenants to diversify economy
- c) Incentives for student loan repayment to attract more primary care health professionals
- d) Give incentives to developers that will build shopping centers and other attractions that include complete streets and other health promoting amenities.

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Build on natural, nature, great outdoors, freedom, health

7. What are the City's principal housing assets?

- a) Diverse

8. What are the City's main housing needs?

- a) More high end condos, apartments, and multi-family housing so that we can have more retail, dining and cultural amenities.
- b) Need higher income people who want to shop, recreate and dine here.
- c) Need more people so we can have more amenities
- d) More high quality, low income housing
- e) Housing developments with health features
- f) Better maintenance of properties

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Located throughout the city - not segregated
- b) Single level to facilitate aging in place even if on multi-floor buildings
- c) Large common areas so that families have a stimulating area to recreate, gather and socialize to build connectedness.

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

Page 13 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- a) Ensure access to availability of childcare for working families and single head of households.
- b) Locate them throughout the community – not segregated
- c) Social Services

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) By the freeways, Metrolink station and major shopping or city centers

Susanna Hughes

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Vacant land – develop it to highest ROI (Return On Investment)
- b) Golf courses – capitalize on their use and build up adjacent retail and services
- c) Natural/nature preserves – capitalize on their use and make them “destinations”
- d) Locations adjacent to main highways/freeways – reserve vacant land immediately adjacent to highways and freeways for high-end retail – capture “freeway shoppers”
- e) Rail Spurs – accessibility to rail spurs throughout the city could be a key selling/developing point to investors and companies looking to relocate to Jurupa Valley (rail vs. rig)

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Vacant small pockets of undeveloped land
- b) Oversized residential lots that are grossly underutilized
- c) Lack of retail that brings folks into the city versus local folks leaving the city to shop
- d) Lack of sufficient tax dollars to properly implement growth
- e) Percent of lower median income

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Large big box: Costco, Sam’s Club, Super Walmart, Target
- b) Medical centers, hospitals, doctor groups, surgery centers
- c) Education: Tech schools, Jr. Colleges, Universities, warehouse distribution centers, e-commerce
- d) Financial district/Institutions
- e) Mom and Pop stores
- f) Restaurants (name recognition – Islands, Chili’s, Applebee’s etc.)

Page 14 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- g) Hotels
- h) Auto Mall
- i) Recreational (equestrian event center, sports arena, performing arts center)

4. What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Areas where “live/work” development could be developed. Residential over retail (or close proximity). Think Rancho Cucamonga areas around Day Creek or Riverside, La Sierra/River Walk.
- b) Shopping mall with well known retailers – think Dos Logos, Riverside Plaza, The Streets (Brentwood)
- c) Create a mini “City Center” within each individual community that is governed by the larger Jurupa Valley City.
- d) Areas to consider: (These areas are examples of places to consider live/work, mixed use, shopping, medical, hotels, etc.)
 - Land south of I-60 between Agate and Vernon Ave., north of Mission
 - Land south of I-60 between Pyrite and Camino Real, north of Mission
 - Opal and 45th
 - Limonite Frontage Road and Maverick Lane
 - Beach and Limonite

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Educate businesses
- b) Tax incentives and fee assistance
- c) California Competes Tax Credits (rehabilitate historical buildings)
- d) Rehabilitation Tax Credits
- e) Hiring and sales tax credits
- f) Job creation tax credits (Ontario does this)

6. What should be the City’s “brand” in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) A well-rounded combination of nature, city, equestrian and “home grown” feel. “Easy Living”
- b) Farm town to big city/rural meets urban
- c) Middle class with natural/recreational elements
- d) Where the blue collar worker plays

7. What are the City’s principal housing assets?

- a) Single family residential
- b) Large lots
- c) Ability for some to have animals

Page 15 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

8. What are the City's main housing needs?

- a) Senior housing – affordable and upscale
- b) Live/work communities
- c) Apartments (\$\$ friendly, but still upscale)
- d) Revitalized neighborhoods

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Live/work communities (redevelopment of areas that are in severe need of reinvention). Land would probably have to be taken by eminent domain.
- b) Affordable and upscale senior housing developments (condos and duplexes in areas where mobile homes exist)
- c) Stretch of vacant land on Limonite between Etiwanda and Wineville and areas at Granite Hill and Pyrite

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Why discriminate? All of the groups listed are regular human beings. I am not sure I fully understand the intent of the question.
- b) The only group I would address is the homeless persons and their families. The City could work with the different local churches (all denominations) to help these folks. For safety reasons basic laws and ordinance should still be implemented to discourage panhandling, begging, etc.
- c) I would love to see our City be one of the first to help create a program to identify and assist these folks. Some of them truly need help, and others only take advantage of the generosity of others.

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Yes, yes, yes!!!! Live/work and Mixed-Use
- b) Areas to consider: (these areas are examples of places to consider live/work, mixed-use, senior housing, shopping, medical, hotels, etc.)
 - Land south of I-60 between Agate and Vernon Ave, north of Mission
 - Land south of I-60 between Pyrite and Camino Real, north of Mission
 - Opal and 45th
 - Limonite Frontage Road and Maverick Lane
 - Beach and Limonite

Page 16 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

Robin Kilcoyne

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Available land
- b) Vacant buildings
- c) Freeway, airports and trains are nearby
- d) Golf courses
- e) Warehouses and manufacturing
- f) Space for colleges

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Empty buildings/storefronts
- b) Need colleges
- c) Lack of hospitality
- d) Lack of medical centers
- e) People commute out of town for jobs, shopping and entertainment
- f) Lot sizes/shapes make storefronts difficult
- g) Need nicer restaurants

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Shopping centers, medium box centers (Smart & Final)
- b) Call Centers and small businesses for sales tax
- c) Tech and Medical businesses
- d) Entertainment and restaurants

Discourage:

- a) Hazardous waste and air pollution (trucking through town)
- b) Drug dispensaries
- c) Junk yards

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Along freeways and exits for strip malls and business parks
- b) Senior amenities near senior homes
- c) Parks with walking trails and places to gather for activities other than sports (checkers, ponds, exercise)
- d) Cement Plant and Land Field – Sports Arena/Concerts

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

Page 17 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- a) Federal and State grants
- b) Solar incentives for city properties
- c) Agreements with other cities – public/private partnership
- d) Colleges to keep people in town

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) City of small communities/community of communities - but as the city grows, the demographics will change
- b) Equestrian, farm, senior, civic center, arts, winery
- c) Outdoor play areas
- d) Visitor handouts to realtors of what the community has to offer

7. What are the City's principal housing assets?

- a) Senior areas have room to expand
- b) Diverse housing types
- c) Family areas have room for planned parks and routes to schools, libraries and entertainment

8. What are the City's main housing needs?

- a) Refurbish older homes
- b) Better planning of where high-density housing can be placed instead of putting them within blocks of rural homes. Plan the big picture before just approving because a developer submits a design.
- c) Home planning needs to include parks and school access plans.
- d) Family areas need planned parks and routes to schools, libraries and entertainment.

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) No high density near horse property or freeways (next to freeways should be businesses for tax dollars)
- b) New homes need to be planned with schools in mind. Not build houses and then consider schools as an after thought.
- c) Apartments near schools/colleges that should be built in our city

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) ADA laws address disabled persons issues

Page 18 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- b) HOA's help single head of households repair homes
- c) Child Care areas and Community Centers
- d) Sidewalks and bus access to connect to shopping

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Near transit areas where apartments can be above businesses.

Diana Leja

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) We have a core group of citizens who understand the importance of shopping in Jurupa Valley
- b) The City and the Chamber of Commerce should work together to reinforce that philosophy in an organized and thought out program – encouraging merchants and residents to participate in a “Shop in Jurupa Valley first” program
- c) What do we have in Jurupa Valley that people from other cities are willing to travel to?
- d) What types of industries are most profitable to the city?
- e) ADA laws address disabled persons issues
- f) HOA's help single head of households repair homes

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Not enough concentration of rooftops to attract retail
- b) Eastvale development, Riverside development draws people and new development out of Jurupa Valley
- c) Previously approved development by the County – “Nimby”

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Manufacturing
- b) Retail, Restaurants, Entertainment
- c) Medical facilities
- d) Professional office space and suites
- e) Furniture, office supplies

Discourage:

- a) Warehouses
- b) Street vendors
- c) Medical Marijuana

GPAC Team and Individual Meeting Notes

September 28, 2015

- d) Smoke shops

4. What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Glen Avon – has great potential for new development including retail, restaurants, entertainment, professional space, etc.
- b) Agua Mansa - manufacturing

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Tax incentives, grants
- b) Develop categories of desired business types and create incentives based on the current desire, such as incentives, streamlined permit process, etc.
- c) Housing credits for professionals

6. What should be the City’s “brand” in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) While we value our rural life style we need to bring in diversity in order to thrive. We need to promote the city as the place that has the greatest opportunity for growth in Sothern California

7. What are the City’s principal housing assets?

- a) Variety of lifestyle options, including rural and large lots with animal keeping
- b) Housing that fits the needs of growing families, as well as those who wish to downsize
- c) Locations: including golf course living, near public transportation and freeway access

8. What are the City’s main housing needs?

- a) Balanced growth and type of homes (create limits on senior or low income, mobile homes, multi-generational new developments)
- b) Housing attractive to families and professionals with moderate to high income

9. What types of multi-family housing could fit Jurupa Valley’s community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) What is the demand?

Page 20 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) How does our senior housing compare to averages and population?
- b) How does our affordable housing averages compare to surrounding areas?
- c) Is this the direction that we want to increase in housing?
- d) What kind of impacts would that have on future development?

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) This exists currently (63rd Street, Eucalyptus St. area, Pedley Road area)
- b) How much do we want, and what types of business do we want to encourage?

Donald Oaks

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Clay Street property
- b) Riverside Cement Plant
- c) Area off Mission Blvd. where Club Metro use to be, Mission/Riverview
- d) Empty buildings (albatross)
- e) High number of commuters
- f) Flabob Airport
- g) Rail line
- h) Field of Dreams
- i) The Cove
- j) Low education level
- k) Golf Courses, Parks
- l) Need Hotel

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Views of the 50 Freeway
- b) Retail
- c) Vacant buildings
- d) People dumping trash on Felspar and other hidden streets
- e) Hotels
- f) Medical facilities
- g) Local jobs

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Page 21 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

Encourage:

- a) Whole Foods, Trader Joe's, Wahoo's Fish Tacos
- b) Popular clothing Stores (i.e. Tilly's, Marshall's, Ross, TJ Max, Home Goods)
- c) Popular restaurant franchises (i.e. Panera Bread, Panda Express)
- d) A non-alcohol type of venue for bands to play that local teens can attend
- e) Medical Centers

Discourage:

- a) Cannabis Shops
- b) Fast food eateries
- c) Repair centers off 60 Freeway

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Clay
- b) I-60 and Pedley
- c) I-60 and Pyrite
- d) Mission/Riverview – Whole Foods
- e) Clay/Limonite – Trader Joe's or Sprouts
- f) Mission Plaza

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Tax incentives or tax credits for water - saving landscaping
- b) New business seeking funding
- c) Grants for higher education schools in the city (Trade School)
- d) Stream line permit process

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Along the 60 Freeway
- b) Rubidoux Nature Center needs to bring back Haunted Trail at Halloween
- c) Need to target a "Family Brand"
- d) North of Limonite East of I-15. What are the current plans?
- e) Growth

7. What are the City's principal housing assets?

- a) Apartments by Lowe's
- b) All new home construction (land)
- c) Horse property in Sky Country
- d) Senior Housing
- e) Estate homes

Page 22 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- f) Mid price homes
- g) Starter homes

8. What are the City's main housing needs?

- a) Housing for the younger generation
- b) Rentals
- c) Estate homes
- d) Mid Priced housing
- e) Starter home prices

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Horse property
- b) Freeway accessible
- c) Close to markets and shopping
- d) All types of multi-family housing (apartments, condominiums, duplex, garden apartments
- e) Walking access to shopping, and retail

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Mission/Riverview Rubidoux
- b) Country Village
- c) New Elderly housing
- d) Female Head of family is not necessarily a special housing need
- e) Homeless: What is the law? How do you address?

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Mission Blvd./Riverview
- b) Limonite
- c) Residential above and business below (like Market Street in Riverside)
- d) Metrolink area

Chris Piper

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Multiple points of entry
- b) Major rail line through the center of the city

Page 23 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- c) Excellent and mostly isolated industrial zones

2. What special economic challenges or constraints does Jurupa Valley face?

- a) High number of communities, keeping some spending away from home
- b) Existing retail is spread out between many small and varied commercial areas
- c) Already high air pollution limits some industrial growth

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Daytime office jobs
- b) Data Centers
- c) Medical Facilities

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Inactive landfill site (73 acres) Zoned N-A, LUD PF – owned by the County EDA
- b) Clay Street Industrial property (69 acres) zoned M-56, LUD LI
- c) Emerald Meadows (230 acres) Mixed zoning and LUD based on approved County Specific Plan #337
- d) Riverside Cement (292 acres) Zoned M-H, LUD HI with 6 acre lake

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Discounted start-up fees (permits, zoning etc.) for select "high-need" industries

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Outdoor Leisure – need to improve the parks and complete the trails
- b) Neighborhoods

7. What are the City's principal housing assets?

- a) Varied quality of single family housing
- b) Large lot properties - unique in region

8. What are the City's main housing needs?

- a) Better mix of housing types. Currently very segregated

Page 24 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Apartments/condos with closely tied outdoors activities

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) No Response

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Build closer to existing commercial centers

Edwin Quinonez

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Galleano Winery
- b) Flabob Airport
- c) Field of Dreams
- d) Five Golf Courses
- e) Vacant land
- f) Freeway access

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Low job to housing ratio
- b) Need for additional infrastructure (i.e. Sewer, storm drain, full streets)
- c) Does not have single designated downtown shopping area

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Medical facilities and hospital
- b) College
- c) Office space

Discourage:

- a) Additional warehouse project then have already been planned/approved

GPAC Team and Individual Meeting Notes

September 28, 2015

4. What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Vacant land north of 60 freeway for shopping
- b) Emerald Meadows

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Fast track project – streamline approval process

6. What should be the City’s “brand” in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Develop marketing plan

7. What are the City’s principal housing assets?

- a) Single family residential – larger lots

8. What are the City’s main housing needs?

- a) Senior Housing
- b) High end housing/incomes

9. What types of multi-family housing could fit Jurupa Valley’s community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Apartment communities with recreational features

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) No Response

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Mission Blvd and Rubidoux

Brenda Reynolds

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Vernola Marketplace, Jurupa Spectrum, Downtown Rubidoux shopping

Page 26 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- b) Galleano Winery
- c) Flabob Airport
- d) All the local golf courses
- e) Discovery Center, Jensen Ranch, Crestmore/Anza Park, Rubidoux Nature Center
- f) All public parks

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Not enough retail stores, grocery stores or restaurants
- b) We have all these unique opportunities: golf, fly, camp, dinosaurs, wine, historical and equestrian but no one knows – need to make the City a destination
- c) No hotels and few restaurants to support tourist
- d) Need to improve the look of the city and facades of buildings
- e) Need to improve the look of some of the older trailer parks on Mission Blvd.
- f) Homes sitting on dirt lots with no amenities

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

- a) Retail, grocery, hotels, restaurants
- b) Hospitals, Medical clinics, dentist
- c) Limit big box warehouses and trucking companies – due to smog impacts
- d) Keep the “pot” shops either to a minimum of keep them out. If they are allowed they should be limited and have increased taxes and business license fees and be subject to inspections and monitoring, all of which they should pay for.

4. What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) The corridor along the 15 Freeway, Pats Ranch Road – Retail, Shopping, hospital, medical offices, office suites, live theater and community center
- b) All freeway exits, the land at the northeast corner of Mission and Crestmore right before the bridge would be nice for a hotel.
- c) The old Emerald Meadows site – housing, retail, a big box store (like Costco or Sam’s). Large Community Park with sports fields and a community center.
- d) Area around City Hall for a Civic Center
- e) Mission Blvd and Rubidoux – shopping center, community park and center

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Whatever the City can afford

Page 27 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) The City of Many Adventures
- b) Central Inland Valley City of Opportunity
- c) Something for Everyone
- d) Lots to Offer
- e) Big City Attractions – Home Town Appeal
- f) Advertise, advertise, advertise (AAA Tour book, Website advertisement, Travel agencies, Video, television, You Tube
- g) Tri-folds at other areas that have attractions,
- h) Creation of a Visitor Center and Billboards
- i) But first get some nice hotels
- j) Come for the golfing stay for the vintage airplanes
- k) Come meet the dinosaurs and then taste the wine
- l) Historical adventures during the day, drive-in movies at night

7. What are the City's principal housing assets?

- a) Existing senior housing projects- on Mission Blvd, Mission Village, Country Village, etc.
- b) Equestrian lots – homes and lots that allow animal keeping
- c) Standard housing throughout the community and the new development projects
- d) I do not consider that most of the present apartment buildings are an asset. They do not provide amenities, some are not well maintained and they are expensive.
- e) Bravo Estates, Hometown Jurupa Hills, Old Plantation mobile home parks

8. What are the City's main housing needs?

- a) Affordable entry level housing, affordable apartment for families
- b) Dedicated areas and zones to preserve equestrian/animal keeping sphere
- c) Suggestions – affordable tax credit housing for multi-family
- d) For single family – possibility of providing "silent seconds" to police, fire, county, city and district employees to attract them to the city. The person should have to live in the home for a minimum of 3 to 5 years and the silent second is due and payable upon the sale of the home. Provided a percentage of this type of home is for low-income residents.
- e) Partner with Habitat for Humanity for "sweat" equity housing for low-income residents.

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

Page 28 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- a) All of the above – mixed in with the smaller lot projects
- b) Nearer the freeways with set backs and ways to offset the air pollution
- c) Near commercial/retail centers – like the upcoming Mission Shopping Center. Near the K Mart Center, the Spectrum and Vernola Marketplace
- d) Affordable housing near work centers provides housing for the workforce.

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) I feel we have enough senior housing. We need multi-family apartments. They should provide options for the number of bedrooms to accommodate a variety of families.
- b) Tax Credit Affordable Housing – best product, well maintained, amenities (see above for locations)
- c) Entry-level single-family homes (outside of the equestrian spheres).
- d) Since some homeless do not want assistance – I am not sure what to do or where to locate.

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Emerald Meadows Land
- b) Vernola marketplace
- c) Mission and Riverview shopping center
- d) There are several lots on Avalon Street where it appears this may be possible and there are areas near the City border off of Rubidous Blvd.

Iris Sanchez

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Location! Close proximity to Los Angeles, Orange County, San Bernardino and San Diego Counties.
- b) Land! Lots of open lots that can accommodate housing, businesses, and open space uses.
- c) Close proximity to major colleges and universities affording the city a pool of a highly educated and advanced skilled workforce and residential tax base.
- d) Part of the hub of consumer goods shipping and receiving for Southern California and other parts of the West Coast.

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Reliance on retail consumer goods based economy.
- b) Lack of advanced high paying career options that will recruit and retain graduates from local colleges and universities.

Page 29 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- c) City needs to have a diverse economy that will ideally withstand the brunt of major economic downturns in the future. Ideally, the City would work toward a progressive approach toward creating an as much as possible self-sustaining economy.

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

- a) High-tech Silicon Valley type of startups and Corporations
- b) Bio-engineering/Bio-medical
- c) Sustainable Agriculture
- d) Renewable Energy
- e) Continue with retail and consumer goods shipping and receiving
- f) Discourage black market underground economy

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) No Response

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) No Response

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) No Response

7. What are the City's principal housing assets?

- a) Big lots and lots of open space for new development
- a) Certain areas of the city that can benefit from gentrification
- b) A semi-blank canvas to create an ideal look and feel to the city

8. What are the City's main housing needs?

- a) Affordable Housing
- b) Smaller single family starter homes
- c) Multi-family dwellings

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Garden homes
- b) Refurbished 1920's - 1950's style bungalow multi-family dwellings

Page 30 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- c) Update/limit mobile home parks to modern manufactured home communities

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Special needs housing should be located in close proximity to any public, social services offices, and/or public transportation, schools, etc. that are frequently used or needed by the group in question. Ex: more senior housing close to senior centers.
- b) Address halfway house location regulations
- c) Work with nonprofits and social service groups to address needs

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Work-live units in Downtown Rubidoux

Rosa Sufuentes

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Multipurpose Equestrian Arena, Boarding-Rental Stables
- b) Farmers Markets
- c) Flabob Airport

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Lack of jobs
- b) Higher Education
- c) Hotels
- d) Schools

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Nice restaurants
- b) Hotels
- c) Hospital

Discourage:

- a) Trucking businesses
- b) Manufacturing warehouses

GPAC Team and Individual Meeting Notes

September 28, 2015

4. What special “Opportunity Sites” (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Emerald Meadows Site
- b) Costco/Sam’s
- c) Pyrite open lot

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Solar/energy saving homes
- b) Water tolerant gardens

6. What should be the City’s “brand” in terms of portraying the public and visitor image, attractions, overall character? How could the City help establish and promote this?

- a) Rural equestrian open space feel
- b) “Community of communities”
- c) Visitor Center

7. What are the City’s principal housing assets?

- a) Open space for future business and recreation
- b) Big lot homes
- c) Equestrian and small animal keeping
- d) Senior Center

8. What are the City’s main housing needs?

- a) Affordable housing for seniors
- b) Affordable housing for new buyers
- c) Update older homes
- d) Maintain communities

9. What types of multi-family housing could fit Jurupa Valley’s community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Jurupa Valley multi-family equestrian and animal keeping

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Shelters for homeless families
- b) Work with other agencies/authorities

Page 32 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Mira Loma Hay and Feed
- b) Home based businesses (CPA, Notary)

Zina Whitney

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Existing shopping opportunities – Deanza Shopping Center, Jurupa Springs, Jurupa Spectrum area, downtown Rubidoux (with renovation)
- b) Public golf courses, Former Riverside Cement Plant and land, Clay Street property
- c) Empty storefronts – available space
- d) Amenities – Jensen Alverado Historic Ranch, Jurupa camping park, Wanamaker Gym tournaments, Rubidoux Nature Center, Jurupa Aquatics Center

2. What special economic challenges or constraints does Jurupa Valley face?

- a) Not enough sales tax – need more retail stores
- b) Need more entertainment venues such as a Round 1 to give families and teenagers something to do in town.
- c) More restaurants (i.e. Red Robin, Golden Corral, B.J.'s)
- d) Need attractions to encourage people to stay in town and spend their money in Jurupa Valley rather than traveling to other cities
- e) Main thoroughfares and their businesses need to look more attractive (façade and parking lot upgrades, lighting improvements)
- f) Marketing campaign to let people know what is here: Flabob, Galleano Winery, Golf Courses, Rubidoux Nature Center, Jurupa Aquatic Center, Land opportunities

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Retail, grocery stores, sit down restaurants
- b) Hospital, Entertainment/Attractions
- c) Other sales tax revenue generating businesses
- d) White collar business
- e) Colleges and Technical Schools
- f) High tech jobs/I.T.

Discourage:

- a) Pot shops

Page 33 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- b) Warehouses (additional)

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Clay Street – hospital and apartments
- b) Pedley Road/60 Freeway – Retail
- c) I-15 corridor – mixed-use – retail, small business and Big Box
- d) Emerald Meadow site (60 Freeway/Rubidoux Blvd.) – Retail, Big Box, housing, public recreation, stadium, mall, concert venues
- e) All new development to include community public facilities, such as: sport fields, Community Centers, etc.
- f) Riverside Cement Plant
- g) Old landfill

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Any Grants the City could obtain should/could be used to improve infrastructure and to increase economic prosperity by improving current business appearances or rehabilitate old buildings.
- b) All this should be done without impacting the City budget for essential services – Health & Safety

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) Hotel - no nice/safe hotels to stay in within the city limits.
- b) "Jurupa Valley ... the opportunities are endless"
- c) "Jurupa Valley ... a place of endless possibilities"
- d) Create a Visitor Center (or an Visitor Center office within City Hall for now)
- e) "A city with a hometown feel"
- f) Chamber of Commerce can work to promote and attract more businesses

7. What are the City's principal housing assets?

- a) Most current inventory of apartments are not of high quality or have not been well maintained
- b) City has a wide variety of housing from apartment and mobile homes to single family homes on large lots and large homes on small lots
- c) Diverse – but the quality and quantity are out of balance

8. What are the City's main housing needs?

- a) Need variety to attract younger generation
- b) Affordable starter homes for young families that does not require three generations to live under one roof to afford the mortgage payments

Page 34 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

- c) Affordable starter homes where singles and young families can start out and still have a yard in which their children can play.

