Comment Letter Appendices (on Flash Drive)

FEIR VOLUME 2 REVISED DRAFT EIR – APPENDICES

** Appendices are referenced here but are contained in FEIR Volume 2*

A NOP-NOC-NOA Materials

- A-1 Notice of Preparation (NOP)
- A-2 Notice of Completion /State Clearinghouse Transmittal
- A-3 Notice of Completion
- A-4 Notice of Availability
- A-5 Distribution List for the City of Moreno Valley World Logistics Center Mailing List

B NOP Response Letters and Public Scoping Meeting Materials

C Agricultural Resources

- C-1 An Agriculture Industry Analysis
- C-2 Agricultural Resources Assessment (Revised)
- C-3 Economic Viability of Agriculture in the East Inland Empire
- C-4 California LESA Model (New-Cushman & Wakefield)

D Air Quality-HRA-GHG

- D-1 Air Quality, Greenhouse Gas, and Health Risk Assessment Report (Revised)
- D-2 Appendix A CalEEMod Output and Regional Emissions Spreadsheets
- D-3 Appendix B Caline4 Output
- D-4 Appendix C Air Pollution Health Effects Information
- D-5 Appendix D GHG Information
- D-6 Appendix E Regional Operation Spreadsheets and Model Output (Revised)
- D-7 Appendix F Localized Spreadsheets (Revised)
- D-8 Appendix G Health Risk Assessment (Revised)

E Biological Resources

- E-1 Habitat Assessment MSHCP Consistency Analysis (Revised)
- E-2 Appendix A – Floral Faunal
- E-3 Appendix B – Site Photographs
- E-4 Appendix C – LA Pocket Mouse Survey
- E-5 Appendix D – Burrowing Owl Survey
- E-6 Appendix E – Sensitive Plant Survey
- E-7 Appendix F – DBESP (Revised)
- E-8 Appendix G – Regulatory Background
- E-9 Appendix H – RCIP Summary Report and Attachment
- E-10 Appendix I – Assessor’s Parcel Numbers
- E-11 Appendix J - Moreno Valley CC Res No. 20004-07
- E-12 Appendix K - Burrowing Owl Relocation Plan (New)
- E-13 Assessment of Jurisdictional Waters and Wetlands (Revised)
- E-14 Moreno Valley Night Lighting Ordinance 851
- E-15 Riverside Conservation Authority Response to Comments JPR

F Cultural Resources

- F Phase 1 and Phase 2 Cultural Resources Assessment (Revised)

G Geotechnical

- G-1 Preliminary Geotechnical Evaluation for Environmental Impact Report (Revised)
- G-2 Leighton Memo on NOP Comments

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

G-3 Geotechnical Review of Offsite Improvement Areas, Amendment to Preliminary Geotechnical Evaluation (Revised)

H Specific Plan and Project Info

H-1 The World Logistics Center Specific Plan (Revised)

H-2 Tentative Parcel Map (New)

I Hazards and Hazardous Materials

I-1 Phase 1 Environmental Site Assessment and Limited Site Characterization for the Kerr Stock Farm Properties

I-2 Phase 1 Environmental Site Assessment and Limited Site Characterization for Sunnymead Poultry Group “C”

I-3 Phase 1 Environmental Site Assessment and Limited Site Characterization for Kerr Stock Farm

I-4 Phase 1 Environmental Site Assessment and Limited Site Characterization for the Group 'A' Properties

I-5 Phase I Environmental Site Assessment Report and Limited Site Characterization for the AIG Inc. Property

I-6 Phase I Environmental Site Assessment Report and Limited Site Characterization for the Saindon Property

I-7 Phase I Environmental Site Assessment Report and Limited Site Characterization for the Colville Property

I-8 Phase I Environmental Site Assessment for APN 478-240-1 1, -1 7, -26, -27, and -30, Moreno Valley, California

I-9 Phase I Environmental Site Assessment and Limited Site Characterization for 69.5± Acres of Agricultural Land, APN' s 477-090-008 thru -012 and 477-100-011 thru -014, in the City of Moreno Valley, Riverside County, California

I-10 Phase I Environmental Site Assessment for Chehade Property

I-11 Phase I Environmental Site Assessment for the Crites Property

I-12 Phase I Environmental Site Assessment and Limited Site Characterization for the Mabon Property

I-13 Phase I Environmental Site Assessment for APN's 477-080-027, -028, -029, and -030 located in Moreno Valley, Riverside County, California

I-14 Phase I Environmental Site Assessment and Limited Site Characterization for APN's 478-240-01 9, -025, and -028 located in Moreno Valley, California

I-15 Phase I Environmental Site Assessment for APN's 478-240-005 and -008 located in Moreno Valley, California

I-16 Phase I Environmental Site Assessment for APN 477-090-007 located in Moreno Valley, California

I-17 Addendum Letter to Add the Triana Property, 12540 Sinclair Street (Assessor's Parcel Number 477-090-001) to the Kerr Stock Farm Properties Phase I Environmental Site Assessment Update

I-18 Environmental Lien Search, for the Addendum Letter to Add the Triana Property

I-19 Phase I Environmental Site Assessment for the Himada Property

I-20 Addendum Letter to Add the Smith Property, 12550 Sinclair Street (Assessor's Parcel Number 477-090-013) to the Kerr Stock Farm Properties Phase I Environmental Site Assessment Update

I-21 Phase I Environmental Site Assessment (ESA) and Limited Site Characterization for 29060 Dracaea Avenue

GLOSSARY OF GENERAL TERMS

Acre-Foot. An acre-foot is the quantity of volume of water that covers one acre to a depth of one foot; equal to 43,560 cubic feet or 325,851 gallons.

Aesthetics. The perception of artistic elements, or elements in the natural or human-made environment that is pleasing to the eye.

Air Quality Criteria. Air quality criteria are the levels of pollution and length of exposure at which adverse effects on health and welfare occur.

Air Quality Standards. Air quality standards are the prescribed level of pollutants in the outside air that cannot be exceeded legally during a specified time in a specified geographical area.

Ambient Noise. Ambient noise is the composite of noise from all sources near and far. The ambient noise level constitutes the normal or existing level of environmental noise at a given location.

Applicant. An applicant is a person who proposes to carry out a project that needs a lease, permit, license, certificate, or other entitlement, for use or financial assistance from one or more public agencies.

Arterial. An arterial is a major street carrying the traffic of local and collector streets to and from freeways and other major streets, with controlled intersections and generally providing direct access to non-residential properties.

Attainment. Attainment means that there is compliance with State and Federal ambient air quality standards within an air basin.

A-Weighted Decibel (dBA). The dB on the A-weighted scale is the sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.

California Environmental Quality Act (CEQA). Enacted in 1970, CEQA requires State and local agencies to estimate and evaluate the environmental implications of their actions. It aims to prevent environmental effects of the agency actions by requiring agencies, when feasible, to avoid or reduce the significant environmental impacts of their decisions. If a proposed activity has the potential for a

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

significant adverse environmental impact, an environmental impact report (EIR) must be prepared and certified as to its adequacy before taking action on the proposed project (*California Public Resources Code* §§21000 et seq.)

Capacity. The maximum rate of flow at which vehicles can be reasonably expected to traverse a point or uniform segment of a lane or roadway during a specified time period under prevailing roadway, traffic, and control conditions.

Collector. Relatively low-speed, low-volume street that provides circulation within and between neighborhoods. Collectors usually serve short trips and are intended for collecting trips from local streets and distributing them to the arterial network.

Community Noise Equivalent Level (CNEL). A 24-hour energy equivalent level derived from a variety of single-noise events, with weighting factors of 5 and 10 dBA applied to the evening (7 p.m. to 10 p.m.) and nighttime (10 p.m. to 7 a.m.) periods, respectively, to allow for greater sensitivity to noise during these hours.

Congestion Management Plan (CMP). A mechanism employing growth management techniques, including traffic level of service requirements, standards for public transit, trip reduction programs involving transportation systems management and jobs/housing balance strategies, and capital improvement programming, for the purpose of controlling and/or reducing the cumulative regional traffic impacts of development.

Cumulative Impact. As used in CEQA, the total impact resulting from the accumulated impacts of individual projects or programs over time.

Current OEHHA Guidance. Guidance recommended by the OEHHA for estimating cancer risks based on a 30-year exposure duration for sensitive receptors and a 25-year exposure duration for worker receptors; this guidance incorporates age sensitivity factors for sensitive receptors

Current SCAQMD Guidance. Guidance recommended by the SCAQMD for estimating cancer risks based on a 70-year exposure duration for sensitive receptors and a 40-year exposure duration for worker receptors; this guidance does not incorporate age sensitivity factors

Day-Night Average Level (L_{dn}). The average equivalent A-weighted sound level during a 24-hour day, obtained after the addition of 10 decibels to sound levels in the night after 10 p.m. and before 7 a.m. (Note: CNEL and L_{dn} represent daily levels of noise exposure averaged on an annual or daily basis, while L_{eq} represents the equivalent energy noise exposure for a shorter time period, typically one hour.)

Decibel (dB). The decibel (dB) is the unit of level that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.

Emission Standard. The maximum amount of pollutant legally permitted to be discharged from a single source, either mobile or stationary.

Environment. In CEQA, the environment are “the physical conditions which exist within the area which will be affected by a proposed project, including land, air, water, mineral, flora, fauna, noise, and objects of historic or aesthetic significance.”

Environmental Impact Report (EIR). A report required pursuant to the California Environmental Quality Act that assesses all the environmental characteristics of an area, determines what effects or impacts will result if the area is altered or disturbed by a proposed action, and identifies alternatives or other measures to avoid or reduce those impacts.

Equivalent Energy Level (L_{eq}). L_{eq} is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. L_{eq} is typically computed over 1-hour, 8-hour, and 24-hour sample periods.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Feasible. To be feasible, according to CEQA, means to be capable of being accomplished in a successful manner within a reasonable time taking into account economic, environmental, social, and technological factors.

Findings. Findings required by CEQA are the conclusions made regarding the significance of a project in light of its environmental impacts. A Statement of Overriding Considerations does not obviate the need to make other required CEQA findings.

Floor Area Ratio (FAR). The FAR is the gross floor area permitted on a site divided by the total net area of the site, expressed in decimals to one or two places. For example, on a site with 10,000 net square feet of land area, a floor area ratio of 1.0 will allow a maximum of 10,000 gross square feet of building floor area to be built. On the same site, an FAR of 1.5 would allow 15,000 square feet of floor area; an FAR of 2.0 would allow 20,000 square feet; and an FAR of 0.5 would allow 5,000 square feet. Also commonly used in zoning, FARs typically are applied on a parcel-by-parcel basis as opposed to an average FAR for an entire land use or zoning district.

Floor Area, Gross. The sum of the horizontal areas of the several floors of a building measured from the exterior face of exterior walls, or from the centerline of a wall separating two buildings, but not including any space where the floor-to-ceiling height is less than six feet. Some cities exclude specific kinds of space (e.g., elevator shafts and parking decks) from the calculation of gross floor area.

Freeway. A freeway is a high-speed, high-capacity, limited-access road serving regional and countywide travel. Such roads are free of tolls, as contrasted with turnpikes or other toll roads. Freeways generally are used for long trips between major land use generators. Major streets cross at a different grade level.

Incorporation by Reference. “Incorporation by reference” is a CEQA term meaning reliance on a previous environmental document for some portion of the environmental analysis of a project. See *CEQA Guidelines* §15150.

Initial Study. An Initial Study is a preliminary CEQA analysis that can be prepared by a Lead Agency to determine whether an EIR or Negative Declaration must be prepared, and identifying the significant environmental effects to be analyzed in an EIR.

Land Use. Any land use is the determination by a governing authority of the use to which land within its jurisdiction may be put so as to promote the most advantageous development of the community.

Lead Agency. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project. The Lead Agency decides whether an EIR or Negative Declaration is required for a project, and causes the appropriate document to be prepared.

Level of Service (LOS). LOS is a qualitative measure describing operational conditions within a traffic stream and how motorists and/or passengers perceive them.

Maximum Noise Level (L_{max}). The maximum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.

Mitigation Measure. A mitigation measure is a change in a project designed to avoid, minimize, rectify, reduce, or compensate for a significant environmental impact.

Mitigation Monitoring and Reporting Program (MMRP). When a lead agency adopts a mitigated negative declaration or an EIR, it must adopt a program of monitoring or reporting which will ensure that mitigation measures are implemented. (See CEQA Statute §21081.6(a) and *CEQA Guidelines* §§15091(d) and 15097.)

Noise. Noise is any sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying (unwanted sound).

Noise Contours. Noise contours are lines drawn about a noise source indicating equal levels of noise exposure.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Notice of Determination (NOD). An NOD is a brief notice filed with the State Clearinghouse to document project approval. The filing of the NOD starts the statute of limitations period. (See *CEQA Guidelines* §15373.)

Notice of Preparation (NOP). An NOP is a brief notice to notify the public, Responsible and Trustee Agencies that an EIR is being prepared for a project. The notice serves to solicit guidance from those agencies and the public about the scope and content of the environmental information to be included in the EIR. (See *CEQA Guidelines* §15375.)

Peak Hour. The hour of highest traffic volume on a given section of roadway between 7:00 a.m. and 9:00 a.m. or between 4:00 p.m. and 6:00 p.m.

Programmatic EIR. A programmatic EIR is an EIR that examines the impacts that would result from a conceptual plan or policy action envisioned by the lead agency, which is carried out at a more general level of analysis based upon the development information available. (See *CEQA Guidelines* §15161.)

Project. According to CEQA, a project is the whole of an action that has the potential to result in significant environmental change in the environment, directly or ultimately. (See *CEQA Guidelines* §15378.)

Project Description. A project description describes the basic characteristics of the project including location, need for the project, project objectives, technical and environmental characteristics, project size and design, project phasing and required permits. The level of detail provided in the project description varies according to the type of environmental document prepared.

Project EIR. A project EIR is an EIR that examines the impacts that would result from development of a specific project. (See *CEQA Guidelines* §15161.)

Public Hearing. A public hearing is a mechanism for providing the public an opportunity to comment on and present evidence relating to a proposed project and its Draft EIR.

Responsible Agencies. According to CEQA, responsible agencies are all public agencies other than the Lead Agency that have discretionary approval power over the project. (See *CEQA Guidelines* §15381.)

Reviewing Agencies. Reviewing agencies are local, State, and Federal agencies with jurisdiction over the project area or resources potentially affected by the project. Cities and counties are also considered reviewing agencies.

Scoping Meeting. A scoping meeting is an optional meeting pursuant to CEQA in which the lead agency meets with members of the public or agency representatives after the Notice of Preparation has been issued to discuss environmental issues related to a project. Scoping sessions provide the opportunity to discuss environmental issues, project alternatives and potential mitigation measures that may warrant in-depth analysis in the environmental review process.

Sensitive Receptors. Sensitive receptors are people or institutions with people that are particularly susceptible to illness from environmental pollution, such as the elderly, very young children, people already weakened by illness (e.g., asthmatics), and persons engaged in strenuous exercise.

Significant Effect on the Environment. A significant effect on the environment means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance (*CEQA Guidelines* §15382).

Thresholds of Significance. Thresholds of significance are criteria for each environmental issue area to assist with determinations of significance of project impacts. They are based on *CEQA Guidelines* Appendix G.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Trustee Agency. According to CEQA, a Trustee agency is a State agency that has jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California. (See *CEQA Guidelines* §15386.)

Volume (Transportation). The volume of traffic is the total number of vehicles that pass over a given point or section of a roadway during a given time interval. Volumes may be expressed in terms of annual, daily, hourly, or sub-hourly periods.

Wastewater. Wastewater is water carrying dissolved or suspended solids from homes, farms, businesses, and industries. The wastewater treatment process includes any process that modifies characteristics of the wastewater, usually for the purpose of meeting effluent standards.

Zoning. Regulation by zone districts of the height, use, and area of structures, the use of land, and the density of population and intensity of allowable uses.

GLOSSARY OF PROJECT-SPECIFIC DEFINITIONS

The following definitions are excerpts from Section 3.4, *Project Description*.

Annexation Area: This term refers to an 85-acre parcel located adjacent to Gilman Springs Road that is to be annexed into the City of Moreno Valley. The parcel is already within the City's adopted Sphere of Influence adopted on November 21, 1985.

CDFW Conservation Buffer Area: This term refers to a 910-acre parcel owned by the State of California as part of the San Jacinto Wildlife Area (SJWA). This land is within the City of Moreno Valley and is included in the approved Moreno Highlands Specific Plan. That plan designates this property for a broad mix of urban uses including suburban residential, schools, parks, and roads. This land was purchased by the State in 1991 to act as a buffer between the sensitive biological resources of the SJWA and the future urban development under the Moreno Highlands Specific Plan. This land has been actively farmed for many decades and most of it remains in active production. The southwestern portion contains areas of non-native grasslands, although aerial photographs show that this area has been intermittently tilled over the last 80 years. This property is included in the General Plan Amendment and the Zone Change to replace the current urban land uses that are permitted and replace them with Open Space and Public Facility designations. This property is not within the proposed World Logistics Center Specific Plan. This Buffer Area is a large part of the "Other Project Areas" described herein.

General Plan Amendment: One of the proposed entitlements is a General Plan Amendment (GPA) that will permit the establishment of logistics land uses on the 3,714-acre property located east of Redlands and south of SR-60. The following General Plan Elements will be amended: Community Development; Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and General Plan Goals and Objectives. The GPA will replace the current Moreno Highland Specific Plan/General Plan Designations with the following land use designations: (a) 2,610 acres for high cube logistics development; (b) 1,084 acres of Open Space; and (c) 20 acres for Public Facilities.

Moreno Highlands Specific Plan: This term refers to the currently approved Specific Plan that covers 3,038 acres of the project area. This Specific Plan permits the development of a master planned, mixed-use community consisting of up to 7,763 residential dwelling units and approximately 603 acres of business, retail, institutional, and other uses. This development will be replaced with the World Logistics Center Specific Plan and 1,104 acres of Open Space and Public Facilities uses.

Off-site Analysis Zone: This term refers to an approximately 1,000-foot wide zone adjacent to the south and east boundaries of the Specific Plan area that was studied by Michael Brandman Associates (MBA) as part of the assessment of potential impacts on biological resources. It covers approximately 1,637.5 acres.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Off-site Improvement Areas: Development under the Specific Plan will require construction of a number of offsite infrastructure improvements covering approximately 104 acres of land adjacent to the Specific Plan Site including, but not limited to the following facilities (see Figure 3.7):

Debris Basins easterly of Gilman Springs Road;

Water reservoirs and access roads located northeast, north, and west of the project site;

SR-60 interchange improvements; and

Roadway, water, sewer, drainage, and utility improvements extending north and west from the project.

Other Project Areas: The San Diego Gas & Electric Company (SDG&E) and the Southern California Gas Company (SCGC) own a total of 194 acres of land immediately south of the Specific Plan site. These properties are included in the proposed General Plan Amendment and the Zone Change to designate them for Open Space and Public Facilities uses. These designations are consistent with present uses. These properties are not within the proposed World Logistics Specific Plan. Approximately 174 acres of the land owned by SDG&E will be designated as Open Space. Nineteen acres of SDG&E land and one acre of SCGC land will be designated as Public Facilities.

Project Site or Project Area: This term refers to the entire 3,818-acre area covered by the EIR encompassed by: (a) the Specific Plan Area (2,610 acres); (b) the CDFW Conservation Buffer Area (910 acres); c) the Public Facilities Lands area (194 acres); and (d) the Off-site Improvement Area on 104 acres.

Proposed Project or World Logistics Center Project: General term applied to all of the entitlements outlined above that are addressed in this EIR, including:

WLC Specific Plan	2,610 acres
General Plan Amendment.....	3,714 acres
Zone Change	3,714 acres
Tentative Parcel Map	1,539 acres
Annexation	85 acres
Off-site improvements	104 acres

Specific Plan Site: Approximately 2,610 acres of the project area are included in the proposed World Logistics Center (WLC) Specific Plan, located generally south of the SR-60 Freeway, east of Redlands Boulevard, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area.

State Lands: Refers to lands owned by the State of California and includes the San Jacinto Wildlife Area (SJWA) located south of the Specific Plan Site, and the Lake Perris State Recreation Area (LPSRA) located southwesterly of the Specific Plan Site.

Tentative Parcel Map Area: A Tentative Parcel Map is being processed to subdivide 1,539 acres of the project for financing purposes only. This property is owned by the project applicant. Approval of the map will confer no development rights to the property.

WLC Specific Plan: The WLC Specific Plan proposes a master-planned logistics campus to include up to 40.4 million square feet of high-cube logistics warehousing, up to 200,000 square feet of light logistics uses, a site for “logistics support” allowed as a special use and 74.3 acres of Open Space in the southwest corner of the site. The Specific Plan includes extensive development standards, design guidelines and review procedures for all development within the project.

World Logistics Center Project: The term refers to all related development and planning activities currently proposed by Highland Fairview in the Rancho Belago area of the eastern end of the City of Moreno Valley. The WLC property is generally located south of the State Route 60 freeway, east of Redlands Boulevard, west of Gilman Springs Road, and north of Mystic Lake and the San Jacinto Wildlife Area.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Zone Change: The project includes a Zone Change covering 3,714 acres which will designate 1,084 acres of land for Open Space (CDFW and SDG&E properties), 20 acres for Public Facilities (SDG&E, SCGC properties) and 2,610 acres for the World Logistics Center Specific Plan.

1.0 INTRODUCTION

The Final Environmental Impact Report (FEIR) for the proposed World Logistics Center Project (WLC) comprises the following documents:

- Volume 1 – Response to Comments and the Mitigation Monitoring and Reporting Program;
- Volume 2 – Revised Draft EIR and Appendices (with corrections);
- Volume 3 – Revised Draft EIR and Appendices (clean);
- Volume 4 – Original Draft EIR and Appendices; and
- Volume 5 – Findings, Statement of Overriding Considerations, Staff Reports, and Resolutions.

The purpose of this FEIR Volume 1 is to respond to all comments received by the City of Moreno Valley (City) regarding the environmental information and analyses contained in the Draft EIR (DEIR). Additionally, any corrections to the text and figures of the DEIR generated either from responses to comments or independently by the City, are indicated in responses to comments contained in FEIR Volume 1. FEIR Volume 2 provides the DEIR revised to show or indicate all changes to the DEIR text and appendices, with changes shown in strikeout/underline format and notes in the text where appropriate. To assist the reader, FEIR Volume 3 provides the Revised DEIR in a clean format with all changes incorporated. FEIR Volume 4 consists of the original DEIR and appendices for comparison and has not been modified to reflect any changes outlined in FEIR Volumes 1 or 2. Finally, FEIR Volume 5 provides the legal processing requirements of California Environmental Quality Act (CEQA) in terms of the findings and statement of overriding considerations, as well as the supporting staff reports and City Council resolutions.

1.1 CONTENT AND FORMAT

Subsequent to this introductory section, Section 2.0 contains copies of each comment letter received on the DEIR, along with annotated responses to each comment contained within the letters. Section 3 of this document contains the Mitigation Monitoring and Reporting Program (MMRP).

1.2 PUBLIC REVIEW OF THE DEIR

As required by the CEQA Guidelines Section 15087, a Notice of Completion (NOC) of the DEIR State Clearinghouse No. 2012021045 for the World Logistics Center Project was filed with the California Office of Planning and Research State Clearinghouse on February 5, 2013. The DEIR was circulated for public review for a period of 63 days, from February 5, 2013 to April 8, 2013. Copies of the DEIR were distributed to all Responsible Agencies and to the State Clearinghouse in addition to various public agencies, citizen groups, and interested individuals. Copies of the DEIR were also made available for public review at the City Planning Department, at one area library, and on the internet.

A total of one-hundred and forty-four (144) comment letters were received during the public review period commenting on the EIR and WLC project. Twenty-three (23) of the comment letters received were from Federal, State, regional, or local agencies. Fifteen (15) comment letters were received from private organizations or conservation groups, and one-hundred and five (106) letters were received from individuals. In addition, several letters/emails from individuals and one letter from the City of Redlands were received well after the close of the public review period. However, all letters

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

that commented on the DEIR or on CEQA issues have been responded to in Section 2.0 of this document.

1.3 POINT OF CONTACT

The Lead Agency for this Project is the City of Moreno Valley. Any questions or comments regarding the preparation of this document, its assumptions, or its conclusions, should be referred to:

Richard Sandzimier, Planning Official
and
Mark Gross, Senior Planner
City of Moreno Valley, Planning Division
14177 Frederick Street
Moreno Valley, California 92553
Phone: (951) 413-3206
e-mail: RichardSa@moval.org
Markg@moval.org

1.4 CHANGES TO THE WLC PROJECT

The DEIR is a programmatic document that examined the development of 41.6 million square feet of logistics warehousing and related uses on the WLC site without any specific building footprints or development characteristics. The primary change in the WLC Project is the total Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

The revised land uses of the WLC project, including the WLC Specific Plan (WLCSP), are outlined in Table 1.A and shown in Figure 1-1. In addition, the Specific Plan land use plan was divided into sixteen (16) Planning Areas based on traffic impact zones which allows for more accurate estimates of potential traffic and air quality impacts of the WLC Project. The specific land use of each planning area is outlined in Table 1.B and shown in Figure 1-2.

The Circulation Plan has remained relatively the same as under the original plan but Street C has been relocated further east and south due to the removal of 100 acres at the southwest corner of the Specific Plan area, and to allow for a more direct connection to the existing Cactus Avenue at the southwest corner of the WLC property.

In the original plan, a trail was proposed along the edge of the Open Space area in the southwestern portion of the site to connect to existing trails along Redlands Boulevard and Cactus Avenue to the west and planned trails within the San Jacinto Wildlife Area and Mystic Lake to the south. In response to changes to the proposed project and concerns expressed by Native Americans, the trail in the revised plan has been moved away from the northern boundary of the Open Space area to reduce potential impacts to the Mt. Russell foothills. This change is shown in Figure 1-3.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table 1.A: WLC Project Characteristics (Original and Revised)

Area/Land Use	Original Project		Revised Project	
	Acres	Square Footage	Acres	Square Footage
World Logistics Center Specific Plan (WLCSP)				
LD Logistics Development ¹	2,606	41,400,000	2,382.8	40,400,000
LL Light Logistics	29	200,000	37.1	200,000
OS Open Space	75	—	74.3	—
ROW ²	—	—	115.8	—
WLCSP Total	2,710	41,600,000	2,610.0	40,600,000
Other Project Areas				
California Department of Fish and Wildlife	910	—	910	—
San Diego Gas and Electric – Open Space	174	—	174	—
San Diego Gas and Electric – Facility	19	—	19	—
Southern California Gas Company – Facility	1	—	1	—
Other Areas Total	1,104	—	1,104	—
Off-site Improvement Areas	104	—	104	—
TOTAL WLC PROJECT AREA	3,918	41,600,000	3,818	40,600,000
Floor Area Ratio (FAR)³	NA	0.352	NA	0.357

¹ Included in LD zone with 3,000 square feet of “logistics support” in Planning Area 22 at northeast corner of Theodore and Eucalyptus.

² Right-of-Way included in each land use category

³ Floor Area Ratio (FAR) is gross building area divided by gross site area

The WLC implementation schedule was revised or extended from 10 to 15 years, so Phase 1 is now scheduled for completion in 2022 rather than in 2017, or from approximately 2015 to 2022, compared to the five-year time period assumed in the DEIR (i.e., 2012 to 2017). Phase 2 is scheduled from approximately 2023 to 2030. Therefore, the quantitative impact analyses for 2017 in the original DEIR were eliminated in the revised DEIR (see FEIR Volume 2).

The revised Specific Plan also makes a specific commitment to achieving the equivalent of “LEED Certified¹ in terms of sustainability and energy conservation. However, due to the time involved in obtaining LEED certification, the Specific Plan indicates development within the WLCSP will comply with the “LEED Certified” level of LEED requirements but may not necessarily obtain actual LEED certification.

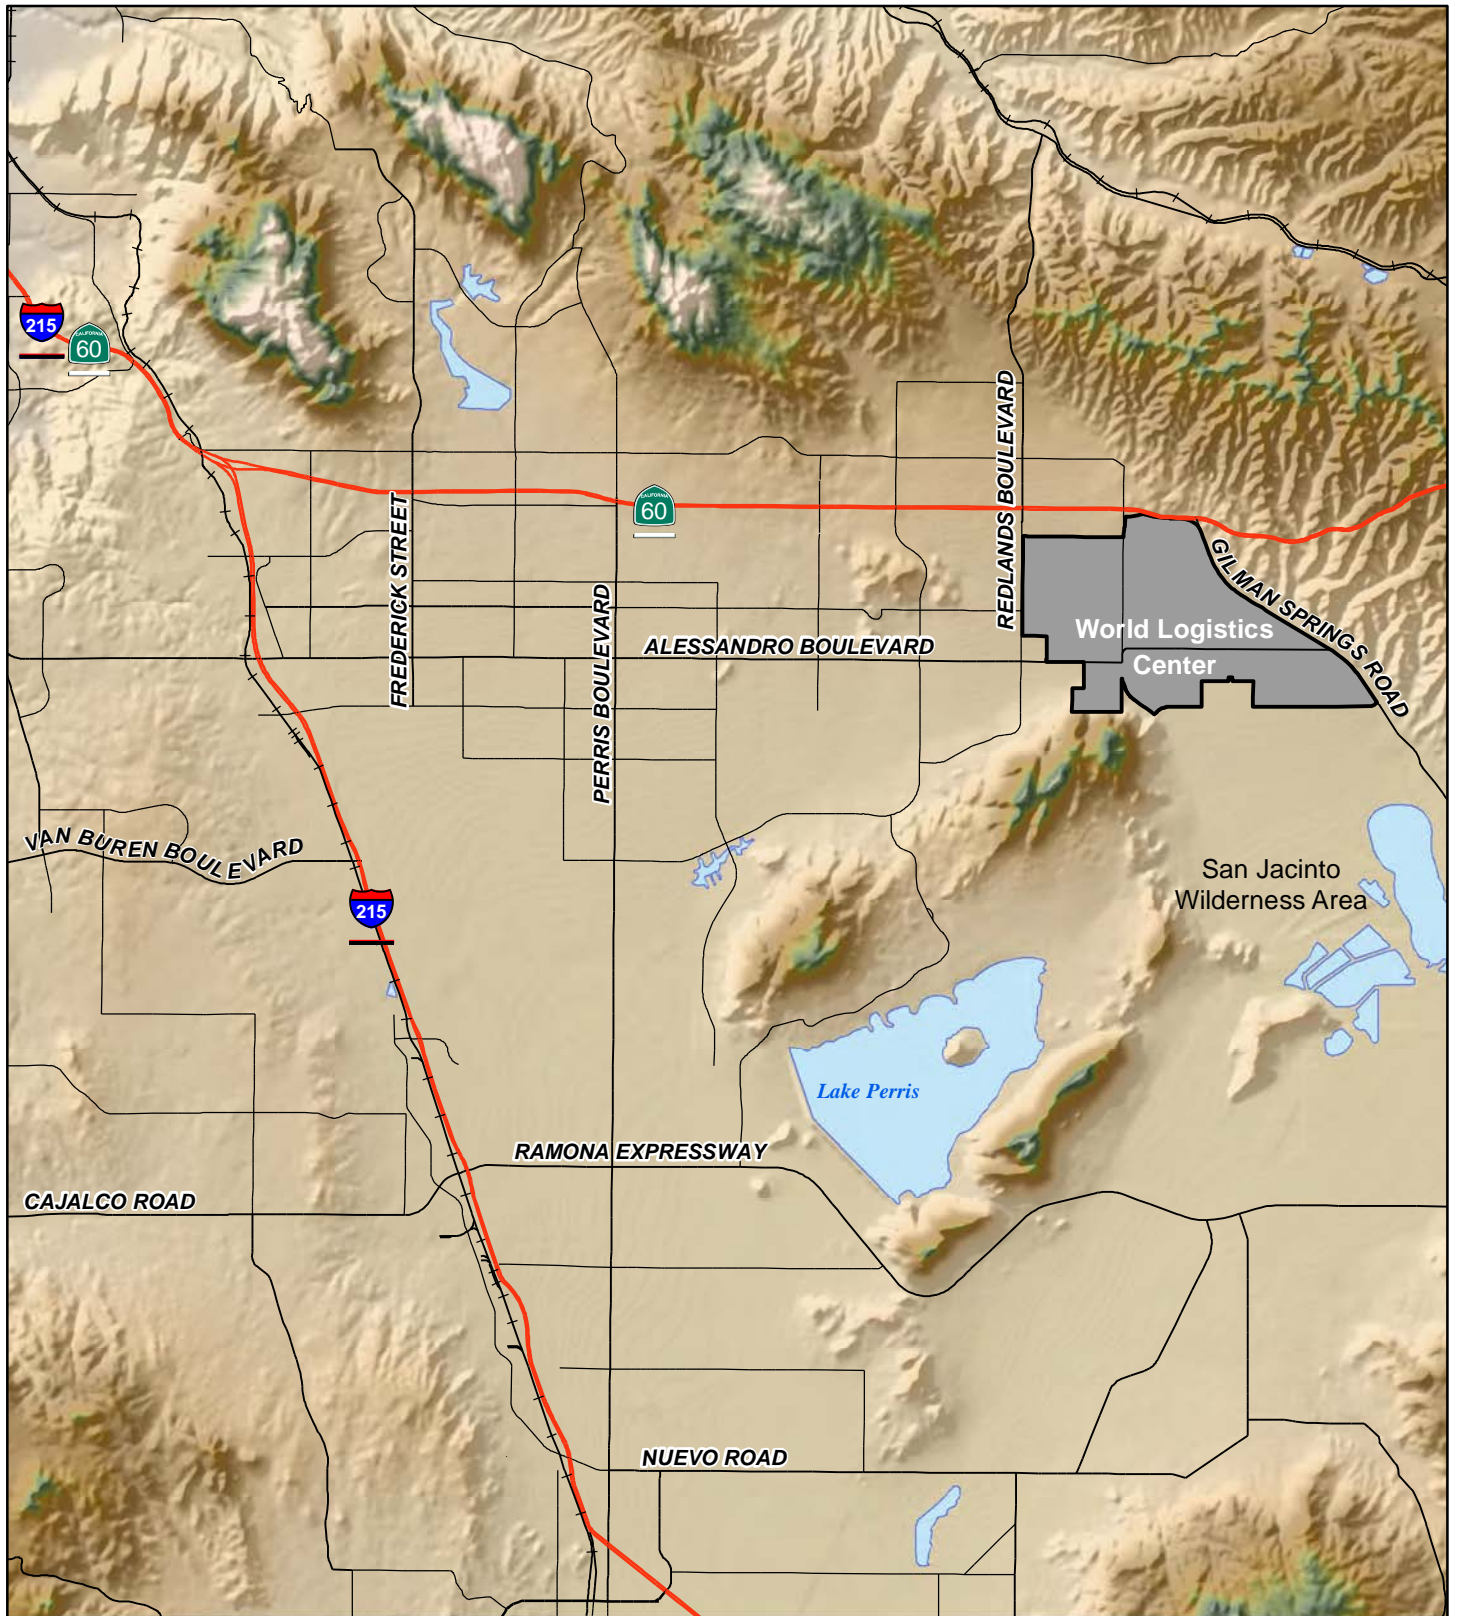

Additional design is also being done on the Drainage 9 “corridor” to allow for wildlife movement as well as flood and erosion control.

¹ Leadership in Energy and Environmental Design program managed by the U.S. Green Building Council (GBC).

1.5 PROJECT OBJECTIVES^[L1]

Based on comments received on the DEIR, the project objectives have been slightly modified as shown below to more accurately reflect the planned future services provided by the WLC project and to clarify the project objectives relative to the evaluation of project alternatives (additional text shown in double underline, deleted text shown in strikeout):

- Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.
- Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan.
- Create a major logistics center in ~~Rancho Belago~~ with good regional and freeway access.
- Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project.
- Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly, accommodating the next-generation of logistics buildings.
- Provide a major logistics center to accommodate a portion of the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach.
- Create a project that will provide a balanced approach to the City's responsibilities of fiscal viability, economic expansion, and environmental integrity.
- Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner.
- Encourage new development consistent with regional and municipal service capabilities.
- Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.
- Provide thousands of construction job opportunities during the project's build-out phase.
- Provide appropriate transitions or setbacks between on-site and off-site uses.

1.5.1 City's Economic Development Action Plan Objectives

In 2011, the City adopted an Economic Development Action Plan (EDAP) that outlined the following general objectives:

Objectives for Economic Development

- Create jobs locally and address City's high unemployment rate
- Address the Community's jobs to housing imbalance
- Strengthen and broaden the local economic foundation by attracting quality businesses
- Enhance City revenue generation from sources such as sales tax, property tax, transient occupancy tax, and utility tax – all aimed at improving quality of life in Moreno Valley

Eastern Moreno Valley–Rancho Belago

- Prime area of Community with large undeveloped areas.
- Skechers USA opening has generated interest by other prospective corporate users.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- Nearly 20-year old Moreno Highlands Specific Plan to expire in 2012
- Highest and Best land uses should be evaluated to address City's jobs to housing imbalance

Survey of Inland Region Industrial/Business Park Zoning (Percent Allocation of Cities Land Area for Job Producing Land Uses)

- Ontario 25.3%
- Perris 21.7%
- San Bernardino 18.0%
- Chino 17.1%
- Fontana 17.0%
- Rancho Cucamonga 15.3%
- Riverside 15.2%
- Corona 11.4%
- Moreno Valley 9.0%

In 2013, the EDAP was replaced and included the following specific objectives related to the World Logistics Center:

World Logistics Center at Rancho Belago

- Collaborate with Highland Fairview in the development of the World Logistics Center—a 41.6 million S.F. master planned corporate park proposed to be developed on 2,700 acres in the Rancho Belago area of eastern Moreno Valley.
- Process an Environmental Impact Report and preliminary development plans for the World Logistics Center in eastern Moreno Valley—south of SR 60 and east of Redlands Boulevard to Gilman Springs Road.
- Assist in the drafting of a Specific Plan that will guide the orderly development for of World Logistics Center.
- Cooperate with Highland Fairview in the formulation of a Development Agreement to create a public-private partnership to help facilitate the development of new public infrastructure in eastern Moreno Valley associated with the World Logistics Center including roads, trails, utilities, storm water protection and fire protection facilities.
- Work with Highland Fairview in branding the World Logistics Center as one of the largest e-commerce focused development projects in the U.S.

1.6 CHANGES TO THE EIR TECHNICAL STUDIES

Subsequent to circulation of the Draft EIR, several project changes, as outlined in Section 1.4, were made that needed to be reflected in the EIR technical studies. In addition, several of the EIR technical studies were revised in response to comments made on the DEIR. The following summarizes the major changes to the DEIR technical studies.

1.6.1 Agricultural Resources Study

- **Project Changes** (100 acres less project area).
- **Revise LESA² Model** calculation area to remove state conservation areas (no development) and modify Zone of Influence based on DEIR comments.
- **Add offsite agricultural easement** based on productivity as mitigation in response to DEIR comments.
- **SUMMARY.** Revision of the LESA model now indicates significant agricultural impact is loss of unique farmland only, and not the loss of locally important farmland. New offsite mitigation will reduce these impacts to less than significant levels.

1.6.2 Air Quality/Health Risks

For a complete summary of the changes and additional details, please refer to the FEIR Air Quality Section 4.3.3 (Methodology).

General Changes

- Project changes (**100 acres less project area, 1 million square feet less building area, phasing increased from 10 to 15 years, addition of fire station**).
- **Incorporate revised data from Traffic Impact Assessment** (see 1.6.9 below).
- **Mitigation measures were refined** and new measures were added.
- A discussion of **ultrafine particles** was added to Section 4.3; however, emissions were not estimated in either the DEIR or the FEIR.

Construction Emissions

- **New Version of CalEEMod³.** The construction emissions were originally estimated with CalEEMod version 2011.1.1; the revised analysis estimates emissions using CalEEMod version 2013.2.2, the most recent version.
- **Extended Construction Period, Refined Construction Equipment, Refined Phasing.** In the DEIR, construction was assumed to occur over 10 years; in the revised analysis, construction is assumed to occur over 15 years. This change necessitated refinements in the construction equipment and phasing. Please refer to Section 4.3.3 for details.

Operational Emissions

- **Trip Lengths and Model for Motor Vehicle Emissions.** Forecasted traffic volumes contained in the revised Traffic Impact Analysis were used to estimate the project's motor vehicle emissions instead of 50 miles per truck trip and the CalEEMod default trip lengths for local trips used in the DEIR. The traffic model provided estimates of project traffic volumes for nearly 500 individual freeway and surface street roadway segments segregated by vehicle class as passenger cars, light heavy duty trucks, medium heavy duty trucks, and heavy-heavy duty trucks. This revised methodology provides a much more accurate estimate of the project's operational mobile source vehicle miles traveled and resulting emissions. In addition, in the DEIR, regional motor vehicle emissions were estimated by CalEEMod, whereas in the revised analysis, emissions are estimated by detailed calculations prepared by Michael Brandman Associates – FirstCarbon Solutions using information from the project's traffic study, including the segment traffic volumes, length, and vehicle mix, as well as speed-specific emission factors from EMFAC2014.

² (California) Land Evaluation and Site Assessments

³ California Emissions Estimator Model

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- **Updated Emission Factors.** The EMFAC2014 mobile source emission model was applied to all vehicle classes in the revised analysis. In the estimate of regional emissions provided in the Draft EIR, the medium and heavy-duty diesel trucks applied the EMFAC2011 model emission factors and the other vehicle classes used the default EMFAC2007 emission factors embedded in the older version of CalEEMod (version 2011). This was because CalEEMod version 2011 was the approved model at the time for estimating regional emissions. The estimate of localized air emissions in the Draft EIR included the most recent emission factors from EMFAC2011.
- **More Onsite Emissions Sources.** Additional sources of operational emissions were also accounted for in this revised analysis including standby diesel generators, fork lifts, and yard trucks.

Local Significance Threshold (LST) Analysis

- **Revisions to the Traffic Volumes.** The operational assessment of localized impacts reflects the changes in traffic volumes associated with the reduction of project size and realignment of roadway segments that are within and border the project's boundaries.
- **Changes in Construction Schedule.** The analysis in the DEIR assumed a construction schedule of 10 years, whereas the revised assessment is based on a 15-year construction schedule. The changes in construction schedule both by year and location within the project were accounted for under the revised, extended project development schedule for estimating the emissions subject to the (LST) assessment.
- **Emission Source Configuration:** The analysis in the DEIR of the off-road construction equipment exhaust was represented in the air dispersion model as a large area source that covered the construction area. The revised analysis represents the off-road construction exhaust emission source as a series of contiguous volume sources which is consistent with the South Coast Air Quality Management District (SCAQMD) methodology for LST assessments.
- **Operational Truck Idling.** The analysis in the DEIR assumed that each heavy duty truck that accessed the site during operation idled for a total of 15 minutes per day. In the revised analysis, each truck was assumed to idle for 5 minutes per day consistent with the California Air Resources Board's Air Toxic Control Measure that limits such idling to 5 minutes. Further, the requirements of Mitigation Measure 4.3.6.3B restricts idling to 3 minutes or less.

Health Risk Assessment

- **Revisions to the Construction Emissions.** This revised analysis reflected the numerous changes in construction equipment, load factors, schedule, and sequencing of construction by location within the project as discussed above.
- **Revisions to Traffic Volumes.** The revised analysis made use of the refined traffic volume forecasts along nearly 500 individual roadway segments that stretched from the Palm Springs area to the Ports of Los Angeles and Long Beach..
- **Expanded Model Extent.** The geographic extent of the air dispersion model domain was expanded to include freeway segments to the ports of Los Angeles and Long Beach.
- **Organic Gas Emissions Included.** The assessment of acute non-cancer hazards was expanded to examine the impacts of the toxic components of the project's total organic gas emissions from gasoline and diesel vehicles. The analysis in the DEIR focused on diesel particulate matter to derive health impacts from the project.
- **Calculated Cancer Population Burden.** The health risk assessment was extended to include the computation of cancer population burden attributed to the project's diesel particulate matter emissions.

- **Updated Current OEHHA Guidance for HRA.** The analysis contained in the DEIR assumed a cancer risk exposure time period of 70 years for sensitive/residential receptors based on OEHHA and SCAQMD guidance. Recently, OEHHA has finalized updated guidance on a new methodology. The updated OEHHA approach uses Age Sensitivity Factors, an increased breathing rate, and an exposure duration of 30 years.
- **Exposure Period for Worker Receptors.** The analysis contained in the DEIR assumed a cancer risk exposure time period of 40 years for workers based on OEHHA and SCAQMD guidance. Recently, OEHHA has finalized updated guidance on a new methodology. The new guidance uses an exposure duration of 25 years.
- **Buffer Analysis.** The analysis includes assessment of cancer risks with a buffer of 250 feet (the project design) and 1,000 feet between the project's operational emissions and the centerlines of Redlands Boulevard, Gilman Springs Road, Bay Avenue, and Merwin Street. The analysis found that a 1,000 foot buffer makes little difference to no difference in the cancer risk results.

Findings

- **Construction Regional Emissions.** The findings have decreased; emissions of volatile organic compound (VOC), oxides of nitrogen (NOx), carbon monoxide (CO), and PM₁₀⁴ are still significant after mitigation. PM_{2.5}⁵ emissions are now less than significant after mitigation. Emissions of VOC, NOx, CO, and PM_{2.5} decreased with the revised analysis, primarily because the construction activity levels decreased and there is now a mitigation measure that requires Tier 4 construction. Emissions of PM₁₀ increased slightly due to the inclusion of unpaved onsite road dust estimates.
- **Operational Regional Emissions.** The findings are the same; emissions of VOC, NOx, CO, PM₁₀, and PM_{2.5} are still over the significance thresholds after mitigation. However, all emissions decreased, due to a decrease in the estimated overall vehicle miles traveled and use of updated mobile source emission factors.
- **LST Analysis.** In the DEIR, the concentrations of nitrogen dioxide, PM₁₀, and PM_{2.5} were significant after mitigation. In the FEIR, nitrogen dioxide and PM_{2.5} were reduced to less than significant; therefore, the only pollutant significant locally is PM₁₀.
- **Health Risk Assessment.** In the DEIR, under the 70-year exposure duration, there are significant cancer risks inside and outside the project boundary. In the FEIR, using the Current OEHHA Guidance, the cancer risks exceed the cancer risk significance threshold at existing residences located within the project boundary but do not exceed the threshold at residences located outside of the project boundary. Further, even though the significance threshold is exceeded on a numerical basis, the risks are expected to be less than significant based on the new health research results from the Health Effects Institute (HEI) that evaluated the health effects of diesel PM emissions from new technology diesel engines such as those that are required as a mitigation measure for this project (Mitigation Measure 4.3.6.2B) that requires that all diesel fueled trucks must be compliant with Model Year 2010 truck emission standards. The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust that were identified when it was designated a toxic air contaminant by CARB in 1998. That designation spurred a series of regulations that brought forth transformative emissions control technology, significantly reducing both emissions and the associated health impacts. This finding is further reinforced by the mitigation requirement that all diesel construction equipment greater than

⁴ Particulate matter of 10 microns or less.

⁵ Particulate matter with a diameter of 2.5 microns or less

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

50 horsepower meet Tier 4 emission standards, the most stringent emission control requirements on off-road construction equipment.

1.6.3 Biological Resources Studies

- **Project Changes** (100 acres less project area).
- **Updated MSHCP⁶ Consistency Report** including raptor foraging assessment.
- **Updated Jurisdictional Delineation.**
- **Prepared Programmatic DBESP⁷ Report** in response to resource agency comments.
- City submitted MSHCP Consistency and DBESP Reports to County RCA⁸ for processing.
- **SUMMARY.** Impacts identified in the original reports were still less than significant with this new information (i.e., no new or substantially different significant impacts).

1.6.4 Cultural Resources Study

- **Project Changes** (100 acres less project area).
- **Modified mitigation language** in response to comments by Native Americans.
- **SUMMARY.** Impacts identified in the original report were still less than significant with this new information (i.e., no new or substantially different significant impacts) with the modified mitigation language.

1.6.5 Greenhouse Gases/Climate Change

For a complete list of the changes, refer to FEIR Greenhouse Gas Emissions, Climate Change, and Sustainability Section 4.7.3 (Methodology).

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- **Incorporate revised data from Traffic Impact Assessment** (see 1.6.9 below)
- **Changes to Construction and Operational Emissions Estimation.** As shown in the Air Quality FEIR Section 4.3 and in Section 1.6.3 above, there were changes to the assumptions for the construction and operational emissions estimation. These changes in assumptions also change the emissions as estimated in the GHG analysis.
- **Addition of Black Carbon Emissions Estimation.** The analysis in the DEIR did not estimate black carbon emissions, which may contribute to climate change. This analysis includes an estimate of black carbon emissions.
- **New Waste Generation Factors.** The new version of CalEEMod has revised operational waste generation factors, which results in less estimated waste generated during operation and less greenhouse gas emissions.
- **AB 32 Capped and Uncapped Emissions.** The greenhouse gas (GHG) emissions in the revised analysis are divided into emissions that fall under California's Cap-and-Trade Program, which was enacted to achieve emissions reductions required under Assembly Bill (AB) 32. Only those GHG emissions that are uncapped are compared with the significance threshold.

⁷ Determination of a Biologically Equivalent or Superior Preservation

⁸ Resource Conservation Agency

- **SUMMARY.** GHG emissions were substantially reduced from those identified in the DEIR mitigated: approximately 665,000 metric tons (mt) Carbon Dioxide Equivalent (CO₂e) in DEIR vs. 380,000 mt CO₂e capped and 6,000 mt CO₂e uncapped emissions in FEIR at buildout. The uncapped emissions in the FEIR are now under the significance threshold of 10,000 mt CO₂e after mitigation. Therefore, the significance finding changed from significant to less than significant.

1.6.6 Hydrology Study

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- **Address watershed and groundwater comments** by resource agencies and others.
- **SUMMARY.** Impacts identified in the original hydrology report were still less than significant with this new information (i.e., no new or substantially different significant impacts).

1.6.7 Noise Study

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- **Incorporate revised data from Traffic Impact Assessment** (see 1.6.9 below).
- **Revised analysis of indirect impacts on San Jacinto Wildlife Area (SJWA)** based on traffic study changes.
- **SUMMARY.** Impacts identified in the revised noise report are still significant even with this new information (i.e., but no new or substantially different significant impacts).

1.6.8 Fiscal/Employment Studies

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- **SUMMARY.** Impacts identified in the revised report are equivalent to those outlined in the original report accounting for the incremental reduction in project size (-3%).

1.6.9 Traffic Impact Assessment (TIA)

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- In response to comments, **the analysis of freeway impacts from WLC trucks was extended to the Ports of Los Angeles and Long Beach.** The extended analysis, covering more than 60 additional centerline miles of freeway, did not find any new impacts that were not already identified in the Draft TIA.
- In response to comments, **an analysis was performed of the feasibility of shipping cargos between the WLC and the Ports of Los Angeles and Long Beach by rail** instead of by truck. The analysis found that this was not feasible for a variety of reasons including the cost and environmental impacts of a new rail alignment, the high fixed handling costs for rail cargo that makes short hauls uneconomical, and system constraints with the rail system itself.
- In response to comments, **an analysis was performed of the potential safety impacts of WLC traffic on local schools.** The analysis found that the project would pose little

safety risk and that appropriate safety features were already present on roads near local schools.

- In response to comments, **a figure was added showing the designated Truck Routes** in the vicinity of the WLC.
- **The WLC implementation schedule was revised** so that Phase 1 is scheduled for completion in 2022 rather than in 2017, as was assumed in the draft report. The scenarios for 2017 were therefore dropped and the scenario for 2022 was revised to analyze Phase 1 only, not full buildout of the WLC.
- **A new chapter was added to analyze Existing Plus Phase 1** (only) conditions.
- **Various grammatical and reference corrections were made**, and in places the text and tables were revised to provide greater clarity to readers.
- **A list of references has been added to the end of each chapter** for the reader's reference.
- **SUMMARY.** Significant impacts identified for Baseline + Project, Phase 1, and Build out conditions of the WLC project still occur as generally indicated in the revised TIA. (Traffic impacts have been incrementally reduced corresponding to the reduction in the amount of building area associated with the project, resulting in no new or substantially different significant traffic impacts).

1.6.10 Utilities

- **Project Changes** (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years).
- **Added information about photovoltaic solar energy systems.**
- **SUMMARY.** Impacts identified in the original utility reports were still less than significant with this new information (i.e., no new or substantially different significant impacts).

1.7 CHANGES TO THE DRAFT EIR

Subsequent to circulation of the DEIR, several project changes were made as outlined in Section 1.4. In addition, several of the EIR technical studies were revised to address these project changes and to respond to comments made on the DEIR. The following summarizes the major changes to the DEIR document as a result of the changes to the project description and technical studies. It should be noted that none of these changes represent significant new information and do not result in substantially greater or new significant environmental impacts than those identified in the DEIR.

1.7.1 Executive Summary

- Incorporated all project changes, corrections from individual analysis sections (4.1 through 4.16), and corrections to EIR sections on other CEQA topics (alternatives, growth-inducing impacts, etc.).

1.7.2 Introduction

- Explain changes in project characteristics from those evaluated in DEIR.
- Briefly describe changes to technical studies.

1.7.3 Project Description

- Loss of 100 acres from the Specific Plan area, resulting in 1 million less square feet of potential logistics warehouse building area.

- Phasing increased from 10 to 15 years.
- Addition of Planning Areas to the Specific Plan.
- Identified Planning Area 22 as the location for the future alternative fueling facility.
- Relocated recreational trail away from open space area in southwest portion of site.

1.7.4 Aesthetics

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- In response to DEIR comments, modified Mitigation Measure (MM) 4.1.6.1C to add performance standard regarding loss of future views of Mt. Russell.
- No other changes after reviewing DEIR comments.
- **SUMMARY.** Mitigation changes will help assure views of Mt. Russell from SR-60 are not significantly blocked. Otherwise, significant impacts in revised DEIR are similar to those outlined in the original DEIR (i.e., no new or substantially different significant impacts).

1.7.5 Agricultural and Forest Resources

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Based on DEIR comments, revised the LESA Model calculations by changing the project acreage, removing the state conservation area (no development), and modifying the Zone of Influence mapping. New results indicate impacts now slightly under LESA significance threshold, but out of an abundance of caution, did not change the impact conclusion (significant).
- Add offsite agricultural easement based on productivity as mitigation in response to DEIR comments regarding loss of locally important agricultural soils.
- **SUMMARY.** Revision of the LESA model now indicates significant agricultural impact is from loss of unique farmland only, and not the loss of locally important farmland. New offsite mitigation will reduce the impact to a less than significant level.

1.7.6 Air Quality/Health Risks

- Please refer to Section 1.6.2.

1.7.7 Biological Resources

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Several mitigation measures had minor changes to address comments by resource agencies and others.
- Existing Setting information and analysis of project impacts was modified to include the updated MSHCP Consistency Report including a raptor foraging assessment. However, this information did not result in a change to the impact determination (i.e., less than significant) with proposed mitigation.
- The assessment of jurisdictional impacts was updated using the latest Jurisdictional Delineation.
- Prepared Programmatic DBESP Report in response to resource agency comments.

- City submitted MSHCP Consistency and DBESP Reports to County RCA for processing.
- **SUMMARY.** Impacts are still less than significant (i.e., no new or substantially different significant impacts with mitigation).

1.7.8 Cultural Resources

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Modified mitigation language in response to comments by Native Americans, specifically MM 4.5.6.1A through 4.5.6.1E regarding archaeological resources and MM 4.5.6.2A regarding historical resources.
- **SUMMARY.** Impacts are still less than significant with mitigation.

1.7.9 Geology and Soils

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- No changes to the impact analysis sections after review of EIR comments.
- **SUMMARY.** Impacts are still less than significant with mitigation.

1.7.10 Greenhouse Gases/Climate Change

- Please refer to Section 1.6.5.

1.7.11 Hazards and Hazardous Materials

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- No changes to the impact analysis sections after review of EIR comments.
- **SUMMARY.** Impacts similar to those identified in the DEIR (less than significant with mitigation).

1.7.12 Hydrology and Water Quality

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Minor changes to text were made to address watershed and groundwater comments by resource agencies and others.
- Minor modifications to MMs 4.9.6.1A, 4.9.6.2A through 4.9.6.2B, 4.9.6.3A, and 4.9.6.3C were made to address comments by resource agencies and others.
- **SUMMARY.** Impacts similar to those identified in the DEIR (less than significant with mitigation).

1.7.13 Land Use and Planning

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- **SUMMARY.** No changes to the impact analysis sections after review of EIR comments (i.e., significant impact of dividing existing neighborhood of onsite rural residences).

1.7.14 Mineral Resources

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- **SUMMARY.** No changes after review of EIR comments (i.e., impacts less than significant).

1.7.15 Noise

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Incorporate data revised noise study (based on revised TIA).
- Added discussion about indirect impacts to San Jacinto Wildlife Area but there is no change in the conclusions (not significant).
- **SUMMARY.** Impacts identified in the revised noise report are still significant even with this new information (i.e., but no new or substantially different significant impacts).

1.7.16 Population, Housing, and Employment

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Various changes to reflect revised fiscal and employment study by David Taussig and Associates (see Section 1.5.8 above).
- **SUMMARY.** No changes after review of EIR comments (i.e., all impacts less than significant).

1.7.17 Public Services

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Minor revisions to show possible future fire station site now planned within the WLC Specific Plan.
- **SUMMARY.** No other changes after review of EIR comments (i.e., all impacts less than significant).

1.7.18 Traffic and Circulation

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Extend freeway impact analysis to LA Ports to respond to DEIR comments.
- Added a discussion of the “Baseline Plus Phase 1” scenario from revised TIA to provide more accurate analysis from the TIA consistent with the latest CEQA court cases.
- Despite many comments, EIR section was not changed based on analysis of potential use of rail service to the WLC project and evaluation of truck safety near schools, both in response to comments by local school district.
- Made several corrections or additions to be fully consistent with data provided in the TIA.
- Added a truck trip distribution figure in response to DEIR comments.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- **SUMMARY.** Significant impacts identified for Baseline + Project, Phase 1, and Build out conditions of the WLC project still occur as generally indicated in the revised TIA. Traffic impacts have been incrementally reduced corresponding to the reduction in the amount of building area associated with the project, resulting in no new or substantially different significant traffic impacts).

1.7.19 Utilities

- Incorporate revised project data (100 acres less project area, 1 million square feet less building area, and phasing increased from 10 to 15 years) and revised entitlement data.
- Minor changes in water and drainage sections to be consistent with revised hydrology study (see Section 1.6.12 above).
- Added information about photovoltaic solar energy systems.
- **SUMMARY.** No other changes after review of EIR comments (i.e., all impacts less than significant).

1.7.20 Other CEQA Topics

- No changes after review of EIR comments regarding significant impacts or growth-inducing impacts of the WLC project.
- Revisions to agricultural reports indicate that impact from loss of locally important agricultural land is actually less than significant and only loss of unique farmland must be mitigated.
- Revised air quality reports indicate cancer risk impacts are only significant for onsite rural residences, not offsite residences, even with expanded mitigation.
- Revised traffic report indicates Baseline + Project, Phase 1, and Build out conditions of the WLC project still occur but in different years for Phase 1 (2022 instead of 2017) and Build out (2027 vs. 2022).

1.7.21 Alternatives

- Slight adjustments to Project Objectives (see previous Section 1.5) to more accurately reflect the goals of the project relative to the Los Angeles Ports.
- No other changes after review of EIR comments.

1.8 RECIRCULATION

Any corrections to the DEIR text, tables, and figures generated either from responses to comments or independently by the City, are outlined in Volume 2 of this FEIR. In other words, the DEIR text, tables, and figures have been modified and published in their entirety as a single document to reflect these EIR modifications. In this regard, Volume 2 shows the additions and corrections in underline/strikeout format, and Volume 3 shows the revised document “clean” with no annotations so the reader can see the final “results” of all the changes.

These DEIR revisions are provided to clarify, refine, and provide supplemental information for the WLC Project DEIR. Changes may be corrections or clarifications to the text, tables, and figures of the original DEIR. Other changes to the DEIR clarify the analysis in the DEIR based upon the information and concerns raised by comments during the public review period. None of the information contained in these DEIR revisions constitutes significant new information or changes to the analysis or conclusions of the DEIR.

It is the conclusion of the City that the information included in all the DEIR revisions and technical studies that resulted from the public comment process do not constitute substantial new information that requires recirculation of the DEIR. The CEQA Guidelines, Section 15088.5, states in part:

- (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the DEIR for public review under Section 15087 but before certification. As used in this section, the term “information” can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. “Significant new information” requiring recirculation includes, for example, a disclosure showing that:
- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
 - (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
 - (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it.
 - (4) The DEIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.
- (b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.

The changes to the DEIR included in these EIR modifications do not constitute “significant” new information because:

- No new significant environmental impact would result from the project or from a new mitigation measure;
- There is no substantial increase in the severity of an environmental impact that would result unless mitigation measures are adopted that reduce the identified significant impacts to a level of insignificance;
- No feasible project alternative or mitigation measure considerably different from others previously analyzed has been proposed or identified that would clearly lessen the significant environmental impacts of the project; and
- The DEIR is not fundamentally or basically inadequate or conclusory in nature such that meaningful public review and comment were precluded.

Therefore, recirculation of the DEIR is not required because the new information added to the EIR through these modifications clarifies or amplifies information already provided or makes insignificant modifications to the already adequate DEIR.

Table 1-C summarizes the results of the various technical studies and analyses and compares them to the CEQA standards for EIR recirculation.

