# A. Introduction

## 1.1 Purpose & Scope

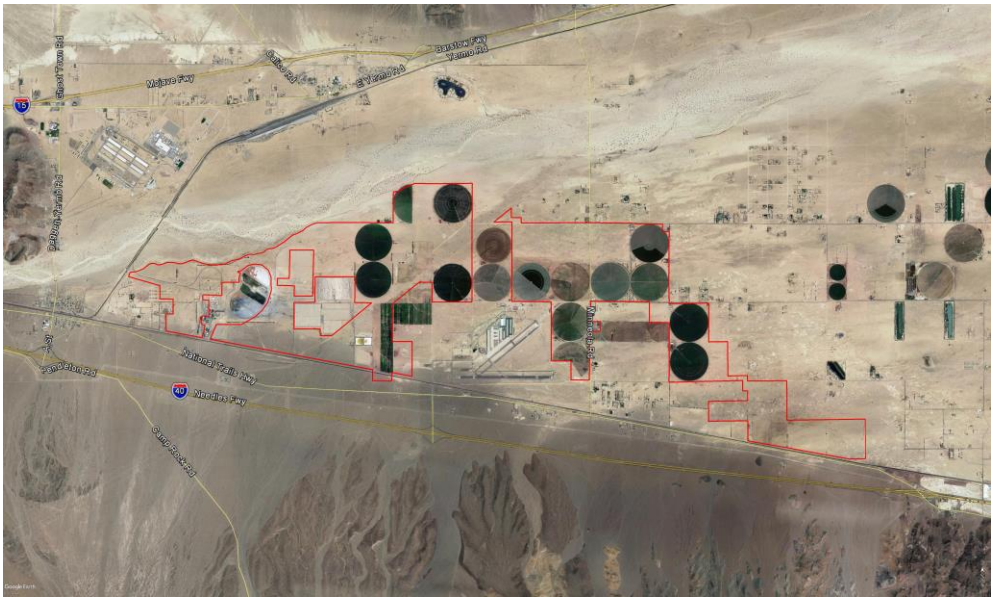
The following Preliminary Hydrology Study & Flood Analysis has been prepared by Joseph E. Bonadiman & Associates, Inc. for determination of hydrologic and flood impacts to a proposed 5,531-acre photovoltaic (PV) solar facility located in the unincorporated community of Daggett in San Bernardino County, CA.

**The scope of this study is as follows:**

- Identification of tributary (offsite) drainage areas impacting the project site, and calculation of peak flow rates and runoff volume for these areas.
- Identification of existing (pre-project) conditions on-site drainage areas, and calculation of peak flow rates and runoff volumes for these areas.
- Identification of developed (post-project) conditions on-site drainage areas, and calculation of peak flow rates and runoff volumes for these areas.
- Analysis of 100-year flood impacts to the project site.
- Summary of findings & conclusion.

## 1.2 Project Location & Watershed Description

The proposed project entails the construction of an approximately 5,531-acre photovoltaic solar facility in the unincorporated community of Daggett in San Bernardino County, CA. The project site is located approximately six miles east of the City of Barstow and 1.5 miles northwest of the unincorporated community of Newberry Springs. The project site is located approximately 0.75 miles north of the I-40 freeway, 0.1 to 0.5 miles north of National Trails Highway, and one mile east of Daggett-Yermo Road. The project site is bounded by the Union Pacific railroad to the west, Santa Fe Street and the Atchison, Topeka, and Santa Fe (A.T.S.F.) railroad to the south, and the Mojave River wash to the north.



The project site is effectively divided into a 2,899-acre eastern site and a 2,632 western site. The eastern site is bounded by rural residential properties to the southwest and the Mojave River wash to the north. An existing railroad spur and associated facilities are located within the northwestern portion of the eastern site; a large borrow pit is located within the existing railroad spur. Existing agricultural fields and facilities are located within the eastern portion of the eastern site. The decommissioned Coolwater Generating Station, a gas-fired electric generating station, and associated lined evaporation ponds are located within the eastern site but are considered "not a part" of the project. Existing Southern California Edison substations and training facilities located adjacent to the Coolwater Generating Station are within and considered part of the eastern project site. The majority of the decommissioned and demolished "Solar Two" (formerly "Solar One") concentrating PV solar generating station is located within the eastern site but is considered "not a part" of the project. The decommissioned and partially-demolished S.E.G.S. I & II PV solar generating stations are located within the eastern site but are considered "not a part" of the project.

**Photo: Looking North at Coolwater Generating Station from Santa Fe Street**

**Photo: Looking North at S.E.G.S. I & II Solar Generating Stations from Santa Fe Road**

The eastern and western sites are separated by existing agricultural fields and facilities located south of the Mojave River wash. North of the A.T.S.F. railroad and Santa Fe Street, the eastern and western sites are separated by the Barstow-Daggett Airport. The western site is comprised primarily of existing agricultural fields and facilities and undeveloped land. Existing rural residential properties are located to the north, south, and east of the western site.

**Photo: Looking North at Agricultural Fields from Santa Fe Road**

Refer to Exhibit "A" for an aerial orthophoto of the project site showing the existing facilities discussed in this section.

The study watershed is approximately 77.65 sq. mi. total. For the purposes of this study, the portion of the watershed south (upstream) of the A.T.S.F. railroad and associated culverts is herein referred to as "off-site", and the portion of the watershed north (downstream) of the A.T.S.F. railroad and associated culverts, which includes the 5,531-acre project site, is herein referred to as "on-site". Refer to Exhibit "B" for a U.S.G.S. quadrangle overlay of the study watershed.

## 1.3 References

The following documents have been made part of this study by reference:

1.) San Bernardino County Hydrology Manual, San Bernardino County Department of Public Works (August 1986).

# B. Methodology & Sources of Data

## 1.1 Methodology - Hydrology Calculations

The requirements and recommendations found in the San Bernardino County Hydrology Manual (August 1986) provided by the San Bernardino County Department of Public Works was used as the basis for the methodology and calculations found in this study.

Off-site flows for areas tributary to the A.T.S.F. railroad culverts and to the east Daggett interceptor channel were calculated independently of the overall watershed using the unit hydrograph method for inclusion in the FLO-2D flood model for the project site.

Existing and developed conditions hydrology calculations for the study watershed were performed using the rational hydrology method for areas less than 640 acres (1 sq. mi.) in size to establish the time of concentration (TC) for these areas, which was subsequently used to calculate lag time for the unit hydrograph calculations for these areas. For drainage areas 640 acres or greater in size, unit hydrograph calculations were performed with lag times calculated using Snyder's lag (Army Corps of Engineers method).

For the tributary (off-site) drainage areas, the USGS quadrangle topographic data indicated braiding of primary watercourses (split flow of streams). As such, it was necessary to perform hydrograph routing for these areas to split, route (using the SCS convex method), and add hydrograph flows for these areas.

The 100-year, 1-hour storm event was used for all rational hydrology method calculations. The 100-year, 24-hour storm event was used for all unit hydrograph and hydrograph routing calculations. Note that for comparison of existing and developed conditions peak flows and runoff volumes, the 100-year, 24-hour unit hydrograph calculations were used.

The San Bernardino County Rational Method (RSBC) and San Bernardino County Unit Hydrograph Method (UNSBC) software applications provided by CivilDesign® Corporation were used for the rational method and unit hydrograph method calculations included in this report. The Hydrograph Routing & Basin Analysis (ROUTE) software application provided by CivilDesign® Corporation was used for the hydrograph routing calculations included in this report.

## 1.2 Methodology - Mojave River Wash Hydraulic Analysis (HEC-RAS)

One-dimensional hydraulic modeling for the Mojave River wash adjacent to the project site was performed using HEC-RAS. Channel reach lengths and cross sections were based on alignment, sample line, and TIN surface data generated in AutoCAD Civil 3D and exported to HEC-RAS.

## 1.3 Methodology - Flood Hazard Analysis (FLO-2D)

Two-dimensional flood modeling for the on-site study watershed north (downstream) of the A.T.S.F. railroad culverts was performed using FLO-2D, per the recommendations found in the FLO-2D User's Manual (v. 2004.10, October 2004). Offsite flood impacts were modeled using hydrographs for the 12 culvert discharge locations, the east Daggett channel discharge location, and the Mojave River wash. On-site precipitation was modeled using the San Bernardino County Hydrology Manual rainfall distribution graph. On-site losses were modeled using the SCS method.

## 1.4 Geographic Information Systems (G.I.S.) Data

Due to the size of the study watershed, available Geographic Information System (GIS) data was utilized, as follows:

- Major watershed and major watercourse shapefile data obtained from the California Spatial Information Library (CASIL) were used for identification of major watershed(s) applicable to the project site, and to identify the major receiving waters for project site discharge.

- A Digital Elevation Model (DEM) of the National Elevation Dataset (NED) provided by USGS was used to generate the 20' topographic contours used for the tributary off-site drainage areas shown in this study. Digital Raster Graphics (DRGs) of USGS Quadrangles provide by CASIL were also used to verify elevations, blue line streams, and other topographical features.

- Property line and street centerline shapefile data obtained from the County of San Bernardino was used for base mapping and exhibits preparation.

- San Bernardino County 2013 General Plan shapefile data obtained from the County of San Bernardino was used for determination of existing watershed land use/zoning classifications.

- Satellite imagery obtained from Google Earth (August 2014) and orthorectified aerial imagery provided by DMI (October 2016) was used for verification of watershed features, including location of drainage facilities, location of impervious surfaces/structures, and pervious cover.

- NOAA Atlas 14 precipitation ASCII grid data was used for area-averaged precipitation values.