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) All types would work as long as they are not all constructed in one area of the city where current residents feel it would be an intrusion on their current way of life.
- b) Near other small lot housing and/or retail shopping areas
- c) Within walking or hiking distance of shopping and parks

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Plans should be made for additional assisted living/convalescent housing
- b) New development with 9 bedrooms is addressing large families
- c) Building codes should address a certain number of homes per development be built ADA compliant
- d) The homeless issue needs to be addressed, but not sure what the City can do other than building homeless shelters, outreach programs/social services
- e) Starter homes of 2 or 3 bedrooms on a ¼ acre lot for young families, small families and single people

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Downtown Rubidoux including the old Club Metro land
- b) Along Etiwanda Ave.
- c) Limonite Ave.
- d) Mission Blvd.
- e) Van Buren Blvd.

Randy Young

1. What special economic assets in Jurupa Valley should the city capitalize upon?

- a) Vacant buildings
- b) Available land
- c) General proximity to freeways
- d) Several golf courses
- e) Santa Ana River access for recreation

Page 35 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

2. What special economic challenges or constraints does Jurupa Valley face?

- a) State Funding
- b) Lack of hospitality, hotels and motels
- c) Lack of medical facilities
- d) No local colleges or university of higher education

3. What types of businesses should the City encourage to promote job growth and economic prosperity? What types of businesses should the City consider discouraging?

Encourage:

- a) Tech jobs, medical and technical
- b) Markets and shopping centers
- c) Medical centers
- d) More entertainment

Discourage:

- a) Marijuana Centers
- b) Junk yards
- c) Businesses that produce hazardous waste and air pollution

4. What special "Opportunity Sites" (undeveloped or underdeveloped areas suitable for new uses) should the City identify and what types of uses should be encouraged there?

- a) Develop Emerald Meadows, Pyrite & I-60, Pedley & I-60
- b) Pyrite & I-60 – shopping center
- c) Pedley & I-60 - hotels
- d) Pedley & Mission – medical services
- e) Emerald Meadows – Mixed-use
- f) River Areas - parks

5. What economic tools or incentives should the City consider, such as business tax incentives, state or federal grants, other?

- a) Habitat partnership
- b) State and Federal Grants
- c) Public-Private partnerships

6. What should be the City's "brand" in terms of portraying the public and visitor image, attractions, and overall character? How could the City help establish and promote this?

- a) "A community of communities"
- b) Golf, Equestrian, Sports, Farm, Animal, Car Enthusiasts

7. What are the City's principal housing assets?

- a) Diverse housing stock

Page 36 of 37

GPAC Team and Individual Meeting Notes

September 28, 2015

8. What are the City's main housing needs?

- a) Senior Housing
- b) Replacement of aging homes
- c) Estate homes
- d) All types/category of homes
- e) Apartments

9. What types of multi-family housing could fit Jurupa Valley's community character, e.g. apartments, condominiums, garden homes, duplexes, other? In what areas should it be located?

- a) Apartments – accessible to freeways
- b) Condo's close to schools and shopping

10. How should the City address special housing needs, including those of the elderly, disabled persons, large families, families with female heads of households, and homeless persons and families? In what areas should these housing needs be located?

- a) Multi-generational – add a few to each development project
- b) Senior/Disabled housing with accommodations and transportation

11. Mixed-Use is an innovative way to encourage residential and commercial uses on the same lot. Where in Jurupa Valley might this form of housing be appropriate?

- a) Metro Link
- b) Freeway access areas
- c) Mission Blvd.

**REGULAR MEETING AGENDA
OF THE JURUPA VALLEY CITY COUNCIL**

Thursday, February 18, 2016

Joint Study Session: 6:00 p.m.

Regular Meeting: 7:00 p.m.

City Council Chamber

8930 Limonite Avenue, Jurupa Valley, CA 92509

- A. *As a courtesy to those in attendance, we ask that cell phones be turned off or set to their silent mode and that you keep talking to a minimum so that all persons can hear the comments of the public and City Council.*
- B. *A member of the public who wishes to speak under Public Comments must fill out a "Speaker Card" and submit it to the City Clerk BEFORE the Mayor calls for Public Comments on an agenda item. Each agenda item up will be open for public comments before taking action. Public comments on subjects that are not on the agenda can be made during the "Public Appearance/Comments" portion of the agenda.*
- C. *As a courtesy to others and to assure that each person wishing to be heard has an opportunity to speak, please limit your comments to 3 minutes.*

1. 6:00 P.M. - JOINT STUDY SESSION WITH THE PLANNING COMMISSION

CALL TO ORDER – CITY COUNCIL:

- Laura Roughton, Mayor
- Verne Lauritzen, Mayor Pro-Tem
- Brian Berkson, Council Member
- Brad Hancock, Council Member
- Frank Johnston, Council Member

CALL TO ORDER – PLANNING COMMISSION:

- Robert Zavala, Chair
- John West, Chair Pro Tem
- Matthew Burris, Planning Commissioner
- Rachel Lopez, Planning Commissioner
- George Ruiz, Planning Commissioner

2. JOINT STUDY SESSION: PRESENTATION TO INTRODUCE AND REFER THE PROPOSED HOUSING ELEMENT TO THE CITY COUNCIL AND PLANNING COMMISSION

Requested Action: That the City Council and Planning Commission receive an introduction on the Interim General Plan (IGP) Housing Element's key issues, needs and strategies, discuss and provide input as appropriate, and refer the item to the Planning Commission for further review.

3. PUBLIC APPEARANCE/COMMENTS

4. 7:00 P.M. - RECONVENE IN REGULAR SESSION

5. CALL TO ORDER AND ROLL CALL FOR REGULAR SESSION

- Laura Roughton, Mayor
- Verne Lauritzen, Mayor Pro Tem
- Brian Berkson, Council Member
- Brad Hancock, Council Member
- Frank Johnston, Council Member

6. INVOCATION

7. PLEDGE OF ALLEGIANCE

8. APPROVAL OF AGENDA

9. PRESENTATIONS

A. PROCLAMATION HONORING RIVERSIDE CITY COLLEGE'S 100TH ANNIVERSARY AND MORENO VALLEY AND NORCO COLLEGES' 25TH ANNIVERSARIES

B. PRESENTATION OF 2015-16 FY MID-YEAR BUDGET

1. Requested Action: That the City Council receive and file the Mid-Year Budget Presentation.
2. That the City Council approve Fiscal Year 2015-16 amendments to the City's Budget as presented in the staff report.

10. PUBLIC APPEARANCE/COMMENTS

Persons wishing to address the City Council on subjects other than those listed on the Agenda are requested to do so at this time. A member of the public who wishes to speak under Public Appearance/Comments OR the Consent Calendar must fill out a "Speaker Card" and submit it to the City Clerk BEFORE the Mayor calls for Public Comments on an agenda item. When addressing the City Council, please come to the podium and state your name and address for the record. While listing your name and address is not required, it helps us to provide follow-up information to you if needed. In order to conduct a timely meeting, we ask that you keep your comments to 3 minutes. Government Code Section 54954.2 prohibits the City Council from taking action on a specific item until it appears on an agenda.

11. INTRODUCTIONS, ACKNOWLEDGEMENTS, COUNCIL COMMENTS AND ANNOUNCEMENTS
12. CITY MANAGER'S UPDATE
13. APPROVAL OF MINUTES
- A. FEBRUARY 4, 2016 REGULAR MEETING**
14. **CONSENT CALENDAR (COMMENTS ON CONSENT AGENDA TAKEN HERE)**

(All matters on the Consent Calendar are to be approved in one motion unless a Councilmember requests a separate action on a specific item on the Consent Calendar. If an item is removed from the Consent Calendar, it will be discussed individually and acted upon separately.)

- A. COUNCIL APPROVAL OF A MOTION TO WAIVE THE READING OF THE TEXT OF ALL ORDINANCES AND RESOLUTIONS INCLUDED IN THE AGENDA**

Requested Action: That the City Council waive the reading of the text of all ordinances and resolutions included in the agenda.

- B. CONSIDERATION OF CHECK REGISTER IN THE AMOUNT OF \$2,005,610.70**

Requested Action: That the City Council ratify the check registers dated January 28 and February 4, 2016 as well as the payroll register dated February 3, 2016.

- C. APPROVAL OF RIGHT-OF-WAY ACQUISITION AGREEMENT FOR THE ACQUISITION OF CERTAIN PROPERTY FROM THE RIVERSIDE COUNTY REGIONAL PARK AND OPEN-SPACE DISTRICT FOR THE WIDENING OF LIMONITE AVENUE BETWEEN ETIWANDA AVENUE AND BAIN STREET**

1. Requested Action: That the City Council approve the Right-of-Way Acquisition Agreement for conveyance of real property from the Riverside

County Regional Park and Open-Space District to the City of Jurupa Valley and authorize the Mayor to sign the Agreement in the final form as approved by the City Attorney; and

2. That the City Council appropriate \$6,500 from the unencumbered Gas Tax funds to fund the Agreement; and
3. That the City Council authorize the City Manager to execute related documents as necessary to fulfill the terms of the Agreement.

D. UPDATING TRANSPORTATION FACILITIES TO BE FUNDED BY DEVELOPMENT IMPACT FEES BY ADDING LIMONITE AVENUE WIDENING, ETIWANDA AVENUE TO BAIN STREET, AND DELETING BAIN STREET, LIMONITE TO BELLEGRAVE

Requested Action: That the City Council pass and adopt Resolution No. 2016-02, entitled:

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF JURUPA VALLEY, CALIFORNIA, UPDATING THE FACILITIES TO BE FUNDED WITH DEVELOPMENT IMPACT FEES BY ADDING LIMONITE AVENUE FROM ETIWANDA AVENUE TO BAIN STREET AND DELETING BAIN STREET FROM LIMONITE TO BELLEGRAVE

E. AGREEMENT FOR SERVICES BETWEEN THE COUNTY OF RIVERSIDE AND CITY OF JURUPA VALLEY FOR THE VAN BUREN BOULEVARD - PHASE 1A PAVEMENT REHABILITATION PROJECT, LIMONITE AVENUE TO 56TH STREET

1. Requested Action: That the City Council approve the Service Agreement by and between the County of Riverside and City of Jurupa Valley for the Van Buren Boulevard Pavement Rehabilitation Project - Phase 1A, Limonite Avenue to 56th Street in an amount not to exceed \$38,000 and authorize the Mayor to execute the Agreement in the final form as approved by the City Attorney.
2. That the City Council appropriate \$38,000 from unencumbered Measure A proceeds to fund the Agreement for the initial Environmental Clearance and Bidding Phase services.

F. ACCEPTANCE OF IMPROVEMENTS CONSTRUCTED FOR THE 28TH STREET PAVEMENT REHABILITATION PROJECT

1. Requested Action: That the City Council accept the improvements constructed by All American Asphalt, Inc. in accordance with the agreement for the 28th Street Pavement Rehabilitation Project, and authorize the City Manager to execute the Notice of Completion; and

2. Direct the City Clerk to file the Notice of Completion with the Riverside County Recorder.

G. ACCEPTANCE OF IMPROVEMENTS CONSTRUCTED FOR THE LOCAL PONDING AREAS PROJECT

1. Requested Action: That the City Council accept the improvements constructed by Gentry Brothers, Inc. in accordance with the agreement for the Local Ponding Areas Project, and authorize the City Manager to execute the Notice of Completion; and
2. Direct the City Clerk to file the Notice of Completion with the Riverside County Recorder.

H. APPROVAL OF SERVICE AGREEMENT BETWEEN THE CITY OF JURUPA VALLEY AND THE COUNTY OF RIVERSIDE FOR THE RUBIDOUX BOULEVARD AT STATE ROUTE 60 INTERCHANGE PROJECT DEVELOPMENT ACTIVITIES

Requested Action: That the City Council approve the Service Agreement for project development activities between the City of Jurupa Valley and the County of Riverside for the Rubidoux Boulevard at State Route 60 interchange project and authorize the Mayor to sign the Agreement in the final form as approved by the City Attorney.

I. ADOPTION OF CONSTRUCTION PLANS, SPECIFICATIONS AND WORKING DETAILS, AND AUTHORIZATION FOR THE COUNTY OF RIVERSIDE TO SOLICIT BIDS FOR THE PYRITE STREET SAFE ROUTES TO SCHOOL PROJECT

1. Requested Action: That the City Council adopt the plans, specifications and working details for the Pyrite Street Safe Routes to School (SRTS) Project; and
2. Authorize the County of Riverside to solicit formal bids in accordance with applicable laws for construction of the Project subject to the California Transportation Commission (CTC) authorizing the grant funding expenditure; and
3. Approve an amendment to the Service Agreement for the Troth Street and Pyrite Street SRTS Improvements between the City of Jurupa Valley and the County of Riverside, subject to final form and format approved by the City Attorney; and
4. Direct the Administrative Services Director to amend the FY 2015/16 Capital Improvement Plan (CIP) to reflect construction costs as outlined in the financial impact section of the staff report.

J. CONSIDERATION OF A CONTRACT EXTENSION FOR PROVISION OF GEOGRAPHIC INFORMATION SYSTEM (GIS) SERVICES

Requested Action: That the City Council authorize the City Manager to enter into an agreement with Digital Map Products, Inc. for the provision of Geographic Information System (GIS) services subject to final contract review by the City Attorney.

15. CONSIDERATION OF ANY ITEMS REMOVED FROM THE CONSENT CALENDAR

16. PUBLIC HEARING

17. COUNCIL BUSINESS

A. JURUPA VALLEY PRO RODEO AND FAMILY FIESTA REQUEST FOR FEE WAIVER AND USE OF CITY SEAL TO PROMOTE THE UPCOMING RODEO

Requested Action: That the City Council pass and adopt Resolution No.2016-03, entitled:

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF JURUPA VALLEY, CALIFORNIA, SUPPORTING THE JURUPA VALLEY PRO RODEO AND FAMILY FIESTA, ALLOWING THE USE OF THE CITY SEAL AND WAIVING THE PERMIT FEES

18. CITY COUNCIL MEMBER ORAL/WRITTEN REPORTS REGARDING REGIONAL BOARDS AND COMMISSIONS

A. MAYOR LAURA ROUGHTON

- 1. UPDATE ON THE WESTERN RIVERSIDE COUNCIL OF GOVERNMENTS - ADMINISTRATION AND FINANCE COMMITTEE MEETING OF FEBRUARY 10, 2016**

B. MAYOR PRO TEM VERNE LAURITZEN

- 1. UPDATE ON THE WESTERN RIVERSIDE COUNTY REGIONAL CONSERVATION AUTHORITY MEETING OF FEBRUARY 17, 2016**

C. COUNCIL MEMBER BRAD HANCOCK

- 1. UPDATE ON THE NORTHWEST MOSQUITO AND VECTOR CONTROL DISTRICT MEETING OF FEBRUARY 18, 2016**

D. COUNCIL MEMBER FRANK JOHNSTON**1. UPDATE ON THE NORTHWEST – TRANSPORTATION NOW COALITION MEETING OF FEBRUARY 11, 2016****19. CITY ATTORNEY’S REPORT****20. COUNCIL MEMBER REPORTS AND COMMENTS****21. ADJOURNMENT**

Adjourn to the Regular Meeting of March 3, 2016 at 7:00 p.m. at the City Council Chamber, 8930 Limonite Avenue, Jurupa Valley, CA 92509.

In compliance with the Americans with Disabilities Act and Government Code Section 54954.2, if you need special assistance to participate in a meeting of the Jurupa Valley City Council or other services, please contact Jurupa Valley City Hall at (951) 332-6464. Notification at least 48 hours prior to the meeting or time when services are needed will assist staff in assuring that reasonable arrangements can be made to provide accessibility to the meeting or service.

Agendas of public meetings and any other writings distributed to all, or a majority of, Jurupa Valley City Council Members in connection with a matter subject to discussion or consideration at an open meeting of the City Council are public records. If such writing is distributed less than 72 hours prior to a public meeting, the writing will be made available for public inspection at the City of Jurupa Valley, 8930 Limonite Avenue, Jurupa Valley, CA 92509, at the time the writing is distributed to all, or a majority of, Jurupa Valley City Council Members. The City Council may also post the writing on its Internet website at www.jurupavalley.org.

City of Jurupa Valley

STAFF REPORT

DATE: FEBRUARY 18, 2016

TO: HONORABLE MAYOR AND MEMBERS OF THE CITY COUNCIL AND PLANNING COMMISSION

FROM: GARY S. THOMPSON, CITY MANAGER
BY: THOMAS G. MERRELL, AICP, PLANNING DIRECTOR

SUBJECT: AGENDA ITEM NO. 2

JOINT GENERAL PLAN STUDY SESSION ON THE GENERAL PLAN HOUSING ELEMENT: POTENTIAL HOUSING ISSUES, NEEDS, AND STRATEGIES

RECOMMENDATION

That the City Council and Planning Commission receive an introduction on the Interim General Plan (IGP) Housing Element's key issues, needs and strategies, discuss and provide input as appropriate, and refer the item to the Planning Commission for further review.

PURPOSE OF MEETING

The City Council and Planning Commission will learn about the key housing factors in Jurupa Valley to be addressed in the Housing Element, including important housing issues that merit special discussion, and staff's thoughts on potential strategies to address those issues. This meeting is intended to *introduce* these topics for discussion and to provide comments to staff. No decisions or final actions will be taken. The draft Housing Element will be considered by the Planning Commission and the City Council later this year.

BACKGROUND

The City is updating its housing element. Originally prepared by the County of Riverside and adopted by the City when it incorporated in 2011, the current Element is out of date, not relevant to the young City's goals and needs, and is due for updating. Jurupa Valley's new Housing Element will set out the City's housing goals, policies and programs through the year 2021.

Page | 1

Simply stated, the housing element does two things: 1) it serves as the main policy guide for local decision-making on all housing matters, and 2) describes the City's demographic, economic and housing factors. Of the seven mandatory chapters, or "elements" in a general plan, the Housing Element is the most detailed and precisely defined by State law. Along with the Safety Element, it is one of only two elements that must be reviewed and approved by State agencies. The Housing Element works in concert with the other General Plan elements to help achieve broad community goals.

Requirements of State Law

State law recognizes the vital role local governments play in the supply and affordability of housing. Housing element law, enacted in 1969, requires cities and counties to adequately plan to meet the existing and projected housing needs for all economic segments of the community. For the private market to adequately address housing needs and demand, local governments must adopt land use plans and regulatory systems which provide opportunities for, and do not unduly constrain, housing development. As a result, California housing policy depends largely upon local general plans and, in particular, on local housing elements. Housing element law also requires the Department of Housing and Community Development ("HCD") to review local housing elements for compliance with State law and to report its written findings to the local government and to certify housing elements that meet the law.

City of Jurupa Valley Perspective

As the City engages the subject of its housing element, it is important to keep the discussion of sensitive subjects in perspective. Meeting State requirements for housing will not be difficult to satisfy, and will not jeopardize the community values developed by the General Plan Advisory Committee. Thus, staff encourages the Commission and Council to keep the following factors in mind when considering the key housing issues:

1. The City's land area is approximately 29,000 acres. Preliminary studies suggest that only about 18 acres of medium and high density zoning may be needed to satisfy State requirements for affordable housing. If such zoning is located in several areas, it will have no significant effect on the community character of low density, small town with traditional neighborhoods and equestrian lifestyle.
2. The GPAC has considered the value of allowing medium and high density residential in a few areas of the City as a strategy to increase property values in distressed neighborhoods and provide the economic conditions to attract quality retail and dining uses.
3. A diversity of housing types is essential to the long term sustainability of any community.
4. Medium or high density does not automatically translate into rental apartments. Multiple dwelling residential projects can include townhomes, condominiums and other forms of home ownership. The result is new high quality, ownership

neighborhoods that serve entry level housing needs for young adults that are newly entering the job market.

5. Residents of affordable housing are typically young adults, young families or senior citizens with steady incomes and ties to the local community.

KEY HOUSING ISSUES

Following is a description of key housing issues that need to be addressed in the new Housing Element. These issues merit discussion and may require changes to City General Plan and/or Zoning Codes. Staff has analyzed the City's demographic picture, housing constraints, and vacant land resources for the construction of new housing. The preliminary results of these analyses provide the technical background on which the Housing Element's policies and programs will be based. While the Housing Element must contain certain information to meet State law, it must also be consistent with the other General Plan elements and with the community's values, hopes and aspirations as reflected in the adopted Community Value Statement. Staff has identified the following preliminary key housing issues:

1. Regional Housing Needs Allocation ("RHNA") Compliance.

What is "RHNA?" It is an abbreviation for the Regional Housing Needs Allocation, a statewide requirement that all cities and counties "accommodate" a share of their region's total housing need. This share, measured in terms of numbers of dwelling units, must be addressed in the jurisdiction's general plan housing element. Jurupa Valley's RHNA numbers for the current seven-year planning period are shown in Table 1.

Table 1: City of Jurupa Valley's Regional Housing Needs Allocation, 1/1/2014 – 10/1/21

| Income Level | Very Low | Low | Moderate | Above Mod | Total |
|-----------------------|----------|-----|----------|-----------|-------|
| No. of Dwelling Units | 409* | 275 | 307 | 721 | 1,712 |
| % of Total | 24% | 16% | 18% | 42% | 100% |
| Source: SCAG 2012 | | | | | |

To meet their RHNA requirement, cities typically identify adequate sites for residential development. Adequate sites includes the following:

- Vacant residentially zoned sites.
- Vacant non-residentially zoned sites that allow residential uses.

- Underutilized residentially zoned sites which are capable of being redeveloped/remodeled at a higher density.
- Non-residential zoned sites that can be redeveloped for, and/or rezoned for, residential use.

Briefly, RHNA is met when a jurisdiction shows that within the Planning Period, it has approved construction of sufficient housing units to meet its allocation, or has designated sufficient vacant land at appropriate densities for each income level. Housing developed at densities of at least 25 dwelling units per acre (du/A) is deemed to be "affordable" to lower income households.

Jurupa Valley has already met its RHNA requirement for Moderate and Above Moderate cost housing; however the City needs additional zoned land suitable for the development of at least 315 new, lower income dwellings at a density of 25 du/A, plus 102 new dwellings at a density of about 20 du/A for Moderate Income housing. Based on a preliminary analysis of Jurupa Valley's vacant land inventory, the City should consider two actions to comply with the RHNA:

- 1) Amend the General Plan Land Use Map and rezone about 13 acres designated at 25 du/ac and about 5 acres designated at 20 du/ac to meet the RHNA numbers; and
- 2) Amend the General Plan and Zoning Ordinance to allow a residential density of at least 25 du/A in the Highest Residential Density (HHDR) General Plan land use designation and in the Residential Incentive (R-6) Zone.

The General Plan Advisory Committee (GPAC) felt that higher density, multi-family housing, including apartments and condominiums, should generally be located close to jobs, commercial centers, and major thoroughfares. Based on GPAC comments and staff's assessment, potential areas where higher residential densities may be appropriate include portions of Belltown, Industrial designated land south of 26th Street, neighborhoods adjacent to and south of CA-60, the Crestmore Project area, the Emerald Meadows Specific Plan area and in Country Village. The residential project proposed by the Riverside County Housing Authority south of the Mission Plaza site would satisfy most or all of the City's RHNA.