THIS PAGE INTENTIONALLY LEFT BLANK

Table 1-C: EIR Changes vs. Recirculation (matrix)

Item	DEIR Level of Significance	Is it New Information?	Is the Info Significant?	New Mitigation	Mitigated Below Significance	CEQA Threshold for Recirculation Exceeded?	Brief Description
PROJECT DESCRIPTION							
SP Boundary Change (-100 acres sw corner)	–	Yes	No	–	–	No	Cactus Ave. alignment isolates property to west. As a result landowner(s) agree with City request to keep existing zoning.
Density Reduction (Reduced 1 MSF)	–	Yes	No	–	–	No	Loss of 100 acres resulted in a reduction of 1 MSF in the project building area.
Phasing Changes	–	Yes	No	–	–	No	Phase 1 will be completed in 2022 rather than 2017 (assumed in DEIR). Separate scenario for 2017 was dropped and the scenario for 2022 was revised to analyze Phase 1 only, not build-out of the WLCSP.
AESTHETICS Significant and Unavoidable							
SP Boundary Change (-100 acres sw corner)	–	Yes	No	No	–	No	Project acres and square footage reduced but visual and lighting impacts equivalent to those outlined in DEIR.
Density Reduction (Reduced 1 MSF)	–	Yes	No	No	–	No	Project acres and square footage reduced but visual and lighting impacts equivalent to those outlined in DEIR.
Phasing Changes	–	Yes	No	No	–	No	Project phasing will not affect aesthetics
Mitigation changes	–	Yes	No	Modified	Yes	No	Add performance standard to viewshed measure to assure preservation of Mt. Russell views. In addition, 4 special edge treatment areas have been added to the perimeter of the project site.
AIR QUALITY Significant and Unavoidable							
Construction Duration - 10 yr to 15 yr	–	Yes	No	No	–	No	Best case 2014 const. start leaves only 8 yrs. Increased to 15 years, use 2015 as const. start. Analyzed years 2022, and 2035. No new significant impacts noted
Varying Exposure Durations for Health Risk Assessment	–	Yes	No	No	–	No	For comparison a 30 year exposure analysis was provided in the DEIR based on application of the updated California Office of Environmental Health Hazards Assessment cancer risk guidance for information purposes only
Cancer Burden	–	Yes	No	No	–	No	Included cancer burden analysis which establishes a numerical value for the cancer risk values shown in the DEIR; impact less than ignificant after mitigation
Age Sensitivity Analysis for Schools	–	Yes	LTS	No	–	No	Prepared an age sensitivity analysis for cancer risk to school-site school age children, including the new proposed high school #5 located north of SR-60. Based on a 9-year exposure, the impact was less than significant.
Extend Freeway Impact Analysis to Ports	–	Yes	No	No	–	No	analysis of freeway impacts was extended to LA ports to determine if port-serving trips caused significant air quality impacts. No new significant impacts noted
SP Boundary Change (-100 acres)Logistics Reduction (Reduced 1 MSF)	–	Yes	No	No	–	No	Removal of 100 acres from the Specific Plan resulting in the reduction of 1 msf of logistics uses and the associated reduction of air quality
On-Site Worker Impacts	–	Yes	No	No	–	No	Examine potential air quality/health risk impacts to onsite workers 25-year exposure timeframes for information purposes only; no new significant impacts noted after mitigation
AGRICULTURE Significant and Unavoidable							
Recalculated LESA Model	LTS	Yes	No	New	Yes	No	LESA model re-run (without CDFW conservation land) indicates less than significant impact for loss of locally important farmland. Offsite mitigation is for loss of Unique Farmland, which reduces agricultural impacts to less than significant levels.
Add offsite mitigation	–	Yes	No	Yes	Yes	No	investigation of offsite mitigation for loss of agricultural land based on productivity of WLC site compared to offsite location.
BIOLOGY Less Than Significant							
Revise/Update Technical Studies	–	Yes	No	Modified	Yes	No	Project bio reports (MSHCP Consistency, Jurisdictional Delineation, Burrowing Owl Survey) were updated due to length of time EIR was taking to process and to respond to comments on DEIR.
Raptor Habitat	–	Yes	Potential	MSHCP	Yes	No	Raptor habitat changed to potentially significant but mitigated to less than significant with payment of MSHCP fees.
MSHCP/DBESP processing	–	Yes	No	Modified	Yes	No	Updated MSHCP and prepared DBESP and processing with City and RCA. Not a CEQA requirement but included in updated biology.
CULTURAL Less Than Significant							
SP Boundary Change (-100 acres)	–	Yes	No	Modified	Yes	No	Cactus Ave. alignment isolates property to west. As a result landowner(s) agree with City request to keep existing zoning. Mitigation language modified in response to Native American concerns and requests.
Realignment of Cactus Avenue	–	Yes	No	No	Yes	No	100 acres was removed from southwest corner of WLCSP and that land was subsequently proposed for a separate development. The planned eastern extension of Cactus Avenue will be rerouted around the new development proposal and through the 74.3 acres of open space land proposed within the WLCSP (southwest corner). Potential cultural impacts can be effectively mitigated by implementatio of mitigation in DEIR.
Alessandro Boulevard	–	Yes	No	No	–	No	Streets D and E within the WLC were realigned to closely resemble the historic route of Alessandro Boulevard.
NOISE Significant and Unavoidable							
Update based on Project and TIA changes	–	Yes	No	Modified	No	No	Incremental reduction in noise impacts due to less acreage and square feet, but still significant as outlined in DEIR.
HYDROLOGY Less Than Significant							
SP Boundary Change (-100 acres)	–	Yes	No	No	–	No	Project hydrology report was revised to address changes in project size and address comments by adding data to clarify detention basin characteristics and specify no groundwater impacts.
Density Reduction (Reduced 1 MSF)	–	Yes	No	Modified	Yes	No	Hydrology report was revised to address different acreage and provide more detail to address many comments on DEIR.
TRAFFIC Significant and Unavoidable							
Extent Freeway Impact Analysis to Ports	–	Yes	No	No	–	No	Study concluded no significant impacts. Traffic below significant thresholds.
Potential Use of Rail	–	Yes	No	No	–	No	TIA substantiates rail is not a feasible alternative.
Trucks and Traffic Safety near Schools	LTS	Yes	No	No	–	No	TIA revised to evaluate WLC truck traffic near 36 local schools, found no significant impacts from project traffic.
Add Truck Route Figure to EIR	–	No	–	No	–	–	TIA figure will be added to EIR.

Modified Phasing Plan	—	Yes	No	No	No	No	Phase 1 will be completed in 2022 rather than 2017 (assumed in DEIR).
Existing Plus Phase 1 Analysis	—	Yes	No	No	No	No	New chapter will be added to TIA to analyze Existing Plus Phase 1 conditions per latest court cases on baseline. TIA still shows significant impacts within City and in other jurisdictions that cannot be mitigated below significance as the City has no control over improvements in other jurisdictions.
SP Boundary Change (-100 acres) & Reduction of 1 MSF	—	Yes	No	—	—	—	See Project Description Change #1 above. TIA modified to account for 100 fewer acres and 1 million square feet less of logistics buildings. Potential impacts are incrementally less than those examined in DEIR due to acreage and square footage reductions (-3.7%).
Grammatical Corrections	—	No	No	—	—	No	TIA needed some minor changes to fix spellings and make text more readable.
Add Reference List for each section	—	No	No	—	—	No	To assist the reader, references were listed for each section of the TIA.
UTILITIES Less Than Significant							
SP Boundary Change (-100 acres sw corner)	—	Yes	No	No	—	No	Revised per acreage and square foot changes in SP.
Density Reduction (Reduced 1 MSF)	—	Yes	No	No	—	No	Revised per square foot changes in SP.
Phasing Changes	—	Yes	No	No	—	No	Infrastructure phasing evaluated per new phasing plan.
GREENHOUSE GASES Significant and Unavoidable							
Extent Freeway Impact Analysis to Ports	—	Yes	No	No	—	No	Info merely responds to questions about GHG impacts examining truck trips all the way to the LA ports, no additional mitigation needed
SP Boundary Change (-100 acres sw corner)	—	Yes	No	No	—	No	Revised per acreage and square foot changes in SP.
Density Reduction (Reduced 1 MSF)	—	Yes	No	No	—	No	Project sill significant due to size, same level or mitigation proposed
State Cap and Trade Program	—	Yes	No	No	Yes	No	Participation by oil refineries in the new State "Cap and Trade" Program effectively mitigates Air Quality Impacts from diesel trucks that would be utilized by the WLC project
Phasing Changes	—	Yes	No	No	—	No	Project sill significant due to size, same level or mitigation proposed

LTS= Less than Significant

Revised March 26, 2015

2.0 RESPONSE TO COMMENTS

A total of one-hundred and forty-four (144) comment letters on the DEIR were received. Twenty-three (23) of the comment letters received were from Federal, State, regional, or local agencies. Fifteen (15) comment letters were received from private organizations or conservation groups, and one-hundred and five (106) letters were received from individuals. All one-hundred and forty-four letters (144) have been responded to within this document. Comments that address environmental concerns have been specifically addressed. Comments that (1) do not address the adequacy or completeness of the DEIR; (2) do not raise environmental issues; or (3) do request the incorporation of additional information not relevant to environmental issues, do not require a response, pursuant to Section 15088(a) of the CEQA Guidelines.

Section 15088 of the CEQA Guidelines, Evaluation of and Response to Comments, states:

- a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the DEIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.
- b) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, major environmental issues raised when the lead agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail, giving the reasons that specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice.
- c) The response to comments may take the form of a revision to the DEIR or may be a separate section in the FEIR. Where the response to comments makes important changes in the information contained in the text of the DEIR, the lead agency should either:
 - 1. Revise the text in the body of the EIR; or
 - 2. Include marginal notes showing that the information is revised in the responses to comments.

Information provided in this Volume 1 of the FEIR clarifies, amplifies, or makes minor modifications to the DEIR. No significant changes have been made to the information contained in the DEIR as a result of the responses to comments, and no significant new information has been added that would require recirculation of the document.

2.1 LIST OF PERSONS, ORGANIZATIONS, AND PUBLIC AGENCIES COMMENTING ON THE DRAFT EIR

The persons, organizations, and public agencies that submitted comments regarding the DEIR through December 1, 2013, are listed below. A total of one-hundred and forty-four (144) comment letters were received. Twenty-three (23) of the comment letters received were from Federal, State, regional, or local agencies. Fifteen (15) comment letters were received from private organizations or

Volume 1 – Response to Comments
World Logistics Center Project

conservation groups, and one-hundred and five (106) letters were received from individuals. Each comment letter received is indexed with a letter and number below.

A. FEDERAL AGENCIES/TRIBAL GROUPS

- A-1 United States Army Corps of Engineers (March 4, 2013)**
Jennifer Lillard, Project Manager
- A-2 Morongo Band of Mission Indians (February 12, 2013)**
Franklin Dancy, Director of Planning
- A-3 Pechanga Band of Luiseño Indians (April 8, 2013)**
Anna Hoover, Cultural Analyst
- A-4 United States Environmental Protection Agency (April 8, 2013)**
Angeles Herrera, Associate Director of Communities and Ecosystems Division
- A-5 Soboba Band of Luiseño Indians (April 8, 2013)**
Joseph Ontiveros, Director of Cultural Resources
- A-6 United States Fish and Wildlife Service (April 22, 2013)***
Kennon Corey, Assistant Field Supervisor

B. STATE AGENCIES

- B-1 California Office of Planning and Research, State Clearinghouse (March 25, 2013)**
Scott Morgan, Director State Clearinghouse
- B-2 California Department of Transportation (Caltrans) (April 5, 2012)**
Daniel Kopulsky, Office Chief, Community Planning/ICR-CEQA
- B-3 California Department of Fish and Game (April 8, 2013)**
Jeff Brandt, Senior Environmental Specialist
- B-4 California State Parks Department (April 8, 2013)**
Ron Krueper, District Superintendent
- B-5 California Air Resources Board (April 16, 2013)***
Cynthia Marvin, Chief, Stationary Source Division
- B-6 Santa Ana Regional Water Quality Control Board (April 25, 2013)***
Mark Adelson, Chief, Regional Planning Section

C. REGIONAL AGENCIES

- C-1 Southern California Edison (March 25, 2013)**
Raymond Hicks, Local Public Affairs Region Manager
- C-2 Metropolitan Water District of Southern California (April 8, 2013)**
Deirdre West, Manager, Environmental Planning Team
- C-3 South Coast Air Quality Management District (April 9, 2013)***
Ian McMillan, Program Supervisor, Intergovernmental Review

- C-4 Semptra Energy (April 29, 2013)**
Thomas Acuna, Land Planning Supervisor (April 24, 2013)

D. COUNTY DEPARTMENTS/AGENCIES

- D-1 Riverside County Flood Control and Water Conservation District (March 25, 2013)**
Henry Olivo, Engineering Project Manager
- D-2 Riverside County Transportation and Land Use Management Agency (TLMA) (April 9, 2013)**
Juan Perez, Director of Transportation and Land Management

E. LOCAL AGENCIES/CITY DEPARTMENTS

- E-1 City of Perris (April 3, 2013)**
Kenneth Phung, Interim Planning Manager
- E-2A City of Riverside (April 8, 2013)**
Steve Hayes, City Planner

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

2.2 ENVIRONMENTAL ISSUES RAISED BY COMMENTERS

The following table shows in general where Master Responses to Comments are addressed (i.e., specific letters and responses within those letters). This will assist readers in finding general responses to the major environmental issues raised by commenters.

Table 2.A: Master Responses to Major Topics Raised by Commenters

Topic	Response to Comment
Aesthetics	F-8-3
Lighting	F-1-21 through F-1-25
Agriculture	F-7A-39 through F-7A-45
Air Pollution/HRA/GHG	C-3
Climate and Water	F-1-74
Schools and Air Quality	E-3-7, F-11-36, F-11-22
Solar/Renewable Energy	F-3-19
Alternative sites	F-7A-67, G-52-1 and G-52-2
Biology	F-7A-25 through F-7A-36
Bio Cumulative Impact/General Plan/MSHCP	F-7A-9
Bio Surveys Table	B-3-4
Burrowing Owl	F-7A-26
CDFW Buffer Area Defined	F-4-2
Raptor Foraging Habitat	F-7A-25
Jurisdictional Waters	F-7A-37 and F-1-15
Plant Surveys	F-7A-28
Wetlands	F-1-15
Cultural Resources	A-3
Cumulative (traffic, ag, air)	F-7A-61 through F-7A-65
Economic/Fiscal/Panama Canal	F-10 and G-88
Jobs and Commuting	F-3-12
Hazmat	F-7A-18 through F-7A-23
Hydrology	B-3-38
Water Basins	F-5-22
Routing Storm Water	F-5-15
Sediment analysis	F-5-16
Water Infiltration	F-5-10
Water Quality	F-5-12
Water Quality and BMPs	F-1-78
Recirculation	E-3-1
Skechers	G-51-3
Traffic	E-2A-4 through E-2A-9
Trucks and the Ports	F-1-49

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table 2.B shows where detailed major issues and concerns are addressed (i.e., specific letters and responses within those letters). This will assist readers in finding responses to their comments, as well as responses to similar comments made by multiple commenters.

Table 2.B: Detailed Index of Environmental Issues Raised by Commenters

Major Comments/Issues	Addressed in Detail in Letters/Comments	Mentioned to Some Degree in Letters/Comments
GENERAL TOPICS	F-8-66, F-8-96, F-11-21	F-7A-11, F-7A-14, F-7A-16, F-7A-17, F-7A-38, F-7A-62, F-8-4, F-8-5, F-8-6, F-8-9, F-8-10, F-8-11, F-8-13, F-8-23, F-8-33, F-8-65, F-8-99, F-8-111, F-8-120, F-9A-40, F-9B-46, F-11-9, F-11-30, F-13-3, F-13-4, F-13-5, F-13-13, G-2-2, G-2-9, G-5-12, G-7-1

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table 2.B: Detailed Index of Environmental Issues Raised by Commenters

Major Comments/Issues	Addressed in Detail in Letters/Comments	Mentioned to Some Degree in Letters/Comments
Fueling Station	B-3-34, C-3-8	B-4-7, F-8-85, F-15-2, F-15-3

2.3 FORMAT OF RESPONSES TO COMMENTS

Aside from the courtesy statements, introductions, and closings, individual comments within the body of each letter have been identified and numbered. A copy of each comment letter and the City's responses are included in this section. Brackets delineating the individual comments and an alphanumeric identifier have been added to the right margin of the letter. Responses to each comment identified are included on the page(s) following each comment letter. Responses to comments were sent to the agencies that provided comments.

In the process of responding to the comments, there were minor revisions to the Environmental Impact Report (refer to FEIR Volume 2). None of the comments or responses constitutes "significant new information" (*CEQA Guidelines* Section 15073.5) that would require recirculation of the Environmental Impact Report.

A. LETTERS FROM FEDERAL AGENCIES/TRIBAL GROUPS

**Letter A-1: United States Army Corps of Engineers (Department of the Army),
(March 4, 2013)**

REPLY TO
ATTENTION OF

DEPARTMENT OF THE ARMY

March 4, 2013

RECEIVED

MAR 11 2013

CITY OF MORENO VALLEY
Planning Division

Regulatory Division

Mark Gross
City of Moreno Valley
Public Works Department
14177 Fredrick Street
Moreno Valley, California 92553

Dear Mr. Gross:

It has come to our attention that the City of Moreno Valley has sent us a Notice of Availability for the Draft Environmental Impact Report for the proposed World Logistics Center (WLC) project located within the City of Moreno Valley, Riverside County, California. The proposed project consists of designation of 2,635 acres for logistics development; 20 acres for public utility uses; 1,159 acres for permanent open space and; 104 acres for utility extensions to serve the World Logistics Center. After reviewing the Draft Environmental Impact Report on the CD you provided us, impacts to jurisdictional waters of the U.S. may be proposed. Therefore, the proposed activity may require a Department of Army (DA) permit from the U.S. Army Corps of Engineers.

A DA permit is required for the discharge of dredged or fill material into, including any redeposit of dredged material other than incidental fallback within, "waters of the United States", including wetlands and adjacent wetlands pursuant to Section 404 of the Clean Water Act of 1972. Examples include, but are not limited to the following activities:

- a. creating fills for residential or commercial development, placing bank protection, temporary or permanent stockpiling of excavated material, building road crossings, backfilling for utility line crossings and constructing outfall structures, dams, levees, groins, weirs, or other structures;
- b. mechanized land clearing and grading which involve filling low areas or land leveling, ditching, channelizing and other excavation activities that would have the effect of destroying or degrading waters of the U.S.;
- c. allowing runoff or overflow from a contained land or water disposal area to re-enter a water of the U.S.; and
- d. placing pilings when such placement has or would have the effect of a discharge of fill material.

- 2 -

An application for a Department of the Army permit is available on our website: <http://www.usace.army.mil/Portals/2/docs/civilworks/permitapplication.pdf>. If you have any questions, please contact me at 213-452-3420 or via e-mail at Jennifer.J.Lillard@usace.army.mil. Please refer to this letter and SPL-2013-00177-JJL in your reply.

"Building Strong and Taking Care of People"

Sincerely,

Jennifer Lillard
Project Manager
South Coast Branch
Regulatory Division

RESPONSES TO LETTER A-1

United States Army Corps of Engineers

Response to Comment A-1-1. The comment states that there is a need for a Department of Army permit from the U.S. Army Corps of Engineers (USACE) due to the potential impacts to jurisdictional waters of the United States.

DEIR Section 4.4.6.3, *Less Than Significant Impacts – Jurisdictional Waters/Wetlands*, examined potential project impacts to wetlands and drainages that may be under the jurisdiction of the USACE, based on a jurisdictional delineation (JD) that was prepared by Michael Brandman Associates (MBA) in March 2012 according to USACE permitting handbook requirements. The MBA jurisdictional delineation found a total of 14 primary drainage features but determined none of them had connectivity to Mystic Lake and were not subject to the jurisdiction of the USACE or Regional Board. In addition, MBA found no jurisdictional wetlands or isolated wetlands on the site.

In addition, DEIR Section 4.4.6.3, *Significant Impacts – Riparian Habitat or Other Sensitive Natural Communities*, states the project does have one catch basin and portions of Drainage Features 7 and 9 are considered riparian/riverine areas, as defined by the County's Multi-Species Habitat Conservation Plan (MSHCP) to which the USACE is a signatory.

MM BIO-3a of Appendix E-13, Volume 2 FEIR provides for programmatic mitigation of jurisdictional impacts and a new mitigation measure (MM 4.4.6.3A) has been added to the FEIR Volume 2, Section 4.4.6.3 to replace DEIR MM 4.4.6.3A.

~~**4.4.6.3A** Prior to the approval of any Plot Plans proposing development adjacent to any on-site drainage channels identified in the project programmatic Jurisdictional Delineation (MBA 2012), the developer shall retain a qualified biologist to prepare a site-specific jurisdictional delineation and submit it to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the development plan will not affect identified jurisdictional areas, no USACE permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and CDFW (i.e., Streambed Alteration Agreement) may still be required for this development.~~

~~The applicant shall consult with USACE, CDFW and RWQCB to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions.~~

~~Any development adjacent to Drainage 9 shall be designed with the channel in its relatively natural condition, and shall provide a minimum 25-foot open space setback from the top of each bank. Any landscaping of this setback area shall use only native species to help protect resources residing within or traveling through these drainages between the SJWA and the Badlands, and to protect any riparian vegetation along this drainage. This measure shall be implemented to the satisfaction of the City Planning Division.~~

4.4.6.3A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.

The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.

Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).

MM BIO-2a of Appendix E-7, Volume 2 FEIR provides for mitigation for Riparian/Riverine impacts and it replaces MM 4.4.6.3B in the FEIR Volume 2, Section 4.4.6.3:

4.4.6.3B ~~As an alternative to Mitigation Measure 4.3.6.3A, the project developer shall retain a qualified biologist to prepare a Determination of Biologically Equivalent or Superior Project (DBESP) relative to development along Drainage 9 in order to maximize protection or preservation of the drainage, otherwise the DBESP must demonstrate why protection or preservation is not possible. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the County Resource Conservation Agency (RCA).~~

~~The DBESP shall be prepared to document measures to reduce impacts to riparian/habitats in accordance with the MSHCP as well as CDFW and USFWS guidelines. The DBESP shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of on-site preservation of riparian areas and/a combination of compensation through purchase and placement of lands with riparian/habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at off-site or on-site locations.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

4.4.6.3B As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the Resource Conservation Agency prior to project approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.

If impacts to riparian habitat within the World Logistics Center Specific Plan (WLCSP) cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.3A.

A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. Therefore, mitigation required for compensation for impacts to riparian/ riverine areas will require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.

As outlined in the WLC programmatic DBESP, erosion control improvements will be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat will be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).

The DEIR concluded that, with implementation of the mitigation measures in the DEIR. Mitigation Measures 4.4.6.3A and 4.4.6.3B above have been revised and potential impacts to riparian habitat or other sensitive natural communities, including on-site drainages, would be reduced to less than significant levels.

If necessary, future development under the WLCSP that affect Drainages 7 or 9 will have to obtain discretionary approvals from the County through the MSHCP or the USACE if federal jurisdiction is established based on drainage and development conditions at that time.

Letter A-2: Morongo Band of Mission Indians (February 12, 2013)

MORONGO
BAND OF
MISSION
INDIANS

A SOVEREIGN NATION

February 12, 2013

**SUBJECT: Notice of Availability
World Logistics Center Project
Draft Environmental Impact Report
SCH# 201202045**

Dear Mr. Gross:

Thank you for contacting the Morongo Band of Mission Indians regarding the above referenced project. The Tribe greatly appreciates the opportunity to review the project and, respectfully, offer the following comments.

The project is outside of the Tribe's current reservation boundaries but within an area that may be considered a traditional use area or one in which the Tribe has cultural ties (e.g. Cahuilla/Serrano territory). It appears that the DEIR has found that the proposed project will not have certain significant unavoidable adverse impacts to Cultural, Historic, or Archaeological Resources. Based upon this finding, the Morongo Band of Mission Indians has no comments at this time. The Tribe, though, reserves the right to comment upon any future development proposals or land use commitments associated with the World Logistic Center Project.

1

If I may be of further assistance with regard to this matter, please do not hesitate to contact me at your convenience.

Very truly yours,

MORONGO BAND OF MISSION INDIANS

Franklin A. Dancy
Franklin A. Dancy,
Director of Planning

RESPONSES TO LETTER A-2

Morongo Band of Mission Indians

Response to Comment A-2-1. The comment states that the Tribe does not have any comments but they reaffirmed their right to comment upon any future development proposals. The City understands the Tribe may comment on development under the World Logistics Center project in the future. Such development would be subject to additional discretionary review and California Environmental Quality Act compliance at that time.

Re: Pechanga Tribe Comments on the Draft Environmental Impact Report for the World Logistics Center Project (SCH#2012021045), General Plan Amendment PA12-0010, Development Agreement PA12-0011, Change of Zone PA12-0012, Specific Plan PA12-0013, Annexation PA12-0014, Tentative Parcel Map PA12-0015

Dear Mr. Gross:

This comment letter is written on behalf of the Pechanga Band of Luiseño Indians (hereinafter, "the Tribe"), a federally recognized Indian tribe and sovereign government. The Tribe formally requests, pursuant to Public Resources Code §21092.2, to be notified and involved in the entire CEQA environmental review process for the duration of the above referenced project (the "Project"). The Tribe requests to be directly notified of all public hearings and scheduled approvals concerning this Project. Please also incorporate these comments into the record of approval for this Project.

The Tribe submits these comments concerning the Project's proposed impacts to cultural resources in conjunction with the environmental review of the Project and to assist the City in developing appropriate avoidance and preservation standards for the significant Luiseño Village Complex that the Project will be impacting. The Tribe is very concerned that the proposed mitigation measures do not adequately provide for protection of the cultural resources located within the Project boundaries and those that could be impacted during development and off-site improvements. The Draft Environmental Impact Report (DEIR) states that there will be no impacts to cultural resources/archaeological sites; however, it appears that a portion of P-33-15046/CA-RIV-8007 may be impacted by development and there is very little discussion of CA-RIV-2993 that could be directly impacted by the construction of a water tank.

The Tribe does not agree that the cultural sites located within the Project area are not significant per CEQA and have provided information to the City and the Project archaeologist in

Sacred Is The Duty Trusted Unto Our Care And With Honor We Rise To The Need

Pechanga Comment Letter to the City of Moreno Valley
 Re: Pechanga Tribe Comments on the World Logistics Project
 April 8, 2013
 Page 2

our NOP/SB18 comments and in our SB18 consultation describing this significant Village Complex that extends much farther southward along Mt. Russell. The City, Developer and archaeologist seem to have disregarded the Tribe's input about this traditional cultural landscape and have not taken the information into account when analyzing the sites and the impacts to them. Additionally, the DEIR states that a public trail will pass through sensitive cultural locations. There must be mitigation provided in the DEIR to guide and protect any resources from impacts, including a long-term management plan to be developed between the Developer/Applicant and the Pechanga Tribe. Finally, the Tribe is concerned that the archaeological study has been included in the DEIR Technical Appendices. Archaeological studies are considered exempt from the Public Record and provided only on an as needed basis. Sensitive cultural information can be found in the document and the Tribe believes it is inappropriate to include it for public review. More information on this concern is provided below.

**THE CITY OF MORENO VALLEY MUST INCLUDE INVOLVEMENT OF AND
 CONSULTATION WITH THE PECHANGA TRIBE IN ITS ENVIRONMENTAL
 REVIEW PROCESS**

It has been the intent of the Federal Government¹ and the State of California² that Indian tribes be consulted with regard to issues which impact cultural and spiritual resources, as well as other governmental concerns. The responsibility to consult with Indian tribes stems from the unique government-to-government relationship between the United States and Indian tribes. This arises when tribal interests are affected by the actions of governmental agencies and departments. In this case, it is undisputed that the project lies within the Pechanga Tribe's traditional territory. Therefore, in order to comply with CEQA and other applicable Federal and California law, it is imperative that the City of Moreno Valley consult with the Tribe in order to guarantee an adequate knowledge base for an appropriate evaluation of the Project effects, as well as generating adequate mitigation measures.

As the City is processing a General Plan Amendment and a Specific Plan for this Project, the City is required to consult with the Pechanga Tribe pursuant to a State law entitled Traditional Tribal Cultural Places (also known as SB 18; Cal. Govt. C. § 65352.3). The purpose of consultation is to identify any Native American sacred places and any geographical areas which could potentially yield sacred places, identify proper means of treatment and management of such places, and to ensure the protection and preservation of such places through agreed upon mitigation (Cal. Govt. C. 65352.3; SB18, Chapter 905, Section 1(4)(b)(3)). Consultation must be government-to-government, meaning directly between the Tribe and the Lead Agency, seeking agreement where feasible (Cal. Govt. C. § 65352.4; SB18, Chapter 905, Section 1(4)(b)(3)).

¹ See e.g., Executive Memorandum of April 29, 1994 on Government-to-Government Relations with Native American Tribal Governments, Executive Order of November 6, 2000 on Consultation and Coordination with Indian Tribal Governments, Executive Memorandum of September 23, 2004 on Government-to-Government Relationships with Tribal Governments, and Executive Memorandum of November 5, 2009 on Tribal Consultation.

² See California Public Resource Code §5097.9 et seq.; California Government Code §§65351, 65352.3 and 65352.4

Sacred Is The Duty Trusted Unto Our Care And With Honor We Rise To The Need

Pechanga Comment Letter to the City of Moreno Valley
 Re: Pechanga Tribe Comments on the World Logistics Project
 April 8, 2013
 Page 3

Lastly, any information conveyed to the Lead Agency concerning Native American sacred places shall be confidential in terms of the specific identity, location, character and use of those places and associated features and objects. This information is not subject to public disclosure pursuant the California Public Records Act (Cal. Govt. C. 6254(r)).

The Tribe met with the City and subsequently the Applicant on May 30, 2012 with the City pursuant to SB18. At that time, we requested to be sent copies of the Specific Plan, Parcel Map, development plans, archaeological study and geotechnical reports and received all documents by October 8, 2012. We were further provided the opportunity to visit the cultural sites on the Property August 22, 2012. The City has consistently maintained contact with the Tribe throughout the process. Therefore, we are concerned that the City did not include our March 16, 2012 comment letter submitted for the Notice of Preparation (NOP) and SB18 in the DEIR. We hope this was just an oversight and request that the Final EIR be updated to include our letter and requested comments.

CONFIDENTIALITY OF ARCHAEOLOGICAL STUDIES AND CULTURAL INFORMATION

Protection of archaeological and cultural sites and resources is of critical importance because they are non-renewable resources and easily damaged. Multitudes of amateur archaeologists and explorers roam undeveloped areas in search of "buried treasures." Anything that provides any information regarding the probable location of a site or the contents of a site is thus more fodder for those who would destroy or pilfer our Tribe's and the State's cultural heritage. When SB18, the law designed to protect California Native American cultural heritage, was enacted it clearly indicated that "each city and county [shall] protect the confidentiality of information concerning" cultural resources. (SB 18 §1(b)(3); Govt. Code §§ 65040.2(g)(3), 65352.3, 65352.4, and 65352.5.)

The State of California and its municipalities recognize the importance of protecting archaeological resources through confidentiality of information regarding the resource in other laws and regulations as well. According to the California Office of Historic Preservation, "Archaeological and Traditional Cultural Property (TCP) locations are generally considered confidential and public access to such information is restricted by laws, including: Section 304 of the National Historic Preservation Act, Section 9(e) of the Archaeological Resources Protection Act, Executive Order 13007 and Sections 6254(r) and 6254.10 of the California State Government Code." Other State agencies and local governments provide assurances within their practices, rules and ordinances for the protection of archaeological, historical and cultural sites and resources through confidentiality of information. (See, e.g. California's Forest Practice Rules for the Protection of Archaeological, Historical and Cultural Sites, Title 14 CCR; City of Morro Bay Coastal Land Use Plan; County of Riverside Planning Department Cultural Resources Investigations Standard Scopes of Work; and County of San Diego Report Formant and Content Requirements, Cultural Resources.)

*Pechanga Cultural Resources • Temecula Band of Luiseño Mission Indians
 Post Office Box 2183 • Temecula, CA 92592*

Sacred Is The Duty Trusted Unto Our Care And With Honor We Rise To The Need

Pechanga Comment Letter to the City of Moreno Valley
 Re: Pechanga Tribe Comments on the World Logistics Project
 April 8, 2013
 Page 4

More importantly, however, the California Historical Resources Information System (“CHRIS”) allows certain individuals, organizations and governmental entities access to archaeological records, but only after signing a confidentiality agreement. By signing the agreement, an individual, organization or governmental entity agrees to keep archaeological site content and location information confidential by not disclosing archaeological information to unauthorized individuals or including it in publicly distributed documents. A failure to comply with the agreement could mean denial of access to CHRIS information.

As such, multiple jurisdictions make a practice of limiting archaeological information provided in public documents, acknowledging that publication of, or even general public access to, such things as site maps, site records, archaeological reports, and cultural surveys are both prohibited by law and potentially harmful to the resources. Thus, for the protection of the cultural resources located within the Project area, we request that the City remove immediately the archaeological study that was mistakenly published with the other portions of the DEIR.

PECHANGA CULTURAL AFFILIATION TO PROJECT AREA

The Pechanga Tribe has a specific legal and cultural interest in this Project as the Tribe is culturally affiliated with the geographic area that comprises the Project property. The Tribe has been the named the consulting tribe on projects in the vicinity of the proposed Project, and, contrary to statements in the archaeological study that the Tribe did not provide information, has specific knowledge of cultural resources and sacred places within/near the proposed Project that we shared with the City, Applicant and archaeologist. The Tribe asserts that this culturally sensitive area is affiliated specifically with the Pechanga Band of Luiseño Indians because of the Tribe’s specific cultural ties to this area. Pechanga considers any resources located on this Project property to be Pechanga cultural resources and we look forward to working directly with the City to continue preserving and avoiding these sensitive tribal cultural resources. Although the Tribe provided the following in our NOP/SB18 comments, we have included it again for the DEIR.

D. L. True, C. W. Meighan, and Harvey Crew³ stated that the California archaeologist is blessed “with the fact that the nineteenth-century Indians of the state were direct descendents of many of the Indians recovered archaeologically, living lives not unlike those of their ancestors.” Similarly, the Tribe knows that their ancestors lived in this land and that the Luiseño peoples still live in their traditional lands. The Pechanga Tribe’s knowledge of our ancestral boundaries is based on reliable information passed down to us from our elders; published academic works in the areas of anthropology, history and ethno-history; and through recorded ethnographic and linguistic accounts. Many anthropologists and historians who have presented boundaries of the Luiseño traditional territory have included the Moreno Valley area in their descriptions (Drucker 1937; Heizer and Whipple 1957; Kroeber 1925; Smith and Freers 1994), and such territory

 Page 5

descriptions correspond almost identically with what was communicated to the Pechanga people by our elders. While historic accounts and anthropological and linguistic theories are important in determining traditional Luiseño territory, the most critical sources of information used to define our traditional territories are our songs, creation accounts, and oral traditions.

Luiseño history originates with the creation of all things at 'éxva Teméeku, in the present day City of Temecula, and dispersing out to all corners of creation (what is today known as Luiseño territory). It was at Temecula that the Luiseño deity *Wuyóot* lived and taught the people, and here that he became sick, finally expiring at Lake Elsinore. Many of our songs relate the tale of the people taking the dying *Wuyóot* to the many hot springs at Elsinore, where he died (DuBois 1908). He was cremated at 'éxva Teméeku. A traditional song recounts the travels of eagle, as he searches for a place where there was no death. His travels begin at Temecula, flying north to San Bernardino and then to the east, south, and west through Julian, Cuyamaca, and Palomar, and returning to Temecula.⁴ It is the Luiseño creation account that connects Elsinore to Temecula, and thus to the Temecula people who were evicted and moved to the Pechanga Reservation, and now known as the Pechanga Band of Luiseño Mission Indians (the Pechanga Tribe). From Elsinore, the people spread out, establishing villages and marking their territories. The first people also became the mountains, plants, animals and heavenly bodies.

Many traditions and stories are passed from generation to generation by songs. One of the Luiseño songs recounts the travels of the people to Elsinore after a great flood (DuBois 1908). From here, they again spread out to the north, south, east and west. Three songs, called *Montivol*, are songs of the places and landmarks that were destinations of the Luiseño ancestors, several of which are located near the Project area. They describe the exact route of the Temecula (Pechanga) people and the landmarks made by each to claim title to places in their migrations (DuBois 1908:110). The Native American Heritage Commission (NAHC) Most Likely Descendent (MLD) files substantiate this habitation and migration record from oral tradition. These examples illustrate a direct correlation between the oral tradition and the physical place; proving the importance of songs and stories as a valid source of information outside of the published anthropological data.

Tóota yixélval (rock art) is also an important element in the determination of Luiseño territorial boundaries. *Tóota yixélval* can consist of petroglyphs (incised) elements, or pictographs (painted) elements. The science of archaeology tells us that places can be described through these elements. Riverside and Northern San Diego Counties are home to red-pigmented pictograph panels. Archaeologists have adopted the name for these pictograph-versions, as defined by Ken Hedges of the Museum of Man, as the San Luis Rey style. This is the predominant style of rock art within the Project area and incorporates elements which include chevrons, zig-zags, dot patterns, sunbursts, handprints, net/chain, anthropomorphic (human-like) and zoomorphic (animal-like) designs. Tribal historians and photographs inform us that some design elements are reminiscent of Luiseño ground paintings. A few of these design elements,

 Page 6

particularly the flower motifs, the net/chain and zig-zags, were sometimes depicted in Luiseño basket designs and can be observed in remaining baskets and textiles today.

Further evidencing the connection between the San Luis Rey rock art style and Luiseno people are these descriptions of how the diamond chain pattern, which is uniquely San Luis style rock art, was incorporated into the Luiseño girls' ceremony. In 1892, Bureau of Ethnology anthropologist H.W. Henshaw compiled information on what was called the "Girls Ceremony." He wrote: 'that during the fourth new moon of the young girl's puberty rite, diamond shaped marks were painted vertically on the cheeks of the girls faces' (Smith & Freers, pg. 19). For Pechanga, the connection to the rock art images held a known meaning. J.P. Harrington would later cross-reference this same "face painting" information in his 1933 work entitled *The Luiseno Girls Ceremony*.

Additionally, according to historian Constance DuBois:

When the people scattered from Ekvo Temeko, Temecula, they were very powerful. When they got to a place, they would sing a song to make water come there, and would call that place theirs; or they would scoop out a hollow in a rock with their hands to have that for their mark as a claim upon the land. The different parties of people had their own marks. For instance, Albañas's ancestors had theirs, and Lucario's people had theirs, and their own songs of Munival to tell how they traveled from Temecula, of the spots where they stopped and about the different places they claimed (1908:158).

An additional type of *tóota yixélval*, identified by archaeologists also as rock art or petroglyphs, are cupules. Throughout Luiseño territory, there are certain types of large boulders, taking the shape of mushrooms or waves, which contain numerous small pecked and ground indentations, or cupules. Many of these cupule boulders have been identified within a few hundred feet of the Project. In fact, the *tóota yixélval* identified close-by are but a small part of the overall Luiseño Village Complex that includes Mt. Russell and other sites to the northwest, south and southeast. The City has identified the area to the north as the Wolfskill Ranch North Complex. The archaeological study also acknowledges the importance of this area and states: "We believed that the nine prehistoric sites should be considered part of the unofficial Wolfskill Ranch North Complex. This Complex is discussed in the City General Plan but is not an officially recognized prehistoric district (p.53)." The Tribe agrees that this area should be included in the City's inventory of significant places and designated as permanent Open Space within the General Plan.

Thus, our songs and stories, our indigenous place names, as well as academic works, demonstrate that the Luiseño people who occupied what we know today as Moreno Valley and the Lakeview area are ancestors of the present-day Luiseño/Pechanga people, and as such, Pechanga is culturally affiliated to this geographic area. The Tribe welcomes the opportunity to

meet with the City to further explain and provide documentation concerning our specific cultural affiliation to lands within your jurisdiction, if so desired.

10

PROJECT IMPACTS TO CULTURAL RESOURCES

As we have continually informed the City, the proposed Project and its Off-Site Impacts are located in a highly sensitive region of Luiseño territory and the Tribe believes that the possibility for recovering subsurface resources during ground-disturbing activities is high. The Tribe has over thirty-five (35) years of experience in working with various types of construction projects throughout its territory. The combination of this knowledge and experience, along with the knowledge of the culturally-sensitive areas and oral tradition, is what the Tribe relies on to make fairly accurate predictions regarding the likelihood of subsurface resources in a particular location. The Pechanga Band is not opposed to this Project; however, we are opposed to any direct, indirect and cumulative impacts this Project may have to tribal cultural resources. The Tribe's primary concerns stem from the Project's proposed impacts on Native American cultural resources. The Tribe is concerned about both the protection of unique and irreplaceable cultural resources, such as Luiseño village sites, sacred sites and archaeological items which would be displaced by ground disturbing work on the Project, and on the proper and lawful treatment of cultural items, Native American human remains and sacred items likely to be discovered in the course of the work.

11

The Tribe has multiple concerns with the DEIR as posed. As indicated above, the Tribe submitted a NOP/SB18 comment letter in March 2012 that was not included in the DEIR or its appendices. The Tribe requests that the Final EIR be updated to include our comment letter and any appropriate Response to Comments.

12

The Tribe has reviewed the Archaeological studies and Appendix F of the DEIR. We are concerned that the Project archaeologist has not included any of the Tribe's information in the reports which would have assisted with site analysis. The Tribe applauds the archaeological consultant for combining a cultural area into one site. They describe this as, "With the addition of new feature elements discovered during the survey and GPS rendering of the original site locations, it became clear that the three original sites, which were all within an 80-meter radius of each other, should be combined into a single site with the newly discovered site elements added." However, they then proceed to say that the 29 milling features are not significant because there were no artifacts found in the area. By ignoring that this site is part of a larger Complex and ignoring the association between the physical remains and the bare spots between them, they are disregarding the importance of this area and overlooking important information that can contribute to the overall body of archaeological and tribal knowledge. The high number of utilized resources in this area and the identification of resources on the adjacent Highlands Fairview Project prove that Luiseño ancestors were extremely active within the region and that this area was a large habitat area, or village complex, for Indian people. Negatively impacting

 Page 8

and/or destroying the cultural sites within this area are a great irreparable loss to tribal culture and scientific knowledge.

A major problem that the Tribe has been observing over the last few decades is the shift in archaeological practices which look at cultural resources on an individual scale, on a project-by-project basis. This piecemeal type of assessment belies the fact that many of these sites are components of much larger complexes, and thus results in evaluations of the sites as not being significant. Further, this kind of piecemeal approach seems to be contrary to the tenets of archaeology which supposedly strives for a holistic approach. Because of this approach, very little regional or settlement pattern research is conducted within the Riverside County area to connect the dots. This has resulted in the systematic destruction of villages and habitation areas.

The Tribe believes that individual recordation of sites is an attempt to piecemeal obvious complexes/large cultural areas into smaller portions in order to make a “not significant” determination. While we understand that recordation of sites in this manner may assist with the management of such sites and features, it undermines the ability to offer a complete and thorough analysis of the Project impacts to cultural resources. The Tribe believes that division of sites and features into separate sites necessarily takes away from the significance of the sites themselves because they are analyzed by only looking at the particulars of that site/feature while missing the relationship to the other sites/features in the vicinity as well as the topography, geography, plant resources and waterways. A particular feature may be part of a significant village or habitation area, but one would never know that if only the feature was analyzed by itself as is the case on this Project. In addition, the Tribe believes this regional analysis would necessarily suggest that there is a high potential for subsurface resources to be found during grading or ground-disturbing activities for this Project.

Almost 25 years ago, Glassow (1985)⁵ addressed the issue of how site complexes and regional complexes (i.e. villages and habitation areas) were being divided into smaller sites for analysis. This procedure misses the full interpretation of the sites, resulting in a “write-off” or dismissal of sites based only on a partial analysis. Small sites are described as those sites which “typically have surface areas on the order of 1,000 m² or less, deposits of less than 50 cm depth, only two or three major classes of cultural remains and very few, most often fragmentary finished artifacts” (59). He states, “...(S)ites on the smaller end of the size range are being systematically neglected by many archaeologists in favor of sites on the larger end of the size range. Not only are small sites seldom investigated, but they are frequently assessed as having no appreciable significance to research and are therefore being destroyed...”(ibid: 58). He further provides an example of an archaeological document that determined a site to be not eligible for the National Register. The assessment stated that although the small site, which contained a lithic scatter and two bifacial tools, contained high integrity, the potential to answer research questions was limited and thus the site was not eligible. This limited data was based

solely upon a survey and one posthole test unit. Archaeologists make the mistake of treating each site as an individual “temporary camp site or isolated feature” as opposed to looking at them as elements or components of larger village complexes.

With regard to this Project, the Tribe asserts that the same methodology and resulting dismissal of sites is occurring. The destruction of milling resources is a common practice in western Riverside County, justified because they are so ‘ubiquitous.’ Scientific potential is measured by the amount of artifacts found around the milling feature, not the feature itself. The Tribe views these important cultural features as part of the larger village complex that can aide in the analysis of that complex as well as the fact that they are the remains of the ancestors.⁶ These types of complexes are rare and endangered by continuing development. Within the last seven (7) years, the Tribe has seen at least five (5) Luiseño village complexes negatively impacted and/or destroyed in western Riverside County. The City contains multiple significant village complexes, with other habitation areas spread throughout. The Tribe asserts that a traditional Luiseño village complex is a special element to not only the Tribe but to the City as well as the State. The citizens of Moreno Valley should be proud of such a special resource and should strive to preserve it in perpetuity.

Kroeber⁷ and Heizer⁸ used ethnographic data to describe the Luiseño Indians’ settlement pattern as consisting of permanent villages of 75 to 200 people located in proximity to reliable sources of water and within range of a variety of floral and faunal food resources, which were exploited from temporary camp locations surrounding the main village. It has also been suggested that, frequently, a number of communities would combine to celebrate important festivals, harvest cycles, and other ceremonial events, occasionally inviting distant, linguistically unrelated groups. Expanding on Kroeber and Heizer’s general description, True and Waugh⁹ described Luiseño settlement patterns as;

The bipolar settlement pattern of the San Luis Rey was represented by relatively permanent and stable villages (both winter and summer), inhabited by several groups exploiting well-established territories and resources that were defended against trespass (we follow Flannery [1976:164] in using “village as a generic

⁶ The Tribe would like to challenge archaeologists to begin researching why artifacts aren’t commonly found around milling features. It is time to look at why resources may not be present instead of anticipating or assuming that resources should be present. We should ask ourselves why would a person stand next to a food processing place and make a utility tool where the waste materials could get into the food or cut feet. Do we, today, stand next to a stove that contains open pots with cooking food and sharpen our knives so that metal debris could come into contact with the food? Thinking about these questions while assessing the significance of sites as they relate to the landscape will provide additional research questions and answers. These resources can provide valuable information for future archaeologists in terms of settlement patterns, patterns of domestic life as well as enhancing our understanding of how prehistoric tribal peoples lived with one another and upon the landscape.

 Page 10

term for any small permanent community”), they saw this as a result of a reasonably long process of adaptation during which several strategic changes take place in settlement location patterns and in procedures for collecting resources. These strategic changes included a “trend toward the congregation of people along the major tributaries, with each tributary and its immediate environs occupied and exploited by a family-based kin group of some kind.

Of great importance to the Luiseño people is how this would look on the landscape. For example, during his visit to Luiseño settlements in the La Jolla region in 1901, Merriam noted that “in many cases the Indians have great masses of tuna, 10-20 feet high, about or near their adobe houses” which “are not near together but scattered about, usually 1/8 or 1/4 of a mile apart and on a cleared place surrounded by chaparral.”¹⁰ Luiseño settlement patterns have also been described ethnographically by Sparkman¹¹ and Strong¹² as sedentary and territorial, with the extended families residing in villages with individual living areas separated anywhere from ¼ of a mile to ½ a mile apart. The proposal that a village foot print covers an expansive area, with each family having its own milling feature is supported by Bean when he argues that “homes were located some distance apart to provide privacy for families, if terrain permitted.”¹³ Bean and Smith also suggest that “a village might occupy three to five square miles.”¹⁴ While Oxendine’s¹⁵ dissertation is often cited when discussing late prehistoric village attributes and locations, little has been done to expand on her definition of a village foot print. The idea that villages could cover an expansive area is supported by True et al. Here, True et al.¹⁶ suggest that the larger outcrops containing multiple milling features are community milling areas and that each group or family within the community had its own specific milling boulder. In other words “each group then had its milling area and each family woman had her mortar or group of milling elements.” To support this claim, True et al. gives the following example: The milling stones located at Silver Crest (Palomar Mountain State Park) belonging to the adjacent Pauma Village were identified by Max Peters as the property of a specific family. Each family had its own “place” and each mortar hole belonged to a particular “lady.” “If the pattern at Molpa in protohistoric times followed that of the adjacent Pauma Village, it is likely that these “holes” were passed down from mother to daughter and were used until they became too deep to be

 Page 11

functional.”¹⁷ Thus there is support for the Tribe’s assertion that each milling feature signifies an integral portion of the much larger village present at the site.

Glassow argues, “(A) small site and its contents gain importance as a document of a set of activities that occurred at a specific place within a particular setting. While the same set of activities might have occurred at a number of other places, it is often important to know the number of such places and variations in their settings.”¹⁸ Even smaller projects, like the currently proposed Project, is the appropriate time for Settlement Pattern research and comparisons of artifact collections to occur and to start piecing the bigger picture together. Trade and travel patterns can be assessed; site formation, ceremonial comparisons, and site type comparisons can continue to be made. Habitation/village sites are often identified, but the necessary scientific and archival research needed to produce a thorough report is not taken. The practice of recording isolated features and artifacts which results in a “negative finding” is slowly destroying larger cultural sites that could have been identified as a significant complex. This lack of context results in destruction of the individual sites, and not only of our cultural heritage, but that of the greater community and the overall history of California.

In addition, by piecemealing projects, archeologists are not necessarily saving the correct portions of the complexes and villages, but only the portions they deem to have scientific value. By archaeologists using this methodology, we as a society are likely missing the most essential pieces of the puzzle and, most importantly, ignoring the cultural value. True and Waugh¹⁹ pointed out that the Luiseño Mission Indians were resourceful with almost an innate ability to adapt to changing circumstances. They argue that either pre-contact or post-contact San Luis Rey Luiseño people had demonstrated a high degree of adaptable behavior as they consolidated to form more complex systems, placing their villages in locations that are situated near the most reliable regional water supplies. True and Waugh proposed that this could only occur within a social matrix capable of sustaining the mosaic of productive, ritual, and social relationships inherent to “village” organizations. In other words, the Luiseño people had developed a very complex sense of community and permanent Settlement Pattern: it was embedded in their Social History. On this Project, the combination of physical archaeological remains, knowledge of resources being identified from adjacent properties and important tribal named places, traditional landscape analysis and oral traditions, a much broader, complex patter can be identified for this area.

At this time, the Tribe thanks the Project Applicant/Developer for placing the majority of the cultural sites within Open Space for preservation. The Tribe is concerned that potentially a portion of P-33-15046 may be impacted by development. We request additional clarification from the City and Developer/Applicant regarding this site. Additionally, the site identified as P-

 Page 12

33-2993, located in the southwest portion appears that it could be impacted by a proposed water tank. This site is briefly addressed in the archaeological study as not having been tested or evaluated for impacts in any way. As it seems that water tank location has not been finalized, the Tribe urges the Developer/Applicant and the City to design the tank to avoid this site and any potential impacts to the possible midden in the area.

21

Additionally, the DEIR states that a public trail will pass through sensitive cultural locations. There must be mitigation provided in the DEIR to guide and protect any resources from impacts. The Tribe would like to assist the City and Developer/Applicant with planning the trail through this area and with landscaping options that will discourage these sites from becoming an attractive nuisance. This will include developing a long-term management plan, to be developed between the Developer/Applicant and the Pechanga Tribe, to ensure that the protection planned during this DEIR process is maintained and that the sites do not become a burden to preserve.

22

REQUESTED TRIBAL INVOLVEMENT AND RECOMMENDED PROJECT MITIGATION MEASURES

The Tribe believes that the proposed mitigation measures as posed are not sufficient, given the sensitivity of the area, to protect and ensure that development activities will not impact buried cultural resources. Neither are they sufficient to provide for long-term protection and care once development activities have been completed. The lack of specificity of the mitigation measures and the lack of a requirement for tribal monitors does not bring the Project into compliance with CEQA nor reduce the impacts to a level below significant. While the Tribe understands that the Property has been subjected to previous disturbances such as the existing residences and agricultural usage, as the Project site lies within such a culturally-sensitive area, the Tribe believes that the possibility exists for the recovery of subsurface resources during earthmoving activities. Furthermore, as the DEIR acknowledges, cultural resources were identified during monitoring on the adjacent Highland Fairview property. These resources, some of which were deeply buried, as well as the known resources in this area that are also deep, are good indicators that additional resources could be found within the Project at a greater distance than the recommended 3,750 feet from the southwest corner. This distance is not realistic and could hinder the archaeologist and the Tribe from identifying significant resources. Therefore, the Tribe submits the revised mitigation measures for inclusion into the final EIR. Please contact the Tribe to discuss these mitigation measures and to review any proposed language changes prior to finalizing the Final EIR (strikeouts are deletions; underlines are additions.)

23

4.5.6.1A Prior to the approval of any grading or other discretionary permit for any of the "Light Logistics" parcels, the parcels shall be evaluated for significance by a qualified archaeologist since they were not available for survey during preparation of the EIR. A Phase I Cultural Resources Assessment shall be conducted by the project archaeologist

 Page 13

and an appropriate tribal²⁰ representative on each of the "Light Logistics" parcels prior to development to determine if it contains significant archaeological or historical resources. A Phase II evaluation shall be completed for any of these sites in order to determine if they that are determined to contain significant archaeological or historical resources based on the results of the Phase I assessment. Cultural resources include but are not limited to stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. If a particular resource is determined to be significant, it All resources determined to be prehistoric or historic shall be adequately documented using DPR523 forms for archival research/storage in the Eastern Information Center (EIC). If the particular resource is determined to be not significant, no further documentation is required. Any artifacts If historic resources are determined to be significant, they shall be considered for relocation or archival documentation, as appropriate, depending on whether the building or buildings are determined to be significant under CEQA. If any building is determined to be significant, a Phase III recovery study shall be conducted to recover remaining significant cultural artifacts. If necessary, a feasibility study shall be conducted to determine if a significant structure can be relocated effectively to off-site parcels. The study shall also identify if there are appropriate parcels available within or close to the Moreno area of the City. If the structure cannot be feasibly relocated, or there is not an appropriate parcel to relocate the structure to, the structure shall be demolished after complete archival recordation in a manner determined by the project archaeologist. If prehistoric archaeological/cultural resources are discovered during the Phase I survey and it is determined that they cannot be avoided through site design, they shall be subject to a Phase II testing program. The project archaeologist, in consultation with the appropriate Tribe, shall determine the significance of the resource(s) and determine the appropriate mitigation for the resources.

4.5.6.1B Prior to the approval of any grading or ground-disturbing permit by the City for construction of off-site improvements for the WLCSP, the developer requesting the permit shall retain a qualified archaeologist to prepare a Phase I cultural resource assessment (CRA) of the project site if an up to date CRA (within 5 years of the current year for which the permit above is sought) is not available for the site at the time of development. If archaeological resources are uncovered or discovered during construction activities, no further excavation or disturbance of the area where the resources were found shall occur until a qualified archaeologist, in consultation with the appropriate Tribe, evaluates the find. Pursuant to Calif. Pub. Res. Code § 21083.2(b) avoidance is the preferred method of preservation for archaeological resources. If the find is determined to be a unique or significant archaeological resource, appropriate action shall be taken to include but not be limited to: (a) planning

²⁰ ²⁰ It is anticipated that the Pechanga Tribe will be the "appropriate" Tribe due to their prior and extensive participation in the Highlands Fairview project and the current Project and their coordination with the City and project applicant in determining potentially significant impacts and appropriate mitigation measures.

 Page 14

construction to avoid archeological sites; (b) capping or covering archeological sites with a layer of soil before building on the affected site; or (c) excavation to adequately recover the scientifically consequential information from and about the resource. Appropriate mitigation shall take into account the religious beliefs, customs, and practices of the appropriate Tribe. Work may continue on other parts of the project site while the unique archaeological resource mitigation takes place. This measure shall be implemented to the satisfaction of the City Planning Division. If the qualified archaeologist, in consultation with the appropriate Tribe, determines that the find is a unique archaeological resource, the resource site shall be evaluated and recorded in accordance with requirements of the State Office of Historic Preservation (OHP) and as described in 4.5.61A. If the site is determined to be significant and cannot be avoided through site design, an adequate amount of data at the specific site shall be collected by the qualified archaeologist and the findings of the report shall be submitted to the City. If the site is not determined to be not significant, the site need not be mitigated for as described above.

24

4.5.6.1C Prior to any discretionary approvals for development ~~within 3,750 feet of the southwest corner of the site,~~ the project developer shall retain a qualified archaeologist to monitor grading as this area has been identified as having moderate to high sensitivity for cultural resources. Project-related archaeological monitoring shall include the following requirements:

1. All construction-related earthmoving shall be monitored to a depth of ten (10) feet below grade by the Project Archaeologist or his/her designated representative and the appropriate Tribe;
2. Once 50 percent of the earth to be moved has been examined, the Project Archaeologist may, at his or her discretion and in consultation with the appropriate Tribe, terminate monitoring if and only if no buried cultural resources have been detected;
3. If buried cultural resources are detected, monitoring shall continue until 100 percent of virgin earth within the permit area has been disturbed and inspected by the Project Archaeologist or his/her designated representative and the appropriate Tribe.
4. Grading shall cease in the area of a cultural artifact or potential cultural artifact as delineated by the Project Archaeologist or his/her designated representative and the appropriate Tribe. Grading should continue in other areas of the site while particular find are investigated; and
5. If cultural artifacts are uncovered during grading, they shall be Phase II tested by the Project Archaeologist and the appropriate Tribe, evaluated for significance in accordance with §15064.5 the *CEQA Guidelines*, and curated in a museum²¹ chosen

25

²¹ The Pechanga Tribe would like the City to know that we own and maintain a curation facility that meets or exceeds 36 CFR Part 79 standards. Currently we do not charge to store Luiseño cultural items. The only exception

 Re: Pechanga Tribe Comments on the World Logistics Project
 April 8, 2013
 Page 15

by the City if the resource(s) are determined to be significant. Appropriate actions for significant resources include but are not limited to avoidance or capping (except of human remains), incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds (Phase III recovery). A mitigation-monitoring report must accompany any archived artifacts.

6. No further grading shall occur in the area of the discovery until the City approves specific actions to protect identified resources. Any archaeological artifacts recovered as a result of mitigation shall be handled as outlined in 5 above, donated to a qualified scientific institution approved by the City where they would be afforded long term preservation to allow future scientific study.

7. The developer shall make reasonable efforts to avoid, minimize, or mitigate significant adverse impacts on cultural resources on the WLCSP property, and the SHPO and local Native American tribes will be consulted and the Advisory Council on Historic Preservation (should there be Federal involvement on this Project) will be notified within 48 hours in compliance with 36 CFR 800.13(b)(3). This measure shall be implemented to the satisfaction of the City Planning Division.

8. The landowner shall relinquish ownership of all cultural resources, including sacred items, burial goods and all archaeological artifacts that are found on the project area to the appropriate Tribe for proper treatment and disposition. All sacred sites, should they be encountered within the project area, shall be avoided and preserved as the preferred mitigation, if feasible.

4.5.6.1D Prior to the issuance of any grading permit within 3,750 feet of the southwest corner of the site, the City and the applicant shall invite interested Tribal Group(s) representatives to help monitor grading if they so desire. Qualified representatives of the Tribal Group(s) shall be granted access to the permit site to monitor grading as long as they provide 48 hour notice to the developer of their desire to monitor, so the developer can make appropriate safety arrangements on the site. the project developer shall retain a qualified tribal monitor from the appropriate tribe and develop a Cultural Resources Treatment Agreement to monitor grading as this area has been identified as having moderate to high sensitivity for cultural resources, in which they have a direct ancestral connection. The Agreement shall address the treatment of known cultural resources, the designation, responsibilities, and participation of professional Native American Tribal monitors during grading, excavation and ground disturbing activities; project grading and development scheduling; terms of compensation by the developer for the monitors; and treatment and final disposition of any cultural resources, sacred sites, and human remains discovered on the site. This measure shall be implemented to the satisfaction of the City Planning Division.

is for human remains, sacred/ceremonial items or grave goods in which the Tribe requests that these items be reburied in an appropriate location of the Project property.

Pechanga Comment Letter to the City of Moreno Valley
 Re: Pechanga Tribe Comments on the World Logistics Project
 April 8, 2013
 Page 16

4.5.6.1E It is possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources (archaeological or historical). In the event that buried cultural resources are discovered during grading and no Project Archaeologist or Historian or tribal representative is present, grading operations shall stop in the immediate vicinity of the find and a qualified archaeologist and the appropriate tribe shall be retained to determine the most appropriate course of action regarding the resource. The Archeologist, in consultation with the appropriate tribe shall make recommendations to the City on the actions that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with §15064.5 of the *CEQA Guidelines* as a matter of last resort. Cultural resources could consist of, but are not limited to, stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area should be recorded on appropriate DPR forms and evaluated for significance in terms of CEQA criteria. If the resources are determined to be unique historic resources as defined under §15064.5 of the *CEQA Guidelines*, mitigation measures shall be identified by the Archaeologist and the appropriate tribe and recommended to the City. Appropriate protective actions for significant resources could include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds. No further grading shall occur in the area of the discovery until the City approves the measures to protect these resources. Any archaeological artifacts recovered as a result of mitigation shall be returned to the appropriate tribe as provided for in 4.5.6.1C(5), above. In addition, reasonable efforts to avoid, minimize, or mitigate adverse effects to the property will be taken and the SHPO and Native American tribes with concerns about the property, as well as the Advisory Council on Historic Preservation native American Heritage Commission will be notified within 48 hours in compliance with 36 CFR 800.13(b)(3). If the project archaeologist and the Tribe cannot agree on the significance or the mitigation for such resources, not including human remains or grave goods, these issues will be presented to the Planning Director or appropriate City representative for decision. The Planning Director or appropriate City representative shall make the determination based on the provisions of the California Environmental Quality Act with respect to archaeological resources and Notwithstanding any other rights available under the law, the decision of the Planning Director shall be appealable to the Planning Commission and/or City Council.

27

4.5.6.1F If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b) remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made. If the Riverside County Coroner determines the remains to be Native American, the Native American Heritage Commission must be contacted within 24 hours. The

 Page 17

Native American Heritage Commission must then immediately identify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code 5097.98 and the Treatment Agreement described in 4.5.6.1D.

28

4.5.7 For cultural resources that are known or discovered during earth-moving activities and which will be preserved either in open space or in areas of no development, a long-term preservation plan must be completed between the Developer and the Pechanga Tribe. The preservation plan must include, but is not limited to, how the resources will be protected (i.e., fencing, native plants, etc.), who has responsibility for the long-term care, who shall pay for the long-term care, the role of the Tribe in maintaining and preserving the resources, approved uses and prohibited uses of the property, access rights and any other relevant provisions related to preservation and protection of cultural resources.

29

4.5.8 For the trails anticipated to be required for this Project, the Developer must consult with the appropriate tribe regarding the location of such trails. Sensitive cultural resources exist on the property and the alignment of the trail could impact subsurface cultural materials. In addition, a long-term maintenance and preservation plan for said trails must be completed between the developer and the Pechanga Tribe to ensure that at a minimum, cultural resources are not damaged through misuse by trail users, vandalism, maintenance needs for the trail and/or improvements or expansion of the trails.

30

The Tribe reserves the right to fully participate in the environmental review process, as well as to provide further comment on the Project's impacts to cultural resources and potential mitigation for such impacts. The Pechanga Tribe looks forward to working together with the City of Moreno Valley in protecting the invaluable Pechanga cultural resources found in the Project area. Please contact me at 951-770-8104 or at ahoover@pechanga-nsn.gov once you have had a chance to review these comments so that we may discuss the proposed mitigation measure language. Thank you.

31

Sincerely,

Anna Hoover
 Cultural Analyst

Sacred Is The Duty Trusted Unto Our Care And With Honor We Rise To The Need

RESPONSES TO LETTER A-3

Pechanga Temecula Band of Luiseño Mission Indians

Response to Comment A-3-1. All public notices regarding the World Logistics Center (WLC) project and its subsequent project-specific applications will be sent to the Tribe as requested.