- Soils shapefile data provided by the Natural Resources Conservation Service (NRCS) Web Soils Survey (WSS) was used to identify the hydrologic soils groups.

## 1.5 Field Investigations & Site Photos

Field investigations were conducted by Joseph E. Bonadiman & Associates, Inc. on August 2, 2016 and August 8, 2017 to verify the drainage characteristics of the site and study watershed. The photos included in this study were taken during these investigations to substantiate the findings included in this study.

## 1.6 Sources of Topography

For tributary (off-site) areas, 20' topographic contours generated from USGS elevation data in addition to applicable USGS quadrangles were used for all elevation values. For existing conditions on-site areas, topographic contours generated from an aerial survey provided by DMI (October 2016) were used. For the developed conditions project site, and for the purposes of this preliminary study, it has been assumed that the general topography would remain substantially unchanged from existing conditions. Grading will be limited to general smoothing of the existing topography.

## 1.7 Watershed Losses

Area-averaged SCS Curve Numbers for all drainage areas and subareas were determined as follows:

1.) **Hydrologic Soil Groups** – Hydrologic soil groups for the project watershed were identified using data obtained from NRCS Soil Survey 698 (v. 9, September 28, 2016) and Soil Survey 671 (v. 8, September 12, 2016). Refer to Exhibit "D.1" for a copy of the NRCS Web Soil Survey Map with the project/tributary watershed overlay, as well as a copy of supporting materials from Soil Surveys No. CA 698 and CA 671. Data for the southern portion of the study watershed is not available from NRCS; as such, the applicable San Bernardino County Hydrology Manual soils map (see Exhibit "D.2") was used to obtain hydrologic soils groups for this portion of the study watershed. Refer to Exhibit "D.3" for the study watershed soils map with composite data from both sources, which shows groups "A", "C", and "D" to be applicable to the watershed.

2.) **Land Use** – Land use designations for the project watershed, per the 2013 San Bernardino County General Plan, are shown on Exhibit "D.4".

3.) **Pervious Fraction** – Exhibit "D.5" is a copy of San Bernardino County Hydrology Manual Figure C-4, which indicates recommended impervious percentages for common land use types. Exhibit "D.6" shows pervious percentages for the existing conditions study watershed. For areas south of the A.T.S.F. railroad zoned industrial, commercial, or open space, the recommended pervious percentages from the Hydrology Manual were used, regardless of actual conditions, to account for future development. For areas zoned Rural Residential and located outside of the project boundary, the recommended pervious percentage from the Hydrology Manual was used, regardless of actual conditions, to account for future development. For all areas north of the A.T.S.F. railroad, excluding those zoned Rural Residential, actual pervious percentages (based on aerial and satellite imagery analysis) were used, as assigning pervious percentages to these areas based on the land use designations shown on Exhibit "D.4" would result in unrealistic and unlikely conditions, due to the unique development in the area (generating stations, airport, etc.).

For developed conditions, an assumed site-wide pervious percentage of 90% was used for the entire project site area; therefore, the pervious percentages shown for existing conditions on Exhibit "D.6" were adjusted to reflect 90% pervious for the entire project site area, as shown on Exhibit "D.7".

4.) **Pervious Cover** – Exhibit "D.8" shows pervious cover types (based on Figures C-2 and C-3 of the Hydrology Manual - see Exhibit "D.10") for the existing conditions study watershed. Per aerial and satellite imagery analysis of the watershed, it was determined that "open brush, poor cover" was appropriate for all areas, with the exception of areas north of the A.T.S.F. railroad shown to be predominantly agricultural (assigned "agricultural - legumes (alfalfa) - good cover") and barren (assigned "barren"). An insignificant amount of residential/commercial landscaping exists within the study watershed; as such, this cover designation was not used.

**Photo: Typical Agricultural Cover**

**Photo: Typical Open Brush, Poor Cover**

For developed conditions, an assumed site-wide pervious cover of "barren" was used for the entire project site area; therefore, the pervious cover types shown for existing conditions on Exhibit "D.8" were adjusted to reflect "barren" cover for the entire project site area, as shown on Exhibit "D.9".

5.) **SCS Curve Numbers** – Existing conditions SCS Curve Numbers (AMC II) were calculated by intersecting the hydrologic soils groups shown on Exhibit "D.3" with the existing conditions pervious cover types shown on Exhibit "D.8", and assigning the applicable SCS Curve Numbers derived from Figures C-2 and C-3 of the SBC Hydrology Manual (see Exhibit "D.10"). These values were then area-averaged for all study areas and subareas using the ArcGIS Spatial Analyst software. Refer to Exhibit "D.11" for the existing conditions SCS Curve Numbers for the study watershed.

Developed conditions SCS Curve Numbers (AMC II) were calculated by intersecting the hydrologic soils groups shown on Exhibit "D.3" with the developed conditions pervious cover types shown on Exhibit "D.9", and assigning the applicable SCS Curve Numbers derived from Figures C-2 and C-3 of the SBC Hydrology Manual (see Exhibit "D.10"). These values were then area-averaged for all study areas and subareas using the ArcGIS Spatial Analyst software. Refer to Exhibit "D.12" for the developed conditions SCS Curve Numbers for the study watershed.

Refer to the hydrology calculation input tables found in this study for the specific SCS Curve Numbers for AMC II and AMC III for each drainage area and subarea. Note that AMC III was used for all 100-year calculations.

## 1.8 Watershed Precipitation

Area-averaged precipitation values for all drainage areas in this report were determined using 100-year, 1-hour, 100-year, 6-hour, and 100-year, 24-hour NOAA precipitation ASCII grid data. The ASCII grid data for these storm events was clipped to each specific drainage area and analyzed to find the average (mean) value for each area using the ArcGIS Spatial Analyst software. Refer to the hydrology calculation input tables found in this study for the specific precipitation values used for each drainage area. Refer to Exhibits "C.1", "C.2", and "C.3" for the study watershed overlays of the 100-year, 1-hour, 100-year, 6-hour, and 100-year, 24-hour precipitation grids, respectively, used in this study.

# C. Offsite (Tributary) Hydrology Discussion, Calculations & Summary

## 1.1 Offsite (Tributary) Drainage Areas Discussion

As discussed in Section "A", the study watershed is approximately 77.65 sq. mi. total. For the purposes of this study, the portion of the watershed south (upstream) of the A.T.S.F. railroad and associated culverts, as well as the portion of watershed tributary to the east Daggett, channel, is herein referred to as "off-site", and the portion of the watershed north (downstream) of the A.T.S.F. railroad and associated culverts, which includes the 5,531-acre project site, is herein referred to as "on-site".

The off-site study watershed discussed in this section is approximately 64 sq. mi. (41,012 acres) total, and includes a.) The drainage areas tributary to railroad culverts and on-site areas (approx.. 58 sq. mi. / 37,229 acres) and b.) the 5.9 sq. mi. (3,783-acre) drainage area tributary to the existing east Daggett interceptor channel. It was necessary to analyze these off-site areas separately from the overall study watershed, to generate hydrographs at each of the 12 A.T.S.F. railroad culvert locations and the east Daggett channel discharge location for the FLO-2D flood model discussed in Section "G" of this study.

Watershed flows tributary to the on-site areas originate approximately 14 miles upstream (to the south) of the A.T.S.F. railroad in relatively steep foothills, and drain via natural braided streams and improved interceptor channels to the I-40 freeway. Drainage is conveyed under the freeway via 31 culverts, and subsequently under and over National Trails Highway via 9 culverts (in addition to other small crossings). Drainage then flows to 12 culverts located along the A.T.S.F. railroad prior to discharging to the on-site areas north of the railroad.

**Photo: Looking North A.T.S.F. R.R. Culvert No. 9 from Santa Fe Street**

**Photo: Looking North A.T.S.F. R.R. Culvert No. 10 from Santa Fe Street**

**Photo: Looking North A.T.S.F. R.R. Culvert No. 11 from Santa Fe Street**

**Photo: Looking North A.T.S.F. R.R. Culvert No. 12 from Santa Fe Street**

Watershed flows tributary to the east Daggett interceptor channel originate approximately 10 miles upstream (to the south) of the A.T.S.F. railroad in relatively steep foothills, and drain via natural braided streams and improved interceptor channels to the I-40 freeway. Drainage is conveyed under the freeway via 4 culverts, and subsequently under National Trails Highway via 2 culverts. Drainage then flows through

culverts under the railroad and Santa Fe Street to the interceptor channel, which conveys flows in a northeasterly direction along the east side of the Union Pacific railroad before discharging under the existing on-site railroad spur via a series of 20 pipe culverts to the Mojave River wash.

**Photo: Looking South at Railroad Culvert to Daggett Interceptor Channel from Santa Fe Street**

**Photo: Looking North at Daggett Interceptor Channel from Santa Fe Street towards Mojave River Wash**

**Photo: Looking North from Project Site at Mojave River Wash**

Note that hydraulics calculations for the culverts located along the A.T.S.F. railroad discussed above are outside the scope of this study. Based on the hydrology calculations performed for this study, it is reasonably assumed that the majority of these culverts are not of adequate capacity to convey the calculated peak 100-year tributary flows under pressure conditions, and that overtopping of the railroad berms at the culvert locations will occur. For the purposes of this study, these flows have been continued through the culverts in question without modification, resulting in conservative calculations.