2. Affordable Housing.

There are many different interpretations of "affordable housing." As used in many cities' general plans and government-sponsored housing programs, affordable housing means housing that is sold or rented at costs that do not exceed a percentage of a Very Low, Low or Moderate Income household's budget – typically, 30 to 35 percent of the household's gross monthly income. To qualify as "affordable" under state or federal standards, such housing is subject to deed restrictions or other mechanism that ensures the housing remains affordable for a set period.

"Affordability" is tied to an area's median income ("AMI"), as published by the State of California on an annual basis. The five household income levels are "Above Moderate", with the annual income set at 120 percent or higher of AMI, "Moderate" with the income level from 80 and 119 percent of AMI, "Low" with the income level between 50 and 79 percent of AMI, "Very Low" with an annual income range of less than 50 percent AMI and "Extremely Low" income which is the higher of 30 percent of the Area Medium Income or the federal poverty level. Table 2 shows the 2015 State Income Limits for Riverside County:

Table 2: State Household Income Limits (\$), Riverside County, 2015

| Income Level | Household Size | | | | | |
|---------------|----------------|--------|--------|---------------|--------|--------|
| | 1 | 2 | 3 | 4 | 5 | 6 |
| Moderate | 54,600 | 62,400 | 70,200 | 78,000 | 84,250 | 90,500 |
| Median | 45,500 | 52,000 | 58,500 | 65,000 | 70,200 | 75,400 |
| Low | 37,550 | 42,900 | 48,250 | 53,600 | 57,900 | 62,200 |
| Very Low | 23,450 | 26,800 | 30,150 | 33,500 | 36,200 | 38,900 |
| Extremely Low | 14,100 | 16,100 | 20,090 | 24,250 | 28,410 | 32,570 |

The City's Housing Profile shows Jurupa Valley's 2011 median household income ranged from \$45,600 to \$68,300, depending upon the community. A preliminary evaluation of the City's housing needs showed that in 2015, a significant portion of households in Jurupa Valley had a cost burden greater than 30 percent. Cost burden is the fraction of a household's total gross income spent on housing costs. For renters, housing costs include rent paid by the tenant plus utilities. For owners, housing costs include mortgage payment, taxes, insurance, and utilities.

Among renters, 56 percent of Jurupa households spent more than 30 percent of their income on housing costs. About 29 percent of renters spent more than 50 percent of their income on housing costs, which is often referred to as a severe housing cost burden. Cost burden rates were also high among Jurupa Valley homeowners. Almost 42 percent of owner-households spent more than 30 percent of their income on housing, and 19 percent spent more than 50 percent of their income on housing. From this and other available housing data, it is evident that many of our own residents would benefit by more diversity and affordability of housing in Jurupa Valley. Much of the City's most affordable housing is in older neighborhoods where many units have deferred maintenance or do not meet current building and zoning codes.

During the process of developing a Housing Element, we must determine the best means of encouraging housing that meets an entire range of housing needs and budgets, including large equestrian properties and multi-family housing. Even with relatively "affordable" sales and rental prices when compared with coastal areas,

Page | 5

Jurupa's new housing is priced too high for many seniors, veterans, disabled persons, young families, and adult children hoping to continue to live in the communities in which they grew up. These and other lower income households must sometimes move outside Jurupa Valley to find apartments or condominiums at a lower price point that meets their budget. Properly designed and located, new affordable housing can be designed to complement nearby market-rate housing, and enhance a neighborhood's appearance and quality of life, consistent with its overall character. Distressed neighborhoods, in particular, can benefit from the additional investment and new construction that affordable housing development can bring.

Cities use various tools to encourage affordable housing, including zoning, density incentives, "inclusionary housing incentives" (requiring a percentage of new housing be developed as "affordable"), state and federal grants, and cooperative programs with housing agencies and non-profit housing providers, such as the Riverside County Housing Authority, Habitat for Humanity and others. The City's Housing Element will include programs to address constraints to housing production and to promote the full range of housing types and needs, including affordable housing.

3. Homeless Shelter and SB 2 Compliance.

Housing for homeless persons is one type of "special needs housing" that must be addressed in all housing elements. According to a 2015 Point-In-Time Homeless Count Report prepared by Riverside County, there were 168 unsheltered homeless persons living in the City in 2015, or about 11 percent of the 1587 total unsheltered persons living in Riverside County. The Report notes that of Riverside County's cities and unincorporated areas, the City of Jurupa Valley is second in terms of highest number of unsheltered homeless persons, behind the City of Riverside with 399 persons, and followed by the cities of Palm Springs and Hemet with 118 and 117 unsheltered homeless persons, respectively.

SB 2 is a state law intended to encourage the construction of emergency shelters to provide temporary housing for homeless persons. It requires cities and counties to designate at least one zone where emergency shelters are allowed as a permitted use, without requiring discretionary approval. SB 2 does not require cities and counties to actually build, fund or provide emergency shelters. The Housing Element must describe how the City intends to meet this requirement.

Jurupa Valley's Municipal Code addresses the SB 2 requirement by allowing homeless shelters in the Industrial Park zone (I-P), subject to the approval of a Site Development Permit. It establishes basic standards that include minimum floor areas for various use areas, off-street parking, outdoor lighting and on-site management. This language was originally prepared by the County of Riverside and adopted by the City upon incorporation in 2011. According to the recent Vacant Land Inventory, the City has about 290 acres of vacant land zoned "I-P." There may be two potential problems with this approach:

Page | 6

1) *Discretionary Approval Required.* Jurupa Valley's Zoning Ordinance requires approval of a homeless shelter through approval of a Site Development Permit. SB 2 requires that the emergency shelter use be allowed with only a building permit issuance and provided that the minimum required shelter standards are met. If the existing City process is deemed inconsistent with SB 2, standards for this use can be amended to provide for compatibility and other concerns that would otherwise be addressed through a Site Development Permit; and

2) *Environmental Justice Element.* Locating emergency shelters in an Industrial zone may not be consistent with the EJ Element policy EJ-2.5, which requires that "the Zoning Regulations provide adequate separation and buffering of residential and industrial uses." This provision may be addressed by a) including a modification to the homeless shelter standards to address the need for a land use buffer (building setbacks, landscaping, fencing), to the extent allowed by SB 2; or b) by designating a non-industrial zone where a homeless shelter would be allowed. Other zones where the homeless shelter use may be appropriate are the Regulated Development Zone (R-D) and the Residential Incentive zone (R-6). Both zones are non-industrial and allow a wide range of residential multi-family uses, assembly and commercial uses. The City has about 17 acres of R-D zoned land and about 32 acres of R-6 zoned land.

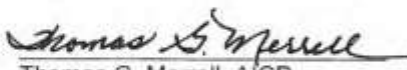

DISCUSSION

Staff requests that the City Council and Planning Commission discuss and where appropriate, provide input on the key housing issues. Specifically, input is requested on the following:

1. Diversity of housing types.
2. Encourage affordable housing that provides entry level ownership.
3. Options to address homeless shelter needs.
4. Are there additional significant housing issues that should be addressed in the Housing Element?

**MINUTES
OF THE REGULAR MEETING
OF THE JURUPA VALLEY CITY COUNCIL
February 18, 2016**

The meeting was held at the Jurupa Valley City Council Chamber, 8930 Limonite Avenue,
Jurupa Valley, CA 92509

1. 6:00 P.M. - JOINT STUDY SESSION WITH THE PLANNING COMMISSION

CALL TO ORDER – CITY COUNCIL:

- Laura Roughton, Mayor
- Verne Lauritzen, Mayor Pro-Tem
- Brian Berkson, Council Member
- Brad Hancock, Council Member
- Frank Johnston, Council Member

CALL TO ORDER – PLANNING COMMISSION:

- Robert Zavala, Chair
- John West, Chair Pro Tem
- Matthew Burris, Planning Commissioner
- Rachel Lopez, Planning Commissioner
- George Ruiz, Planning Commissioner

Mayor Roughton called the study session to order at 6:05 p.m.

2. JOINT STUDY SESSION: PRESENTATION TO INTRODUCE AND REFER THE PROPOSED HOUSING ELEMENT TO THE CITY COUNCIL AND PLANNING COMMISSION

Jeff Hook, Principal Planner, introduced the proposed Housing Element. He provided a brief PowerPoint presentation and responded to questions from the City Council and Planning Commission.

3. PUBLIC APPEARANCE/COMMENTS

Ellen Porter discussed the homelessness issue and suggested that the Council consider working with Path of Life Ministries, a local non-profit which provides housing and shelter services. She suggested that a quality condominium project is a nice alternative for entry level homebuyers.

Betty Anderson suggested that apartments should not be concentrated in one area of town and should be equally distributed. She believes the community needs more entry-level homes that would attract first time home buyers; however, there should be a minimum lot size to discourage stacked-flats and high density homes.

CITY COUNCIL AND PLANNING COMMISSION COMMENTS

Following discussion, the City Council and Planning Commission members provided input and referred the proposed Housing Element to the Planning Commission for further review.

Mayor Roughton thanked the Planning Commission for participating in tonight's meeting. She recessed the meeting at 7:29 p.m.

4. 7:00 P.M. - RECONVENE IN REGULAR SESSION

5. CALL TO ORDER AND ROLL CALL FOR REGULAR SESSION

- Laura Roughton, Mayor
- Verne Lauritzen, Mayor Pro Tem
- Brian Berkson, Council Member
- Brad Hancock, Council Member
- Frank Johnston, Council Member

Mayor Roughton called the regular meeting to order at 7:40 p.m.

6. INVOCATION was given by Abbot Hongratana, from the Suddhavasa Buddhist Meditation Center.

7. PLEDGE OF ALLEGIANCE was led by Mayor Laura Roughton.

8. APPROVAL OF AGENDA

A motion was made by Mayor Pro Tem Lauritzen, seconded by Council Member Johnston, to approve the Agenda.

9. PRESENTATIONS

A. PROCLAMATION HONORING RIVERSIDE CITY COLLEGE'S 100TH ANNIVERSARY AND MORENO VALLEY AND NORCO COLLEGES' 25TH ANNIVERSARIES

The City Council presented a Proclamation honoring Riverside City College's 100th Anniversary and Moreno Valley and Norco College's 25th Anniversaries.

Janet Green, representing the Riverside Community College District Board of Trustees accepted the Proclamation and presented a Certificate of Recognition to the Council.

B. PRESENTATION OF 2015-16 FY MID-YEAR BUDGET

Alan Kreimeier, Administrative Services Director, presented the staff report.

City Manager Gary Thompson provided additional information and responded to Council's questions.

Following discussion, a motion was made by Council Member Hancock, seconded by Council Member Johnston, to approve Fiscal Year 2015-16 amendments to the City's Budget as presented in the staff report.

Ayes: Berkson, Hancock, Johnston, Lauritzen, Roughton
Noes: None
Absent: None

10. PUBLIC APPEARANCE/COMMENTS

Ellen Porter voiced a concern that the Special Joint Council meeting on February 25, 2016 conflicts with the Jurupa Area Recreation and Park District's board meeting. This creates a missed opportunity for the JARPD board members to provide feedback.

Don Porter voiced opposition to the Paradise Knolls residential project and the housing density that is being proposed. He outlined his concerns that the proposed equestrian facility will not be used as it is intended because high-density housing does not mix well with horse owners.

Diana Leja announced that the Jurupa Valley Arts Council is gearing up for their next fundraising event: "An Evening in Tokyo." The event will take place on Saturday, February 27, 2016 at Country Village. Tickets are available by visiting their website: www.jurupavalleyartscouncil.org

Betty Anderson voiced a concern that the posted staff report for the Paradise Knolls Agenda Report did not include all the attachments.

11. INTRODUCTIONS, ACKNOWLEDGEMENTS, COUNCIL COMMENTS AND ANNOUNCEMENTS

Council Member Johnston announced that the YMCA will hold a fundraiser chili cook-off on Saturday, February 27 which benefits their programs and services. Tickets are available by contacting him at City Hall. He was pleased to attend the Eagle Scout Court of Honor last week under the leadership of Council Member Hancock. He complimented the two Eagle Scout recipients, stating that it was a very impressive ceremony. He encouraged the Jurupa Area Recreation and Park District staff to post their staff reports and financial data on their website.

Council Member Hancock offered his condolences to Mayor Roughton on the loss of her father.

Council Member Berkson announced that the next Town Hall meeting will be held Tuesday, February 23, 2016 at Rubidoux High School.

Mayor Pro Tem Lauritzen commended Council Member Hancock for his dedication to the scouting program. He expressed how he and his wife encouraged all seven of their sons to earn their Eagle Scout awards. He asked that tonight's meeting be adjourned in memory of Mayor Roughton's father.

Mayor Roughton thanked everyone for their outpouring of support over the last few weeks. She announced that Senator Richard Roth will host a small business summit at the Board of Supervisor's Chamber in the City of Riverside on Friday, February 19, 2016 at 8:00 am. Later that morning at 10:00 a.m., Assemblyman Eric Linder will host a "Senior Scam" fraud prevention program at Country Village.

12. CITY MANAGER'S UPDATE

City Manager Gary Thompson announced that the next Town Hall meeting will be held Tuesday, February 23 at Rubidoux High School. The Joint meeting with the City of Riverside will be held Thursday, February 25, 2016 at Crestmore Manor at 6:00 p.m. A public "meet and greet" reception will be held prior to the Joint Meeting.

13. APPROVAL OF MINUTES

A. FEBRUARY 4, 2016 REGULAR MEETING

A motion was made by Mayor Pro Tem Lauritzen, seconded by Council Member Berkson, to approve the Minutes of the February 4, 2016 meeting.

Ayes: Berkson, Hancock, Johnston, Roughton
Noes: None
Abstained: Lauritzen

14. CONSENT CALENDAR

A. COUNCIL APPROVAL OF A MOTION TO WAIVE THE READING OF THE TEXT OF ALL ORDINANCES AND RESOLUTIONS INCLUDED IN THE AGENDA

Requested Action: That the City Council waive the reading of the text of all ordinances and resolutions included in the agenda.

B. CONSIDERATION OF CHECK REGISTER IN THE AMOUNT OF \$2,005,610.70

Requested Action: That the City Council ratify the check registers dated January 28 and February 4, 2016 as well as the payroll register dated February 3, 2016.

C. APPROVAL OF RIGHT-OF-WAY ACQUISITION AGREEMENT FOR THE ACQUISITION OF CERTAIN PROPERTY FROM THE RIVERSIDE COUNTY REGIONAL PARK AND OPEN-SPACE DISTRICT FOR THE WIDENING OF LIMONITE AVENUE BETWEEN ETIWANDA AVENUE AND BAIN STREET

1. Requested Action: That the City Council approve the Right-of-Way Acquisition Agreement for conveyance of real property from the Riverside County Regional Park and Open-Space District to the City of Jurupa Valley and authorize the Mayor to sign the Agreement in the final form as approved by the City Attorney; and
2. That the City Council appropriate \$6,500 from the unencumbered Gas Tax funds to fund the Agreement; and
3. That the City Council authorize the City Manager to execute related documents as necessary to fulfill the terms of the Agreement.

D. UPDATING TRANSPORTATION FACILITIES TO BE FUNDED BY DEVELOPMENT IMPACT FEES BY ADDING LIMONITE AVENUE WIDENING, ETIWANDA AVENUE TO BAIN STREET, AND DELETING BAIN STREET, LIMONITE TO BELLEGRAVE

Requested Action: That the City Council pass and adopt Resolution No. 2016-02, entitled:

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF JURUPA VALLEY, CALIFORNIA, UPDATING THE FACILITIES TO BE FUNDED WITH DEVELOPMENT IMPACT FEES BY ADDING LIMONITE AVENUE FROM ETIWANDA AVENUE TO BAIN STREET AND DELETING BAIN STREET FROM LIMONITE TO BELLEGRAVE

E. AGREEMENT FOR SERVICES BETWEEN THE COUNTY OF RIVERSIDE AND CITY OF JURUPA VALLEY FOR THE VAN BUREN BOULEVARD - PHASE 1A PAVEMENT REHABILITATION PROJECT, LIMONITE AVENUE TO 56TH STREET – REMOVED FROM THE CONSENT CALENDAR FOR FURTHER DISCUSSION

1. Requested Action: That the City Council approve the Service Agreement by and between the County of Riverside and City of Jurupa Valley for the Van Buren Boulevard Pavement Rehabilitation Project - Phase 1A, Limonite Avenue to 56th Street in an amount not to exceed

\$38,000 and authorize the Mayor to execute the Agreement in the final form as approved by the City Attorney; and

2. That the City Council appropriate \$38,000 from unencumbered Measure A proceeds to fund the Agreement for the initial Environmental Clearance and Bidding Phase services.

F. ACCEPTANCE OF IMPROVEMENTS CONSTRUCTED FOR THE 28TH STREET PAVEMENT REHABILITATION PROJECT

1. Requested Action: That the City Council accept the improvements constructed by All American Asphalt, Inc. in accordance with the agreement for the 28th Street Pavement Rehabilitation Project, and authorize the City Manager to execute the Notice of Completion; and
2. Direct the City Clerk to file the Notice of Completion with the Riverside County Recorder.

G. ACCEPTANCE OF IMPROVEMENTS CONSTRUCTED FOR THE LOCAL PONDING AREAS PROJECT

1. Requested Action: That the City Council accept the improvements constructed by Gentry Brothers, Inc. in accordance with the agreement for the Local Ponding Areas Project, and authorize the City Manager to execute the Notice of Completion; and
2. Direct the City Clerk to file the Notice of Completion with the Riverside County Recorder.

H. APPROVAL OF SERVICE AGREEMENT BETWEEN THE CITY OF JURUPA VALLEY AND THE COUNTY OF RIVERSIDE FOR THE RUBIDOUX BOULEVARD AT STATE ROUTE 60 INTERCHANGE PROJECT DEVELOPMENT ACTIVITIES – REMOVED FROM THE CONSENT CALENDAR FOR FURTHER DISCUSSION

Requested Action: That the City Council approve the Service Agreement for project development activities between the City of Jurupa Valley and the County of Riverside for the Rubidoux Boulevard at State Route 60 interchange project and authorize the Mayor to sign the Agreement in the final form as approved by the City Attorney.

I. ADOPTION OF CONSTRUCTION PLANS, SPECIFICATIONS AND WORKING DETAILS, AND AUTHORIZATION FOR THE COUNTY OF RIVERSIDE TO SOLICIT BIDS FOR THE PYRITE STREET SAFE ROUTES TO SCHOOL PROJECT

1. Requested Action: That the City Council adopt the plans, specifications and working details for the Pyrite Street Safe Routes to School (SRTS) Project; and
2. Authorize the County of Riverside to solicit formal bids in accordance with applicable laws for construction of the Project subject to the California Transportation Commission (CTC) authorizing the grant funding expenditure; and
3. Approve an amendment to the Service Agreement for the Troth Street and Pyrite Street SRTS Improvements between the City of Jurupa Valley and the County of Riverside, subject to final form and format approved by the City Attorney; and
4. Direct the Administrative Services Director to amend the FY 2015/16 Capital Improvement Plan (CIP) to reflect construction costs as outlined in the financial impact section of the staff report.

J. CONSIDERATION OF A CONTRACT EXTENSION FOR PROVISION OF GEOGRAPHIC INFORMATION SYSTEM (GIS) SERVICES

Requested Action: That the City Council authorize the City Manager to enter into an agreement with Digital Map Products, Inc. for the provision of Geographic Information System (GIS) services subject to final contract review by the City Attorney.

A motion was made by Council Member Johnston, seconded by Mayor Pro Tem Lauritzen, to approve the Consent Calendar with the exception of Items 14.E and 14.H which were removed for further discussion.

Ayes: Berkson, Hancock, Johnston, Lauritzen, Roughton
Noes: None
Absent: None

15. CONSIDERATION OF ANY ITEMS REMOVED FROM THE CONSENT CALENDAR

14.E. AGREEMENT FOR SERVICES BETWEEN THE COUNTY OF RIVERSIDE AND CITY OF JURUPA VALLEY FOR THE VAN BUREN BOULEVARD - PHASE 1A PAVEMENT REHABILITATION PROJECT, LIMONITE AVENUE TO 56TH STREET

Mayor Roughton requested that this item be removed from the Consent Calendar for further discussion. She asked City Manager Thompson to provide a status on the City's efforts to obtain a Local Agency Code, or "Locode" which is needed for processing agreements with Caltrans.

City Manager Thompson provided additional information and responded to Council's questions.

A motion was made by Mayor Roughton, seconded by Mayor Pro Tem Lauritzen, to approve the Service Agreement by and between the County of Riverside and City of Jurupa Valley for the Van Buren Boulevard Pavement Rehabilitation Project - Phase 1A, Limonite Avenue to 56th Street in an amount not to exceed \$38,000 and authorize the Mayor to execute the Agreement in the final form as approved by the City Attorney; and appropriate \$38,000 from unencumbered Measure A proceeds to fund the Agreement for the initial Environmental Clearance and Bidding Phase services.

Ayes: Berkson, Hancock, Johnston, Lauritzen, Roughton
Noes: None
Absent: None

14.H. APPROVAL OF SERVICE AGREEMENT BETWEEN THE CITY OF JURUPA VALLEY AND THE COUNTY OF RIVERSIDE FOR THE RUBIDOUX BOULEVARD AT STATE ROUTE 60 INTERCHANGE PROJECT DEVELOPMENT ACTIVITIES

Mayor Roughton requested that this matter be removed from the Consent Calendar for further discussion.

Mike Myers, Assistant City Engineer, provided additional information and responded to Council's questions.

A motion was made by Mayor Roughton, seconded by Council Member Johnston, to approve the Service Agreement for project development activities between the City of Jurupa Valley and the County of Riverside for the Rubidoux Boulevard at State Route 60 interchange project and authorize the Mayor to sign the Agreement in the final form as approved by the City Attorney.

Ayes: Berkson, Hancock, Johnston, Lauritzen, Roughton
Noes: None
Absent: None

16. PUBLIC HEARING

17. COUNCIL BUSINESS

A. JURUPA VALLEY PRO RODEO AND FAMILY FIESTA REQUEST FOR FEE WAIVER AND USE OF CITY SEAL TO PROMOTE THE UPCOMING RODEO

Terri Rollings, Assistant to the City Manager/PIO presented the staff report.

Laura Bakewell and Bob Laurence, representing the Jurupa Valley Pro Rodeo, provided information on the June 3-5, 2016 event and updated the Council on the status of their permit application process.

A motion was made by Mayor Pro Tem Lauritzen, seconded by Council Member Johnston, to pass and adopt Resolution No. 2016-03, entitled:

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF JURUPA VALLEY, CALIFORNIA, SUPPORTING THE JURUPA VALLEY PRO RODEO AND FAMILY FIESTA, ALLOWING THE USE OF THE CITY SEAL AND WAIVING THE PERMIT FEES

| | |

| Noes: | None |
| Absent: | None |

18. CITY COUNCIL MEMBER ORAL/WRITTEN REPORTS REGARDING REGIONAL BOARDS AND COMMISSIONS

A. MAYOR LAURA ROUGHTON

1. Mayor Roughton gave an update on the Western Riverside Council of Governments - Administration & Finance Committee meeting of February 10, 2016.

B. COUNCIL MEMBER BRAD HANCOCK

1. Council Member Hancock gave an update on the Northwest Mosquito and Vector Control District meeting of February 18, 2016.

C. COUNCIL MEMBER FRANK JOHNSTON

1. Council Member Johnston gave an update on the Northwest – Transportation NOW Coalition meeting of February 11, 2016.

19. CITY ATTORNEY'S REPORT

City Attorney Peter Thorson had no report.

20. COUNCIL MEMBER REPORTS AND COMMENTS

Council Member Berkson reminded residents that the 91 Freeway will be closed all weekend for major construction work.