Response to Comment A-3-2. The designated Open Space area of the WLC Specific Plan was specifically configured to include all known prehistoric cultural resources located at the base of Mount Russell, including CA-RIV-8007 and CA-RIV-2993. Any future trail within or in the vicinity of Open Space Area shall be located and designed to avoid any sensitive cultural resources in consultation with appropriate tribal groups.

Mitigation Measure (MM) 4.5.6.1C was modified to list where additional survey work would be conducted, and the revised measure is described in more detail in Response to Comment A-3-23.

Response to Comment A-3-3. As shown in the technical report, project archaeologists performed two separate sacred lands searches, one in 2005 and another in 2011. Both were designed to provide local tribal groups with the opportunity to comment on the archaeological work effort. In both instances, letters to all tribes named by the Native American Heritage Commission (NAHC) were submitted to each named tribal contact by mail by the project archeologist. The Pechanga Band did not respond to the letter in 2011 and the Pechanga Band was not named on the NAHC list in 2005. Had the Pechanga Tribe responded to the letter in 2011, their response letter would have been shown in Appendix B of the technical report in the Draft Environmental Impact Report (DEIR) and the mode of contact would have been reproduced within the body of the report similar to the modes of contact for other tribal groups.

The designated Open Space area in the WLC Specific Plan was specifically configured to envelop all known prehistoric cultural resources including CA-RIV-8007 and CA-RIV-2993.

Response to Comment A-3-4. Government-to-Government consultations have been underway between City staff and staff from Pechanga Cultural Resources. On May 30, 2012, the City met with Pechanga Cultural Resources staff Anna Hoover, Ebru Ozdil, and Michele Fahley. This meeting took place at City Hall and was informational in nature. The meeting was in direct response to a letter provided in the past from the Pechanga Band that had requested consultation. Staff has not met with this Tribal agency since the release of the DEIR. Ongoing consultations will continue to occur up to the release of the Final Environmental Impact Report (FEIR) and well after review and a final project decision is reached by the City Council.

Response to Comment A-3-5. The Government-to-Government consultation process is being followed following proper procedures. Sensitive cultural resources have not and will not be disclosed to the public.

Response to Comment A-3-6. The March 16, 2012 tribal comment letter shall be included in the FEIR.

Response to Comment A-3-7. Refer to Response to Comment A-3-2.

Response to Comment A-3-8 It must be noted that both the Pechanga Band and Soboba Band have overlapping geographic interests in this area. The City, the project proponent, and project archaeologists do not have legal authority to assign exact cultural affiliations or jurisdictions upon or responsibilities for existing or buried prehistoric cultural resources. The NAHC would be contacted to make a determination of affiliation and Most Likely Descendant (MLD) if necessary.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Several of the mitigation measures (MMs 4.5.6.1D and 4.5.6.1E) in the EIR state that future impacts to surficial or buried prehistoric cultural resources as a result of development within the WLC Specific Plan will be subject to consultation between all concerned parties, including the Tribe and the City of Moreno Valley.

Response to Comment A-3-9. We do not question any aspect of the Tribe's interpretative comments. The Soboba also claim this area as a part of their cultural heritage and it is highly probable that both groups used the area through time. Determining the relationship of these lands to specific groups falls outside of the EIR and a decision on how efforts are cooperatively covered lies with the City of Moreno Valley.

Response to Comment A-3-10. Please refer to Response to Comment A-3-9.

Response to Comment A-3-11. The EIR states that direct impacts to known prehistoric cultural resources will be avoided by including these resources into the Open Space areas of the Specific Plan. Off-site development and indirect impacts to cultural resources in the Open Space and off-site portions of the project, as well as the "Light Logistics Parcels" are subject to further analytical review and consultation with concerned parties including all appropriate tribal groups. Impacts to unknown prehistoric cultural resources during construction are addressed in MMs 4.5.6.1C and 4.5.6.1E.

Existing mitigation measures (MM 4.5.6.1C) in the EIR do allow all appropriate tribal groups to monitor earthmoving during grading and require that the Project Archaeologist immediately consult with all appropriate tribal groups if archaeological finds take place (MMs 4.5.6.1C and 4.5.6.1E in the DEIR). Project-specific agreements with grading monitors are premature at this point in the process. The City requires that all appropriate tribal groups be invited to monitor grading prior to the issuance of project-specific grading permits. The terms and conditions of tribal monitoring will be negotiated on a project-by-project basis. The terms and conditions shall include a discussion on monitoring intensity, the identification of any significant resources and the disposition of any cultural items retrieved.

Response to Comment A-3-12. The letter will be added to the appendices of the FEIR. The City is conducting on-going consultation with all interested local Native American tribes and will continue such consultation throughout the life of the project.

Response to Comment A-3-13. The interpretations provided in the project archaeologist's report represent the expert opinion of a qualified analytical team. All known prehistoric cultural resources exposed at the modern ground surface level were included in the Open Space area within the WLC Specific Plan, whether those sites were considered significant or not. Since the sites are to be avoided, and encompassed into open space, the designation of the site as significant, or not significant, is moot.

Response to Comment A-3-14. Regardless of how archaeologists interpret prehistory as it is expressed by the remnants of material culture, the fact remains that no known prehistoric cultural resources located on the modern ground surface will be directly impacted by construction of the WLC project and that physical observation of all grading activities in the vicinity will occur by qualified professional monitors and by Native American monitors if they choose to participate.

Response to Comment A-3-15. Regardless of how archaeologists interpret prehistory as it is expressed by the remnants of material culture, no prehistoric cultural resources located on the modern ground surface will be directly impacted by construction. The idea of divide and conquer is not the intention of the cultural resource assessment. The project archaeologist provided a fairly standardized definition of what constitutes an archaeological site. The definition was adhered to for defining a site and was incorporated into defining site boundaries. The City agrees that having a

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

series of sites concentrated into a constrained area should be taken into consideration when assessing significance. In this instance, it is noted that the boundary of the Open Space area was drawn to include all prehistoric sites, thereby providing protection to the resources.

Response to Comment A-3-16. Refer to Response to Comment A-3-15.

Response to Comment A-3-17. Refer to Response to Comment A-3-15.

Response to Comment A-3-18. The EIR and the supporting cultural resource assessment report do not disagree with the Tribes' interpretation of existing regional cultural evidence and artifacts. The interpretative disagreement, with relationship to the EIR, is rendered moot by placing all known prehistoric cultural resources into the Open Space section of the Specific Plan, thereby avoiding them during construction of the project. These sites are therefore preserved for future generations.

Response to Comment A-3-19. Refer to Response to Comment A-3-18.

Response to Comment A-3-20. Refer to Response to Comment A-3-14.

Response to Comment A-3-21. The eastern portion of CA-RIV-8007 is located in the Open Space area designated within the WLC Specific Plan, and the western portion of the site is located on an adjacent parcel that is not a part of the Project. Therefore, this site will be completely avoided during construction of the project.

Response to Comment A-3-22. In response to this comment, the proposed route of the future public trail has been adjusted to the north approximately 2,000 feet to avoid any possible impact to known cultural resources (refer to Figure 1-3). The trail route is now proposed to run along Street E instead of along the boundary of the designated Open Space.

Response to Comment A-3-23. Impacts to buried cultural resources are considered adequate following CEQA guidelines, but refined modifications to those measures have been made following comments made by Tribal representatives. Subsequent to receiving Letter A-3, the EIR's cultural resource mitigation measures were re-examined by the City, the project archeologists, and the authors of the EIR. The following statement has been added to the cultural resource section of the EIR just before MM 4.5.6.1A:

Mitigation Measures. The following measures are proposed to help reduce potential impacts on known, unknown, or potential archaeological or historical resources to less than significant levels. The wording of the measures has been changed from the Draft Environmental Impact Report to address specific comments made by the Pechanga Tribe. The Tribe did request that the survey area limitations outlined in MMs 4.5.6.1C and 4.5.6.1D be removed. After consultation with the project archaeologist the measures have been modified to refer to specific planning areas within the World Logistics Center Specific Plan as shown below:

4.5.6.1A Prior to the approval of any grading or other discretionary permit for any of the "Light Logistics" parcels, the parcels shall be evaluated for significance by a qualified archaeologist ~~since they were not available for survey during preparation of the EIR. A Phase II. A Phase 1~~ Cultural Resources Assessment shall be conducted by the project archaeologist and an appropriate tribal representative(s) on each of the "Light Logistics" parcel ~~prior to development to determine if it contains~~ significant archaeological or historical resources.

A Phase II 2 significance evaluation shall be completed for any of these sites ~~that are determined to~~ in order to determine if they contain significant archaeological or historical resources ~~based on the results of the Phase I assessment~~. Cultural resources

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

include but are not limited to stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. ~~If a particular resource is~~ All resources determined to be significant, ~~it prehistoric or historic shall be adequately~~ documented using DPR523 forms for archival research/storage in the Eastern Information Center (EIC). If the particular resource is determined to be not significant, no further ~~documented~~ documentation is required. ~~Any artifacts~~ If prehistoric resources are determined to be significant, they shall be considered for relocation or archival documentation, ~~as appropriate, depending on whether the building or buildings are~~ determined to be significant under CEQA. If any building resource is determined to be significant, a Phase III³³ recovery study shall be conducted to recover remaining significant cultural artifacts. ~~If necessary, a feasibility study shall be conducted to~~ determine if a significant structure can be relocated effectively to off-site parcels. ~~The study shall also identify if there~~ If prehistoric archaeological/cultural resources are appropriate parcels available within or close to the Moreno area of the City. ~~If the structure discovered during the Phase 1 survey and it is determined that they cannot~~ be feasibly relocated, ~~or there is not an appropriate parcel to relocate the structure~~ to, ~~the structure shall be demolished after complete archival recordation avoided~~ through site design, they shall be subject to a Phase 2 testing program. The project archaeologist and in consultation with appropriate tribal group(s) shall determine the significance of the resource(s) and determine the most appropriate disposition of the resource(s) in accordance with applicable laws, regulations and professional practices (per Cultural Report MM CR-1, MM CR-2, MM CR-7 Table 3, pg.74).

- 4.5.6.1B** Prior to the ~~approval-issuance of any grading or ground-disturbing permit by the City for~~ construction of off-site improvements ~~for the WALKS, the developer requesting the permit shall retain~~ qualified archaeologist shall be retained to prepare a Phase I cultural resource assessment (CRA) of the project site if an up to date Phase I cultural resource assessment is not available for the site at the time of development per Cultural Report MM CR-5, Table 3, pg.74).

Appropriate tribal representatives as identified by the City shall be invited by the Project Archaeologist to participate in this assessment.

If archaeological resources are ~~uncovered or~~ discovered during construction activities, no further excavation or disturbance of the area where the resources were found shall occur until a qualified archaeologist evaluates the find. If the find is determined to be a unique archaeological resource, appropriate action shall be taken to ~~include but not be limited to:~~ (a) planning; (a) plan construction to avoid the archeological sites; (the preferred alternative); (b) capping cap or covering cover archeological sites with a layer of soil before building on the affected site-project location; or (c) excavation-excavate the site to adequately recover the scientifically consequential information from and about the resource. ~~Work~~ At the discretion of the project archaeologist, work may continue on other parts of the project site while the unique archaeological resource mitigation takes place. This measure shall be implemented to the satisfaction of the ~~City Planning Division Official.~~

~~If the qualified project archaeologist, in consultation with the monitoring Tribe(s),~~ determines that the find is a unique archaeological resource, the resource site shall be evaluated and recorded in accordance with requirements of the State Office of Historic Preservation (OHP). ~~If the site resource is determined to be significant, an adequate amount of data at the specific site shall be collected by the qualified archaeologist and the findings of the report shall be submitted to the City. If the site find is not determined to be not significant the site need not be mitigated for as described above no mitigation is necessary.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Should a future project-level analysis show that cultural resource site CA-RIV-3346 will be directly or partially impacted by project-level construction, an Addendum cultural resource report must be prepared and include an analysis of the alternatives associated with mitigation for impacts to this resource following CEQA Guidelines Section 15126.4(b)(3). This information must be included in any project-level CEQA compliance documentation. It should be noted that Phase 3 data recovery is an acceptable mitigation action under CEQA Guidelines Section 15126.4(b)(3)(C) (per Cultural Report MM CR-3, Table 3, pg.74).

Should it be determined through a future project-level EIR analysis that prehistoric cultural resource sites CA-RIV-2993 and/or CA-RIV-3347 shall be directly impacted by future construction, these sites must be Phase 2 tested for significance (per Cultural Report MM CR-4, Table 3, pg.74).

4.5.6.1C ~~Prior to the issuance of any discretionary approvals for development within 3,750 feet of the southwest corner of the site, the project developer shall retain grading permits a qualified archaeologist shall be retained to monitor all grading as this area has been identified as having moderate and shall invite tribal groups to high sensitivity for cultural resources to participate in the monitoring. Project-related archaeological monitoring shall include the following requirements per Cultural Report MM CR-6, MM CR-8, Table 3, pg.74):~~

- ~~1. All construction-related earthmoving shall be monitored to a depth of ten (10) feet below grade by the Project Archaeologist or his/her designated representative. Once 50 percent all areas of the earth to be moved has development project that have been examined cut to 10 feet below existing grade have been inspected by the monitor, the Project Archaeologist may, at his or her discretion, terminate monitoring if and only if no buried cultural resources have been detected;~~
- ~~2. If buried cultural resources are detected, monitoring shall continue until 100 percent of virgin earth within the permitspecific project area has been disturbed and inspected by the Project Archaeologist or his/her designated representative.~~
- ~~3. Grading shall cease in the area of a cultural artifact or potential cultural artifact as delineated by the Project Archaeologist or his/her designated representative. A buffer of at a minimum 25 feet around the cultural item shall be established to allow for assessment of the resource. Grading shouldmay continue in other areas of the site while the particular find are investigated; and~~
- ~~4. If prehistoric cultural artifactsresources are uncovered during grading, they shall be Phase 2 tested by the Project Archaeologist, and evaluated for significance in accordance with §15064.5(f) of the CEQA Guidelines , and curated in a museum chosen by the City if the resource(s) are determined to be significant. Appropriate actions for significant resources as determined by the Phase 2 testing include but are not limited to avoidance or capping, incorporation of the site in green space, parks, or delineation into open space. If such measures are not feasible, Phase 3 data recovery excavations of the finds (Phase III recovery)recovery of the significant resource will be required, and curation of recovered artifacts and/or reburial, shall be required. A mitigation-monitoring report associated with Phase 2 testing or Phase 3 data recovery must accompanybe delivered to the City and, if necessary, the museum where any archived recovered artifacts have been curated.~~
- ~~5. No further grading shall occur in the area of the discovery until the City approves specific actions to protect identified resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

by the City where they would be afforded long-term preservation to allow future scientific study.

6. The developer shall make reasonable efforts to avoid, minimize, or mitigate significant adverse impacts on cultural resources ~~on the WLCSP property, and the SHPO. The State Historic Preservation Office (SHPO)~~ and local Native American tribes will be consulted and the Advisory Council on Historic Preservation will be notified within 48 hours of the find in compliance with 36 CFR 800.13(b)(3). This measure shall be implemented to the satisfaction of the ~~City Planning Division Official.~~

4.5.6.1D Prior to the issuance of any grading ~~within 3,750 feet of the southwest corner of the site, the City and the applicant permit the project archaeologist shall invite~~ interested Tribal Group(s) representatives to monitor grading activities. Qualified representatives of the Tribal Group(s) shall be granted access to the project site to monitor grading as long as they provide 48-hour notice to the developer of their desire to monitor, so the developer can make appropriate safety arrangements on the site. This measure shall be implemented to the satisfaction of the ~~City Planning Division Official.~~

4.5.6.1E It is possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources (archaeological or historical). In the event that buried cultural resources are discovered during grading and no Project Archaeologist or Historian is present, grading operations shall stop in the immediate vicinity of the find and a qualified archaeologist shall be retained to determine the most appropriate course of action regarding the resource. The Archaeologist shall make recommendations to the City on the actions that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with §15064.5 of the *CEQA Guidelines*. Cultural resources could consist of, but are not limited to, stone artifacts, bone, wood, shell, or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area ~~should~~ shall be recorded on appropriate California Department of Parks and Recreation forms and evaluated for significance in terms of CEQA criteria. If the resources are determined to be unique historic resources as defined under §15064.5 of the *CEQA Guidelines*, ~~mitigation measures shall be identified by the Archaeologist and recommended to the City. Appropriate~~ appropriate protective actions for significant resources ~~could include~~ such as avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds ~~shall be implemented by the project archaeologist and the City.~~

No further grading shall occur in the area of the discovery until the City and project archaeologist approve the measures to ~~protect~~ address these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the City where they would be afforded long-term preservation to allow future scientific study.

~~In addition, reasonable efforts to avoid, minimize, or mitigate adverse effects to the property will be taken and the SHPO and Native American tribes with concerns about the property, as well as the Advisory Council on Historic Preservation will be notified within 48 hours in compliance with 36 CFR 800.13(b)(3)~~

Letter A-4: United States Environmental Protection Agency (April 8, 2013)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION IX

75 Hawthorne Street
San Francisco, CA 94105-3901

Letter A-4

April 8, 2013

John Terell
Planning Official
City of Moreno Valley
14177 Frederick St.
Moreno Valley, CA, 92553

Subject: Proposed World Logistics Center Project, Draft Environmental Impact Report

Dear Mr. Terell:

The U.S. Environmental Protection Agency (EPA) became aware of the proposed World Logistics Center project in the City of Moreno Valley after being contacted by a resident concerned with potential air quality impacts from the project. Although EPA generally limits our review to Environmental Impact Statements required to comply with the National Environmental Policy Act, we do periodically review Environmental Impact Reports (EIR) if the potential impacts are substantial. Based on the concerns that were brought to our attention, EPA conducted a limited review of the World Logistics Center Project Draft EIR, dated February 4, 2013. Our review focused on potential air quality and health-related impacts.

The Draft EIR acknowledges that the proposed project is in an area that currently does not meet EPA's National Ambient Air Quality Standards and is classified as extreme nonattainment for 8-hour ozone, serious nonattainment for PM₁₀, and nonattainment for PM_{2.5}. For this reason, it is critical to identify and commit to all available mitigation measures to reduce air quality impacts as much as possible. The Draft EIR states that emissions from the construction and operation of the proposed project, even with the proposed mitigation measures, would lead to significant and unavoidable air quality impacts and would expose sensitive receptors to substantial pollutant concentrations (pages 1-2, Appendix A). The document further states that the project would exceed South Coast Air Quality Management District regional significance thresholds for volatile organic compounds, nitrogen oxides, carbon monoxide, PM₁₀, and PM_{2.5}.

To avoid or minimize the air quality impacts from the proposed project, we encourage the City to consider using the most robust mitigation measures available. Section 4.3 of the Draft EIR lists mitigation measures for the construction and operation of the proposed project. In addition to these measures, we suggest that the City consider implementing the mitigation measures listed below.

- Limit idling of heavy equipment and trucks to less than 5 minutes and verify compliance through unscheduled inspections. Information about the California Air Resources Board (CARB) mobile source anti-idling requirements is available at: <http://www.arb.ca.gov/insprog/truck-idling/truck-idling.htm>.
- Limit the use of the facility to zero/near-zero emission trucks meeting, at a minimum EPA's Tier 4 2010 emissions standards.

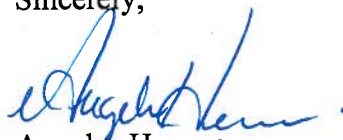

- Larger Tier 4 construction equipment will be more widely available in 2015.¹ If practicable, starting in 2015, limit construction equipment to EPA's Tier 4 emission standards.
- Commit to the use of construction equipment powered by alternative fuels (i.e., biodiesel, compressed natural gas, and electricity).

Furthermore, we suggest that the City review and consider the mitigation measures included in the Mitigation Monitoring and Reporting Program discussed in the Consent Judgment for *Center for Community Action and Environmental Justice et al. v. County of Riverside et al.*, February 14, 2013.² Specifically, we recommend that the City consider restricting truck routes from accessing roads next to residential areas; enforcing the California Air Resources Board's anti-idling regulation; establishing a diesel minimization plan; and utilizing its best efforts to analyze whether this project, and future projects subject to the California Environmental Quality Act, may impact certain overburdened communities and sensitive populations.

Lastly, we recommend that Section 4.3 of the Draft EIR be updated to describe the communities that would be impacted by air emissions from the proposed project. We encourage the City to evaluate any relevant and available demographic, socioeconomic, health, and environmental data to assess whether potential environmental justice concerns exist. We suggest that the City analyze and disclose the potential for certain subpopulations and overburdened communities to be more adversely affected by air pollution, and identify specific mitigation measures to address impacts to these populations. The additional analysis may identify a need to further lessen, mitigate, or avoid completely potential emissions from the World Logistics Center. Further, such an analysis may lead to specific design changes aimed at maintaining or improving the health of affected residents.

Please contact me, at (415) 972-3144, or Jacquelyn Hayes, of my staff, at (415) 972-3259 or hayes.jacquelyn@epa.gov, if EPA can be of assistance in this matter.

Sincerely,

Angeles Herrera
Associate Director
Communities and Ecosystems Division

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

RESPONSES TO LETTER A-4

United States Environmental Protection Agency (April 8, 2013)

Response to Comment A-4-1. The United States Environmental Protection Agency (EPA) stated their right to review the EIR and make comments. The City acknowledges the EPA's authority and interest in commenting on the WLC project Draft Environmental Impact Report (DEIR).

Response to Comment A-4-2. The City acknowledges that the EPA's primary concern is regarding air quality, including criteria air pollutants such as particulates and ozone. The EPA also correctly summarizes the results of the EIR regarding air pollutants that will exceed the SCAQMD's significance criteria: volatile organic compounds; oxides of nitrogen; carbon monoxide; and both large and small particulates. The EIR outlines a number of measures that could help reduce or mitigate project emissions (Mitigation Measures (MMs) 4.3.6.1A through 4.3.6.1N), as discussed in Section 4.3 of the corrected DEIR which is Volume 2 of this Final Environmental Impact Report (FEIR) document. Due to the size and type of project proposed, it is not possible to reduce project emissions to less than significant levels.

Response to Comment A-4-3. The commenter suggested mitigation measures, as discussed below. Please see the Mitigation Monitoring Reporting Program (FEIR Volume 1) for a list of the current project mitigation measures.

Suggested Mitigation Measure	Response
1. Limit idling of heavy equipment and trucks to less than 5 minutes and verify compliance through unscheduled inspections.	Partially Included. MM 4.3.6.2A includes idling restrictions during construction, which reduce idling time to 3 minutes. MM 4.3.6.3B includes idling restrictions during operation and also requires that signs be posted with a number to report idling violations. The Air Resources Board (ARB) can also inspect and impose fines of \$300 to \$1,000 (www.arb.ca.gov/msprog/truck-idling/factsheet.pdf).
2. Limit the use of the facility to zero/near-zero emission trucks meeting, at a minimum EPA's Tier 4 2010 emissions standards.	Partially Included. Diesel trucks are required to be model year 2010 or later pursuant to MM 4.3.6.3B. This was a project design feature in the DEIR and has been added as a mitigation as part of the FEIR (FEIR Volume 2, Section 4.3 Air Quality). However, the requirement of zero and near-zero trucks are not feasible as discussed in Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment.
1. Larger Tier 4 construction equipment will be more widely available in 2015. If practicable, starting in 2015, limit construction equipment to EPA's Tier 4 emission standards.	Included. MM 4.3.6.2A, has been refined and requires Tier 4 equipment for all diesel off-road equipment greater than 50 horsepower.
2. Commit to the use of construction equipment powered by alternative fuels (i.e., biodiesel, compressed natural gas, and electricity).	Partially Included. MM 4.3.6.2A includes a requirement to provide electrical hook ups to the power grid. However, to require biodiesel or natural gas for construction is not feasible because of the availability and sourcing of those types of equipment.

Response to Comment A-4-4. The commenter suggested that the City review and consider the mitigation measures in the Mitigation Monitoring and Reporting Program discussed in the Consent Judgment for *Center for Community Action and Environmental Justice et al. v. County of Riverside et al*, February 14, 2013 (the Mira Loma project). There are a variety of measures in that document (the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

commenter did not provide the document, but it can be found at the following website: http://oag.ca.gov/system/files/attachments/press_releases/Mira%20Loma%20-%20Consent%20Judgment_0.pdf). The measures are summarized in the following table.

Suggested Mitigation Measure	Response
<i>Restricted Truck Route Ordinance.</i> Restrict truck routes from accessing roads next to residential areas.	Already Included. Section 3.3.3 of the Specific Plan, Truck Circulation, indicates the following: “The World Logistics Center plan directs all heavy truck traffic to SR-60 and Gilman Springs Road and away from Redlands Boulevard (south of Eucalyptus) and Cactus Avenue. These prohibitions are incorporated in the City’s Truck Route Ordinance.”
<i>Air Filtration Systems.</i> Applicants shall fund the purchase, installation, and maintenance of in-home air filtration systems for qualifying residential parcels.	Not Incorporated. Air filtration systems are not required as discussed in Master Response, Air Filtration Systems for Residences In Responses to Comment Letter C-3.
<i>Anti-idling Regulation.</i> Enforce the ARB’s anti-idling regulation.	Already Included. MM 4.3.6.2A includes idling restrictions during construction that reduce allowed idling time to 3 minutes. MM 4.3.6.3B includes idling restrictions during operation.
<i>Clean Trucks.</i> Require trucks greater than 16,000 pounds meet or exceed 2007 model year emissions standards.	Already Included. The requirement of model year 2010 or newer trucks was a project design feature in the DEIR; however, this is now included in MM 4.3.6.3B to demonstrate the emissions reductions.
<i>Buffers.</i> Establish landscaped setbacks between some residences and the project.	Already Included. The World Logistics Center Specific Plan (WLCSP) requires that buildings must be set back 250 feet from residentially zoned property. In addition, MM 4.1.6.1A also requires a 250 setback.
<i>Solar.</i> Solar ready buildings; apply for solar funding.	Incorporated. The FEIR includes rooftop solar (MM 4.16.4.6.1C).
<i>Air Monitoring.</i> Measure black carbon and/or other indicators of diesel particulate matter.	Not Included. This would not provide any benefit for the project and would not reduce emissions or impacts. Air monitoring would not be able to distinguish pollutant levels of the project from all other sources of emissions in the project area (from other projects and the adjacent freeway). There will be future CEQA review on project level plot plans, which would confirm consistency with the assumptions made in the programmatic EIR. If a project level analysis is found inconsistent then it may be required to perform its own Health Risk Assessment (HRA).
<i>Electrification.</i> Project applicant to install and maintain a minimum of two Level 2 Electric Vehicle Supply Equipment at each plot plan with buildings over 100,000 square feet. (Also requires one Level 3 station at one of the plots.)	Already Included. MM 4.3.6.3C requires an onsite alternative fueling station. MM 4.3.6.4A requires electric vehicle-charging stations at each building and requires electrical power sources for service equipment and docking of trucks. The type of electrical station is not specified to allow for advances in electrical technology.
LEED. Buildings in excess of 100,000 square feet shall be LEED Silver or higher.	Partially Included. In the FEIR, the project has incorporated MM 4.16.4.6.1C; a summary is provided below (please refer to the Mitigation Monitoring Reporting Program for exact wording): <ol style="list-style-type: none"> 1) <u>Install solar panels with a capacity equal to the peak daily demand for the office uses in each warehouse building;</u> 2) <u>Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24’s energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and</u>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	3) <u>Require the equivalent of “Leadership in Energy and Environmental Design Certified” for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.</u>

The commenter also recommends that the project establish a “diesel minimizing plan.” However, details regarding this plan were not included within the letter. The project contains a variety of project design features and mitigation measures to reduce diesel particulate matter emissions, including the following: requiring that heavy duty diesel trucks be model year 2010 or later (MM 4.3.6.3B), requiring Tier 4 onsite construction equipment (MM 4.3.6.2A), and requiring non-diesel onsite equipment (MM 4.3.6.3B and project design features).

The commenter also recommends analyzing whether this project and future projects subject to CEQA may impact certain overburdened communities and sensitive populations. As described in Section 4.3 and in Master Response-2 below, the latest research demonstrates that there is no cancer risk from new technology diesel exhaust produced by diesel engines equipped with a diesel particulate filter. As a result, the proposed project will not result in a significant health risk impact. Nonetheless, a localized analysis and the health risk assessment is in the DEIR (Section 4.3) and in the revised analysis assessed the potential impact of project emissions to a wide range of sensitive receptors extending from Palm Springs to the ports of Los Angeles and Long Beach. The results after mitigation were that offsite receptors would receive less than significant impacts. This is primarily due to additional mitigation such as the use of Tier 4 construction equipment and lower emission rates for heavy-duty trucks published by CARB. Under recently adopted OEHHA methodology (which incorporates age sensitivity factors, 30-year exposure duration, and higher breathing rates for a more conservative analysis), there would be a significant impact for three homes within the project site. However, as mentioned above, the latest research shows that new technology diesel exhaust does not cause cancer and would not result in a significant impact.¹² The localized analysis and the health risk assessment took into account cumulative traffic. The localized analysis also accounted for existing background concentrations of air pollutants. Refer to pages 4.3-58 through 4.3-66 in the DEIR for the localized analysis and pages 4.3-71 through 4.3-83 for the health risk assessment. In addition, please refer to the revised analysis (see Master Response-1 in Response to Comment Letter C-3), which indicates that with refined construction and operational assumptions and emission factors, impacts are reduced.

The commenter suggests the EIR conduct an environmental justice analysis of the project air quality impacts on minority of low socioeconomic communities. The onsite rural residences, and the residential community immediately adjacent to the western boundary of the WLC project site, would be the primary receptors of air quality and health risk impacts of the WLC project. Localized air quality impacts outside of the project boundaries are less than the South Coast Air Quality Management District (SCAQMD's) localized air quality thresholds that were devised under the SCAQMD's Environmental Justice Initiative #4. None of these areas have high minority or Hispanic populations compared to the City as a whole. This conclusion is supported by the following comparison of the 2010 federal census data for the WLC property and the long established residential neighborhoods west and southwest of the WLC site (census tracts 426.24, 426.22, and 487.00 respectively):

¹² “Advanced Collaborative Emissions Study” published by the Health Effects Institute (HEI) in 2015 (Research Report 184 final). The HEI consists of governmental and private industry representatives including the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Race/Ethnic Group	City-Wide	CT 426.24	CT 426.22	CT 487.00
White	41.9%	51.5%	34.8%	34.1%
Black/African American	18.0%	13.1%	19.2%	28.3%
Asian	6.1%	6.3%	15.5%	10.2%
Native American	1.5%	0.7%	0.9%	1.2%
Other	32.5%	28.4%	29.6%	26.2%
Total	100.0%	100.0%	100.0%	100.0%
Hispanic	54.4%	45.3%	44.2%	40.7%

Source: 2010 Census website <http://www.census.gov/2010census/popmap/ipmtxtl.php?fl=06>

NOTES: CT = Census Tract (from U.S. 2010 federal census)

CT 426.24 includes WLC site, Mystic Lake, and neighborhoods along Redlands west to Moreno Beach Drive

CT 426.22 includes neighborhoods west of Moreno Beach Drive

CT 487.00 includes neighborhoods southwest of Moreno Beach Drive

Race categories = Other includes all other race categories plus those who indicated two races or more

Hispanic – ethnic category that is separate from race categories (i.e., can overlap several races)

The 2010 census data shows the 3 census tracts in and around the WLC site have a lower proportion of Hispanics than the City-wide figure (i.e. 10-14% less than the City total), so these neighborhoods would not be considered high minority or low socioeconomic status areas. Therefore, no further environmental justice analysis is necessary.

It should be noted that race data for the onsite residences is not provided because there are only 7 residences and privacy could not be maintained if detailed census block data from census tract 426.24 was released for these residences.

Most of the air quality impacts of the WLC project will be within the project boundaries, generally east of Redlands Boulevard/Merwin Street, south of SR-60, west of Gilman Springs Road, and north of the San Jacinto Wildlife Area. There is no empirical evidence that these incremental increases in project emissions, and the related incremental increase in regional air pollutants from project-related diesel truck emissions, will have significant health impacts on minority or low socioeconomic communities adjacent to these freeways.

Note about the term “Hispanic”

According to Wikipedia...Due to the technical distinctions involved in defining "race" vs. "ethnicity," there is confusion among the general population about the designation of Hispanic identity. Currently, the United States Census Bureau defines five race categories: (1) White; (2) Black or African American; (3) Native American or Alaska Native; (4) Asian; and (5) Native Hawaiian or Other Pacific Islander.

According to census reports, of the above races the largest number of Hispanic or Latinos are of the White Race, the second largest number come from the Native American/American Indian race who were the indigenous people of the Americas. The inhabitants of Eastern Island are Pacific Islanders and since the island belongs to Chile they are theoretically Hispanic or Latinos. Because Hispanic roots are considered aligned with a European ancestry (Spain), Hispanic/Latino ancestry is defined solely as an ethnic designation (similar to being Norse or Germanic). Therefore, a person of Hispanic descent is typically defined using both race and ethnicity as an identifier—i.e., Black-Hispanic, White-Hispanic, Asian-Hispanic, Amerindian-Hispanic or "other race" Hispanic.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The term "Hispanic" broadly refers to the culture, peoples, or nations with a historical link to Spain. The term commonly applies to countries once colonized by Spain, particularly the countries of Latin America that were colonized by Spain. It could be argued that the term should apply to all Spanish speaking cultures or countries, as the historical roots of the word specifically pertain to the Iberian region. It is also difficult to label a culture with one term, such as Hispanic, as the customs, traditions, beliefs and art forms (music, literature, dress, architecture, cuisine or others) vary widely depending on country and even within the regions of said country. (Wikipedia website accessed February 23, 2014).

Letter A-5: Soboba Band of Luiseño Indians (April 8, 2013)

RECEIVED

APR 24 2013

CITY OF MORENO VALLEY
Planning Division

April 8, 2013

Attn: Mark Gross, AICP Senior Planner
City of Moreno Valley Planning Division
14177 Frederick Street
Moreno Valley, CA 92553

Letter A-5

Re: World Logistics Center Project, Draft EIR (SCH#2012021045)

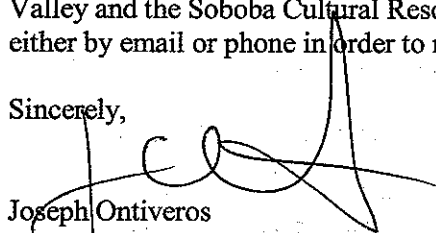

The Soboba Band of Luiseno Indians appreciates your observance of Tribal Cultural Resources and their preservation in your project. The information provided to us on said project has been assessed through our Cultural Resource Department, where it was concluded that although it is outside the existing reservation, the project area does fall within the bounds of our Tribal Traditional Use Areas. This project location is in close proximity to known village sites and is a shared use area that was used in ongoing trade between the Luiseno and Cahuilla tribes. Therefore it is regarded as highly sensitive to the people of Soboba.

Soboba Band of Luiseno Indians is requesting the following:

1. **Government to Government** consultation in accordance to Section 106. Including the transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.
2. The transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.
3. Soboba Band of Luiseno Indians continues to act as a consulting tribal entity for this project.
4. Working in and around traditional use areas intensifies the possibility of encountering cultural resources during the construction/excavation phase. For this reason the Soboba Band of Luiseno Indians requests that a Native American monitoring component be included as a mitigation measure for the environmental impact report. The Tribe is requesting that a Treatment and Dispositions Agreement between the developer and The Soboba Band be provided to the City of Moreno Valley prior to the issuance of a grading permit and before conducting any additional archaeological fieldwork.
5. Request that proper procedures be taken and requests of the tribe be honored (Please see the attachment)

The Soboba Band of Luiseno Indians is requesting a face-to-face meeting between the City of Moreno Valley and the Soboba Cultural Resource Department. Please contact me at your earliest convenience either by email or phone in order to make arrangements.

Sincerely,

Joseph Ontiveros
Director of Cultural Resources
Soboba Band of Luiseno Indians
P.O. Box 487
San Jacinto, CA 92581
Phone (951) 654-5544 ext. 4137
Cell (951) 663-5279
jontiveros@soboba-nsn.gov

Coordination with County Coroner's Office. The Lead Agencies and the Developer should immediately contact both the Coroner and the Soboba Band in the event that any human remains are discovered during implementation of the Project. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the NAHC within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c).

Non-Disclosure of Location/Reburials. It is understood by all parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer agrees to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

RESPONSES TO LETTER A-5

Soboba Band of Luiseño Indians

Response to Comment A-5-1. The Band has provided comments regarding these facts, and their response letter has been reproduced in Appendix B of the Cultural Resources Assessment (Final Environmental Impact Report (FEIR) Volume 2 Appendix F).

Response to Comment A-5-2. Government-to-Government consultations have been underway between the City and staff from both Pechanga Cultural Resources and the Soboba Band of Luiseno Indians. On May 30, 2012, the City met with Pechanga Cultural Resources staff. On November 27, 2012, the City met with the Soboba Band. Both meetings took place at City Hall and were informational in nature. The meetings were in direct response to letters from the two Tribal agencies requesting consultation. Staff has not met with Pechanga Cultural Resources or the Soboba Band of Luiseno Indians since the release of the Draft Environmental Impact Report (DEIR). The City has indicated that consultations will continue to occur with both the Pechanga Cultural Resources and the Soboba Band of Luiseno Indians throughout the duration of the World Logistics Center (WLC) project at the request of the tribal groups. Both groups will receive all future project notices.

Response to Comment A-5-3. Government-to-Government relations regarding this project have been opened as part of the Senate Bill 18 process and the City will provide the Band with information regarding all subsequent development within the WLC.

Response to Comment A-5-4. The City will continue to provide government-to-government consultation with all interested tribal groups. The City is not familiar with the term “consulting tribal entity.”

Response to Comment A-5-5. Existing mitigation measures in the EIR (see Mitigation Measure (MM) 4.5.6.1D see Response to Comment A-3-23) allow all appropriate tribal groups to monitor earthmoving during grading. Project-specific agreements with grading monitors are premature at this point in the process. The City requires that all appropriate tribal groups be invited to monitor grading prior to the issuance of project-specific grading permits.

Response to Comment A-5-6. The codes that the Soboba Band cites in this comment are State laws associated with the discovery of human remains (HSC 7050.5c), the City and project archaeologists are required to follow them as well as the specific mitigation measures outlined in the DEIR (Section 4.5.2.2, State Health and Safety Code) regarding the disposition of human remains found during any excavations. State law requires human remains of pre-historic origin be returned to the Most Likely Descendant (MLD) for disposition. The determination of the MLD is made by the Native American Heritage Commission and is outside of the purview of the project proponent or the City.

MM 4.5.6.1A, 4.5.6.1B, 4.5.6.1C and 4.5.6.1D requires the project archaeologist to consult with tribes once any archaeological finds are made during construction. Each of these measures have been edited slightly to indicate that the City, after discussion with the project archaeologist and with consultation with tribal groups, is the Lead Agency that must fulfill measures associated with potential impacts to significant cultural resources and/or human remains. Refer to Response to Comment A-3-23 to see revised MM 4.5.6.1A through 4.5.6.1E.

Lastly, since more than one tribe may be involved in that consultation, and may be involved during grading and monitoring, it is not possible to stipulate or determine, as part of this EIR, that the Soboba Band or any other tribe must be designated as the party to which any ceremonial items are returned for disposition.

Letter A-6: United States Fish and Wildlife Service (April 22, 2013)

United States Department of the Interior

FISH AND WILDLIFE SERVICE

Ecological Services
Palm Springs Fish and Wildlife Office
777 East Tahquitz Canyon Way, Suite 208
Palm Springs, California 92262

In Reply Refer To:

Mr. Mark Gross
City of Moreno Valley
Community and Economic Development Department
14177 Frederick Street
Moreno Valley, California 92552

APR 22 2013

Subject: Draft Environmental Impact Report, World Logistics Center Project, City of Moreno Valley, Riverside County, California

Dear Mr. Gross:

The U.S. Fish and Wildlife Service (Service) has reviewed the Draft Environmental Impact Report (DEIR) for the World Logistics Center Project (Project) and appreciates the opportunity to comment. The proposed Project is located on 3,820 acres of land in the city of Moreno Valley (City) in Riverside County, south of State Route 60 between Redlands Boulevard and Gilman Springs Road, and is adjacent to the San Jacinto Wildlife Area (SJWA). The proposed Project is a master plan for development of up to 41.6 million square feet of building area for high-cube logistics warehouse distribution facilities. The Project includes a General Plan Amendment, adoption of a Specific Plan, a Zone Change, a Development Agreement, a Tentative Parcel Map, and an annexation.

The primary concern and mandate of the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. The Service is also responsible for administering the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*). The Service is providing the following comments in keeping with our agency's mission to work with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people and the Project's consistency with the Western Riverside County Multiple Species Habitat Conservation Plan.

On June 22, 2004, the Service issued a section 10(a)(1)(B) permit for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The MSHCP established a multiple species conservation program to minimize and mitigate habitat loss and the incidental take of covered species in association with activities covered under the permit. Under the MSHCP, Permittees conduct covered activities consistent with the MSHCP, its associated Implementing Agreement, and section 10(a)(1)(B) permit issued. The City of Moreno Valley is an MSHCP Permittee and the Project is within the MSHCP Plan Area.

Mr. Mark Gross (FWS-WRIV-12B0159-13CAP0091)

2

The proposed Project site and associated infrastructure improvements (i.e., offsite road improvements, debris basins, etc.) are located in MSHCP Criteria Cell Groups T, X, D' and E' of the Reche Canyon/Badlands Area Plan. Project features extend into Existing Core H (Lake Perris State Recreation Area/San Jacinto Wildlife Area) to the south, Proposed Core 3 to the north and east, and are adjacent to Existing Public/Quasi Public Lands to the north and south.

3

We are concerned that riparian/riverine resources within on and off site development areas and impacts to those resources may not be appropriately characterized. We also have questions regarding the Project's focused surveys and proposed mitigation for western burrowing owl (*Athene cunicularia hypugea*, burrowing owl) and Los Angeles pocket mouse (*Perognathus longimembris brevinasus*, LAPM). Additionally we have concerns about potential Project impacts to MSHCP reserve assembly and the potential for the project to degrade existing conservation values on the SJWA. Furthermore, we would like to clarify the Project's obligations under the Migratory Bird Treaty Act. The Service requests revising and recirculating the DEIR to address these issues as discussed below.

4

Reserve Assembly

The Project proposes development within Cell Group X. The proposed Project will not preclude reserve assembly in Cell Group X; however wildlife movement between the badlands and the SJWA may be severely restricted. Please include an analysis of wildlife connectivity across Gilman Springs Road post project in the recirculated DEIR. The analysis should include any road improvements or features to facilitate or accommodate wildlife movement across the road and the efficacy of those measures in the presence of project-related increases in traffic.

5

The southern boundary of the Project is adjacent to Cell Group D' and abuts Existing Public/Quasi Public Lands and Existing Core H. The northern offsite infrastructure improvements will extend into the southern portion of Cell Group T and Proposed Core 3. Development within the Criteria Cells is subject to the Joint Project Review (JPR) process, described in Section 6.6.2 of the MSHCP. The DEIR states that the JPR process will be conducted as project specific development applications are made. We encourage the City to complete MSHCP implementation and do a JPR for the entire Specific Plan during CEQA review. This will eliminate uncertainty for future development proponents in the Specific Plan Area and provide clarity regarding the Project's MSHCP compliance.

6

The SJWA is adjacent to and south of the Project site. The DEIR identifies a 250-foot buffer zone between Project development and the SJWA. We appreciate the inclusion of the buffer area in the Specific Plan, but note that the buffer area includes project features and infrastructure, and seeming contradictory expectations regarding function. The buffer area is to be fenced and planted with trees to segregate the project from the SJWA. Yet the DEIR also states that any LAPM or burrowing owls located during future project development will be translocated to the buffer area. Adverse alterations to drainage pattern alterations, Project related ambient noise, pollutant discharge, lighting, and emissions are all to be mitigated to some degree by the proposed buffer. We request an analysis of the Project activities and impacts with the potential to negatively affect the conservation values on the SJWA and the expected efficacy of the proposed 250 foot buffer at alleviating any negative impacts.

7

Mr. Mark Gross (FWS-WRIV-12B0159-13CAP0091)

3

Riparian/Riverine Resources

The DEIR describes impacts to riparian and/or riverine areas as defined by the MSHCP Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools Policy (Riparian/Riverine Policy, MSHCP section 6.1.2). However, it appears that not all hydrological features within the Project site with characteristics of riparian/riverine resources were considered in the DEIR. Offsite development discussed in the DEIR, Section 3.4.11, includes the construction of four debris basins and one to two water reservoirs. Based on aerial imagery, these Project features appear to have the potential to affect riparian/riverine resources. Riparian/riverine resources include areas that convey water during all or portions of the year even when they do not express water dependent vegetation. We request a revised DEIR which identifies impacts to all hydrologic features covered by the Riparian/Riverine Policy, including those affected by project-related infrastructure outside of the Specific Plan development area.

8

Onsite development plans as depicted in DEIR, Figure 3.18, have potential to impact riparian/riverine resources. According to the DEIR, only Drainage 9 is considered riparian habitat. Drainage features 4, 8, 10, 11, and 12 also appear to be riparian/riverine. According to the Jurisdictional Delineation (Michael Brandman Associates 2012) the drainages have properties which indicate periodic hydrological conveyance. Although the Jurisdictional Delineation stated that the drainages do not have clear connectivity to traditionally navigable waters, these features do have connectivity to the SJWA and its associated hydrological complex, making them subject to the Riparian/Riverine Policy. Furthermore, several of the drainages contain riparian vegetation including mule fat (*Baccharis salicifolia*) and cottonwood (*Populus fremontii*). We request the revised DEIR reassess the hydrologic features on site and discuss the Projects conceptual grading design plans potential to impact riparian/riverine resources.

9

The DEIR states that impacts to riparian/riverine resources are to be mitigated through the preparation of Determinations of Biologically Equivalent or Superior Preservation (DBESPs) as individual projects are approved. As with the JPR process, we encourage the City to implement the Riparian/Riverine Policy and complete MSHCP implementation for the entire Specific Plan area. The DBESP should include an assessment of any impacts from the proposed Project to all hydrologic features covered by the Riparian/Riverine Policy, mitigation for unavoidable impacts to those features and an analysis sufficient to demonstrate that the proposed mitigation would result in preservation equal or superior to an avoidance alternative.

10

The Project requires the construction of debris basins, but the long-term maintenance of the basins was not discussed in the DEIR. Vegetation in that develops in the basins may support nesting birds and other wildlife. If basin maintenance activities are required, we would like to remind the Project applicant that impacts to nesting birds protected under the Federal Migratory Bird Treaty Act (MBTA) of 1918, as amended (16 U.S.C. 703 *et seq.*), must be avoided. The Service recommends the revised DEIR include a discussion of debris basin maintenance activities, potential impacts resulting from maintenance activities and any measures to avoidance, minimization or mitigate those impacts.

11

Additional Survey and Procedure Needs

Mr. Mark Gross (FWS-WRIV-12B0159-13CAP0091)

4

Burrowing Owl

The proposed Project is located within Additional Survey Needs and Procedure Area for western burrowing owl as described in Section 6.3.2 of the MSHCP. According to the DEIR, habitat assessments and focused burrowing owl surveys were conducted in 2005 (May 10, 20, 23, and August 29); 2007 (May 1, 2, 3, and 4); and 2010 (June 9, 10, 11, and 16). Suitable habitat and small mammal burrows which could be utilized by burrowing owl were recorded throughout the site. In 2005, a single pair of burrowing owls was detected. Mitigation measures 4.4.6.4C commits future development within the Specific Plan Area to preconstruction surveys. We would like to clarify that as part of MSHCP implementation, focused burrowing owl surveys during the nesting season will need to be conducted as part of individual project approvals. We request that measure 4.4.6.4C be revised to require surveys consistent the Burrowing Owl Survey Instructions for the Western Riverside County MSHCP instead of pre-construction surveys. Revised measure 4.4.6.4C should be included in the revised DEIR.

12

Mitigation measure 4.4.6.4D describes procedures for relocating active burrowing owl burrows outside of the breeding season. While the MSHCP does provide for the active translocation of burrowing owls, this activity can only be undertaken when proposed projects affect isolated burrowing owls occupying areas with little or no conservation value. Owls are known from the Project site and given its proximity to existing conservation land it is premature to assume that any owls found onsite can be translocated or evicted. The Service requests that the City and the project proponent work with the California Department of Fish and Wildlife, the Western Riverside County Regional Conservation Authority and us to develop a comprehensive strategy for burrowing owl in the Specific Plan Area. A comprehensive strategy is appropriate given the scale of the proposed Specific Plan if impacts to burrowing owl from build out of the specific Plan are to be mitigated to a level that is biologically equivalent or superior to avoidance, as required by the MSHCP. The comprehensive strategy should be discussed and analyzed in a revised DEIR.

13

Los Angeles Pocket Mouse

The Project site is located within Additional Survey and Procedure Needs for LAPM. Surveys for LAPM were conducted June 27 to July 2, 2010. LAPM were not reported, however, three other species of pocket mice were reported: San Diego pocket mouse (*Chaetodipus fallax fallax*), desert pocket mouse (*Chaetodipus penicillatus*) and long-tailed pocket mouse (*Chaetodipus formosus*). Desert pocket mouse and long-tailed pocket mouse are desert species, not known from western Riverside County or cismontane California, (www.bison.usgs.ornl.gov), and neither have been recorded, trapped or observed in the project vicinity (N. Peterson, CDFW, pers. comm. 2013). (The long-tailed pocket mouse was reported on the project site by same consulting biologist in 2005.) However, the desert pocket mouse resembles the LAPM and the long-tailed pocket mouse resembles the California pocket mouse (*Chaetodipus californicus*), both of which are known from the project vicinity and routinely captured on the SJWA and Lake Perris State Recreation area, immediately south of the proposed project. We request focused LAPM trapping be redone by mammalogists who have familiarity with the local hetromyid (kangaroo rats and pocket mice) fauna. Additionally, the new LAPM survey effort should include trap arrays within the MSHCP LAPM survey area along the northeastern edge of the Specific Plan Area. If the drainage facilities proposed on the north side of Gilman Spring Road are within the LAPM survey area, the infrastructure project areas should be

14

Mr. Mark Gross (FWS-WRIV-12B0159-13CAP0091)

5

trapped as well. We request that survey results and a DBESP for LAPM be included in a revised DEIR.

14

The DEIR included mitigation measure 4.4.6.4E for loss of habitat and Project impacts to LAPM. Mitigation measure 4.4.6.4E provides that if the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the project site or off site to compensate for any loss of occupied LAPM habitat.

Alternatively, individuals may be relocated to the 250-foot setback zone along the southern boundary of the property. The area described in this measure is also described for burrowing owl conservation and relocation. The Service requests that the City and the project proponent work with the California Department of Fish and Wildlife, the Western Riverside County Regional Conservation Authority and us to develop a comprehensive strategy for LAPM in the Specific Plan Area. A comprehensive strategy is appropriate given the scale of the proposed Specific Plan if impacts to LAPM from build out of the specific Plan are to be mitigated to a level that is biologically equivalent or superior to avoidance. The comprehensive strategy should be discussed and analyzed in a revised DEIR.

15

Translocation and On-site Conservation Area

As discussed previously, the Service is concerned about the role of the proposed 250-foot buffer area. The DEIR prescribes translocation of listed flora, burrowing owl, LAPM, and calls for the area to serve as a buffer that will act as a sequester zone for project emission, noise, and lighting pollution. It is not appropriate as a receptor site for either LAPM or burrowing owl. It is insufficient in terms of area, spatial configuration, and planned use. Burrowing owls are a species of raptor which prey on small mammals such as the LAPM. Translocation within this narrow, relatively restricted area may exacerbate the existing predator prey relationship between the species and subsequently increase local population depredation frequencies (McKinney et. al. 2006). Furthermore, burrowing owls require large open expanses of sparsely vegetated area to forage and nest. The buffer area is to be planted with trees. Trees offer perch sites to bird eating raptors, such as red-tailed hawks, which eat burrowing owls. We request that a revised DEIR propose comprehensive strategies for Project effects to LAPM and burrowing owl as discussed above.

16

Migratory Birds

The MBTA protects migratory birds, and their nests, eggs, young, and parts from possession, sale, purchase, barter, transport, import, and export, and take. For the purposes of the MBTA, "take" is defined as "to pursue, hunt, shoot, wound, kill, trap, capture, or collect," or attempt to engage in any of the aforementioned activities (50 C.F.R. § 10.12). We appreciate the inclusion of mitigation measures 4.4.6.4A and 4.4.6.4B to avoid effects to nesting birds. However, we request that the words 'special status' be removed from 4.4.6.4B because the MBTA applies to all nesting birds included in the MBTA, (virtually all birds expected in the Project area), not just those with sensitive status. Please note, the Service recommends a 300-foot buffer for non-listed birds and a 500-foot buffer for special status birds and raptor species. We also recommend that a biological monitor be present to monitor the effects of construction on any active nests and to ensure that there is no encroachment into the buffer zone.

17

Mr. Mark Gross (FWS-WRIV-12B0159-13CAP0091)

6

We appreciate the opportunity to comment on the DEIR. If you have questions or comments regarding this letter, please contact Christ Allen of the Service at 760-322-2070, extension 215.

Sincerely,

Kennon A. Corey
Assistant Field Supervisor

RESPONSES TO LETTER A-6

United States Fish and Wildlife Service (USFWS)

Response to Comment A-6-1. The commenter has accurately described the project examined in the DEIR. Subsequent to circulation of the Draft Environmental Impact Report (DEIR), 100 acres was removed from the World Logistics Center Specific Plan (WLCSP) site which also removes 1 million square feet of logistics development of the proposed project. The revised DEIR document (Final Environmental Impact Report (FEIR) Volume 2) evaluates the impacts of the revised project, which are generally equivalent to those of the project evaluated in the DEIR. These changes will incrementally reduce overall impacts of the WLC project.

Response to Comment A-6-2. The City acknowledges the USFWS' statutory and regulatory responsibilities regarding comments on environmental documents such as the WLCSP EIR.

Response to Comment A-6-3. The USFWS has accurately summarized the approval of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP), the fact the City participates in that program, and the MSHCP Criteria Cells located just south of the WLC project site.

Response to Comment A-6-4. These introductory statements provide a summary of the concerns that USFWS has on the Program Level EIR. These statements are further discussed in the following Responses in which they appear in the comment letter: Reserve Assembly (Responses to Comments A-6-5 through A-6-7), Riparian/Riverine Resources (Responses to Comments A-6-8 through A-6-11), Additional Survey and Procedure Needs (Responses to Comments A-6-12 through A-6-15), and Migratory Birds (Response to Comment A-6-17). In addition, comments regarding Translocation and On-site Conservation Area are discussed in (Response to Comment A-6-16), but were not included in the USFWS statement under Comment A-6-4.

Response to Comment A-6-5. The USFWS comments on the restriction of wildlife movement between the badlands and the San Jacinto Wildlife Area (SJWA). Portions of the WLCSP are contained within the western portion of Cell Group X and will not preclude Reserve Assembly within Cell Group X. Wildlife movement between the Badlands and the SJWA within the WLCSP is already restricted by State Route 60 and Gilman Springs Road. Existing culverts under Gilman Springs road are currently unusable due to sediment blockage. In addition, the actively disked agricultural fields within the WLCSP site limit the amount of vegetative refugia (i.e., refuge) often required for smaller animals to travel back and forth between the Badlands and the SJWA. Based on current conditions, development of the project site will not likely adversely affect wildlife movement. As a project design feature, the project will maintain Drainage 9 as a natural occurring drainage, augmented with some minor erosion control features, to maintain a wildlife travel path within the eastern portion of the WLCSP. Under the proposed Specific Plan, existing Alessandro Boulevard will be reconstructed and the existing culvert drainage facility will be replaced with a bridge structure, which will allow wildlife species to travel from Gilman Springs Road to the SJWA without having to cross a paved road. The existing marginal riparian habitat within Drainage 9 will be enhanced following the installation of the erosion control devices, which will reduce erosion and downstream sediment deposition as well as provide opportunities to create additional riparian habitat.

As described in the DEIR on page 4.4-17, the MSHCP Conservation Area is made up of existing and proposed "Core" areas, or large assemblages of public land that contain important habitat and listed or sensitive species populations. The core areas are connected by a series of "linkages" or "corridors" identified across public and private lands to allow wildlife movement and genetic connectivity and diversity among the core areas. The MSHCP identifies conservation areas through a series of "criteria cells" within which certain biological resources (i.e., vegetation and/or physical features) should be preserved over the long term. The WLCSP is not located within any areas designated as an existing or proposed linkage or corridor.

As stated in the Draft Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013) (hereafter MSHCP Consistency Analysis), in Section 2.2.5, wildlife corridors link together areas of suitable habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. Corridors effectively act as links between different populations of a species. The WLCSP was assessed to determine if a wildlife movement corridor occurs on or within any portion of the WLCSP. Due to the location of the WLCSP, there is a potential to impede daily activity of local wildlife species that travel to and from the adjacent badlands south toward Mystic Lake. This is more appropriately referred to as a travel path and not a wildlife movement corridor. The travel path associated with the WLCSP is small in comparison to the large badlands area that continues south along the east side of the WLCSP and connects to the SJWA.

Potential project design features include a crossing of Drainage 9, reconstruction of the existing Alessandro Road, under crossings at Gilman Springs Road, and re-contouring of the upland swale portion of Drainage 9 to allow for easier access into Drainage 9 to allow it to remain as a natural travel path and may be enhanced to promote erosion control, water quality enhancements, travel usage by local wildlife species, to reduce impacts to wildlife movement corridors to less than significant. Details of Drainage 9 improvements and the surrounding area will be developed as specific projects are designed, developed, and approved. In addition, MSHCP fees will be used to purchase off-site conservation lands that could be used for conservation of large established or proposed wildlife movement corridors as described in the MSHCP.

Response to Comment A-6-6. The USFWS suggests that the City complete MSHCP implementation and Joint Project Review (JPR) for the entire Specific Plan during CEQA review. An MSHCP Consistency Analysis and a Determination of a Biologically Equivalent or Superior Preservation (DBESP) Analysis have been prepared and are currently in process of being reviewed by the City of Moreno Valley and Riverside Conservation Authority (RCA) as part of the JPR process.

Response to Comment A-6-7. Comments were made about the contradictory uses of the 250-foot buffer zone between project development and the SJWA. The proposed 250-foot buffer area is provided to introduce a significant permanent physical separation between future WLC buildings and the adjacent SJWA property. There is also an additional 150-foot setback from the edge of the 250-foot buffer area to the nearest building. Within the buffer area will be substantial native landscaping, property maintenance accesses, landscaped drainage basins, employee and visitor parking and low-profile fencing to block pedestrian and vehicular access to the SJWA from the project site. The landscape design for this area will emphasize native plants with low water use, compatibility with SJWA, habitat value, and nesting and perching for raptors and other birds. Additionally, landscaping of this area will enhance the aesthetic edge, help to reduce noise and light from entering the SJWA area.

The buffer area will also include berms, detention basins, and spreading basins along the southern boundary of the WLCSP, which will help to mitigate potential drainage impacts, provide for the improvement of the quality of storm water runoff entering the SJWA, and provide the opportunity to create significant riparian/riverine habitat as the project develops. Project drainage will be treated in on-site detention basins before entering large storm drain systems made up of bio-swales, retention basins, open drainage courses and underground piping that work to protect against flooding, maximize the infiltration of runoff, minimize downstream erosion and siltation, and to provide habitat where possible.

The drainage facilities as outlined in the project hydrology study will provide suitable earthen berms for possible burrowing owl usage. Based on numerous years of surveys on the WLCSP, no more than one pair of burrowing owl has ever been observed onsite in any one year. Therefore, relocating one pair of burrowing owl within the 250-foot buffer area is not considered potentially significant. Since no

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Los Angeles pocket mice (LAPM) have been observed within the project site, no LAPM relocation is anticipated in the buffer area.

In regard to the issue of separating development from existing sensitive habitat, note that in addition to the 250-foot on-site buffer proposed by the project, the closest sensitive riparian habitat within the SJWA is approximately 4,000 feet south of the WLCSP project boundary. Even though the SJWA owns the land immediately south of the WLCSP area, there is a 3,000-foot area between the WLCSP and the edge of the disked agricultural fields currently within the SJWA and another 1,000-foot area of non-native grasslands between the disked agricultural fields and the closest sensitive riparian habitat. There is a total of 4,000 linear feet of open-space between the sensitive habitat of the SJWA and the WLCSP project site. It is important to note that the 910-acre area of the SJWA immediately south of the proposed project was purchased by the State of California in 2001 to, among other things, serves as a buffer between the SJWA and future development to the north (the Moreno Highlands Specific Plan). The acquisition of this buffer area created a State-owned 3,000-foot wide separation between the future development and the SJWA at that time. The WLCSP project is not proposing to seek “credit” for these 910 acres nor use it to mitigate any project impacts. However, the fact that this area provides a buffer between the sensitive areas of the SJWA and new development to the north cannot be disputed. It is serving the purpose for which it was purchased. This property is actively disked for agricultural use and there are no active plans to cease that agricultural activity.

Therefore, the 250-foot on-site buffer area will add to existing buffer areas and help to reduce noise, light, water quality, aesthetics, and air quality impacts of the WLCSP project. It will also provide an opportunity to transplant/relocate sensitive plants and/or burrowing owl if observed during project-specific protocol surveys.

This is a programmatic document and project-level impacts are not being analyzed at this time.

Response to Comment A-6-8. The USFWS made comments about riparian and/or riverine areas that were not addressed in the DEIR. The DEIR did not fully address off-site infrastructure impacts to areas that may be considered Riparian/Riverine Areas. A programmatic-level Determination of Biological Equivalent or Superior Preservation (DBESP) has been prepared (FEIR Volume 2 Appendix E-7) documenting all Riparian/Riverine Areas in the WLCSP project area, including all off-site infrastructure elements. Off-site areas that were not fully addressed in the DEIR, but are addressed in the DBESP, include Drainages 15 and a portion of Drainage 8 north of Gilman Springs Road. These areas include only 0.1 acre of Riparian/Riverine Area that was not evaluated in the DEIR.

Response to Comment A-6-9. The commenter states that some drainage features were incorrectly designated as not riparian/riverine habitat in the DEIR. Based on the MSHCP Guidelines (Section 6.1.2), Riparian/Riverine Areas are lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend upon soil moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year. The intent of the designation of riparian/riverine is to protect drainage features that may not otherwise be protected under the jurisdiction of the United States Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB) and/or California Department of Fish and Wildlife (CDFW). Impacts to these features are still considered potentially significant under the MSHCP, even though they may not meet the minimum criteria to be considered jurisdictional by USACE, RWQCB, and/or CDFW.