## 1.2 Offsite (Tributary) Unit Hydrograph Method Calculations

Input values for the offsite (tributary) 100-year, 24-hour unit hydrograph method calculations prepared for this study are tabulated as follows:

**Table 1** – Offsite (Tributary) Unit Hydrograph Method Input Values

| AREA | SIZE (AC) | LEN. (FT) | LCA (FT) | CHANGE (FT) | RAIN 100-1 (IN) | RAIN 100-6 (IN) | RAIN 100-24 (IN) | PERV. % | SCS (AMC II) | SCS (AMC III) |
|---|---|---|---|---|---|---|---|---|---|---|
| A | 1,527.33 | 29,891 | 13,688 | 2156.00 | 1.29 | 2.13 | 3.17 | 98.50 | 68.50 | 85.80 |

| P | **0.83** | **3,931.61** | **948.52** |

Refer to Technical Appendix No. 1 for printouts of the offsite (tributary) 100-year, 24-hour unit hydrograph calculations. Refer to Exhibit "E" for the offsite study map.

## 1.3 Offsite (Tributary) Hydrograph Routing Calculations

The U.S.G.S. quadrangles for the offsite watershed indicate braided blue-line streams. Offsite area "E" is shown to split at its downstream watercourse location. The split flows of Area "E" then flow to confluence with flows from Areas "F" and "G", respectively. Area "G" is subsequently shown to split at its downstream watercourse location. The split flows of Area "G" then flow to confluence with flows from Areas "H" and "I", respectively.

Offsite area "J" is shown to split at its downstream watercourse location. The split flows of Area "J" then flow to confluence with flows from Areas "K" and "L", respectively.

Hydrograph routing was necessarily for modeling of these flow divisions and combinations. The SCS convex method of channel routing was used to route natural flows as discussed above, and tabulated below:

**Table 3** – Offsite (Tributary) Hydrograph Routing Calculations

| LOCATION | ROUTING ACTION | $Q_{100}$ (CFS) AT LOCATION | $V_{100}$ (AF) AT LOCATION |
|---|---|---|---|
| R1.0 | SPLIT AREA "E" HYDROGRAPH | 2,799.51 | 570.68 |
| R1.0 TO R1.1 | ROUTE SPLIT FLOW OF AREA "E" HYDROGRAPH TO CHANNEL TRANSITION | 2,449.18 | 570.68 |
| R1.1 TO R1.2 | ROUTE SPLIT FLOW OF AREA "E" HYDROGRAPH TO AREA "F" DISCHARGE POINT | 2,449.18 | 570.68 |
| R1.2 | COMBINE AREA "F" HYDROGRAPH AT AREA "F" DISCHARGE POINT | **6,592.17** | **1,589.76** |
| | | | |
| R2.0 | SPLIT AREA "E" HYDROGRAPH | 2,799.51 | 570.68 |
| R2.0 TO R2.1 | ROUTE SPLIT FLOW OF AREA "E" HYDROGRAPH TO AREA "G" DISCHARGE POINT | 2,462.08 | 570.68 |
| R2.1 | COMBINE AREA "G" HYDROGRAPH AT AREA "G" DISCHARGE POINT | 2,671.25 | 628.84 |
| R2.1 | SPLIT AREAS "EG" HYDROGRAPH | 1,335.62 | 314.42 |
| R2.1 TO R2.2 | ROUTE SPLIT FLOW OF AREAS "EG" HYDROGRAPH TO AREA "H" DISCHARGE POINT | 1,229.57 | 314.42 |
| R2.2 | COMBINE AREA "H" HYDROGRAPH AT AREA "H" DISCHARGE POINT | **1,655.64** | **388.92** |
| | | | |
| R2.0 | SPLIT AREA "E" HYDROGRAPH | 2,799.51 | 570.68 |
| R2.0 TO R2.1 | ROUTE SPLIT FLOW OF AREA "E" HYDROGRAPH TO AREA "G" DISCHARGE POINT | 2,462.08 | 570.68 |
| R2.1 | COMBINE AREA "G" HYDROGRAPH AT AREA "G" DISCHARGE POINT | 2,671.25 | 628.84 |
| R2.1 | SPLIT AREAS "EG" HYDROGRAPH | 1,335.62 | 314.42 |
| R2.1 TO R3.0 | ROUTE SPLIT FLOW OF AREAS "EG" HYDROGRAPH TO AREA "I" DISCHARGE POINT | 1,228.56 | 314.42 |
| R3.0 | COMBINE AREA "I" HYDROGRAPH AT AREA "I" DISCHARGE POINT | **5,807.39** | **1,404.14** |
| | | | |
| R4.0 | SPLIT AREA J" HYDROGRAPH | 600.52 | 84.60 |
| R4.0 TO R4.1 | ROUTE SPLIT FLOW OF AREA "J" HYDROGRAPH TO CHANNEL TRANSITION | 567.01 | 84.60 |
| R4.1 TO R4.2 | ROUTE SPLIT FLOW OF AREA "J" HYDROGRAPH TO AREA "K" DISCHARGE POINT | 567.01 | 84.60 |
| R4.2 | COMBINE AREA "K" HYDROGRAPH AT AREA "K" DISCHARGE POINT | **6,254.40** | **1,730.42** |
| | | | |
| R5.0 | SPLIT AREA J" HYDROGRAPH | 600.52 | 84.60 |
| R5.0 TO R5.1 | ROUTE SPLIT FLOW OF AREA "J" HYDROGRAPH TO CHANNEL TRANSITION | 573.33 | 84.60 |
| R5.1 TO R5.2 | ROUTE SPLIT FLOW OF AREA "J" HYDROGRAPH TO AREA "L" DISCHARGE POINT | 573.33 | 84.60 |
| R5.2 | COMBINE AREA "L" HYDROGRAPH AT AREA "L" DISCHARGE POINT | **3,106.12** | **486.05** |

Refer to Technical Appendix No. 2 for printouts of the offsite (tributary) 100-year, 24-hour hydrograph routing calculations. Refer to Exhibit "E" for the offsite study map illustrating these routed flows.

Based on the unit hydrograph and hydrograph routed discussed above, the 100-year, 24-hour flow rates and volumes tributary to each of the 12 A.T.S.F. railroad culverts, as well as the east Daggett channel, are summarized below:

**Table 4** – Offsite (Tributary) Hydrology Summary

| CULVERT NO. | OFFSITE AREA(S) | $Q_{100}$ (CFS) TO CULVERT | $V_{100}$ (AF) TO CULVERT |
|---|---|---|---|
| 1 | A | **1,600.72** | **266.36** |
| 2 | B | **1,829.92** | **267.68** |
| 3 | C | **1,742.41** | **264.76** |
| 4 | D | **4,307.31** | **1,537.16** |
| 5 | E & F (ROUTED) | **6,592.17** | **1,589.76** |
| 6 | E, G, & H (ROUTED) | **1,655.64** | **388.92** |
| 7 | E, G, & I (ROUTED) | **5,807.39** | **1,404.14** |

| 9 | J & L (ROUTED) | **3,106.12** | **486.05** |
| 10 | M | **288.10** | **14.80** |
| 11 | N | **2,917.50** | **310.20** |
| 12 | O | **438.36** | **22.60** |
| DAGGETT CHANNEL | P | **3,931.07** | **948.24** |

**Note:** Review of the East Daggett Diversion to A.T. & S.F. Bridge hydraulics calculations summary prepared by the San Bernardino County Flood Control District (August 18, 1967) indicates an unbulked $Q_{100}$ of 3,900 c.f.s. tributary to the East Daggett Channel. This published $Q_{100}$ is comparable to the calculated $Q_{100}$ for offsite Area "P" of 3,931 cf.s. Refer to Attachment No. 1 for a copy of the published $Q_{100}$ for the channel.

# D. Existing Conditions Hydrology Calculations & Summary

## 1.1 Existing Conditions Hydrology Discussion

After discharge through the 12 A.T.S.F. railroad culverts discussed in Section "C", on-site flows continue northerly and northeasterly before discharging to the Mojave River wash to the north and adjacent rural residential and undeveloped properties to the east. Typically, on-site drainage is conveyed as natural overland flow along very gradual slopes and relatively unconcentrated, shallow channelization, with the exception of drainage improvements associated with the existing on-site railroad spur, Coolwater Generating Station, decommissioned/removed solar facilities, and the Barstow-Daggett airport. Existing on-site paved and dirt roads do not have any associated storm drain facilities.

On-site Areas 1 through 10A are located along the northwestern edge of the project site and discharge via natural flows to confluence with the Mojave River wash.

Drainage from on-site Area 10B is the area located within the existing railroad spur that contains a large borrow pit. It is assumed that 100-year flows are contained within the pit area; therefore no discharge has been calculated for Area 10B for existing conditions.

On-site Areas 11 through 14 are located along the northwestern edge of the project site and discharge via natural flows to confluence with the Mojave River wash.

Drainage for on-site Area 15 flows northerly/northeasterly through the Coolwater Generating Station and Edison facilities and northerly/northeasterly through primarily undeveloped areas before discharging via natural flows to confluence with the Mojave River wash.

Drainage from on-site Area 16 is the Coolwater Generating Station lined detention ponds. It is assumed that 100-year flows are contained within the ponds; therefore no discharge has been calculated for Area 16.

On-site Areas 17 through 29 are located along the northern edge of the project site and discharge primarily via natural flows directly to confluence the Mojave River wash or through adjacent rural residential properties along the northeastern portion of the project site.

On-site Areas 30 through 45 (excluding Area 48, discussed below) are located at the eastern portion and along the eastern edge of the project site. Discharge from these areas flows primarily easterly and northeasterly through undeveloped, agricultural, and rural residential areas before discharging to undeveloped and rural residential properties to the east.

Drainage from the offsite portion of Area 47 discharges through railroad culverts No. 1 and 2 and flows northeasterly before ponding against existing berms running north-south along the western edge of the Coolwater Generating Station and running east-west as the bermed railroad spur. These berms are assumed to generally be of adequate height (4 ft. to 6 ft.) to prevent flows from entering these facilities. Some ponding is anticipated to occur from these flows prior to discharge through three pipe culverts located at the railroad spur to confluence with the Mojave River wash.