Council Member Johnston provided the following closing quote: "Logic will get you from A to B but imagination will take you everywhere" ~ Albert Einstein.

Mayor Roughton reminisced about her father and shared some of her favorite memories of him.

21. ADJOURNED IN MEMORY

A motion was made by Mayor Pro Tem Lauritzen, seconded by Council Member Johnston, to adjourn the meeting in memory of Mayor Roughton's father, James Frederick Fleck.

| | |
|----------------|--|
| Ayes: | Berkson, Hancock, Johnston, Lauritzen, Roughton |
| Noes: | None |
| Absent: | None |

There being no further business before the City Council, Mayor Roughton adjourned the meeting at 9:27 p.m.

The next meeting of the Jurupa Valley City Council will be held March 3, 2016 at 7:00 p.m. at the City Council Chamber, 8930 Limonite Avenue, Jurupa Valley, CA 92509.

Respectfully submitted,

Victoria Wasko, CMC
City Clerk

**CITY OF JURUPA VALLEY
NOTICE OF PUBLIC MEETING ON
THE GENERAL PLAN HOUSING ELEMENT**

The City of Jurupa Valley invites you to attend a public meeting on the draft Housing Element of the new Interim General Plan. The meeting will be held in the City Council Chambers, 8930 Limonite Avenue in the City of Jurupa Valley, on **Tuesday, February 23rd, 2016 at 6:30 p.m.** **This is a public meeting and anyone may comment on the items being discussed. Residents, property owners, housing developers, business owners, non-profit and government agencies, disabled persons, senior citizens, and others with special housing problems, issues or needs are welcome.**

The purposes of the meeting are to hear public comments on Jurupa Valley's housing needs, constraints and goals and to provide information on the City's General Plan Housing Element update, now underway. Some of the issues that may be discussed include, but are not limited to: 1) affordable housing, particularly for low-income persons, seniors, disabled persons, and first-time home buyers, 2) the need for quality multi-family housing, including apartments and condominiums, 3) large lot homes suitable for equestrian/animal keeping, 4) proximity of multi-family housing to jobs, commercial centers and major thoroughfares, 5) more independent living and assisted living centers for senior citizens, 6) housing for homeless persons, 7) housing for single heads of households with children, and 8) the possibility of mixed use housing, particularly along Mission Boulevard in Rubidoux, Pedley and Glen Avon village centers and near retail centers and freeways.

For more information on the items being discussed, visit the City's website at www.jurupavalley.org, or contact Jeff Hook, Principal Planner, at Jhook@jurupavalley.org, (949) 489-1442; or Mary Wright, General Plan Program Manager, at Mwright@jurupavalley.org, (949) 489-1442.

City of Jurupa Valley

Purposes of Workshop

1. **EXPLAIN:** Introduce *Housing Element* and key housing issues Jurupa Valley
2. **LISTEN:** We're here to listen to your ideas, comments, recommendations
3. **DISCUSS AND REFLECT:** Respond to questions, discuss issues, consider possibilities

City of Jurupa Valley

Introductions

1. Introduce Jeff Hook and Mary Wright, planners for JV working on GP team
2. What is a General Plan?
 - “Blueprint” to achieve City’s goals
 - Guide decisions on land use and planning
 - Improve economy, environment, safety and quality of life for all persons

City of Jurupa Valley

Where we are

1. 1st “locally grown” general plan. About 1 ½ years into the process
2. Completion target – Fall 2016
3. 8 public workshops in 2015
4. 12 General Plan Advisory Committee (GPAC) meetings in 2015 -- JV assets, issues and needs

City of Jurupa Valley

Overview

1. Housing Element (HE) is one of 7 required parts of a general plan
2. Current HE prepared by Riverside Co.; out of date
3. New Interim General Plan includes Housing Element
4. Sets housing policies and programs through 2021

City of Jurupa Valley

5

Housing Element Contents

1. Demographics
2. Housing Needs
3. Resources and Constraints
4. Quantified objectives
5. Goals, policies, programs

City of Jurupa Valley

7

Demographic Highlights

1. Estimated population in 2013: 95,679
2. Projected population by 2035: 126,000
3. Working population ages 25-54 = largest group, followed by young families
4. 26,874 dwelling units in JV
5. 81% of JV households are families
6. Over half of JV housing units built <1980

8

Housing Needs Overview

1. Evaluation of population, housing, and economic characteristics
2. Existing and growth needs (RHNA)
3. Special needs
 - a) Disabled persons
 - b) Elderly
 - c) Large households (5+ persons)
 - d) Veterans
 - e) Female-headed households
 - f) Homeless

City of Jurupa Valley

9

Resources and Constraints

Inventory of Land Resources

- Vacant land/Infill sites
- Underutilized land
- Potential sites for rezoning

Constraints

- Governmental
- Non-governmental
- Environmental

City of Jurupa Valley

11

Goals, Policies and Programs

2014 – 2021 “Housing Action Plan”:

1. Establishes JV housing policy
2. Sets specific housing programs
3. Sets quantified housing targets (RHNA)
4. Identifies responsible agencies, funding, schedule

City of Jurupa Valley

12

GPAC Input

Primary housing needs:

1. Affordable housing, especially for seniors, 1st-time homebuyers
2. Quality apts. and condos near jobs, commercial centers, and major roads
3. Large lot homes: equestrian/animal keeping
4. Quality patio or garden homes near parks and schools

*VERNOLA MARKETPLACE
APARTMENTS
JURUPA VALLEY, CALIFORNIA*

13

GPAC Input, Continued

Special housing needs:

1. Senior housing, including independent living and assisted living centers
2. Homeless shelter
3. Housing for single parents and children
4. Higher densities: a) along Mission; b) old town Rubidoux and Glen Avon; c) near retail centers; and d) near Metrolink and freeway access

City of Jurupa Valley

14

Key Housing Issues

1. Regional Housing Need Assessment (RHNA)
2. Affordable Housing
3. Homelessness/SB 2
4. Other?

City of Jurupa Valley

15

Regional Housing Needs

1. "RHNA" = Regional Housing Needs Allocation
2. Requires cities to meet a share of region's housing need
3. Sets no. of dwelling units to be allowed, by income level
4. JV's RHNA plan is shown below:

| Income Level | Very Low | Low | Moderate | Above Mod | Total |
|--|----------|-----|----------|-----------|-------|
| No. of Dwellings | 409* | 275 | 307 | 721 | 1,712 |
| % of Total | 24 | 16 | 18 | 42 | 100 |
| Jurupa Valley's Regional Housing Needs Allocation, 1/1/2014 – 10/1/21 Source: SCAG 2012 | | | | | |

City of Jurupa Valley

16

RHNA Strategy

1. RHNA requirement met when:
 - a) Sufficient housing units approved within planning period; *or*
 - b) Sufficient land area available *at appropriate residential density*
2. *Key:* Density of 30 du/A deemed “affordable” for lower income households
3. City has already met Moderate and Above Moderate requirement

RHNA Strategy

Two actions to consider to meet RHNA:

- a) amend GP to allow max. 30 du/A (or at least 25 du/A) in HHDR designation and in R-6 zone, and
- b) In Interim General Plan, designate about 34 acres as HHDR (at 25 du/A), and rezone to R-6

Affordable Housing

1. "Affordable" – housing cost does not exceed 30-35% of HH's gross monthly income
2. Helps retain core groups: young families, single working adults and seniors
3. Average Median Income (AMI) used to establish affordability for five income levels

City of Jurupa Valley

21

Affordable Housing

1. 2011 median HH income = \$45,600 - \$68,300
2. Many JV renters' and homeowners' housing costs exceed 30% of monthly income
3. New affordable housing stabilizes neighborhoods, enhances economy, and builds community

City of Jurupa Valley

23

Affordable Housing Strategy

1. Use incentives - rezoning, development incentives, grants, and working with housing agencies
2. CDBG and HOME & other grant programs, inclusionary housing program, and housing rehabilitation programs

Homelessness

1. About 168 unsheltered homeless persons in JV; about 11% of County total
2. 2nd highest homeless population in County, behind City of Riverside
3. SB 2 requires cities to specify at least one zone where homeless shelters are permitted, w/o discretionary approval
4. City currently allows shelters in I-P zone, with Site Development Permit

SB 2 Strategy

1. May be problems w/ existing strategy, due to
 - a) land use conflicts and zoning reqmts., and
 - b) EJ policy on residential and industrial use
2. Alternative strategies:
 - a) Include land use buffer in standard shelter requirements; remove SDP requirement; or
 - b) Allow shelters in R-D and R-6 zones; remove Site Development Permit requirement.
 - c) Identify another zone where shelters allowed

Public Input

Specific Items to address:

1. What are the 3 most important housing needs facing Jurupa Valley?
2. Where should higher density housing (small homes, apartments, garden homes, condominiums) be located?
3. How should the City address homelessness?
4. Other?

Discussion

Draft 2017 General Plan

**Appendix 15.0
Economic Analysis**

April 2017

Economic Development Strategy & Implementation Plan Summary

December 18, 2014

**Prepared By:
*Kosmont Companies***

Project Background & Status

- Kosmont was retained by the City for the preparation and initial implementation of an Economic Development Strategy and Implementation Plan
- The purpose of the Strategy and Plan is to evaluate existing market conditions (with a focus on retail and industrial) and effectuate the Strategy to successfully promote economic growth within the City
- An overview of the Strategy and Plan is presented herein

Plan Outline

1. Analysis

- a) Economic & Demographic Profile
- b) Market Demand Analysis

2. Strategy

- a) Trade Area Retailer Voids
- b) Opportunity Site Assessment & Prioritization

3. Implementation

- a) Summary of Findings
- b) Outreach in Progress
- c) Financing & Incentives
- d) Next Steps

3

Analysis Outline

1. Analysis

a) Economic & Demographic Profile

- i. Population & Household Demographics
- ii. Unemployment & Employment by Industry

b) Market Demand Analysis

- i. Household & Employment Growth
- ii. Supply, Vacancy & Lease Rates
- iii. Taxable Retail Sales Performance
- iv. Retail Sales Surplus / Leakage

4

1. Analysis

Economic & Demographic Profile

Population & Household Demographics

5

Demographic Highlights

Population & Households

- Population of ~97,800 and ~25,400 households within the City in 2014
- Population of ~1.03 million and ~282,400 households within 10 miles of Pedley Road & Jurupa Road

Income

- Avg. HH income ~\$67,500 in City and ~\$74,000 within 10 miles
- 2.1% annual growth projected for HH income over next 5 years in City

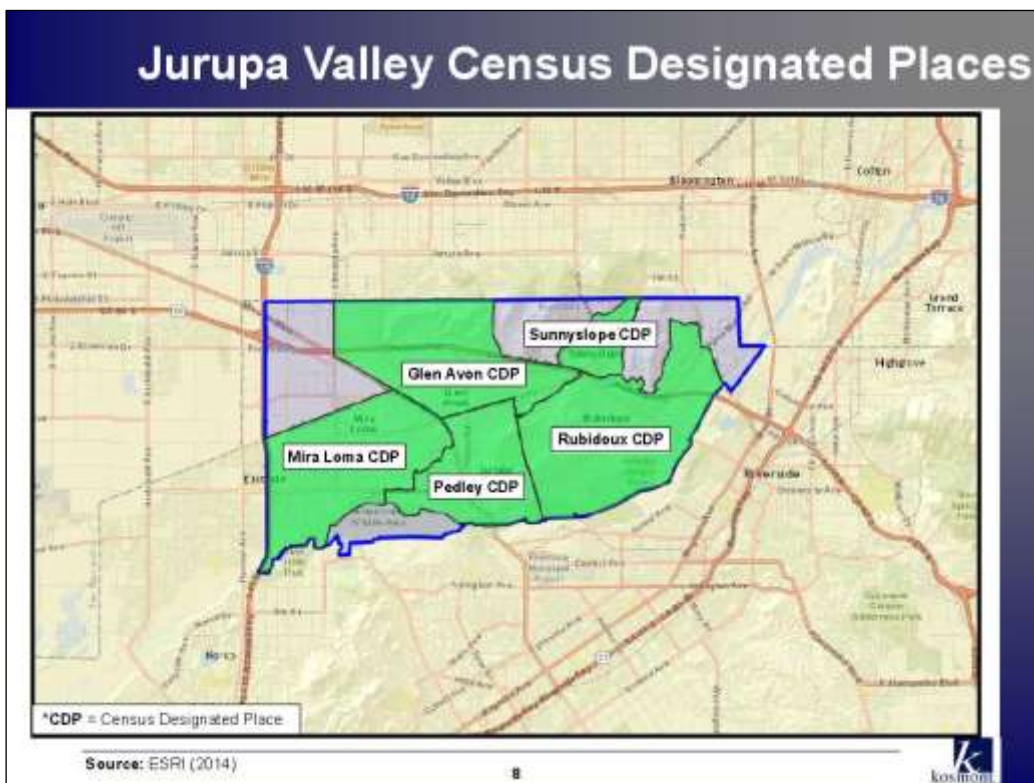

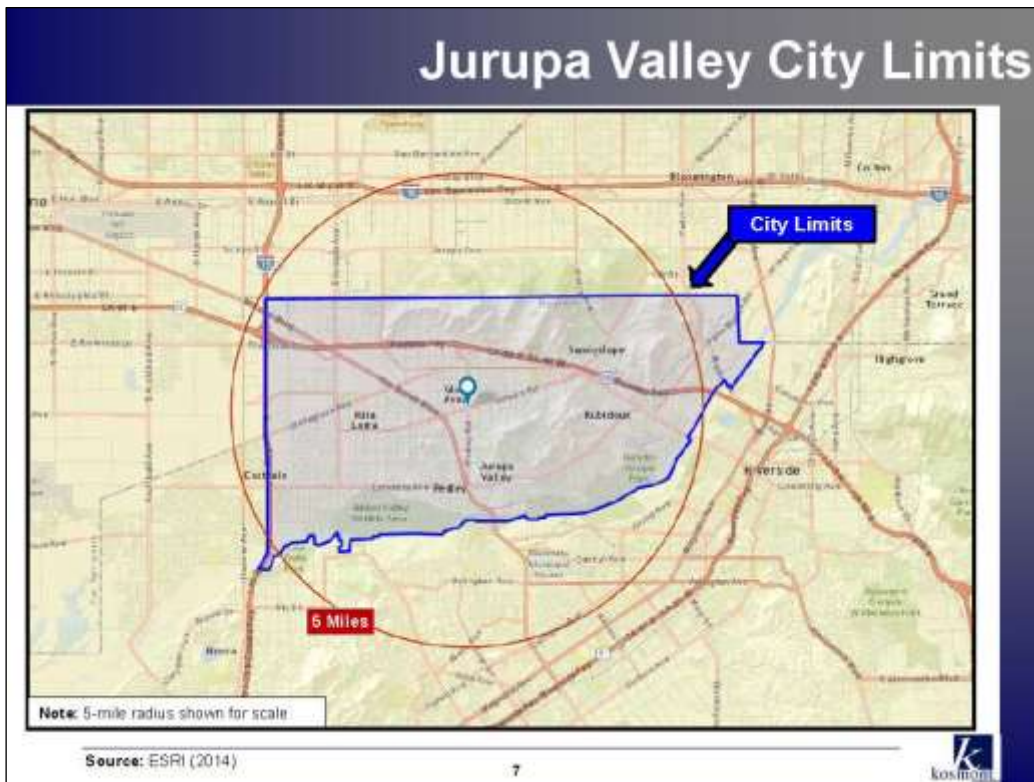

Other Demographic Characteristics

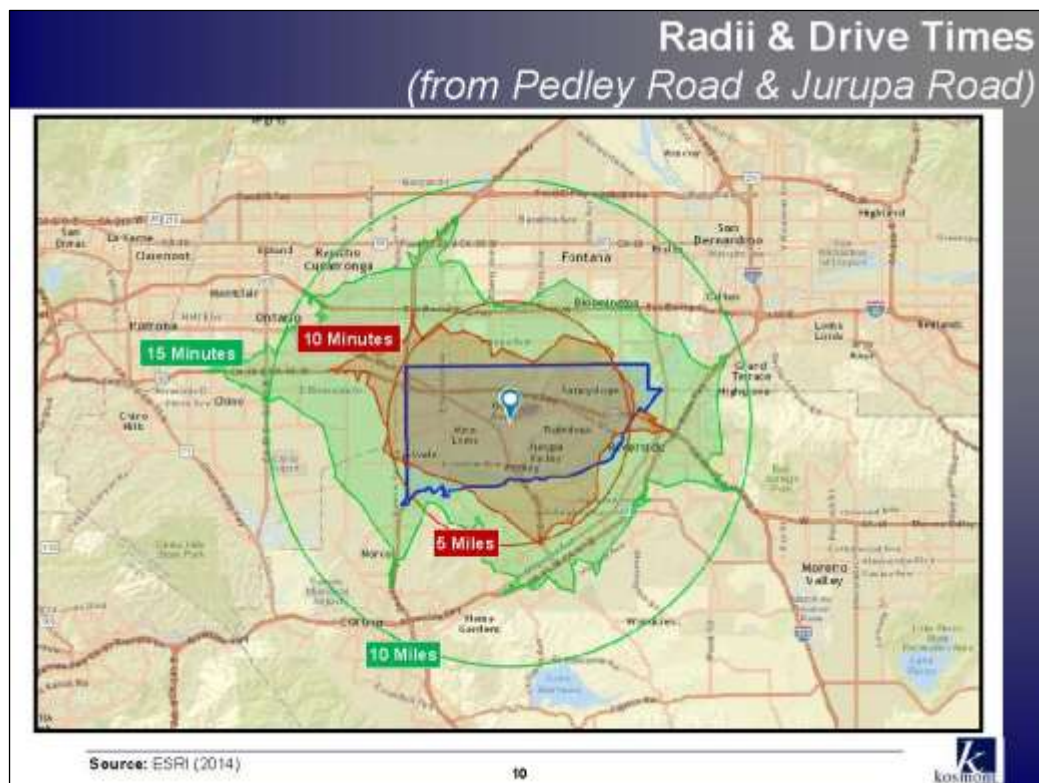

- Average household size of 3.8 in City (relatively large)
- Median age of 31 in City (younger)
- 10% Bachelor's Degree or higher (low)
- 69% (approx.) Hispanic in City

1. Analysis

Market Demand Analysis

Supply, Vacancy & Lease Rates

32

Supply, Vacancy & Lease Rates

- Supply, vacancy, and lease rates for retail and industrial uses are compared between major Inland Empire markets
- Jurupa Valley falls within the "Riverside" submarket of the Inland Empire market area for retail (as defined by CoStar) and within the "Jurupa Valley / Eastvale" submarket for industrial (as defined by Colliers)
- Both retail and industrial vacancy within the City's submarket is estimated **below** the Inland Empire average
- Both retail and industrial lease rates within the City's submarket are estimated **above** the Inland Empire average

Source: CoStar Property, Colliers International (Q3 2014)

Market Demand Analysis

Taxable Retail Sales Performance

Taxable Retail Sales Performance

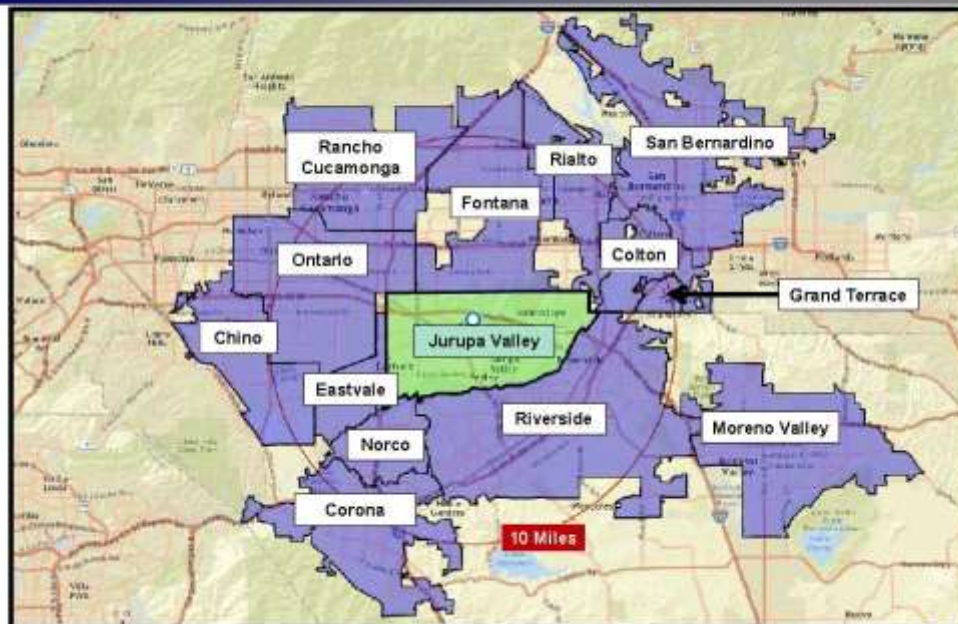

- Taxable consumer spending across retail categories is totaled and normalized for population within the City and comparison regions for the purpose of evaluating relative taxable retail sales performance
- Retail sales per capita for the City (~\$5,500) is below average when compared to the Riverside County (~\$9,400) and San Bernardino County (~\$10,200) averages
- Higher performing sales categories include **grocery** and **other retail*** sales
- Lower performing retail categories include **apparel**, **general merchandise**, **restaurants and bars**, **building materials**, and **automotive dealerships / supply dealers**

* "Other retail" includes: sporting goods, office supply, drug stores, and other retail

39

Jurupa Valley & Comparison Cities

44

1. Analysis

Market Demand Analysis

Retail Sales Surplus / Leakage

45

Retail Sales Surplus / Leakage

- Overall retail sales in the City are **lower** than retail spending potential based on households and average household income, suggesting that, overall, the City is likely leaking a significant portion of Jurupa Valley resident retail purchases to other jurisdictions (i.e. sales **leakage**)
- Certain categories, however, are exhibiting a retail sales **surplus**, including:
 - General Merchandise Stores
 - Furniture & Home Furnishings Stores
 - Electronics & Appliance Stores
 - Miscellaneous Store Retailers
 - Food & Beverage Stores
 - Building Materials, Garden Equipment & Supply Stores

Note: Includes estimated taxable and non-taxable retail sales

46

Retail Sales Surplus / Leakage by Category City of Jurupa Valley

| Retail Category | Retail Spending Potential | Retail Sales | Retail Surplus/ (Leakage) | Percent Surplus/ (Leakage) |
|---|---------------------------|----------------------|---------------------------|----------------------------|

2. Strategy

- a) Trade Area Retailer Voids
- b) Opportunity Site Assessment & Prioritization

50

2. Strategy

Trade Area Retailer Voids

81

Summary: Retailer Voids

- Retailer voids were evaluated for all major retail categories within the City and larger trade area
- Potential voids were then evaluated based on potential compatibility between trade area characteristics and retailer demographic preferences, as well as current retailer expansion activity
- Potential voids include clothing/apparel, casual and other restaurants, sporting goods, office supply, fitness, drug stores, dollar stores, office supply, wholesale, and others