Based on the DEIR, a single catch basin and portions of Drainage Features 7 and 9 contain riparian plant species and are considered Riparian/Riverine areas, as designated by the MSHCP. Based on further analysis of the requirements for Riparian/Riverine areas under Section 6.1.2 of the MSHCP, the areas described as Riparian/Riverine have been updated and included in the DBESP (FCS 2013 –MBA FEIR Volume 2, Appendix E-7). The single catch basin, previously identified as a

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Riparian/Riverine Area, is no longer classified as such. As stated in Section 6.1.2 of the MSHCP, "With the exception of wetlands created for the purpose of providing wetlands habitat or resulting from human actions to create open waters or from the alteration of natural stream courses, areas demonstrating characteristics as described above which are artificially created are not included in these definitions." Therefore, the artificially created catch basins, which were used to collect cow waste, are no longer considered Riparian/Riverine areas.

Based on the MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1) and a programmatic-level DBESP for potential impacts to Riparian/Riverine Areas (FCS-MBA 2013-FEIR Volume 2 Appendix E-7), all Riparian/Riverine Areas affected by on-site or off-site impacts were documented and included in the updated report.

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the DEIR and the draft wetland delineation. Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the 1987 Regional Supplement to the USACE Wetland Delineation manual: Arid West Region and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under California Environmental Quality Act (CEQA) and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the RWQCB and CDFW.

Any impact to drainage features that are under regulatory agency jurisdiction or are considered riparian/riverine areas under the MSHCP are considered potentially significant and will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through either onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank.

Response to Comment A-6-10. The USFWS encourages the City to implement the Riparian/Riverine Policy and complete the MSHCP implementation for the entire Specific Plan area. Based on the programmatic-level DBESP for potential impacts to Riparian/Riverine Areas (FCS-MBA 2013-FEIR Volume 2 Appendix E-7), all Riparian/Riverine Areas affected by either on-site or off-site impacts were included as potentially significant impacts and mitigation may include on-site creation within detention basins with drainage spreading structures. Based on the 2013 assessment of the Riparian/Riverine Areas, Drainages 7, 8, 9, 12, and 15 have the potential to be considered Riparian/Riverine Areas. Project-level DBESPs will be required on a project-by-project basis, if Riparian/Riverine Areas are determined to occur within the project footprint.

Response to Comment A-6-11. Comments were made about the lack of discussion in the DEIR on the long-term maintenance of the basins. The WLCSP proposes to create a series of drainage improvements throughout the WLCSP area to treat nuisance-flows and storm run-off before entering into off-site drainage features. The drainage improvements will treat all of the first flush flows and will be used to collect debris and filter water before eventually flowing into a spreading basin. The drainage improvements may be used to mitigate for impacts to drainage features. Vegetation in several of the drainage improvements will be allowed to provide riparian/riverine habitat. Routine maintenance around inlets and outlets will be necessary to maintain the function of the drainage improvements.

Therefore, the following project design features will be required for all drainage improvements. Maintenance activities should completely avoid the nesting season, which is typically from February 1 to August 31. If maintenance activities cannot avoid the nesting season, then a pre-maintenance nesting bird survey will be required within 2 weeks of any maintenance activity. If a nesting bird is present, then all maintenance activities must avoid the active nesting and all areas within 250-feet of the nest. A biological monitor must be present during maintenance activities if an active nest is present within the spreading basins. Maintenance activities may proceed within the 250-buffer only at the discretion of a biological monitor. If vegetation removal is required to maintain the drainage

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

improvements, the impacts should be limited to only necessary vegetation removal. For reference, see MMs 4.4.6.4A through MM 4.4.6.4H. Prior to creating the drainage improvements, a plant palette must be approved by a qualified biologist that is familiar with the local flora. The palette should be similar to those species that commonly occur in the SJWA, so invasive unwanted plant species are not introduced into the SJWA, such as pampas grass, arundo, and fountain grass.

If the drainage improvements are used as compensatory mitigation for impacts to onsite drainage features, these mitigation areas will be considered protected habitat and will likely require a conservation easement and a streambed alteration agreement from the CDFW for maintenance activities.

Response to Comment A-6-12. The USFWS requests that MM 4.4.6.4D be revised to require surveys consistent with the Burrowing Owl Survey Instructions for the Western Riverside County MSHCP instead of pre-construction surveys. MM 4.4.6.4D has been revised to include:

In support of the project-level environmental review, focused/protocol level surveys should be completed by a qualified biologist and submitted to the City for individual development projects. The surveys shall be conducted based on the Burrowing Owl Survey Instructions for the Western Riverside County MSHCP. Based on communications with RCA staff, the Burrowing Owl Survey Instructions have been augmented to reflect the CDFW 2012 staff report for burrowing owls (CDFW 2012). The augment requires focused surveys to be spread-out during the survey season. As currently described in the MSHCP, surveys may be conducted consecutively (see MM 4.4.6.4D).

4.4.6. 4DC ~~Prior to issuance of any grading permits, a~~ A pre-construction clearance survey for burrowing owl shall be ~~prepared~~conducted by a qualified biologist ~~and submitted to the City. This survey shall be required and conducted no more than thirty (30) days prior to initiation of any grading or ground disturbing activities within the project area.~~

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the study disturbance area during the 30-day pre-construction survey, ~~consultation with the CDFW and USFWS shall take place and no construction activity shall take place within maintain a 500-foot of an-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the California Department of Fish and Wildlife (CDFW) shall take place and an appropriate avoidance distance established.~~ No disturbance to active burrows shall occur without appropriate permitting through the ~~MBTA~~Migratory Bird Treaty Act and/or ~~CDFW~~California Department of Fish and Wildlife.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the ~~CDFW and USFWS~~California Department of Fish and Wildlife. A relocation plan may be required by California Department of Fish and Wildlife if active and/or passive relocation is necessary. The relocation plan will outline the basic process and provides options for avoidance and mitigation. Artificial burrows may be constructed within the buffer area south of the World Logistics Center Specific Plan. Construction activity may occur within 500 feet of the ~~active nests~~burrows at the discretion of the biological monitor in consultation with CDFW.

If active nests are identified in a development area, the nests shall be avoided or the owls actively or passively relocated to the 250-foot setback area in the southern portion of the Specific Plan site (see Mitigation Measure 4.4.6.1A). This setback area shall be considered a “conservation area” for burrowing owl or other species of animals or plants that need to be relocated from the portions of the WLCSP site to be developed. In the event no burrowing owls have been identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, Mitigation Measure 4.4.6.4D shall apply. To avoid active nests adequately, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season. This measure shall be implemented to the satisfaction of the City Planning Division.

- 4.4.6.4D** — If active burrowing owl burrows are detected outside the breeding season, passive and/or active relocation may be undertaken following consultation with and approval by the CDFW and/or USFWS. The installation of one way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re enter the holes/dens. Owls may also be actively relocated on site to the 250-foot clear buffer zone along the southern boundary of the WLCSP, as outlined in Mitigation Measure 4.4.6.1A. This measure shall be implemented to the satisfaction of the City Planning Division.

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor.

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, the following has been added to MM 4.4.6.4D to clarify burrowing owl relocation efforts:

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment A-6-13. The USFWS requests that the City and project proponent work with the CDFW, the Western Riverside County Resource Conservation Authority (RCA) and themselves to develop a comprehensive strategy for burrowing owl in the Specific Plan area. Protocol surveys for burrowing owl were conducted in 2005, 2007, 2010, and 2013 on all or portions of the WLCSP. In the eight years of conducting surveys on the WLCSP, no more than a single pair of burrowing owls has ever been observed within the WLCSP in any one year and in some years, no burrowing owl were observed. The WLCSP does not provide sufficient habitat to support a large population of burrowing owls, nor is it likely to provide suitable habitat in the foreseeable future. Since there has been no recorded occurrences of burrowing owl in the 250-foot buffer area, the passive relocation of a single pair or even a few pair of burrowing owls to this area will not affect existing burrowing owl and a comprehensive strategy is not necessary.

Per MSHCP requirements (MSHCP Section 6.3.2), a comprehensive strategy would be appropriate if more than three pairs of burrowing owl were consistently observed within the WLCSP during the previous burrowing owl surveys, but, this is not the case within the WLCSP area. Based on MSHCP guidelines, each project within the WLCSP will be required to conduct project-level surveys and based on the findings, will develop a strategy to handle burrowing owl issues on a project-level basis.

It should be noted that final construction of the 250-foot buffer area might not be completed when burrowing owl relocation may be necessary on a project-level basis. Relocation of burrowing owls to the 250-foot buffer area may be completed with the construction of temporary burrows. These burrows will be designed to coincide with construction progress. For instance, owls can be relocated to areas that will be constructed last, so they can remain in the same location for as long as possible. Once the preliminary phase of the buffer area has started, more permanent burrowing owl burrows can be constructed for long-term relocation.

Response to Comment A-6-14. The USFWS requests that focused LAPM trapping be redone by mammalogists who have familiarity with the local hetromyid fauna. Protocol level surveys were conducted by FCS biologist Kelly Rios, who has approximately 20 years of experience trapping mammal species throughout southern California. Protocol surveys were conducted in 2013 in all areas of the WLCSP and off-site infrastructure areas that contain suitable habitat for LAPM. During the trapping effort, field measurements were taken for each of the individual species captured and identification was verified by Philip Verne, another highly experienced mammalogist that has worked closely with Kelly on several projects. The 2013 survey report is included as an appendix in the MSHCP Consistency Analysis (FCS-MBA 2013). Based on the findings in the report, the following species were identified: deer mouse (*Perognathus maniculatus*), desert pocket mouse (*Chaetodipus penicillatus*), Northwestern San Diego pocket mouse (*Chaetodipus fallax*), Western harvest mouse (*Reithrodontomys megalotis*), and desert woodrat (*Neotoma lepida*). All of the small mammals captured during the 2013 trapping effort were much larger than the Los Angeles pocket mouse. LAPM is considered absent from the project site and a DBESP is not required.

Response to Comment A-6-15. The USFWS requests that the City and project proponent work with the CDFW, the RCA and themselves to develop a comprehensive strategy for LAPM in the Specific Plan area. Protocol surveys for LAPM were conducted in 2005, 2010, and 2013 within suitable habitat of the WLCSP. In all the years of conducting surveys on the WLCSP, no LAPM have ever been observed within the WLCSP. This shows sufficient evidence that the WLCSP does not provide sufficient habitat to support LAPM, nor is it likely to provide suitable habitat in the foreseeable future. Since there has been no recorded occurrences of LAPM in the northern portion of the SJWA, then the relocation of any individuals to the 250-foot buffer area will not affect LAPM in the northern portion of the SJWA, and a comprehensive strategy is not necessary. A comprehensive strategy would be appropriate if several LAPM were consistently observed within the WLCSP during the previous LAPM surveys. However, based on MSHCP guidelines, each project within the WLCSP will still be required

to complete protocol-level surveys for LAPM if they contain suitable habitat and based on the findings, will develop a strategy to handle LAPM issues on a project-level basis.

If LAPM was observed within the project site, 90% of the suitable habitat within the WLCSP will be required for conservation until the conservation goals for this species has been met. If more than 90 percent of the suitable habitat onsite cannot be avoided, a DBESP will be required for impacts to LAPM. The DBESP will include all mitigation measures required to provide biologically equivalent or superior preservation of the species.

Response to Comment A-6-16. Comments were made about the insufficiencies of the 250-foot buffer area as a receptor site for either LAPM or burrowing owl. The 250-foot buffer area will be designed as a transition area from the proposed development area to the SJWA. The 250-foot buffer area will have landscape vegetation and a barrier fence to prohibit access to SJWA by the public. The buffer area will help to reduce potentially significant impacts associated with air quality, lighting, noise, and aesthetics. Based on the MSHCP Guidelines (MSHCP Section 6.3.2), impacts to burrowing owl and LAPM, are not considered significant and, therefore, the buffer area does not require design features specifically for those species. However, as a project design feature, the detention and spreading basins will be designed to provide suitable riverine/riparian habitat for LAPM. This area could be used to relocate LAPM, if at some point in the future, LAPM are discovered within the WLCSP. However, at this time, this species is considered absent and mitigation is not required. The proposed project buildout could take as long as 15 years. Although it cannot completely be ruled out, the possibility LAPM could occur within selective portions of the WLCSP in the future, the applicant is preparing the WLCSP to deal with all potential issues on a long-term basis. The majority of the LAPM suitable habitat within the WLCSP is located within Drainage 9 and portions will be enhanced to provide higher quality riparian/riverine habitat. In the event that LAPM are discovered during project-level focused surveys, a DBESP for impacts to LAPM will be required and more detailed mitigation program will be prepared.

Based on the MSHCP, impacts to a single pair of burrowing owls within project sites that are not within cell criteria areas can passively relocate burrowing owls to an off-site location prior to construction with no additional mitigation requirements. The southern portion of the WLCSP makes for an ideal location for burrowing owl because the large expansive unoccupied burrowing owl habitat that occurs within the SJWA. The closest recorded occurrence of burrowing owl is well over 6,000 linear feet away, which will provide more than sufficient foraging area for a relocated pair of burrowing owl. In the event that more than three pairs of burrowing owls are observed within a single project site during project specific focused surveys, additional mitigation measures will be required. The project applicant will need to consult with the City along with the RCA to develop a comprehensive strategy to mitigate for the loss of more than three pair of burrowing owl. The strategy will require a more detailed design of the 250-buffer area to address design features that would benefit burrowing owl, such as artificial burrow creation and spacing, perch creation, minimizing vegetation growth, providing suitable foraging habitat, and reduce predators.

Red-tailed hawks, burrowing owl, and LAPM are part of the natural food-chain that occurs in general region. Based on current surveys, no LAPM occur within the WLCSP. However, there are red-tailed hawk and burrowing owl. One of the goals of the 250-foot conservation area is to provide more suitable habitat for burrowing owl. The improvements within the 250-foot buffer are intended to provide higher-quality burrowing owl habitat and any increase in predation as a result of an increased burrowing owl population is not considered a significant project related impact and does not require mitigation.

Response to Comment A-6-17. The USFWS requests that the words special status be removed from MM 4.4.6.4B. The mitigation measure below has been revised.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Migratory/Nesting Birds

- 4.4.6.4B** If it is determined that project-related grading or construction will affect ~~special-status~~ nesting migratory bird species, no grading or heavy equipment activity shall take place within the limits established in Mitigation Measure 4.4.6.4A until it has been determined by a qualified biologist that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. This measure shall be implemented to the satisfaction of the City Planning Division.

SCH#: 2012021045

Dear Mark Gross:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. The review period closed on March 21, 2013, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title World Logistics Center (General Plan Amendment, Change of Zone, new Specific Plan, Tentative
Lead Agency Parcel Map (Finance Map); Development Agreement, and annexation of
 Moreno Valley, City of

Type EIR Draft EIR

Description The proposed World Logistics Center project (WLC) site covers 3,918 acres in eastern Moreno Valley. A General Plan Amendment is proposed to designate 2,635 acres for logistics warehousing including up to a maximum of 41.4 million sf of "Logistics Development" and 200,000 sf of warehousing-related uses classified as "Light Logistics." The remaining 1,104 acres will be designated for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives. The site is just north of the San Jacinto Wildlife Area and includes 7 rural residential properties. A new Specific Plan will be adopted to govern development of the 2,635 acres, and a separate zoning amendment will also be processed to rezone 1,104 acres for open space and public facilities uses.

Moreno Valley, CA 92553

Review of Traffic Impact Analysis for the World Logistic Center Riv-60-PM 21.38

Dear Mr. Terell,

We have completed our review for the noted project which is located south of State Route 60 (SR-60) between Redlands Boulevard and Gilman Springs Road extending to the southerly City boundary of Moreno Valley. The project is a proposed Master Plan for the future development of up to 41.6 million square feet of building area providing for modern high-cube logistics warehouse distribution facilities.

As the owner and operator of the State Highway System (SHS), it is our responsibility to coordinate and consult with local jurisdictions when proposed development may impact our facilities. As the responsible agency under the California Environmental Quality Act (CEQA), it is also our responsibility to make recommendations to offset associated impacts with the proposed project. Although the project is under the jurisdiction of the City of Moreno Valley due to the Project's potential impact to State facilities it is also subject to the policies and regulations that govern the SHS.

We have the following concerns regarding the Traffic Impact Study:

Traffic Study

- Table 1: Other Development Project Assumed to be Completed by 2017 (page 8) – Please include a column that shows the area in square feet of residential usages. 2
- Table 17: Existing Freeway Ramp Level of Service (page 56) – At the segment of SR-60 EB Off-Ramp to Redlands Blvd, the AM peak hour volume is 119 vph whereas Figure 7 on page 30 shows 207 vph and the PM peak hour volume is 30 vph whereas Figure 7 shows 434 vph. Please verify. 3
- Figure 30: Turning Movement Volumes under Existing Plus Project Conditions (B) – At Intersection #30, the PM Peak hour volume is missing. 4

Mr. Terrell
 April 3, 2013
 Page 2

- Figure 30: Turning Movement Volumes under Existing Plus Project Conditions (B) – AT Intersection #15 and #16, why is the lane configuration different than that shown on Figure 7 on page 30? 5
- Figure 30: Turning Movement Volumes under Existing Plus Project Conditions (B) – Why are the following traffic volumes for Existing Plus Project Conditions less than the existing condition volumes shown on Figure 7? 6
 - Intersection #67, SBL PM volume is 230 vph whereas Existing shown 410 vph.
 - Intersection #68m WBR PM volume is 0 whereas Existing shown 234 vph.
 - Intersection #72, SBR PM volume is 0 whereas Existing show 44 vph.
 - Intersection #77, SBR AM/PM volumes are 0/0 whereas Existing shows 46/90 vph.
- Figure 30: Turning Movement Volumes under Existing Plus Project Conditions (B) – At Intersection #77, why are there two volumes for the EBT AM/PM volumes, 30/20 and 10/10 vph? 7
- Figure 32: Turning Movement Volumes under 2017 Plus Project Conditions (B) – Why is the SBL AM traffic volumes (250 vph) less than for Existing Plus Project Conditions (340 vph)? 8
- Table 28: Existing Plus Project Freeway Mainline LOS (page 113) – Why are the following traffic volumes for Existing Plus Project Conditions less than the Existing Conditions volumes? 9
 - ID #36, Gilman Springs Road to Jack Rabbit Trail, Existing Plus Project volume is 980 whereas No Project shows 1002 vph.
 - ID #37, Jack Rabbit Trail to I-10/Potrero Blvd, Existing Plus Project volumes is 980 whereas No Project shows 1002 vph.
 - ID #38, Potrero Blvd. to I-10, Existing Plus Project volumes is 980 whereas No Project shows 1002 vph.
- Please check the Turning Movement Volumes for all scenarios and revise the calculations, Figures, and Tables, where needed. 10
- Table 14: Existing Conditions LOS at Study Intersections – The LOS at Intersection #13 do not match with the data shown in Appendix B. 11
- For all unsignalized intersections, please use HCS software to calculate the LOS. 12
- Freeway Direct Impacts from 358, Table 43: 2017 Plus Project Freeway Mainline Impacts and Mitigations, and Table 57: 2022 Plus Project Freeway Mainline Impacts and Mitigations. 13
 - It is estimated that if World Logistic Center (WLC) is completely built out, the project will pay nearly \$72 million in Riverside County Transportation Uniform Mitigation Fee (TUMF) fees (page 346). It is also estimated that the WLC could potentially pay \$41 million in City of Moreno Valley's Development Impact Fees (DIF).

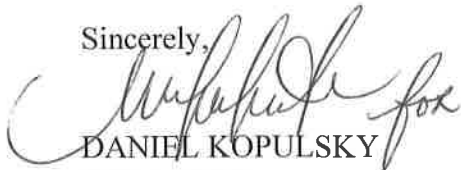

Mr. Terrell
April 3, 2013
Page 3

- It is recommended that a system of coordinating these fees with a state sponsored program of collecting transportation mitigation fees from development projects be developed to implement the necessary improvements and mitigation measures on the State Highway System as outlined in Table 43 and Table 57.

14

We appreciate the opportunity to offer comments concerning this project. If you have any questions regarding this letter, please contact Talvin Dennis at (909) 383-6908 or myself at (909) 383-4557 for assistance.

Sincerely,

DANIEL KOPULSKY
Office Chief
Community Planning/IGR-CEQA

RESPONSES TO LETTER B-2

California Department of Transportation (Caltrans) District 8

Note to Commenter: The Traffic Impact Assessment (TIA) has been revised and can be found in Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1. The responses below reference the revised TIA.

Response to Comment B-2-1. The City acknowledges Caltrans' statutory and regulatory responsibilities regarding comments on environmental documents such as the World Logistics Center Specific Plan (WLCSP) EIR. It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment B-2-2. The commenter requested that a column showing the floor area of residential uses be added to Table 1 in the TIA (Other Development Projects Assumed to be Completed by 2017). This table has been renamed as "Other Development Projects Assumed to be Completed by 2022 in the revised TIA prepared for this EIR (FEIR Volume 2 Appendix L-1).

Most jurisdictions measure residential developments in terms of dwelling units and non-residential developments in terms of floor area. Even projects that are in a relatively advanced stage of development (i.e. already passed the EIR stage and already received some level of development approval) may have residential lots where the floor space of the individual units is not yet known. Moreover, since the trip generation rates are calculated based on the number of dwelling units or households, not residential floor space, the specific square footage of dwelling units has no bearing on the traffic analysis.

Response to Comment B-2-3. The commenter noted an inconsistency between Table 17 and Figure 7 in the Traffic Impact Assessment (TIA) for the SR-60 eastbound TIA prepared for this EIR (FEIR Volume 2 Appendix L-1).

Ramp volumes inconsistencies have been corrected in the revised TIA. Note that even with the corrected/higher set of volumes, the Level of Service (LOS) for both the freeway and the east bound (EB) ramp intersection would be very good (LOS "A" or "B").

Response to Comment B-2-4. The commenter noted that one of the turning movement volumes at Intersection 30 was omitted from Figure 30 in the TIA.

The PM peak-hour volume for the WB left-turn movement that was accidentally omitted from the figure has been added and corrected in the revised TIA.

Response to Comment B-2-5. The commenter inquired about the inconsistency in the lane configurations at Intersections 15 and 16 as shown in Figures 7 and 30 in the TIA.

For the Plus Project scenarios it was assumed that the Theodore/SR-60 Interchange would be upgraded and re-configured, which would result in a different lane configuration at these two intersections. That configuration was shown in Figure 25 in the TIA.

Response to Comment B-2-6. The commenter inquired as to why Existing Plus Project volumes in TIA Figure 30 are lower than Existing volumes in TIA Figure 7 at four intersections.

For the four identified intersections (IN-67, IN-68, IN-72, and IN-77) the correct volumes were analyzed but were not shown properly on the graphics. TIA Figures 7 and 30 have been revised to show the volumes that were analyzed in the study.

Response to Comment B-2-7. The commenter inquired as to why TIA Figure 30 seems to show two east-bound through volumes for Intersection #77.

The traffic volume figures are shown in sets of three for each approach. For east-bound approaches the top numbers represent right-turns. TIA Figure 30 has been corrected in the revised TIA.

Response to Comment B-2-8. The commenter inquired as to why 2017 Plus Project Conditions traffic volumes in TIA Figure 32 are less than Existing Plus Project Conditions traffic volumes in TIA Figure 30.

The Existing Plus Project scenario assumed the full build-out of the project while the 2017 scenario assumed that only Phase 1 of the project was completed. Text in the TIA has been clarified so these scenarios are identified as “Full Build-out” or “Phase 1 (only).” The Existing Plus Project Scenario, while included in the TIA, is not intended to represent a sequential condition with the other scenarios that were analyzed.

Response to Comment B-2-9. The commenter inquired as to why Existing Plus Project volumes are lower than Existing volumes at certain freeway locations.

Traffic models, including the RIVTAM model, match trip origins to trip destinations according to algorithms that reflect actual travel behavior as measured in surveys. In this case the model is reflecting the fact that some people who currently live west of the WLC site and travel east towards Beaumont to work in the morning will instead take advantage of the opportunity have a shorter commute by working at the WLC instead. This would result in a small decrease in EB traffic on this portion of SR-60 in the morning and a similar decrease in WB traffic in the evening. This is an effect that policies promoting better jobs-housing balances are designed to achieve. Please refer to TIA Chapter 4, Section D, sub-section on WLC Auto Traffic.

Response to Comment B-2-10. The commenter requested all calculations be checked and revised where needed.

Checks for all calculations have been conducted and changes made where appropriate.

Response to Comment B-2-11. The commenter inquired as to why in TIA Table 14, the LOS for Intersection #13 did not match the one shown in Appendix B.

In accordance with *Highway Capacity Manual* methodology for unsignalized intersections Table 14 reports the result for the worst-performing approach. For Intersection #13 the worst-performing approach is the EB approach in the AM peak hour and the west bound (WB) approach in the PM peak hour. The results shown in Table 14 are consistent with Appendix B for these approaches.

Response to Comment B-2-12. The commenter requested that Highway Capacity Software (HCS) be used to determine the LOS for unsignalized intersections rather than Synchro. Synchro is the software package approved by the City for use in analyzing intersections in the project TIA. Synchro incorporates the HCM methodology as required in Caltrans Guide for the Preparation of Traffic Impact Studies, as does HCS software. The two models were compared and the comparison found that the results of the models were nearly identical, except for the fact that HCS truncates fractional numbers while Synchro rounds them. In other words, HCS would change “23.8” into “23” while

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Synchro would change it to “24.” Therefore, Synchro model is slightly more conservative (as it may add a vehicle to some movements).

Response to Comment B-2-13. The commenter notes that the WLC will pay nearly \$72 million (M) in TUMF fees and \$41M in DIF fees. Per the TUMF calculation handbook the Total TUMF fees are estimated at \$34M.

Response to Comment B-2-14. The commenter requests the City coordinate TUMF fees with a State-sponsored program to pay for necessary improvements. Please refer to Mitigation Measure (MM) 4.15.7.4E in FEIR Volume 2 (as well as MM Trans-5 in TIA Chapter 11, Section G (FEIR Volume 2 Appendix L). MM 4.15.7.4E, as revised in the FEIR, requires that the developer pay its fair share of the cost of constructing the traffic improvements required to mitigate the project's traffic impacts, identified in EIR Tables 4.15.AT through 4.15.AY, for intersections and road segments (including freeway ramp intersections with local arterials) outside of the City's jurisdiction (i.e., under the jurisdiction of other cities, the County and Caltrans) in order to mitigate the identified programmatic impacts to less than significant levels. The fair share payment requirement shall be imposed as a condition of plot plan approval for each building within the project, and no certificate of occupancy for a building within the project shall be issued until the fair share payment for that building has been paid.

Letter B-3: California Department of Fish and Wildlife (April 8, 2013)

EDMUND G. BROWN, Jr., Governor
CHARLTON H. BONHAM, Director

Letter B-3

April 8, 2013

Mr. Mark Gross
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

Subject: Draft Environmental Impact Report
World Logistics Center Project
State Clearinghouse No. 2012021045

Dear Mr. Gross:

The Department of Fish and Wildlife (Department) appreciates the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the World Logistics Center Project (Project) [State Clearinghouse No. 2012021045]. The Department is responding to the DEIR as a Trustee Agency for fish and wildlife resources (California Fish and Game Code Sections 711.7 and 1802, and the California Environmental Quality Act [CEQA] Guidelines Section 15386), and as a Responsible Agency regarding any discretionary actions (CEQA Guidelines Section 15381), such as the issuance of a Lake or Streambed Alteration Agreement (California Fish and Game Code Sections 1600 *et seq.*) and/or a California Endangered Species Act (CESA) Permit for Incidental Take of Endangered, Threatened, and/or Candidate species (California Fish and Game Code Sections 2080 and 2080.1).

1

Project Description and Geographic Setting

The Project is located within the City of Moreno Valley (City) and is bounded by State Route 60 (SR-60) to the north, Redlands Boulevard to the west, Gilman Springs Road to the east, and the San Jacinto Wildlife Area to the south. The Project involves a General Plan Amendment, new Specific Plan, Change of Zone, and Tentative Parcel Map. The Project proposes 2,635 acres of logistics land uses including up to 41.4 million square feet of high-cube logistics uses and 200,000 square feet of warehouse and related uses.

2

The 2,635 acre Project site is situated directly north of the approximately 20,000-acre San Jacinto Wildlife Area (SJWA) and 8,800-acres Lake Perris State Recreational Area. The Project is bordered to the north and east by the San Timoteo Badlands, which includes Regional Conservation Authorities (RCA) Multiple Species Habitat Conservation Plan (MSHCP) Badlands Plan Area

Proposed Core 3 and Norton Younglove Reserve. Several MSHCP proposed or existing linkages are associated with the SJWA and Proposed Core 3.

Biological Resources and Impacts

The CEQA document should contain sufficient, specific, and current biological information on the existing habitat and species at the Project site; measures to minimize and avoid sensitive biological resources; and mitigation measures to offset the loss of native flora and fauna and State waters. The CEQA document should not defer impact analysis and mitigation measures to future regulatory discretionary actions.

If sensitive species have the potential to occur on the Project site, species-specific surveys should be conducted using methods approved by the Department, or the CEQA document should assume the presence of the species throughout the project site. Surveys should be conducted within 12 months of circulation of the CEQA document. To assist with review, an accompanying map detailing the location of sensitive species or sensitive species habitat should also be included in the subsequent CEQA document.

The Department submitted a comment letter on the Notice of Preparation (NOP) for the DEIR on March 22, 2012. In this letter the Department recommended that the Project applicant and/or lead agency consult with the Department and land management staff from the SJWA for assistance with species occurrence information within the vicinity of the Project site, and for assistance with avoidance, minimization, and mitigation measures. Based on the Department's review of the DEIR, the biological resources section does not provide an accurate account of the species that may be affected by the Project. The Department has identified that key species were excluded from the assessment and that others were documented as having limited to no suitable habitat. The Department recommends that the DEIR be revised following consultation with Department staff.

Current biological survey data (collected between 2006 and 2013), provided by the MSHCP, documents numerous detections of species that were represented in the DEIR as being absent from the Project area or having a low potential to occur onsite due to lack of suitable habitat. Furthermore, most of the data presented in the DEIR was sourced from the California Natural Diversity Database (CNDDDB) and supplemented with incidental sightings documented during species-specific surveys. As previously recommended in the Department's NOP comment letter (March 22, 2012), the Project applicant and/or lead agency should consult with the Department to obtain species information and discuss potential Project impacts.

The DEIR does not provide a complete or accurate assessment of raptor species that use the Project site. Evaluations on the potential impacts to State fully protected Bald Eagle (*Haliaeetus leucocephalus*) and Golden Eagle (*Aquila chrysaetos*) were not conducted, despite documentation of both species occurring onsite or directly adjacent to the Project site (MSHCP 2008, 2011). The DEIR states that the American Peregrine Falcon (*Falco peregrinus anatum*), a State fully protected species, has a low potential to occur onsite, and further elaborates that they have not been recorded within 7 miles of the Project site (CNDDDB 2012). This information is incorrect: biological surveys conducted by the MSHCP have detected the species four times within the Project area.

7

Several State Species of Special Concern were analyzed in the DEIR for their potential to occur within the World Logistics Center Specific Plan (WLCSP) area. The DEIR states that the Ferruginous Hawk (*Buteo regalis*), White-tailed Kite (*Elanus leucurus*), Merlin (*Falco columbarius*), Prairie Falcon (*Falco mexicanus*), and Peregrine Falcon, have only a low potential to occur onsite. Furthermore, the DEIR states that all of these species, with the exception of the Ferruginous Hawk, had not been recorded within 7 miles of the Project site (CNDDDB 2012). Contrary to the information included in the DEIR, MSHCP biologists have detected all of the aforementioned species, and the Tricolored Blackbird (*Agelaius tricolor*), another State Species of Special Concern, either within or adjacent to the WLCSP (MSHCP 2006-2012). Detections by MSHCP include: Ferruginous Hawk ($n = 22$ detections), White-tailed Kite ($n = 14$), Merlin ($n = 3$), Prairie Falcon ($n = 6$), and Peregrine Falcon ($n = 4$).

8

The DEIR recognizes only "marginally suitable" foraging habitat for Loggerhead Shrike (*Lanius ludovicianus*), California Horned Lark (*Eremophila alpestris actia*), Ferruginous Hawk, Merlin, Prairie Falcon, and Burrowing Owl (*Athene cunicularia* [BUOW]). However, based solely on the diversity of species found utilizing the Project area (recorded from biological surveys conducted by the MSHCP, and observations by SJWA land management staff) the habitat is not marginal. The biological resources section does not provide an accurate account of the species that have been documented on the site, or the quality of the habitat that will be impacted by the project. The Department recommends the Project applicant and/or lead agency consult with the Department to accurately identify species occurrences in the vicinity of the Project site, assess the quality of the foraging habitat, and identify avoidance, minimization, and mitigation measures. The Department recommends the DEIR be revised following consultation with Department staff.

9

The DEIR states that State-threatened Stephens' kangaroo rat (*Dipodomys stephensi*) has a low to moderate potential to occur within the World Logistics Center Planning Area, although the "species may range through the general area." The document also claims that there is limited suitable habitat for San Diego jackrabbit (*Lepus californicus bennettii*) and Los Angeles pocket mouse

10

(*Perognathus longimembris brevinasus* [LAPM]), both State Species of Special Concern. However, surveys by the MSHCP detected two (2) San Diego jackrabbit (within 400 meters and 800 meters of the Project area), and multiple Stephens' kangaroo rat (SKR) within 250 meters of the Project area boundary.

10

The Department is concerned with the results of the focused surveys for Los Angeles pocket mouse included in the DEIR. Specifically, the survey results document the capture of two (2) long-tailed pocket mice (*Chaetodipus formosus*) in 2005, and four (4) in 2010; and 87 desert pocket mice (*Chaetodipus penicillatus*) in 2010. The Department questions the accuracy of the identifications as these occurrences are outside of the documented distribution range for these species, and neither species have been trapped by MSHCP biologists who perform regular small mammal trapping surveys within the general area. Because the Department has considerable concern regarding the accuracy of these identifications, the Department requests that new surveys be conducted under the supervision of trained small-mammal biologists.

11

The CEQA document analyzed the potential for California Native Plant Society (CNPS) listed plant species to occur onsite. The DEIR states that no evidence of any CNPS-listed plant species was found onsite, and also concluded that no suitable habitat for CNPS-listed plant species occurs within the Project area. These findings are in contrast to biological surveys performed by the MSHCP that have verified the presence of an individual Coulter's goldfield (*Lasthenia glabrata coulteri*) immediately south of the Project, and much less than the stated 2-mile distance.

12

Foraging habitat

In the Department's opinion, the DEIR has underestimated the relative level of impacts to foraging habitat associated with development of the Project. The Department is also of the opinion that the value of foraging habitat within the Project area has been grossly underestimated. The DEIR states that there is, "marginal foraging habitat for some raptor species" and that "an adverse but not significant impact to raptor foraging habitat is anticipated." As stated previously, the following species have been documented on or adjacent to the Project area: Bald Eagle, Golden Eagle, Osprey, White-tailed Kite, Ferruginous Hawk, Peregrine Falcon, Prairie Falcon, BUOW, Merlin, Barn Owl, Short-eared Owl, Red-shouldered Hawk, and American Kestrel. The diversity of raptor species documented to use the WLCSP area provides abundant evidence of the local and potential regional value of the site as foraging habitat. The Department strongly recommends that the DEIR be revised to include results of additional studies, and that the Lead Agency consult with the MSHCP and land managers at the SJWA, Mystic Lake, and Lake Perris, to identify and assess potential impacts to species and habitats that may have been excluded in prior

13

assessments. The revised DEIR should also identify appropriate mitigation measures to offset the loss of foraging habitat.

13

The DEIR states that Mitigation Measure 4.2.6.1A *"will help maintain raptor and other bird foraging until the WLCSP property is developed."* Additionally, the DEIR anticipates that *"the State would maintain its [CDFW Conservation Buffer Area] function as a buffer and also as foraging habitat for raptors..."* Aside from the temporary measure listed above, and a reliance on the State-owned wildlife area to provide for and maintain raptor foraging habitat, the DEIR fails to propose mitigation measures to offset the permanent loss of foraging habitat. The State-owned SJWA open space areas cannot be used to mitigate the permanent loss of foraging habitat resulting from development of the proposed Project. The revised DEIR should clearly identify impacts to foraging habitat and provide an appropriate mitigation plan to offset the losses.

14

Natural Community Conservation Program (NCCP)

The Department is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and candidate plant and animal species, pursuant to the CESA, and administers the Natural Community Conservation Plan (NCCP) Program. Within the Inland Deserts Region, the Department-issued NCCP Approval and Take Authorization for the Western Riverside County MSHCP per Section 2800, *et seq.*, of the California Fish and Game Code on June 22, 2004. The MSHCP establishes a multiple species conservation program to minimize and mitigate habitat loss and the incidental take of covered species in association with activities covered under the permit.

15

Compliance with approved habitat plans, such as the MSHCP, is discussed in CEQA. Specifically, Section 15125(d) of the CEQA Guidelines requires that the CEQA document discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the MSHCP as a result of this Project is necessary to address CEQA requirements. To obtain additional information regarding the MSHCP please go to:
<http://www.rctlma.org/mshcp/>.

The proposed Project occurs within the MSHCP area and is subject to the provisions and policies of the MSHCP. To be considered a covered activity, Permittees must demonstrate that proposed actions are consistent with the MSHCP and its associated Implementing Agreement. The City of Moreno Valley is the Lead Agency and is signatory to the Implementing Agreement of the MSHCP. The Project is located in subgroups D and X of the Reche Canyon/Badlands Plan Area of the MSHCP.

If the project is not processed through the MSHCP for covered species, then the project is subject to the Federal Endangered Species Act (FESA) and/or CESA for threatened, endangered, and/or candidate species. A CESA Incidental Take Permit (ITP) must be obtained if the project has the potential to result in take of species of plants or animals listed under CESA, either during construction or over the life of the project. The Department's CESA ITP states that a project must fully minimize and mitigate impacts to State-listed resources.

16

Impacts to Waters of the State

Although the proposed Project is within the MSHCP, a Notification of Lake or Streambed Alteration is still required by the Department, should the site contain jurisdictional waters. Additionally, the Department's criteria for determining the presence of jurisdictional waters are more comprehensive than the MSHCP criteria in Section 6.1.2 (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools). The Department is responsible for assessing and evaluating impacts to jurisdictional waters, which is typically accomplished through reviewing jurisdictional delineation (JD) reports, supporting information, and conducting site visits.

A JD was included with the DEIR. The Department has reviewed the JD and strongly disagrees with the jurisdictional findings and the jurisdictional conclusion. Of the 14 drainage features identified in the DEIR, only isolated portions of two (2) drainages were considered to be jurisdiction of the State. According to the JD, the remaining portions of these drainages, and the other 12 features onsite, were not considered jurisdiction of the State, *"because the drainage is ephemeral, unvegetated, provides no cover, and does not appear to [appear to] provide habitat linkage or other benefits to wildlife resources...."* The JD also includes other assumptions of non-jurisdiction, including a lack of *"streambed or any other characteristic that would otherwise define it as CDFG jurisdictional waters"* and the absence of fish and wildlife resources. A non-jurisdictional determination based on any of the characteristics stated above is incorrect. The California Water Code (CWC) defines *Waters of the State* as *"...any surface water or groundwater, including saline waters, within the boundaries of the state."* The definition places no limitations on duration of stream flow, amount or type of vegetation, ability to provide cover, existence of connectivity to any other waterway or habitat area, or perceived lack of benefits to wildlife. The Department requests that the JD be revised using the CWC definition of Waters of the State and submitted to the Department for review. The Department recommends that the JD incorporate the drainages identified in the Hydrology and Water Quality section of the DEIR.

17

The Department opposes the elimination of ephemeral, intermittent, and perennial streams, channels, lakes, and their associated habitats. The Department recommends avoiding stream and riparian habitat to the greatest extent possible.

18

Any unavoidable impacts need to be compensated with the creation or restoration of in-kind habitat either on-site or off-site at a minimum 3:1 replacement-to-impact ratio, depending on the impacts and proposed mitigation. Additional mitigation requirements through the Department's Lake and Streambed Alteration Agreement process may be required, depending on the quality of habitat impacted, proposed mitigation, project design, and other factors. The Department recommends submitting a Lake or Streambed Alteration notification early in project planning, since modification of the proposed project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Lake or Streambed Alteration notification package, please go to <http://www.dfg.ca.gov/habcon/1600/forms.html>.

18

The following information will be required for the processing of a Notification of Lake or Streambed Alteration and the Department recommends incorporating this information into the CEQA document to avoid subsequent documentation and project delays:

- 1) Delineation of lakes, streams, and associated habitat that will be temporarily and/or permanently impacted by the proposed project (include an estimate of impact to each habitat type);
- 2) Discussion of avoidance and minimization measures to reduce project impacts; and,
- 3) Discussion of potential mitigation (as defined in Section 15370 of the CEQA guidelines) measures required to reduce the project impacts to a level of insignificance.

19

In the absence of specific mitigation measures in the CEQA document, the Department believes that it cannot fulfill its obligations as a Trustee and Responsible Agency for fish and wildlife resources. Permit negotiations conducted after and outside of the CEQA process are not CEQA-compliant because they deprive the public and agencies of their right to know what project impacts are and how they are being mitigated (CEQA Section 15002).

20

Impacts to Surrounding Lands and Associated Species

As previously stated, the Department provided comments on the NOP for this Project on March 22, 2012. The Department recommended analysis of impacts on the adjacent SJWA and species that may utilize this area. Suggested areas of analysis provided by the Department included potential impacts to species and habitats as a result of development of the Project and associated light, noise, trash, emissions, vectors, fuel management, runoff and water quality. Because the DEIR provides only minimal information pertaining to these suggested areas of analysis, the Department is unable to provide an adequate review of the potential impacts of the Project to wildlife and habitats on the adjacent SJWA. The Department requests that impacts to wildlife and habitat adjacent to the Project are thoroughly analyzed using appropriate studies to determine suitable mitigation

21

measures. In the absence of specific mitigation measures in the CEQA document, the Department believes that it cannot fulfill its obligations as a Trustee and Responsible Agency for fish and wildlife resources.

21

Wildlife Movement

The DEIR states that the Project will not restrict wildlife movement to and from the San Timoteo Badlands (Badlands) and SJWA/Mystic Lake area. As proposed, the project will abut the Badlands along portions of its northern border as well as its nearly 2-mile long eastern border at Gilman Springs Road, creating an obstruction to wildlife movement between the Badlands and open areas to the south (Existing Core H of the MSHCP, Mystic Lake, Lake Perris, and SJWA). Though a narrow connection between the Badlands and open space areas to the south are anticipated through future acquisitions within Proposed Core 3 of the MSHCP, this limited connection is conceptual and has not been finalized. The proposed Project will create a nearly 2-mile long physical barrier between the Badlands and MSHCP Proposed Core 3 to the north, and the SJWA and existing Core H to the south.

22

Data collected from three culvert crossings under SR-60, located just north of the Project area, has demonstrated extensive wildlife movement activities adjacent to the proposed Project. Species observed using the crossings include: bobcat, badger, coyote, deer, long-tailed weasel, black-tailed jackrabbit, and desert cottontail. Future phased development of the Project, along with associated increases in traffic, lighting, and noise, will likely directly negatively impact wildlife through direct mortality, or alter movement patterns by forcing wildlife to move east or west, away from the Project, and by precluding the ability of wildlife to use the existing culverts under SR-60. Furthermore, the project and related growth-inducing effects will likely contribute to a need for the creation of new roads, new or improved interchanges, and widening of existing roadways, such as Gilman Springs Road and SR-60. These future road improvements will result in impacts to the existing culverts that are used as wildlife crossings. The Department requests that studies be conducted to understand the potential impacts of the Project on wildlife movement within and adjacent to the Project site. Mitigation measures focusing on reducing impacts to wildlife (e.g., direct mortality) and wildlife movement within the geographic setting of the Project area should be provided, such as contributions towards wildlife crossings under Gilman Springs Road and designing low-impact solutions to widening roadways, such as SR-60, over existing wildlife crossings.

23

Predation effects

The Project proposes the construction of 60-foot tall buildings and installation of cottonwood trees along the southern edge of the Project area, adjacent to the SJWA. The DEIR states that the buildings will provide a benefit to raptors, as

24

they may be used as perching structures. However, the Department would like to point out that the provision of such perching structures may also result in increased levels of predation in open space areas adjacent to the development, including the SJWA. The Department recommends that all buildings and other potential perching structures be constructed a minimum of 250-meters away from surrounding open space areas.

▲
24

Lighting

The DEIR states that night lighting may have adverse affects on a range of wildlife species. Affects include mortality due to increased predation, reduced health due to the disturbance of diurnal rhythms, and reduced clutch size, egg size, or survival of nesting birds. Although the Project intends to remain consistent with both the night lighting guidelines within the City's Municipal Codes and the City's Dark Sky Lighting Ordinance, the Department requests that additional measures be proposed to reduce or eliminate the long-term cumulative lighting impacts to the SJWA. Additionally, as some phases of the construction schedule propose the use of continuous lighting (i.e., 24-hour-per-day, 7-days-per-week) over extended periods of time, construction lighting may result in negative impacts to wildlife species. The Department requests that the DEIR be revised to include an assessment of the effects of all phases of construction lighting on adjacent habitat and associated species, and appropriate mitigation measures be incorporated to reduce or eliminate these impacts. .

25

Noise

The Project will produce increased noise levels that will reach the SJWA during both the construction phases of the Project and throughout the long-term operation of the facility; the DEIR states that noise levels will exceed 60 dBA roughly 1,000 feet into the SJWA during construction of the southernmost areas of Phase 2. As stated in the DEIR, increased noise levels near wildlife areas can affect mammals, birds, and other species by contributing to behavioral changes, such as increased startling of birds (especially harmful during nesting periods), changes in foraging patterns, sleep pattern disruption, and decreased overall condition/health from noise stress. Increased noise levels may also indirectly affect wildlife species by decreasing the habitat value of certain areas, resulting in decreased occupancy or use.

26

As estimated in the DEIR, some phases of the on-site construction schedule may occur on a continuous basis (24-hour-a-day, 7-day-per-week) and continue periodically over a nine-year period. The Department is concerned that such an extensive construction term and schedule may adversely impact species known to utilize the adjacent open space areas.

27

Although mitigation measures for short-term construction noise were proposed in the DIER, the measures focus solely on human residences, and do not consider measures for the adjacent SJWA and other nearby open space areas. The Department requests that the DEIR be revised to include measures that will reduce or eliminate the potential for construction noise entering the SJWA and other open space areas.

28

Trash

The Project has the potential to contribute increased amounts of trash to the neighboring SJWA and other adjacent open space areas, which may result in an added burden to land management obligations. The Department recommends the Project provide a minimum 250-meter setback between the development and SJWA and other open space areas to minimize the potential for increased land management obligations. The setback area should be maintained free of trash and debris in perpetuity to ensure that the SJWA and the land management obligations of the SJWA are not adversely impacted by the development and long-term operation of the Project site.

29

Greenhouse Gas Emissions

The Department is committed to reducing the effects of climate change on the State's natural resources and implementing legislative requirements addressing greenhouse gas emissions. The Natural Resources Agency adopted new guidelines on December 31, 2009, requiring lead agencies to analyze greenhouse gas (GHG) emissions under section 15064.4 of the CEQA Guidelines during CEQA review. Assembly Bill 32, the California Global Warming Solutions Act, established a state goal of reducing GHG emissions to 1990 levels by the year 2020 (a reduction of approximately 25 percent from forecast emission levels). Senate Bill 97, a "companion" bill directed amendments to CEQA statutes to specifically establish that GHG emissions and their impacts are appropriate subjects for CEQA analysis. Senate Bill 375 calls on California's urban regions to develop coordinated plans for reducing GHG emissions through more efficient transportation and development patterns. Regional transportation agencies, in coordination with local governments, must now design "Sustainable Communities Strategies" (SCSs) to achieve mandated GHG emissions reduction targets from automobiles and light trucks.

30

The Project appears to be counter to legislative and executive efforts to reduce GHG emissions as the Project is located at a considerable distance from ports, railroads, airports, and major freeways. The Project will likely emit greenhouse gases during both pre- and post-construction from: vehicle mileage trips to the site, energy to run the facility, water supply, and landscape maintenance equipment. Furthermore, land use conversion of the Project site, from agricultural to a warehouse facility, will reduce the ability of the existing Project site to sequester

31

carbon. The Department recommends that the subsequent CEQA document include a quantitative analysis that includes, but is not limited to, the primary sources of GHG emissions associated with the project pre- and post-construction, including: vehicular traffic, generation of electricity, natural gas consumption/combustion, solid waste generation and water usage. An assessment of the potential direct and indirect effects of Project-associated GHGs should be provided, including the loss of open space for sequestering carbon, the extent of change in GHGs compared to the existing environmental setting, and the potential conflicts with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. The revised DEIR should include an analysis of the potential direct and indirect impacts of GHGs and appropriate mitigation should be proposed for these impacts.

31

Vector control

The Project area and adjacent open space lands are used by a multitude of sensitive species. Following build-out, the Project may implement a vector control plan to address vectors such as rats, mice, gophers, ground squirrels, and mosquitoes. The Department is concerned with the potential risks of primary or secondary poisoning on the wildlife species that use the adjacent open space areas. Secondary poisoning occurs when scavenging species eat dead or dying rodents that have been killed by rodenticides. Owls, hawks, other scavenging birds and predators such as raccoons, foxes, skunks and coyotes are at risk. If chemical rodenticides are necessary, the Department recommends the use of bait products that contain the ingredients chlorophacinone or diphacinone. These compounds require multiple feedings to kill rodent pests, so they pose a lower secondary poisoning risk compared to rodenticides used to control mice and rats within homes, barns or other buildings. Over-the-counter rodenticides - including many commonly known brands that contain the active ingredients brodifacoum, bromadiolone or difethialone - can only be legally used to control rats and house mice in and very close to structures. It is not legal to use these products in open areas such as pastures or fields and they should not be used adjacent to open space areas.

32

The Project also includes the construction of detention basins and swales to treat onsite stormwater runoff. Stormwater treatment control best management practices (BMPs) and other basins can increase potential mosquito/vector control breeding habitat. It is in the interest of the City and the Department to offer the public the highest level of protection from vectors while also protecting natural resources and reducing the use of pesticides. The Department encourages the City to use preventative planning, compatible design, and effective long-term maintenance to avoid or reduce vectors. City should refer to the California Health & Safety Code § 2000-2093 for definitions and liabilities associated with the creation of habitat conducive to vector production and to guidance provided by the local mosquito and vector control districts/agencies. Please be aware that

33

some vector control measures may have associated environmental impacts and require notification pursuant to the Department's Lake and Streambed Alteration Program.

33

Fuel Management

The DEIR references the MSHCP Fuel Management Guidelines and states that all brush management will occur entirely within the Project boundary. However, the DEIR does not provide a description of the types of proposed fuel management activities, where fuel management areas will be located, the size of the fuel management areas, or the type(s) of vegetation that will be planted, if any, within the fuel management area. The Department recommends the DEIR be revised to provide a fuel management plan that includes a detailed plant palette, proposed maintenance activities, graphics that clearly define fuel modification zones with reference to the Project development, and an assessment of current and long-term potential impacts related to the fuel management area and associated maintenance activities.

34

Drainage Features and Hydrology

Development and operation of the Project will alter existing hydrology and drainage patterns within the Project site, and on adjacent properties, including Mystic Lake and the SJWA. According to Figure 4.9.1 of the DEIR, five of the total six watersheds within the Project boundary eventually drain to the SJWA. Drainage from the Project area will either, *"...be directed to the regional storm drain system and away from the adjacent open space, or treated by water quality and retention basins to maintain historical runoff rates and patterns..."* All storm water runoff coming from north of SR-60 or from north of Gilman Springs Road will be conveyed to storm water facilities and eventually discharged to adjacent lands or other facilities.

35

Offsite improvements are mentioned briefly within the Project Description section of the DEIR. These improvements include, but are not limited to, the construction of four debris basins east of Gilman Springs Road, drainage improvements to the east of the Project boundary between Cactus Avenue and Brodiaea Avenue, and interchange improvements along SR-60. The DEIR does not provide a description these improvements nor does it assess the biological impacts associated with the construction and perpetual maintenance of these facilities. Some, if not all of these facility improvements are required to develop the Project, and would be directly related to and constructed in conjunction with the Project, therefore, a biological and environmental impact assessment should be completed and disclosed in the revised DEIR.

All watershed areas, except Watershed E, will contain detention basins to mitigate onsite flows. Watersheds C and D are provided a "spreading area" while

36

Watersheds C, D, E, and F all contain discharge points at which the flows being conveyed through the Project area will be released onto adjacent properties. The DEIR does not provide information regarding the size, capacity, design, function, or maintenance requirements of the retention and/or detention basins, "spreading area", or discharge points. The DEIR also does not explain how the drainage facilities and discharge points will "...maintain historical runoff rates and patterns..." once they exit the Project site, except by stating that drainage systems that discharge into existing downstream facilities would be designed to not exceed existing discharge levels.

36

The DEIR states that Drainage 9 (referred to as Line "E" in the Hydrology and Water Quality Section of the DEIR) will be protected in its natural state and provided a minimum 25-foot setback from the banks. However, the Hydrology and Water Quality section of the DEIR proposes reinforced concrete box culverts at the Alessandro Boulevard and Brodiaea Avenue crossings and a realignment and improvement of a lateral connecting to this Drainage. The DEIR also states that runoff from north of SR-60 would be routed to this channel. If the intention to preserve this channel is based on its biological values and functions, the Department recommends that this buffer be greatly increased and the addition of any proposed structures be reconsidered.

37

Overall, the DEIR contains limited information pertaining to impacts associated with the capture of offsite drainages (offsite debris basins), retention of those drainages, and subsequent controlled release of these waters to the adjacent SJWA. It is also unclear whether post-construction onsite storm-water runoff will be released from detention basins to downstream lands. The Department is concerned that State-owned land may be adversely impacted by the compounded point releases of flows that may have normally sheet flowed or traveled within numerous smaller drainages. The Department recommends the DEIR be revised to include specific and detailed plans for all drainage control facilities, including the offsite debris basins and any proposed outlet facilities. The revised DEIR should also disclose and analyze impacts associated with these facilities, and provide appropriate mitigation to offset impacts.

38

Water Quality

The DEIR does not provide sufficient information for the Department to review the potential impacts of the Project on water quality. The Department is particularly concerned with the impact of the Project on surface waters flowing offsite into the SJWA and Mystic Lake. The discussion of water quality in the DEIR focuses on future compliance with the NPDES and General Construction permit process. Deferred analysis of Project impacts is not sufficient and compliance with State laws regarding water quality does not preclude impact(s). The revised DEIR should include specific analysis of anticipated water quality impacts or assume impacts and propose specific mitigation. The deferred

39

analysis included in the DEIR does not disclose impacts. Furthermore, all future projects constructed subject to the specific plan will require subsequent CEQA analysis.

39

Buffer and Setback Areas

Throughout the DEIR, the approximate 910 acres of State-owned land adjacent to the southern boundary of the Project area is referred to as the "CDFW Conservation Buffer Area." The DEIR states that *"the CDFW Conservation Buffer Area was originally purchased by the State to provide a buffer between SJWA/Mystic Lake and future development within the Moreno Highlands Specific Plan."* Although the acquisition of the lands broadened the area between potential future developments and recreational uses at the then northern border of the SJWA, providing a buffer was not the sole purpose of the acquisition. Lands that comprise the "CDFW Conservation Buffer Area" include agricultural properties that were purchased by the CDFW from individual land owners through grants attained under the Safe Neighborhood Parks, Clean Water, Air & Coastal Protection Bond Act (Prop 12). The lands were purchased by the CDFW and incorporated into the SJWA to expand the existing wildlife area, provide upland refuge for SKR during flooding events at Mystic Lake, and to contribute toward the preservation of a wildlife corridor between the SJWA and the Badlands. The Department agrees that these lands should be rezoned/designated as Open Space; however, the lands cannot be used to offset impacts associated with development of the Project, provide for the Project's open space requirements, provide a setback/buffer from the Project, or to mitigate/minimize impacts resulting from the Project.

40

The Specific Plan provides for a 400-foot setback along the southern boundary of the Project, adjacent to the SJWA, which includes a 250-foot development setback and a 150-foot building setback. The 250-foot development setback is proposed to include landscape areas, drainage and water quality facilities, barriers (walls and fencing), maintenance access drives, and other related uses. As this area includes maintained, engineered facilities required by the development, it cannot be considered as a setback or buffer from development. Rather, it should be considered a component of the development.

41

As the Department previously stated, the DEIR does not provide sufficient information on potential impacts to species, habitat, and the SJWA itself, from fuel management, water quality, lighting, noise, trash, predation effects, vector control, and GHG emissions. To help mitigate these impacts the Department recommends that the Project provide a minimum 250-meter natural/undeveloped buffer within its own development footprint. The 250-meter setback/buffer area should not contain any manufactured structures, such as detention and water quality basins, walls and fences, or irrigated landscaping.

42

LAPM, BUOW, and Sensitive Plants

Mitigation measures 4.4.6.2A, 4.4.6.4C, and 4.4.6.4E describe proposed relocation efforts planned for sensitive plants, LAPM, and BUOW. The measures propose that these species be relocated onsite, within the 250-foot setback area, and that the area be considered a conservation area for plant or animal species that need to be relocated due to development of the Project. However, the DEIR also states that the 250-foot setback area may be used for, *"landscaping, drainage and water quality facilities, fences and walls, maintenance access drives, and similar related uses."* The DEIR also proposes that the 250-foot buffer area will provide mitigation for indirect impacts of air pollutants on adjacent wildlife. The Department is very concerned with the appropriateness of these mitigation proposals. The 250-foot setback area cannot be used as described above, and also serve as a relocation and conservation area for sensitive species.

43

Air Pollutants

The DEIR states that, *"The 250-foot setback ...and the presence of the CDFW Conservation Buffer Area, will effectively mitigate potential indirect impacts of air pollutants...on wildlife within the SJWA."* As stated previously, the State-owned SJWA cannot serve as mitigation for Project impacts. Potential indirect impacts on wildlife and habitats associated with the SJWA should be fully disclosed, assessed, and mitigated within the Project's boundary, and not deferred to the adjacent state-owned wildlife area.

44

Cumulative Impacts

The Project is proposed in a rapidly developing region of southern California. The regional scarcity of biological resources may increase the cumulative significance of Project activities. Cumulative effects analysis should be developed as described under CEQA Guidelines Section 15130. Cumulative impacts analysis should include the Project's contribution to greenhouse gas emissions and impact on regional air quality. Please include all potential direct and indirect project related impacts to streambeds, riparian areas, wetlands, vernal pools, alluvial fan habitats, wildlife corridors, wildlife foraging habitats, or wildlife movement areas, aquatic habitats, sensitive species and other sensitive habitats, open lands, open space, and adjacent natural habitats in the cumulative effects analysis.

45

Alternatives Analysis

The CEQA document should analyze a range of alternatives which would avoid or otherwise minimize impacts to sensitive biological resources. The DEIR analyzed six project alternatives including: 1) No Project/No Build; 2) No Project/Existing General Plan; 3) Alternative 1: Reduced Density; 4) Alternative

46

2: Mixed Use A; 5) Alternative 3: Mixed Use B – MHSP with logistics warehousing; and 6) Alternative Sites. Although these alternatives were analyzed, none of the options focused on reducing impacts to biological resources. Alternative 1: Reduced Density option decreases the logistics warehousing development from 41.6 million square feet (msf) to 29 msf, but does not reduce the Project footprint or increase open space areas. Mixed Use A (Alternative 2) maintains the same acreage of impact as the proposed project, but provides for other uses including light manufacturing, retail commercial, and professional offices. Mixed Use B (Alternative 3) is nearly identical to the No Project/Existing General Plan alternative with the exception of swapping 603 acres of business, retail, institutional, and other uses for logistics warehousing. In the Department's opinion the DEIR fails to propose and analyze a full range of alternatives, and as such, the Department is unable to fulfill its obligations as a Trustee Agency.

46

The Department considers Rare Natural Communities as threatened habitats, having both local and regional significance. Thus, these communities should be fully avoided and otherwise protected from Project-related impacts. The CEQA document should include an evaluation of specific alternative locations with lower resource sensitivity where appropriate. Off-site compensation for unavoidable impacts through acquisition and protection of high-quality habitat should be addressed.

47

Please note that the Department generally does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered species. Department studies have shown that these efforts are experimental in nature and largely unsuccessful.

48

Department Recommendations

The Department has the following concerns about the Project, and requests that these concerns be addressed in a revised DEIR:

1. The revised DEIR should include current biological data based on all available information. The Department recommends that the Project applicant/Lead Agency consult with staff from the Department (including SJWA land management) and MSHCP to obtain species occurrence information, assist in the identification of cumulative impacts, and to aid in the development of appropriate avoidance, minimization, and mitigation measures. If sensitive species may occur within the project area, species specific surveys, conducted at the appropriate time of year and time of day, should be included in the revised DEIR. Acceptable species specific surveys have been developed by the Department, and by the U.S. Fish and Wildlife Service, and are accessible through each agencies websites.

49

2. The Department recommends that the JD be revised to include all jurisdictional areas per the CWC's definition of *Waters of the State*. Subsequent to the revision of the JD, the revised DEIR should reevaluate the impacts to the streambeds, including potential indirect impacts both upstream and downstream of the Project area, and provide appropriate avoidance, minimization and mitigation measures for the impact to, and/or loss of streambeds and their associated habitats. The analysis in the revised DEIR should satisfy the requirements of the Department's Lake and Streambed Alteration Program and CESA (if deemed necessary). 50
3. The Department recommended analysis of several potential impacts to wildlife resources on the adjacent SJWA and Lake Perris Recreation Area in its March 22, 2012 NOP comment letter. Topics suggested for analysis included: light, noise, trash, emissions, habitat connectivity, fuel modification, vector control, and runoff. These topics were not adequately identified and analyzed in the DEIR. The Department recommends the DEIR be revised to include these topics, and that further focused analysis and studies, including additional topics listed in this letter, be conducted to determine the impacts resulting from the Project. Appropriate minimization and mitigation measures should also be identified in the revised DEIR to offset these impacts. 51
4. To reduce impacts to adjacent open space areas, the Department recommends the Project incorporate a 250-meter setback area along its southern boundaries, and within Project's footprint, where the Project abuts open space areas (including the SJWA). The Department reiterates that the setback area should be independent of any State-owned lands. The revised DEIR should not refer to the SJWA as a "CDFW Conservation Buffer Area", nor should it defer its mitigation obligations or compensatory measures to the SJWA or other adjacent open spaces lands. 52
5. The DEIR should be revised to incorporate appropriate, species-specific mitigation measures to address potential impacts to species and habitat. Specifically, revisions should address the mitigation measures proposed for Los Angeles pocket mouse, Burrowing Owl, and sensitive plants. 53
6. The revised DEIR should provide a thorough analysis of direct, indirect, and cumulative impacts and identify specific measures to offset such impacts. As previously stated, the revised DEIR should include all potential direct and indirect project related impacts to streambeds, riparian areas, wetlands, vernal pools, alluvial fan habitats, wildlife corridors, wildlife foraging habitats, or wildlife movement areas, aquatic habitats, sensitive species and other sensitive habitats, open lands, open space, 54

and adjacent natural habitats. The cumulative impacts analysis should also include an assessment of the Project's contribution to GHG emissions and regional air quality.