Drainage from on-site Area 48 flows easterly and northeasterly through existing culverts and earthen detention ponds/channels running between the runways of the Barstow Daggett Airport and through primarily agricultural and undeveloped areas prior to discharging to adjacent undeveloped properties to the east of the project site.

Drainage from the offsite portion of Area 49 discharges through railroad culverts No. 3, 4 and 5 and flows easterly and northeasterly through undeveloped and agricultural land, the decommissioned and partially-demolished S.E.G.S. I & II PV solar generating stations, and the Barstow-Daggett Airport before discharging to adjacent undeveloped and rural residential properties to the east of the project site. Culverts and earthen detention ponds/channels located between the runways of the Barstow-Daggett Airport provide some protection of the airport from Area 49 flows.

Drainage from the offsite portion of Area 51 discharges through railroad culverts No. 6, 7, 8, 9 and 10 and flows easterly through primarily undeveloped and rural residential areas prior before discharging to adjacent undeveloped properties to the east of the project site.

Drainage from the offsite portion of Area 52 discharges through railroad culverts 11 and 12 and flows northeasterly through undeveloped areas before discharging to undeveloped properties to the east of the project site.

## 1.2 Exiting Conditions Rational Method Calculations

For existing conditions areas less than 640 acres (1 sq. mi.), the rational hydrology method was used to generate Time of Concentration (TC) values to generate lag times for use in the unit hydrograph calculations for these areas.

Input values and output calculations for the existing conditions 100-year, 1-hour rational method calculations prepared for this study are tabulated as follows:

**Table 5** – Existing Conditions Rational Method Input Values & Output Calculations

| AREA | SIZE (AC) | SUBAREA REACH | LEN. (FT) | U.S. ELEV. (FT) | D.S. ELEV. (FT.) | RAIN 100-1 (IN) | PERV. % | SCS (AMC II) | SCS (AMC III) | AREA TC (MIN.) | TOTAL $Q_{100}$ (CFS) |
|---|---|---|---|---|---|---|---|---|---|---|---|

Refer to Technical Appendix No. 3 for printouts of the existing conditions 100-year, 1-hour rational method calculations. Refer to Exhibit "F" for the existing conditions study map.

## 1.3 Existing Conditions Unit Hydrograph Calculations

As discussed above, for existing conditions areas less than 640 acres (1 sq. mi.), the rational hydrology method was used to generate Time of Concentration (TC) values to generate lag times in the unit hydrograph calculations for these areas. For all other existing conditions areas (640 acres / 1 sq. mi. or greater), the Snyder (Army Corps of Engineers) lag equation was used to establish lag times for these areas. Input values for the existing conditions 100-year, 24-hour unit hydrograph calculations prepared for this study are tabulated as follows:

| AREA | SIZE (AC) | LEN. (FT) | LCA (FT) | ELEV. CHANGE (FT) | RAIN 100-1 (IN) | RAIN 100-6 (IN) | RAIN 100-24 (IN) | PERV. % | SCS (AMC II) | SCS (AMC III) | TC (MIN.) | TC (HR.) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|

Refer to Technical Appendix No. 4 for printouts of the existing conditions 100-year, 24-hour unit hydrograph calculations. Refer to Exhibit "F" for the existing conditions study map.

## 1.4 Existing Conditions Hydrograph Routing Calculations

The U.S.G.S. quadrangles for the offsite watershed indicate braided blue-line streams. Offsite area 50 is shown to split at its downstream watercourse location. The split flows of Area 50 then flow to confluence with flows from Areas 49 and 51, respectively.

Hydrograph routing was necessarily for modeling of these flow divisions and combinations. The SCS convex method of channel routing was used to route natural flows as discussed above, and tabulated below:

**Table 8** – Existing Conditions Hydrograph Routing Calculations

| LOCATION | ROUTING ACTION | $Q_{100}$ (CFS) AT LOCATION | $V_{100}$ (AF) AT LOCATION |
|---|---|---|---|
| R1.0 | SPLIT AREA 50 HYDROGRAPH | 2,799.51 | 570.68 |
| R1.0 TO R1.1 | ROUTE SPLIT FLOW OF AREA 50 HYDROGRAPH TO AREA 49 DISCHARGE POINT | 2,461.44 | 570.68 |
| R1.1 | COMBINE AREA 49 HYDROGRAPH AT AREA 49 DISCHARGE POINT | **8,140.15** | **3,663.71** |
| | | | |
| R2.0 | SPLIT AREA 50 HYDROGRAPH | 2,799.51 | 570.68 |
| R2.0 TO R2.1 | ROUTE SPLIT FLOW OF AREA 50 HYDROGRAPH TO AREA 51 DISCHARGE POINT | 2,460.42 | 570.68 |
| R2.1 | COMBINE AREA 51 HYDROGRAPH AT AREA 51 DISCHARGE POINT | **12,269.86** | **3,994.79** |

Refer to Technical Appendix No. 5 for printouts of existing conditions 100-year, 24-hour hydrograph routing calculations. Refer to Exhibit "E" for the existing conditions study map illustrating these routed flows.

# E. Developed Conditions Hydrology Calculations & Summary

## 1.1 Developed Conditions Hydrology Discussion

Due to the nature of the proposed project (PV Solar Generating Station), the overall hydrology for existing conditions will remain substantially unchanged for existing conditions (as grading will be limited to smoothing of existing topography), excepting the following:

- For the proposed 5,531 acre project site, the pervious percentage was assumed to be 90%, to account for any paved access roads, driveways, parking areas, and structures typical of this type of development. The area-averaged pervious percentage of all drainage areas/subareas within the project site limits were therefore adjusted accordingly for developed conditions.

- For the proposed 5,531 acre project site, the pervious cover was assumed to be "barren", to account for all clearing/grubbing activities and gravel areas typical of this type of development. The area-averaged pervious cover of all drainage areas/subareas within the project site limits were therefore adjusted accordingly for developed conditions.

- The existing borrow pit within the existing railroad spur is located inside the proposed project site. This pit will be filled and compacted if this area is developed as part of the project. Therefore, runoff currently contained within the borrow pit will be added to the developed conditions discharge.

## 1.2 Developed Conditions Rational Method Calculations

Input values and output calculations for the developed conditions 100-year, 1-hour rational method calculations prepared for this report are tabulated below:

**Table 9** – Developed Conditions Rational Method Input Values & Output Calculations

| AREA | SIZE (AC) | SUBAREA REACH | LEN. (FT) | U.S. ELEV. (FT) | D.S. ELEV. (FT.) | RAIN 100-1 (IN) | PERV. % | SCS (AMC II) | SCS (AMC III) | AREA TC (MIN.) | TOTAL $Q_{100}$ (CFS) |

Refer to Technical Appendix No. 6 for printouts of the developed conditions rational method calculations.
Refer to Exhibit "G" for the developed conditions study map.

## 1.3 Developed Conditions Unit Hydrograph Calculations

Input values for the developed conditions 100-year, 24-hour unit hydrograph calculations prepared for this study are tabulated as follows:

**Table 10** – Developed Conditions Unit Hydrograph Input Values

| AREA | SIZE (AC) | LENGTH (FT) | LCA (FT) | ELEV. CHANGE (FT) | RAIN 100-1 (IN) | RAIN 100-6 (IN) | RAIN 100-24 (IN) | PERV. % | SCS (AMC II) | SCS (AMC III) | TC (MIN.) | TC (HR.) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | 1.00 | N/A | | | 1.26 | 1.84 | 2.50 | 90.00 | 78.00 | 92.80 | 10.81 | 0.18 |

## 1.4 Developed Conditions Hydrograph Routing Calculations

As with existing conditions, the U.S.G.S. quadrangles for the offsite watershed indicate braided blue-line streams. Offsite area 50 is shown to split at its downstream watercourse location. The split flows of Area 50 then flow to confluence with flows from Areas 49 and 51, respectively.

As with existing conditions, hydrograph routing was necessarily for modeling of these flow divisions and combinations. The SCS convex method of channel routing was used to route natural flows as discussed above, and tabulated below:

**Table 12** – Developed Conditions Hydrograph Routing Calculations

| LOCATION | ROUTING ACTION | $Q_{100}$ (CFS) AT LOCATION | $V_{100}$ (AF) AT LOCATION |
|---|---|---|---|
| R1.0 | SPLIT AREA 50 HYDROGRAPH | 2,799.51 | 570.68 |
| R1.0 TO R1.1 | ROUTE SPLIT FLOW OF AREA 50 HYDROGRAPH TO AREA 49 DISCHARGE POINT | 2,461.44 | 570.68 |
| R1.1 | COMBINE AREA 49 HYDROGRAPH AT AREA 49 DISCHARGE POINT | **8,498.27** | **3,888.92** |
| | | | |
| R2.0 | SPLIT AREA 50 HYDROGRAPH | 2,799.51 | 570.68 |
| R2.0 TO R2.1 | ROUTE SPLIT FLOW OF AREA 50 HYDROGRAPH TO AREA 51 DISCHARGE POINT | 2,460.42 | 570.68 |
| R2.1 | COMBINE AREA 51 HYDROGRAPH AT AREA 51 DISCHARGE POINT | **12,296.89** | **4,008.83** |

Refer to Technical Appendix No. 8 for printouts of developed conditions 100-year, 24-hour hydrograph routing calculations. Refer to Exhibit "G" for the developed conditions study map illustrating these routed flows.