82

2. Strategy

Opportunity Site Assessment & Prioritization

87

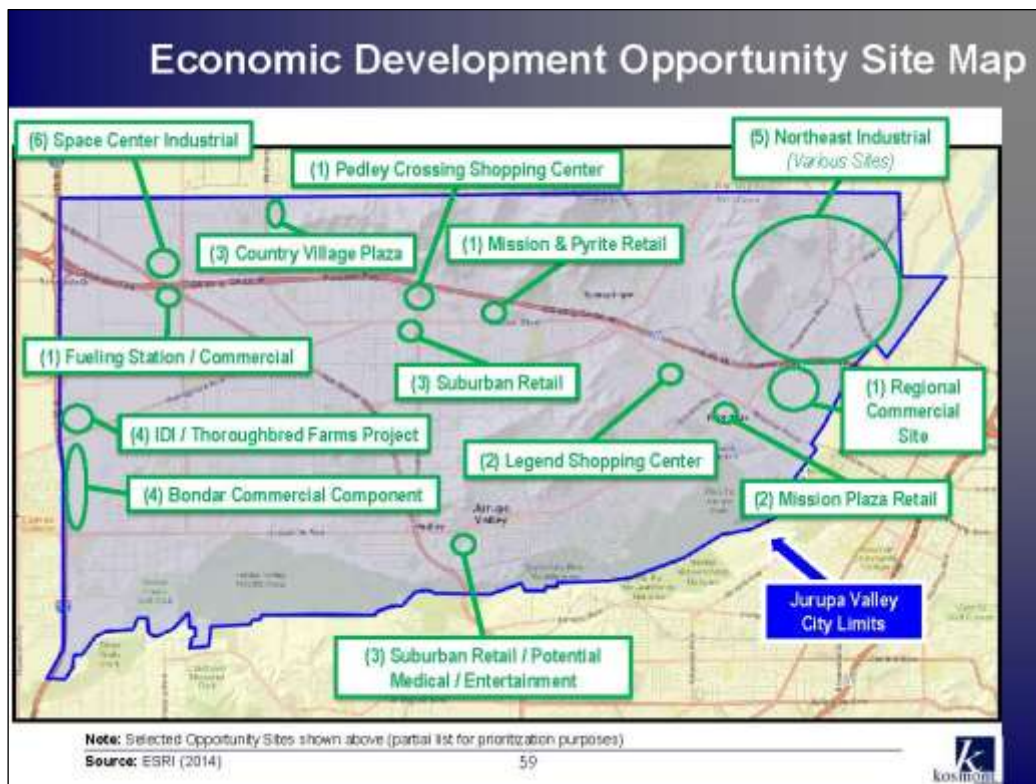

Opportunity Site Assessment & Prioritization

- Several locations within City were emphasized by the City and evaluated by the City/Consultant Team as potential Opportunity Sites for commercial development
- Preliminary prioritization of Opportunity Sites was based on evaluated potential economic impact, timing, and development feasibility

88

E.D. Opportunity Site Area Summary

| # | Site Area | Potential Projects |
|----|--------------------------------|---|
| 1) | CA-60 Freeway Commercial | <ul style="list-style-type: none"> Pedley Crossing Shopping Center (~30 acres) Mission & Pyrite Retail (~30 acres) Truck / Auto Fueling Station & Commercial Regional Commercial Site; various commercial uses (~200 acres) |
| 2) | Mission Street District Retail | <ul style="list-style-type: none"> Legend Shopping Center (~4.5 acres) Mission Plaza Retail |
| 3) | Suburban Retail / Medical | <ul style="list-style-type: none"> Existing Retail Vacancy / Potential Medical / Entertainment Use Country Village Plaza SWC Mission and Pedley Retail |
| 4) | I-15 Freeway Commercial | <ul style="list-style-type: none"> IDI / Thoroughbred Farms Mixed-Use Commercial (~100 acres) Bondar Commercial Component (~100+ acres) |
| 5) | Northeast Industrial | <ul style="list-style-type: none"> West Riverside Landfill Solar (~74 acres) Fleetwood, Cement sites, other existing vacancy absorption Eligibility for GO-Biz employment credits & related incentives |
| 6) | Space Center Industrial | <ul style="list-style-type: none"> Potential point-of-sale industrial uses (~50 acres) |

Note: Selected Opportunity Sites listed above (partial list for prioritization purposes)

60

Preliminary Prioritization Factors

Economic development opportunity site areas were evaluated with primary consideration given to fiscal / economic impact and timing / feasibility:

| # | Economic Development Opportunity Site Area | Fiscal Revenue Generation | Job Creation | Overall Econ Impact* | Timing / Feasibility |
|----|--|---------------------------|--------------|----------------------|----------------------|
| 1) | CA-60 Freeway Commercial | HIGH | HIGH | HIGH | MID |
| 2) | Mission Street District Retail | HIGH | HIGH | HIGH | MID |
| 3) | Suburban Retail / Medical / Ent. | MED | HIGH | HIGH | SHORT |
| 4) | I-15 Freeway Commercial | HIGH | HIGH | HIGH | MID |
| 5) | Northeast Industrial | LOW | MED | MED | MID |
| 6) | Space Center Industrial | MED | MED | MED | MID |

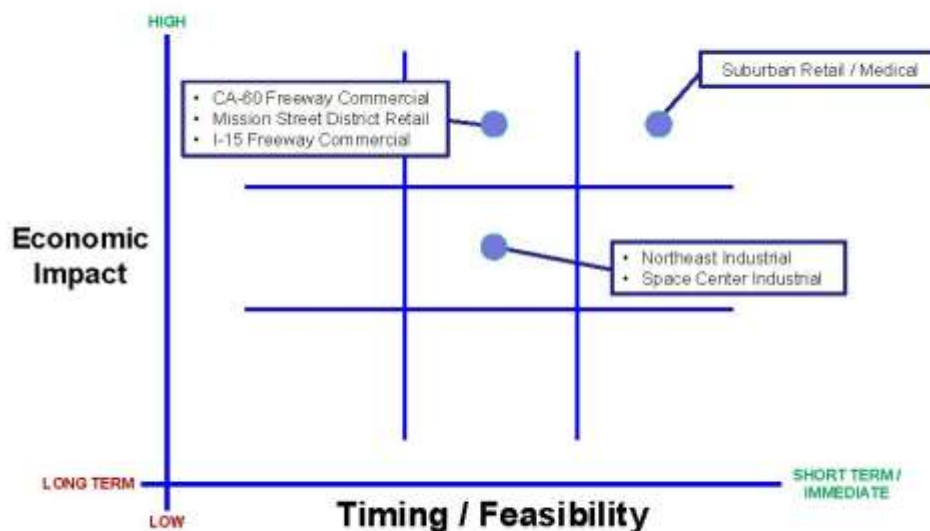

Short term = Less than 1 year; Mid term = 1-3 years; Long term = 3+ years

Notes: Overall Economic Impact represents the cumulative impacts of fiscal revenue generation and job creation

61

Preliminary Timing / Feasibility & Impact Summary

62

Preliminary Categorization by E.D. Priority

| Economic Development Priority | Potential E.D. Tools | Related Focus Areas (Partial List) |
|----------------------------------|--|---|
| Fiscal Revenue Generation | <ul style="list-style-type: none"> • Sales Tax • Transient Occupancy Tax • Franchise Fees | <ul style="list-style-type: none"> • CA-60 Freeway Commercial • Mission Street District Retail • I-15 Freeway Commercial |
| Job Creation | <ul style="list-style-type: none"> • Medical / Healthcare • Logistics / Distribution • Retail / Restaurants | <ul style="list-style-type: none"> • Suburban Retail / Medical • Northeast Industrial • Space Center Industrial |

63

Implementation Outline

3. Implementation

- a) Summary of Findings
- b) Outreach in Progress
- c) Financing & Incentives
- d) Next Steps

64

Summary of Findings

Demographics & Employment

- Younger, largely Hispanic and blue collar local population with strong incomes
- Employment concentrated within transportation and warehousing, retail trade, and manufacturing services

Retail & Industry Retention & Recruitment

- City performs below average relative to neighboring jurisdictions in terms of taxable retail sales per capita and capture of resident and non-resident spending (i.e. leakage)
- Higher performing retail categories include **grocery, electronics & appliances,** and **miscellaneous retail sales,** while lower performing retail categories include **apparel, restaurants and bars,** and **sporting goods**

Economic Development without Redevelopment

- Dissolution of redevelopment agencies will continue to have a negative effect on most California Cities and impact to health of general fund
- Alternative economic tools should be explored for Jurupa Valley to retain and improve tax base and facilitate potential public-private transactions

65

Outreach in Progress

| Retailers / Developers / Brokers / Property Owners | Feedback / Progress Highlights |
|---|---|
| <ul style="list-style-type: none"> • Albertsons Property Owner • Ashley Furniture • Bondar Property Owner • Cardenas • Flying J / Truck Stop • Wal-Mart • IKEA | <ul style="list-style-type: none"> • Introductory discussions and meetings arranged with retailers, developers & brokers during ICSC conferences such as Western Division Conference in San Diego (October 2014) and Southern California Idea Exchange in Los Angeles (upcoming February 2015) • Initial retailer interest in various sites within City • Coordination with property owners on marketing efforts |

66

Overview of Financing, Incentives & Other Economic Development Tools

- City may consider evaluation of potential economic development tools & strategies on case-by-case / transactional basis:

| Local Level | State & Federal Level |
|---|---|
| <ul style="list-style-type: none"> Site-specific tax revenue ("SSTR") pledges Impact fee reductions / waivers / deferrals Development opportunity reserve ("DOR") Tax-exempt revenue & utility bonds Lease-leaseback financing Ground leases Operating covenants Cap and Trade and Enhanced Infrastructure Financing Districts (proposed/new Legislation) | <ul style="list-style-type: none"> Small Business Administration (SBA) loans U.S. Economic Development Administration (EDA) grants New Market Tax Credits (NMTCs) CA Infrastructure Bank (I-Bank) loans EB-5 Immigrant Investment Community Development Block Grants (CDBG) |

67

Suggested Focus Areas for Implementation

| Suggested Focus Areas | Potential Targets |
|---|--|
| Commercial/retail projects in high-impact Opportunity Site Areas, including major transit corridors | <ul style="list-style-type: none"> Mission Street District Retail (note recent County RDA settlement with DOF frees up ~\$10 million for grocery retail development) Commercial freeway opportunity sites adjacent to CA-60 and I-15 |
| Retail / business attraction of void industries with growth potential in the trade area | <ul style="list-style-type: none"> Clothing & Clothing Accessories Stores (e.g., TJ Maxx, Burlington Coat Factory) Health & Personal Care Stores (e.g., pharmacies) Sporting Goods (e.g., Dicks Sporting Goods, Big 5) Food Services & Drinking Places (e.g., fast-casual restaurants) Motor Vehicle & Parts Dealers Gasoline Stations |
| New point-of-sale fulfillment center and logistics industrial projects based on low market industrial vacancies and growth in those sectors | <ul style="list-style-type: none"> Point-of-sale fulfillment / e-commerce centers Logistics / distribution centers |
| Educational and vocational programs to increase levels of education and job creation based on projected areas of growth | <ul style="list-style-type: none"> Retail Trade Professional and Business Services Health Care and Social Assistance Accommodation and Food Services Transportation and Warehousing Wholesale Trade |

68

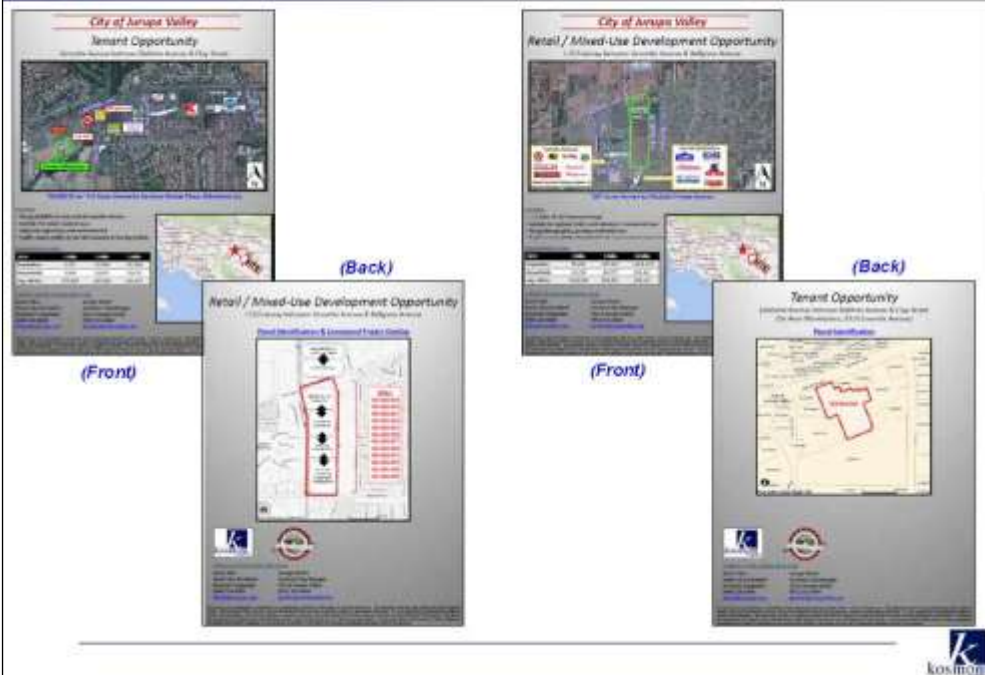

Next Steps for Implementation

- Based on Council and other stakeholder feedback, Kosmont will refine Opportunity Site prioritization for utilization and implementation by City and Consultant Team
- Based on evaluated Opportunity Sites and compatible voids, City and Consultant Team should continue outreach to targeted retailers/businesses and developers:
 - Refine and distribute marketing collateral material to promote Opportunity Sites
 - Refine targeted list of retailers and developers for outreach
 - Continued outreach to targeted retailers (incl. email outreach, conference calls, meetings / site tours, conference participation at ICSC and other events)
- Prioritized Implementation Plan should serve as basis for future implementation, e.g. job creation, incentive programs for attraction of retail, fulfillment centers, other targeted businesses / users
- Evaluation of financing, incentives, and other economic development tools on a transactional basis (e.g. sales tax, TOT pledges)

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

EXECUTIVE SUMMARY

The purpose of the Jurupa Valley Multi-Purpose Community Trails Plan is to develop a framework for building an integrated system of community trails (equestrian / hiking / trail biking) that will link residents to the outdoors. The future network will provide residents of Jurupa Valley, Eastvale, and the greater region with the close-to-home and close-to-work access to community trails that connect to the area's most popular destinations and surrounding natural areas. These trails will serve the non-vehicular transportation and recreation needs and help to encourage quality environmental and economic growth.

These trails will provide a variety of benefits that will ultimately affect the area's economic, environmental, and social health. These benefits include:

- Improved pedestrian, equestrian, trail hiking, and trail biking transportation;
- Improve health through active living;
- Clean air, protected natural open space and wildlife habitats;
- Enhanced cultural awareness and education about Jurupa Valley's rich heritage and natural features;
- Create value and generate economic activity.

Based on stakeholder and public input, extensive fieldwork, research into related planning efforts, and a thorough analysis of aerial photographs, the proposed trails network is designed to achieve the following objectives:

- Build upon the existing Jurupa Valley trail network which constitutes the central core of the future region-wide trail system;
- Connect major destinations and serve as an opportunity for alternative transportation and recreation;
- Offer residents a viable choice to walk, bike, or ride horses for their local trips;
- Provide opportunities for improving the personal health and fitness of individuals;
- Serve as a regional asset to residents and visitors of the greater Jurupa Valley region;
- Stimulate economic growth through increases in real property value and tourism;
- Enhance and protect the environmental quality of open spaces, river corridors, and mountainous terrain; and
- Conserve and tell the story of local culture, history, and environmental resources through interpretive signage;

The objective is to create an "equestrian friendly" environment that maintains the "equestrian lifestyle" in Jurupa Valley.

Primary trails within the system provide regional connections to surrounding communities and adjacent trail systems. Secondary trails provide connectivity to recreational, educational, and historical facilities and destinations. Feeder trails within residential neighborhoods are identified as "equestrian routes" where streets are the trails and horses have priority. These streets have paved roads with soft shoulders. This maintains the lifestyle that is there.

The trail system is based on nodal connections within the JARPD and City of Jurupa Valley boundaries. Trails are all-purpose and equestrian use with regional connections to nodes outside of Jurupa Valley. Trail connections include; a route under the 15 Freeway along the Santa Ana River to the Silverlakes Equestrian & Sports Park in Norco, across the Mission Avenue bridge over the Santa Ana River to Mount Rubidoux in Riverside, across the Van Buren Boulevard bridge over the Santa Ana River to the Hidden Valley Nature Center in Riverside, over the Jurupa Mountains to the trails system in Fontana, and along the San Sevaine flood control channel to the trails system in Rancho Cucamonga.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

DISTRICT BOUNDARY

Trails within the boundaries of the Jurupa Area Recreation and Park District are designated as Community Trails. The District is responsible for managing the Community Trails throughout the district boundaries within the City of Jurupa Valley and in the City of Eastvale east of Hamner Avenue and west of Interstate 15.

District Boundary Map (Exhibit A)

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

MULTI-PURPOSE COMMUNITY TRAIL POLICIES

POLICIES

The vision for the Jurupa Valley Multi-Purpose Community Trails System is derived from input from community residents, stakeholders, JARPD Trails/Arenas Committee members, JARPD staff, City of Jurupa Valley staff, Riverside County Regional Park & Open-Space District staff, Riverside County Flood Control and Water Conservation District staff, Inland Empire Resource Conservation District staff, and the consultant team. Policies for development of the community trails network include the following:

- Review, maintain, and expand community multi-purpose trails system;
- Develop a safe and interconnected area-wide network of trails that link together destinations and people both locally and regionally;
- Develop a trails network that provides facilities and programs designed to expand and encourage active recreation and alternative transportation;
- Enhance, protect, and preserve the environmental quality of open space, waterways, and wildlife habitats;
- Conserve and tell the story of local culture, history, and heritage through interpretive signage;
- Stimulate economic growth through increased tourism and real property value by developing a region-wide trails network;
- Establish agency coordination with City of Jurupa Valley and City of Eastvale;
- Identify street intersections where vehicular traffic and trail user (equestrian / hiking / trail biking) conflicts are dangerous;
- Coordinate safety solutions for dangerous street intersections with City of Jurupa Valley Traffic Engineering and Planning Departments;
- Create an "equestrian friendly" environment that maintains the "equestrian lifestyle";
- Identify residential neighborhoods where streets are narrow with equestrian trails, and designate them as "equestrian routes" where horses have priority and utilize the street as a trail;
- Designate trails as two (2) types, Recreational Use trails owned by public agencies and Equestrian Routes which are not developed trails but have been historically used as one;
- Establish public trail designation through onsite signage program that identifies trail alignments throughout the community by posting signs for all multi-purpose trails, as appropriate;
- Establish natural trails interpretive signage program;
- Adopt a Community Multi-Purpose Trails Development Ordinance;
- Create a trail maintenance and operations program; and
- Establish a separate funding account for Multi-Purpose Community Trails development.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

MULTI-PURPOSE COMMUNITY TRAILS DEVELOPMENT STANDARDS

Community Trails are separated into Urban Space and Open Space trails. Development standards have been adopted for each type. The type of Community Trails and standards for each are listed below:

MULTI-PURPOSE COMMUNITY TRAIL STANDARDS

Community Trail – Urban Space A

14' wide utility easement with 2' optional front planting area and a 12'-14' decomposed granite trail. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – Urban Space B

14' wide utility easement with 5' front curb adjacent concrete sidewalk and 9' back decomposed granite trail. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail.

Community Trail – Urban Space C

14' wide utility easement with 9' front curb adjacent decomposed granite trail and 5' back concrete sidewalk. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – Urban Space D

12' wide utility easement with 2' optional front planting area and a 10'-12' decomposed granite trail. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – A

20' wide easement with 3' front planting area, 14' decomposed granite trail, and 3' rear planting area along reverse frontage wall. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – B

20' wide easement with 6' front planting area, 14' decomposed granite trail, and vine pocket planting along reverse frontage wall. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on the front side of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – C

20' wide easement with 5' street adjacent concrete sidewalk and curb, 1' front planting area, 14' decomposed granite trail, and vine pocket planting along reverse frontage wall. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on the front side of the trail.

Community Trail – D

20' wide easement with front 14' decomposed granite trail, and 6' back planting area and vine pocket planting along reverse frontage wall. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

Community Trail - E

20' wide easement with front 14' decomposed granite trail, back 5' concrete sidewalk, and 1' back planting area and vine pocket planting along reverse frontage wall. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. Pedestrian access shall be provided with a trail fence opening of 48" width every 60' o.c. along the street where curb parking is allowed.

Community Trail – Open Space A

12' wide easement with 12' decomposed granite trail. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. A variance may be granted by the JARPD Trails Committee for use of native soil and an approved edging material.

Community Trail – Open Space B

14' wide utility easement with 6' walking trail and 8' equestrian trail comprised of decomposed granite. A standard 2-rail PVC trail fence and 6" wide concrete header is provided on both sides of the trail. A variance may be granted by the JARPD Trails Committee for use of native soil and an approved edging material.

Multi-Purpose Community Trails Plan

LOCAL AND REGIONAL TRAILS SYSTEM CONNECTIVITY

The objective of the Multi-Purpose Community Trails network within the JARPD area is to provide community wide connectivity to the most unique areas of the community while linking the existing parks and arenas via the primary trails of the network.

The unique experiences of the Jurupa Valley are the Santa Ana River on the southern edge and Jurupa Mountains on the northeast side.

Primary East to West Trail

Jurupa Valley / Santa Ana River Trail

The backbone of the network involves providing an east-west primary trail beginning at the Mission Blvd. and Crestmore Road intersection on the north embankment of the Santa Ana River. The trail winds throughout the community along the river moving inland at times and frequently winding along the upper embankment of the river with panoramic views of the riverbed below. The trail passes through several open spaces and crosses under the Van Buren Blvd. bridge through to the west side of the bridge and leads to the centrally located collection point at Horseshoe Lake. The trail moves westerly through a residential area and emerges at the south side of the existing Paradise Knolls Golf Course with a section of trail between the river and golf course. As the trail heads west it is south of Limonite Avenue and is proposed to cross the San Sevaine Channel spillway via a future bridge. Continuing along Limonite Avenue, the trail connects to the Mary Tyo Trail Head at the intersection of Etiwanda Avenue and Limonite Avenue. A regional trail from the Mary Tyo site leads south along the Santa Ana River and intersects with community Trail B on the west side of the Goose Creek Golf Course. The regional trail extends west along the Santa Ana River and intersects with community Trail D. This regional trail heads north, then west and south and travel under the 15 Freeway to the Silverlakes Equestrian & Sports Park in Norco.

Primary South to North Trail

Jim Real / Galena Trail

The primary south-north trail leading from the Santa Ana River to the Jurupa Mountains begins at Horseshoe Lake and follows the east-west trail to the Limonite Avenue and Baine Street intersection. The trail begins at this location and moves north on the Jim Real Trail between Baine Street and the San Sevaine Channel. The trail continues north to the Galena Street intersection and turns east at Galena to the Rutile Street crossing at Van Buren Blvd. The Galena Street trail section continues east to the Jurupa Road intersection and stays on the north side of Jurupa Road connecting to the Mission Estates Trail. This section moves north to Mission Blvd. and crosses at the equestrian / pedestrian signal at Caleb Street. This crossing continues the trail on the north side of Mission Blvd. with a connection to Glen Avon Heritage Park on the west and continues east to the open space trail section leading to Camino Real south of the 60 Freeway. The trail continues north under the Camino Real and 60 Freeway bridge and connects to the Jurupa Mountains Discovery Center.

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

The trails network shall connect to all of the neighborhood, community, and regional parks within the JARPD area.

Neighborhood, Community, and Regional Parks

Jurupa Area Recreation and Park District

1. Avalon Park
2. Cambria Park
3. Centennial Park
4. Clay Park
5. Delaware Greenbelt
6. District Office and Skate Park
7. Esplanade Park
8. Felspar Arena
9. Glen Avon Heritage Park
10. Harmony Park
11. Horseshoe Lake Park
12. Knowles Park
13. Laramore Park and Arena
14. Limonite Meadows
15. Moonriver Park
16. Shaylor Park (Mission Estates)
17. Tot Lot (Mission Estates)
18. Vernola Park
19. Veteran's Memorial Park
20. Wineville Park
21. Horseshoe Lake Park
22. Jurupa Mountains Park #1
23. Jurupa Mountains Park #2
24. Armstrong Park

Riverside County Regional Park & Open-Space District

1. Big League Dreams Sports Park
2. Downey Street Community & Equestrian Park (pending JARPD acquisition)
3. Eddie Dee Smith Senior Center
4. Mary Tyo Park & Trail Head (pending JARPD acquisition)
5. Rancho Jurupa Park
6. Rancho Jurupa Regional Sports Park
7. The Cove Waterpark

The trails shall also connect to historic and cultural facilities within the JARPD region.