54

7. The revised DEIR should analyze a range of fully considered and evaluated alternatives to the Project (CEQA Guidelines Section 15126.6). It is the Department's opinion that the DEIR currently fails to propose and analyze a full range of alternatives, and as such the Department is unable to fulfill its obligations as a Trustee Agency.

55

In summary, the Department requests that the revised DEIR include current information regarding biological resources, an updated JD and impact analysis for State Waters, assessments and studies to determine the impacts to surrounding lands and associated species, appropriate mitigation measures, a thorough analysis of cumulative impacts, and an analysis of a broader range of Project alternatives. If you should have any questions pertaining to these comments, please contact Kimberly Freeburn Marquez at (909) 945-3484.

56

Sincerely,

Jeff Brandt
Senior Environmental Scientist

RESPONSES TO LETTER B-3

California Department of Fish and Wildlife

Response to Comment B-3-1. The City acknowledges the California Department of Fish and Wildlife's (CDFW) role as both a responsible and trustee agency, and its subsequent permitting authority under Fish and Game codes. Moreover, the City recognizes the important role the CDFW has in the California Environmental Quality Act (CEQA) review process for this project, and has addressed the CDFW's comments in the following responses.

Response to Comment B-3-2. This comment accurately reflects the characteristics of the World Logistics Center (WLC) project and the various Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) areas and constraints in the vicinity of the WLC project. It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment B-3-3. The Environmental Impact Report (EIR) contains sufficient, specific, and current data on both habitat and species within the WLC area, and does analyze potential impacts of the WLC project on these biological resources. However, the commenter must keep in mind that the EIR is a programmatic document, and a number of comments made by the commenter mistakenly assume the EIR is a project-level document (e.g., Responses to Comments B-3-33, B-3-34, etc.). Due to the level of information currently available about the WLC project, a programmatic EIR is the most appropriate CEQA compliance document at this time. The EIR clearly states that more detailed CEQA analysis will be performed once more specific project-level data and plans are submitted to the City for review (future site plans, plot plans, etc.) consistent with the programmatic WLC Specific Plan. The Draft Environmental Impact Report (DEIR) provides mitigation at a programmatic level, but does rely on implementation at the project level once specific development plans are submitted. The DEIR mitigation measures contain sufficient performance standards so that mitigation of project impacts is not deferred but rather will be applied to future discretionary permit applications, including obtaining permits from the Department as appropriate (e.g., Streambed Alteration Agreements for onsite drainages if they are state jurisdictional).

Response to Comment B-3-4. The surveys have been updated and provided in the updated Habitat Assessment and MSHCP Consistency Analysis (FCS 2013- Final Environmental Impact Report (FEIR) Volume 2 Appendix E-1) (hereafter MSHCP Consistency Analysis). Table B-3.A below includes a summary of the biological surveys addressing the request of the CDFW.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table B-3.A: Summary of Survey Types, Dates, Locations, and Staff

Report Year	Field Date(s)	Survey	Parcel Name	Staff

2012	July 1-6	Los Angeles Pocket Mouse Focused Surveys	WLCSP	K. Rios
2013	June 13, 20, 21, 27, July 3, 7, and 9	Burrowing Owl Focused Surveys	WLCSP	D. Hameister T. Molioo S. Crawford Z. Ziade L. Westmoreland C. Lytle
2013	July 8-11	Los Angeles Pocket Mouse Focused Surveys	WLCSP	K. Rios S. Crawford

Response to Comment B-3-5. Throughout the preparation of the CEQA document, attempts were made to contact SJWA staff to obtain local sensitive species information that was not previously included in the California Natural Diversity Data Base (CNDDB 2013) or obtained from Resource Conservation Authority (RCA) staff. Geographic Information Systems (GIS) data regarding the San Jacinto Wildlife Area (SJWA) and surrounding area was provided and is included in the MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1). The updated MSHCP Consistency Analysis provides an accurate account of the species that may be affected by WLCSP development. Additional consultation with CDFW is not required.

Response to Comment B-3-6. The Department's NOP comment letter recommended the City consult with the Department to obtain species information and discuss potential project impacts. Based on recent studies, six California species of concern occur within the WLCSP area and include black-tailed jackrabbit, northwestern San Diego pocket mouse, logger-headed shrike, California horned lark, white-tailed kite, western burrowing owl. All six of these species are covered under the MSHCP. There are no species of concern potentially occurring within the WLCSP that are not covered under the existing MSHCP. Since, the CDFW is a participating agency in the MSHCP, consultation with CDFW was completed as part of the MSHCP process and additional consultation is not required. Contact was made with Dr. Heather Pert of CDFW at the June 5, 2013 "Consultant Toolkit for MSHCP Implementation" with regard to preliminary consultation on species present. An email was sent to Dr. Pert and other CDFW staff (particularly staff at the SJWA) for permission to survey the Conservation Buffer Area in 2013. Dr. Pert replied on June 18, 2013 stating, *"We are unclear why you need surveys for that area. It is already in conservation and therefore does not need surveys for rezoning. Please explain the need for surveys."*

The project biologist followed with another email dated June 19, 2013. This project biologist stated:

"We received multiple comments on the DEIR concerning the area and the fact that while no direct impacts would occur from the project, there could be indirect impacts. Do you have any recent studies on this area that we could use in our document on what is present in the area? I have no problem not surveying the area as I agree there are no impacts to the zone change, but I also need to be able to address comments. Information from the Department would help resolve the problem and in reality make for a stronger document."

This was followed by a reply from Dr. Pert on June 19, 2013 stating, *"It does seem appropriate for the CDFW to share our survey information with you for that area. Our information is from the RCA bio-monitoring surveys. My understanding is that the RCA recently provided data to MBA, for a possible project across Gilman Springs Road at the abandoned golf course. The radius was five miles so MBA should already have the data for San Jacinto Wildlife Area."*

This constituted our consultation with CDFW. The RCA data specifically for the WLCSP was also obtained from the RCA and used in both the surveys conducted by the biological consultant in 2013 and in revisions to the MSHCP Consistency Analysis.

Response to Comment B-3-7. The commenter states that the DEIR does not provide a complete or accurate assessment of raptor species that use the project site. Based on the RCA data and onsite field surveys, the following raptor species were recorded to occur with the SJWA:

- Bald Eagle
- Golden Eagle
- Burrowing Owl
- Cooper's Hawk
- Ferruginous Hawk
- Merlin
- Northern Harrier
- Peregrine Falcon
- Prairie Falcon
- Turkey Vulture
- White-tailed Kite

Suitable nesting and foraging habitat for all of these species is known to occur within the SJWA. However, suitable foraging and nesting habitat does not occur within the WLCSP for many of these species such as bald eagle, Cooper's hawk, peregrine falcon, and prairie falcon. For the majority of these species, raptor use of the WLCSP is limited to migratory paths that lead to or away from the SJWA. Removal of extensive agricultural areas will not affect migratory patterns to and from the SJWA. Raptor species observed within the WLCSP include northern harrier, turkey vulture, white-tailed kite, red-shouldered hawk, and red-tailed hawk. All of which, are known to forage in open disturbed habitats, similar to the disked agricultural fields in the WLCSP.

Due to the relatively close proximity of the SJWA, which contains moderate to high quality raptor foraging habitat, there is a potential for the loss of low-quality foraging habitat for California fully protected species such as golden eagle and white-tailed kite. Any impact to California fully protected species is considered a potentially significant impact requires mitigation. These species are considered covered under the MSHCP and payment of the MSHCP Development Fee may be used to purchase off-site habitat within core conservation areas that will provide long-term conservation of moderate to high quality foraging habitat. This will reduce project-related impacts to a less than significant level.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment B-3-8. Comments were made about inaccurate information provided for several State Species of Special Concern. These comments are accurate. At the time of the DEIR submittal in early 2013, RCA data was not obtained at that time. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), which included information from RCA Biological Monitoring Programs, it was noted that all of these species were recorded to occur on or within the immediate vicinity of the survey area. This changed the potential for these species to occur onsite from low to moderate. However, these species are still covered under the MSHCP and payment of the fee is the appropriate mitigation for any potentially significant impacts to these species.

Response to Comment B-3-9. The commenter states that an accurate account of the species and habitat on the project site have not been adequately provided by the DEIR. Based on the RCA data and numerous field visits, and consultation with CDFW as outlined in Response to Comment B-3-6, the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1) takes into consideration all of the available occurrence data. However, this does not change the foraging habitat quality. The foraging habitat on site consists of actively disked wheat fields, which is plowed dirt for most of the year, with the exception of the winter wheat growing season. Fields are typically disked at least twice a year. The soils within the survey area are powdery, which makes it very difficult for burrowing mammals to live. The vegetation is monotypic and has no species diversity. Due to the disturbed nature of the habitat, the prey base is also limited and does not provide an abundant food source. The WLCSP provides for a 250-foot buffer area between the proposed development and the SJWA to avoid direct impacts to species associated with the SJWA. Barrier fences will be installed to prohibit human trespass onto the SJWA from the project area, which will minimize impacts associated with human interactions. Mitigation will consist of payment of the MSHCP fee, which may be used to purchase off-site lands for future conservation.

Response to Comment B-3-10. The CDFW described MSHCP surveys that detected two State Species of Special Concern within 250 meters (820.2 feet) and 400 meters (1,312.3 feet) of the project site. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), the San Diego jackrabbit is considered present within portions of the WLCSP. In addition, SKR was revised to be a high potential to occur within suitable habitat areas in the WLCSP. LAPM trapping efforts were conducted on several occasions over the years and have not been recorded to occur within the WLCSP. This species is considered absent from the WLCSP (also refer to Response to Comment A-6-15).

Response to Comment B-3-11. The CDFW is concerned with the results of the focused surveys for LAPM included in the DEIR. Protocol level surveys were conducted by FCS biologist Kelly Rios, who has approximately 20 years of experience trapping mammal species throughout southern California. Protocol surveys were conducted in 2013 in all areas of the WLCSP and off-site infrastructure areas that contain suitable habitat for Los Angeles pocket mouse (LAPM). During the trapping effort, field measurements were taken for each individual species captured and identification was verified by Philip Verne, another highly experienced mammalogist that has worked closely with Kelly on several projects. The 2013 survey report is included as an appendix in the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1). Based on the findings in the report, the following species were identified as being present on the site and confirmed by Philip Verne, deer mouse (*Perognathus maniculatus*), desert pocket mouse (*Chaetodipus penicillatus*), northwestern San Diego pocket mouse (*Chaetodipus fallax*), Western harvest mouse (*Reithrodontomys megalotis*), and desert woodrat (*Neotoma lepida*). In 2005 and 2010, northwestern San Diego pocket mouse was misidentified as long-tailed pocket mouse (*Chaetodipus formosus*) and has been corrected.

Response to Comment B-3-12. It is the CDFW's opinion that the DEIR contradicts finding by biological surveys performed by the MSHCP that have verified the presence of Coulter's goldfield less than 2-miles south of the project site. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), suitable habitat for this species does not occur within the project

site. Coulter's goldfield occurs in marshes, swamps and wetlands, all of which occur within the SJWA (within 1 mile of the WLCSP). This habitat does not occur within the WLCSP and project development will have no impacts to Coulter's goldfields.

Response to Comment B-3-13. The CDFW expressed their opinion that the DEIR has underestimated the relative level of impacts to foraging habitat associated with development of the project. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), impacts to raptor foraging habitat were considered potentially significant. Mitigation will be provided by the payment of the MSHCP mitigation fee. These fees are designed to be used to purchase off-site lands that will provide suitable foraging habitat for raptor species as part of the MSHCP consistency. Previous consultation with CDFW is outlined in Response to Comment B-3-6. Future consultation with CDFW during project-specific development is always recommended, but not required.

Response to Comment B-3-14. Based upon comments received on the DEIR, additional studies are necessary to determine if the loss of raptor foraging habitat is considered significant. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), raptor species that commonly use the WLCSP area for foraging are common raptors that have adapted to urbanization, such as red-tailed hawks, red-shouldered hawks, and white-tailed kites. These raptors are commonly observed in urbanized areas and the loss of poor-quality foraging habitat is not considered a potentially significant impact requiring mitigation.

Due to the relatively close proximity of the SJWA, which contains moderate to high quality raptor foraging habitat, there is a potential for the loss of low-quality foraging habitat for California fully protected species such as golden eagle and white-tailed kite. Any impact to California fully protected species is considered a potentially significant impact requires mitigation. These species are considered covered under the MSHCP and payment of the MSHCP Development Fee may be used to purchase off-site habitat within core conservation areas that will provide long-term conservation of moderate to high quality foraging habitat. This will reduce project-related impacts to a less than significant level.

In addition, the 250-foot buffer area along the southern portion of the WLCSP will be a transitional area from landscape vegetation to native habitat that will continue to the SJWA boundary. Currently, the CDFW Conservation Buffer Area is maintained as extensive agricultural fields, similar to current conditions within the WLCSP. Although the WLCSP project does not propose to use this area as mitigation, it should be noted that removing agricultural activities within the SJWA will greatly increase the quality of the adjacent foraging habitat. The introduction of landscape trees, shrubs, and light poles within the WLCSP will provide additional perching areas for raptors.

Response to Comment B-3-15. The commenter states that an assessment of the impacts to the MSHCP as a result of this project is necessary to address CEQA requirements. A complete description of MSHCP consistency is included in the updated MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), no additional response required.

Response to Comment B-3-16. The commenter states that if the project is not processed through the MSHCP for covered species, then the project is subject to the Federal Endangered Species Act (FESA) and/or California Endangered Species Act (CESA) for threatened, endangered, and/or candidate species. All information within the comment is adequately described and necessary if the project is not processed under the MSHCP. As noted in Response to Comment B-3-15, a complete description of MSHCP consistency is included in the updated MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment B-3-17. The commenter declares that a Notification of Lake or Streambed Alteration may be required if the site contains jurisdictional waters. All identifiable and potentially jurisdictional drainages on the site were mapped and included in the DEIR and the draft wetland delineation. Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the 1987 Regional Supplement to the United States Army Corps of Engineers (USACE) Wetland Delineation manual: Arid West Region and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the Regional Water Quality Control Board (RWQCB) and CDFW.

The applicant will secure a jurisdictional determination with the USACE and confirm with the RWQCB and CDFW to determine if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. (See MM 4.4.6.3A below).

The updated jurisdictional delineation report assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. In addition these areas are also under the jurisdiction of the RWQCB. A maximum of 5.0 acres may be under CDFW and RWQCB jurisdiction. It should also be noted that Drainages 12 and 15 are hydrologically connected to downstream waters of the US and are also under the USACE jurisdiction. Mitigation for impacts to no more than 5.0 acres of waters of the State will be mitigated by the creation of a minimum of 5.0 acres of habitat creation or purchase of credits at an approved mitigation bank. MMs 4.4.6.3A and 4.4.6.3B were revised as follows to address potential impacts to jurisdictional drainages if they are impacted by future development:

4.4.6.3A ~~Prior to the approval of any Plot Plans proposing development adjacent to any on-site drainage channels identified in the project programmatic Jurisdictional Delineation (MBA 2012), the developer shall retain a qualified biologist to prepare a site-specific jurisdictional delineation and submit it to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the development plan will not affect identified jurisdictional areas, no USACE permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and CDFW (i.e., Streambed Alteration Agreement) may still be required for this development.~~

~~The applicant shall consult with USACE, CDFW and RWQCB to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions.~~

~~Any development adjacent to Drainage 9 shall be designed with the channel in its relatively natural condition, and shall provide a minimum 25-foot open space setback from the top of each bank. Any landscaping of this setback area shall use only native species to help protect resources residing within or traveling through these drainages between the SJWA and the Badlands, and to protect any riparian vegetation along this drainage. This measure shall be implemented to the satisfaction of the City Planning Division.~~

4.4.6.3A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation

will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.

The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.

Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).

4.4.6.3B ~~As an alternative to Mitigation Measure 4.3.6.3A, the project developer shall retain a qualified biologist to prepare a Determination of Biologically Equivalent or Superior Project (DBESP) relative to development along Drainage 9 in order to maximize protection or preservation of the drainage, otherwise the DBESP must demonstrate why protection or preservation is not possible. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the County Resource Conservation Agency (RCA).~~

~~The DBESP shall be prepared to document measures to reduce impacts to riparian/habitats in accordance with the MSHCP as well as CDFW and USFWS guidelines. The DBESP shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of on site preservation of riparian areas and/a combination of compensation through purchase and placement of lands with riparian/habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at off site or on site locations.~~

4.4.6.3B As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the Resource Conservation Agency prior to project approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.

If impacts to riparian habitat within the World Logistics Center Specific Plan (WLCSP) cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.3A.

A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. Therefore, mitigation required for compensation for impacts to riparian/ riverine areas will require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.

As outlined in the WLC programmatic DBESP, erosion control improvements will be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat will be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).

Any impact to drainage features that are under regulatory agency jurisdiction or are considered riparian/riverine areas under the MSHCP are considered potentially significant and will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank. Compensatory mitigation will be negotiated during the permit acquisition process.

A Compensatory Mitigation Plan may be required for all unavoidable impacts and will be consistent with the USACE/USEPA's *Compensatory Mitigation for Losses of Aquatic Resources; Final Rule* and the USACE's *Standard Operating Procedure for Determination of Mitigation Ratios*.

An updated jurisdictional delineation report was prepared to address concerns raised by CDFW (FEIR Volume 2 Appendix E-13). The previous jurisdictional delineation assumed CDFW jurisdiction over a select portion of drainage features 7 and 9. The updated jurisdictional delineation report assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. The California Water Code defines Waters of the State as "... any surface water or groundwater, including saline waters, within the boundaries of the state." All drainage features referenced in the hydrology and water quality section of the EIR (Section 4.9) are included in the jurisdictional delineation.

In the public interest of protection and conservation of fish and wildlife resources of the state (§1600), Fish and Game Code Section 1602 requires any person, state or local governmental agency, or public utility to notify the CDFW before beginning any activity that will do one or more of the following: (1) substantially obstruct or divert the natural flow of a river, stream, or lake; (2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake. CDFW's jurisdiction includes ephemeral, intermittent, and perennial watercourses, including dry washes, characterized by:

- 1 The presence of hydrophytic vegetation.

2. The location of definable bed and banks.
3. The presence of existing fish or wildlife resources.

Furthermore, CDFW jurisdiction is often extended to habitats adjacent to watercourses, such as oak woodlands in canyon bottoms or willow woodlands that function as part of the riparian system. Historic court cases have further extended CDFW jurisdiction to include watercourses that seemingly disappear, but re-emerge elsewhere. Under the CDFW definition, a watercourse need not exhibit evidence of an ordinary high water mark (OHWM) to be claimed as jurisdictional. However, CDFW does not regulate isolated wetlands; that is, those that are not associated with a river, stream, or lake.

The CDFW regulates activities that involve diversions, obstruction, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife resources. Since several of the projects within the WLCSP will require such activities, a Section 1602 Streambed Alteration Notification will be required and submitted to the CDFW for review for each project specific development, as appropriate. The request will include a detailed project description, a description of proposed impacts, a conceptual mitigation plan, and completed notification forms. Typically, CDFW will be able to complete the agreement within 60-90 days of the completion of the CEQA process for each project.

Response to Comment B-3-18. The WLCSP may result in unavoidable impacts to as much as 5.0 acres of stream and riparian habitat under the jurisdiction of the CDFW. The jurisdictional delineation completed in 2013 has not been verified by CDFW. These impacts will be mitigated through on-site creation, offsite conservation and/or purchase of in kind habitat at replacement ratios established during the permit process, but will be at a minimum of 1:1 mitigation ratio to ensure a no-net-loss of riparian habitat.

Response to Comment B-3-19. The comment provides information on what will be required for the processing of a Notification of Lake or Streambed Alteration. During individual project development, if a Notification of Lake or Streambed Alteration is required, the information described in Comment B-3-19 will be incorporated. This information has been updated in Section 4.4.6.3 of the DEIR.

Response to Comment B-3-20. The comment states that the absence of mitigation measures relating to Notification of Lake or Streambed Alteration interferes with the Department's ability to fulfill its obligations as a Trustee and Responsible Agency for fish and wildlife resources. Based on the most current jurisdictional delineation, impacts to Drainages 7, 8, 9, 12, and 15 will require a Notification of Lake or Streambed Alteration. A maximum of 5.0 acres of streambed under CDFW jurisdiction may potentially be impacted. Permit negotiations are not part of the CEQA process and must take place independently and cannot be completed until the CEQA document has been approved.

However, deferred mitigation is not acceptable under CEQA guidelines. Since the DEIR for WLCSP is a program level-document, it will not have the specific level of detail required for a project-level CEQA document. Mitigation measures are generally described at a program level, which is appropriate for this CEQA document. Additional environmental documentation prepared at a project-level of detail will be prepared and used to support permitting with the CDFW.

Any impact to drainage features that are under regulatory agency jurisdiction or are considered riparian/riverine areas under the MSHCP are considered potentially significant and will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank. Compensatory mitigation will be negotiated during the permit acquisition process.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Response to Comment B-3-21. The commenter states that the CDFW recommended analysis of impacts on the adjacent SJWA and, without specific mitigation measures pertaining to this, the CDFW feels that it cannot fulfill its obligations as a Trustee and Responsible Agency. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), the WLCSP will have no direct impact on the adjacent SJWA. Due to the disturbed nature of the SJWA immediately adjacent to the WLCSP, it is highly unlikely that any sensitive species would be found in the disked agricultural fields.

An email was sent to Dr. Pert and other CDFW staff (particularly staff at the SJWA) for permission to survey the Conservation Area in 2013. Dr. Pert replied on June 18, 2013 stating, *"We are unclear why you need surveys for that area. It is already in conservation and therefore does not need surveys for rezoning. Please explain the need for surveys."*

The project biologist followed with another email dated June 19, 2013. This project biologist stated:

"We received multiple comments on the DEIR concerning the area and the fact that while no direct impacts would occur from the project, there could be indirect impacts. Do you have any recent studies on this area that we could use in our document on what is present in the area? I have no problem not surveying the area as I agree there are no impacts to the zone change, but I also need to be able to address comments. Information from the Department would help resolve the problem and in reality make for a stronger document."

This was followed by a reply from Dr. Pert on June 19, 2013 stating, *"It does seem appropriate for the CDFW to share our survey information with you for that area. Our information is from the RCA bio-monitoring surveys. My understanding is that the RCA recently provided data to MBA, for a possible project across Gilman Springs Road at the abandoned golf course. The radius was five miles so MBA should already have the data for San Jacinto Wildlife Area."*

Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1), mitigation measures will be imposed by the City of Moreno Valley through its processing of entitlements on a project-by-project basis regarding light, noise, trash, emissions, vectors, fuel management, runoff and water quality. All project operations within the WLCSP will be required to prepare a Water Quality Management Plan (WQMP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of toxic contamination to any downstream water body. All project construction activities within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of construction related contamination to any downstream water body. All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in detail in Section 4.9 of the DEIR, *Hydrology and Water Quality*. Lastly, the portions of the WLCSP that are specifically located adjacent to Core Conservation Areas (e.g., SJWA), which are located along the eastern and southern boundary of the WLCSP, will require project specific design features and measures related to light, noise, trash, emissions, vectors, fuel management, runoff and water quality as part of the MSHCP requirements for projects affecting a recognized Urban/Wildlands interface. Mitigation measures will include specific project designs such as:

- Light directing/restricting covers on light poles;
- Vegetated buffer along the southern and western edge of the WLCSP to reduce noise impacts adjacent to residential development and the conservation area; and
- Street sweeping and trash removal requirements to reduce on-site and off-site trash issues.

The vegetated buffer mentioned above as well as a perimeter wall will be used to reduce the emissions leaving the WLCSP. All detention basins will be designed to facilitate water quality improvements and will require assessments by vector control to reduce or eliminate standing water, and the SWPPP and NPDES for each project will adequately address all fuel management, runoff, water quality requirements.

Response to Comment B-3-22. The commenter states that the DEIR is incorrect in its assertion that the proposed project will not restrict wildlife movement to and from the San Timoteo Badlands and the SJWA/Mystic Lake area. It should be noted that currently, SR-60 and Gilman Springs Road already create a significant barrier between the Badlands and the SJWA. There are also several rural residences that occur along the east side of Gilman Springs Road and there are many proposed residences that have yet to be constructed. Therefore, the current existing conditions already have created a significant barrier between these two open space areas. It should also be noted that Existing Core H and Proposed Core 3 are connected just south of the WLCSP and therefore will not be completely separated by the proposed development. The disturbed nature of the extensive agricultural fields also limits the amount of wildlife species that may use the WLCSP area as a wildlife corridor. There is no supporting documentation that claims the WLCSP is used as a wildlife movement corridor.

The WLCSP is not within a significant wildlife movement corridor and as a result was not included in any conservation area, corridor, or linkage within the MSHCP. Therefore, the proposed WLCSP will not have a significant impact on wildlife movement on a regional basis. In an effort to provide an existing corridor through the eastern portion of the WLCSP, Drainage 9 will remain in its current location and has the potential to provide a travel path for wildlife species between Existing Core H and Proposed Core 3. Drainage 9 may require some initial re-grading and reinforcement to eliminate erosion issues, but may ultimately be enhanced to provide higher quality riparian habitat.

Response to Comment B-3-23. The CDFW requests that studies be conducted to understand the potential impacts of the project on wildlife movement within and adjacent to the project site. Biological resources have been studied on the project site for many years. Wildlife movement by ground dwelling animals north of the WLCSP is precluded because the majority of the underground culverts used to convey storm flows beneath SR-60 are filled with sediment (Master Plan of Drainage Report 2014). Therefore, construction activities associated with the WLCSP will not have any impact on wildlife movement from the area north of the WLCSP. Similarly, all of the culverts that convey storm flows beneath Gilman Springs Road are also filled with sediment and have not been maintained for many years. Therefore, wildlife species are forced to cross over the top of SR-60 and Gilman Springs Road. In an effort to control flood waters entering the project site, new storm drains will be required beneath SR-60 and Gilman Springs Road. Where appropriate, these drainage features will be designed to allow wildlife crossings, which under current conditions is unavailable. These project design features will take into consideration the length, width, and height of the culverts to allow for wildlife to move freely beneath SR-60 and Gilman Springs Road. As stated in Response to Comment B-3-22, Drainage 9 will remain in its current location to provide a potential travel path for wildlife species between Existing Core H and Proposed Core 3.

Response to Comment B-3-24. The CDFW recommends that all buildings and other potential perching structures be constructed a minimum of 250-meters away from surrounding open space areas. Light poles and transmission lines will be designed as project design features to provide raptor perching sites to reduce potentially significant impacts to raptor foraging habitat as discuss in Response to Comment B-3-14. However, there is a conflict in the recommendations from the CDFW. Designing light poles and utility poles to be raptor perching sites, may also potentially increase the number of raptors that will use the area surrounding the WLCSP. This may have an indirect impact to sensitive wildlife species that may be predated by the increased number of raptors. This potential issue is highly subjective and is not considered a significant indirect impact. There are over 3,000

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

linear feet of disked agricultural lands along the southern edge of the WLCSP. The loss of a few common rodent species, such as deer mouse, will not be a significant impact. There are already numerous utility poles used by red-tailed hawks along Gilman Springs Road. The increase in raptor perching sites is not a significant impact.

Response to Comment B-3-25. The CDFW requests that the DEIR be revised to include an assessment of the effects of all phases of construction lighting on adjacent habitat and associated species, and appropriate mitigation measures be incorporated to reduce or eliminate these impacts. The project will comply with all requirements of the night lighting guidelines as stated in the WLCSP. Each individual project will require a separate set of mitigation measures or project design features for lighting condition needs depending on where in the WLCSP the project is located. Projects located along the edges of the WLCSP will have more lighting requirements than those located in the central or northern portion of the WLCSP. These lighting design features and/or mitigation measures will be established during the project specific entitlement process.

Response to Comment B-3-26. The commenter correctly summarizes impacts to biological resources due to noise. Portions of the WLCSP will produce increased noise levels that will affect common wildlife species by decreasing already poor quality habitat values. A decrease in occupancy of common wildlife species is not a significant impact. Due to the distance of the WLCSP to high quality riparian habitat within the SJWA (approximately 4,000 feet), an increase in noise levels within the WLCSP will not significantly affect suitable habitat for sensitive wildlife species.

Response to Comment B-3-27. The CDFW is concerned that extensive noise impacts due to construction term and schedule may adversely impact species known to utilize the adjacent open space areas. A noise analysis has been prepared for the project to quantify potential short and long-term noise impacts that could occur as a result of development of the parcel adjacent to open space areas. Based on recent studies (Landrum and Brown 2012) noise contours would exceed 60 A-weighted decibels (dBA) [L_{eq}] roughly 1,000 feet into the CDFW Conservation Buffer Area during construction of the southernmost areas of Phase 2. Building construction activities associated with Phase 2 are expected to last no more than 3 to 6 months at one time. The City of Moreno Valley Noise Ordinance requires that noise levels remain below 55 dBA (Leq) during nighttime hours. USFWS typically uses 60 dBA as a noise threshold for impacts to wildlife species. To achieve this noise level the edge of WLCSP would only need to be 100 feet from the nearest suitable habitat for sensitive wildlife species and no soundwall or noise barrier would need to be present. Therefore, any noise-related impacts would be temporary in nature and generally limited to construction of Phase 2 facilities along the southern boundary of the WLCSP.

The southern edge of the project site is well over 4,000 linear feet from the northern edge of high quality habitat of the SJWA. Construction noise, even if continuous, will not significantly affect any off-site sensitive habitat or suitable habitat for sensitive wildlife species. The proposed WLCSP will be built over a span of 15 years, but construction will not be continuous and will occur at different parts of the WLC over time. The burrowing owl that was observed in 2013 was observed immediately adjacent to Alessandro Boulevard, which is a heavy traffic street during the morning and afternoon rush hours. It does not appear that noise caused by traffic has deterred use of the WLCSP at this location.

Response to Comment B-3-28. The CDFW requests that the DEIR be revised to include measures that will reduce or eliminate the potential for construction noise entering the SJWA and other open space areas. Based on recent studies (Landrum and Brown 2012) noise contours would exceed 60 A-weighted decibels (dBA) [L_{eq}] roughly 1,000 feet into the CDFW Conservation Buffer Area during construction of the southernmost areas of Phase 2. The southern edge of the project site is well over 4,000 linear feet from the northern edge of high quality habitat of the SJWA. Construction noise, even if continuous, will not significantly affect any off-site sensitive habitat or suitable habitat for sensitive wildlife species. Additional mitigation measures are not necessary for the area adjacent to the SJWA.

However, in the future, if the extensive agricultural lands on the SJWA are replaced with natural vegetation communities and/or suitable habitat for sensitive wildlife species, then additional mitigation measures may be required on a project specific basis.

Response to Comment B-3-29. The CDFW recommends the project provide a minimum 250-meter (820.21 feet) setback between the development and SJWA and other open space areas to minimize the potential for increased land management obligations. This issue is addressed in detail in Response to Comment B-3-42 in this Letter.

Response to Comment B-3-30. The CDFW states their commitment to reducing the effects of climate change on the State's natural resources and implementing legislative requirements addressing greenhouse gas emission. The City appreciates the CDFW's commitment to reducing greenhouse gases (GHG), and encourages the commenter to refer to Section 4.7 of the DEIR for additional information on the efforts of the WLC project to limit or reduce its GHG emissions, including allowance for solar energy systems.

Response to Comment B-3-31. The CDFW suggests that the revised DEIR should include an analysis of the potential direct and indirect impacts of GHGs and appropriate mitigation should be proposed for these impacts. An updated Air Quality Assessment was prepared for the WLCSP. The plan details all of the sources of GHG emissions and provides an assessment of project related direct and indirect impacts associated with Project-Associated GHGs. It should be noted that a project specific air quality assessment will be required for individual projects during future entitlement processes which will contain appropriate mitigation tiered off the impact analysis and mitigation in this EIR.

The CDFW recommends a quantitative analysis include the primary sources of greenhouse gas emissions associated with operation of the project, including vehicles, generation of electricity, natural gas consumption/combustion, solid waste generation, water usage, and landscape maintenance equipment. The DEIR quantified those sources of emissions as shown in Table 4.7.G (page 4.7-32) and Table 4.7.I (page 4.7-35). The landscape emissions are less than 1 metric tons of carbon dioxide equivalent (MTCO_{2e})/year and therefore are not shown in the tables. The revised analysis also quantifies those sources and estimates fewer greenhouse gas emissions than in the original DEIR (refer to Volume 2 Section 4.3 Air Quality).

The commenter also requests that construction greenhouse gas emissions be estimated. The construction greenhouse gas emissions were estimated in the DEIR (Table 4.7.E, pages 4.7-29 and 4.7-30) and in the revised analysis (refer to FEIR Volume 2 Section 4.3, Table 4.7.E).

The commenter also requests quantification of the land conversion from agricultural to warehouse. This quantification was estimated to be 16,523 MTCO_{2e} in the DEIR in Table 4.7.E (page 4.7-30) and is shown as a one-time "land use change (conversion from crop to urban)." This has been refined in the revised analysis and is now added to the operational emissions (refer to FEIR Volume 2 Section 4.3, Table 4.7.H).

The commenter also requests that the potential conflicts with any applicable plan, policy, or regulation to reduce greenhouse gases be identified. This was addressed in DEIR Section 4.3 Air Quality, Impact 4.7.6.2 (pages 4.7-36 through 4.7-43) and was found to be significant and unavoidable. In the FEIR, this impact was changed to less than significant.

Response to Comment B-3-32. The CDFW recommends the use of bait products that contain the ingredients chlorophacinone or diphacinone. If and when rodenticides are used, the applicant will only

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

use bait products for rodent elimination, which must contain chlorophacinone or diphacinone. This is not a required mitigation measure. It is best described as a Best Management Practice.

Response to Comment B-3-33. The commenter states that the City should use preventative planning, compatible design, and effective long-term maintenance to avoid or reduce vectors. It is also the desire of the City to control vectors associated with the detention basins of the WLC project, however, the commenter must remember this is a programmatic document, and the EIR clearly states that more detailed CEQA analysis will be performed once more specific project-level data and plans are submitted for discretionary review to the City (e.g., future site plans, plot plans, etc.) consistent with the programmatic WLCSP. The DEIR provides mitigation at a programmatic level, but does rely on implementation at the project level once specific development plans are submitted. Future discretionary review by the City will include any detention basins needed to support development within the WLCSP. The general characteristics of these basins are described in Section 4.9 of the DEIR, and the water quality characteristics of the WLC project and basins are shown in Specific Plan Section 5.1.8.8. This information is based on the conceptual basins identified in the project hydrology report (DEIR Appendix J-1) and the revised project hydrology report (FEIR, Volume 2 Appendix J-1) with this document. A mitigation measure has been added to the FEIR (Volume 2) as follows:

4.4.6.4I The individual property owner and/or Property Owners Association (POA) as appropriate shall be responsible for maintaining the various onsite landscaped areas, open improved or natural drainage channels, and detention or flood control basins in a manner that provide for fuel management and vector control pursuant to standards maintained by the City Fire Marshall and County Department of Environmental Health- Vector Control Group. This measure requires the individual owner or Property Owners Association (POA) to manage vegetation in and around these areas or improvements so as to not represent a fire hazard as defined by the City Fire Department through the substantial buildup of combustible materials. This measure also requires the individual owner or Property Owners Association to manage vegetation and standing water in drainage channels and basins such that they do not encourage or allow vectors to occur (primarily rats and mosquitoes). Runoff shall not be allowed to stand in channels or basins for more than 72 hours without treatment or maintenance to prevent establishment of mosquitoes per published County vector control guidelines and “Best Management Practices for Mosquito Control on California State Properties” which is available from the California West Nile Virus website at <http://www.westnile.ca.gov/resources>. This measure shall be implemented by the Property Owners Association in consultation with the City Fire Department and Riverside County Department of Environmental Health – Vector Control Group.

Response to Comment B-3-34. The CDFW recommends the DEIR be revised to provide a fuel management plan that includes a detailed plant palette, proposed maintenance activities, graphics that clearly define fuel modification zones with reference to the project development, and an assessment of current and long-term potential impacts related to the fuel management area. Again, the commenter has apparently misunderstood that the DEIR is a programmatic document and does not address site specific development at this time. Subsequent development applications may include specific fuel management plans if they are necessary and so desired by the City. However, there is already considerable detail in the WLCSP (both the original and the revised versions) in terms of the project’s landscaping palette, including the detention basins. As outlined in the DEIR (Section 3.4.9), the landscaping palette is consistent with the MSHCP guidelines for urban/wildland interfaces and emphasizes native species over weedy or introduced non-native species. For additional information, see Section 4.2.9 of the WLCSP. In addition, MM 4.4.6.1A in the DEIR address plants suitable for the detention basins as these areas may be used for future relocation of sensitive species, or at a minimum riparian habitat adjacent to the north end of the SJWA.

Response to Comment B-3-35. Comments were made about the need for a biological and environmental impact assessment to be included in the FEIR. The proposed drainage improvements will be designed to reduce standing water and will spread storm water flows within a gradually sloping basin. The drainage improvements will contain riparian scrub vegetation, which will also limit vectors such as mosquitoes. The drainage improvements will be used to filter and clean the first flush pollutants from storm flows. The treated water will be collected and piped to the drainage improvements, where the water will be used to establish a riparian habitat along the southern boundary of the WLCSP. Flows will be contained within a meandering swale, allowing for riparian vegetation and possibly wetland creation. Riparian vegetation will be maintained at the entrance and exit of the drainage improvements to ensure functionality of the basins over time. The drainage improvements will vary in size and shape, but will generally be 100-200 feet in width and several hundred feet in length. A general description of the drainage improvements are discussed in the Master Plan of Drainage Report (CH2M Hill 2014 – FEIR Volume 2 Appendix J-1). The nuisance flow associated with the proposed development will provide a more regular water source, which will be used to support a higher quality riparian habitat than current existing within drainage features within the WLCSP area.

Response to Comment B-3-36. The CDFW's comment stated that the DEIR does not provide information regarding the size, capacity, design, function, or maintenance requirements of the retention and/or detention basins, "spreading area," or discharge points. The previous DEIR did not contain a detailed description of the proposed detention basins and spreading areas. Based on the Master Plan of Drainage Report (CH2M Hill 2014 - FEIR Volume 2 Appendix J-1), five of the seventeen proposed debris basins will also include a spreading structure. These structures are all located along the southern boundary of the WLCSP and will provide the last phase of water quality treatment before exiting the WLCSP. Spreading basin structures will be installed within all of portions of Basin Nos. B3, C2, D2, F1, and F2. The Master Plan of Drainage Report (CH2M Hill 2014 - FEIR Volume 2 Appendix J-1) provides a detailed description of the size of each basin (Table 3.3 - Proposed Basins). Figure 9 of the report provides a detailed design of a typical detention basin with spreading structures. The design of the basins is preliminary and the location may change based on negotiations with regulatory agencies during the permitting process.

The detention basins with spreading structures will be designed for energy dissipation and habitat creation. The purpose of the detention basins with spreading structures is to reduce the velocity of the water before it leaves the project site. The water will enter the detention basins from an underground storm drain outlet that originate from an upstream detention basin. The upstream detention basins are designed to take first flush storm water, which will treat the storm water before it enters the downstream detention basins with spreading structures.

Once water enters the basin, it will flow through an energy-dissipating device, such as riprap, to reduce scour and erosion. Water will then meander through a gradual sloping basin that will be planted with a variety of riparian plant species such as mule fat, cottonwood, willows, coyote bush, and other appropriate riparian plants. Vegetation will be monitored to determine if removal or trimming of individual plants that may cause potential structure damage is necessary. Otherwise, vegetation within the basins will be relatively undisturbed.

Storm water flows will then flow into an outlet riser that will convey flows into a spreading structure with a bubbler outlet. This will reduce downstream erosion, but will maintain existing flows and character of a sheet flow pattern within the downstream drainage features.

The created riparian habitat will function as a linear boundary between the developed portion of the WLCSP and the open space associated with the SJWA. This boundary area will be part of the 250-foot buffer area that is proposed between the WLCSP and the SJWA. The riparian habitat will provide a nature barrier or wall, which will assist in blocking nuisance light, muffling excessive noise, and

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

knock down air emissions to minimize air quality impacts to the adjacent SJWA. In addition, street sweeping will provide an initial water quality element. The detention basins will provide a secondary treatment for water quality as well as provide a catchment area for debris and trash. Riparian habitat created in the spreading basins, will provide a tertiary treatment for water quality. It is anticipated that all storm flows and nuisance flows will be treated to a point where it will be of beneficial use within the spreading grounds and riparian habitat will not be affected by on-site and off-site pollution sources.

The impermeable surface of roads and buildings will increase the amount of run-off during storm events. In addition, nuisance-flows from irrigation systems used for landscaping will also increase the amount of available moisture. The detention basins with spreading grounds will be designed to contain the additional flows that will be received from the new development and at the same time will allow downstream flows at the current rate. Downstream flows are required to be maintained at current conditions with regard to flow rate. No more and no less water will be available during storm events.

Routine maintenance within the detention basins with spreading structures will be completed on an as-needed basis to maintain the integrity of the facilities. A Biological Resource Management Plan (BRMP) will be prepared to document maintenance activities within the riparian areas prior to issuance of any permits for development along the southern boundary of the site per (MM 4.4.6.4F). Maintenance activities will include, but are not limited to, trimming, tree removal, weeding, and seeding. Vegetation thinning will only be necessary if the plants within the detention basins becomes a potential risk to the integrity of the facility (refer to Section 4.9 in the DEIR. Also, refer to Appendix J of Volume 2 of the FEIR).

In addition, all project operations within the WLCSP will be required to prepare a Water Quality Management Plan (WQMP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of toxic contamination to any downstream water body. The WQMP will contain specific project design features just as street sweeping and trash removal practices that will reduce trash impacts to the SJWA. All project construction activities within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP), which will also contain detailed precautions necessary to eliminate trash to any downstream water body. All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in detail in Section 4.9 of the DEIR, *Hydrology and Water Quality*. A long-term storm water management plan is required to maintain debris basins and provide long-term maintenance objectives to allow storm water to be filtered and used in supporting on-site riparian habitat as part of the projects mitigation area.

Response to Comment B-3-37. The commenter states the buffer around Drainage 9 should be increased and the addition of any proposed structures be reconsidered. Drainage 9 is currently a highly eroded drainage feature with low to moderate quality habitat. The majority of the channel contains an unvegetated channel with sparse vegetation. Currently, the plan for this drainage is to redesign this feature to have better function and value than the highly eroded feature it is today. As discuss in Section 4.4.6.3A of the DEIR, a 25-foot buffer area will be vegetated with native plant species on either side of the drainage. Currently, the extensive agricultural areas are disked to the edge of the drainage feature, leaving no buffer area to the existing drainage feature. This additional 25-foot buffer of native plants is sufficient to provide a barrier between the existing drainage feature and the proposed development.

The improvements associated within Drainage 9 include the reconstruction of the existing Alessandro Boulevard and re-grading the upstream portion of the channel to fit a more natural flowing drainage feature. Several drop structures are proposed within Drainage 9 to reduce flow velocity, which will reduce erosion and provide a greater area to create additional riparian habitat that would normally be

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

scoured during storm events. This will reduce the amount of erosion and downstream sediment deposition. All of the proposed improvements within Drainage 9 are necessary to protect the drainage and greatly increase the function and value of the drainage.

Response to Comment B-3-38. The Department recommended the DEIR be revised to include specific and detailed plans for all drainage control facilities. The project's drainage design will mitigate impacts from the project so that the flows, volumes, and velocities mimic existing conditions leaving the project's boundary. Additional information has been added to DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report Section 3.2, Proposed Drainage Systems* to provide more specific information for the drainage systems. In addition, Figure 1, *Proposed Storm Drains and Basins* and Figure 4, *Hydrology Map for Proposed Condition* were revised and Figure 8, *Typical Detention Basin* and Figure 9, *Typical Detention Basin with Drainage Spreading Structure* were added to provide additional information (refer to Appendix J of Volume 2 of the FEIR). Key elements of the revised Section 3.2 *Proposed Drainage Systems* in the technical study are summarized below.

Proposed Drainage Systems

Development of the proposed project site will increase the impervious surface due to the construction of the projects' buildings, roadways and associated improvements. The improvements will have the potential to increase storm water runoff. Underground drainage systems and detention and infiltration basins are proposed to convey the storm water runoff and mitigate the increased flow due to the proposed land development. Ultimately, for the proposed condition, the peak flows, volumes, and velocities at downstream discharge points where the flows exit the southerly project boundary will mimic the existing condition.

Six (6) major drainage systems are proposed, named Line "A" (referred to Line "F" in the Moreno Master Drainage Plan (MMDP)), Line "B", Line "C", Line "D", Line "E" and Line "F", shown on Figure 1. The majority of the Line "E" will remain as is; with one exception: a cross culvert is proposed where Line "E" crosses the proposed Street C, and a proposed Line "E-1" 96-inch reinforced concrete pipe (RCP) will join the existing Line "E" at the bridge/culvert. The information is summarized in Table B-3.B below.

Table B-3.B Project Proposed Condition for 100-year 3-hour Storm Event

Drainage System	Watershed	Discharge Point	Manning's n	Peak Flow (cfs)	Preliminary Sizing
"A"	"A"	A4	0.015	2,170	12'x9' and 12'x8' RCBs

*	"F"			40	-

* Basin only

**The Line "E" is the existing earthen channel to be protected in place except at Street C.

***See Figures 1 and 4 for bridge/culvert location at Street C

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Combined detention and infiltration basins are proposed to mitigate the peak flow rate and flow volumes. Table B-3.C presents the sizes of each of the basins. Two separate analyses were performed for the detention and infiltration basins. The first analysis was part of the drainage system analysis to size the basins to mitigate the flow from the 100-year, 3- and 24-hour storms. In this analysis the bottom 2 feet of the basins (identified as Basin Infiltration Depth in Table B-3.C) is infiltration storage and assumed to be full prior to the storm. The second analysis was performed to analyze the pre- and post-project infiltration for the project. This is a water balance model analysis of historical daily runoff.

Table B-3.C: Proposed Basins

Basin No.	Approx . Basin Length (ft)	Approx . Basin Top Width (ft)	Basin Depth h (ft)	Basin Detention Depth (ft)	Basin Infiltration Depth (ft)	Side Slope	Basin Detention Volume (ac-ft)	Basin Infiltration Volume (ac-ft)	Total Basin Volume (ac-ft)
Basin A1	1,200	1,260	8	6	2	2	97	32	129

Basin F2*	840	120	5	3	2	2	7	4	11

*spreading basin

There is no offsite debris basins proposed. The proposed drainage facilities in the WLC project have been sized to convey the expected sediment load. As such, debris basins upstream of Gilman Springs Road are not needed nor required for this project. The project onsite area will not generate significant amount of sediment due to the proposed logistics land use. The sediment that proceeds through the Gilman Springs Road culverts will be transported to the proposed detention basins on the WLCSP area. The proposed basins will settle the sediment before exiting the project boundary, similar to how the sediment settles in the existing channels and overland area in the existing condition.

Mitigation of Impacts

The mitigation of impacts of the facilities is discussed in the DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report Section 4, Mitigation of Impacts of Proposed Development*. Key elements are summarized below.

Drainage Area Comparison

For the existing condition, the boundaries of sub-watersheds are determined based on the topographic characteristics. For the proposed condition, the boundaries of the sub-watersheds are altered slightly to accommodate the proposed grading and roadways. As a result, the tributary areas

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

of the proposed sub-watersheds are slightly different compared to the existing condition. However, the proposed boundaries are generally consistent with the existing boundaries. The proposed project will not alter the existing drainage pattern flowing southerly throughout the project site. All flow from offsite and onsite will drain to Perris Valley hydro-subarea or Gilman Springs hydro-subarea. The total drainage areas of proposed condition remain the same as the existing condition, as presented in Table B-3.D.

Table B-3.D: Comparison of Existing and Proposed Drainage Areas

Exist. Condition			Prop. Condition		
Watershed	Area(ac)	Hydro-Subarea	Watershed	Area (ac)	Hydro-Subarea
"A"	2,657	Perris Valley	"A"	2,746	Perris Valley

Total	8,999			8,999	

Stormwater Runoff Comparison

The proposed project will increase the percentage of impervious areas and will have the potential to increase peak discharges. The proposed detention/infiltration basins and spreading areas will mitigate the increased peak discharges. With attenuation, the total peak discharge at the project's southerly boundary will be less than the total peak discharge of the existing condition. Table B-3.E compares the peak discharges at the downstream discharge points where the storm water runoff exits the project's southerly boundary for 100-year 3-hour storm events.

Table B-3.E: Comparison of Existing and Proposed Stormwater Runoff for 100-year 3-hour Storm

Hydro-Subarea	Watershed	Exist. Condition		Prop. Condition	
		Discharge Point	Peak Discharge(cfs)	Discharge Point	Peak Discharge (cfs)
Perris Valley	"A"	78	2,470	A4	2,170
	Total		2,470		2,170
Gilman Hot Springs	"B"	12	430	B5 930

* Outflow from Basin D3.

** Outflow from Basin F3.

Flows at Project Boundary

Flows exiting the project's boundary in the proposed condition will mimic existing conditions. There are six watershed areas and drainage courses that deliver flow through the project area. These are identified as watershed areas "A" through "E" on Figure 3. The existing capacity of these drainage courses at the project boundary was determined. Flows in excess of this capacity would flow overland and sheet flow across the project boundary in the existing condition. Detention Basins and spreading area facilities are proposed to reduce the proposed conditions flow to pre-project conditions at the project boundary. Table B-3.F identifies the existing and proposed 100-year flow, the drainage course capacity, and the sheet flow at the project boundary.

Table B-3.F: Comparison of Existing and Proposed Flows at Project Boundary

Watershed	Existing Conditions at Project Boundary			Proposed Conditions at Project Boundary		
	Existing 100-year Flow (cfs)	Existing Drainage Course Capacity (cfs)	Existing 100-year sheet flow (cfs)	Proposed 100-year Flow (cfs)	Proposed 100-year flow from Basin to Drainage Course (cfs)	Proposed 100-year sheet flow from Basin (cfs)
A ¹	2,470	2,200	270	2,170	N/A	N/A
B	1,130	55	1,075	930	55	875
C	820	165	655	750	165	585
D	815	65	750	795	65	730
E ²	1,990	6,220	0	1,800	N/A	N/A
F	495	70	425	390	70	320

Notes:

¹ Flows to improved channel - No sheet flow proposed in proposed conditions.

² Existing facility has capacity for flow – No detention basin proposed.

Flow Velocities at Project Boundary

This project proposes a number of open space, detention basins and spreading areas (shown in Figure 1 and Figure 4) to mitigate the increased runoff, volumes and flow velocities. As a result, the flow velocities at the project boundary for the proposed condition are less than the existing condition, as illustrated in Table B-3.G. For the watersheds “A” and “E” in the proposed condition, the runoff will flow to the existing Green Belt Channel and existing earth channel, respectively. Therefore, sheet flow would not occur at the project boundary. The flow velocities in the watersheds “B”, “C”, “D”, and “F” for the proposed and existing conditions were analyzed. For the proposed condition, the runoff will flow to the basins and spreading areas, then flow over the weir structures, and eventually flow to the existing channels downstream of the project’s boundary. Flows in excess of channel capacity would flow overland and sheet flow across the project’s boundary. For the existing condition, the runoff would flow in to the existing drainage channels, and the flow in excess of channel capacity would flow overland and sheet flow across the project’s boundary.

Table B-3.G: Comparison of Existing and Proposed Flow Velocities at Project Boundary

Exist Watershed	Node*	Velocity (fps)	Prop Watershed	Node*	Velocity (fps)
B	12	5.16	B	B5	2.19
	22	4.40			2.19
C	37	8.80	C	C4	2.01
	41	3.60			2.01
D	53	4.77	D	D3	2.10
D	61	4.45			2.10
F	81	3.33	F	F2	1.78
F	83	6.29			1.78
F	102	3.61			1.78
F	112	3.83			1.78

* See Figure 3 for node locations at existing watershed southerly boundary, and see Figure 4 for node locations at proposed watershed southerly boundary.

Runoff and Infiltration Volumes Comparison

An analysis and comparison of the volume of runoff and infiltration for the pre and post project conditions was performed as outlined in the *Master Plan of Drainage Report Appendix H*. A total of three scenarios were analyzed, a baseline and two project scenarios. The scenarios are described below:

Baseline or Pre-Project conditions, where most of the land use is agricultural and the crop is considered to be dry wheat.

Scenarios of Post-Project Conditions, where the development of the site will happen and the impervious area will increase. Two scenarios were considered under the Post-development conditions, those are:

Scenario 1) Detention Basins and bio retention areas with 0.15 inch per hour (in/hr) infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The lower end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and total dead storage currently assumed at 212 acre feet (AF). In reality the amount of dead storage needed will be a function of the measured infiltration rate at the site.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Scenario 2) Detention Basins and bio retention areas with 0.3 in/hr infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The higher end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and dead storage is assumed at 212 AF.

The results of the analysis are summarized in Table B-3.H below.

Table B-3.H: Model Results for Runoff and Infiltration and the Percentage Change from Baseline Conditions

Scenario	Runoff		Infiltration	
	1990-2012 Average(AF/yr)	Percent Change from Baseline	1990-2012 Average(AF/yr)	Percent Change from Baseline
Baseline	59	-	1,649	-
Scenario 1	125	110%	1,850	12%
Scenario 2	40	-33%	1,945	18%

The project's impacts will be mitigated with the implementation of Scenario 2. The volume of runoff after the project is constructed will be less than the existing volume of runoff and the amount of infiltration will increase. Infiltration tests to refine Scenarios 1 and 2 will be performed in final design so runoff and infiltration will mimic existing conditions.

Response to Comment B-3-39. The CDFW declares that there is not sufficient information for them to review the potential impacts of the project on water quality; however, the City respectfully disagrees. Specific analysis of anticipated water quality impacts are described in Section 4.9.6.3, *Operation-Related Water Quality Impacts* of the DEIR. The DEIR also includes site design, source control, and treatment BMPs as proposed mitigation measures. The project will comply with the *Water Quality Management Plan (WQMP) for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012) which requires the use of Low Impact Development (LID) Best Management Practices (BMPs) that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area.

The *Water Quality Management Plan (WQMP) for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012) discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted Total Maximum Daily Loads (TMDLs) in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

Detailed site plans showing the location of treatment BMPs will be prepared as part of the final project-specific WQMP. Currently, the WQMP is at a Specific Plan level and details cannot be provided at this stage. The locations of the LID BMPs are not shown in the current Specific Plan phase, but will be shown in the final project-specific WQMP.

Also, the project has committed to performing a Water Quality Monitoring Program on the adjacent SJWA. A Water Quality Monitoring Plan for the SJWA will be prepared, which will contain specific performance standards to ensure that runoff does not impact the SJWA. MM 4.9.6.3C outlines a very detailed process that must be implemented to ensure the SJWA will not be affected by water pollution from the project site.

Changes to DEIR

*Consistent with the comments provided by Letter B-3 (California Department of Fish and Wildlife), the text in DEIR Section 4.9.6.1, Page 4.9-30 and 4.9.6.3, Page 4.9-42 is amended to include more specific requirements to **MMs 4.9.6.1A**, and **4.9.6.3C**. **MM 4.9.6.1B** has been added to ensure the performance and monitoring of the drainage facilities. The modified mitigation measures resulting from the comment is not considerable, and is considered to be a minor refinement of the existing measures. The change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The revisions to the text of the DEIR are as follows:*

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s)–as appropriate within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

4.9.6.1B The bioretention areas and detention/infiltration basins shall be designed to assure infiltrations rates. The monitoring plan will follow the guidelines presented by the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

California Storm Water Quality Association (CASQA) in the California Storm Water Best Management Program (BMP) Handbook, Municipal, January 2003 Section 4, Treatment Control Best Management Programs Fact Sheets TC-11 Infiltration Basin and TC-30 Vegetated Swale).

For the Bioretention areas, as needed maintenance activities shall be conducted to remove accumulated sediment that may obstruct flow through the swale. Bioretention areas shall be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 48 72 hours.

For the detention/infiltration basins, a 3-5 year maintenance program shall be implemented mainly to keep infiltration rates close to original values since sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by scraping the bottom of the detention basin, seed or sod to restore groundcover, aerate bottom and dethatch basin bottom (CASQA 2003).

4.9.6.3C

Prior to issuance of future discretionary permits for any development along the southern boundary of the World Logistics Center Specific Plan (WLCSP), the project developer of such sites, in cooperation with the Property Owners Association (POA), shall establish and annually fund a Water Quality Mitigation Monitoring Plan (WQMMP) to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (SJWA). This program shall include at least quarterly sampling along the southern boundary of the site (i.e., at the identified outlet structures of the project detention basins) during wet season flows and/or when water is present, as well as sampling of any dry-season flows that are observed entering the San Jacinto Wildlife Area property from the project property, including Drainage "H," 9, which is planned to convey only clean off-site flows from north of the World Logistics Center Specific Plan site across Gilman Springs Road. The program shall also include at least twice yearly sampling after completion of construction, and a pre-construction survey must be completed to determine general water quality baseline conditions prior to and during development of the southern portion of the World Logistics Center Specific Plan. This sampling shall be consistent with and/or comply with the requirements of applicable Storm Water Pollution Prevention Plans (SWPPPs) for the development site.

The project developer of sites along the southern border of the World Logistics Center Specific Plan shall be responsible for preventing or eliminating any toxic pollutant (not including sediment) found to exceed applicable established public health standards. In addition, the discharge from the project shall not cause or contribute to an exceedance of Receiving Water Quality Objectives for the potential pollutants associated with the project as identified in Table 4.9.J. Once development is complete, the developer shall retain qualified personnel to conduct regular (i.e., at least quarterly) water sampling/testing of any basins and their outfalls to ensure the San Jacinto Wildlife Area will not be affected by water pollution from the project site. The City Planning and/or Land Development Division shall file an annual water quality report with the Moreno Valley City Council, State Department of Recreation (Mystic Lake Manager), and Eastern Municipal Water District. This measure shall be implemented to the satisfaction of the City Planning Official Land Development

Final Programmatic Environmental Impact Report

Source: *Preliminary Water Quality Management Plan for World Logistics Center Specific Plan*, CH2M HILL, September 2014.

In summary, the City disagrees with the CDFW's position that there is not sufficient information for them to review the potential impacts of the project on water quality. The DEIR does contain sufficient information upon which to review the programmatic elements of the WLC project. The EIR has been prepared at the earliest appropriate time as encouraged by CEQA, although there is not detailed information yet on the size and location of specific buildings. When specific buildings are proposed at specific locations in the future, additional analysis, consistent with tiering under CEQA, will be conducted to determine if the specific development will have new or more extensive impacts than those outlined in the WLC project DEIR. This process is consistent with the goals and requirements of CEQA relative to programmatic and subsequently tiered project-level CEQA documents. The hydrology and water quality documents provided in the DEIR, and revised and attached to this FEIR, demonstrate the project will not have significant water quality impacts, based on the conceptual design of the WLC project and with implementation of the programmatic mitigation outlined in Section 4.8 of the DEIR.

Response to Comment B-3-40. The CDFW stated that the 910 acres of State-owned land adjacent to the southern boundary of the project area may not be used to offset impacts associated with the development of the project. The DEIR did not propose to use the CDFW Conservation Buffer Area along the southern boundary of the WLCSP to offset impacts of project development, nor was the area proposed to meet or offset any open space requirements of the WLC project. However, the original purpose of the CDFW land is outlined in Section 4.4.1.10 in the DEIR. The CDFW Conservation Buffer Area is defined in the DEIR on page 3-19 as follows:

***CDFW Conservation Buffer Area:** This term refers to a 910-acre parcel owned by the State of California as part of the San Jacinto Wildlife Area (SJWA). This land is within the City of Moreno Valley and is included in the approved Moreno Highlands Specific Plan. That plan designates this property for a broad mix of urban uses including suburban residential, schools, parks, and roads. This land was purchased by the State in 1991 to act as a buffer*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

between the sensitive biological resources of the SJWA and the future urban development under the Moreno Highlands Specific Plan. This land has been actively farmed for many decades and most of it remains in active production. The southwestern portion contains areas of non-native grasslands, although aerial photographs show that this area has been intermittently tilled over the last 80 years. This property is included in the General Plan Amendment and the Zone Change to replace the current urban land uses that are permitted and replace them with Open Space and Public Facility designations. This property is not within the proposed World Logistics Center Specific Plan.”

That land was clearly purchased to act as a buffer between the SJWA and future development, in fact land within the Moreno Highlands Specific Plan was specifically purchased for that purpose. The WLCSP would not interfere with the CDFW land continuing to provide upland refuge for SKR during flooding events at Mystic Lake, or assist in wildlife movement between Mystic Lake and the Badlands. In fact, Drainage 9 within the WLCSP is being planned to allow for wildlife movement as the WLC project is developed.

Response to Comment B-3-41. The commenter raises no issue with the adequacy of the DEIR and no response is required. The City Council will consider all comments received during its consideration of the project.

The commenter raises a concern with the labeling of a setback area proposed along the southerly edge of the Specific Plan. The commenter is concerned with its designation as a “setback” or a “buffer” because the Specific Plan permits limited improvements (drainage, access, landscaping, fencing, etc.) within the 250-foot area. Buildings and truck access/parking are prohibited in this area. The issue is one of semantics. The City Council will consider the appropriateness of the proposed 250-foot setback when it considers the proposed Specific Plan.

Response to Comment B-3-42. Detailed information regarding fuel management, water quality, lighting, noise, trash, predation effects, vector control, and GHG emissions is included in the Urban / Wildlands Interface Guidelines Section (Section 6.1.4) of the updated MSHCP Consistency Analysis report (FCS/MBA 2013-FEIR Volume 2 Appendix E-1).

The CDFW Conservation Buffer Area is a 910-acre parcel owned by the State of California as part of the larger SJWA. This land is within the City of Moreno Valley and is included in the approved Moreno Highlands Specific Plan. That plan designates this property for a broad mix of urban uses including suburban residential, schools, parks, and roads. This land was purchased by the state in 1991 to act as a buffer between the sensitive biological resources of the SJWA and the future urban development under the Moreno Highlands Specific Plan. This land has been actively farmed for many decades and most of it is currently is being dry farmed. This farming activity extends approximately 2,800 feet south of the proposed WLC project area and forms a buffer between the WLC development and the sensitive biological resources of the SJWA. See DEIR Figure 3.3. The nearest existing sensitive biological resource within the SJWA are wetlands areas which are located an additional 1,200 feet south of the CDFW Conservation Buffer Area. The total distance between the proposed project and sensitive biological resources on the SJWA is approximately 4,000 feet (3/4 mile). In addition to this buffer area on the SJWA property, the WLC project is providing an additional 250-foot buffer area to further distance the future urban uses of the WLC from the existing sensitive biological resources of the SJWA. This distance is substantial larger than the 250 meters (820.3 feet) suggested by the commenter.