# F. Existing vs. Developed Conditions Comparison & Proposed Mitigation

## 1.1 Existing vs. Developed Conditions Comparison

The existing and developed conditions 100-year, 24-hour hydrograph and (as appropriate) routing calculations discussed in Sections "D" and "E" are summarized as follows:

**Table 13** – Existing vs. Developed Conditions Comparison

| AREA | EXISTING $Q_{100}$ (CFS) | PROPOSED $Q_{100}$ (CFS) | $Q_{100}$ INCREASE (CFS) | EXISTING $V_{100}$ (AF) | PROPOSED $V_{100}$ (AF) | $V_{100}$ INCREASE (AF) |
|---|---|---|---|---|---|---|
| 1 | 2.27 | 3.10 | 0.83 | 0.12 | 0.17 | **0.05** |

| 45 | 10.68 | 11.04 | 0.36 | 0.70 | 0.74 | **0.04** |
| 46 | 3,931.07 | 3,931.61 | 0.54 | 948.24 | 948.52 | **0.28** |
| 47 | 2,754.99 | 2,777.99 | 23.00 | 563.85 | 574.04 | **10.19** |
| 48 | 732.31 | 752.60 | 20.29 | 120.74 | 128.53 | **7.79** |
| 49 & 50 (ROUTED) | 8,140.15 | 8,498.27 | 358.12 | 3,663.71 | 3,888.92 | **225.21** |
| 50 & 51 (ROUTED) | 12,269.86 | 12,296.89 | 27.03 | 3,994.79 | 4,008.83 | **14.04** |
| 52 | 3,269.02 | 3,316.92 | 47.90 | 379.87 | 396.52 | **16.65** |
| **TOTAL:** | **33,879.92** | **35,015.89** | **1,135.97** | **10,117.27** | **10,490.54** | **373.27** |

As tabulated on the previous page, the proposed project will result in an increase in total watershed 100-year, 24-hour flows of **1,135.97 c.f.s.**, **(a 3.4% increase)** and an increase in total watershed 100-year, 24-hour volume of **373.27 a.f. (a 3.7% increase).**

### 1.2 Proposed Mitigation

The 373.27 a.f. 100-year, 24-hour volume increase anticipated to be generated by the proposed project equates to a per-acre increase of **0.07 a.f. per-acre (3,049 cu. ft. per acre)** for the 5,531-acre project site.

This increase shall be captured in long, narrow, and shallow strip retention basins located along intermittent locations within the project site, rather than at the downstream limits of the project site. This will allow 100-year discharge (following retention of the calculated volume differential) from the basins to normalize within the project boundary prior to discharging to adjacent properties, to mimic existing drainage conditions to the absolute extent possible and prevent artificial concentration of flows at the project limits.

## G. Flood Hazard Analysis

### 1.1 Sources of Flood Hazards

Based on the hydrologic analysis of the study watershed and field investigation of the project site, the following potential flood hazards have been identified:

- **Mojave River Wash**: Exhibit "H.1" contains copies of the relevant FEMA Flood Insurance Rate Maps (FIRMs) for the project watershed. As indicated on these maps, no published flood information is available from FEMA. The United States Army Corps of Engineers (USACoE) publication titled "Flood Plain Information – Mojave River (Vicinity of Barstow)", dated October 1968, contains estimated unbulked 100-year peak flow, velocities, and channel water surface profile and flood inundation limits for the reach of the Mojave River wash with potential to impact the project. Relevant excerpts are included as Attachment No. 2. A $Q_{100}$ of **18,500 c.f.s.** is indicated for the wash in the vicinity of the project.

- **East Daggett Interceptor Channel**: As previously discussed and indicated in Attachment No. 1, the published unbulked $Q_{100}$ for the East Daggett Interceptor Channel is 3,900 c.f.s. The calculated $Q_{100}$ in this report for the drainage area tributary to the channel is **3,931.61 c.f.s.** Discharge of these flows from the channel through the 20 identified pipe culverts located under the existing on-site railroad spur at the northwestern portion of the project site flow naturally in a northeasterly direction to confluence with the Mojave River wash.

- **Tributary (Offsite) Flows:** The peak calculated $Q_{100}$ flows through the 12 A.T.S.F. railroad culverts discharging to the project site are substantial and were therefore identified as have the potential to cause flood hazard impacts to the project site.

- **On-Site Flows:** The on-site areas north and downstream of the A.T.S.F. railroad are typically very flat with high potential to pond. Therefore, these areas were identified as have flood hazard potential resulting from a localized 100-year event.

## 1.2 Mojave River Wash Hydraulic Analysis

A HEC-RAS hydraulic analysis was performed for an approximately 19,900 ft. (3.77 mile) reach of the Mojave River wash beginning upstream at the existing railroad bridge crossing to the west (upstream) and ending downstream at a location slightly past the northernmost portion of the project site. This reach was identified as having the highest potential to impact the project site due to close proximity of the southern bank of the wash to the northern project site boundary. Cross sections were generated at 128 locations along the study reach using the on-site aerial topography for the project. Note that it was necessary to include 20' USGS contours along the northernmost edge of the aerial topographic survey for the northern (left) bank of the Mojave River wash and "smooth" the transition between the aerial topography and USGS topography at each the affected cross sections. However, based on the HEC-RAS results, flow within the wash did not substantially incorporate this added topography. The published $Q_{100}$ of 18,500 for the Mojave River wash at the project location was combined with the published $Q_{100}$ of 3,900 c.f.s. for the East Daggett Interceptor Channel for a total $Q_{100}$ **22,400 c.f.s**. used in the HEC-RAS analysis.

Manning's "n" values were used in the hydraulic model to estimate frictional energy losses in the flow. The FEMA Flood Insurance Study (FIS) for San Bernardino County, CA & Incorporated Areas (revised September 2, 2016) indicated "n" values of 0.040-0.045 for the main channel and 0.040-0.050 for left and right overbanks of the Mojave River at Barstow. Aerial and satellite imagery indicated that the main channel and overbanks of the Mojave River at Barstow is very sandy with almost no vegetation. The main channel and overbank conditions of the Mojave River at Barstow is very similar to the main channel and overbank conditions of the Mojave River at the project location. Therefore, a main channel "n" value of 0.040 and overbank "n" values of 0.045 were used for the hydraulic analysis of the channel reach at the project location.

Refer to Attachment No. 3 for the HEC-RAS output summary table, water surface profile plot, and cross sections plots. Refer to Exhibit ""I" for the HEC-RAS study map indicated the calculated flow limits. As shown on the output summary table, the main channel depth of flow (after normalization of the hydraulic model) averages **4 to 5 ft.** These depths correlate with the 100-year water surface profiles estimated by the USACoE for the Mojave River channel for the reach in question (see Exhibit "H.2"). Attachment No. 3 also indicates that the 100-year average main channel velocities (after normalization of the hydraulic model) range from approximately **2.5 to 4 f.p.s.** As shown in Attachment No. 2, these calculated velocities correlate to the 100-year flow velocity of 4 f.p.s. estimated by the USACoE for the lower limit of their study. Note that the USACoE shows the 100-year velocity of the wash at the Daggett location to be higher (10 f.p.s.); however, this location is actually upstream of the existing railroad bridge, where significant narrowing of the channel occurs in comparison to the reach analyzed for this report.

Based on the HEC-RAS hydraulic analysis, and as shown on Exhibit "I", the 100-year flows of the Mojave River wash do not exceed the southern (right) overbank of the wash, and do not impact the project site.

## 1.3 FLO-2D Flood Analysis

A FLO-2D flood simulation was performed to determine potential flood hazards impacting the project site. A 12,873-acre (20.11 sq. mi.) grid model was generated from the existing aerial topographic survey of the areas north of the A.T.S.F. railroad and the Mojave River wash. Due to the size of the analyzed area, a 100-ft. grid size was selected. Note that the southeast portion of the project site was added after the aerial topographic survey was preformed and mapped; therefore, this portion of the project site was not included in the FLO-2D calculations. Also note that (as with the HEC-RAS hydraulic model) it was necessary to include 20' USGS contours along the northernmost edge of the aerial topographic survey for the northern (left) bank of the Mojave River wash; however, based on the FLO-2D results, flow within the wash did not substantially incorporate this added topography.

The 100-year, 24-hour hydrographs for each of the 12 railroad culvert locations discharging to the project site, as well as the 100-year, 24-hour hydrograph for the East Daggett Interceptor Channel, were placed at the appropriate locations on the study grid. A total simulation time of approximately 35 hours was used to match the total time of the longest hydrograph.

Generation of the hydrograph for the Mojave River wash was based on the 18,500 c.f.s. 100-year flow estimated by the USACoE. This flow was then distributed as a hydrograph based on Page 31 of the USACoE Mojave River flood study, which states that "the rise from streambed to extreme flood peak during a local storm (thunderstorm) would be approximately 2 to 3 hours and the floodwaters would remain on the floodplain for less than 1/2 day" (see Attachment No. 4 for excerpt). This description was based on the stage hydrograph illustrated as Figure 11 on Page 22 of the USACoE study, which was based on the stream gage data recorded for the January 1943 flood at River Mile 61.6 / Barstow (see Attachment No. 4). The Mojave River wash hydrograph used in the FLO-2D study was constructed by adjusting the time-discharge data of the recorded hydrograph for the 18,500 c.f.s. estimated flow (see constructed hydrograph plot included in Attachment No. 4). Note that to "spread" the flow over the width of the wash in the FLO-2D model, the 18,500 c.f.s. hydrograph was divided into four equal 4,625 c.f.s. hydrographs, to more accurately simulate flow within the wash.