Historic and Cultural Facilities

1. Jensen Alvarado Historic Ranch and Museum
2. Jurupa Mountains Discovery Center
3. Louis Rubidoux Nature Center

Trail connections shall connect to regional historic and cultural facilities in adjacent communities.

1. Hidden Valley Nature Center (Riverside)
2. Martin Tudor-Jurupa Hills Regional Park (Fontana)
3. Mount Rubidoux Park (Riverside)
4. Silverlakes Equestrian & Sports Park (Norco)

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

HISTORIC RIVERSIDE COUNTY COMMUNITY TRAILS MAP

Community Trails Map – Jurupa Community Plan (Exhibit M)

DESCRIPTION OF MULTI-PURPOSE COMMUNITY TRAILS

The following is a generalized description of the locations of trails added to the Jurupa Community Plan Public Facilities Map through CGPA No. 390. The trail alignments depicted on "CGPA NO. 390, EXHIBIT B, REVISED NOVEMBER 15, 1994" represent conceptual trail alignments centered on the trail symbol locations. This description likewise is intended to represent a generalized description of trail routing. Trail symbol locations and route descriptions as depicted on mapped exhibits and described in this document do not constitute a commitment to acquire or use the underlying land for public purposes. Trail alignments may deviate from the described locations as necessary to minimize environment impacts, to comply with requirements of public agencies, and to provide for the expeditious establishment of the multi-use trail system.

Trail A, as amended by the Board of Supervisors, begins at the southeasterly corner of the Riverside County Regional Equestrian Center at the future intersection of Cleveland Avenue and 65th Street and proceeds easterly along the future alignment of 65th Street to Hamner Avenue, thence southerly along the westerly side of Hamner Avenue to the regional trail generally paralleling the Santa Ana River.

Trail A-1, was deleted by the Board of Supervisors.

Trail B begins on Riverside Avenue at the San Bernardino County line proceeds easterly to Day Creek Channel, thence southerly along the channel to 66th Street, thence southerly along an undeveloped extension of Lucretia Avenue to an already-adopted regional trail paralleling the Santa Ana River.

Trail BD Link links Trails B and D along a Flood Control right-of-way.

Trail C, as amended by the Board of Supervisors, begins at the intersection of Hamner Avenue (Trail A) Schleisman Road and proceeds easterly and northerly along Schleisman Road to 68th Street, thence easterly along 68th Street to its intersection with Trail B at the corner of 68th Street and Lucretia Avenue.

Trail D extends along Wineville Road from Riverside Avenue on the north to Bellegrave Avenue on the south. At Bellegrave Avenue, Trail D connects to the regional trail which parallels Wineville Avenue southerly of Bellegrave Avenue.

Trail E follows Day Creek Channel's Lateral "A" and its westerly extension (northerly of 58th Street) in providing west-east access from Wineville Avenue and its parallel trail to Etiwanda Avenue (Trail F).

Trail F begins at the corner of Etiwanda Avenue and Bellegrave Avenue and extends southerly along Etiwanda Avenue to Limonite Avenue, thence westerly along Limonite Avenue to Lucretia Avenue (Trail B).

Trail G begins at the corner of 58th Street and Etiwanda Avenue and extends easterly along 58th Street to Dodd Street, thence southerly along Dodd Street to Limonite Avenue, where a connection may be made to the regional trail which generally parallels Bain Street between Bellegrave Avenue and Limonite Avenue and extends southerly of Limonite Avenue to the Santa Ana River.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

Trail H begins at the corner of Bellegrave Avenue and Marlatt Street and extends southerly along Marlatt Street to 58th Street (Trail G).

Trail I begins at Country Village Road northerly of Highway 60 and extends easterly cross-country to intersect with Trail Q along a northerly extension of Pyrite Road.

Trail J is a northerly branch of Trail I which proceeds from a westerly terminus at its intersection with Trail I cross-country to intersect with Trail Q along a northerly extension of Pyrite Road.

Trail K, as amended by the Board of Supervisors, begins at the intersection of Galena Street with Bain Street and/or the regional trail segment paralleling Bain Street and proceeds easterly along Galena Street and Galena Street extended easterly across Van Buren Boulevard. Easterly of Van Buren Boulevard, Trail K proceeds easterly along Galena Street to Tyrolite Street, thence southerly along Tyrolite Street to Trail R, a cross-country trail.

Trail K-1 constitutes an alternative routing for the segment of Trail K westerly of the intersection of Galena Street and Rutile Street. Trail K-1 extends northwesterly from this intersection to the regional trail located between Union Street and Van Buren Boulevard, but does not cross Van Buren Boulevard.

Pursuant to the directives of the Planning Commission, Trail K-1 shall only be developed if a grade-separated crossing of Bellegrave Avenue is established. In the event that Trail K-1 is established, Trail K shall not cross Van Boulevard. However, the segment of Trail K extending easterly along Galena Street from Bain Street to Kingsbridge Lane will be permitted to be developed in conjunction with Trail L as Trail L-1.

Trail L begins at Galena Street where it would be intersected by a direct northerly extension of Steve Avenue, then proceeds southerly cross-country along such undeveloped extension of Steve Avenue to 50th Street, thence southerly along existing Steve Avenue to 53rd Street, thence easterly along 53rd Street to Beach Street, thence southerly along Beach Street to Limonite Avenue, thence easterly along Limonite Avenue to Downey Street, thence southerly along Downey Street to 64th Street and continuing southerly along an undeveloped extension of Downey Street to the regional trail which, in this area is located along the northerly side of the Santa Ana River.

Pursuant to the directives of the Riverside County Planning Commission, Trail L shall not be permitted to cross Jurupa Road or Limonite Avenue and shall be developed as three trail segments (northerly of Jurupa Road, southerly of Jurupa Road and northerly of Limonite Avenue, and southerly of Limonite Avenue) until such time as traffic controls (either a traffic signal – which may be a special demand-actuated trail crossing signal – or a four-way stop sign) are established at these trail crossings.

Trail M* extends easterly from Trail L along an undeveloped westerly extension of Athens Street and along Athens Street to its easterly terminus at Knowles Field.

Pursuant to the directives of the Planning Commission, Trail M* shall constitute a pedestrian-bicycle trail, with no equestrian use permitted.

Trail N extends from the corner of Bain Street and 60th Street (intersection with the regional trail paralleling Bain Street) easterly along 60th Street to Serendipity Road, northerly long Serendipity to 58th Street, easterly along 58th Street to Ash Street, southerly along Ash Street to 59th Street, easterly along 59th Street to a natural watercourse, thence northeasterly along the watercourse to Van Buren Boulevard, across Van Buren Boulevard and through an existing channel under the Union Pacific/Metrolink rail line, emerging along the watercourse, then proceeding easterly along 54th Street to its easterly terminus at the West Riverside and Jurupa Canal.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

A grade-separated trail crossing will be required at Van Buren Boulevard in order to implement the segment of Trail N northeasterly of the intersection of 56th Street and Felspar Street and southwesterly of the intersection of 54th Street and Pedley Road.

Trail O is a branch of Trail N which proceeds easterly from the natural watercourse to Felspar Street, thence southerly along Felspar to 58th Street, thence easterly along 58th Street to an existing equestrian arena.

Trail R begins at the corner of Pedley Road and 58th Street (intersection with the regional trail paralleling Pedley Road) and extends easterly along 58th Street to its easterly terminus, thence northeasterly, generally following the alignment of the West Riverside and Jurupa Canal to the southerly margin of the Jurupa Retention Basin (as depicted on the Public Facilities Map), thence cross-country to Soto Street (intersection with Trail V).

Trail S extends cross-country southerly from 58th Street (Trail R) to Pedley Road and its parallel regional trail.

Trail T extends northeasterly cross-country from Trail R beyond the easterly terminus of 56th Street to encircle a local park.

Trail U was deleted by the Planning Commission, pursuant to staff recommendation.

Trail V, as amended by the Planning Commission, begins at the corner of Jurupa Road and Soto Street (intersection with the regional trail paralleling Jurupa Road) and extends southerly along Soto Street and its undeveloped southerly extension, then proceeds cross-country southwesterly to a point just northeasterly of the intersection of Camino Real with Blackhawk Place, thence southeasterly, northeasterly, and southeasterly around the homes along Lakeside Drive, then continues easterly along 45th Street as Trail X.

Trail W begins at its intersection with Trail Y northwesterly of the intersection of Scenic Drive with 34th Street and proceeds cross-country in a southwesterly direction to the Jurupa Mountains Cultural Center. Trail W then crosses under Highway 60 via the Camino Real underpass and proceeds southerly along Camino Real to Mission Boulevard, thence cross-country along the planned extension of Camino Real Road in a southerly direction to Jurupa Road. Trail W thence proceeds southerly along Camino Real Road to its intersection with Trail R.

Pursuant to the directives of the Planning Commission, Trail W shall not be permitted to cross Mission Boulevard and shall be developed as two trail segments (northerly and southerly of Mission Boulevard) until such time as traffic control (either a traffic signal – which may be special demand-actuated trail crossing signal – or a four-way stop sign) is established at this trail crossing.

Trail X, as amended by the Planning Commission, begins westerly of the westerly terminus of 45th Street (at an intersection with Trail V) and extends easterly along 45th Street to Memorial Park, thence northerly and easterly through Memorial Park to the intersection of Limonite Avenue with Riverview Drive, thence southwesterly along Riverview Drive to the regional trail located northerly of the Santa Ana River.

Trail Y, as amended by the Planning Commission, begins at its intersection with Trail W northwesterly of the intersection of Scenic Drive with 34th Street and extends cross-country in a northeasterly direction to its northerly terminus at Trail Z.

Trail Z, as amended by the Planning Commission, begins at the regional trail which extends northerly and easterly from the Jurupa Mountains Cultural Center and extends easterly to its intersection with Trail Y, thence southeasterly and northeasterly to Sierra Avenue and 27th Street, where it intersects Trail AA.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

near the corner of 27th Street and Karen Lane, then continues easterly, southeasterly, and northeasterly along a route paralleling the rear property lines of homes on the north side of Sandra Drive, then continues cross-country in a northeasterly direction to the San Bernardino County line.

Trail AA begins at the San Bernardino County line and proceeds cross-country in a southeasterly direction along a route which parallels Sierra Avenue. At Karen Lane, Trail AA intersects 27th Street and continues along 27th Street to its southeasterly terminus at Gail Drive, then continues cross-country, crossing Armstrong Road and continuing southeasterly to its intersection with Trail BB and the regional trail which extends from the Jurupa Road corridor to the Santa Ana River at Market Street.

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

MULTI-PURPOSE COMMUNITY TRAILS

The following is a generalized description of the locations of trails added to the Jurupa Community Plan Public Facilities Map through CGPA No. 390. The trail alignments depicted on "CGPA NO. 390, EXHIBIT B, REVISED NOVEMBER 15, 1994" represent conceptual trail alignments centered on the trail symbol locations. This description likewise is intended to represent a generalized description of trail routing. Trail symbol locations and route descriptions as depicted on mapped exhibits and described in this document do constitute a commitment to acquire or use the underlying land for public purposes. However, trail alignments may deviate from the described locations as necessary to minimize environment impacts, to comply with requirements of public agencies, and to provide for the expeditious establishment of the multi-use trail system.

MULTI-PURPOSE COMMUNITY TRAILS INVENTORY AND CLASSIFICATION

The following is a list of community trails that have been identified and classified per the established trail descriptions. Each type of trail will have an implementation strategy based on whether it is an existing one or is proposed for development. The trail name and type of each trail is listed below.

| <u>Trail Name</u> | | <u>Trail Type</u> |
|-------------------|---|--|
| 1. Trail A | (no longer designated) | Eliminated by construction of Interstate 15 freeway |
| 2. Trail B | | Open Space Trail A-C |
| 3. Trail BD | | Community Trail A |
| 4. Trail C | | Community Trail A |
| 5. Trail D | | Community Trail A |
| 6. Trail E | | Urban Trail A-C |
| 7. Trail F | | Open Space Trail A-C |
| 8. Trail G | | Urban Trail A-C |
| 9. Trail H | | Urban Trail A-C |
| 10. Trail I | | Open Space Trail A-C |
| 11. Trail J | | Open Space Trail A-C |
| 12. Trail K | | Urban Trail A-C |
| 13. Trail K-1 | (no longer designated) | Eliminated by construction of Orco Block |
| 14. Trail K-2 | (to be added to Trails Plan) | Urban Trail A-C |
| 15. Trail L | | Urban Trail A-C |
| 16. Trial M | | Urban Trail A-C |
| 17. Trail N | | Open Space Trail A-C |
| 18. Trail O | | Open Space Trail A-C |
| 19. Trial Q * | (Pyrite Street) North of the SR60 Freeway South of the SR60 Freeway | Open Space A-C Urban Trail A-C |
| 20. Trail R | | Open Space Trail A-C |
| 21. Trail S | | Open Space Trail A-C |
| 22. Trail T | | Open Space Trail A-C |
| 23. Trail U | (interrupted section) | Pending negotiations with Riverside County Regional Park & Open Space District |
| 24. Trail V | (to be revised) | Open Space Trail A-C |
| 25. Trail W | | Open Space Trail A-C |
| 26. Trail X | | Urban Trail A-C |
| 27. Trail Y | | Open Space Trail A-C |

Multi-Purpose Community Trails Plan

TRAILS MAINTENANCE AND OPERATIONS PROGRAM

TRAIL MAINTENANCE TO BE PERFORMED ON A CONTINUOUS, SCHEDULED BASIS:

1. **Trail User Safety**
Safety is central to all maintenance operations, and is the single most important trail maintenance concern. Items for consideration include scheduling and documentation of inspections, the condition of railings, bridges, and trail surfaces, proper and adequate signage, removal of debris, and coordination with other agencies associated with trail maintenance.
2. **Trails Inspection**
Trails inspections are integral to all trail maintenance operations. Inspections will occur on a regularly scheduled basis, the frequency of which will depend on the amount of trail use, location, age, and the type of construction. All trail inspections are to be documented.
3. **Trail Sweeping**
Trail sweeping is one of the most important aspects of trail maintenance, helping to ensure trail user safety. The type of sweeping to be performed depends on trail design and location. Trails that require sweeping of the whole system will be swept by machine. Trails that require only spot sweeping of bad areas will be swept by hand or with blowers. Some trails require a combination of methods. Sweeping will be performed on a regular schedule.
4. **Trash Removal**
Trash removal from trail corridors is important from both a safety and an aesthetic viewpoint, and includes removing ground debris and emptying trash containers. Trash removal will take place on a regularly scheduled basis, the frequency of which will depend on trail use and location.
5. **Tree and Shrub Pruning**
Tree and shrub pruning will be performed for the safety of trail users. Pruning will be performed to established specifications on a scheduled and as needed basis, the frequency of which will be fairly low.
6. **Mowing of Vegetation**
Trails maintenance personnel will mow vegetation along trail corridors on a scheduled basis only where mowing is not performed by other agencies or park districts.
7. **Scheduling Maintenance Tasks**
Inspections, maintenance, and repair of trail-related concerns will be regularly scheduled. Inspections and repair priorities should be dictated by trail use, location, and design. Scheduling maintenance tasks is a key item towards the goal of consistently clean and safe trails.

TRAIL MAINTENANCE TO BE PERFORMED ON AN IRREGULAR OR AS NEEDED BASIS:

1. **Trail Repair**
Repair of asphalt or concrete trails will be closely tied to the inspection schedule. Prioritization of repairs is part of the process. The time between observation and repair of a trail will depend on whether the needed repair is deemed a hazard, to what degree the needed repair will affect the safety of the trail user, and whether the needed repair can be performed by the trails maintenance crew or if it is so extensive that it needs to be repaired by outside entities.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

2. **Trail Replacement**
The decision to replace a trail and type of replacement depends on many factors. These factors include the age of the trail, and the money available for replacement. Natural trails may be replaced with a decomposed granite surface and an asphalt trail with a new asphalt surface, or replacement with a concrete trail. In general, replacing asphalt trails with concrete is desirable. Parks Planning will coordinate all trail replacement, and the Trail Coordinator will recommend trails for replacement.
3. **Weed Control**
Weed control along trails will be limited to areas in which certain weeds create a hazard to users (such as thorny plants along trail edges). Environmentally safe weed removal methods should be used, especially along waterways.
4. **Trail Edging**
Trail edging maintains trail width, and improves drainage. Problem areas include trail edges where berms tend to build up, and where uphill slopes erode onto the trails. Removal of this material will allow proper draining of the trail surface, allow the flowing action of water to clean the trail, and limit standing water on trail surfaces. Proper drainage of trail surfaces will also limit erosion of the surface during rainy conditions.
5. **Trail Drainage Control**
In places where low spots on the trail catch water, trail surfaces should be raised or drains built to carry away water. Some trail drainage control can be achieved through the proper edging of trails. If trail drainage is corrected near steep slopes, the possibility of erosion must be considered.
6. **Trail Signage**
Trails fall into two categories: safety and information. Trail users should be informed where they are, where they are going, and how to use trails safely. Signs related to safety are most important and should be considered first. Information signage can enhance the trail user's experience. A citywide system of trail information signage should be a goal.
7. **Revegetation**
Areas adjacent to trails that have been disturbed for any reason should be revegetated to minimize erosion.
8. **Habitat Enhancement and Control**
Habitat enhancement is achieved by planting vegetation along trails, mainly trees and shrubs. This can improve the aesthetics of the trail, help prevent erosion, and provide for wildlife habitat. Habitat control involves mitigation of damaged caused by wildfire.
9. **Public Awareness**
Creating an understanding among trail users of the purpose of trails and their proper use is a goal of public awareness. Basic concepts of trail use include resolution of user conflicts, and speed limitations. The representatives should be easily accessible to field questions and concerns.
10. **Trail Program Budget Development**
A detailed budget should be created for the trails program, and revised on an annual basis.

V2C Group, Inc. – Draft 03-10-16

Jurupa Area Recreation & Park District
Multi-Purpose Community Trails Plan

11. **Volunteer Coordination**
The use of volunteers can help increase public awareness of trails, and provide a good source of labor for the program. Sources of volunteers include Boy Scouts, school groups, church groups, trail users, or court workers. Understanding volunteer's concerns is important, as are possible incentives or recognition of work performed. Implementation of an "Adopt-a-Trail" program should be considered.
12. **Records**
Good record-keeping techniques are essential to an organized program. Accurate logs should be kept on items such as daily activities, hazards found and action taken, maintenance needed and performed, etc. Records can also include surveys of the types and frequency of use of certain trail sections. This information can be used to prioritize trail management needs.
13. **Graffiti Control**
The key to graffiti control is prompt observation and removal. During scheduled trail inspections any graffiti should be noted and the graffiti removal crew promptly notified.
14. **Mapping**
Several maps are privately marketed and available for trail users. From a maintenance standpoint, an accurate, detailed map of the trail system is important for internal planning and maintenance use.
15. **Coordination with Other Agencies**
Maintenance of trails located within more than one jurisdiction, like regional trails, is provided by other agencies. A clear understanding of maintenance responsibilities needs to be established to avoid duplicating efforts or missing maintenance on sections of the trails.
16. **Education and Interpretation**
Many segments of the trail system contain a wealth of opportunities for education and interpretation. Trails along waterways provide good opportunities to teach and study concepts about urban wildlife and ecology. Educational opportunities range from interpretative signage to educational tours.
17. **Law Enforcement**
A greater law enforcement effort might be made toward the goal of a safer trail system. Law enforcement agencies should be aware about the location of trails, and the types and levels of use they receive. Sections of trail corridors being used by transients is an ongoing problem that is not easily solved. Increased law enforcement awareness will be addressed on an as needed basis.
18. **Proper Training of Employees**
Properly training maintenance employees is essential to the efficient operation of the trails maintenance program. All employees should be thoroughly trained to understand and be aware of all of the above mentioned aspects of trail maintenance. Safety, a good work ethic, and proper care of equipment and tools will always be the backbone of a good training program. Employees must also be aware of the need for positive public contact. Proper positive attitude towards public questions and concerns is important, as is the conveyance of this information to trail supervisors.

Excerpts for this trails maintenance program were taken from "Trail Maintenance and Management" article written by Jed Wagner, Denver Parks and Recreation Department. Jed Wagner was for several years the supervisor of Denver's Trails Maintenance Program. This article was written in 1999. Article was hosted by AmericanTrails.org.

Draft 2017 General Plan

Appendix 17.0 Mira Loma Warehouse Distribution Center Policy

April 2017

City of Jurupa Valley

PLANNING DEPARTMENT POLICY DIRECTIVE 12-01 **MIRA LOMA WAREHOUSE / DISTRIBUTION CENTER POLICY**

BACKGROUND

The Mira Loma Warehouse / Distribution Center Policy states:

"that in the Business Park, Light Industrial, and Heavy Industrial land use designations within the Jurupa Area Plan, warehousing and distribution uses, and other goods storage facilities, shall be permitted only in the [Mira Loma Warehouse Policy Area], and that "this policy shall not apply to firms which only store goods that are manufactured or assembled on-site. In such a case, the use shall be evaluated based on the underlying general plan land use designation, and any potential impacts on the community from diesel and other hazardous emissions, traffic generation, local existing land use compatibility and other environmental and socioeconomic concerns. No warehouses, distribution centers, intermodal transfer facilities (railroad to truck), trucking terminals or cross dock facilities shall be allowed outside of the Mira Loma Warehouse/Distribution Center Policy Area." Also, Article II, Section 2.2. (General Plan Consistency) of the zoning code states "no discretionary permit shall be approved pursuant to the zoning ordinance unless it is determined that the permit is consistent with the General Plan."

Applicants have expressed concern that an overzealous application of this policy could prevent many industrial uses from occupying properties in the City of Jurupa Valley.