As outlined in the DEIR there are a number of alternative approaches to setting an “appropriate” buffer distance between human activity and active urban uses. These buffer areas are usually used in relation to wetlands areas and are generally defined in feet measured horizontally from the edge of a defined wetland (McElfish 2008). Enacted Local government buffer ordinances show a wide range of wetland buffer dimensions. The shortest that was found was 15 feet measured horizontally from the

border of the wetland, with the largest being approximately 350 feet. Several ordinances set 500 feet as a distance for greater regulatory review of proposed activities, but do not require non-disturbance at this distance. (McElfish 2008). A minimum 250-foot setback is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity. A total setback of 400 feet to WLCSP buildings will help provide an additional buffer from building lighting and noise. Together, two buffer areas totally 400 feet in width will effectively mitigate potential direct and indirect impacts on the SJWA to indirect noise, light, and air quality impacts.

The CDFW Conservation Buffer Area, the entirety of which is currently being dry farmed, appears to be disked at least once each year and planted with winter wheat and likely provides foraging area for wintering raptors and game birds. CDFW typically does not have any kind of setback requirements from foraging bird areas. Additionally the closest wetland/riparian habitat are more than 4,250 linear feet from the southern edge of the WLCSP boundary. Since the project is setback more than the typical setbacks to protect wetlands and nesting birds no additional setback is required. Providing additional on-site setback/buffer area as suggested by the commenter would ignore the existence of a substantial distance between the existing sensitive environmental resources of the SJWA (wetlands and nesting habitat) and the proposed project. In addition, no resource agency or conservation group has provided any scientific evidence that a 250-meter onsite buffer is necessary to protect SJWA resources, and the EIR and this response have demonstrated that the proposed 250-foot buffer and additional 150-foot building setback will be sufficient to protect biological resources. Therefore, no additional mitigation is required.

Response to Comment B-3-43. The commenter states that the CDFW is concerned about the appropriateness of MM 4.4.6.2A, 4.4.6.4C, and 4.4.6.4E. The proposed 250-foot buffer area will incorporate many types of land-use options as part of the buffer area. The buffer area is approximately 70-acres; nearly half of the area will be used for detention basins with spreading structures and the creation of riparian habitat. While the buffer area will include some limited access drives, the detention basins and landscaping will separate the primary project area from the more sensitive habitat areas to the south. The vegetation and landscaping berms will help screen the adjacent habitat from lighting, attenuate noise, and assist in dropping out air-borne pollutants. Based on the most recent focused protocol level surveys, sensitive plant and LAPM are considered absent from the project site and will not require relocation (FCS/MBA 2013-FEIR Volume 2 Appendix E-1).

A single pair of burrowing owl was observed within the entire WLCSP area (FCS/MBA 2013-FEIR Volume 2 Appendix E-1). A single pair of burrowing owl typically requires a minimum of 6.5 acres (CDFW 1998). Since there have been no observation of burrowing owl within the CDFW Conservation Buffer Area (RCA Data 2013), the relocation of a single pair of burrowing owl to a portion of the buffer area will be more than sufficient habitat. In addition, artificial burrows will be installed along the southern berms of the detention basins to assist in establishing a larger population of burrowing owl within the adjacent SJWA. The buffer area will be designed to provide higher quality riparian habitat than the poor quality habitat that currently occurs with the WLCSP. The riparian habitat within the basins will not provide any suitable habitat for burrowing owl, but the southern berm can be used to establish artificial burrows, which will be used by passively relocated burrowing owls. The burrowing owls will be relocated to the southern berms of the detention basins adjacent to the SJWA, which along with portions of the project site, will be more than sufficient to support at least a single pair of burrowing owl.

Response to Comment B-3-44. This commenter restates an earlier comment that says the State-owned SJWA cannot serve as mitigation for project impacts. The DEIR should be revised to remove the SJWA as a mitigation for the potentially significant impacts of air quality. The portion of the SJWA immediately south of the WLCSP, which is part of the General Plan amendment, was purchased for, among other things, to function as a buffer area between the proposed development area and the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

SJWA. The project simply changes the General Plan and zoning of the CDFW acquisition to Open Space. This portion of the SJWA was not included in the original conservation area set forth in MSHCP for Core Area H.

The 250-foot setback area will be created with a number of design features that will reduce the significant impacts associated with air quality. Perimeter walls will be created that provide a physical barrier to reduce the amount of air pollutants that leave a project site. In addition, riparian vegetation and trees will be planted along the southern boundary of the WLCSP as another barrier to reduce air quality impacts. The creation of the 250-foot buffer, along with the additional riparian vegetation and barrier wall, will assist in reducing indirect air quality impacts on the SJWA.

Response to Comment B-3-45. The commenter states that direct and indirect impacts to biological resources due to greenhouse gas emission should be included in the cumulative impacts analysis. Section 4.4.7 of the DEIR discusses Cumulative Impacts to biological resources with regard to the MSHCP, which is a regional planning document that provides for long-term conservation goals for the western Riverside County area. The DEIR does not discuss cumulative impacts with regard to sensitive habitats or species that are not covered under the MSHCP. CEQA requires the discussion of the cumulative impacts of proposed projects. The WLCSP was assessed based on closely related past, present, and future projects that may be developed in the near future. Cumulative impacts are typically analyzed using either a List Method or a Regional Growth Projection Method. Since the WLCSP is a program-level document, the Regional Growth Project Method is an appropriate methodology to evaluate cumulative impacts. The project related impacts associated with the WLCSP were assessed based on the contribution to cumulative impacts on a regional basis.

Adoption of the City of Moreno Valley General Plan EIR did not result in significant direct impacts to existing biological resources. All future development projects anticipated in the General Plan can feasibly be mitigated to less than significant levels and therefore, would not contribute to a cumulative impact on a regional basis. However, adoption of the General Plan would lead to future indirect impacts through approval of development projects within the City of Moreno Valley.

MMs 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I, as listed in Section 4.4 of the DEIR, will reduce the project related impacts to a level less than significant. As a result, the contributions of impacts associated with project within the WLCSP are fully mitigated and will not contribute to cumulative impacts within the region.

Adoption of the City of Moreno Valley General Plan EIR did not result in significant direct impacts associated with GHG emissions; however, adoption of the General Plan would lead to future indirect impacts through approval of development projects within the City of Moreno Valley.

Project-related impacts resulting in quantifiable direct impacts to biological resources from GHG emissions would be addressed subsequently through analysis at a lower tier, project-specific level of environmental review. MM 4.7.6.1A, as listed in the DEIR, will reduce help reduce programmatic GHG impacts to less than significant levels.

The CDFW comments that cumulative effects analysis should be developed as described under CEQA Guidelines Section 15130. Cumulative impacts should include the project's contribution to greenhouse gas emissions and impacts on regional air quality. Include all potential direct and indirect project related impacts to streambeds, riparian areas, wetland, vernal pools, alluvial fan habitats, wildlife corridors, wildlife foraging habitats, or wildlife movement areas, aquatic habitats, sensitive species, and other sensitive habitats, open lands, open space, and adjacent natural habitats in the cumulative effects analysis.

A complete discussion of the impacts to biological resources can be found in the project MSHCP/DBESP document contained in Appendices E of the FEIR Volume 2.

Cumulative greenhouse gas emissions were assessed in the DEIR Section 4.7 on pages 4.7-43 and 4.7-44 and were found to be significant. However, as shown in the FEIR, these impacts are now less than significant in the FEIR.

The commenter indicates that the greenhouse gas section does not provide an analysis on how this level of greenhouse gas emissions will impact the surrounding area or region. There are no models available to identify how the relatively small quantity of project emissions will influence the surrounding area. The current climate models look at the global climate and global emissions. The project's emissions compared with global emissions are relatively small; the emissions would not be perceptible in the global climate models. Pages 4.7-5 and 4.7-6 of the DEIR Section 4.7 explain potential climate change effects to California. Pages 73 through 76 of Appendix D to the DEIR and Section 4.7 in the FEIR Volume 2 explain potential climate change effects (reduction in water supply, increased wildfires, flooding) to Moreno Valley.

Response to Comment B-3-46. It is the CDFW's opinion that the DEIR fails to propose a full range of alternatives. The commenter must remember that alternatives, under CEQA, are designed to reduce or eliminate one or more significant impacts of the proposed project as identified in the DEIR. The WLC EIR did not identify significant impacts of the WLC project on biological resources due to the design of the project and proposed mitigation. Therefore, none of the project alternatives are required to specifically reduce or address biological impacts. The DEIR does present a reasonable range of alternatives given the potential environmental impacts of the project.

Response to Comment B-3-47. It is the CDFW's opinion the DEIR should include an evaluation of specific alternative locations with lower resource sensitivity. The project biological reports do not identify any "Rare Natural Communities" present on the project site or in any of the offsite improvement areas. The biological reports also conclude the project site contains minimal biological habitat and consists mainly of dry-farmed agricultural land. The biological reports conclude the project site does contain any MSHCP criteria cells, and evaluates all potential project impacts to MSHCP criteria cells both onsite and south and east of the site, and determined there would be no significant impacts on the cells from project implementation. A portion (southwest corner) of Criteria Cell 1204 is located on the WLCSP site (refer to Figure 4.4.3 of the DEIR, Section 4.4 Biological Resources). The western on-third of Criteria Cell 1297 is also located on the WLCSP site. According to DEIR, Section 4.4.1.15 (f), *'Within the southwestern portion of Cell Group X, and specifically within Criteria Cells 1204 and 1297, the project area encroaches on 114.2 acres. Under the MSHCP, conservation for Cell Group X is proposed for the northeastern portions of the Cell Group. The project area is not within the targeted conservation areas and, therefore, will not adversely affect the County's ability to achieve the goals of the MSHCP (see Figure 4.4.4).'*" Cell Group D: Criteria Cells 1364, 1370, 1377, 1386, 1389, 1477, 1482, 1483, and 1577 are located along the southern boundary of the WLCSP site. According to DEIR Section 4.4.1.15 (h), *"Under the MSHCP, conservation for Cell Group D is proposed for the southern and western portions of the Cell Group. The project area includes approximately 60 percent of the northern portion of the Cell Group; therefore, future development of the project area is consistent with the conservation goals for this cell group. The majority of Cell Group D is within the northern extent of SJWA, a Public/Quasi-Public Conserved Land. This area is part of the SJWA and designated as conserved by the CDFW. It is designated as the Conservation Area and is not proposed for development under the project. Any development within land adjacent to Cell Group D (and the SJWA) must incorporate urban edge design features to minimize any potential impacts to the SJWA."*

Response to Comment B-3-48 The commenter states the CDFW does not support the use of relocation, salvage, and/or transplantation as mitigation for impacts to rare, threatened, or endangered species. Based on the DEIR, three species were recommended for relocation, salvage, and/or transplantation. Based on current survey findings, LAPM and/or sensitive plant species are absent from the WLCSP and will not require any type of relocation, salvage, and/or transplantation.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The only species that may require relocation is burrowing owl, which has been an acceptable way of avoiding impacts to burrowing owl throughout Riverside County.

Prior to construction of any of the proposed projects within the WLCSP, a 30-day pre-construction survey will be required for burrowing owl. If burrowing owl are observed during the 30-day preconstruction and is outside of the nesting season (February to August), then passive relocation of the owls is an acceptable means of minimizing impacts. A burrowing owl relocation plan will be prepared to describe the methods of relocation as well as a description of artificial burrow construction and proposed location of artificial burrows within the 250-foot buffer area or other suitable location. The burrowing owl relocation plan will be reviewed and approved by CDFW prior to implementation.

Response to Comment B-3-49 This commenter states the DEIR contains inadequate biological data. A revised MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1) has been included, which updates surveys for burrowing owl and LAPM. A recent sensitive plant survey was not conducted due to the severe drought conditions within the region over the past three years. However, due to the disturbed nature of the WLCSP, very little suitable habitat occurs within the project site for sensitive plant species. Those areas that do provide some habitat were previously surveyed during a year with adequate rainfall (2010), but no sensitive plant species were observed.

Based on the most current information available, sensitive plant species are not likely to occur within the project site. However, for those area within WLCSP that contain some suitable habitat for sensitive plant species, which include areas of native vegetation such as Riversidean sage scrub and chaparral, additional focused surveys for sensitive plant species shall be required during the year the project-level CEQA document is prepared.

Response to Comment B-3-50. The CDFW recommends that the jurisdictional delineation be revised to include all jurisdictional areas per the CWC's definition of *Waters of the State*. An updated wetland delineation report (2013) was prepared to address concerns regarding regulatory agency jurisdiction over the drainage features within the WLCSP. The previous jurisdictional delineation assumed CDFW jurisdiction over a select portion of Drainages 7 and 9. All identifiable and potentially jurisdictional drainages on the site were mapped and included in the draft Program EIR and the draft wetland delineation. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the CDFW.

The applicant shall secure a jurisdictional determination with the CDFW to determine if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will apply for a Streambed Alteration Agreement prior to initiation of construction.

The updated jurisdictional delineation report assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. A maximum of 5.0 acres may be under CDFW jurisdiction. Mitigation for impacts to no more than 5.0 acres of waters of the State will be mitigated by the creation of a minimum of 5.0 acres of habitat creation or purchase of credits at an approved mitigation bank. MMs 4.4.6.3A and 4.4.6.3B address potentially significant impacts to waters of the state.

Any impact to drainage features that are under CDFW jurisdiction will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank. Compensatory mitigation will be negotiated during the permit acquisition process.

Response to Comment B-3-51 The commenter recommended analysis of several potential impacts to wildlife resources on the adjacent SJWA and Lake Perris Recreation Area. This response is similar

to Response to Comment B-3-21. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013-DEIR Volume 2 Appendix E-1), mitigation measures will be imposed by the City of Moreno Valley through its processing of entitlements on a project-by-project basis regarding light, noise, trash, emissions, vectors, fuel management, runoff, and water quality. All project operations within the WLCSP will be required to prepare a WQMP, which will specifically detail all of the required safety precautions necessary to eliminate the risk of toxic contamination to any downstream water body. All project construction activities within the WLCSP will be required to prepare a SWPPP, which will specifically detail all of the required safety precautions necessary to eliminate the risk of construction related contamination to any downstream water body. All development within the project area will be required to obtain a statewide general NPDES construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in detail in Section 4.9 of the DEIR, *Hydrology and Water Quality*. Lastly, the portions of the WLCSP that are specifically located adjacent to Core Conservation Areas, which are located along the eastern and southern boundary of the WLCSP, will require project specific design features and measures related to light, noise, trash, emissions, vectors, fuel management, runoff and water quality as part of the MSHCP requirements for projects affecting a recognized Urban/Wildlands interface. Mitigation measures include specific project designs such as:

- Light directing/restricting covers on light poles;
- Vegetated buffer along the southern and western edge of the WLCSP to reduce noise
- Street sweeping and trash removal requirements to reduce on-site and off-site trash issues;
- The vegetated buffer mentioned about as well as a perimeter wall will be used to reduce the emissions leaving the WLCSP;
- All detention basins will be designed to facilitate water quality improvements and will require assessments by vector control to reduce or eliminate standing water; and
- The SWPPP and NPDES for each project will adequately address all fuel management, runoff water quality requirements.

Response to Comment B-3-52 The commenter recommended that the project incorporate a setback area along its southern boundaries and not refer to the SJWA as a "CDFW Conservation Buffer Area." It should be noted that the land was purchased as a buffer area to any proposed development within the WLCSP. Currently the land that is within the SJWA that is proposed for a General Plan Amendment, is currently disked as extensive agricultural fields and provides little to no suitable habitat for any sensitive plants or wildlife species. Current land use of the WLCSP would indicate that any adjacent project impacts would not have any significant impacts to actively disked farmlands on the SJWA. The disked farm land extends for 4,500 linear feet before reaching sensitive wetland/riparian habitat associated with the SJWA. Therefore, although the northern portion of the SJWA is not considered mitigation for impacts associated with the WLCSP, it does provide a 4,500 foot buffer between the proposed development and sensitive wetland/riparian habitat associated with the SJWA. Therefore, a 250-foot setback, rather than a 250-meter setback, is sufficient to provide a vegetated buffer between the proposed WLCSP development and the adjacent open space of the SJWA.

Response to Comment B-3-53 The CDFW requested that the revised DEIR incorporate appropriate, species-specific mitigation measure to address potential impacts to species and habitat. Since LAPM and sensitive plants were determined to be absent from the WLCSP, no additional mitigation measures are required since impacts to these species will be less than significant. With regard to burrowing owls, prior to issuance of any grading permits, a pre-construction survey for burrowing owls shall be conducted and a report prepared by a qualified biologist and submitted to the City. This

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

survey shall be required and conducted no more than 30 days prior to initiation of ground disturbing activities. If construction is to be initiated during the breeding season (February through August) and burrowing owl is determined to occupy any portion of the study area during the 30-day pre-construction survey, consultation with the CDFW and USFWS shall take place and no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined that the nest/burrow is no longer active and all juveniles have fledged the nest/burrow. No disturbance to active burrows shall occur without appropriate permitting through the Migratory Bird Treaty Act (MBTA) and/or CDFW.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, passive relocation may be conducted following consultation with the CDFW and USFWS. Construction activity may occur within 500 feet of the active nests at the discretion of the biological monitor.

If active nests are identified in a development area, the nests shall be avoided or the owls actively or passively relocated to the 250-foot setback area in the southern portion of the Specific Plan site (see MM 4.4.6.4D). This setback area shall be used as a “conservation area” for burrowing owl or other species of animals or plants that need to be relocated from the portions of the WLCSP site are developed. In the event no burrowing owls have been identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, MM 4.4.6.4D shall apply. To avoid active nests adequately, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season.

This measure shall be implemented to the satisfaction of the City Planning Official (MM 4.4.6.4D). If active burrowing owl burrows are detected outside the breeding season, passive and/or active relocation may be undertaken following consultation with and approval by the CDFW and/or USFWS. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re-enter the holes/dens. Owls may also be actively relocated on site to the 250-foot clear buffer zone along the southern boundary of the WLCSP or other suitable location, as outlined in MM 4.4.6.4D. This measure shall be implemented to the satisfaction of the City Planning Official.

Response to Comment B-3-54 This commenter advises that the DEIR should provide a thorough analysis of direct, indirect, and cumulative impacts and identify specific measures to offset such impacts. Please refer to Responses to Comments B-3-17, B-3-18, B-3-20, B-3-22, and B-3-23. The FEIR provides a thorough analysis of all direct, indirect, and cumulative impacts at a program-level. Appropriate mitigation measures are recommended to reduce the level of significance to a less than significant level. Please keep in mind that project-specific designs and impacts are not required for a program-level document; however, an appropriate estimation of project related impacts is included in the FEIR, where appropriate.

Response to Comment B-3-55. The commenter has indicated the DEIR failed to evaluate a full range of alternatives, but failed to suggest appropriate feasible alternatives or explain why those evaluated are insufficient. CEQA requires the evaluation of alternatives that reduce or eliminate one or more of the significant impacts identified for a project, however, the DEIR did not identify any significant impacts to biological resources after implementation of the recommended mitigation measures in Section 4.4 of the DEIR. Therefore, there was no requirement under CEQA to evaluate any alternatives that specifically addressed biological resources. It is unfortunate the commenter did not provide additional guidance as to characteristics of an alternative that would be more acceptable to the Department.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment B-3-56. This commenter summarizes all of the CDFW's requests and recommendation for the revised DEIR. The FEIR document includes updated biological reports as recommended by the CDFW, including an updated Jurisdictional Delineation and MSHCP Consistency Reports, and a programmatic DBESP report as recommended by the Department (see FEIR Volume 2 Appendix E). These updated documents support the conclusions of the DEIR (i.e., less than significant impacts to biological resources). The cumulative impact analysis in the DEIR was appropriate for the proposed WLC project, and the DEIR contained a reasonable range of alternatives based on the significant impacts of the proposed project outlined in the DEIR, which did not include biological resources.

Letter B-4: State of California Department of Parks and Recreation (April 8, 2013)

DEPARTMENT OF PARKS AND RECREATION

Major General Anthony L. Jackson, USMC (Ret), Director

Inland Empire District
17801 Lake Perris Drive
Perris, CA 92571
(951) 443-2423

April 8, 2013

Mark Gross
City of Moreno Valley
Community Development Department
14177 Frederick Street
Moreno Valley, CA 92552

Subject: Comments on the World Logistics Center Draft Environmental Impact Report
SCH #: 2012021045

Dear Mr. Gross:

The Inland Empire District of the Department of Parks and Recreation (State Parks) appreciates the opportunity to comment on the aforementioned project. State Parks is a trustee agency as defined by the California Environmental Quality Act (CEQA). State Parks' mission is to provide for the health, inspiration and education of the people of California by helping to preserve the state's extraordinary biological diversity, protecting its most valued natural and cultural resources, and creating opportunities for high-quality outdoor recreation. As the office responsible for the stewardship of Lake Perris State Recreation Area (Lake Perris), we have an interest and concern about contemplated alterations of land use adjacent to the park.

1

In general, State Parks requests revisions to the proposal and design of the project due to the potential for a substantial number of significant impacts related to ecosystem health, sensitive biological resources and wildlife movement. Furthermore, it appears that the amount of the proposed development is directly proportional to the levels of impact (i.e., the larger the development area, the higher amount of significant impacts).

2

For these reasons, we suggest looking at alternatives which reduce the development area, thereby potentially reducing the amount of impact. The following are comments regarding the scope and content of information for inclusion in the draft environmental impact report.

3

The DEIR addresses impacts to the California Department of Fish and Wildlife owned and operated, San Jacinto Wildlife Area (SJWA) on numerous occasions but rarely addresses impacts to Lake Perris, while just as with the SJWA, the project shares a boundary with Lake Perris. In many cases it may be appropriate to consider impacts to both units as one large conserved unit; however, the DEIR needs to address direct,

4

indirect and cumulative impacts to Lake Perris in all areas of the document independently as well.

4

As a signatory to the Western Riverside County Multi-species Habitat Conservation Plan (MSHCP) State Parks is privy to MSHCP biological monitoring program plant and animal survey results and reports. As such State Parks is aware of numerous observations of state and federal listed species as well as MSHCP covered species made by the MSHCP biological monitoring program within or immediately adjacent to the project area which have not been identified or addressed in the DEIR. These omissions need to be addressed in the Final EIR and avoidance and mitigation measures developed for all state, federal and MSHCP plan covered species. State Parks recommends that the project proponents contact the MSHCP monitoring program for the results of its surveys within and adjacent to the project area.

5

The DEIR comments on impacts to raptor foraging habitat in section 4.4 on several occasions under the regulatory framework of California Fish and Game Code and California Code of Regulations but fails to address impacts to golden eagle, *Aquila chrysaetos*, foraging under California Fish and Game code or federal Bald and Golden Eagle Protection Act (16 U.S.C. 668-668c). The DEIR needs to address impacts to golden eagle foraging habitat from this project.

6

The DEIR references the MSHCP Fuel Management Guidelines and agrees to incorporate all brush management within the development boundaries. The DEIR does not provide a description of what type of fuel management activities are planned for the development, where the fuel management area will be, the size of the fuel management area, or what type of vegetation will be planted, if any, within the fuel management area. The DEIR should provide a fuel management plan, including a plant palette and proposed maintenance activities, graphics that clearly define these fuel modification zones with reference to the development, and an assessment of any potential impacts related to the fuel management area and associated maintenance activities. Analysis of impacts related to fuel modification areas should not be deferred to future development.

7

The DEIR addresses migratory corridors/ linkages in the following manor (p. 4.4-33):

"The project area is adjacent to an existing migratory corridor across Gilman Springs Road (i.e. Criteria Cells 1290, 1389, and 1390) as designated by the MSHCP. While the open agricultural fields that presently occupy much of the project area are not designated as corridors or linkages in the MSHCP, the project site, including the CDFW property, supports extensive agricultural fields, which do not constitute native vegetation, but do provide some foraging value and may allow for migration or movement of wildlife through the general area even considering the level of repeated disturbance by agricultural activities. Wildlife movement through this area is generally planned to take place across the Mystic Lake property to the south. The northern (upland) portion of the SJWA (i.e., the CDFW Conservation Buffer Area) and the southern portion of the Specific Plan area do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement."

8

And (p 4.4-62):

"According to the project biological report, the project area does not contain any wildlife movement corridors or linkages. It is likely that wildlife moves through adjacent properties such as the SJWA and the Mystic Lake area to the south, the Badlands area to the east and the Lake Perris State Recreation Area to the southwest. The project biological report concluded that development of the project as proposed would not have any significant impact on wildlife movement in the area, and would not fragment habitat or adversely affect wildlife movement through the surrounding areas. Therefore, impacts in this regard are less than significant, and no mitigation is needed."

State Parks believes that the DEIR and the project biological report do not adequately address project impacts to migratory corridors/ linkages as they apply to Lake Perris. We suggest that wildlife movement studies be conducted to further analyze potential impacts to wildlife corridors/ linkages to the Lake Perris/SJWA area from the project. Lake Perris is occupied by a host of common, sensitive and state and federal listed species which will be left largely isolated by this project. In order to maintain genetic integrity they require varied linkages to larger adjacent open spaces. State Parks suggests that studies consider lesser linkages in addition to those identified in the MSHCP, specifically the areas identified as "On-site Drainages" that traverse the project area, without such lesser linkages Lake Perris will be left as a relatively isolated peninsula of preserved open space leading to the loss of biodiversity and over all habitat value.

The referenced project biological report only concentrated on certain onsite species with only anecdotal observations of other wildlife. Specific comprehensive wildlife movement studies are needed to properly analyze potential impacts of such a large scale project as this.

Loss of species will lead to recreational impacts as well as much of the visitation to Lake Perris is for wildlife viewing and visiting a wild place. Even when the public does not see a mountain lion, golden eagle or any other species or personal interest during their visit the knowledge that they might or that that species could be hiding around the corner is an important recreational draw.

The Project will create certain barriers to wildlife movement, including the physical barrier between the Badlands and open space areas to the south of the Project, a significant increase in traffic surrounding the Project area, and increased levels of light and noise. The build out of the proposed Project will create an obstruction to wildlife movement to and from the Badlands across the nearly 2-mile Project boundary along Gilman Springs Road. This barrier forces wildlife to move east, potentially causing a funneling effect across Gilman Springs Road at the edge of the development. This forced detour effectively limits the ability for wildlife to utilize the existing culverts under State Route 60 to further access the Badlands open space.

The DEIR also largely overlooks impacts to the Badlands, and its significant acreages of public and private open space as well. Further evaluation of impacts to this important

8

9

10

11

12

open space and the linkage to it needs to be made and avoidance and mitigation measures established.

12

Mitigation measures focusing on reducing impacts to wildlife movement in the area should be provided. In considering mitigation measures for wildlife movement further analysis of impacts to wildlife moving across roads and roadkill need to be made and avoidance and mitigation measures developed for reducing injury or death of wildlife crossing roads.

13

The Specific Plan provides for a 400-foot setback along the southern boundary of the Project, adjacent to Lake Perris and SJWA, which includes a 250-foot development setback and a 150-foot building setback. The 250-foot development setback would include landscape areas, drainage and water quality facilities, barriers (walls and fencing), maintenance access drives, and other related uses as described in the DEIR. This area should not be considered a buffer from development but rather an aspect of the development as they will contain maintained facilities required by the development. State Parks recommends a minimum 250 feet natural/undeveloped buffer that would not contain any manufactured structures, such as detention and water quality basins, walls and fences, and irrigated landscaping.

14

The DEIR states that night lighting may have adverse effects on a range of wildlife species. Effects include mortality due to increased predation, reduced health due to the disturbance of diurnal rhythms, and reduced clutch size, egg size, or survival of nesting birds. Although the Project intends to remain consistent with both the night lighting guidelines within the City's Municipal Codes and the City's Dark Sky Lighting Ordinance, additional measures should be proposed to reduce the cumulative impacts to Lake Perris and SJWA.

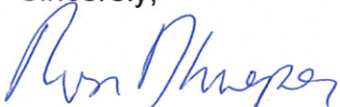

15

The DEIR also states that approximately 75 acres in the southwest corner of the project area is designated and restricted to passive open space and recreation use adjacent to Mount Russell and Lake Perris. The DEIR does not identify how this area will be managed as a passive open recreational open space. Or whether a conservation easement designating it as such will be placed on the property?

16

Thank you again for coordinating this project with us. For further discussion, please contact me or Enrique Arroyo at (951) 453-6848.

Sincerely,

Ron Krueper
District Superintendent
Inland Empire District

Jay Chamberlin, State Parks
Kim Freeburn, California Department of Fish & Wildlife

RESPONSES TO LETTER B-4

State of California Department of Parks and Recreation

Response to Comment B-4-1. The City acknowledges that the California Department of Parks and Recreation (Department) is responsible for maintaining the facilities and resources of Lake Perris near the southwest corner of the World Logistics Center (WLC) project. The City also understands the Department's concerns regarding the WLC project relative to Lake Perris.

Response to Comment B-4-2. The commenter states that it is the size of the proposed project that is creating the numerous significant impacts. The commenter is correct to some degree that some (though not all) of the impacts of the project are proportionally related to the size of the project (i.e., more square footage of logistics buildings, more traffic, air pollution, noise, etc.). The Draft Environmental Impact Report (DEIR) did identify a number of significant environmental impacts of the WLC project; however, the EIR concluded that impacts to biological resources will be reduced to less than significant levels by project design and the proposed mitigation. These conclusions have not changed even though the project biology reports were all updated and in some cases revised to address the many comments received on the biological resource reports.

Response to Comment B-4-3. This commenter suggests the DEIR analyze alternatives that focus on reduced development area. The DEIR did examine a number of alternatives but, because impacts to biological resources were determined to be less than significant, no alternatives were specifically developed to reduce those impacts. The commenter is encouraged to re-read Section 6 of the DEIR for more information regarding alternatives.

Response to Comment B-4-4. The commenter requests more analysis of impacts to Lake Perris. Lake Perris is approximately 2.6 miles southwest of the WLC Specific Plan (SP) area and does not share a boundary with Lake Perris. It is assumed that the comment is referring to the Lake Perris State Recreational Area, which is located southwest of the WLCSP. The land included in the State Park and surrounding area is within lands designated as Public/Quasi-Public and is conserved under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The WLCSP will not have any direct impacts to Lake Perris or the Lake Perris State Recreational Area

Indirect impacts that may affect Lake Perris State Recreational Area include light, noise, air quality, and hydrology. The WLCSP is separated from the Lake Perris State Recreational Area by Mt. Russell as well as a small series of hills between Mt. Russell and the Bernasconi Hills (DEIR Figure 4.1.1 shows the locations of these features). These topographic features have a minimum elevation difference of 160 feet above the WLCSP and drops 60 feet on the southwest side along the edge of Lake Perris. This provides a natural barrier that would eliminate all light and noise impacts to Lake Perris and the Lake Perris State Recreational Area. In addition, the prevailing winds blow in the easterly direction away from Lake Perris and therefore, no indirect air-quality impacts to Lake Perris associated with the WLCSP. The WLCSP has no direct hydrologic connection to the Lake Perris State Recreational Area and therefore project development will have no indirect impacts to Lake Perris or the Lake Perris State Recreational Area with regard to hydrology. Therefore, there are no indirect project related impacts to the Lake Perris State Recreational Area associated with the development of the WLC.

The WLCSP also has a 1,500-foot buffer between the proposed development and the northern edge of the Lake Perris State Recreational Area. This area, which encompasses the northern slopes of Mount Russell is too steep to develop and will remain as designated open space.

Payment of the MSHCP Development Fee will reduce cumulative project related impacts associated with the adjacent Lake Perris State Recreational Area to a level less than significant. Subsequent

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

California Environmental Quality Act (CEQA) review will be required on a project-by-project basis to ensure conformance with the MSHCP and future implementing plans/ordinances at the project-specific level.

Response to Comment B-4-5. The commenter states there are listed federal, state, and MSHCP covered species that were not included in the DEIR. In an attempt to obtain sensitive species information, not previously included in the CNDDDB 2013, Resource Conservation Authority (RCA) staff was contacted. Geographic Information Systems (GIS) data regarding the San Jacinto Wildlife Area (SJWA) and surrounding area was provided by RCA staff and is included in the Draft Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1) (hereafter MSHCP Consistency Analysis).

Response to Comment B-4-6. The commenter states the DEIR needs to address impacts to golden eagle foraging habitat from this project. Under the City of Moreno Valley General Plan, Raptor Foraging/Wintering Habitat (including golden eagle foraging habitat) is considered a regionally sensitive habitat (General Plan Final Program EIR pg. 5.9-27). It also states that some Field/Cropland areas provide valuable foraging habitat (General Plan Final Program EIR pg. 5.9-28). The areas adjacent to native habitats are of higher value for raptor foraging, but an assessment of the value of the Field/Cropland area require an area-by-area investigation.

Golden eagles were not observed during any of the 8 years of surveys within the WLCSP. The prey base within the WLCSP is considered extremely limited based on the burrowing owl surveys conducted in 2013. The WLCSP is actively farmed, which also minimizes the amount of available vegetative cover on an annual basis. All of these factors greatly lowers the habitat value of the WLCSP with regard to raptor foraging habitat. The likelihood of the WLCSP to support a population of golden eagles is extremely low, but the possibility cannot be ruled out that golden eagles could occur within the WLCSP during selective portions of the year.

The golden eagle is a California fully protected species, but is also a covered species under the MSHCP. Impacts to golden eagles are mitigated through the payment of the MSHCP fee. The fees collected from each project, will be used to purchase off-site conservation lands, which will conserve higher-quality foraging habitat, which is necessary for the long-term conservation of the species. Impacts to golden eagle foraging habitat is a potentially significant impact, but payment of the MSHCP Development Fee will reduce those impacts to a less than significant level.

Response to Comment B-4-7. The commenter states the DEIR should include a fuel management plan. A Fuel Management Plan focuses on hazard reduction for people and their property on a project-by-project basis. Fuel management involves the reduction of fuel loads in areas where fire may threaten public safety and property, suppressing fires once they start, and providing access for fire suppression equipment and personnel.

A Fuel Management Plan will be required on a project-by-project basis and under MSHCP guidelines, is only required for those projects located adjacent to Conservation Areas (MM 4.4.6.4J). Therefore, projects located along southern and eastern WLCSP boundary will have a Fuel Management Plan. The Plan will include a plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area. A list of non-native invasive plants that are prohibited from installation will also be required. The Plan will included maintenance activities and a maintenance schedule. Fuel modification zones will be mapped and include an impact assessment as required under CEQA guidelines for a project-level analysis. A Fuel Management Plan cannot be designed for a program-level analysis because project specific information such as proposed access, construction materials, and other project design features will not be available until individual projects are proposed.

A new mitigation measure has been added to the Revised DEIR Section 4.4 Biological Resources to ensure a fuel management plan is prepared and approved by the City prior to plot plan approval for those planning areas on the south and east boundaries of the WLCSP project adjacent to MSHCP Conservation Areas.

4.4.6.4J A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the World Logistics Center Specific Plan adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas. The Fuel Management Plan shall be prepared by the project proponent and submitted for approval to the prior to plot plan approval for those projects on the southern and eastern Western Riverside County Multiple Species Habitat Conservation Plan boundary. Per the Western Riverside County Multiple Species Habitat Conservation Plan guidelines, the Fuel Management Plan shall include the following:

- A plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area.
- A list of non-native invasive plants that are prohibited from installation.
- Maintenance activities and a maintenance schedule.

Fuel modification zones shall be mapped and include an impact assessment as required under California Environmental Quality Act guidelines for a project-level analysis. The plan shall demonstrate that the adjacent Western Riverside County Multiple Species Habitat Conservation Plan Areas are adequately protected from expected fire risks.

Response to Comment B-4-8. The commenter states the DEIR and project biological report does not sufficiently address project impacts to migratory corridors/linkages as they apply to Lake Perris. Lake Perris is located southwest of the WLCSP and is located within a designated open-space area. Land use surrounding Lake Perris includes the developed portion of the City of Moreno Valley to the north, residential development and agricultural uses to the south, residential and commercial development to the west, and agricultural uses and undeveloped open-space occurs to the east.

Therefore, the Lake Perris is surrounded on three sides by development that would limit wildlife movement to the north, south, and west. Wildlife have uninhibited movement to the east within the SJWA, which directly connects to the Badlands further to the east.

The proposed WLCSP is located at the eastern most extent of the City of Moreno Valley and current land use is designated as residential development. Based on the City of Moreno Valley General Plan, this portion of the city was not designated as a conservation area and was intended to be part of the urban development.

SR-60 and Gilman Springs Road have already created a significant barrier between Lake Perris and adjacent open space areas to the north and east. It should also be noted that Existing Core H and Proposed Core 3 within the MSHCP are connected just south of the WLCSP and therefore will not be completely separated by the proposed development. The disturbed nature of the extensive agricultural fields also limits the amount of wildlife species that may utilize the WLCSP area as a wildlife corridor.

The WLCSP is not within a significant wildlife movement corridor (see Section 4.4.5.2 of the DEIR) and as a result was not included in any conservation area, corridor, or linkage within the MSHCP or designated as such in the City's General Plan. Therefore, the proposed WLCSP will not have a significant impact on wildlife movement between open space areas within the Badlands and Lake

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Perris. The development of the WLCSP will not cut-off or otherwise impede wildlife movement from the Lake Perris State Recreational Area to the east.

Lake Perris State Recreational Area is characterized as being occupied by a host of common, sensitive, and state and federal listed species, which will be left largely isolated by this project. The extensive agricultural fields and other non-native plant communities within the WLCSP do not provide a suitable linkage between the Lake Perris State Recreational Area and the Badlands area to the northeast. Therefore, the sensitive wildlife species that occur within the Lake Perris State Recreational Area will be no more isolated with the development of the WLCSP that they are with the existing land use.

Although not required, Drainage 9 will remain in its current location to provide drainage from the Badlands area south through the eastern portion of the WLCSP area. The drainage will also serve as a travel path for wildlife species between Existing Core H and Proposed Core 3. Drainage 9 will require some initial re-grading and reinforcement to eliminate erosion issues and improve water quality but will ultimately be enhanced to provide higher quality riparian habitat.

Response to Comment B-4-9. The commenter suggests comprehensive wildlife movement studies are needed to properly analyze potential impacts of the proposed project. Biological resources have been studied on the project site for nearly eight years (refer to Table B-3.A in Response to Comment B-3-4). Wildlife movement north of the WLCSP is precluded by ground dwelling animals because the majority of the underground culverts used to convey storm flows beneath SR-60 are nearly completely filled with sediment (Master Plan of Drainage Report 2014 refer to FEIR Volume 2 Appendix J). Therefore, construction activities associated with the WLCSP will not have an impact on wildlife movement from the area north of the WLCSP. Similarly, all of the culverts that convey storm flows beneath Gilman Springs Road are also nearly filled with sediment and have not been maintained for many years. The WLCSP area was not included as an existing linkage or a proposed linkage under the MSHCP. Due to the disturbed nature of the WLCSP area and the lack of native habitat connecting Lake Perris to the Badlands, it is reasonable to assume that WLCSP does not function as a regional wildlife movement corridor (see Section 4.4.5.2 of the DEIR).

However, as a project design feature and not a mitigation measure, Drainage 9 will remain in its current location and will be enhanced to improve existing habitat within the channel. The drainage will also have a 25-foot buffer on either side that will contain native vegetation. This area will provide larger local wildlife, such as coyote, raccoons, and opossums, a higher quality travel path along the eastern side of the WLCSP.

Response to Comment B-4-10. The commenter suggests the proposed project will decrease the draw of recreational areas like Lake Perris by reducing the amount of wildlife in the area. The project design is intended to maintain a wildlife corridor connection along Drainage 9 in the eastern portion of the WLC site, which will allow for wildlife movement between the Badlands to the north and Mystic Lake and the SJWA to the south. This corridor will be at least 100 feet wide, and the actual channel which will be maintained in a relatively natural condition except for necessary flood control improvements. Development that affects this channel would require subsequent environmental review and regulatory permitting from the California Department of Fish and Wildlife at a minimum. Such permitting would include consultation with the CDFW as an adjacent responsible agency.

Response to Comment B-4-11. The commenter describes the barriers to wildlife movement caused by the proposed project. The WLCSP, once completely developed will cause a physical barrier between the portion of the Badlands located immediately to the north and the SJWA located immediately to the south. However, the Badlands area is a series of relatively undisturbed rolling hills that is parallel to Gilman Springs Road, which runs along the eastern portion of the WLCSP in a northwest to southeast direction. The SJWA is a large conservation area that connects the Badlands

to Lake Perris. Therefore, the development of the WLCSP area will not completely impeded wildlife movement between the Badlands and Lake Perris.

Several project design features are included in the general concept of the WLCSP that will minimize a forced detour at the edge of the proposed development and include maintaining Drainage 9 as a natural drainage feature and replacing sediment-filled culverts along Gilman Springs Road. The funneling effect across Gilman Springs Road will have some benefit by forcing wildlife species to travel further south to cross Gilman Springs Road at the southern edge of the WLCSP from the Badlands Area directly to the area within the SJWA.

In addition, the WLCSP development is located within an area that is currently zoned for residential development in the General Plan. The proposed development strategy in the General Plan was not considered a potentially significant impact with regard to wildlife movement corridors.

The WLCSP is not within a significant wildlife movement corridor and as a result was not included in any conservation area, corridor, or linkage within the MSHCP or designated as a conservation area within the General Plan (see Section 4.4.5.2 of the DEIR).

Development of the WLCSP will increase traffic, light, and noise. However, Mitigation Measures (MMs) 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I will reduce significant impacts related to these issues to less than significant levels.

Response to Comment B-4-12. The commenter states the DEIR overlooks impacts to the Badlands. The WLCSP and the proposed offsite facilities are bordered to the east by MSHCP Proposed Core 3, also known as the Badlands. With the exception of a few small drainage improvements, the WLCSP will avoid the Badlands. However, those projects that are located immediately adjacent to a core or proposed core area require project design features to minimize potentially significant impacts associated with the Urban/Wildlands interface as described in the MSHCP.

The portions of the WLCSP and offsite facilities that are on or immediately adjacent to conservation areas shall incorporate the design features and measures related to drainage features, toxics, lighting, noise, invasive plants, barriers, and grading/land development discussed below. These measures make the proposed project consistent with the MSHCP, Section 6.1.4, and Guidelines Pertaining to the Urban/Wildlands Interface. A detailed description of recommendations pertaining to an Urban/Wildlands interface is described in MMs Bio-6D in the MSHCP Consistency Analysis (FCS-MBA 2013-FEIR Volume 2 Appendix E-1).

Small drainage improvements (basins) are anticipated for the east side of Gilman Springs Road, within the disturbed portion of the Badlands. The number of basins needed and their locations will be assessed on a project-by-project basis. Any impacts to jurisdictional drainage features are considered significant impacts and will require appropriate regulatory permitting as described in MMs 4.4.6.3A and 4.4.6.3B.

Response to Comment B-4-13. The commenter requests mitigation measures be created to reduce impacts to wildlife movement in the area. It should be noted that currently, State Route 60 (SR-60) and Gilman Springs Road create a significant barrier between the Badlands and the SJWA. There are also several rural residences that occur along the east side of Gilman Springs Road and there are many proposed residences that have yet to be constructed. Therefore, the current existing conditions have already created a significant barrier between these two open space areas.

The disturbed nature of the extensive agricultural fields limits the amount of wildlife species that may utilize the WLCSP for regional movement. The WLCSP is not within a significant wildlife movement corridor and as a result was not included in any conservation area, corridor, or linkage within the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

MSHCP. Therefore, the proposed WLCSP will not have a significant impact on wildlife movement on a regional basis and mitigation measures are not required.

It should also be noted that MSHCP Existing Core H and Proposed Core 3 are connected just south of the WLCSP and therefore will not be separated by the proposed development.

As a project design feature, Drainage 9 will remain in its current location to provide regional drainage, but may also be used as a travel path for wildlife species between MSHCP Existing Core H and Proposed Core 3. Drainage 9 will require some initial re-grading and reinforcement to eliminate erosion issues and improve water quality, but will ultimately be enhanced to provide higher quality riparian habitat. All necessary regulatory permits and mitigation measures will be required for all project impacts associated with the Drainage 9 improvement. In addition, culverts that convey storm flows beneath SR-60 and Gilman Springs Road will be cleaned out and/or replaced, which will allow smaller wildlife species to travel along Drainage 9. These are considered project design features and are not mitigation measures for a potentially significant impact.

Response to Comment B-4-14. The commenter requests additional mitigation to reduce night time lighting effects to wildlife. The 250-foot buffer area along the southern portion of the WLCSP will not contain any buildings or similar development. There is an additional 150-foot building setback for structures, which provides a total building setback of 400 feet from the SJWA boundary. The purpose of the buffer area is to provide a transition from the proposed development to the northern edge of the SJWA to minimize potentially significant indirect impacts to the SJWA. The portion of the SJWA immediately adjacent to the WLCSP is in active agriculture and does not provide suitable habitat for any sensitive plant and/or wildlife species known to occur within the SJWA. The closest suitable habitat is approximately 4,500 feet to the south of the WLCSP. A 250-foot natural/undeveloped buffer with no manufactured structures, such as detention basins and water quality basins, walls and fences, and irrigated landscaping is not necessary or required. MM 4.4.6.1A will reduce potentially significant impacts associated with the Urban/Wildlands Interface under the MSHCP to a level less than significant.

Response to Comment B-4-15. As required in the City of Moreno Valley, all development projects are subject to the City's Municipal Code. Mitigation for these impacts is described in Section 4.1.6.4 of the DEIR. All direct light rays will be contained within the building sites. Limited lighting away from the building will be used for security and basic building illumination. All exterior lights will be shielded to direct light away from the SJWA and Lake Perris State Recreational Area.

In addition, as a project design feature, a series of drainage improvements will be designed along the southern boundary of the WLCSP. The riparian vegetation associated with those improvements will be designed to provide a vegetative barrier that will block most of the remaining indirect project lighting from the adjacent SJWA and Lake Perris State Recreational Area. Riparian trees such as willows and cottonwoods, will be planted within selective portions of the drainage improvements to provide riparian habitat, but will be maintained to support the functionality of the basins.

Response to Comment B-4-16. In response to comments received on the DEIR, the proposed Specific Plan has been updated to add more clarity to a number of its sections. Relative to this comment, the Specific Plan has been updated to add planning area designations to the various development areas within the project. The 74.3-acre property referenced in the comment is identified as Planning Area 30 and designated as Open Space. The Specific Plan includes provisions for the irrevocable offer of dedication of Planning Area 30 to the City of Moreno Valley in connection with the first development proposal for property adjacent to the planning area. It will be retained as undeveloped open space in public ownership as outlined in a new MM 4.1.4.1D as follows:

4.1.6.1D Prior to the issuance of permits for any development activity adjacent to Planning Area 30 (74.3 acres in the southwest portion of the Specific Plan), the entirety of

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Planning Area 30 shall be offered to the State of California for open space purposes. In the event that the State does not accept the dedication, the property shall be offered to Western Riverside County Regional Conservation Authority or an established non-profit land conservancy for open space purposes. In the event that none of these organizations accepts the dedication, the property may be dedicated to a property owners association or may remain in private ownership and may be fenced and access prohibited.

Letter B-5: California Air Resources Board (April 16, 2013)

Air Resources Board

Matthew Rodriguez

APR 18 2013

CITY OF MORENO VALLEY
Planning Division

Mr. John Terell
Planning Official
Community and Economic Development Department
Planning Division
14177 Frederick Street
Post Office Box 88005
Moreno Valley, California 92552

Dear Mr. Terell:

The California Air Resources Board (ARB) is providing comments regarding the Draft Environmental Impact Report (EIR) for the proposed World Logistics Center (Center) a 3,918 acre project which includes 2,710 acres for logistics warehousing to be developed by the project applicant Highland Fairview. This new facility provides an opportunity to create a state-of-the-art-facility that promotes the use of the cleanest technologies available during both the construction phase and full project build-out.

The Center includes a number of features that attempt to mitigate the impacts of the increase in diesel truck traffic in the region as well as emissions from project construction. These features include designated truck routes to direct trucks away from a nearby residential community, design principles that include special edge treatments to provide a buffer between the Center and an existing residential community, sustainability principles that encourage active transportation, and the requirement for all heavy-duty trucks entering the facility to meet or exceed 2010 emission standards or be powered by an alternative fuel. Nonetheless, the long-term operation of diesel trucks will have a significant impact in the region. Given the magnitude and scope of the Center, these features need to be expanded to include emerging zero-emission technology for the equipment that will serve the facility.

At full project build-out, emissions from diesel trucks will be the largest contributor to cancer risk from the Center. ARB staff believes that technology capable of

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our website: <http://www.arb.ca.gov>.

California Environmental Protection Agency

Mr. John Terrell
 April 16, 2013
 Page 2

zero-emissions will be available for additional applications, including trucks, in the early years of full project build-out. The final project conditions should support development of this technology and provide for its use to better protect the health of nearby residents from the harmful effects of fine particle pollution (including diesel particulate matter), ensure the emission reductions required to attain air quality standards for all pollutants, and reduce greenhouse gases.

3

Background

The proposed Center project area covers 3,918 acres in eastern Moreno Valley (near Highway 60 and roughly 75 miles east of the Ports of Los Angeles and Long Beach). The entire project area is covered by a City of Moreno Valley General Plan Amendment that proposes to redesignate 2,635 acres for logistics development, with the remaining area designated for use as public utility, open space, or utility extensions. Currently, the Center project area is designated as a mix of residential, commercial, business park, and open space land uses.

Within the project area, 2,710 acres are included in a proposed World Logistics Center Specific Plan (Specific Plan). The Specific Plan allows for up to 41.4 million square feet of high-cube logistics (logistics development) including 20,000 square feet of land for logistics support for vehicle fueling, as well as 200,000 square feet of warehouse and related uses (light logistics). The project area will be built-to-suit under the requirements of the Specific Plan, individual development permits, and mitigation required as a result of the EIR. It is proposed that the Center be built in two phases with development build-out years of 2017 for Phase 1 and 2022 for Phase 2. At full project build-out it is expected that on average about 58,300 non-diesel vehicles and 12,700 heavy duty diesel vehicles will operate at the facility daily.

4

Existing land use surrounding the proposed Center is the Highland Fairview Corporate Park and State Route 60 to the north; San Jacinto Wildlife Area and Lake Perris State Recreation Area to the south; vacant hillsides and scattered Residential to the east; and Suburban Residential Neighborhood to the west.

The draft EIR presents several analyses of the Center's potential air quality impacts at both a regional and local level. The document presents two scenarios: 1) the "No Project" scenario in which assumes full build-out of the City of Moreno Valley General Plan in 2035 except for the project site, and 2) the "With Project" scenario which assumes the project were built-out in accordance with its proposed phased build-out schedule and then added to the No Project scenario. Both of the scenarios reflect the benefits of adopted ARB and federal regulations that are reducing emissions from the transportation sector over time. The draft EIR also assesses the maximum individual

5

Mr. John Terell
April 16, 2013
Page 3

cancer risk (risk) to residents in the neighboring residential community from Center emissions. When risk from the two scenarios is compared, there is an estimated net increase in risk from the Center (with proposed mitigation) of 20.9 chances in a million.

5

The draft EIR also presented year-by-year estimated greenhouse gas emissions from Center operations in 2014 through 2022. Even after all feasible mitigation is implemented, Center-related greenhouse gas emissions will exceed the South Coast Air Quality Management District significance threshold of 10,000 million metric tons of carbon dioxide equivalents per year by a wide margin. At full project build out in 2022 (including all mitigation and project design features), total projected greenhouse gas emissions exceed 665,000 million metric tons of carbon dioxide equivalents per year. Impacts related to greenhouse gas emissions and climate change will be significant and unavoidable.

6

ARB staff concludes that the proposed Center would increase the health risk in the immediate area and the project should utilize all existing and emerging zero-emission technology and implement land use decisions that minimize diesel exposure to the neighboring community.

7

Recommendations

The majority of the localized cancer risk for the Center is attributable to the increase in diesel PM from the construction and long-term operation of the facility. The draft EIR estimates a net increase in diesel PM from the Center's total operational emissions of 24 pounds per day in 2017 and 54 pounds per day in 2022 (total operations include truck yards, local roadways internal to the project site, local surface streets, and main freeway segments in the project area). Consequently, ARB staff recommends actions to support the development, demonstration, and deployment of zero- and near zero-emission technology to reduce localized health risk and regional emissions. We believe that use of these technologies is feasible within the build-out years of the Center, consistent with the California Environmental Quality Act definition:

8

"Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. (California Code of Regulations, title 14, section 15364)

The Specific Plan should be modified to require the use of the cleanest technologies within the Center as a project and lease condition accordingly:

Mr. John Terrell
 April 16, 2013
 Page 4

1. From the onset, require that all medium-heavy and heavy-heavy duty trucks, including any alternative fuel vehicles, meet or exceed the 2010 emission standards. As it becomes available, require that trucks traveling between the Center and any ports or railyards within 100 miles use zero/near zero technology.
2. Require, to the greatest extent possible, on-site service vehicles and equipment use zero emission technology and, if zero-emission technology is unavailable, that all vehicles and equipment meet the cleanest applicable emission standard.
3. Require, when available, the use of zero-emission property maintenance equipment.

8

In addition, proposed mitigation measure 4.3.6.2A (construction equipment exhaust mitigation) should require the use of electric construction tools, when available and feasible, rather than just provide electric hookups. In addition, require all construction fleets be in compliance and monitor compliance with current air quality regulations for off-road equipment. Proposed mitigation measure 4.3.6.3B (localized construction and operations emission mitigation) should require all tenants be in compliance and monitor compliance with all current air quality regulations for on-road trucks including ARB's Heavy-Duty Greenhouse Gas Regulation and Truck and Bus Regulation. ARB is available to provide assistance in implementing this recommendation.

9

ARB recommends these additional mitigation measures to further minimize impact to the surrounding community:

1. The developer, Highland Fairview, or the City of Moreno Valley provide incentives for tenants to encourage the use of alternative modes of commuting by their employees including, but not limited to, active transportation, public transportation, car pool, and the use of zero-emission vehicles. These same methods of transportation should be strongly encouraged or required for movement within the Center area.
2. Shift the proposed development along the west side of the project area to focus on light logistics or other uses to ensure that any operations of diesel trucks or equipment are at least 1000 feet away from residential occupied or zoned property or other sensitive receptor.
3. Minimize all traffic, beyond just heavy-duty truck traffic, by limiting the use of the "D" Street entrance to only local residents.

10

11

12

Mr. John Terell

Page 5

4. Increase the required distance from any on-site fueling stations to residential occupied or zoned property or other sensitive receptor from 250 feet to 1,000 feet.

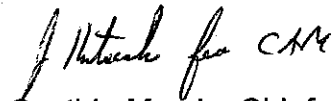

13

Closing

ARB staff appreciated the opportunity to comment on the draft EIR. Given the scale of the facility and the risk associated with the increase in diesel PM from the Project, it is critical that the draft EIR and Specific Plan incorporate the use of advanced technologies as they become available. We are pleased to provide assistance for successful implementation and deployment of a state-of-the-art facility that serves the region's distribution and air quality needs, while protecting public health. If you have questions, please call me at (916) 324-0062 or contact Mr. Jack Kitowski, Assistant Division Chief, Stationary Source Division at (916) 445-6102 or jkitowsk@arb.ca.gov.

14

Sincerely,

Cynthia Marvin, Chief
Stationary Source Division

State Clearinghouse #2012021045

RESPONSES TO LETTER B-5

California Air Resources Board

Response to Comment B-5-1. The commenter has accurately described the project characteristics related to truck emissions, although it should be noted there will be an alternative fueling station that will open during the first phase of development to serve trucks that use liquefied or compressed natural gas as vehicle fuel. It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet. The WLC implementation schedule was revised or extended from 10 to 15 years, so Phase 1 is now scheduled for completion in 2022 rather than in 2017, or from approximately 2015 to 2022, compared to the five-year time period assumed in the Draft Environmental Impact Report (DEIR) (i.e., 2012 to 2017). The second phase is scheduled for 2023 to 2030. Therefore, the quantitative impact analyses for 2017 in the original DEIR were eliminated in the revised DEIR (see Final (F) EIR Volume 2).

Response to Comment B-5-2 and B-5-3. The commenter suggested mitigation measure, as discussed below. Please see the Mitigation Monitoring Reporting Program (FEIR Volume 1) for a list of the mitigation measures.

Suggested Mitigation Measure	Response
Emerging zero-emission technology for the equipment that would serve the facility should be implemented. The project should support development of this technology.	Partially Included. The project requires non-diesel emergency generators, forklifts, and service equipment. Please also refer to Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment.

Response to Comment B-5-4. The commenter has accurately summarized the project information presented in the DEIR. Also refer to Response to Comment B-5-1 for changes made to the size and phasing of the proposed project.

Response to Comment B-5-5. The commenter presents a summary of the scenarios in the DEIR.

The cancer risks as estimated in the DEIR are located in Table 4.3.AB for locations in the residential areas across Redlands Boulevard. The cancer risks were recalculated in the revised air quality analysis (FEIR Volume 2 Appendix D) and FEIR (Volume 2 Section 4.3 Air Quality) based on the revised construction and occupancy schedule, new traffic volumes, and realignment of roadways. Please refer to the FEIR and/or Master Response-1.

Response to Comment B-5-6. The commenter has accurately summarized the conclusions of the DEIR relative to the original proposed project and its emission of greenhouse gases. Refer to Response to Comment B-5-1 indicating the reduction in the size of the proposed project. In addition the phasing of the project has changed.

Response to Comment B-5-7. The commenter states the World Logistics Center (WLC) will increase the health risk in the immediate area and should use all available zero-emission technology. As discussed in Section 4.3 of the EIR and Master Response-1 and Master Response-2, the project will not increase health risk in the immediate area. Nonetheless, the WLC Specific Plan (SP) proposes an alternative fueling station that will open during the first phase of development to serve trucks that use liquefied or compressed natural gas as vehicle fuel. In addition, future development under the WLCSP will comply with vehicle fleet fuel requirements at the time of development approval. However, the project will support a variety of future users which are unknown at this time,

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

so it is not possible to specify or require future users to have zero emission or alternative fuel fleets since most logistics companies use independent contractors and truck drivers rather than maintain their own fleets.

Finally, it should be noted that the project has committed under various mitigation measures to requiring the most stringent levels of emission mitigation under existing emission control regulations including the use of Model Year 2010 engine diesel trucks and Tier 4 off-road construction equipment.

Response to Comment B-5-8. The commenter discusses the particulate matter (PM) emissions. Refer to the updated air quality and health risk assessment for a refinement of the PM and cancer risk values (FEIR Volume 2 Appendix D).

The commenter recommends actions to support the development, demonstration, and deployment of zero- and near-zero emission technology. The commenter believes the technologies are feasible within the build-out years of the project. However, as discussed in Master Response: Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment in Response to Comment Letter C-3, those technologies are not feasible for the project.

The commenter suggested mitigation measures, as discussed below.

Suggested Mitigation Measure	Response
1. From the onset, require that all medium-heavy and heavy-heavy duty trucks, including and alternative fuel vehicles, meet or exceed the 2010 emission standards.	Already Included. This was a project design feature in the DEIR and is now part of MM 4.3.6.3B.
2. As it becomes available, require that trucks traveling between the Center and any ports or rail yards within 100 miles use zero/near zero technology.	Not Included. See Master Response: Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment in Response to Comment Letter C-3.
3. Require, to the greatest extent possible, onsite service vehicles and equipment use zero emission technology, and if zero-emission technology is unavailable, that all vehicles and equipment meet the cleanest applicable emission standard.	Partially Included. Low-emission and zero-emission technologies are required for onsite equipment, as stated in Specific Plan Section 12.3: "The use of diesel-powered service yard vehicles (yard goats, etc.) is prohibited at all times within the Specific Plan area. Pallet jacks, forklifts, and other onsite equipment used during building operation (indoors or outdoors) shall be powered by electricity, natural gas, propane, or other non-diesel fuel." The commenter requests that onsite service vehicles also have zero emission technology; however, it is not feasible to require this as discussed in Master Response: Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment in Response to Comment Letter C-3.
4. Require, when available, the use of zero-emission property maintenance equipment.	Partially Included. As a project design feature, the forklifts will be fueled by alternative fuel. In addition, Mitigation Measure 4.3.6.3B requires that the yard trucks be powered by alternative fuel. The landscaping equipment emissions are negligible as estimated by the CalEEMod land use emission model; therefore, according to the emissions analysis, it is not necessary to implement zero-emission landscaping

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	equipment. The WLCSP Section 12.4 requires that electric power sources will be provided both indoor and outdoor to accommodate electric property maintenance equipment.

Response to Comment B-5-9. The commenter suggested mitigation measures, as discussed below.

Suggested Mitigation Measure	Response
Mitigation measure 4.3.6.2A should require the use of electric construction tools, when available and feasible, rather than just provide electrical hookups.	Incorporated. This language is incorporated in MM 4.3.6.2A.
Require all construction fleets be in compliance and monitor compliance with current air quality regulations for off-road equipment.	Incorporated. This language is incorporated in MM 4.3.6.2A.
Mitigation measure 4.3.6.3B should require all tenants be in compliance and monitor compliance with all current air quality regulations for on-road trucks including ARB's Heavy-Duty Greenhouse Gas Regulation and Truck and Bus Regulation.	Incorporated. This language is incorporated in MM 4.3.6.3B.

Response to Comment B-5-10. The commenter suggested a mitigation measure, as discussed below.

Suggested Mitigation Measure	Response
The developer, Highland Fairview, or the City of Moreno Valley provide incentives for tenants to encourage the use of alternative modes of commuting by their employees including, but not limited to, active transportation, public transportation, car pool, and the use of zero-emission vehicles. These same methods of transportation should be strongly encouraged or required for movement within the Center area.	Already Included. MM 4.3.6.4A requires that tenants participate in Riverside County's rideshare program, which encourages carpooling and public transportation. In addition, all tenants will need to comply with the requirements of South Coast Air Quality Management District (SCAQMD) Rule 2202, which accomplishes the same goals as requested by the commenter.

Response to Comment B-5-11. Shifting the land use designation from LD to LL along the west side of the project would have no effect on the presence of diesel trucks and equipment in that area. Neither designation includes any restriction on the type of vehicles that can access future buildings.

The Specific Plan provides for a 250-foot setback for buildings and truck access/parking facilities from adjacent residential zoned areas.

The commenter suggested a mitigation measure, as discussed below:

Suggested Mitigation Measure	Response
Shift the proposed development along the west side of the project area to focus on light logistics or other uses to ensure that any operations of diesel trucks or equipment are at least 1,000 feet away from residential occupied or zoned property or other sensitive receptor.	Not Included. Please refer to Master Response-4 in the Response to Comment Letter C-3 concerning the 1,000 foot buffer.

Response to Comment B-5-12. The commenter recommends limiting use of the Street D entrance (now renamed the Cactus Avenue Extension) to local residents only, as a means to minimize traffic.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Section 21101.6 of the California Vehicle Code states that local authorities may not place gates or other selective devices on any street which deny or restrict the access of certain members of the public to the street, while permitting others unrestricted access to the street. Local authorities may prohibit vehicles based on size (weight or height) as is being proposed for the Cactus Avenue Extension, but they cannot limit access to a public street based on the residence of the driver. On that basis, heavy trucks would be prohibited from using the Cactus Avenue Extension.