Local 100-year thunderstorm precipitation over the FLO-2D model area was simulated using the FLO-2D precipitation function. Base on the 100-year, 24-hour NOAA data obtained for this study (see Exhibit "C.3"), the area-averaged precipitation for the FLO-2D model area was determined to be 2.53 in. This total rainfall was distributed based on the San Bernardino County rainfall distribution graph described in the SBC Hydrology Manual.

Losses for the FLO-2D model area were based on the SCS method in accordance with the SBC Hydrology Manual. The area-averaged SCS Curve Number (AMC III) for the FLO-2D model area was determined to be **83.45** (per the data illustrated on Exhibit "D.11"). Based on this SCS Curve Number, the initial rainfall abstraction (Ia) used in the FLO-2D model was determined to be **0.40** in., using the equation 0.2 * (1000/CN – 10).

The levee function of FLO-2D was used to simulate the bermed railroad spur and other protective berms constructed for existing facilities and the existing line evaporation ponds. For (primarily) overland desert floodplain flow with poor brush cover and minimal debris, a Manning's "n" of 0.045 was used for the entire

FLO-2D model area, with the exception of the main channel of the Mojave River wash, which was assigned an "n" value of 0.040 as discussed in Section G1.2 of this study.

The FLO-2D simulation summary is included as Attachment No. 5. Exhibit "J" shows the maximum calculated 100-year flood depths impacting the project site. Exhibit "K" shows the maximum calculated 100-year flood velocities impacting the project site.

Exhibit "J" and Exhibit "K" include overlays of the USACoE Mojave River wash flood limits (per the USACoE maps included as Exhibit "H.2") as well as the 100-year flow limits calculated in HEC-RAS for this study (per Exhibit "I").

As shown, all three flow limits for the Mojave River wash show that the 100-year flows are contained within the southern (right) bank of the wash, and therefore do not encroach into the project boundary. Variation between the USACoE, HEC-RAS, and FLO-2D flow extents can be attributed to differing topographic sources, dates of the studies performed, and methodology (approximate methods for the USACoE study vs. one-dimensional analysis for HEC-RAS vs. two-dimensional analysis for FLO-2D).

## H. Summary & Conclusion

Per the hydrology and hydraulics calculations performed for this preliminary study, the proposed 5,531-acre Daggett Solar Power Facility will result in a 100-year, 24-hour volume increase of 373.27 a.f. This volume differential shall be captured and retained in strip basins distributed in a manner that will mimic existing hydrology to the maximum possible extent. The proposed project will not substantially change existing conditions topography.

Regarding flood hazard mitigation, it is recommended that the proposed PV solar arrays be elevated one foot above the calculated 100-year max. flood depths shown on Exhibit "J", to account for freeboard. The array pilings should be of adequate design to account for scour associated with the 100-year flood velocities down on Exhibit "K".

**In conclusion, development of the proposed Daggett Solar Power Facility will include necessary mitigation measures to capture the increased runoff resulting from the project, while providing adequate design measures to protect the proposed PV solar arrays.**

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mojave Desert Area, West Central Part, California
Survey Area Data: Version 9, Sep 28, 2016

Soil Survey Area: San Bernardino County, California, Mojave River Area
Survey Area Data: Version 8, Sep 12, 2016

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 13, 2016—Feb 2, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

*Aggregation Method:* Dominant Condition

*Component Percent Cutoff: None Specified*

*Tie-break Rule:* Higher

| Apartments | 65 - 90 | 80 |
| Mobile Home Park | 60 - 85 | 75 |
| Commercial, Downtown Business or Industrial | 80 - 100 | 90 |

Notes:

1. Land use should be based on ultimate development of the watershed. Long range master plans for the County and incorporated cities should be reviewed to insure reasonable land use assumptions.

2. Recommended values are based on average conditions which may not apply to a particular study area. The percentage impervious may vary greatly even on comparable sized lots due to differences in dwelling size, improvements, etc. Landscape practices should also be considered as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. A field investigation of a study area shall always be made, and a review of aerial photos, where available, may assist in estimating the percentage of impervious cover in developed areas.

3. For typical equestrian subdivisions increase impervious area 5 percent over the values recommended in the table above.

SBC Hydrology Manual - Figures C-2 & C-3
SCS Curve Numbers (AMC II)

**THIS PAGE INTENTIONALLY LEFT BLANK**

Residential Landscaping (Lawn, Shrubs, etc.) - The pervious portions of commercial establishments, single and multiple family dwellings, trailer parks and schools where the predominant land cover is lawn, shrubbery and trees.

Row Crops - Lettuce, tomatoes, beets, tulips or any field crop planted in rows far enough apart that most of the soil surface is exposed to rainfall impact throughout the growing season. At plowing, planting and harvest times it is equivalent to fallow.

Small Grain - Wheat, oats, barley, flax, etc. planted in rows close enough that the soil surface is not exposed except during planting and shortly thereafter.

Legumes - Alfalfa, sweetclover, timothy, etc. and combinations are either planted in close rows or broadcast.

Fallow - Fallow land is land plowed but not yet seeded or tilled.

Woodland - grass - Areas with an open cover of broadleaf or coniferous trees usually live oak and pines, with the intervening ground space occupied by annual grasses or weeds. The trees may occur singly or in small clumps. Canopy density, the amount of ground surface shaded at high noon, is from 20 to 50 percent.

Woodland - Areas on which coniferous or broadleaf trees predominate. The canopy density is at least 50 percent. Open areas may have a cover of annual or perennial grasses or of brush. Herbaceous plant cover under the trees is usually sparse because of leaf or needle litter accumulation.

Chaparral - Land on which the principal vegetation consists of evergreen shrubs with broad, hard, stiff leaves such as manzonita, ceanothus and scrub oak. The brush cover is usually dense or moderately dense. Diffusely branched evergreen shrubs with fine needle-like leaves, such as chamise and redchank, with dense high growth are also included in this soil cover.

Annual Grass - Land on which the principal vegetation consists of annual grasses and weeds such as annual bromes, wild barley, soft chess, ryegrass and filaree.

Irrigated Pasture - Irrigated land planted to perennial grasses and legumes for production of forage and which is cultivated only to establish or renew the stand of plants. Dry land pasture is considered as annual grass.

Meadow - Land areas with seasonally high water table, locally called cienegas. Principal vegetation consists of sod-forming grasses interspersed with other plants.

Orchard (Deciduous) - Land planted to such deciduous trees as apples, apricots, pears, walnuts, and almonds.

Orchard (Evergreen) - Land planted to evergreen trees which include citrus and avocados and coniferous plantings.

Turf - Golf courses, parks and similar lands where the predominant cover is irrigated mowed close-grown turf grass. Parks in which trees are dense may be classified as woodland.

**SAN BERNARDINO COUNTY**
**HYDROLOGY MANUAL**

**SCS COVER TYPE DESCRIPTIONS**

Figure C-2

POOR: Heavily grazed or regularly burned areas. Less than 50 percent of the ground surface is protected by plant cover or brush and tree canopy.

FAIR: Moderate cover with 50 percent to 75 percent of the ground surface protected by vegetation.

GOOD: Heavy or dense cover with more than 75 percent of the ground surface protected by vegetation.

In most cases, watershed existing conditions cover type and quality can be readily determined by a field review of a watershed. In ultimate planned open spaces, the soil cover condition shall be considered as "good." Figure C-3 provides the CN values for various types and quality of ground cover. Impervious areas shall be assigned a CN of 98. It is noted that for ultimately developed conditions, the CN for urban landscaping (turf) is provided in Figure C-3.

## C.4. WATERSHED DEVELOPMENT CONDITIONS

Ultimate development of the watershed should normally be assumed since watershed urbanization is reasonably likely within the expected life of most hydraulic facilities. Long range master plans for the County and incorporated cities should be reviewed to insure that reasonable land use assumptions are made for the ultimate development of the watershed. A field review shall also be made to confirm existing use and drainage patterns. Particular attention shall be paid to existing and proposed landscape practices, as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. Appropriate actual impervious percentages can then be selected from Figure C-4. It should be noted that the recommended values from these figures are for average conditions and, therefore, some adjustment for particular applications may be required.

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11 North. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

**Base map** information shown on this FIRM was derived from digital orthophotography collected by the U.S. Department of Agriculture Farm Service Agency. This imagery was flown in 2005 and was produced with a 1-meter ground sample distance.