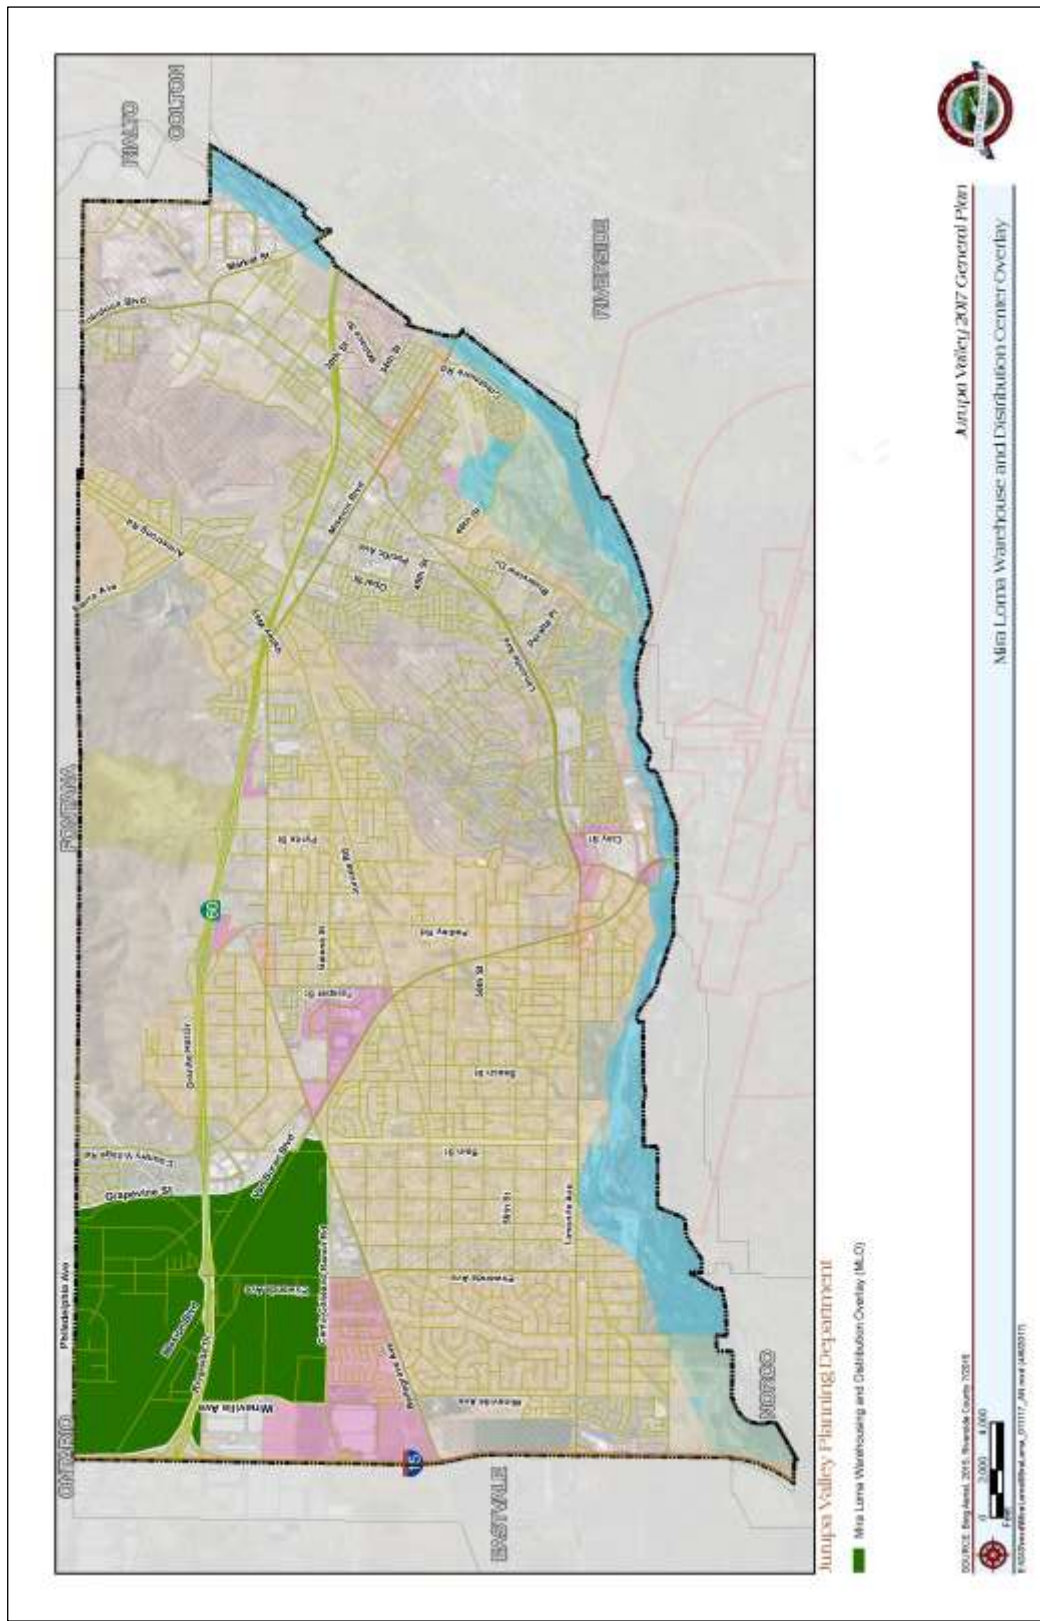

DIRECTIVE

This policy directive establishes the appropriate interpretation and application of the Mira Loma Warehouse / Distribution Center Policy as follows:

For industrial uses established outside of the policy area, the principal use of the building will prevail in determining whether the use is manufacturing or warehouse. Minor and incidental use of pre-packaged or pre-fabricated parts that are combined with the primary product will not be considered warehousing or distribution. Planning staff is directed to evaluate each proposed industrial use in light of the specific proposed use, and permit businesses that manufacture, fabricate, assemble or process raw material or assemble prefabricated components into finished products as the principal activity on the site regardless of whether a minor part of their operation includes redistribution of finished goods as a part of the use.

Draft 2017 General Plan

**Appendix 18.0
Jurupa Valley
Communities**

April 2017

Jurupa Valley's Distinct Communities

One of the most unique and delightful aspects of Jurupa Valley is the variety and number of distinct communities located here. The City's motto, "A Community of Communities," is an apt description, since residents strongly identify with these nine different communities. Each community varies in size, visual character, and focus. While separate, residents in each community unite in a commitment to preserving their uniqueness and to working together to create a prosperous and healthy future for the City as a whole. The City's communities are briefly described below.

Belltown

Belltown is a small community located north of SR 60, between Rattlesnake Peak and the Santa Ana River. This community is characterized by low-density single-family residences, a large industrial area and, scattered commercial uses.

Figure 1: Belltown, looking northeast, with Market Street in center of photo

Crestmore Heights

Crestmore Heights has a mix of mostly older, suburban, and semi-rural properties at the base of the Jurupa Mountains and near the Agua Mansa Industrial Area. The area offers opportunities for animal keeping and has good access to open space and equestrian and hiking trails.

Figure 2: Crestmore Heights, looking north, with Rubidoux Boulevard in center of photo

Glen Avon

The largely low-density community of Glen Avon is located in the central portion of Jurupa, just south of SR 60. The rural community area southerly of Jurupa Road affords an opportunity to maintain an equestrian friendly place and serve as an historic village center. Yet, Mission Boulevard and Van Buren Boulevard cut through this community, accommodating scattered commercial, industrial, and higher-intensity residential development. The Jurupa Mountains and Pedley Hills offer a scenic natural backdrop for this community, as well as the traveling public.

Figure 3: Glen Avon, looking north, with SR 60 crossing left to right

Indian Hills

Indian Hills is a picturesque, golf-course-oriented residential enclave located in the foothills between the Pedley Hills and the community of Rubidoux, northerly of the Santa Ana River. Much of this area is included within, and has been developed pursuant to, Specific Plan No. 123.

Figure 4: Indian Hills, looking north, toward Pedley Hills

Jurupa Hills

Jurupa Hills is a mostly suburban area located between Limonite Avenue and the Santa Ana River. The community is characterized by gently rolling hills and easy access to the Santa Ana River and trails.

Figure 5: Jurupa Hills, looking north, with the Santa Ana River along the bottom of the photo

Mira Loma

The largely rural community of Mira Loma is located in the western portion of Jurupa. The presence of several trails throughout the community reflects the importance of equestrian uses in the area. A significant amount of land in the northwestern Mira Loma area near the I-15/SR 60 junction is converting from dairy to industrial, warehousing, and truck distribution uses to capitalize on direct access to the freeway system and to tap into the rapidly expanding pattern of goods movement throughout the entire region. The proximity of the warehousing uses to the residential areas has generated considerable concern in the community relating to air pollution impacts from the many diesel-powered vehicles and heavy trucks associated with the warehousing and distribution uses.

Figure 6: Mira Loma, looking north, with Bain Street and San Seva Channel to the right of center of the photo

Pedley

The community of Pedley is nestled among the rolling foothills and canyons of the Pedley Hills in the southern portion of Jurupa. It contains a variety of rural and suburban-style residential neighborhoods, as well as a thriving commercial district along Limonite Avenue. Industrial uses are located along the banks of the Santa Ana River. Due to its location, history, and mix of uses, the Pedley community includes one of three historic “village centers” in Jurupa Valley. The Metrolink station in Jurupa Valley is located along Limonite Avenue and Van Buren Boulevard, making the Pedley community particularly important in terms of regional connections.

Figure 7: Pedley, looking north, with Limonite Boulevard along the bottom and Van Buren in the center of the photo

Rubidoux

The historic community of Rubidoux is the most intensely developed of all the communities in Jurupa. Bordered roughly by the Pedley Hills, the Santa Ana River, and SR 60, Rubidoux comprises a variety of land uses, including residential, commercial, industrial, and several public uses. Historic Mission Boulevard serves as the spine for Rubidoux Village Center, one of three such centers in Jurupa Valley where pedestrian-oriented, mixed-use development is encouraged. The Jensen Alvarado Historic Ranch and Museum, and Flabob Airport are prominent features of the Rubidoux community.

Figure 8: Rubidoux, looking north, with Mission Street crossing from the upper left corner

Sunnyslope

Nestled at the base of the Jurupa Mountains north of SR 60, Sunnyslope is a mostly low-density community consisting of older, single-family residences and mobile homes. The community's location provides opportunities for equestrians and hikers to explore open space areas along the City's northerly border. Its visibility from the highway also provides opportunities for the development of visitor-serving uses such as hotels, motels, restaurants, and travel centers.

Jurupa Valley
California

Draft 2017 General Plan

Appendix 19.0 Multi-Modal Transportation Options

April 2017

Multi-Modal Transportation Options

During eight public workshops and General Plan Advisory Committee meetings, two of the most commonly expressed mobility concerns were 1) lack of safe pedestrian facilities, especially crosswalks, and 2) speeding traffic in residential areas and in areas with high pedestrian traffic (e.g., around schools). The options presented below provide a “menu” of roadway improvements that address these specific concerns while giving the City a wide range of cost-effective roadway improvements. Many can be accomplished for relatively low cost, such as high visibility crosswalk markings and bulbouts. These options are not intended as mandatory standards, but rather tools that can be applied where appropriate to suit local conditions and can enhance neighborhood character with landscaping, decorative paving and public art. All require engineering studies and analysis to determine suitability and site-specific designs.

One of the City’s primary mobility goals is “To create a multi-modal mobility network which is attractive and provides all users with safe connections to homes, jobs, schools, commercial areas, public facilities and recreation areas, and which protects Jurupa Valley’s semi-rural character and lifestyle, and reduces dependence on the use of single-occupant automobiles.” To augment the planned roadway system improvements, the City may also consider various innovative actions to help achieve the goal of a “multi-modal” transportation system and to better manage increased traffic and meet a wide range of other community objectives.

To achieve this goal, it is important to design and implement a multi-modal transportation system that will minimize congestion, minimize pass-through traffic, and maintain the semi-rural character of the City while accommodating a reasonable amount of growth and development. Therefore, this section describes the innovative strategies that could help reduce congestion, minimize pass-through traffic on major streets and redirect regional traffic to highways and major expressways. Traffic studies show that the benefits of street widening are often short-lived, as they both accommodate and attract higher traffic volumes, including added pass-through traffic. In addition, City residents have expressed opposition to extensive street widenings as they believe it will change the City’s semi-rural, equestrian-oriented nature and adversely affect quality of life. Consequently, in Jurupa Valley, street widening is generally not a recommended option except for a limited number of high volume roadways.

The City of Jurupa Valley places high importance on maintaining its semi-rural character, promoting walking, biking and equestrian uses, and enhancing residents’ quality of life. Consequently, the City seeks to avoid conventional street or intersection widening, and instead, supports using a number of innovative transportation actions, as summarized below. These options may be used singly or in combination, for potential changes or improvements to local roadways and intersections to help reduce congestion in a manner that is compatible with their surroundings. Traffic impacts and additional system improvement options are more fully discussed in the General Plan Program EIR, and in the General Plan Traffic Study, Appendix 3C.

There are a wide range of transportation improvements that provide innovative and effective alternatives to conventional street widening. Many of these improvements can be accomplished within existing rights-of-way and can be designed to complement Jurupa Valley’s semi-rural

character. The improvements described and pictured below are considered to have potential applications in the City, although detailed engineering studies and analysis will be needed to determine where one or more of the options may be appropriate and to ensure their design is tailored for Jurupa Valley.

Street Design Alternatives

1. **High Visibility Crosswalks.** High Visibility Crosswalks include striped patterns, pavement lights, improved signing, and/or advance flashing beacons to improve the visibility of the crosswalk. They can also feature artistic colors and patterns that borrow local themes and culture. These crosswalks are applicable on local streets where speed control and pedestrian crossing designation are desired. The benefits can include discouraging cut-through traffic since they may slow traffic and increase driver awareness of crosswalks, and require minimal cost to install and maintain.
2. **Pavement Striping.** Pavement Striping is used to create narrow lanes, which gives the impression of a narrow street. This makes motorists feel restricted, which helps reduce speeds. Striping can be at curb end or in the middle of the street to create a median. It is most applicable to long, wide residential streets where speeding traffic could occur. Pavement striping is easy to install and modify with relatively low cost implementation.
3. **Gateways.** Gateways are special entrances that reduce the width of the travel way through the use of islands and are usually placed on roadways to narrow each direction of travel and interrupt the path along the center of the roadway. Gateways tend to be highly visible to motorists to notify a change in the roadway, may discourage cut-through traffic, can help slow traffic and provide attractive neighborhood or village entries by including public art and/or low maintenance landscaping.

High visibility crosswalk

Pavement striping

Gateways

4. **Bulbouts** can reduce traffic speed and improve pedestrian safety. They are simply intersection curb extensions that extend into parking lanes, but not into the bicycle or through lanes. Bulbouts often have high visibility pavement color, texture or other markings and provide a highly visible entry or gateway statement into activity areas or where significant numbers of pedestrians are present. Entering an area where a bulbout is present gives greater visibility to pedestrians, reduces unprotected pedestrian crossing time and tends to slow traffic.

Intersection bulbouts (City of San Luis Obispo, California)

5. **Roundabouts.** The use of roundabouts as an alternative to conventional stop and signal control intersections is becoming increasingly popular in California and the U.S. Studies conducted by the insurance industry have determined that these types of intersections result not only in a significant decrease in automobile traffic at an intersection, but also a reduction in pedestrian accidents as well. At a conventional intersection, the pedestrian faces four potential vehicle conflicts:

Roundabout (City of Bend, Oregon)

- Crossing movements on red (typically high-speed, illegal);
- Right turns on green (legal);
- Left turns on green (legal for protected-permitted or permitted left turn phasing); and
- Right turns on red (typically legal).

Pedestrians at roundabouts, on the other hand, face two conflicting movements on each approach:

- Conflict with entering vehicle; and
- Conflict with exiting vehicle.

The crossing of the roundabout is relatively simple. The pedestrian waits for a gap in traffic and crosses from the curb to the splitter island that provides protection, and then crosses from the splitter island to the far curb when another gap in traffic occurs. Crossing in two steps halves the vehicle exposure for each segment. In addition, safety is improved because the vehicles are forced to go slower through the roundabout than at a conventional intersection.

Roundabout crosswalk treatment

6. **Mid- Block Bulbouts.** Crossings are raised islands in the parking zone that can be detached from the curb line to allow for drainage and to provide enhanced visibility crosswalks. Mid- block bulbouts provide pedestrians with additional opportunities for crossing streets with infrequent intersections or where a direct route is needed for a popular destination, such as transit stop or shopping center. They may be most appropriate in the City's Village Plan areas as designated in the Land Use Element, where the City seeks more pedestrian-oriented development and small-scale commercial areas. Locations for mid-block crossings and related improvements require detailed engineering studies and analysis to provide maximum visibility of pedestrians to motorists and reasonable opportunities for pedestrians to cross safely.

Mid-block bulbouts

7. **Chicanes** are curb extensions that alternate from one side of the street to the other, forming S- shaped curves. To prevent drivers from taking a straight line through the feature, it is recommended to shift the alignment of at least one lane width and to have deflection angles of at least 45 degrees. This type of alignment is best applied to local streets where speed control is desired, provided the street is wide enough to accommodate the curvilinear design.

Chicanes

8. **Partial Street Closures** are barriers that block travel in one direction for a short distance on otherwise two-way streets. They are used in sets to make travel through neighborhoods with gridded streets circuitous rather than direct. That is, they are not lined up along a border that would preclude through movement, but instead are staggered, which leaves through movement possible but less attractive than alternative routes.

Partial street closures

Traffic Management Alternatives

1. **Intelligent Transportation Systems (ITS)** are technology improvements that improve traffic flow and minimize disruptions to travel. ITS type projects can include sophisticated traffic signal systems designed to manage speed and enhance traffic flow, dynamic message signs, incident management cameras, weather stations, highway advisory radio, transit automatic vehicle location, and video surveillance.
2. **Adaptive Traffic Control Systems (ATCS)**. Improving traffic operations on major thoroughfares within the City of Jurupa Valley through implementation of ATCS could help alleviate traffic congestion. ATCS attempts to modify the coordination of many traffic signals to prevailing traffic conditions in real- time. All techniques rely on traffic- detection equipment and a central computer monitoring station that uses the collected data to optimize traffic signal coordination and timings to provide more efficient cycle- lengths and green- times.

Several jurisdictions nationwide have implemented their own ATCS in recent years. The most notable implementation in Southern California is the system developed by Los Angeles Department of Transportation (LADOT) for the City of Los Angeles. The ATCS automatically adjusts traffic signal timing at 375 intersections within the City of Los Angeles in response to real-time traffic demands. The evaluation results published by LADOT show that the ATCS reduced travel time by 12.7%, decreased average stops by 31%, and lowered average delay by 21.4% (Preliminary Evaluation Study of Adaptive Traffic Control System, Banerjee, Frances T, City of Los Angeles Department of Transportation, July 2001). ATCS can be used by the City of Jurupa Valley for improvement of traffic congestion along major thoroughfares within the City.

3. **Transportation Demand Management (TDM)** is a strategy to increase the efficiency of a transportation system by encouraging a shift from single- occupant vehicle (SOV) trips to non- SOV modes, or shifting auto trips out of peak periods. The goal of TDM is to reduce auto trips by increasing travel options through incentives to encourage individuals to modify their travel behavior. The cumulative impact of TDM strategies can have an impact on travel behavior, system efficiency, and SOV rates. TDM programs can be implemented by employers or public agencies. Employer based TDM strategies can reduce vehicle trips by providing employees with incentives, information, and additional transportation options to

commute through other modes than SOV, to commute during off- peak times of day, or eliminate certain work trips altogether. Employer based strategies may include:

- Instituting parking charges;
- Unbundling free or subsidized parking from employee benefits;
- Providing free days of parking for employees who carpool/vanpool;
- Transit Subsidies: Provision of subsidized transit passes/vanpool fares, or shuttle services;
- Bike/Walk Facilities: Secure workplace parking for bikes, and shower and locker facilities;
- Preferred Parking for Carpools: Provision of preferred parking spaces for Carpool/Vanpool vehicles;
- Vanpools, Shuttles, and Car-sharing: Provision of free vanpool vehicles, shuttle services, or car sharing programs for employees to reduce private vehicles;
- Telecommuting: Allow employees to work from home or a non-office location one or more days a week;
- Compressed Workweek: Enabling employees to compress regularly scheduled hours into fewer work days per week; and
- Flexible Schedule: Allowing employees to offset work hours from the typical 9:00 to 5:00 standard and shift commute travel to off-peak hours.

Establishment of a trip reduction ordinance by the City could encourage non-SOV modes such as public transit, vanpools, carpools, and bicycles, rather than SOV. Also, a trip reduction ordinance could encourage alternate work hours that serve to reduce the typical peak demand upon the street network, parking facilities, and transit systems. The trip reduction ordinance could apply to large, non-residential development projects, which would be required to reserve and designate preferential parking spaces for carpool vehicles, provide employees with commuter matching services and trip reduction information, and provide bicycle parking facilities and other non-automobile enhancements.

4. **Transit Pass Programs.** A growing number of transit agencies have been teaming with employers, universities, developers, and residential neighborhoods to provide universal transit passes. These passes provide unlimited rides on local or regional transit providers for low monthly fees, often absorbed by employers, schools, or developers. This strategy could increase the number of transit ridership and reduce SOV and congestion.

5. **Safety Education Programs.** Safety education programs are an important component of a traffic calming program because they include efforts to make the public more aware of its own driving behavior and the impact it has on others. Pedestrian and bicycle safety programs alert and educate pedestrians and bicyclists on road safety. Driver safety information and education can help improve driver behavior.

Bicycle safety programs

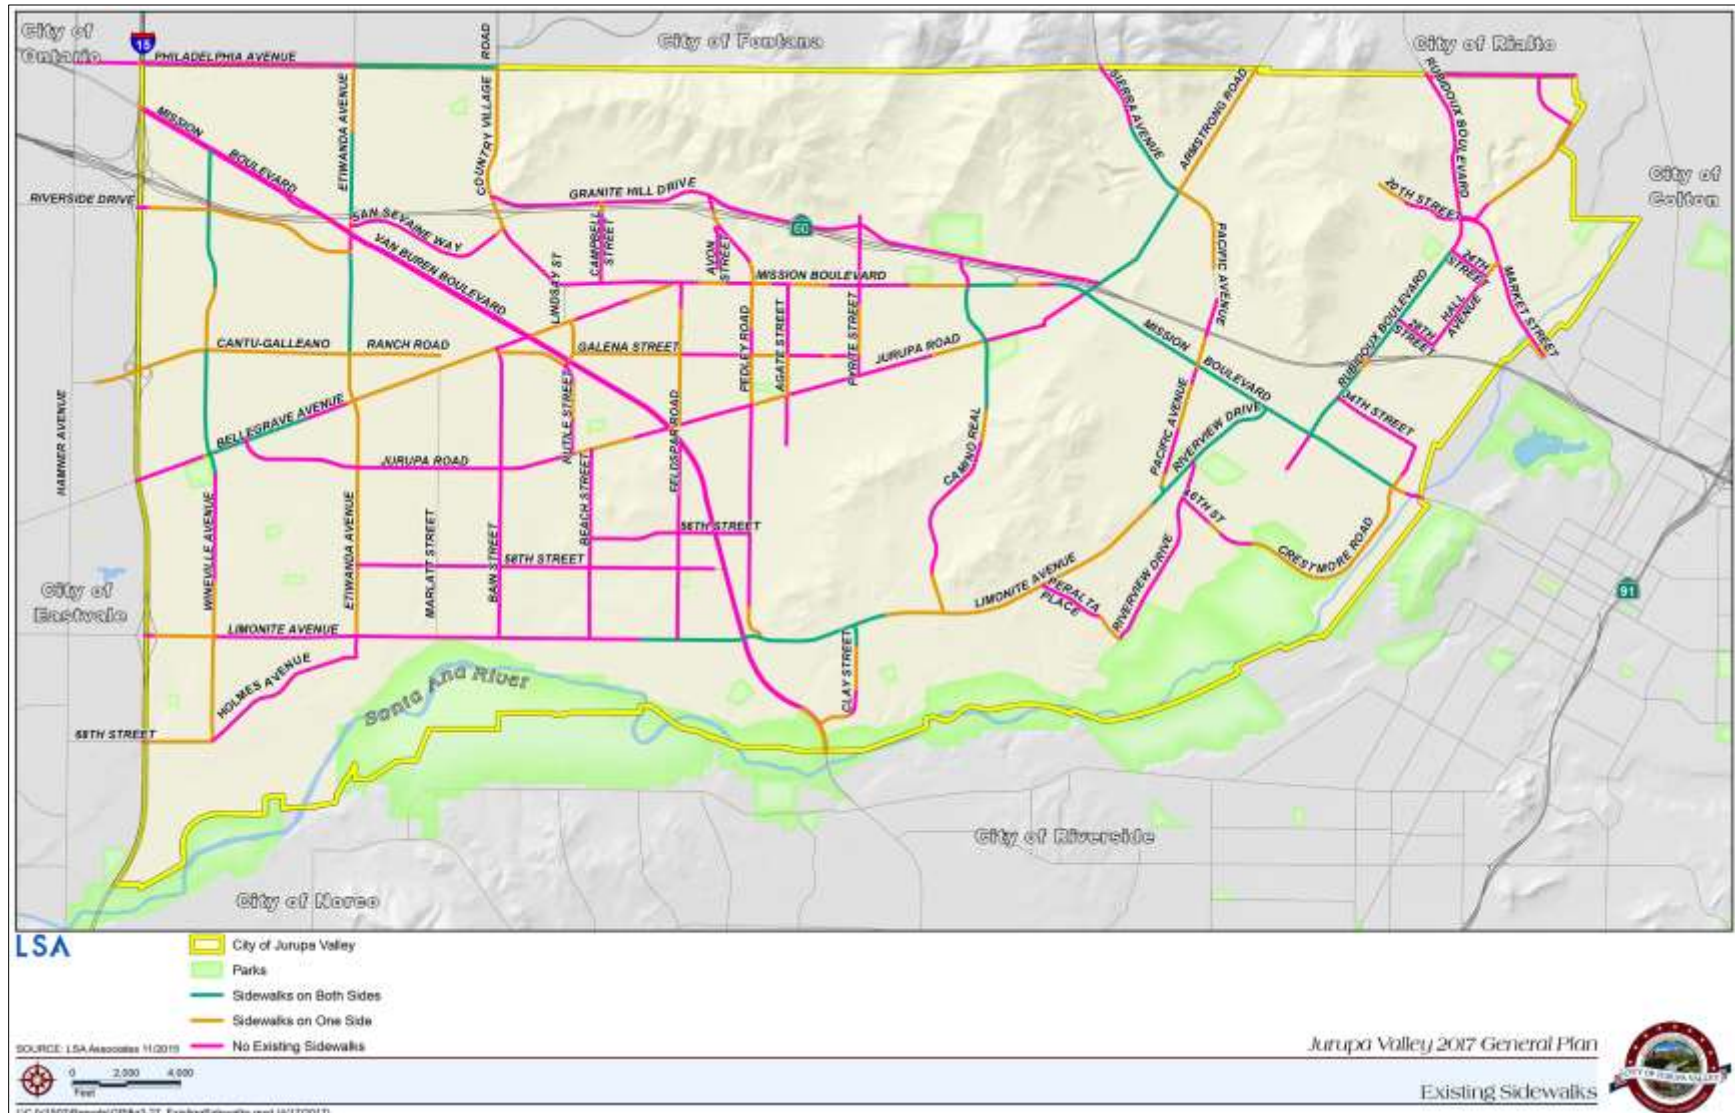

Pedestrian and Bicycle Facilities

To meet a wide range of community needs, the City's transportation system must also include facilities for bicycles, pedestrians, equestrians, rail and public transit facilities. In addition to providing more travel options, these alternative transportation modes have other significant benefits, including reduced fuel usage and emissions, health and recreation opportunities, reduced traffic congestion and an improved quality of life. Increasing the community's use of non-motorized travel modes can mean changes to long-standing habits or behaviors. Thus, it requires more effort than merely building new facilities or expanding existing facilities. It requires public outreach and education to promote these modes and their safe use.