The commenter suggested a mitigation measure, as discussed below:

Suggested Mitigation Measure	Response
Minimize all traffic, beyond just heavy-duty truck traffic, by limiting the use of the "D" street entrance to only local residents.	Not Included. The Cactus Street extension is a public street. While the project does place restrictions on heavy-duty vehicles, prohibiting use of the street, the City cannot limit street access to only nearby residents. In addition, there is no way to distinguish among light vehicles those that are operated by local residents as opposed to nearby communities like Lake Perris. As a result, the proposed limitation is infeasible.

Response to Comment B-5-13. Any on-site fueling station is a "stationary source" under AQMD rules and as such, will be subject to all applicable rules and regulations regarding layout and design at such time as a specific site is selected and a project is proposed. In addition to AQMD rules, any proposed fueling station will be subject to a discretionary Plot Plan process which will evaluate the specific design and any potential impacts on nearby uses. No significant impact has been identified and therefore no specific mitigation is required.

The commenter suggested a mitigation measure, as discussed below.

Suggested Mitigation Measure	Response
Increase the required distance from any onsite fueling stations to residential occupied or zoned property or other sensitive receptor from 250 feet to 1,000 feet.	Partially Included. The proposed onsite fueling station shall be placed a minimum of 1,000 feet from any offsite residential occupied or zoned property or other sensitive receptors pursuant to MM 4.3.6.3C. As a stationary source, rules established by the SCAQMD will determine the location and controls placed on the facility to ensure that there is no impact on residential areas.

Response to Comment B-5-14. The commenter summarized their earlier comments and recommendations. Future development within the WLCSP may take advantage of alternative fuel or zero emission vehicles, and will comply with all fleet and/or fuel requirements at the time of development approval in the future. The project will support a variety of future users which are unknown at this time, so it is not possible to require future users to have zero emission or alternative fuel fleets since most logistics companies use independent contractors and truck drivers rather than maintain their own fleets.

Letter B-6: Santa Ana Regional Water Quality Control Board (April 25, 2013)

EDMUND G. BROWN JR.
GOVERNOR

MATTHEW RODRIGUEZ
SECRETARY FOR
ENVIRONMENTAL PROTECTION

Santa Ana Regional Water Quality Control Board

April 25, 2013

Mark Gross
City of Moreno Valley
14177 Fredrick Street
Moreno Valley, CA 92552

DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE WORLD LOGISTICS CENTER PROJECT

Dear Mr. Gross;

Regional Water Quality Control Board (Board) staff would like to take this opportunity to provide comments on the Draft Environmental Impact Report (DEIR) for the World Logistics Project. According to the DEIR, the proposed project site covers 3,918 acres in the eastern section of the City of Moreno Valley. A General Plan Amendment is proposed to designate 2,635 acres for logistics warehousing, including up to a maximum of 41.1 million square feet of logistics development and 200,000 square feet of warehousing-related uses, classified as light logistics. 1,104 acres of the project site will be designated for permanent open space and public facilities. Of the open space area, 1,085 acres are currently owned by the California Department of Fish and Wildlife (CDFW). CDFW had purchased this area as a buffer between development and the San Jacinto Wildlife Area operated by the CDFW.

1

Listed below are brief comments concerning the proposed project. We note that the DEIR discusses several mitigation measures that are to be taken to reduce the project's impacts to water quality and aquatic beneficial uses.

1. The project needs to take all reasonable measures to avoid impacts to water quality standards as a result of this project. Impacts that cannot be avoided must be minimized, and all impacts must be mitigated.
2. Of particular concern is the runoff from the proposed project that will flow southeast towards Mystic Lake and the San Jacinto Wildlife area, and south towards the Perris Valley Drain and Reach 3 of the San Jacinto River. It is well established that runoff from urban land uses contains pollutants that can be detrimental to aquatic ecosystems, such as those that exist from time to time in Mystic Lake and that perennially exist on San Jacinto River Reach 2 (Canyon Lake), and other downstream reaches. Mystic Lake is ephemeral, and is essentially a terminal lake with all runoff to the lake staying in the lake to evaporate or infiltrate, except during rare periods when abnormally high rain fall occurs in the San Jacinto River's high elevation watershed for consecutive years, and Mystic Lake spills over into the San Jacinto River Reach 4 channel downstream of the lake. Even though Mystic Lake is not currently listed in the Water Quality Control Plan for the Santa Ana River Basin (Basin Plan) it is known

2
3

to have several beneficial uses¹ including REC1 (intermittent use), REC2, WILD, WARM (intermittent use), and RARE.

3

3. In addition, runoff from the proposed project possibly could impact other downstream waters such as the 303 (d) listed impaired Canyon Lake and Lake Elsinore. BMPs need to be identified and implemented that control pollutants for which TMDLs have been adopted and for which the project's receiving waters (Canyon Lake, principally, but also Lake Elsinore) are 303(d) listed.

4

4. The DEIR comprehensively lists several mitigation measures proposed to reduce impacts to hydrology and water quality to a less than a significant level. Staff strongly encourages the project proponent to implement BMPs that result in off-site run-off flows not increasing with project construction. DEIR Table 1.A, referencing Section 4.9.6.1A, summarizes mitigation measures for modifications to local drainage and other hydrological changes, reporting, "Each identified watershed within the project area will have an appropriate detention basin to retain storm water such that off-site flows downstream will not increase over existing levels. Runoff characteristics south of the site will be maintained similar to current conditions". This statement is somewhat ambiguous, and is clarified in the referenced section. To protect the integrity of undeveloped drainages downstream of the project, project stormwater runoff retention facilities must be designed and operated such that the entire hydrograph of post-project runoff is not significantly different than the pre-project runoff hydrograph. While addressing peak flow is an important consideration, other runoff characteristics must also be addressed to prevent hydro-modification of the runoff's receiving waters.

5

5. The DEIR lists the treatment control BMPs and Assessment Methodology to be used on the project to reduce project impacts to water quality. Board staff strongly encourages the use of BMPs that promote infiltration and evapotranspiration, including infiltration basins, bio-retention facilities, and extended detention basins to reduce impacts to water quality. All BMPs must include provisions that identify the party(s) responsible for funding and carrying out BMPs' long term management, including capital replacement.

6

6. The DEIR states that the applicant shall consult with the United States Army Corps of Engineers (USACE), CDFW, and RWQCB to establish the need for permits (e.g., Clean Water Act Section 401 Certification) for project impacts to jurisdictional waters. The proponent should consider project configurations that avoid impacts to all on-site and downstream waters, whether or not those waters are subject to USACE jurisdiction. Although the DEIR states that most, if not all of, the drainages located on the property are not jurisdictional, per the USACE, these drainages have water quality standards that must be protected. The Basin Plan considers that waters not specifically identified in the plan have the same beneficial uses as the waters to which they are tributary. Applying this "tributary rule" to the project site, beneficial uses of the drainages on or adjacent to the project site include: REC1, REC, WARM, WILD, RARE, GWR, and AGR.

7

¹ Definitions of the beneficial uses are shown in the DEIR and Chapter 3 of the Basin Plan.

Leaving the drainages in their existing condition, or restoring them to a more natural condition, is preferable to "developing" them into flood control conveyances, or allowing them to be hydro-modified by altering their hydrology. On-site hydrology controls should be implemented that do not allow increases in runoff as a result of the project development. If increases in stormwater runoff are unavoidable, then the proponent should be required to implement drainage facilities that allow for groundwater recharge, that are of adequate width to provide a buffer for ecological functions, as well as setbacks for passive recreation, such as a trail or bikeway, and maintenance, and that allow for the mature growth of native riparian vegetation. Board staff notes that the DEIR proposes that Drainage 9 will be designed with the channel to remain in a relatively natural condition, and shall provide a minimum 25-foot open space setback from the top of each bank. Other drainages on site and downstream from the site should be left in similar condition.

8

7. Almost all of the open space proposed for this project is the 1,085 acres owned by the CDFW. The project proponent has not proposed designating significant amounts of land from their property as open space. Staff recommends that the project proponent and the CEQA lead implement Alternative One or another project alternative that allows more open space. Open space areas provide water quality benefits such as storm water retention and groundwater recharge as well as the opportunity for other amenities that benefit the community.

9

8. The DEIR states that there is 25 acres of farm land considered prime farm land in the project site. The DEIR notes that 5 acres of this land will be offered to the City to be used as a possible heritage farm area. Staff recommends that the CEQA lead consider designating all 25 acres as land to remain in farming. Farm land can provide water quality benefits such as storm water retention and groundwater recharge as well as other benefits to the community.

10

If you have any questions, please contact Dave Woelfel at (951) 782-7960 or dwoelfel@waterboards.ca.gov or me at 951 782- 3234 or madelson@waterboards.ca.gov.

Sincerely,

Mark G. Adelson
Chief, Regional Planning Section

cc: California Department of Fish and Wildlife – Kim Freeburn

RESPONSES TO LETTER B-6

Santa Ana Regional Water Quality Control Board

Response to Comment B-6-1. The commenter has accurately summarized the project characteristics relative to water quality, including the purpose of the California Department of Fish and Wildlife (CDFW) land south of the World Logistics Center Specific Plan (WLCSP) site as a buffer or separation between the San Jacinto Wildlife Area (SJWA) and future development. It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment B-6-2. The comment states that the project need to take all reasonable measures to avoid water quality impacts. Water quality impacts of the WLC project are evaluated in Section 4.9, *Hydrology and Water Quality*, of the Draft Environmental Impact Report (DEIR). That section concluded the WLC project would not have significant impacts on water resources, groundwater, flooding, etc. if the project was built per the design guidelines in the Specific Plan and implementation of the recommended mitigation measures.

Response to Comment B-6-3. The commenter is concerned about the runoff from the proposed project. The project has proposed site design, source control, and treatment Best Management Practices (BMPs) to mitigate water quality impacts to Mystic Lake and the SJWA as outlined in the preliminary Water Quality Management Plan prepared for the project. The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of Low Impact Development (LID) BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. As required by revised Mitigation Measure (MM) 4.9.6.3A, a site specific water quality management plan will be prepared to identify site design, source control and LID treatment BMPs. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by revised MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the SJWA.

Also, the project has committed to performing a Water Quality Monitoring Program on the discharge from the project to the adjacent SJWA. Revised MM 4.9.6.3C outlines a very detailed process that must be implemented to ensure the SJWA will not be affected by water pollution from the project site. Please refer to Response to Comment B-3-39 for the revised MM 4.9.6.3A-C.

Response to Comment B-6-4. The commenter continues to express their concern about impacts from runoff to downstream waters. The Water Quality Management Plan Guidance Document for the Santa Ana Region of Riverside County discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above [sediments, nutrients, metals, toxic organic compounds, trash, oxygen-demanding substances, oil and grease, bacteria and viruses, and pesticides], and those subject to adopted TMDLs in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

The project will comply with the Nutrient Total Maximum Daily Load (TMDL) for Lake Elsinore and Canyon Lake by implementing LID-based BMPs. According to the *Comprehensive Nutrient Reduction Plan for Lake Elsinore and Canyon Lake* (prepared for Riverside County Flood Control and Water Conservation District by CDM Smith, January 28, 2013 in compliance with Order No. R8-2010-0033, NPDES Permit No. CAS618033), “Post-construction LID-based BMPs required for new development and significant re-development projects are the only structural watershed-based BMPs currently included in the CNRP. The newly developed Water Quality Management Plan (WQMP) requirements ensure that a portion of the wet weather runoff will be contained onsite for all future development projects subject to WQMP requirements. Implementation of WQMP requirements over time coupled with the in-lake remediation projects (described below) are expected to provide sufficient mitigation of nutrients.” (p. 2-3).

Response to Comment B-6-5. The commenter suggests BMPs be implemented so that off-site runoff flows do not increase with project construction. Additional information has been added to the *Hydrology and Water Quality Master Plan of Drainage Report* (FEIR Volume 2 Appendix J) to provide specific and detailed plans for the drainage systems to include the size, capacity, design, function and maintenance requirements of the detention basins. The project will comply with the hydromodification requirements as outlined in Section F of the *Preliminary Water Quality Management Plan* and Section 5 of the *Master Plan of Drainage Report*. The detention basins have been modified to combine detention and infiltration. Additional analysis has been performed to detail the infiltration capacity of the basins and indicates that runoff leaving the project site will be less than or equal to the existing condition. Infiltration after the project will be greater than the existing condition. Additional details on the spreading areas and mitigation of flow volumes and velocities at the project boundary have been added to the *Master Plan of Drainage Report* and are summarized in the Response to Comment B-3-38 from the CDFW to address similar comments regarding drainage and water quality impacts of the project.

Response to Comment B-6-6. The commenter suggests that BMPs that promote infiltration and evapotranspiration be used to reduce impacts to water quality. The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of LID BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. As stated in the WQMP and also on Page 4.9-41 of the DEIR, the BMP strategy for the project is to select LID BMPs that promote infiltration and evapotranspiration. Infiltration BMPs will be preferred, but may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. In situations where infiltration BMPs are not appropriate, bio retention and/or biotreatment BMPs that provide opportunity for evapotranspiration and incidental infiltration will be considered. All of these BMPs are considered as LID BMPs and will treat a wide range of pollutants, including the Pollutants of Concern that have been identified for the project. Section I of the WQMP identifies the operation, maintenance, and funding requirements of the BMPs. In addition, DEIR MM 4.9.6.3B outlined below requires the Master Property Owners Association to maintain all onsite water quality basins.

4.9.6.3B The Property Owners Association (POA) and all property owners shall be responsible to maintain all onsite water quality basins according to requirements in the guidance Water Quality Management Plan and/or subsequent site-specific Water Quality Management Plans, and established guidelines of the Regional Water Quality Control Board. Failure to properly maintain such basins shall be grounds for suspension or revocation of discretionary operating permits, and/or referral to the Regional Water Quality Control Board for review and possible action. This measure shall be implemented to the satisfaction of the City Land Development Division, in consultation with the City Engineer, and Regional Water Quality Control Board.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment B-6-7. The commenter suggests the project avoid impacts to all on-site and downstream waters. The beneficial uses of the receiving waters are identified in the WQMP. Applying the tributary rule the beneficial uses of the drainage courses on the project site are noted. The DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report* outline bio retention areas and detention/infiltration basins that will be constructed to mitigate impacts to water quality and quantity.

Response to Comment B-6-8. The commenter prefers that the drainages be left in their existing condition, or restored to a more natural condition instead of being developed into flood control conveyances. The DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report* outline bio retention areas and detention/infiltration basins that will be constructed to mitigate the increased runoff and provide for peak flow attenuation and infiltration similar to pre development conditions. Table 3-3 of the *Hydrology and Water Quality Master Plan of Drainage Report* (FEIR Volume 2 Appendix J) outlines the basin lengths and widths. Adequate width for the basins has been provided as a buffer for ecological functions and for setbacks for maintenance and areas for native riparian vegetation. With the construction of these bio retention and detention/infiltration areas the drainage features of the project will provide increased opportunities for beneficial uses related to passive recreation and native riparian vegetation. For more information, the reader is referred to Response to Comment B-3-39 from the California Department of Fish and Wildlife to address similar comments regarding drainage and water quality impacts of the project.

Response to Comment B-6-9. The commenter suggests that the lead agency implement a project alternative that allows for additional open space. The DEIR did identify a number of significant environmental impacts of the WLC project, however, the EIR concluded that impacts to hydrology (runoff and flood control), water quality, and biological resources would be reduced to less than significant levels by project design and the proposed mitigation measures. These conclusions have not changed even though the project biology and hydrology reports were all updated and, in some cases, revised to address the many comments received on these technical studies. The project as proposed would have extensive areas with landscaping that would allow for percolation of irrigation water or onsite runoff to flow into planned detention basins during wet times, and then these waters could percolate back into the local groundwater. Since the DEIR did not determine there were any significant biological or hydrological impacts after mitigation, none of the project alternatives provide more open space.

Response to Comment B-6-10. The commenter misstates the discussion regarding the mitigation measure which requires the offering of five acres to the City for use as a possible heritage farm area. The mitigation measure does not require that the five-acre dedication be within the area designated as prime farm land nor does it require the dedicated area be used for farming. The DEIR (Section 4.2) provides clear evidence that agricultural uses are not viable in the region and would be particularly difficult to sustain on a parcel of limited size. The City cannot require privately-owned property to be retained in agricultural use or put to any specific use. In response to comments on the DEIR, the existing (California) Land Evaluation and Site Assessments (LESA) model analysis was rerun and a new LESA analysis was conducted for the project. These analyses both determined that the impact of the project on Farmland of Local Importance was less than significant. Accordingly, the mitigation measures have been revised. After additional discussion and review, the it was decided to eliminate the heritage farm mitigation measure (identified in the revised DEIR as MM 4.2.6.1A) as it could result in other environmental impacts (pesticide application, increased water use, liability for site users and the City, etc.). The new MM 4.2.6.1A identified in the revised DEIR would provide an offsite agricultural conservation easement which is now considered the appropriate mitigation for the agricultural impacts of the WLC project (i.e., loss of 25 acres of Unique Farmland).

An extensive drainage system is a part of the project which will provide opportunities for storm water retention and ground water recharge. The details of this system will be incorporated into each project specific plot plan application.

Re: World Logistics Center Project Draft EIR (SCH# 2012021045)

Southern California Edison (SCE) appreciates the opportunity to provide comment on the above referenced project.

Electrical Capacity

Please note, Moreno Valley Utilities (MVU) will need to file an interconnect application with SCE, in accordance with the applicable filed Federal Energy Regulatory Commission (FERC) tariffs, for any increased substation capacity connected to SCE's system, whether it is from MVU's existing Moreno Valley substation or another potential location, as proposed in the Draft EIR. Following receipt of MVU's application SCE will initiate and complete a system impact study analysis at MVU expense to determine: 1) the method of service necessary to serve the additional MVU load, whether from the existing Moreno Valley substation, or another method of service as determined by SCE, or the interconnection as proposed in the Draft EIR; 2) what, if any, system upgrades may be required to provide such service capacity; and 3) if the proposed interconnect location is acceptable to SCE. This analysis will include, but not be limited to, SCE system conditions, existing generation and queued ahead proposed market generation, SCE and MVU electrical load at that time and the load forecasts of both utilities. A facilities study analysis will also be required, at MVU's expense, to identify the specific facilities required for interconnection and system upgrades as well as the cost. Once completed, an interconnection agreement will also be required between the parties. It will outline the interconnection and operating responsibilities between the parties. SCE will perform the work required

Menifee, Ca 92585

Office: 951 928-8238
E-mail: Raymond.hicks@sce.com

1

and MVU will pay SCE for the work required.

Existing Facilities

Relocation, rearrangement, or undergrounding of SCE overhead lines at developer expense may be required as part of the development. The extent of such work can be determined when street improvement plans are prepared. The preliminary information in the current Draft EIR does not provide enough clarity to make this assessment.

Please note that SCE's rights-of-ways and fee-owned properties are purchased for the exclusive use of SCE to operate and maintain its present and future facilities. Any proposed use will be reviewed on a case-by-case basis by SCE's Operating Department. Approvals or denials will be in writing based upon review of the maps provided by the developer and compatibility with SCE right-of-way constraints and rights. In the event the project proposes to impact SCE facilities or its land related rights, please forward five (5) sets of project plans, and a PDF copy of the same, depicting SCE's facilities and its associated land rights to the following location for review as noted above:

G.O.3 – Second Floor
Rosemead, CA 91770

General Order 131-D Requirements

Please be advised if development plans result in the need to build new or relocate existing SCE electrical facilities that operate at or above 50 kilovolt (kV), the SCE construction may have environmental impacts subject to California Environmental Quality Act (CEQA) review as required by the California Public Utilities Commission (CPUC). If those environmental impacts are identified and addressed by the Lead Agency in the CEQA process for the larger project, SCE may not be required to pursue a later, separate, mandatory CEQA review through the CPUC's General Order 131-D (GO 131-D) process. If, however, the SCE facilities are not adequately addressed in the CEQA review for the larger project, and/or the new facilities could result in significant environmental impacts, the required additional CEQA review at the CPUC could delay approval of the SCE power line portion of the project for several years and thus impact the schedule for the larger project.

26100 Menifee Rd.
Menifee, Ca 92585

Office: 951 928-8238
E-mail: Raymond.hicks@sce.com

Unfortunately, SCE is not able to provide specific comments on the Draft EIR due to the fact SCE has not yet received the applicable requests from MVU and the project applicant and pursuant to the requirements specified in this letter to determine impacts to SCE's facilities.

Once again, we appreciate the opportunity to comment on the project. If you have any questions regarding this letter, do not hesitate to contact me at (951) 928-8238.

Sincerely,

Raymond Hicks
Local Public Affairs Region Manager

RESPONSES TO LETTER C-1

Southern California Edison

Response to Comment C-1-1. Southern California Edison (SCE) comments are specifically directed to what the responsibility of Moreno Valley Utility (MVU) is with respect to providing electrical service to additional load in MVU's service territory. MVU must submit an application to the Federal Energy Regulatory Commission (FERC). Since this project falls within MVU's service territory, it is the serving utilities responsibility to secure additional power from SCE. World Logistics Center (WLC) has provided all of the current information to MVU for their use in evaluating what additional power requirements they will have in the area so the application can be submitted properly. SCE will then need to do a complete and thorough review of their systems in order to properly serve MVU's needs.

Any new SCE facilities required for any potential interconnect could also require a California Environmental Quality Act (CEQA) review but should be covered in MVU's specific EIR for a new substation once they file an application. It is impossible to address SCE's needs for new or upgraded system without MVU having filed their application.

With regard to any impacts to SCE's existing facilities, there may be the need to relocate, rearrange and/or underground some of the existing SCE facilities and acknowledge that SCE facilities over 50 kV needing relocation may fall into the G.O. 131-D requirement and be subject to a CEQA review under California Public Utilities Commission guidelines. If there are any impacts to SCE's system from this project, they will be handled in the proper manner described within SCE's letter.

**Letter C-2: Metropolitan Water District Of Southern California (April 8, 2013)
and Appendix 1 (On Flash Drive)**

THE METROPOLITAN WATER DISTRICT
OF SOUTHERN CALIFORNIA

Letter C-2

Office of the General Manager

April 8, 2013

Via E-Mail and Federal Express

Mr. Mark Gross
Senior Planner
City of Moreno Valley
Community & Economic Development Department, Planning Division
14177 Frederick Street
Moreno Valley, CA 92552-0805

Dear Mr. Gross:

Notice of Availability of the
Draft Environmental Impact Report for the World Logistics Center Project

The Metropolitan Water District of Southern California (Metropolitan) has received the Notice of Availability of the Draft Environmental Impact Report (EIR) for the World Logistics Center Project (proposed project). The proposed project covers 3,918 acres in eastern Moreno Valley, generally located east of Redlands Boulevard, south of State Route 60 (SR60), west of Gilman Springs Road, and north of the San Jacinto Wildlife Area. The project proposes a maximum of 41.4 million square feet of high-cube logistics warehouse distribution uses classified as "Logistics Development" and 200,000 square feet of warehousing-related uses classified as "Light Logistics." Also included in the proposed project is a General Plan Amendment that will designate 2,635 acres for logistics development, 20 acres for public utility uses, and 1,159 acres for permanent open space. The remaining 104 acres will be used for utility extensions to serve the proposed project. Within the proposed project area, 2,710 acres are included in a proposed World Logistics Center Specific Plan (specific plan) which contains all of the 2,635 acres of proposed logistics land uses and 75 acres of the Open Space. Off-site infrastructure improvements, including construction of debris basins, water reservoirs and access roads, SR60 interchange modifications, and other road and utility modifications, are also proposed. This letter contains Metropolitan's response to the Notice of Availability as a potentially affected public agency.

Metropolitan owns property and owns and operates facilities on and adjacent to the site of the proposed project. As shown on the attached map, Metropolitan's irregularly shaped fee-owned property (APN 422-040-009 and 422-040-015), Inland Feeder Tunnel, and appurtenant tunnel access structure are located within the proposed specific plan area. In addition, Metropolitan's 145-inch-inside-diameter Inland Feeder pipeline and appurtenant structures extend through the specific plan area in the street rights-of-way for Eucalyptus Avenue, Theodore Street, and Davis

Mr. Mark Gross

Page 2

April 8, 2013

Road. Metropolitan also has a 110-foot-wide easement along Davis Road. While Metropolitan's property is referenced in Sections 3.3.1 and Section 4.4.1 of the Draft EIR, the Inland Feeder pipeline is not mentioned in the document.

2

Metropolitan is concerned with the potential impacts to its fee property, the Inland Feeder pipeline, and associated facilities resulting from future excavation, construction, utilities or any development that may occur as a result of proposed project activities. Please note that Metropolitan does not allow any structures within its fee property or easement. Development associated with the proposed project must not restrict any of Metropolitan's day-to-day operations and/or access to its facilities. Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities and properties at all times in order to repair and maintain its system. Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. To assist in preparing plans that are compatible with Metropolitan's facilities, easements and properties, we have enclosed a copy of the "Guidelines for Developments in the Area of Facilities, Fee Properties, and /or Easements of The Metropolitan Water District of Southern California." Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way.

3

In order to avoid potential conflicts with Metropolitan's facilities and rights-of-way, Metropolitan requires that detailed design plans for any activities within the vicinity of our facilities, fee property or rights-of way be submitted prior to construction for review and written approval. Approval of the proposed project where it could impact Metropolitan's property should be contingent on Metropolitan's approval of design plans for the proposed project. Metropolitan requests that the text of the EIR be revised to acknowledge the presence of the Inland Feeder pipeline and appurtenant facilities within the boundaries of the proposed project and that the text also state that Metropolitan will need to approve any development plans that have the potential to impact Metropolitan's property or facilities.

Additionally, Metropolitan is concerned about limiting other potential uses for its fee-owned property through the proposed specific plan land use designation discussed in the Draft EIR and respectfully requests that its fee-owned property be excluded from this Specific Plan. The property lends itself to not only high cube distribution but to other industrial type uses as well. By allowing more diverse uses, the city can achieve its objective of providing employment opportunities for a wide range of companies and residents as well as enhance the city's tax base by providing a wide variety of employment opportunities for both skilled and semi-skilled workers. In addition, the 500,000 square feet and 24-foot or greater height requirements specified for the logistics development (LD) land use designation (identified in Sections 3.4.2 and 3.4.6 of the Draft EIR) also limits future users of the property. We recommend that the Specific Plan provide adequate flexibility for economically viable uses based on market segmentation dynamics and configuration of developable parcels impacted by topographical and geographical conditions.

4

Mr. Mark Gross

Page 3

April 8, 2013

We appreciate the opportunity to provide input to your planning process and we look forward to receiving future environmental documentation and design plans regarding this proposed project. If you have any questions, please contact Ms. Jennifer Harriger at (213) 217-7658.

Very truly yours,

A handwritten signature in black ink, appearing to read "Deirdre West", with a stylized flourish at the end.

RESPONSES TO LETTER C-2

Metropolitan Water District of Southern California

Response to Comment C-2-1. The commenter has accurately summarized the project information presented in the Draft Environmental Impact Report (DEIR). It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment C-2-2. The commenter has accurately summarized the relevant Metropolitan Water District of Southern California (Metropolitan) property information to the proposed project, and the information provided by the commenter relative to the Inland Feeder will be added to Sections 3.3.1 and 4.4.1 of the DEIR. The Inland Feeder will be protected during project construction and occupancy by the presence of various roads and easements in the southern portion of the site, as shown on Figure 3.4A in Chapter 3 Project Description of the Final (F)EIR Volume 2. In addition, Appendix A to Comment Letter C-2 provided by MWD shows the general boundaries of its property in the northeast corner of the World Logistics Center Specific Plan (WLCSP) site.

Response to Comment C-2-3. This commenter expresses the Metropolitan's concern with the potential impacts to its fee property, the Inland Feeder pipeline. Development of the Metropolitan's property within the WLCSP would not occur without the express permission and approval of the District (i.e., no other entity could propose or process any development proposals on the Metropolitan property without Metropolitan's express consent). Development of surrounding properties within the WLCSP are not expected to cause physical or environmental impacts on the Metropolitan property, and all improvements and facilities owned by Metropolitan would be protected in place during development of the WLCSP.

Response to Comment C-2-4. The commenter states Metropolitan requires detailed design plans for any activities within the vicinity of their facilities, fee property, or rights-of way be submitted prior to construction for review and written approval. The goal of the WLC project is to create a regional logistics center on the entire WLCSP property. The Metropolitan property is located in the far northeast corner of the WLCSP site, and it is not located adjacent to Theodore Street and several intervening properties between the Metropolitan property and access to the SR-60 Freeway. In addition, the placement of the Metropolitan's existing facilities on its site would limit the placement of other land uses on this property. Therefore, it would be difficult to designate the Metropolitan property for a largely different land use compared to the rest of the WLC property.

Response to Appendix C-2-1. Appendix 1 was reviewed to address Response to Comment C-2-3.

Letter C-3: South Coast Air Quality Management District (April 9, 2013)

14177 Frederick Street
Moreno Valley, CA 92553

Review of the Draft Environmental Impact Report (Draft EIR) for the Proposed World Logistics Center Project

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the World Logistics Center (WLC) Draft Environmental Impact Report (EIR), the lead agency's willingness to accept this letter one day late, and for the lead agency and applicant reaching out to us early on to discuss how to prepare the air quality analysis. The following comments are meant as guidance for the lead agency and should be incorporated into the Final EIR as appropriate.

1

The Draft EIR determines that the proposed project would have significant long term air quality impacts. Specifically, the air quality analysis demonstrates that the project's operational NOx emissions could exceed 3,000 pounds per day, compared to a CEQA significance threshold of 55 pounds per day. Further, the project's cancer risks exceed 100 per one million for onsite residents (i.e., residents within the plan area), and cancer risks exceed 10 per one million for residents close to the project site and in freeway adjacent communities reaching all the way to the SR-60 and I-15 interchange approximately 20 miles west of the project site.

2

These impacts will be added to a community that already experiences some of the worst air quality in the nation, with the local air quality monitor recording the sixth most exceedances of the 8-hour ozone standard nationwide (a total of 54 days in 2011). Other areas of the basin that have seen substantial increases in warehouse development also experience PM2.5 levels that exceed federal standards. Considering this existing air quality setting, and the proposed project's high level of emissions well above significance thresholds, additional mitigation must be implemented.

3

SCAQMD staff appreciates that the project includes some design features and mitigation measures to reduce the air quality impacts from this regionally significant project. These include measures like the prohibition of trucks that do not meet 2010 emission standards, requiring all onsite equipment (like hostlers) to use alternative fuels, and providing onsite alternative fueling infrastructure. However, even with the incorporation of these

4

measures the Draft EIR reveals that air quality and cancer risk impacts are still significant, both during operations, and the ten year long construction period. Therefore, it is imperative that the lead agency specify how these measures will be made enforceable to ensure that the project's regional air quality impacts and health risk impacts are minimized and provide additional feasible mitigation.

↑
4

Because diesel truck emissions contribute over 95% of total air quality impacts from this project, additional measures must be taken to increase the number of alternative-fueled trucks serving this project and to reduce impacts on the community. These measures include: implementing a mandatory phase-in schedule for non-diesel trucks to serve the project, requiring additional onsite electric charging for trucks, requiring natural gas fueling infrastructure to be built before the first warehouse is completed, and providing additional buffers to separate diesel truck activity from the community. Details regarding these comments and others are provided in the attachment.

↑
5

Pursuant to Public Resources Code Section 21092.5, please provide the SCAQMD with written responses to all comments contained herein prior to the adoption of the Final EIR. Further, staff is available to work with the lead agency to address these issues and any other air quality questions that may arise. If you have any questions regarding the enclosed comments, please contact me at (909) 396-3244.

↑
6

Sincerely,

Ian MacMillan
Program Supervisor, CEQA-IGR
Planning, Rule Development, and Area Sources

SN:IM:DG

SBC130206-07
Control Number

1. Alternative Fueled Truck Phase-In Schedule

Given that the proposed project will generate significant health risk impacts to a large number of surrounding and on-site residents (with risks up to 100 in a million) and will generate significant regional emissions, the lead agency should require mitigation that requires accelerated phase-in for non-diesel powered trucks. For example, natural gas trucks, including class 8 HHD trucks, are commercially available today. Natural gas trucks can provide a substantial reduction in health risks, and may be more financially feasible today due to reduced fuel costs compared to diesel. In the Final EIR, the lead agency should require a phase-in schedule for these cleaner operating trucks to reduce project impacts. SCAQMD staff is available to discuss the availability of current and upcoming truck technologies and incentive programs with the lead agency and project applicant.

7

2. Electric Vehicle (EV) Charging Stations

Trucks that can operate at least partially on electricity have the ability to substantially reduce the significant health risks and NOX impacts from this project. Further, trucks that run at least partially on electricity are projected to become available during the life of the project as discussed in the 2012 Regional Transportation Plan. It is important to make this electrical infrastructure available when the project is built so that it is ready when this technology becomes commercially available. The cost of installing electrical charging equipment onsite is significantly cheaper if completed when the project is built compared to retrofitting an existing building. Therefore, the SCAQMD staff recommends the lead agency require each warehouse and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in. Similar to the City of Los Angeles requirements for all new projects, the SCAQMD staff recommends that the lead agency require at least 5% of all vehicle parking spaces (including for trucks) include EV charging stations¹. Further, electrical hookups should be provided at the onsite truck stop for truckers to plug in Transportation Refrigeration Units and any other onboard auxiliary equipment.

8

3. CNG Fueling Station and Convenience Site (*Advanced Installation Date*)

As described in the Draft EIR, the proposed project is projected to generate health risks offsite greater than 10 in one million to both local residents and residents along the 60 Freeway. Further, the proposed project has the potential to generate these significant air quality impacts for the region beginning in the first year of construction and operation, hence it is crucial that the lead agency implement measures that could reduce emissions sooner rather than later. Natural gas trucks have the ability to substantially reduce health risk impacts as they do not emit any diesel particulate matter, the primary driver of health risk impacts. The SCAQMD staff therefore recommends that the lead agency revise mitigation measure 4.3.6.3C to require the installation of an alternative fueling facility (e.g., natural gas) to serve the project site prior to operation of any logistics warehousing within the plan area.

9

¹ http://ladbs.org/LADBSWeb/LADBS_Forms/Publications/LAGreenBuildingCodeOrdinance.pdf

4. Operational Emissions Analysis and Mitigation Requirements

The local and regional air quality analysis for the proposed project is based on two scenarios identified in the Draft EIR as Scenario 1 and Scenario 2. Scenario 1 represents full build-out of the proposed project within one calendar year by 2012 whereas Scenario 2 represents a construction and operational phase-in schedule with full build-out of the project by 2022 (These Scenarios differ from HRA Scenarios 1 and 2 on a no project and with project analysis). In Scenario 1 of the regional emission analysis, the project would emit over 7.4 tons of NO_x emissions per day at project build out, while in Scenario 2 the project could emit over 1.5 tons per day of NO_x. A majority of these emissions (approximately 98%) are generated by the 14,600 daily heavy duty diesel truck trips estimated to serve the proposed project. Although Scenario 2 may be more representative of both construction and operation of the proposed project the lead agency based the project's significance determination for air quality impacts on Scenario 1 (worst case scenario). As a result, the Draft EIR allows for significant levels of NO_x emissions (over 7.4 tons per day) from the proposed project. For reference, 7.4 tons represents approximately one-fifth of the entire 2022 NO_x emissions budget from heavy-heavy duty trucks (HHDT) in the four county SCAB region. In comparison Scenario 2 build-out emissions comprise only about 4% of the baseline HHDT NO_x emissions in 2022. While it is exceedingly rare for a single project to account for ~4% of basin-wide emissions, the 20% estimate from Scenario 1 is unprecedented and does not present a credible value to determine significance based on project conditions described in the Draft EIR. The cause of this overestimate is likely due to the use of EMFAC 2007 instead of EMFAC 2011, and assuming that trucks not meeting 2010 emissions standards will be used.

10

SCAQMD typically encourages a conservative analysis for CEQA purposes; however, the scale of overestimation here does not seem appropriate. For example, it could let the lead agency at a later date allow much higher emissions than the Scenario 2 emissions estimate (for example through future variances from the 2010 truck requirement) without requiring additional mitigation pursuant to CEQA. SCAQMD encourages the lead agency to use the Scenario 2 estimate (adjusting it as necessary to make it appropriately conservative) to determine project significance and to provide contingency measures in case future conditions indicate that emissions might exceed this value.

5. Project Impacts Higher due to Proximity of Project to Existing Sensitive Receptors

The proposed project requires that all heavy duty trucks access the site via Theodore Street to avoid travelling within the adjacent residential community. Further, mitigation measure 4.3.6.4A(k) requires at least a 250-foot setback between residentially zoned property and warehouse buildings. It appears that the dispersion modeling takes this buffer zone and truck restriction into account. However, as seen in Figure 4.3.11 and 4.3.12 of the Draft EIR, cancer risk impacts still exceed SCAQMD's significance thresholds of 10 in one million for a substantial distance into the community, including an east-west band extending over one mile from SR-60. Pursuant to CEQA Guidelines 15126.4, all feasible mitigation must be implemented to reduce these impacts, even if the mitigated impact remains

11

significant. At a minimum, the project should require the 1,000 foot buffer as recommended in the state Air Resources Board's Land Use Handbook. This buffer should also apply to any undeveloped sensitive receptors that may be sited in the future next to the WLC Specific Plan area.

11

6. 2010 Diesel Haul Trucks, Service Yard Trucks and Other On-Site Equipment

Given that Scenario 2 of the Draft EIR allows for a significant levels of daily emissions (~1.5 tons/day of NO_x) from the proposed project it is imperative that the lead agency enforce the project operational restriction/design feature that requires all medium-heavy duty and heavy-heavy duty trucks entering logistics sites to meet or exceed 2010 engine emission standards. Additionally, the project requires that all service yard trucks and other onsite equipment be powered by electricity, natural gas, propane and/or 100% biodiesel fuel (see page 3-33 of the Project Description in the Draft EIR for discussion of this requirement, also, see comment #13 regarding bio-diesel fuel). However, it is uncertain to SCAQMD how these provisions will be enforced long-term. Therefore, the SCAQMD staff recommends that lead agency include a description in the Final EIR that specifies how the above-mentioned 2010 engine emissions standards and on-site equipment specifications will be enforced. In the event that the lead agency determines that it is not feasible to enforce these conditions that capture these requirements/design features the lead agency should revise the health risk assessment (HRA) to ensure that the analysis does not take credit for cleaner trucks and equipment thereby potentially underestimating the project's health risk impacts.

12

7. Solar Roof Panels

Previously, SCAQMD staff has heard lead agency staff state that all new warehouses must offset all office electrical use using solar generation either onsite or offsite. It is therefore surprising that while the proposed project consists of over 41 million square feet of roof space on buildings greater than 500,000 ft², that the lead agency does not provide any commitment in the Draft EIR to the installation of solar panels. Given the availability of roof space associated with this project the lead agency should maximize the opportunity to produce solar energy by including mitigation beyond MM 4.16.4.6.1A. Specifically, the lead agency should require that buildings maximize the possible number of solar energy arrays.

13

8. Onsite Residential Receptors

On page 4.3-73 (Table 4.3.AA) of the Draft EIR the lead agency identified the potential incremental cancer risk for onsite residential receptors as 100.7 in a million; however, the lead agency does not provide any discussion about mitigation for on-site receptors in the Draft EIR. The WLC Specific Plan provides a "Right-to-Farm" provision in section 11.5 that indicates that residential uses may stay on the project site for a considerable time, overlapping with warehouse operations. Therefore, the SCAQMD staff recommends that the lead agency provide discussion about the proximity of on-site residents to potential future warehousing within the plan area and any applicable project conditions or mitigation measures that will minimize the significant health risk impacts to these residents.

14

9. Cactus Avenue Truck Access

As described in the Draft EIR, while heavy duty trucks must access the site via Theodore Street, by 2022 more than 1,500 light-heavy and medium-heavy duty diesel trucks per day are projected to access the site via Cactus Avenue and then Iris Avenue to the southwest according to the Draft EIR. It is not clear what destination these trucks are serving as there do not appear to be any non-residential or school land uses within about 5 miles of this access point. The lead agency should clarify if this path is meant to be a truck route linking the warehouses on the west side of the city with those proposed in the project. If alternate routes are available that will not impact as many sensitive receptors, then those should be made a requirement of the plan.

15

10. Preclusion of Refrigerated Warehouse Space

Based on a review of the project's emissions calculations it appears that the lead agency determined the project's air quality impacts using emission factors for unrefrigerated warehouses/truck activity. However, the discussion provided in the first paragraph of page 3-33 (project description) of the Draft EIR allows for refrigerated warehouse uses whereas Section 11.1 of the WLC Specific Plan prohibits refrigerated warehouses. Therefore, the SCAQMD staff recommends that the lead agency either revise the air quality analysis to account for emissions from refrigerated warehouse uses or include a mitigation measure that precludes the use of refrigerated warehousing at the project site.

16

11. Fleet Mix/Trip Rate

The proposed project primarily supports goods movement in the region that relies on HHDTs, however, based on Table 17 of the Air Quality Appendix the proposed project assumes that only 12.5% of the proposed project's total trips are generated by HHDTs (from a total of 20% trucks). CalEEMod guidance and the NAIOP study referenced in the Draft EIR both indicate that a higher truck percentage may be more appropriate for the proposed land use. Further, regional goods movement operational activities fluctuate based on seasonality. For example, goods movement activity often increases at the end of the year with back-to-school and holiday seasons. Given that SCAQMD significance thresholds are based on peak daily emissions, the Final EIR should include a discussion about whether the trip rates are annual average rates or peak daily rates that include adjustments for seasonality. Also, given that the project could significantly elevate health risk impacts to residents surrounding the project site and regional goods movement corridors, the SCAQMD staff recommends that the lead agency incorporate mitigation and monitoring that ensures any additional air quality impacts from extra diesel haul truck trips beyond those identified by the Draft EIR are publicly disclosed and mitigated where feasible.

17

12. Health Risk Impacts

The HRA contained in the Draft EIR appropriately compares the project's cancer risk levels to SCAQMD's Maximum Incremental Cancer Risk (MICR) threshold of 10 in one million. However, it does not appear that the lead agency conducted a cancer burden analysis using the SCAQMD's significance threshold of 0.5. A cancer burden calculation provides a more useful measure of the extent of cancer risk across a

18

populated area. Given the large area already encompassed within the 10 in one million risk contour in Figure 4.3.11, the one in one million contours will likely affect a much larger population. The Final EIR should include maps showing the one in one million contours as well as the calculated cancer burden.

18

13. On-Site Equipment

Based on a review of the air quality analysis it does not appear that the lead agency included potential emissions from on-site equipment (e.g., service yard trucks, emergency generators and auxiliary equipment) used for logistics operations in the air quality impacts significance determination. Therefore, the SCAQMD staff recommends that the lead agency revise the air quality analysis and HRA to include all on-site emissions sources and ensure that they are accounted for in the Final EIR. Also, given that on-site equipment emissions will contribute to the project's overall significant air quality and health risk impacts the SCAQMD staff recommends that the lead agency prohibit the use of on-site diesel powered equipment including bio-diesel to minimize the project's operational emissions and require the use of electric equipment. If diesel fueled emergency generators are required for the proposed project they should be equipped with diesel particulate filters. Installing diesel particulate filters on emergency standby engines is feasible and would ensure compliance with BACT, and SCAQMD Rules 1470 and 1472.

19

14. Onsite Mobile Equipment not Included in Localized or Regional Analysis

Neither the regional emissions nor dispersion modeling analyses include emissions from onsite mobile equipment such as hostlers and forklifts. While section 11.3 of the Specific Plan requires that all onsite mobile equipment utilize alternative fuels to reduce diesel emissions, this equipment will still emit criteria pollutants such as NO_x and PM if it relies on fuels like natural gas. Emission factors for hostlers and forklifts can be obtained either from ARB's OFFROAD2007 or from engine manufacturers if specific equipment types are known. These emissions should be included in the regional emissions estimate and the localized criteria pollutant analyses in the Final EIR.

20

15. Localized NO₂ Dispersion Modeling Analysis Methodology

The NO₂ modeling analysis for combined construction and operation of the project does not compare against the federal one hour standard. Because the construction duration will last more than the three year averaging period of the standard, and because construction will overlap with operations, NO₂ concentrations should also be compared against the federal standard for this period.

21

Further, the annual average emission rate was used for the 1-hour analysis. Because this 1-hour standard is designed to evaluate peak impacts, a peak one hour emission rate should be input into all hours that it could reasonably occur in the model. Although peak 1-hour emissions are calculated within the emission calculation spreadsheets provided to SCAQMD, it is not clear if these are appropriate for this exercise. The peak 1-hour rates in the calculation sheets take an entire day's

emissions and puts them all into one hour. As this intensity of activity is unlikely to occur, a peak hour should be calculated based on anticipated operations.

21

16. Construction Mitigation Measures

Given that the construction air quality analysis in the Draft EIR demonstrates significant regional air quality impacts from NO_x, VOC, CO, PM₁₀ and PM_{2.5}, and significant local air quality impacts from NO₂, PM₁₀ and PM_{2.5}, the SCAQMD staff recommends that the lead agency provide additional mitigation pursuant to CEQA Guidelines Section 15126.4. Specifically, SCAQMD staff recommends that the lead agency minimize or eliminate significant adverse air quality impacts by adding the mitigation measures provided below. Also, the lead agency should note that the following measures have been determined to be feasible and applicable to past projects within other jurisdictions².

- Require the use of electricity from power poles rather than temporary diesel or gasoline power generators, and
- Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NO_x and PM emissions requirements.

22

Further, SCAQMD staff recommends that the lead agency replace MM 4.3.6.2A (a) and (b) with the following:

- ✓ Project Start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
- ✓ Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.
- ✓ A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

² For example see the Metro Green Construction Policy at:

http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

- ✓ Encourage construction contractors to apply for SCAQMD “SOON” funds. Incentives could be provided for those construction contractors who apply for SCAQMD “SOON” funds. The “SOON” program provides funds to accelerate clean up of off-road diesel vehicles, such as heavy duty construction equipment. More information on this program can be found at the following website:
<http://www.aqmd.gov/tao/Implementation/SOONProgram.htm>

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website:
www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html.

Also, the SCAQMD staff recommends that the lead agency replace mitigation measures 4.3.6.2C (a) as follows:

- a) Non-VOC containing paints, sealants, adhesives, solvents, asphalt primer, and architectural coatings (where used), or pre-fabricated architectural panels shall be used in the construction of the Project to reduce VOC emissions to the maximum extent practicable.

17. Cleaner Operating Truck Incentive Programs

The project should require that all tenants provide information and promote incentive programs and available alternative fueling truck technologies. This information should be updated as needed to ensure that the most recent information is available. Further, the lead agency should require that all future tenants apply for incentive funding (such as VIP, Carl Moyer, etc.) to upgrade their fleet. If they are awarded funding, they must also be required to use it within a reasonable period of time.

RESPONSES TO LETTER C-3

South Coast Air Quality Management District

Master Response-1 Changes to Air Quality, Greenhouse Gas, and Health Risk Assessment

Master Response-2 Health Effects of Diesel Particulate Matter

Master Response-3 Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment

Master Response-4 1,000 Foot Buffer

Master Response-5 Air Filtration Systems for Residences

Master Response 1: Changes to Air Quality, Greenhouse Gas, and Health Risk Assessment

The following is based on the revised Air Quality, Greenhouse Gas, and Health Risk Assessment.

Air Quality Improvement in the South Coast Air Basin

The project is located within the South Coast Air Basin (air basin). The air quality in the air basin has been steadily improving over the last couple of decades as measured in air pollutant concentrations by the South Coast Air Quality Management District (SCAQMD). A concentration of a pollutant is a measure of the amount of a pollutant in the air. Some pollutants are measured in parts per million (ppm) and some are measured in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

When sensitive people, such as children, pregnant women, and the elderly, breathe in air pollutants, they can experience health effects. These health effects differ based on the type of pollutant, the length of time someone is exposed, and the concentration of the pollutant. In general, health effects can include coughing, sore throat, chest pain, difficulty breathing, reduced lung function, asthma aggravation, chronic lung diseases, cancer, and lung damage.

Federal, state, and local agencies enact rules and regulations to reduce air pollutant emissions to protect the health of sensitive individuals. The United States Environmental Protection Agency (EPA) sets federal ambient air quality standards and the California Air Resources Board (ARB) sets state ambient air quality standards to protect public health and welfare. When concentrations of pollutants exceed the standards, sensitive individuals may experience health effects.

Ozone is a pollutant formed in the air when emissions of volatile organic compounds (VOC) and nitrogen oxides (NO_x) combine in the presence of sunlight. Ozone is a pollutant of concern in the air basin because ozone levels exceed the ozone standards. As shown in Figure 4.3.1: *Ozone Concentration Trends in the South Coast Air Basin* in the Final Environmental Impact Report (FEIR) Volume 2, ozone concentrations in the basin have generally decreased over the past twenty years for 1-hour and 8-hour averaging time periods as defined by the State and/or federal ambient air quality standards. The 1-hour and 8-hour concentration refers to the average of the concentration over a 1-hour and 8-hour time period, respectively.

The main source of NO_x and VOC emissions in the basin are from on-road motor vehicles, not from the operation of buildings. Although vehicle miles traveled in the basin continue to increase, ozone concentrations are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with cleaner and lower-emitting vehicles. VOC and NO_x are ozone precursors; therefore, if those emissions decrease, it follows that ozone concentrations would

also decrease. Another pollutant of concern is particulate matter (PM). PM is a mixture of small particles and liquid droplets suspended in the air. It is made up of components such as chemicals, metals, soil, or dust particles. The size of these particulates is linked to their potential for causing health problems. Ultrafine particles are less than 0.1 in micron in diameter, fine particles are less than 2.5 microns in diameter (PM_{2.5}), and coarse particles are larger than 2.5 microns and smaller than 10 microns in diameter (PM₁₀). The Air Resources Board (ARB) and Environmental Protection Agency (EPA) have established standards for PM_{2.5} and PM₁₀ but not for ultrafine particles. PM_{2.5} and PM₁₀ are a concern in the air basin because sometimes the concentrations exceed the standards. PM_{2.5} is often used as a marker for toxic air pollutants such as diesel PM.

As shown in FEIR Section 4.3, PM₁₀ and PM_{2.5} annual concentrations have continued to decrease since 1990 within the air basin as a whole. Additionally, emissions are expected to decrease and then level out after the year 2014.

In the Inland Empire there is a marked decreasing trend in PM_{2.5} concentrations in Riverside-Rubidoux, Fontana, and San Bernardino from 2001 to 2012 and at Mira Loma from 2006 to 2012. The relevance of these trends is that PM_{2.5} levels have displayed a decreasing trend in the Inland Empire despite increases in urban development including the development of large warehouse complexes since 2001.

Part of the success in the decreasing NO_x and PM emissions are standards placed on motor vehicles. The figure below demonstrates the changes in U.S. heavy duty diesel emission standards for NO_x and PM. The project would incorporate mitigation that would require that the heavy duty trucks accessing the project incorporate 2010 emissions standards. As shown below, the 2010 standards are only a fraction of the older standards, at 0.2 grams per horsepower hour (g/HP-hr) of NO_x and 0.01 g/HP-hr of PM. The text in blue represents the off-road construction standards; 2011 is Tier 4 Interim and 2014 is Tier 4 Final.

Exhibit C-3-1: Changes in U.S. Heavy Duty Diesel NO_x and PM Emission Standards

Air Pollutant Emissions from Project

The construction and operation of the project would generate various sources of air pollutant emissions. During construction, there would be exhaust and dust emissions from the onsite construction equipment, worker vehicles, and haul trucks. During operation, there would be exhaust emissions from the heavy-duty trucks that would bring goods and materials to and from the warehouses, as well as worker vehicles, and onsite equipment. There would also be dust emissions from travel on paved roads.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The construction related emissions of VOC, NO_x, CO, and PM₁₀ as estimated in the revised analysis are still significant. However, after mitigation, PM_{2.5} emissions are now less than significant. Average daily emissions of VOC, NO_x, CO, and PM_{2.5} have decreased by approximately 100, 600, 500, and 25 pounds per day, respectively. This is primarily because the construction period for the project increased from 10 years to 15 years, the construction activity levels decreased, Tier 4 equipment is now applied as mitigation, and a newer version of the California Emissions Estimator Model (CalEEMod) land use emission model was used to estimate construction emissions. The average PM₁₀ emissions increased slightly by an average of approximately 35 pounds per day, primarily because of the inclusion of unpaved road dust in the emissions estimates.

The mitigated combined construction and operational emissions (without the existing emissions subtracted) are shown in Exhibit C-3-2 below. All combined emissions (with the exception of sulfur oxides, which are negligible) would exceed the SCAQMD's regional significance thresholds. The emissions (except sulfur oxides) would exceed the thresholds individually for construction and operation as well.

Exhibit C-3-2: Project Construction and Operation Emissions

Operational emissions at buildout for the revised analysis as compared with the estimates in the DEIR are as follows:

- For unmitigated operational emissions, VOC, NO_x, CO, and PM₁₀ emissions decreased by approximately 140, 1800, 2200, and 600 pounds per day lower than in the DEIR, respectively.
- Mitigation reduces NO_x by approximately 200 pounds per day at buildout. Mitigated operational emissions of VOC, NO_x, CO, and PM₁₀ are approximately 140, 2000, 2000, and 600 pounds per day lower than in the DEIR, respectively.

- Emissions of PM_{2.5} increased by approximately 150 pounds per day in both unmitigated and mitigated scenarios because of the use of updated ARB mobile source emission factors.

The revised emissions are lower because of the following: a reduction in the project size (from 41.6 to 40.6 million square feet); the emission factors for the mobile trucks and vehicles have been updated to the ARB's newest factors; and the project's vehicle miles traveled (VMT) decreased. In the DEIR, the VMT at buildout for diesel trucks was 730,100 miles per day and in the revised analysis, the VMT for diesel vehicles is 420,400 miles per day; therefore, the VMT for diesel vehicles decreased by approximately 309,700 miles per day. The VMT decreased because the analysis in the DEIR assumed an arbitrary average of 50 miles per trip for all heavy duty trucks, while the revised analysis computed the VMT using forecast traffic volumes from a detailed regional transportation model for nearly 500 freeway and roadway segments represented in detail in the Traffic Impact Analysis. The VMT for light duty vehicles increased by approximately 64,600 miles: in the Draft EIR, the VMT for light duty vehicles was 549,700 miles per day and in the revised analysis, the VMT for gasoline vehicles is 614,300 miles per day. To put the revised VMT in terms of an average trip rate, it would be 14.9 miles per trip (1,034,750 miles/day divided by 69,549 trips/day) on average, which includes all vehicle types. An average trip rate for the diesel vehicles would be approximately 35.3 miles per trip (420,440 miles/day divided by 11,908 trips/day). An average trip rate for the light-duty vehicles would be approximately 10.7 miles per trip (614,310 miles/day divided by 57,641 trips/day).

Localized Air Quality Analysis

The analysis of localized air quality impacts determines the potential of the project to violate any air quality standard, contribute substantially to an existing or projected air quality violation, or expose nearby sensitive receptors to substantial pollutant concentrations. This analysis is commonly referred to as a Localized Significance Threshold (LST) analysis and considers the emissions that are generated from all construction and operational activities while within or along the boundaries of the project. Based on estimates of project local emissions and their corresponding air quality impacts, the following is a summary of the project's localized impact analysis:

- The highest localized air quality impacts would occur at the existing residences within the project boundaries.
- After application of mitigation, the project impacts would not exceed any SCAQMD localized significance threshold at any residential or sensitive receptor located outside of the project boundaries for any of the localized air quality assessments evaluated in the revised air quality analysis for the assessment years 2012, 2021, 2027, and final build out assumed to be 2035.
- After application of mitigation, project impacts would exceed the SCAQMD localized significance thresholds for PM₁₀ during operation under the Project Phase 1 (2012) condition at the existing residences located within the project boundaries, assuming Phase 1 of the Project would be fully in operation in the existing year 2012.
- After application of mitigation, project impacts would exceed the SCAQMD localized significance for PM₁₀ during operation under the Project Phase 1 and Phase 2 Full Build Out (2012) condition at the existing residences located within the project boundaries, assuming that the project would be operational in the existing year 2012.
- After application of mitigation, project impacts would exceed the SCAQMD localized significance thresholds for PM₁₀, concentrations at the existing residences located within the project boundaries during the year 2021 when the project construction would take place at the western portion of the project adjacent to the existing residences across Redlands Boulevard.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

- After application of mitigation, project impacts would exceed the SCAQMD localized significance thresholds for PM₁₀ at the existing residences located within the project boundaries in 2027, the year when construction activities would take place along the east portion of the project adjacent to the existing residences across Gilman Springs Road.
- At final buildout project impacts would exceed the SCAQMD localized significance thresholds for PM₁₀ concentrations at the existing residences located within the project boundaries during operations under the proposed development schedule.

Cancer Risk from Project

Diesel particulate matter (diesel PM) is the primary pollutant of concern regarding the emissions of toxic air contaminants (TAC) from the project. A TAC is a chemical that is present in the atmosphere in small quantities but, nonetheless, can result in cancer health risks and non-cancer health hazards. The ARB, after a 10-year research investigation identified diesel PM as a carcinogenic substance. Diesel PM is a complex mixture of perhaps a few hundred chemical components. Even though diesel PM comprises numerous compounds, cancer risk from the inhalation of the diesel PM as a whole will outweigh the cancer risk associated with the individual chemical components.

As stated by the (California) Air Resources Board (ARB) in study of diesel PM exposure from ports and goods movement in California, “Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted. Risk assessment is thus best understood as a tool for comparing risks from various sources, usually for purposes of prioritizing risk reduction, and not as literal prediction of the community incidence of disease from exposure” (ARB 2006, Page 4).

It should be noted further that the geographical scope of the health risk analysis was expanded in the revised analysis to cover an area of approximately 3,500 square miles that extended from Palm Springs to the ports of Los Angeles and Long Beach. The geographical scope contained in the revised analysis is about 40 percent greater than the area encompassed in the DEIR and was required to analyze project impacts all the way from the project site to the ports of Los Angeles and Long Beach.

During construction, the diesel powered vehicles and equipment would emit diesel PM. During operation, the diesel trucks that would access the project site would also emit diesel PM. In addition, diesel PM would also be emitted by standby emergency generators and yard service trucks in the unmitigated case (diesel prohibited with mitigation). Gasoline fueled vehicles emit organic gases, some of which are classified as TACs. The revised air quality analysis determined the cancer risk and non-cancer hazards from exposure to those air toxics at sensitive/residential receptors, worker receptors, and school sites in the area. In the DEIR, only impacts from diesel PM were assessed; for the revised analysis, total organic gases were also included to analyze acute non-cancer hazards from diesel and gasoline powered vehicles.

Exposure Durations for Cancer Risk

In the FEIR, cancer risk is presented for periods of 30 years under the Current OEHHA Guidance for residential exposure and 25 under the Current OEHHA Guidance for worker exposure. In addition, the FEIR included a 9-year exposure duration to examine health impacts on school age children.

The underlying factors used in the analysis exemplify the conservative nature of utilizing the exposure scenarios and the underlying assumptions:

- The residential cancer risk calculation assumes that each resident will be exposed to diesel particulate matter (diesel PM) and organic gases for 24 hours a day for 350 days a year at

the location of his or her home throughout the residential exposure period. It's as if no one ever left his or her backyard to go to work or school.

- Studies have shown that over 90 percent of all residents remain in their homes for less than 30 years.
- The worker cancer risk calculation assumes that workers are exposed to diesel PM for 8 hours a day for 245 days a year, next to, but outside of the buildings in which they work.
- Studies have shown that over 95 percent of workers stay at the same job location for less than 25 years.
- Cancer risk results are derived using the emissions from construction equipment and cars and trucks which will serve the project. Emissions are a function of the number of construction equipment in usage, length of time in operation, power of the equipment, and load factor while mobile source emission depend on the number of vehicle trips and miles traveled, vehicle class, model year, and vehicle speed. The project's emissions have been estimated using methodologies published by the SCAQMD and the CARB.
- The atmospheric dispersion model and traffic model (used in estimating mobile source emissions) that are used to estimate risks generally provide impact estimates that are over-estimates based on the use of conservative model assumptions.

Trip Estimates are Conservative

It should also be noted that the traffic analysis used a conservative estimate of the number of truck trips after the project begins operation. This is important because diesel PM emissions are directly related to both the number of trucks and the vehicle miles traveled.

The traffic analysis in the EIR used the traffic generation rate for high-cube warehouses suggested by the Institute of Traffic Engineers ("ITE") which is based on traffic counts from a number of large warehouses located in California and elsewhere in the United States. This rate was also compared to the trip generation rate actually resulting from the Skechers warehouse immediately adjacent to the project. The Skechers warehouse is representative of the warehouses planned for the project. The ITE trip generation rate is three times greater than the Skechers warehouse traffic counts (see Table 4.15.K in the revised EIR). Because the project analysis used a higher trip generation rate, the vehicle miles traveled are also higher. The combination of the conservative forecasts of traffic and of the miles traveled means that the calculation of the cancer risk in the EIR overstates the extent of that risk regardless of the exposure period used.

Conclusion

The revised EIR provides cancer risk calculations based on both 30-year exposure periods for residential receptors and 25-year exposure periods for work place receptors using the Current OEHHA Guidance, the cancer risks exceed the cancer risk significance threshold at existing residences located within the project boundary but do not exceed the threshold at residences located outside of the project boundary. Further, even though the significance threshold is exceeded on a numerical basis, the risks are expected to be less than significant based on the new health research results from the Health Effects Institute (HEI) that evaluated the health effects of diesel PM emissions from new technology diesel engines such as those that are required as a mitigation measure for this project (MM 4.3.6.2B) that requires that all diesel fueled trucks must be compliant with Model Year 2010 truck emission standards. The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust that were identified when it was designated a toxic air contaminant by CARB in 1998. That designation spurred a series of regulations that brought forth transformative emissions control technology, significantly reducing both emissions and the associated health impacts. This finding is

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

further re-enforced by the mitigation requirement that all diesel construction equipment greater than 50-horsepower meet Tier 4 emission standards, the most stringent emission control requirements on off-road construction equipment. The public and the City's decision makers will be presented, and therefore will be fully informed, about the extent of the project's cancer risks.

Summary of Health Risk Results

To provide an understanding of the meaning of cancer risk, a person exposed to a cancer risk level of 1 in a million implies a likelihood that up to one person, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day indoors and outdoors) to the levels of toxic air contaminants over a specified duration of time such as 30 years. This risk would be an excess cancer risk in addition to any cancer risk borne by a person not exposed to the project's emissions. The results of the health risk assessment prior to the application of mitigation are summarized in Table C-3.A for various receptors located within the project boundaries and outside of the project boundaries as shown in the DEIR. Compared to the risks shown in the DEIR, the revised risks are substantially lower. This is due to several reasons including changes in the original construction and occupation schedule, realignment of the internal roadways, reductions in the total size of the project, reductions in the construction equipment inventory, use of the EMFAC2014 mobile source emission model for mobile sources and the newest version of the CalEEMod for estimating construction emissions, and a 5-day construction work week. The maximum daily emissions are required for the regional analysis, because project emissions can occur on any day of the week. However, in order to calculate annual average emissions, it is necessary to base emissions upon a realistic work schedule. The revised analysis assumes a more realistic annual average use of construction equipment by assuming that the maximum equipment would occur for five days per week (instead of six days per week as in the DEIR). In this way, an annual average emission inventory was estimated.