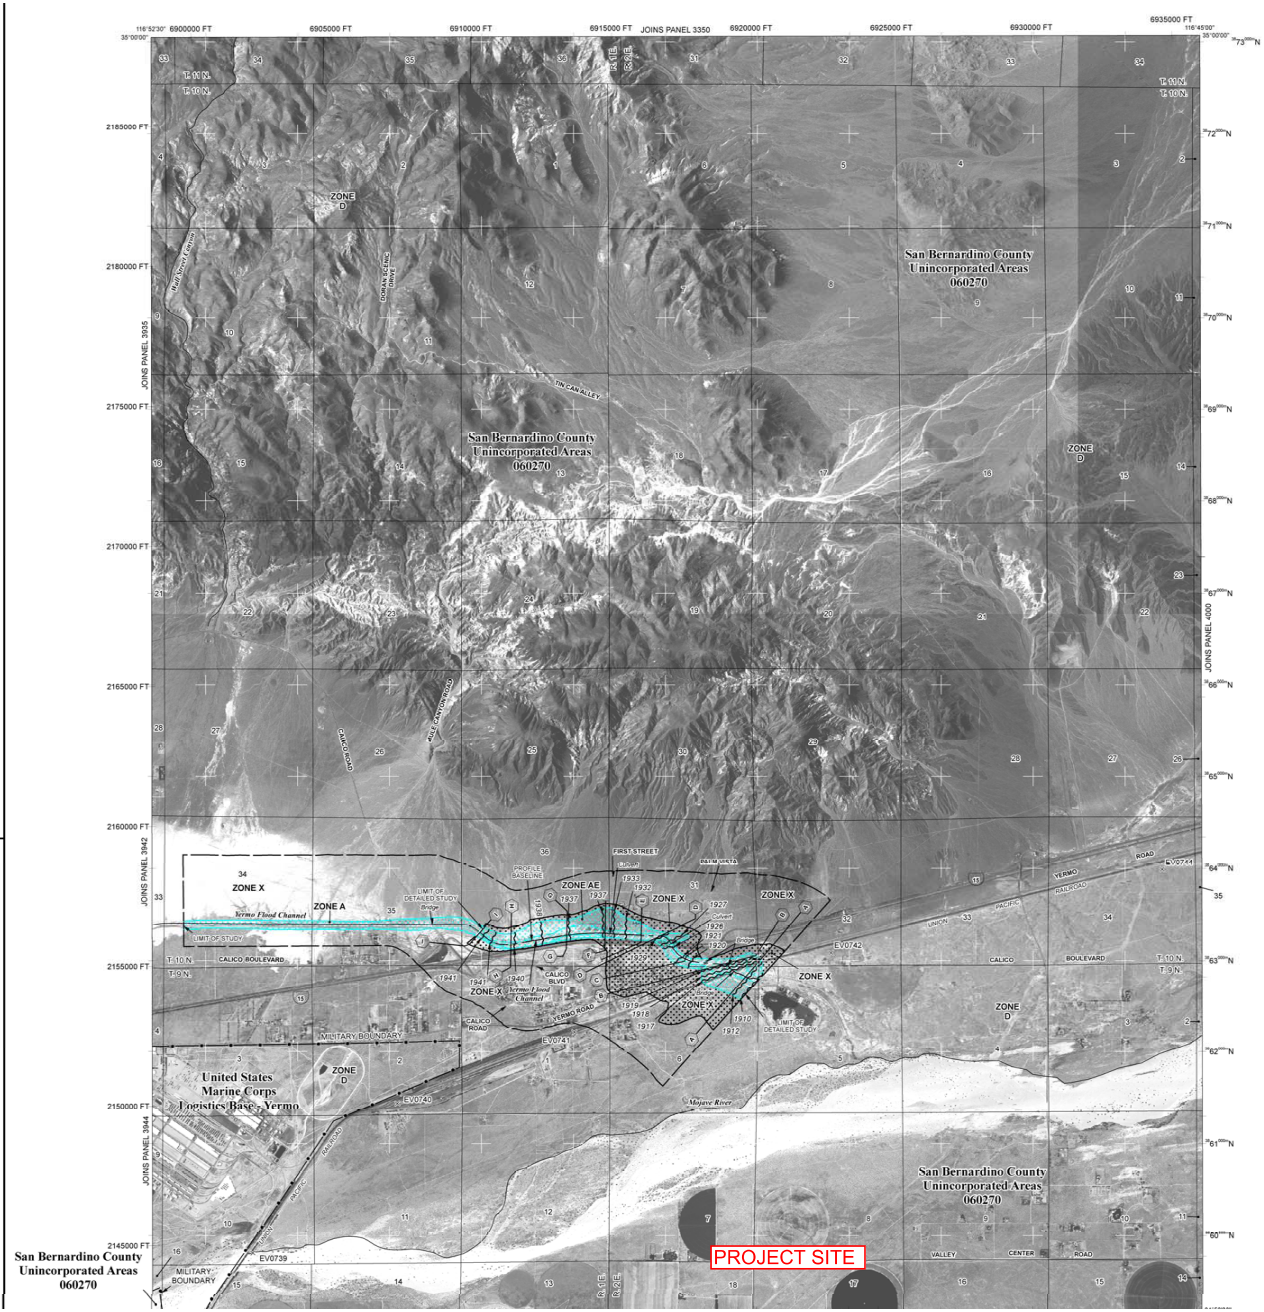
This map may reflect more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.



SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

**ZONE A** No Base Flood Elevations determined.

**ZONE AE** Base Flood Elevations determined.

**ZONE AH** Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

**ZONE AO** Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

**ZONE AR** Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

**ZONE A99** Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

**ZONE V** Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

**ZONE VE** Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

**ZONE X** Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

**ZONE X** Areas determined to be outside the 0.2% annual chance floodplain.

**ZONE D** Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAS)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

ASSUMPTIONS USED IN STUDY

1. Backwater from ponding at the ~~entrance~~ entrances to the culverts beneath the freeway (California Route 40) is not an acceptable situation, as it causes inundation of road surface.

2. Damage to roadway embankment by impounded water is a situation that must be avoided.

3. Roadway embankment should not be overtopped by a storm of 100 year frequency.

4. Conditions of flow at entrance and exit are considered good with earth ditches approaching and leaving culvert.

5. Some silting and some debris are expected, but in figuring capacities of facilities under road and railroad embankments, these factors were neglected so as to arrive at a maximum or peak flow.

6. Approach conditions are assumed by using plan and profile sheet (stick file Number 80) and assuming construction was accomplished per this sheet without alternations. The easterly levee and ditch were assumed to have approximately the same flowline grade as the westerly ditch and levee. No information is available on the easterly levee and ditch Flowline grades are assumed as 0.024 ft/ft as they approach both the bridges beneath National Trails Highway (old 66) and the bridge beneath the A.T. & S.F. Railroad bridge.

7. Manning's "N" for earth channels is assumed to be 0.025 and for R.C. Box and R.C. Pipe it is assumed to be 0.012.

8. Magnitude of the 100 year storm is assumed to be 3900 cfs for the area that now drains ultimately to the bridge beneath the A.T. & S.F. tracks. Capacity of the existing drainage facilities beneath existing freeway (State Route 40) are computed to be approximately 3000 cfs.

Determination of Standard Project Flood

Severe as the maximum known flood may have been on any given stream, it is a commonly accepted fact that, in practically all cases, sooner or later a larger flood can and probably will occur. For the purpose of determining the Standard Project Flood, a standard project storm was derived in accordance with the Corps of Engineers' criteria. Past floods were analyzed to determine loss rates. The loss rates were applied to the standard project storm precipitation to determine the Standard Project Flood. The Standard Project Flood is defined as the largest flood that can be expected from the most severe combination of meteorological and hydrological conditions considered reasonably characteristic of the geographical region involved.

The Standard Project Flood peak discharges at several points along the Mojave River are given in table 5. These peak discharges are based on the assumed occurrence of a local storm (thunderstorm) centered over the tributary area along the study reach of the Mojave River and with the Mojave River Reservoir in operation. The analysis indicates that the peak discharge of the Standard Project Flood produced by the local storm will be of the same magnitude for the entire study reach of the Mojave River.

Table 6

INTERMEDIATE REGIONAL FLOOD

PROJECT DATA
Project Title: MOJAVE
Project File : MOJAVE.prj
Run Date and Time: 6/8/2018 10:10:47 AM

Project in English units

PLAN DATA

Plan Title: Plan 02
Plan File : i:\2016 Jobs\164309 NRG Solar Inc - Coolwater\Hydrology\Attachments\HEC-RAS\MOJAVE.p02

Geometry Title: MOJAVE
Geometry File : i:\2016 Jobs\164309 NRG Solar Inc - Coolwater\Hydrology\Attachments\HEC-RAS\MOJAVE.g01

Flow Title : MOJAVE
Flow File : i:\2016 Jobs\164309 NRG Solar Inc - Coolwater\Hydrology\Attachments\HEC-RAS\MOJAVE.f01

Plan Summary Information:
Number of: Cross Sections = 128 Multiple Openings = 0
Culverts = 0 Inline Structures = 0
Bridges = 0 Lateral Structures = 0

Computational Information
Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

FLOW DATA

Flow Title: MOJAVE
Flow File : i:\2016 Jobs\164309 NRG Solar Inc - Coolwater\Hydrology\Attachments\HEC-RAS\MOJAVE.f01

Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.
This may indicate the need for additional cross sections.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth
for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.
This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the
need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated
water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program
defaulted to critical depth.

Warning: Divided flow computed for this cross-section.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater
than 1.4.
          This may indicate the need for additional cross sections.

Warning: Divided flow computed for this cross-section.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.
This may indicate the need for additional cross sections.

# ATTACHMENT NO. 4

Mojave River Wash
100-Year Hydrograph

Table 7 gives information concerning the velocity of water that would occur during the Standard Project Flood in the main channel and overbank areas on the Mojave River at the same points as shown in table 6.

Table 7

STANDARD PROJECT FLOOD

VELOCITY

| Stream | Location | Mile above mouth | Velocity | |
|---|---|---|---|---|
| | | | Channel fps | Overbank fps |
| Mojave River | Lower limit of study | 44.6 | 4.5 | 2.0 |
| | Daggett | 52.7 | 10.5 | 6.0 |
| | Old U.S. 91 (business) at Barstow | 61.5 | 5.5 | 2.5 |
| | Barstow | 62.1 | 10.0 | 7.0 |
| | Lenwood | 67.0 | 9.5 | 2.5 |
| | Hodge | 74.6 | 3.5 | 2.5 |
| | Upper limit of study | 84.0 | 5.0 | -- |

Velocities greater than 3 feet per second combined with depths of 3 feet or greater are generally considered hazardous.

Rate of rise and duration of flooding

The rise from streambed to extreme flood peak during a local storm (thunderstorm) would be approximately 2 to 3 hours and the floodwaters would remain on the flood plain for less than 1/2 day. During a general storm and with the Mojave River Reservoir in operation the rise from streambed to extreme flood peak would be approximately 1 1/2 days and the floodwaters would remain on the floodplain for approximately 2 to 3 days.