Pedestrian Facilities

Pedestrian facilities include sidewalks, walkways, bridges, crosswalks, signals, illumination, and other amenities (e.g., benches, bus shelters), among other items. These facilities are an important part of the City's non-motorized transportation network. Pedestrian facilities provide a vital link between many other modes of travel and can make up a considerable portion of short-range trips made in the community. Where such facilities exist, people will be much more likely to make shorter trips by walking rather than by vehicle. Equestrian facilities can also include some of these features, or be designed with a more rural character, as is typical in Jurupa Valley. Equestrian facilities are discussed here due to their connections to streets and sidewalks, and also in the Conservation and Open Space Element in relationship to recreation and open space trails.

Pedestrian facilities also provide a vital link for commuters who use other transportation facilities such as rail, bus, and park-n-rides. Without adequate pedestrian facilities, many commuters may be forced to utilize an automobile because of difficult or unsafe conditions that exist at their origin or destination. Pedestrian facilities within the immediate vicinity of schools and recreational facilities are important components of the non-motorized transportation system and essential to provide Safe Routes to Schools. Such facilities, typically in the form of sidewalks and trails, are provided where they are appropriate and enhance the safety of those who choose to walk to and from their destination. Pedestrian facilities may be warranted when any one or combination of the following conditions is present: any type of residential development; any type of activity center; any type of commercial center; downtown business districts; any type or combination of parks and recreation facilities; along or near transit routes and/or facilities; any type of business or office center; and, along or near any type of watercourse or body of water.

Existing sidewalks

For the most part, sidewalks are installed in most urban environments when the roadway frontage is developed. Because development occurs in stages, numerous missing links can occur in the sidewalk system. Eventually these are filled in, but this can take many years.

Sidewalks provide safe passage for pedestrians by creating a right-of-way that is separate from vehicular traffic. They are particularly important in, to, and from activity areas around the City, such as shopping districts, schools, recreation centers, and government buildings. Sidewalks encourage pedestrian activity, which is a defining element of community and neighborhood identity. In addition, good pedestrian connections are imperative for transit service because most transit trips begin and end with a pedestrian trip. Lack of sidewalks discourages pedestrian transportation.

The typical pedestrian system could be described as a grid system of streets with sidewalks on both sides that provide easy and direct connections between the trip origin and destination. It should also provide for convenient and safe street crossings and include sidewalks separated from streets and provide shade from trees.

As part of its overall General Plan mobility studies, the City evaluated pedestrian facilities using five pedestrian measurements described below.

1. **Directness:** The directness measure represents the actual pedestrian distance from trip origin to destination. Since pedestrian trips are highly dependent on trip length, the pedestrian infrastructure's ability to provide the shortest and most direct route is critical. The ideal pedestrian network is the grid system, since curve linear street patterns add distance to the potential trip. Barriers can also affect pedestrian travel. Freeways, rivers, and railroads can divide a community and restrict direct connections between one another except at a limited number of street over/under crossings.
2. **Continuity:** Continuity measures the completeness of the pedestrian system. A continuous sidewalk system not only allows the pedestrian to make an uninterrupted trip, it may also be required for a stroller or wheelchair user to utilize the sidewalks. Gaps in continuity can come in the form of missing segments, broken or overgrown vegetation, or physical barriers such as discontinuous streets or fences. Continuity is measured by the completeness of the sidewalk/walkway system and by identifying whether or not gaps exist. Other aspects of continuity are whether there are sidewalks along one or both sides of the street and whether there exists an overall continuity of sidewalk that provides a line of sight from block to block.
3. **Street Crossings:** The Achilles heel of pedestrian and equestrian systems is the intersections where they must cross. Intersections are where the pedestrian and equestrian must interface with automobiles, which can be especially dangerous for equestrians, since response times may be slower, which can result in safety concerns. As streets get wider and carry higher volumes of traffic, potential uses by pedestrians are avoided as safety becomes a concern. There are many factors that affect the pedestrian's real and perceived comfort and safety in crossing the street ranging from traffic control, crosswalks, number and width of travel lanes, travel speeds, and traffic volumes. Major arterial roadways can significantly affect a pedestrian's safety in crossing a street.

4. **Visual Interest and Amenities:** This measure of the pedestrian system's attractiveness and appeal is the most difficult to quantify and compare, and the most likely to change as an area matures. Some aspects of this measure are related to facilities that enhance the comfort of the user. These include elements such as shade trees, street lighting, benches, distance from sidewalk or trail to traffic lanes, relationship to buildings and street furniture, existence of curbside parking, speed of traffic, may be particularly important to pedestrians with mobility or visual impairments. To encourage pedestrian travel, sidewalk areas should be attractive and separated from the curb or roadway with landscaped parkways including canopy shade trees, especially on heavily-travelled arterial streets. Other elements that add visual appeal for pedestrians include landscape planters, trash receptacles, and public art.
5. **Pedestrian Safety and Security:** The pedestrian environment must feel like a safe place for people to walk. The key pedestrian security facility element is whether the pedestrian is clearly visible to other pedestrians or activities. Whereas this measurement is more appropriate at a site level, one can begin to identify areas where security might be an issue at the neighborhood level. Pedestrians require a sense of security, both through visual line of sight with others and separation from vehicles. Pedestrians feel safer if there is adequate distance from adjacent travel lanes, curbside parking, and minimal conflicts with vehicles exiting out of driveways. They also require well-lighted pathways. The map above shows the locations of the existing sidewalks in 2017 within the City. There are many gaps in continuity of sidewalks that would prevent pedestrians from making uninterrupted trips in the east-west and north-south directions within the City. Also, Van Buren Boulevard, Jurupa Road, Camino Real, Limonite Avenue, and Mission Boulevard have curves that add distance to potential pedestrian trips. Major street amenities such as shade trees, low-level shielded pedestrian lighting and benches occur on few segments and have many gaps in continuity. Therefore, the City lacks a comprehensive pedestrian network that connects all areas of the City to parks, libraries, schools, and other local destinations.

Pedestrian Crossings

The following principles should be incorporated into every pedestrian crossing improvement:

1. Pedestrians must be able to cross roads safely. Cities have an obligation to provide safe and convenient crossing opportunities.
2. The safety of all street users, particularly more vulnerable groups, such as children, the elderly, and those with disabilities, and more vulnerable modes, such as walking and bicycling, must be considered when designing streets.
3. Pedestrian crossings must meet accessibility standards and guidelines.
4. Real and perceived safety must be considered when designing crosswalks—crossing must be “comfortable.” A “safe” crossing that no one uses serves no purpose.
5. Crossing treatments that have the highest crash reduction factors (CRFs) should be used when designing crossings.
6. Safety should not be compromised to accommodate traffic flow.

7. Good crossings begin with appropriate speed. In general, urban arterials should be designed to a maximum of 30 mph or 35 mph (note: 30 mph is the optimal speed for moving motor vehicle traffic efficiently).
8. Every crossing is different and should be selected and designed to fit its unique environment.
9. Sidewalks should be separated from the roadway by a landscaped parkway, including canopy shade trees.

The following issues should also be considered when planning and designing street crossings:

1. Ideally, uncontrolled crossing distances should be no more than 21 feet, which allows for one 11-foot lane and one 10-foot lane. Ideally, streets wider than 40 feet should be divided (effectively creating two streets) by installing a median or two crossing islands.
2. The number of lanes should be limited to a maximum of three lanes per direction on all roads (plus a median or center turn lane).
3. There must be a safe, convenient crossing at every transit stop.
4. Double (or triple) left or right turns concurrent (permissive) with pedestrian crossings at signalized intersections must never be allowed.
5. Avoid concurrent movements of motor vehicles and pedestrians and equestrians at signalized intersections.
6. People and horses should never have to wait more than 90 seconds to cross at signalized intersections.
7. Self-actuated crossing buttons and pedestrian signals should be provided at all signalized crossings where pedestrians and equestrians are allowed.

Pedestrian Crossing Design Tools and Techniques

For improved safety, many different street design tools and techniques measures may be used successfully at a pedestrian crossing, depending on site conditions and potential users. Marked crosswalks are commonly used at intersections and sometimes at mid-block locations. Marked crosswalks are often the first measure in the toolbox followed by a series of other measures that are used to enhance and improve marked crosswalks. The decision to mark a crosswalk should not be considered in isolation, but rather in conjunction with other measures to increase awareness of pedestrians. Without additional measures, marked crosswalks alone may not increase pedestrian safety, particularly on multi-lane streets. Following are several “tools” that have been used successfully in Southern California and adapted to a wide range of community types and individual right-of-way situations. Many of these solutions would also be applicable to equestrian street crossings and should be considered for same.

Marked Crosswalks. Crosswalks are present by law at all intersections, whether marked or unmarked, unless the pedestrian crossing is specifically prohibited. At mid-block locations, crosswalks only exist where marked. At these non-intersection locations, the crosswalk markings legally establish the crosswalk. Crosswalks should be considered at mid-block locations where there is strong evidence that pedestrians want to cross there, due to origins and destinations across from each other and an overly long walking distance to the nearest controlled crossing. Marked crosswalks alert drivers to expect crossing pedestrians and direct pedestrians to desirable crossing locations. Although many motorists are unaware of their precise legal obligations at crosswalks, the California Vehicle Code requires drivers to yield to pedestrians in any crosswalk, whether marked or unmarked. Marking crosswalks at every intersection is not necessary or desirable.

Crosswalk Markings. According to the MUTCD, the minimum crosswalk marking shall consist of solid white lines. They shall not be less than 6 inches or greater than 24 inches in width. The best locations to install marked crosswalks are:

1. All signalized intersections
2. Crossings near transit locations
3. Trail crossings
4. High land use generators
5. School walking routes
6. When there is a preferred crossing location due to sight distance
7. Where needed to enable comfortable crossings of multi-lane streets between controlled crossings spaced at convenient distances

Controlled Intersections. Intersections can be controlled by traffic signals, YIELD or STOP signs. Marked crosswalks should be provided on all intersection legs controlled by traffic signals, unless the pedestrian crossing is specifically prohibited. Marked crosswalks may be considered at STOP-controlled intersections. Factors to be considered include high pedestrian volumes, high vehicle volumes, school zone location, high volume of elderly or disabled users, or other safety related criteria.

Uncontrolled Intersections and Mid-Block Crosswalks. Intersections without traffic signals or STOP signs are considered uncontrolled intersections. The decision to mark a crosswalk at an uncontrolled location should be guided by an engineering study. Factors considered in the study should include vehicular volumes and speeds, roadway width and number of lanes, stopping sight distance and triangles, distance to the next controlled crossing, night time visibility, grade, origin-destination of trips, left turning conflicts, and pedestrian volumes. The engineering study should be based on the FHWA study, Safety Effects of Marked Versus Unmarked Crosswalks at Uncontrolled Locations.

The following list provides some of the key recommendations from the study:

1. It is permissible to mark crosswalks on 2-lane roadways.

2. On multi-lane roadways, marked crosswalks alone are not recommended under the following conditions (the other tools listed in this section can be considered to enhance the crosswalk):
 - ADT > 12,000 w/o median
 - ADT > 15,000 w/ median
 - Speeds greater than 40 mph
3. Raised medians can be used to reduce risk.
4. Signals or other treatments should be considered where there are many young and/or elderly pedestrians.

Frequency of Marked Crosswalks at Uncontrolled Locations. Marked crosswalks should be spaced so people can cross at preferred locations. If people are routinely crossing streets at non-preferred locations, consideration should be given to installing a new crossing. Pedestrians need crossings with appropriate devices (islands, curb extensions, advanced yield lines, etc.) of multi-lane streets where there are strong desire lines. Along urban streets, a well-designed crossing should be provided at least every one-eighth mile.

High-Visibility Crosswalks. Because of the low approach angle at which pavement markings are viewed by drivers, the use of longitudinal stripes in addition to or in place of transverse markings can significantly increase the visibility of a crosswalk to oncoming traffic. While research has not shown a direct link between increased crosswalk visibility and increased pedestrian safety, high-visibility crosswalks have been shown to increase motorist yielding and channelization of pedestrians, leading the Federal Highway Administration to conclude that high-visibility pedestrian crosswalks have a positive effect on pedestrian and driver behavior.

Colored and stamped crosswalks should only be used at controlled locations. Staggered longitudinal markings reduce maintenance since they avoid vehicle wheel paths.

Typical crosswalk markings: Continental, Ladder, and Staggered Continental (credit: Michele Weisbart)

Raised Crossing Islands and Medians. Raised islands and medians are the most important, safest, and most adaptable engineering tool for improving street crossings. *Note on terminology: a median is a continuous raised area separating opposite flows of traffic. A crossing island is shorter and located just where a pedestrian crossing is needed.* Raised medians and crossing islands are commonly used between intersections when blocks are long (500 feet or more in downtowns) and in the following situations:

- Speeds are higher than desired
- Streets are wider than necessary for planned traffic volumes
- Traffic volumes are high
- Sight distances are poor

Staggered median crossing (credit: Marcel Schmaedick)

As a general rule, crossing islands are preferable to signal-controlled crossings due to their lower installation and maintenance cost, reduced waiting times, and their safety benefits. Crossing islands are also used with road diets, taking four-lane undivided, high-speed roads down to better performing three-lane roadways (two travel lanes and a center turn lane); portions of the center turn lane can be dedicated to crossing islands. Crossing islands can also be used with signals. Crossing islands are often used for trails, high pedestrian flow zones, transit stations, schools, work centers, and shopping districts.

Crossing Island Design. Crossing islands, like most traffic calming features, perform best with tall trees (no or minimal branching near base) and low ground cover. This greatly increases their visibility, reduces surprise, and lowers the need for a plethora of signs. When curves or hill crests complicate crossing locations, median islands are often extended over a crest or around a curve to where motorists have a clear (six second or longer) sight line of the downstream change in conditions. Lighting of median islands is essential. The suggested minimum width of a crossing island is 6 feet. When used on higher speed roads, and where there is space available, inserting a 45-degree bend to the right helps orient pedestrians to the risk they encounter from motorists during the second half of their crossing.

Raised Crosswalks. Raised crosswalks slow traffic and put pedestrians in a more visible position. These may be most appropriately used in Jurupa Valley's village centers and other areas with significant pedestrian traffic; or where motor vehicle traffic should move slowly, such as near schools, sports fields or entertainment/tourist centers. They are especially effective near elementary schools where they raise small children by a few inches and make them more visible.

Raised crosswalk: University of North Carolina Campus, Chapel Hill, NC (credit: Ryan Snyder)

They are trapezoidal in cross section and have a flat top where the pedestrians cross. The level crosswalk area must be paved with smooth materials; any texture or special pavements used for aesthetics should be placed on the beveled slopes for enhanced visibility.

Curb Extensions or “Bulbouts”. Curb extensions extend the sidewalk or curb line out into the parking lane, which reduces the effective street width. Curb extensions significantly improve pedestrian crossings by reducing the pedestrian crossing distance, visually and physically narrowing the roadway, improving the ability of pedestrians and motorists to see each other, and reducing the time that pedestrians are in the street. Reducing street widths improves signal timing since pedestrians need less time to cross.

Curb extensions or “bulbouts” (credit: Michele Weisbart)

Motorists typically travel more slowly at intersections or mid-block locations with curb extensions, as the restricted street width sends a visual cue to slow down. Turning speeds are lower at intersections with curb extensions (curb radii should be as tight as is practicable). Curb extensions also prevent motorists from parking too close to the intersection.

Curb extensions also provide additional space for two curb ramps and for level sidewalks where existing space is limited, increase the pedestrian waiting space, and provide additional space for pedestrian push button poles, street furnishings, plantings, bike and motorcycle parking and other amenities. A benefit for drivers is that extensions allow for more visible traffic sign placement.

Curb extensions are generally only appropriate where there is an on-street parking lane. Where street width permits, a gently tapered curb extension can reduce crossing distance at an intersection along streets without on-street parking, without creating a hazard. Curb extensions must not extend into travel lanes or bicycle lanes. Curb extensions must be designed and installed with several other aspects of roadway design and operation kept in mind:

1. May impact street drainage and require catch basin relocation
2. May impact underground utilities
3. May require loss of curbside parking, though careful planning often mitigates this potential loss, for example by relocating curbside fire hydrants, where no parking is allowed, to a curb extension
4. May complicate delivery access and garbage removal
5. May impact snow plows and street sweepers
6. May affect the turning movements of larger vehicles such as school buses and large fire trucks

Advanced Yield/Stop Lines. Stop lines are solid white lines 12 to 24 inches wide, extending across all approach lanes to indicate where vehicles must stop in compliance with a stop sign or signal. Advance stop lines reduce vehicle encroachment into the crosswalk and improve drivers' view of pedestrians. At signalized intersections, a stop line is typically set back between 4 and 6 feet.

At uncontrolled crossings of multi-lane roads, advance yield lines can be an effective tool for preventing multiple threat vehicle and pedestrian collisions. Placing traffic stop lines 20 to 50 feet in advance of crosswalks, depending upon location-specific variables such as vehicle speeds, traffic control, street width, on-street parking, potential for visual confusion, nearby land uses with vulnerable populations, and demand for queuing space. Thirty feet is the preferred setback for effectiveness at many locations. This setback allows a pedestrian to see if a car in the second (or third) lane is stopping after a driver in the first lane has stopped.

Bicycle Facilities

The City of Jurupa Valley has expressed a vision that encourages choice in travel modes and accommodates those without automobiles for safe mobility and healthy outcomes. A planned bicycle route system within the City of Jurupa Valley provides an important alternative to driving an automobile. A planned system guides the City and development on the orderly and planned implementation of the City's multi-modal transportation system.

The key to successful bicycle mobility is connectivity. Bicyclists need to be able to travel seamlessly on the bicycle network and get to where they need to go. They also need to feel secure and safe when using the facilities by having sufficient separation from vehicles. The "Three Feet for Safety Act," which was incorporated into the California Vehicle Code in September 2014, requires motorists overtaking or passing a bicycle in the same direction to leave a minimum distance of three feet between the motor vehicle and bicyclist.

Bikeway Types

Bicycle classifications include Class I bike paths, Class II bike paths, Class III bike paths and Combination Trails (Regional/Class I bike paths). Each type of facility has certain characteristics and offers varying levels of safety, perceived or otherwise. These bikeway types are shown graphically below, along with other bikeway designs that can meet specialized needs or conditions, such as Bicycle Boulevards and Shoulder Bikeways.

Class I Bikeways, or Shared Use Paths

Shared use paths are facilities separated from motor vehicle traffic by an open space or barrier, either within the highway right-of-way or within an independent right-of-way.

Bicyclists, pedestrians, joggers, and skaters often use these paths. Shared-use paths are appropriate in areas not well served by the street system, such as in long, relatively uninterrupted corridors like waterways, utility corridors, and rail lines. They are often elements of a community trail plan. Shared use paths may also be integrated into the street network with new subdivisions.

Shared-use path

CA (credit: Ryan Snyder)*

Bicyclist using bike lane (credit: Dan Burden)

Class III, or Shared Roadways

A shared roadway is a street in which bicyclists ride in the same travel lanes as other traffic. There are no specific dimensions for shared roadways. On narrow travel lanes, motorists have to cross over into the adjacent travel lane to pass a cyclist. Shared roadways work well and are common on low-volume, low-speed neighborhood residential streets, rural roads, and even many low-volume highways. In California shared roadways are known as Class III bikeways.

Class III Bicycle route (credit: Marty Bruinsma)

Class IV, or Separated Bikeways

A Class IV Bikeway (separated bikeway or “cycle track”) is for the exclusive use of bicycles and includes a separation required between the bikeway and through vehicle traffic. This separation may include grade separation, flexible posts, inflexible barriers, or on-street parking, as shown below. Separated bikeways typically operate as one-way bikeway facilities in the same direction as vehicular traffic on the same side of the roadway. Where off-street bikeways are not feasible, separated bikeways provide bicyclists a greater sense of comfort and usability, thereby increasing the likelihood of their use.

One-way, Class IV Bikeway

Combination Class I Bikeway/Regional Trails

Regional collectors linking the urban and rural communities and major water bodies and regional parks in the County and provide opportunities for long-distance users to take advantage of this system for long one-way or loop-type trips. These facilities may also include pedestrian and equestrian uses.

Combination Class I Bikeway/Regional Trail

Bicycle Boulevards

A bicycle boulevard is a street that has been modified to prioritize through bicycle traffic but discourage through motor vehicle traffic. Traffic calming devices control traffic speeds and discourage through trips by automobiles. Traffic controls limit conflicts between automobiles and bicyclists and give priority to through bicycle movement at intersections.

Bicycle boulevard: Portland, OR (credit: Ryan Snyder)

Shoulder Bikeways

This facility accommodates bicycle travel on rural highways and country roads by providing a suitable area for bicycling and reducing conflicts with faster moving motor vehicles.

A designated bikeway network provides a system of facilities that offers enhanced bicyclist safety or priority when compared to other roadways in the City. However, all public streets should safely and comfortably accommodate bicyclists, regardless of whether the street is designated as a bikeway. Several general types of bikeways are listed below. In California, cities should follow minimum width and geometric criteria in the Highway Design Manual Chapter 1000, or follow proper procedures for exemptions and experiments. Chapter 1000 contains *minimum standards*.

Some jurisdictions read this to mean exact dimension. In many circumstances, exceeding these minimums provides for a more desirable bicycling environment.