MASS BALANCE INFLOW - OUTFLOW VOLUME

*** INFLOW (ACRE-FEET) ***

TOTAL POINT RAINFALL: 2.5300 INCHES

| | WATER |
|---|---|
| RAINFALL VOLUME | 2700.46 |
| INFLOW HYDROGRAPH | 42491.34 |
| INFLOW HYDROGRAPHS + RAINFALL | 45191.80 |

*** OUTFLOW (ACRE-FT) ***

OVERLAND INFILTRATED AND INTERCEPTED WATER 1.39 INCHES

| OVERLAND FLOW | WATER |
|---|---|
| WATER LOST TO INFILTRATION & INTERCEPTION | 1475.65 |
| FLOODPLAIN STORAGE | 3661.82 |
| FLOODPLAIN OUTFLOW HYDROGRAPH | 40054.68 |
| FLOODPLAIN OUTFLOW, INFILTRATION & STORAGE | 45192.14 |

*** TOTALS ***

| | |
|---|---|
| TOTAL OUTFLOW FROM GRID SYSTEM | 40054.68 |
| TOTAL VOLUME OF OUTFLOW AND STORAGE | 45192.14 |

SURFACE AREA OF INUNDATION REGARDLESS OF THE TIME OF OCCURRENCE:
(FOR FLOW DEPTHS GREATER THAN THE "TOL" VALUE TYPICALLY 0.1 FT OR 0.03 M)

THE MAXIMUM INUNDATED AREA IS: 7476.48 ACRES

COMPUTER RUN TIME IS : 6.22461 HRS

THIS OUTPUT FILE WAS TERMINATED ON: 9/ 9/2017 AT: 22:29: 1

San Bernardino County Synthetic Unit Hydrology Method
Manual date - August 1986

Program License Serial Number 6320

---

164309 - NRG COOLWATER SOLAR FACILITY - DAGGETT, CA
OFFSITE AREA "B"
100-YEAR, 24-HOUR STORM EVENT
BY: JDN, DATE: 08-10-17

---

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

| Sub-Area (Ac.) | Duration (hours) | Isohyetal (In) |
|---|---|---|
| Rainfall data for year 100 | | |
| 1602.41 | 1 | 1.28 |
| Rainfall data for year 100 | | |
| 1602.41 | 6 | 2.07 |
| Rainfall data for year 100 | | |
| 1602.41 | 24 | 3.02 |

---

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

******** Area-averaged max loss rate, Fm ********

| SCS curve No.(AMCII) | SCS curve NO.(AMC 3) | Area (Ac.) | Area Fraction | Fp(Fig C6) (In/Hr) | Ap (dec.) | Fm (In/Hr) |
|---|---|---|---|---|---|---|
| 69.0 | 86.2 | 1602.41 | 1.000 | 0.261 | 0.979 | 0.256 |

Area-averaged adjusted loss rate Fm (In/Hr) = 0.256

********* Area-Averaged low loss rate fraction, Yb **********

| Area (Ac.) | Area Fract | SCS CN (AMC2) | SCS CN (AMC3) | S | Pervious Yield Fr |
|---|---|---|---|---|---|
| 1568.76 | 0.979 | 69.0 | 86.2 | 1.60 | 0.562 |
| 33.65 | 0.021 | 98.0 | 98.0 | 0.20 | 0.923 |

Area-averaged catchment yield fraction, Y = 0.570
Area-averaged low loss fraction, Yb = 0.430
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Watercourse length = 27687.00(Ft.)
Length from concentration point to centroid = 11420.00(Ft.)
Elevation difference along watercourse = 1996.00(Ft.)
Mannings friction factor along watercourse = 0.035
Watershed area = 1602.41(Ac.)
Catchment Lag time = 0.684 hours
Unit interval = 5.000 minutes
Unit interval percentage of lag time = 12.1916
Hydrograph baseflow = 0.00(CFS)
Average maximum watershed loss rate(Fm) = 0.256(In/Hr)
Average low loss rate fraction (Yb) = 0.430 (decimal)
VALLEY DEVELOPED S-Graph proportion = 0.000
VALLEY UNDEVELOPED S-Graph proportion = 0.000
FOOTHILL S-Graph proportion = 0.060
MOUNTAIN S-Graph proportion = 0.000
DESERT S-Graph proportion = 0.940

Computed peak 5-minute rainfall = 0.609(In)
Computed peak 30-minute rainfall = 1.043(In)
Specified peak 1-hour rainfall = 1.284(In)
Computed peak 3-hour rainfall = 1.721(In)
Specified peak 6-hour rainfall = 2.071(In)
Specified peak 24-hour rainfall = 3.025(In)

Rainfall depth area reduction factors:
Using a total area of 1602.41(Ac.) (Ref: fig. E-4)

5-minute factor = 0.925 Adjusted rainfall = 0.564(In)
30-minute factor = 0.925 Adjusted rainfall = 0.965(In)
1-hour factor = 0.925 Adjusted rainfall = 1.188(In)
3-hour factor = 0.990 Adjusted rainfall = 1.705(In)
6-hour factor = 0.995 Adjusted rainfall = 2.061(In)
24-hour factor = 0.998 Adjusted rainfall = 3.019(In)

Unit interval percentage of lag time = 9.9863
Hydrograph baseflow = 0.00(CFS)
Average maximum watershed loss rate(Fm) = 0.143(In/Hr)
Average low loss rate fraction (Yb) = 0.251 (decimal)
VALLEY DEVELOPED S-Graph proportion = 0.000
VALLEY UNDEVELOPED S-Graph proportion = 0.000
FOOTHILL S-Graph proportion = 0.100
MOUNTAIN S-Graph proportion = 0.000
DESERT S-Graph proportion = 0.900

Computed peak 5-minute rainfall = 0.646(In)
Computed peak 30-minute rainfall = 1.105(In)
Specified peak 1-hour rainfall = 1.361(In)
Computed peak 3-hour rainfall = 1.777(In)
Specified peak 6-hour rainfall = 2.103(In)
Specified peak 24-hour rainfall = 3.138(In)

Rainfall depth area reduction factors:
Using a total area of 4924.59(Ac.) (Ref: fig. E-4)

5-minute factor = 0.793 Adjusted rainfall = 0.512(In)
30-minute factor = 0.793 Adjusted rainfall = 0.877(In)
1-hour factor = 0.793 Adjusted rainfall = 1.080(In)
3-hour factor = 0.972 Adjusted rainfall = 1.727(In)
6-hour factor = 0.986 Adjusted rainfall = 2.073(In)
24-hour factor = 0.993 Adjusted rainfall = 3.117(In)

OFFSITE AREA "H"
100-YEAR, 24-HOUR STORM EVENT
BY: JDN, DATE: 08-10-17

---

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

| Sub-Area (Ac.) | Duration (hours) | Isohyetal (In) |
|---|---|---|
| Rainfall data for year 100 | | |
| 512.19 | 1 | 1.39 |
| Rainfall data for year 100 | | |
| 512.19 | 6 | 1.89 |
| Rainfall data for year 100 | | |
| 512.19 | 24 | 2.70 |

---

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

******** Area-averaged max loss rate, Fm ********

| SCS curve No.(AMCII) | SCS curve NO.(AMC 3) | Area (Ac.) | Area Fraction | Fp(Fig C6) (In/Hr) | Ap (dec.) | Fm (In/Hr) |
|---|---|---|---|---|---|---|
| 62.3 | 80.8 | 512.19 | 1.000 | 0.356 | 0.816 | 0.290 |

Area-averaged adjusted loss rate Fm (In/Hr) = 0.290

********* Area-Averaged low loss rate fraction, Yb **********

| Area (Ac.) | Area Fract | SCS CN (AMC2) | SCS CN (AMC3) | S | Pervious Yield Fr |
|---|---|---|---|---|---|
| 417.95 | 0.816 | 62.3 | 80.8 | 2.38 | 0.399 |
| 94.24 | 0.184 | 98.0 | 98.0 | 0.20 | 0.915 |

Area-averaged catchment yield fraction, Y = 0.494
Area-averaged low loss fraction, Yb = 0.506
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Watercourse length = 14210.00(Ft.)
Length from concentration point to centroid = 5562.00(Ft.)
Elevation difference along watercourse = 473.00(Ft.)
Mannings friction factor along watercourse = 0.035
Watershed area = 512.19(Ac.)
Catchment Lag time = 0.467 hours
Unit interval = 5.000 minutes
Unit interval percentage of lag time = 17.8278
Hydrograph baseflow = 0.00(CFS)
Average maximum watershed loss rate(Fm) = 0.290(In/Hr)
Average low loss rate fraction (Yb) = 0.506 (decimal)
DESERT S-Graph Selected
Computed peak 5-minute rainfall = 0.658(In)
Computed peak 30-minute rainfall = 1.126(In)
Specified peak 1-hour rainfall = 1.386(In)
Computed peak 3-hour rainfall = 1.678(In)
Specified peak 6-hour rainfall = 1.894(In)
Specified peak 24-hour rainfall = 2.704(In)

Rainfall depth area reduction factors:
Using a total area of 512.19(Ac.) (Ref: fig. E-4)

5-minute factor = 0.976 Adjusted rainfall = 0.642(In)
30-minute factor = 0.976 Adjusted rainfall = 1.099(In)
1-hour factor = 0.976 Adjusted rainfall = 1.353(In)
3-hour factor = 0.997 Adjusted rainfall = 1.673(In)
6-hour factor = 0.998 Adjusted rainfall = 1.891(In)
24-hour factor = 0.999 Adjusted rainfall = 2.702(In)