Table C-3C shows the resulting cancer risks estimated with the application of the "Current OEHHA Guidance" that includes a 30-year exposure duration and incorporated age-sensitivity factors. As noted therein, the results shown in Table 3C-C are consistent with the significance results shown in the DEIR that concluded that the SCAQMD cancer risk significance threshold is exceeded at locations both within and outside of the project boundary including both existing residential areas as well as in residentially-zoned areas to the southwest of the project and along Gilman Springs at the eastern boundary of the project prior to mitigation.

Table C-3D and Table C-3E summarize the results of the project cancer risks after application of mitigation. As noted in Table C3-E with the "Current OEHHA Guidance", the SCAQMD significance threshold is exceeded at 3 existing residences located within the project boundary.

Based on the recent research results published by the Health Effects Institute, the diesel PM emissions from the truck fleet and construction fleet that will be operated by the project consisting of Model Year 2010 diesel trucks and Tier 4 off-road construction equipment, the project's impacts are not expected to result in significant cancer risk impacts.

In response to comments, analysis of implementing a 1,000 foot buffer indicates that the buffer would not have a substantial impact on the cancer risk estimates. There is only a minimal difference in the maximum values and a negligible difference in the cancer risk contours. The health risk assessment also has the following cancer burden and non-cancer results:

- The project's cancer burden level of 0.1 after mitigation based on the Current OEHHA Guidance that call for a 70-year exposure duration and age-sensitivity factors in estimating cancer burden.; therefore, the project would not exceed the SCAQMD's threshold of 0.5.
- The project's non-cancer chronic and acute hazard index would not exceed the SCAQMD's thresholds at any receptor.

- The project would result in a cumulatively considerable health risk impact even after mitigation for sensitive/residential receptors.

Exhibit C-3-3 below presents the project risk in perspective with other lifetime risks in the United States based on mortality statistics. As shown in the chart, the project cancer risk has a slightly higher risk than dying from a lightning strike and lower risk than accidental drowning.

World Logistics Center Project

Greenhouse Gas Emissions from Project

Greenhouse gas (GHG) emissions are of concern because the accumulation of them in the atmosphere can contribute to climate change. California's Assembly Bill (AB) 32 requires that the State reduce its greenhouse gas emissions to 1990 levels by the year 2020. One of the ways California will reduce these emissions is through the California Cap-and-Trade Program. This program places a cap on certain sectors (e.g., electricity generation, petroleum refining, and cement production). The cap provides regulatory certainty of future emissions since regulated entities will not be permitted to emit GHG emissions that exceed the cap. The project emissions sources covered by the Cap-and-Trade Program include fuel combustion sources (motor vehicle and truck exhaust, construction exhaust, natural gas, onsite equipment) and electricity generation. The project emissions sources not covered by the Cap-and-Trade Program include waste decomposition in landfills, land use change, and refrigerant leakage.

The analysis in the DEIR did not divide the greenhouse gas emissions into AB 32 capped and uncapped emissions. The DEIR compared the total project emissions to the SCAQMD draft industrial threshold for greenhouse gas emissions of 10,000 metric tons of carbon dioxide equivalents (MTCO₂e) per year and found the emissions to be significant and unavoidable even after mitigation. However, the revised analysis divides the Greenhouse Gas Emissions into capped and uncapped and compares the uncapped emissions to the SCAQMD's significance threshold.

The SCAQMD has recognized that the GHG emissions associated with capped sources should not be counted for the purpose of determining what the GHG emissions are for facilities that will use electricity generated elsewhere. See the following negative declarations adopted by the SCAQMD:

- Ultramar Inc. Wilmington Refinery Proposed Cogeneration Project, SCH No. 2012041014, April, 2013 (available at www.aqmd.gov/ceqa/documents/2013/nonaqmd/Ultramar_Neg_Dec.pdf)

- Phillips 66 Los Angeles Refinery Carson Plant - Crude Oil Storage Capacity Project, SCH No. 2013091029, September 2013, (available at www.aqmd.gov/ceqa/documents/2013/nonaqmd/Draft_ND_Phillips_66_Crude_Storage.pdf).

A summary of the greenhouse gas emissions as estimated in the DEIR and the FEIR is shown in the table below. The analysis in the FEIR divides the AB 32 capped and uncapped emissions and compares the uncapped emissions to the SCAQMD significance threshold. As shown in the Table C-3.B, after mitigation, the AB 32 uncapped emissions do not exceed the SCAQMD's threshold of 10,000 MTCO₂e.

As shown in Table C-3.B the emissions as estimated in the Final EIR are lower mainly because of the following reasons:

1. Motor vehicle emissions were reduced by about 163,000 MTCO₂e/year because of the reasons specified in the operational regional analysis regarding updated emission factors and vehicle miles traveled.
2. Operational waste emissions were reduced by approximately 136,000 MTCO₂e/year because the new version of CalEEMod (2013) lowered its waste generation rates for warehouse development.

Master Response-2 Health Effects of Diesel Particulate Matter

A common theme in many of the comments received concerning air quality dealt with the health impacts from diesel particulate matter (diesel PM). Based upon the information available at the time the DEIR was circulated, the health effects of diesel PM were discussed in the DEIR (pages 4.3-10, 4.3.-32-37, and Appendix D, pages 52–60), as follows:

“Diesel PM is part of a complex mixture of thousands of particles and gases that is produced when an engine burns diesel fuel. Organic compounds account for 80 percent of the total particulate matter mass, which consists of compounds such as hydrocarbons and their derivatives. Diesel exhaust is a major source of ambient particulate matter pollution such as PM_{2.5} in urban environments. Typically, the main source of diesel PM is from combustion of diesel fuel in diesel-powered engines. Such engines are in on-road vehicles such as diesel trucks, off-road construction vehicles, diesel electrical generators, and various pieces of stationary construction equipment” (DEIR, Appendix D, page 52).

“Some short-term (acute) effects of diesel PM exposure include non-cancer effects such as eye, nose, throat, and lung irritation, coughs, headaches, light-headedness, and nausea. Studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Human studies on the carcinogenicity of diesel PM demonstrate an increased risk of lung cancer, although the increased risk cannot be clearly and solely attributed to diesel exhaust exposure” (DEIR, Appendix D, page 52).

The following information has been added to the revised analysis to update and expand upon the information in the DEIR:

The principal concern regarding exposures to traditional diesel PM lies in its small size and thus its ability to penetrate deep into lung tissues when inhaled. Diesel exhaust has been found to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

cause health effects from short-term or acute exposures and from long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical an individual is exposed to and the length of time of that exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel PM but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.

Long-term (chronic) exposure to diesel exhaust is likely to occur when a person works where diesel is used regularly or experiences repeated exposure to diesel fumes over a long period of time. Human health studies demonstrate a correlation between exposure to traditional diesel exhaust and increased lung cancer rates in occupational settings. Experimental animal inhalation studies of chronic exposure to diesel exhaust have shown that a range of doses causes varying levels of inflammation and cellular changes in the lungs. Human and laboratory studies have also provided considerable evidence that diesel exhaust is a likely carcinogen.

Several studies of occupational and ambient health risks have documented the health effects due to exposure to diesel PM. In its comprehensive assessment of diesel exhaust, the California Office of Environmental Health Hazards Assessment (OEHHA) analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, 1950's era railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer¹³. Based on these studies, CARB identified diesel exhaust a toxic air contaminant in 1998.

Another study, the Children's Health Study performed by the University of Southern California,¹⁴ focused on children's responses to health effects of several air pollutants including oxides of nitrogen, ozone, PM₁₀, vapor phase strong acids, (nitric acid and hydrochloric acid), carbon monoxide, and ultrafine particulates. The Children's Health Study, which began in 1992, is a large, long-term study of the effects of chronic air pollution exposures on the health of children living in Southern California. Children may be more strongly affected by air pollution because their lungs and their bodies are still developing. Children are also exposed to more air pollution than are adults, since they breathe faster and spend more time outdoors in strenuous activities. About 5,500 children in twelve communities were enrolled in the study; two-thirds of whom were enrolled as fourth-graders. Data on the children's health, their exposures to air pollution, and many factors that affected their responses to air pollution were gathered annually until they graduated from high school.

The major conclusions reached in the Children's Health Study were:

- Children exposed to higher levels of particulate matter, nitrogen dioxide, acid vapor, and elemental carbon, had significantly lower lung function at age 18, an age when the lungs are nearly mature and lung function deficits are unlikely to be reversed.
- Children who were exposed to current levels of air pollution had significantly reduced lung growth and development when exposed to higher levels of acid vapor, ozone, nitrogen dioxide, and particulate matter, which are made up of very small particles that can be breathed deeply into the lungs.
- Children living in communities with higher concentrations of nitrogen dioxide, particulate matter, and acid vapor had lungs that both developed and grew more slowly and were less

¹³ California Office of Environmental Health Hazard Assessment. Health Effects of Diesel Exhaust. Website: http://oehha.ca.gov/public_info/facts/pdf/diesel4-02.pdf

¹⁴ "Children's Health Study", USC Environmental Health Services Center, published by the New England Journal of Medicine on March 5, 2015.

able to move air through them. This decreased lung development may have permanent adverse effects in adulthood.

- Children who moved away from study communities had increased lung development if the new communities had lower particulate matter levels, and had decreased lung development if the new communities had higher particulate matter levels.
- Days with higher ozone levels resulted in significantly higher school absences due to respiratory illness. Children with asthma who were exposed to higher concentrations of particulate matter were much more likely to develop bronchitis.

It is important, however, to put into context, the level of pollutants that were measured during the above measurement time periods during the 1990s and early 2000s. As noted in Master Response-1 in Letter C-3, air quality levels have improved by 50 to 60 percent from the early 2000s to today and even more so since the early 1990s. As also shown in Master Response-1 in Letter C-3, emission controls already adopted by the ARB and EPA will continue to see further emission reductions and improved air quality levels into the future. Further, it is important to point out several potential factors that may confound the relationship between diesel PM exposures and health effects. These factors include the effects of co-pollutants, that is, the effects other pollutants such as gaseous pollutants that confound the relationships, differences in biological responses when extrapolating from animals to human exposures, extrapolations of high occupational exposures to lower environmental exposures, lack of knowledge of worker exposure histories, and factors such as smoking and diet.

In the most recent update to the Children's Health Study¹⁵, researchers discovered that improvements in regional air quality contributed to improved children's lung function. Specifically, combined exposure to two harmful pollutants, nitrogen dioxide (NO₂) and fine particulate matter, fell approximately 40 percent for children in the third study group (2007-2011) compared to the first study group (1994-98). The study followed children from Long Beach, Mira Loma, Riverside, San Dimas and Upland.

Children's lungs grew faster as air quality improved. Lung growth from age 11 to 15 was more than 10 percent greater for children breathing the lower levels of NO₂ from 2007 to 2011 compared to those breathing higher levels from 1994 to 1998.

The percentage of children in the study with abnormally low lung function at age 15 dropped from nearly 8 percent for the 1994-98 group, to 6.3 percent in 1997-2001, to just 3.6 percent for children followed between 2007 and 2011.

Additionally, in January 2015, there has been a major new study that evaluates the health impacts of "new technology diesel exhaust" (NTDE). Beginning in 2001, USEPA and CARB begin issuing a series of regulations that require new diesel-powered vehicles and equipment to use the latest emissions control technology. This technology relies on two components. The first is a diesel particulate filter, which is capable of reducing particulate matter emissions by over 90% (required for new engines beginning in 2007). The second technology is selective catalytic reduction, which reduces emissions of nitrogen oxides by over 90% (required for new engines beginning in 2010). Diesel emissions from equipment equipped with this technology is referred to as NTDE. As a result of the advances in emission control technology, USEPA, CARB, and other government and industry stakeholders commissioned a series of studies called the Advanced Collaborative Emissions Study (ACES). ACES has been guided by an ACES Steering Committee consisting of representatives of HEI and CRC, along with the U.S. Department of Energy, U.S. EPA, engine manufacturers, the

¹⁵ "Children's Health Study", USC Environmental Health Services Center, published by the New England Journal of Medicine on March 5, 2015.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others. The Health Effects Institute (HEI), funded in part by USEPA, was selected to oversee Phase 3 of ACES.

Phase 3 of ACES evaluated whether emissions from new technology diesel engines cause cancer or other health effects. Specifically, it evaluated the health impacts of a 2007-compliant engine equipped with a diesel particulate filter. HEI found that lifetime exposure to new technology diesel exhaust (NTDE) did not cause carcinogenic lung tumors. The study also confirmed that the concentrations of particulate matter and toxic air pollutants emitted from NTDE are more than 90% lower than emissions from traditional older diesel engine.

The HEI study clearly demonstrates that the application of new emissions control technology to diesel engines have virtually eliminated the health impacts of diesel exhaust.

The proposed project has committed to 2010-compliant trucks for operation and Tier 4 equipment for construction, both of which rely on diesel particulate filters similar to those tested in the HEI study. These vehicles reduce emissions by 90% when compared to 2006 vehicles and by 99% when compared to uncontrolled diesel engines. Recent emissions testing by CARB revealed that these diesel engines are cleaner than originally estimated. These findings, which are reflected in the latest CARB emissions factor model EMFAC2014, are 70% cleaner than previously estimated. As a result of the very low emissions from new technology diesel engines and the research conducted by HEI, it is projected that the proposed project would not result in any cancer risk from diesel emissions.

Master Response-3: Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment

Major improvements in diesel engine technology have occurred over the past several years. Exhibit C-3-1 shows changes in the EPA's nitrogen oxides (NOx) and particulates (PM) emissions standards. The heavy-duty operational diesel values are shown in beige, while the off-road equipment Tier 4 emissions standards are shown in blue. Model year 2010 and newer heavy-duty trucks are 96 percent cleaner for NOx and 90 percent cleaner for PM than 1994 model year trucks producing substantial improvements in air quality.

During operation, the WLC project prohibits trucks older than 2010 model year from entry into the facility. The WLC project would only allow entry of diesel trucks which are model year 2010 or newer (Mitigation Measure (MM) 4.3.6.3B), which would reduce air pollutant emissions on and off the project site. Please see the Mitigation Monitoring Reporting Program for a list of the mitigation measures (FEIR Volume 1).

Also during operation, no diesel-powered onsite yard trucks, equipment, and emergency generators will be allowed at the project site (MM 4.3.6.3B and project design feature), which would reduce diesel particulate matter emissions on the project site. The project is also implementing solar photovoltaic (MM 4.16.4.6.1C); therefore, the electricity from this solar could power any onsite electric equipment and yard trucks.

During construction, the WLC project requires Tier 4 off-road equipment, MM 4.3.6.2A also requires that haul trucks used during construction be model year 2007 or newer.

Several commenters suggested zero-emission, near-zero, and/or hybrid electric trucks and equipment as potential mitigation measures. This is not feasible as discussed below.

Zero- and near-zero emission truck technologies include battery-electric trucks, fuel cell trucks, dual-mode (hybrid) electric trucks with all-electric range and, potentially, other technologies. These technologies are still in the testing stages and are not commercially available. There are no

commercially viable zero-emission or hybrid trucks currently available and it is unknown whether any such demonstration project would be successful and lead to commercially viable zero-emission or hybrid trucks in the future. To require a project to use these types of technologies is not feasible because they are not available, it is unknown when or if they will become feasible in the future.

The Port of Los Angeles is testing various types of zero-emission technology solutions for heavy-duty vehicles as part of its Clean Air Action Plan and through its joint Technology Advancement Program with the Port of Long Beach.¹⁶ The SCAQMD provided money to the port through a \$4.1 million dollar grant from the U.S. Department of Energy. This money funded only 13 zero emission trucks: Balgon plug-in, hydrogen Fuel Cell truck, Transpower plug-in, and U.S. Hybrid plug-in. These trucks have a low range of travel between 100 miles and 200 miles per charge.

The Port of Long Beach states that the use of electric and hydrogen fuel cell trucks is currently not feasible:

“The trucks may result in feasible technology to provide zero emissions goods movement between Pier S and near-dock rail yards. Until the trucks have successfully completed their prototype testing and are being produced for the commercial market, they are not yet considered viable zero-technology options. The reliability and durability of heavy-duty electric trucks in a short-haul port-duty cycle have yet to be proven. At this time, no commercial production zero emissions drayage truck is available or expected to be available in the near future. Because the technology is still in the development stage, the Port does not include requirements within the environmental documents for a single terminal, but rather continues to update the CTP [Clean Trucks Program]. In addition, a viable business model for zero emissions technology has not yet been established. Given the initial high cost of equipment and reduced operating characteristics of current prototype zero emissions equipment, additional investigation is necessary to determine the financial viability of this equipment following prototype demonstration and prior to any small-scale deployment.”¹⁷

According to the most recent monthly inventory, there were no electric hybrid trucks in the Port of Los Angeles out of 12,226 trucks.¹⁸

There are problems with some zero emission technologies, such as batteries. While diesel fuel is a dense energy source, yielding sufficient energy per unit weight to haul 50,000-pound loads, batteries do not have sufficient energy density. Rather, the batteries would outweigh payload, sacrificing efficiency and requiring many more trucks to be on the road per unit of goods transported.¹⁹

Master Response-4: 1,000 Foot Buffer.

Several commenters have proposed that the project use a “1,000-foot buffer between the project and sensitive receptors as recommended in the California Air Resources Board’s Land Use Handbook.” However, those recommendations are outdated and not applicable to this specific project. First, the Land Use Handbook states that for distribution centers and warehouses, “ARB recommends a separation of 1,000 feet based on the combination of risk analysis done for TRUs [transportation refrigeration units] and the decrease in exposure predicted with the South Coast AQMD modeling” (page 14). MM 4.3.6.3E has been added, which prohibits refrigeration unless it can be demonstrated

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

that the environmental impacts resulting from the inclusion of the refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. The Land Use Handbook was published in 2005 before ARB promulgated its On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation significantly reducing diesel emissions from sources like warehouses (the ARB analysis was “assuming a current fleet diesel PM emission rate”). In addition, the project’s commitment to allow only trucks that are compliant with United States Environmental Protection Agency’s (USEPA) 2010 emissions standards, which are over 90% cleaner than the prior generation of trucks, means that the assumptions that were modeled and considered during the preparation of the Land Use Handbook are not valid for this project. Additionally, based on improved mitigation, such as the requirement to use Tier 4 construction equipment, there is no significant health impact outside the project boundaries based on the current OEHHA methodology. More importantly, the recommendation was made prior to the release of the Health Effects Institute study (discussed in Master Response-2), which found no evidence that new technology diesel exhaust causes cancer. This means that current OEHHA methodology for calculating cancer risk is not applicable and that there is no cancer risk attributable to project-related diesel emissions.

Nonetheless, an analysis of a 1,000-foot buffer between the project’s operational emissions and the centerlines of Redlands Boulevard, Gilman Springs Road, Bay Avenue, and Merwin Street was included in the revised Air Quality, Greenhouse Gas, and Health Risk Assessment prepared for the project. The results show that there is no substantial difference in the cancer risk estimates with the use of a 1,000-foot buffer. Any difference is well within the mathematical and physical limitations and uncertainties of the various methodologies used to estimate cancer risk. These limitations and uncertainties deal with the approximate mathematical formulations used to describe and simulate of the complex atmospheric processes that disperse air pollutants, experimental limitations in the accuracy for estimating emissions from sources, and the limitations in quantifying the physical relationships between a specific level of air pollution and a direct health effect.

In addition, pursuant to the WLCSP (Section 2.5) and MM 4.1.6.1A, the WLC will have a minimum 250-foot buffer between the project and residentially zoned properties along Redlands Boulevard, Merwin Street, and Bay Avenue. A berm along Redlands Boulevard and landscaping will also create a visual screen between the WLC and adjacent communities to reduce the visibility of the proposed warehouse structures and improving aesthetics and reducing impacts on the neighboring community. The effectiveness of vegetative barriers on air quality is highly complex and depends on a number of factors including particle size, wind speed, leaf area density, and gaps in the vegetation, tree species, and season. The project proposed to plant a wide variety of vegetative species, as shown in the WLCSP, Section 5.4, and Onsite Landscaping that could act as a vegetative barrier. At this time, it is not possible to gauge the effectiveness of the vegetative barriers in absorbing air pollutants. However, a SCAQMD forum, Near-Road Mitigation Measures and Technologies, given November 21, 2013, featured several presentations that showed that vegetative barriers had measurable benefits in reducing pollution.

The Gilman Springs Road edge in the eastern portion of the project is adjacent to existing and future suburban residential (zoned) uses. This edge will feature a restricted use area of 250 feet from these residentially zoned properties. No buildings, truck courts, loading areas, truck circulation areas, or truck or trailer storage uses are permitted within this area. Employee/visitor parking, emergency access, landscaping, drainage facilities, and property maintenance access are permitted. This restricted use area may be reduced subject to the review of project specific air quality and noise analyses.

In summary, a 1,000-foot barrier will not reduce air quality impacts for the WLC project.

For additional information about the project design features and mitigation measures that have been incorporated into the project, see Section 4.1 of the FEIR and Figures 4.1.4 through 4.1.4J and Figures 4.1.5 through 4.1.5J.

Master Response-5: Air Filtration Systems for Residences.

At the time the DEIR was circulated, the proposed project was identified to have a significant increase in cancer risk associated with diesel emissions from project construction and operation. Several commenters have proposed air filtration systems to reduce these impacts from the proposed project.

Since the circulation of the DEIR, new data has become available regarding air quality impacts. This information includes the new, significantly lower diesel truck emission rates published by CARB, new assessment methodology published by OEHHA, and a new study, funded by CARB and EPA, and on the health impacts of diesel emissions (HEI study).²⁰ In evaluating cancer risk, under the updated OEHHA methodology (30-year exposure, age sensitivity factors, higher breathing rate), after mitigation there would be no residences outside the project boundaries that would have a cancer risk over the 10 in a million threshold. There would be three residences within the project boundaries where the risk exceeded 10 in one million. Under current SCAQMD methodology (70-year exposure, no age sensitivity factors), cancer risk at receptors inside and outside the project would be less than the significance threshold. However, the latest research (discussed in Section 4.3 of the EIR and Master Response-2), demonstrates that new technology diesel exhaust does not contribute to cancer. As a result of this new research there is no need to provide filters to reduce the health risk impact from the proposed project.

Commenters have also recommended the establishment of various types of mitigation fund to provide off-site improvements related to air quality, such as air filters or landscaping. However, such mitigation does not mitigate specific, project-related impacts. While the concepts proposed for funding are recognized to provide benefits such as improving indoor air quality, the benefits are not tied to reducing impacts from the proposed project. There is no nexus between the generalized benefits of a proposed community benefits fund and specific project impacts. As a result, such a fund cannot be reasonably expected to avoid or minimize air quality impacts of the project as is required for mitigation.

Response to Comment C-3-1. The City is happy to accept comments from the SCAQMD regarding air quality impacts of the WLC project, and has addressed the SCAQMD's comments in the following paragraphs.

Response to Comment C-3-2. The City acknowledges that the SCAQMD's primary concern is air quality, including criteria air pollutants such as particulates and ozone. The District has correctly summarized the results of the EIR regarding air pollutants that would exceed the SCAQMD's significance criteria. The EIR outlines a number of measures that could help reduce or mitigate project emissions (MMs 4.3.6.1A(a) through 4.3.6.1A(n)), as discussed in Section 4.3 of the FEIR which is Volume 2. Due to the size and type of project proposed, it is not possible to reduce project emissions to less than significant levels.

Response to Comment C-3-3. The commenter demands additional mitigation measures due to the existing air quality issues in the project area. The DEIR does conclude there will be significant air pollutant impacts from development of the WLC project, mainly due to its size and type of uses

²⁰ "Advanced Collaborative Emissions Study" published by the Health Effects Institute (HEI) in 2015 (Research Report 184 final). The HEI consists of governmental and private industry representatives including the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

proposed. Section 4.3, *Air Quality*, of the DEIR, does propose a number of mitigation measures that will help reduce emissions from both construction and project occupancy. Due to the size of the project, and its related exceedances of SCAQMD standards, there are no mitigation measures available that will reduce regional air pollutant impacts to less than significant levels.

Response to Comment C-3-4. The commenter indicates that the Lead Agency should specify how these mitigation measures and project design features will be made enforceable to ensure that the project's regional air quality and health risk impacts are minimized. The mitigation measures will be enforced through the Mitigation Monitoring Reporting Program (refer to FEIR Volume 1). The project design feature that requires that diesel trucks meet a certain emission standard is now a mitigation measure instead of a project design feature, to make it more enforceable. Trucks that do not meet the 2010 emissions standards will be prohibited entry at the facility gate by the tenant. This requirement will also be enforced through the WLCSP and the lease. Please see the Mitigation Monitoring Reporting Program (FEIR Volume 1) for a list of the project's revised mitigation measures.

Response to Comment C-3-5. The SCAQMD provides an introduction to some of the mitigation measures that are referenced later in its letter. Responses to these suggested mitigation measures are contained in the responses which follow.

Response to Comment C-3-6. This response fulfills the CEQA requirements to provide a written response at least ten days prior to the adoption of the FEIR.

Response to Comment C-3-7. The commenter requests the project implement additional mitigation for air impacts and alternative fuel vehicles. The WLCSP proposes an alternative fueling station that will open during the first phase of development to serve trucks that use liquefied or compressed natural gas as vehicle fuel. In addition, future development under the WLCSP will comply with vehicle fleet fuel requirements at the time of development approval. The DEIR Section 4.3 did provide mitigation for alternative fuel vehicles. MM 4.3.6.3C requires the WLC project to provide the establishment of onsite alternative fueling infrastructure (electric charging stations and/or natural gas fueling), which will help facilitate the use of these low-emitting trucks. MM 4.3.6.4A(g) requires a minimum of two electric vehicle-charging stations for automobiles or light-duty trucks to be provided at each building, and facilities with 100 parking spaces or more shall have three percent of the total parking spaces capable of supporting electric vehicle supply equipment charging locations. MM 4.3.6.4A(j) provides an incentive for people to drive low fuel vehicles by requiring preferred parking for low-emitting and fuel-efficient vehicles equivalent to at least eight percent of the required number of parking spaces at each warehouse. MM 4.3.6.2A includes a requirement to provide electrical hook ups to the power grid for construction equipment. However, to require biodiesel or natural gas for construction is not feasible because of the availability and sourcing of those types of equipment. MM 4.3.6.3B requires alternative fueled yard trucks and emergency generators. WLCSP Section 12.3 requires pallet jacks, forklifts and other onsite equipment be powered by non-diesel fuel.

However, the project will support a variety of future users which are unknown at this time, so it is not possible to specify or require future users to have zero emission or alternative fuel fleets since most logistics companies use independent contractors and truck drivers rather than maintain their own fleets. Also refer to Responses to Comments B-5-7, B-5-8, B-5-14, C-3-9, C-3-19, C-3-23, D-2-3, E-2A-17, F-1-66, or more discussion of zero emission vehicles, see Master Response-3 in Letter C-3.

Response to Comment C-3-8. The commenter suggests that electric vehicle charging stations be included on the project site. MM 4.3.6.4A has been revised to state:

4.3.6.4A ~~g) A minimum of two electric vehicle charging stations for automobiles or light-duty trucks shall be provided at each building.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

g) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. In addition, parking facilities with 100 parking spaces or more shall be designed and constructed so that at least three percent of the total parking spaces are capable of supporting future electric vehicle supply equipment (EVSE) charging locations. Only sufficient sizing of conduit and service capacity to install Level 2 Electric Vehicle Supply Equipment (EVSE) or greater are required to be installed at the time of construction.

Mitigation Measure 4.3.6.3E prohibits refrigeration unless it can be demonstrated that the environmental impacts resulting from the inclusion of the refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Therefore, in the unlikely event that trucks servicing the WLC facility require Transportation Refrigeration Units they will not have an impact greater than currently identified in the Environmental Impact Report.

According to the TIA, 93 percent of all heavy trucks trip are internal to the region and ports, so Auxiliary Power Units (APU) are unlikely to be found on trucks servicing the WLC. Therefore, providing electrical hookups for APUs is not necessary.

The commenter suggested mitigation measures, as discussed below:

Suggested Mitigation Measure	Response
The lead agency should require each warehouse and other plan areas that allow truck parking to be constructed with the appropriate infrastructure to facilitate sufficient electric charging for trucks to plug-in.	Not Included. There are no commercially available electric heavy-duty trucks. Additionally, there are no design standards for charging of zero-emission heavy-duty trucks. All known technology demonstrations that are being conducted involve third-party vendors, with no truck OEMs yet designing or manufacturing zero-emission trucks. As a result, it is not feasible to provide infrastructure for technology standards that do not yet exist. See also Master Response: Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment in Response to Comment Letter C-3.
The SCAQMD staff recommends that the lead agency require at least 5 percent of all vehicle parking spaces (including for trucks) include EV charging stations.	Partially Included. MM 4.3.6.4A requires a minimum 2 EV charging stations per building and three percent of parking spaces capable of supporting electric vehicle supply equipment charging stations. This is consistent with the building standard proposed by the California Buildings Standards Commission at Section 5.106. It is not possible to project accurately what the electric vehicle demand will be upon project completion. The Skechers building provided two stations and there is small to little use. Providing 3 percent of parking spaces with charging stations is conservative as it could provide the potential for over 20 stations on a building the equivalent size of Skechers (1.8 million square feet and 750 parking spaces). Future demand is speculative. The ARB has had a zero emission regulation for over 20 years and has failed to provide electric vehicles.
Electrical hookups should be provided at the onsite truck stop for truckers to plug in Transportation Refrigeration Units and any other onboard auxiliary equipment.	Included. The MM 4.3.6.3E states: “ <u>Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to,</u>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	<u>refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan application proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).</u> ” Therefore, TRUs are dealt with through MM 4.3.6.3E. .

Response to Comment C-3-9. The commenter suggested a mitigation measure, as discussed below.

Suggested Mitigation Measure	Response
The lead agency should revise mitigation measure 4.3.6.3C to require the installation of an alternative fueling facility (e.g., natural gas) to serve the project site <u>prior to operation</u> of any logistics warehousing within the plan area.	Partially Included. The alternative fueling station has been moved to Phase 1 of development; however, there would not be enough activity or demand for the station to be a viable business with only a couple of buildings operational. The developer will work with an alternative fuel provider and will install the station in as soon as they determine it is feasible, but no later than end of Phase 1.

Response to Comment C-3-10. The commenter notes the credibility of the emission scenarios used on the assessment of the project’s operational emissions.

We agree that Scenario 1, Existing (2012) Plus Project Build out, which assumes the project is completely built out in 2012, does not represent a rational point of discussion principally because of the improbability of such a scenario. Nonetheless, this scenario was included to provide consistency with the Traffic Impact Analysis (TIA) and to provide a worst case air quality assessment. We agree that Scenario 2, which analyzes the project’s intended development schedule, represents a much more practical analysis basis.

The project’s regional operational emissions in the DEIR were based on emission estimates from an older version of the CalEEMod Model (version 2011) available at the time of the preparation of the DEIR. In the DEIR, the emission rates for the heavy-heavy-duty truck vehicle class were modified, however, to reflect default rates contained in the California Air Resources Board (ARB) Emissions Factor model 2011 (EMFAC2011) mobile source emission model. Emission rates for all other vehicle classes were derived from the older ARB EMFAC2007 emission model as embedded as part of the older 2011 version of CalEEMod. In the revised air quality analysis, consistent with MM 4.3.6.3B, model year 2010 diesel truck emission rates were included as part of the analysis of project impacts after mitigation and emissions were estimated by applying the most current version of the EMFAC model, EMFAC2014.

In addition, the methodology and estimates of the project’s regional operational mobile source emissions have been revised in the revised air quality analysis and are now based on the project’s traffic volumes by vehicle class on nearly 500 individual roadway segments as derived from the traffic impact model used to assess potential project traffic impacts. The most current emission rates from the EMFAC2014 mobile source emission model were used in the revised analysis.

Response to Comment C-3-11. The commenter suggested a mitigation measure, as discussed below.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
The project should require the 1,000-foot buffer as recommended in the state Air Resources Board's Land Use Handbook. This buffer should also apply to any undeveloped sensitive receptors that may be sited in the future next to the WLCSP area.	Not Included. Please refer to Master Response-4, 1,000 foot buffer in Response to Comment Letter C-3.

Response to Comment C-3-12. The commenter recommends that the lead agency include a description in the FEIR that specifies how the 2010 engine emissions standards and onsite equipment specifications will be enforced. The requirement to use 2010 emissions standards for diesel trucks is now included in MM 4.3.6.3B and in the WLCSP instead of a project design feature and therefore would be enforced as specified in the Mitigation Monitoring and Reporting Plan and tenant leases (FEIR Volume 2, Section 4.3 Air Quality).

Regarding the service yard trucks and other operational onsite equipment, the following project design feature on page 3-33 in the DEIR makes the following commitment regarding the project: "All service yard trucks (hostlers, yard goats, etc.), pallet jacks, forklifts, and other onsite equipment used during operation shall be powered by electricity, natural gas, and/or propane. Electrical power sources shall be provided for service equipment." In the FEIR, biodiesel was removed from the WLCSP pursuant to comments received by the SCAQMD.

These requirements would be enforced through the Mitigation Monitoring and Reporting Plan (FEIR Volume 1) and the lease.

Response to Comment C-3-13. The SCAQMD suggested a mitigation measure, as discussed below.

Suggested Mitigation Measure	Response
Given the availability of roof space associated with this project the lead agency should maximize the opportunity to produce solar energy by including mitigation beyond MM 4.16.4.6.1A. Specifically, the lead agency should require that buildings maximize the possible number of solar energy arrays.	Partially Incorporated. MM 4.16.4.6.1C requires solar for the ancillary office portion of the project buildings.

Response to Comment C-3-14. The commenter requested a discussion regarding the proximity of onsite residents to warehouse operations and any mitigation measures that will minimize the significant impacts to these residents.

A total of seven existing residences are situated within the project boundaries. These existing residences are located near the intersection of Theodore Street and the proposed Street E and Street F as well as near the intersection of Redlands Boulevard and Dracaea Avenue. Based on the health risk assessment contained in the revised analysis, there would be no increase in cancer risk based on the latest research that demonstrates that new technology diesel exhaust does not cause cancer. Nonetheless, the FEIR contains a revised health risk analysis using both the current SCAQMD methodology and the recently adopted OEHA methodology. Under the SCAQMD methodology, there would be no significant health risk impact. This is due primarily to revised mitigation, including the requirement to use Tier 4 construction equipment, and recently revised emissions factors for heavy-duty trucks published by CARB. Under the OEHA methodology, the construction and operation of the project would result in cancer risk levels that would exceed the SCAQMD's cancer risk significance threshold of 10 in a million at five residences located along Theodore Street and proposed Streets E and F. However, these analyses assume the use of traditional diesel engines, which are prohibited from the project. See Master Response-2 for more information.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

As discussed in Master Response-4, a 1,000 foot buffer was explored as a possible mitigation measure; however, the buffer would only marginally reduce the impacts at the onsite residences with no improvements at receptors located outside of the project. In addition, as discussed in Master Response-5, the latest research (discussed in Section 4.3 of the EIR and Master Response-2), demonstrates that new technology diesel exhaust does not contribute to cancer. As a result of this new research there is no need to provide filters to reduce the health risk impact from the proposed project.

Response to Comment C-3-15. The commenter states by Year 2022 more than 1,500 light-heavy and medium-heavy duty diesel trucks per day are expected to access the site via Cactus Avenue. The commenter states it is not clear what destination these trucks would serve as there do not appear to be any non-residential or school land uses within 5 miles of this access point. The commenter asks the lead agency to clarify if this path is meant to be a truck route linking the warehouses on the west side of the city with those in the proposed project. The commenter recommends if alternate routes are available they would not impact as many sensitive receptors and these routes should be made a requirement of the project.

The Cactus Avenue access point is intended as a replacement route for vehicles currently using Alessandro Blvd to traverse the site. Alessandro Blvd is currently the only designated truck route running east-west through Moreno Valley (see truck route map below); however, as part of the proposed project the Alessandro Blvd connection will be permanently severed. Traffic counts show light and medium trucks currently comprise 3% of the traffic on this portion of Alessandro Blvd. This traffic serves, among other things, commercial traffic to the businesses along Alessandro Blvd and Cactus Avenue, and commercial traffic to and from the neighboring cities southeast of Moreno Valley. This traffic is expected to grow in the future as the General Plan calls for more commercial development both east and west of the WLC site (refer to the General Plan land use map below).

There would be no practical way to distinguish through traffic from WLC traffic, so the restriction would have to apply to neither or both. If both, this could hamper both existing and future non-WLC commercial traffic in Moreno Valley. The City proposes that this access point be closed to heavy trucks but continue to allow for light and medium trucks as a reasonable compromise between the needs of the business community and the concerns of local residents.

Response to Comment C-3-16. The SCAQMD recommends that the lead agency either revise the air quality analysis to account for emissions from refrigerated warehouse uses or include a mitigation measure that precludes the use of refrigerated warehousing at the project site. MM 4.3.6.3E states:

4.3.6.3E Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan application proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).

Therefore, the proposed mitigation measure is not necessary because refrigerated warehouse uses are dealt with through implementation of MM 4.3.6.3E.

Response to Comment C-3-17. The commenter states the EIR assumes only 12.5% of the project's total trips are generated by heavy trucks, while CalEEMod and the National Association of Industrial and Office Properties (NAIOP) Study indicate a higher percentage may be more appropriate. Also,

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

the commenter states goods movement activity fluctuates based on seasonality. The commenter states the FEIR should include a discussion about whether the trips rates are annual averages or peak daily rates that include adjustments for seasonality.

Per the City of Moreno Valley *Traffic Analysis Guidelines* the vehicle percentages from the Fontana *Truck Trip Generation Study* were used. That survey found that 12.3% of trips entering or leaving high-cube warehouses were heavy trucks, while some other sources have a higher percentage of heavy trucks (the NAIOP study, for example, had 20.8% heavy trucks; City of Moreno Valley 2013 survey data²¹ yields 13.4% trucks calculated on a weighted average). The commenter incorrectly concluded that this meant that the WLC analysis forecasted too few trucks. In fact, because the WLC analysis utilizes a very high overall trip generation rate, the resulting number of truck trips estimated for the project is actually slightly higher than in the NAIOP and City 2013 surveys, and much higher than the Skechers data indicates would be appropriate (see figures below from the TIA). The figures used in this analysis can therefore be considered a high estimate of truck traffic and a very high estimate of car traffic compared to conditions actually found at the most comparable sites.

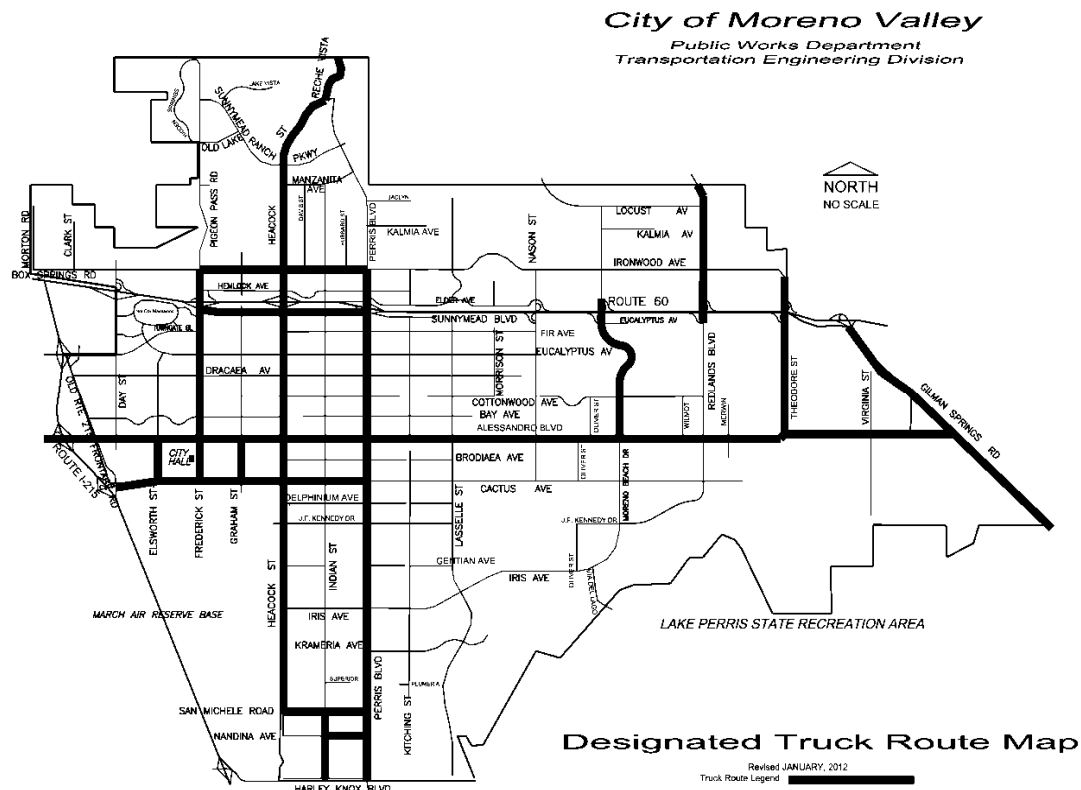

Exhibit C-3-4: Moreno Valley Designated Routes

²¹ Vehicle Mix Assumption for High-Cube Warehouse, Memo from Michael Lloyd to Eric Lewis, September 27, 2013.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

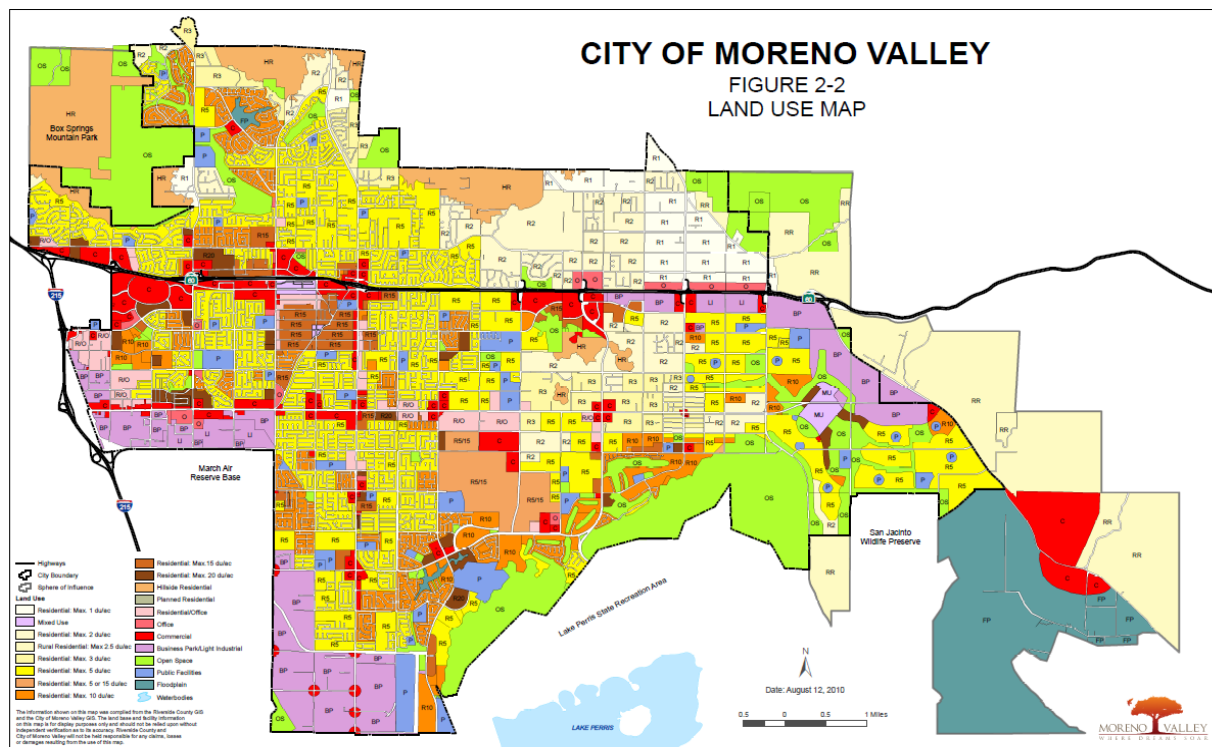

Exhibit C-3-5: Moreno Valley General Plan Adopted Land Use Map

Table C-3.C: Comparison of Truck Trip Generation from Southern California Sources

Source	Total Vehicle Trips/Day/KSF	% Trucks	Heavy Duty Truck Trips/Day/KSF	Other Vehicle Trips/Day/KSF
WLC	1.68	12.3	0.207	1.473
NAIOP	0.99	20.8	0.206	0.784
Skechers	0.57	15.2	0.086	0.481
Moreno Valley 2013 ¹	1.624	13.4 ²	0.218	1.406

¹ Vehicle Mix Assumption for High-Cube Warehouse, Memo from Michael Lloyd to Eric Lewis, September 27, 2013.

² Although the un-weighted average reported in the Memo is 17.6%, when calculated based on a weighted average, the rate drops to 13.4%.

Exhibit C-3-6: Comparison of Trip Generation from Southern California Sources

An analysis was performed to determine if seasonality of traffic flows may be a significant factor that needs to be accounted for in the analysis. The monthly fluctuations in traffic flow on SR-60 in Moreno Valley were reviewed to determine if this was the case. The average daily traffic on SR-60 from 2011 was collected by Caltrans at the SR-60 and the Perris, Heacock, and Day interchanges and summarized by month. The average daily traffic for each individual month was calculated and compared to the annual average. The data showed the monthly fluctuations in traffic were not consistent between interchanges; in months where the traffic volumes at one interchange were above the annual average while the adjacent interchange count location was below the annual average. For example, the lowest month of the year for the SR-60/Perris interchange, January, was the highest month for the two nearby interchanges. In 10 out of 12 months the two count interchanges closest to the project (Perris Blvd. and Heacock Ave.) deviated in opposite directions from the annual average.

If this area were subject to seasonal peaking then the three interchange count locations would show similar peaking characteristics during any given month. The count data showed no such consistency; therefore, seasonal peaking of ambient traffic is not considered a significant factor for traffic analysis for the WLC (as illustrated in the Exhibit C-3-7 below).

A further analysis was performed to determine whether there may be significant seasonal peaking of truck traffic from the WLC that needs to be factored into the analysis. There are several reasons to believe this will not occur:

- When it is fully operational the WLC is expected to have 15-to-25 different tenants from a variety of economic sectors; for example the NAIOP survey found tenants in the consumer goods, pharmaceuticals, automotive products, tools, office supply, home furnishings, and building materials sectors. To the extent that these sectors have season peaks they occur at different times of the year and would tend to offset each other (i.e. a high period for one

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

tenant may be a low period for the tenant next door). This is one reason why traffic on SR-60 itself does not display seasonal peaking.

- Furthermore, the commenter's opinion that seasonal variation in truck traffic may pose significant impacts was premised on the commenter's erroneous over-estimate of the amount of truck traffic that will be generated by the WLC. To the extent that truck volumes will be smaller, the impact of any variations in truck traffic will also be smaller.

For these reasons, there is no basis for a presumption that seasonal peaking of truck traffic will create any significant impacts that have not already been identified using the trip generation rates from the ITE *Trip Generation Manual*.

The lowest month of the year for the Perris IC was the highest month for the two nearest interchanges.		In 10 out of 12 months the two count sites deviated in opposite directions from the annual average; i.e. one was higher than the annual average and the other lower.													

Exhibit C-3-7: Average Day Traffic at Three Interchanges near the WLC

Response to Comment C-3-18. The commenter asked to include a cancer burden assessment of the project's cancer risks as well as include a cancer risk map that shows the one-in-one-million cancer risk contour.

The health risk assessment contained in the DEIR was expanded in the revised analysis to include the computation of cancer population burden attributed to the project's diesel PM emissions. In this expanded assessment, the cancer burden calculation estimated cancer risks in over 2,300 individual census tracts spanning the region from Palm Springs to Los Angeles. In accordance with the OEHHHA's methodology, the cancer burden was calculated by multiplying the estimated cancer risk at each census tract centroid by the census tract populations in those census tracts where the estimated cancer risk exceeded 1 in a million. The burden estimation methodology is provided in Section 4.3.3 - Risk Assessment Methodology of the revised analysis. The results of the cancer burden estimation are shown in the discussion of FEIR Volume 2 Appendix D Section 5.2. Based on the cancer risks estimated for the 70-year exposure duration as per the Current OEHHHA Guidance, the project's toxic air contaminant emissions would result in an increased cancer burden of 0.1 individuals out of the population of 633. The SCAQMD has established a threshold for cancer burden of 0.5. The project's estimated cancer burden values do not exceed this threshold. The cancer burden impacts are not significant impacts. This analysis assumes that the use of new technology diesel engines contributes

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

to an increase in cancer risk. However, the latest research, as described in Master Response-2, demonstrates that new technology diesel exhaust does not cause cancer.

Response to Comment C-3-19. The SCAQMD staff recommends that the lead agency revise the air quality analysis and health risk assessment to include all onsite emissions sources and ensure that they are accounted for in the FEIR.

The air quality analysis, localized analysis, and health risk assessment have been revised to include these emissions sources (refer to FEIR Volume 2 Section 4.3 Air Quality).

The SCAQMD staff recommends that the lead agency prohibit the use of onsite diesel powered equipment including bio-diesel to minimize the project's operational emissions and require the use of electric equipment. As part of the FEIR, biodiesel has been excluded from the list of potential alternative fuels as a response to this comment (refer to FEIR Volume 2 Section 4.3 Air Quality).

The SCAQMD also recommends that if diesel fueled emergency generators are required for the proposed project they should be equipped with diesel particulate filters. Included as a MM 4.3.6.3B is the use of non-diesel emergency generators, which would eliminate diesel emissions from this source.

Response to Comment C-3-20. The SCAQMD requests that emissions from onsite mobile equipment be included in the regional and localized analysis. The revised air quality, health risk assessment, and greenhouse gas analysis include these emissions sources and discuss the emissions estimation assumptions (refer to FEIR Volume 2 Section 4.3 Air Quality).

Response to Comment C-3-21. The commenter asked to include consideration of the federal NO₂ 1-hour ambient air quality standard for the combined construction and operation of the project.

The federal NO₂ ambient air quality standard is addressed in the revised analysis, FEIR Volume 2 Appendix D Section 5.2, even though the federal 1-hour NO₂ standard is not currently listed in the most current version of the SCAQMD's Localized Significance Thresholds (website: <http://aqmd.gov/ceqa/handbook/signthres.pdf>). Because of the format of this standard (which is a probability-based standard over 3 years), the comparison of the project's impacts with this standard is provided for the project's operational impacts. Compliance with the standard was not provided for construction impacts because of the highly transient nature of construction, which varies substantially from day to day and place to place. Compliance determination with this standard is most appropriate for assessment of operational impacts, which are reasonably stable from one day to the next.

The commenter also questions if the annual average emission rate was used for the 1-hour analysis. Annual emission rates were not used to estimate 1-hour emissions. For construction, the estimation of the 1-hour emission rate was determined by dividing the total daily emissions by the length of the construction day, typically 10 hours. For operational mobile emission sources, the maximum one-hour emission rate was determined from the estimated afternoon peak-hour traffic vehicle trips and volumes as provided by the in the traffic impact analysis. The maximum 1-hour emission rates were used to estimate pollutant impacts for those air pollutants with averaging times of 8 hours or less. The annual average emission rates were used to estimate daily and annual air quality impacts.

Response to Comment C-3-22. The SCAQMD suggested the following construction mitigation measures, as discussed below.

Suggested Mitigation Measure	Response
Require the use of electricity from power poles rather than temporary diesel or gasoline power generators.	Partially Incorporated. MM 4.3.6.2A has been edited to include this suggestion unless physical or jurisdictional limits make use of temporary overhead power infeasible. Infeasible is where

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	physical constraints such as spanning a major roadway, freeway or flood channel would prohibit temporary overhead power, or long runs of electrical lines results in excessive voltage drops and unable to meet the power requirements, or the available power source is from SCE lines, who are not allowed by tariffs to provide power in this area of Moreno Valley, and Moreno Valley Utilities source is too far away due to voltage drops in long runs of lines.
Require the use of 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) and if the lead agency determines that 2010 model year or newer; if diesel trucks cannot be obtained the lead agency shall use trucks that meet EPA 2007 model year NOx and PM emissions requirements.	Partially Incorporated. MM 4.3.6.2A has been revised to require 2007 construction haul trucks or newer.
For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html	Already Included. The first set of off-road engine mitigation measures as recommended by the SCAQMD (Table I) suggest repowered engines with Tier 2 or Tier 3 engines. Table II discusses the percent reductions for each Tier. Table III discusses the percent reductions for retrofits from diesel particulate filters and diesel oxidation catalysts. MM 4.3.6.2A already includes a requirement of Tier 4 engines, which provides substantial reductions in pollutants. The additional retrofits as identified in Table III are generally for older pieces of equipment. Since the project will be using Tier 4 construction equipment, these equipment are newer and the retrofits would not be required.
Also, the SCAQMD staff recommends that the lead agency replace mitigation measures 4.3.6.2C (a) as follows: a) Non-VOC containing paints, sealants, adhesives, solvents, asphalt primer, and architectural coatings (where used), or pre-fabricated architectural panels shall be used in the construction of the Project to reduce VOC emissions to the maximum extent practicable.	Incorporated. This text has been added to the measure; however, the requirement to use 100 grams per Liter or less paint is retained because the wording suggested by the SCAQMD indicates “to the maximum extent practicable.” Where non-VOC paints are not available, there would need to be a restriction of the VOC content in paints that are less than the current regulations.

SCAQMD staff recommends that the lead agency replace MM 4.3.6.2A (a) and (b) with the following:

Suggested Mitigation Measure	Response
Project Start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.	Partially Included. MM 4.3.6.2A has been refined and requires that off-road diesel powered construction equipment greater than 50 horsepower meet Tier 4 standards.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.	
A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.	Partially Incorporated. A requirement that the unit's tier specification be provided is incorporated into MM 4.3.6.2A
Encourage construction contractors to apply for SCAQMD "SOON" funds. Incentives could be provided for those construction contractors who apply for SCAQMD "SOON" funds. The "SOON" program provides funds to accelerate cleanup of off-road diesel vehicles, such as heavy-duty construction equipment. More information on this program can be found at the following website: www.aqmd.gov/tao/Implementation/SOONProgram.htm	Incorporated. This measure is incorporated into MM 4.3.6.2A.

Response to Comment C-3-23. The commenter suggests the following mitigation measures.

Suggested Mitigation Measure	Response
The project should require that all tenants provide information and promote incentive programs and available alternative fueling truck technologies. This information should be updated as needed to ensure that the most recent information is available.	Incorporated. This measure is incorporated into MM 4.3.6.3B.
The lead agency should require that all future tenants apply for incentive funding (such as VIP, Carl Moyer, etc.) to upgrade their fleet. If they are awarded funding, they must also be required to use it within a reasonable period of time.	Incorporated. This measure is incorporated into MM 4.3.6.3B.

Re: Draft Environmental Impact Report / World Logistics Center Project

Dear Mr. Terell:

San Diego Gas and Electric (SDG&E) and the Southern California Gas Company (SCGC) have reviewed the Draft Environmental Impact Report for the World Logistics Center (WLC) Project and would like to submit the following comments. SDG&E and SCGC own a total of 194 acres of land immediately south of the Specific Plan site. SDG&E operates a natural gas compressor plant, known as the Moreno Compressor Station, on 19 acres in the south-central portion of the site. The SCGC operates a metering and valve station on two separate parcels (totalling 1.5 acres) in the south-central portion of the site south of Alessandro Boulevard along existing Virginia Street. The World Logistics site contains a variety of overhead and underground utility lines associated with oil, natural gas, and electrical service.

1

SPECIFIC COMMENTS

1. The DEIR concludes that noise impacts from pipeline blow-down events on planned land uses within WLC site would need to be mitigated through a combination of setbacks and sound attenuation devices installed at SCGC's facility. SDG&E and SCGC request that language be added to the EIR stating that the developer shall be responsible for mitigating any impacts associated with locating development within 500 feet of the blow down events that would occur at SDG&E and SCGC facilities.

In addition, SDG&E and SCGC requests that the following language be added to mitigation measure 4.12.6.4A to clarify responsibility for installation of any sound attenuation facilities:

Mitigation Measures. Operation of the proposed WLC project could result in exposure of people to noise levels as high as 130 dBA or greater during SCGC blow-down events. The following measure would reduce long-term utility related noise impacts associated with the proposed WLC project:

4.12.6.4A Prior to the issuance of building permits for projects within 500 feet of the SCGC and SDG&E facilities, documentation shall be submitted to the City confirming that sound attenuation devices or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events area available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund any sound attenuation improvements to the blow-down

2

World Logistics Center
Draft Environmental Impact Report Comments
April, 2013
Page 2 of 2

facilities required by this measure. It shall also be the responsibility of the developer to coordinate with SDG&E and/or SCGC regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the SDG&E compressor station or the SCGC pipelines. This measure shall be implemented to the satisfaction of the City Planning Official.

2

2. As discussed in Section 3.4.6.3 of the DEIR, relocation of natural gas transmission lines within the proposed WLC project into public street rights - of-way and easements will be necessary to support site development and grading of the WLC project. SDG&E and SCGC request that language be added to the DEIR stating that any relocations of utilities necessary to implement the World Logistics project will be the responsibility of the developer. SCGC will work with the project proponent to relocate the pipeline(s) to a mutually agreeable location at the project proponent's expense.

3

3. As discussed in Chapter 3 of the DEIR, a general plan amendment and zone change covering 3,814 acres, which will designate 1,084 acres of land for Open Space (CDFW and SDG&E properties), 20 acres for Public Facilities (SDG&E and SCGC properties), and 2,710 acres for the WLC Specific Plan is proposed as a part of the WLC Project. SDG&E and SCGC requests that language be added to the DEIR including assurances that SDG&E and SCGC property designated as open space in accordance with the proposed general plan amendment and zone change would not be considered permanently set aside for habitat preservation. SDG&E and SCGC need to retain the ability to implement projects on SDG&E and SCGC property.

cc: Lea Petersen
Dave Stallings
Devin Zornizer

RESPONSES TO LETTER C-4

Sempra Energy

Response to Comment C-4-1. The Company has accurately summarized the project conditions that are most relevant to natural gas facilities.

Response to Comment C-4-2. Southern California Gas Company (SDG&E) and SCGC request that language be added to the EIR stating that the developer shall be responsible for mitigating any impacts associated with locating development within 500 feet of the blow down events that would occur at SDG&E and SCGC facilities. Comments and changes to Mitigation Measure (MM) 4.12.6.4A as suggested by SDG&E and SCGC have been incorporated as follows:

4.12.6.4A Prior to the issuance of building permits for projects within ~~500~~ 1,300 feet of the Southern California Gas Company (SCGC) and San Diego Gas and Electric (SDG&E) blow-down facilities, documentation shall be submitted to the City confirming that sound attenuation devices and/or improvements for the blow-down facilities providing at least a 40 dB reduction in noise levels during blow-down events are available and will be installed for all planned blow-down events. It shall be the responsibility of the developer to fund all sound attenuation improvements to the blow-down facilities required by this measure. It shall also be the responsibility of the developer to coordinate with San Diego Gas and Electric and/or Southern California Gas Company regarding the installation of any sound attenuation devices or improvements on the blow-down facilities at either the San Diego Gas and Electric compressor station or the Southern California Gas Company pipelines. This measure shall be implemented to the satisfaction of the City ~~Planning~~ Official Land Management Division (per Noise Study MM N-11, pg.65).

Response to Comment C-4-3. SDG&E and SCGC request that language be added to the DEIR stating that any relocations of utilities necessary to implement the WLC project will be the responsibility of the developer. The comment does not raise an issue with the adequacy of the DEIR. No response is required. The project proponent will work with SCGC to relocate the pipeline(s) to a mutually agreeable location. Any relocation of existing pipelines will be done in accordance with the existing pipeline easement documents.

Response to Comment C-4-4. SDG&E and SCGC requests that language be added to the DEIR including assurances that SDG&E and SCGC property designated as open space in accordance with the proposed general plan amendment and zone change would not be considered permanently set aside for habitat preservation. The designation of Open Space (OS) with the WLC proposed General Plan Amendment and Zone Change, over property owned by SDG&E or SCGC, is not for habitat preservation nor is the WLC receiving any benefit or credits for the OS designation over SDG&E or SCGC property. The City Municipal Code Table 9.02.020-1 lists several permitted uses within the OS designation which include agricultural and public facilities.

D. LETTERS FROM COUNTY DEPARTMENTS/AGENCIES

Attention: Mark Gross, AICP
Ladies and Gentlemen: Senior Planner

DEIR
Re: PA 12-0010, 11, 12, 13, 14, 15
World Logistics Center

The District does not normally recommend conditions for land divisions or other land use cases in incorporated cities. The District also does not plan check city land use cases, or provide State Division of Real Estate letters or other flood hazard reports for such cases. District comments/recommendations for such cases are normally limited to items of specific interest to the District including District Master Drainage Plan facilities, other regional flood control and drainage facilities which could be considered a logical component or extension of a master plan system, and District Area Drainage Plan fees (development mitigation fees). In addition, information of a general nature is provided.

The District has not reviewed the proposed project in detail and the following checked comments do not in any way constitute or imply District approval or endorsement of the proposed project with respect to flood hazard, public health and safety or any other such issue:

- ☐ No comment.
- ☐ This project would not be impacted by District Master Drainage Plan facilities nor are other facilities of regional interest proposed.
- ☐ This project involves District Master Plan facilities. The District will accept ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.
- ☒ This project proposes channels, storm drains 36 inches or larger in diameter or other facilities that could be considered regional in nature and/or a logical extension of the adopted Moreno Master Drainage Plan. The District would consider accepting ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.
- ☒ This project is located within the limits of the District's Moreno Area Drainage Plan for which drainage fees have been adopted; applicable fees should be paid by cashier's check or money order only to the Flood Control District or City prior to issuance of grading permits. Fees to be paid should be at the rate in effect at the time of issuance of the actual permit.
- ☒ An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities. For further information, contact the District's encroachment permit section at 951.955.1266.
- ☒ The District's previous comments are still valid. The Moreno MBP is currently being revised.

GENERAL INFORMATION

This project may require a National Pollutant Discharge Elimination System (NPDES) permit from the State Water Resources Control Board. Clearance for grading, recordation or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.

If this project involves a Federal Emergency Management Agency (FEMA) mapped flood plain, then the City should require the applicant to provide all studies, calculations, plans and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation or other final approval of the project, and a Letter of Map Revision (LOMR) prior to occupancy.

If a natural watercourse or mapped flood plain is impacted by this project, the City should require the applicant to obtain a Section 1602 Agreement from the California Department of Fish and Game and a Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.

Very truly yours,

HENRY OLIVO
Engineering Project Manager

Date: 3/25/2013

EWR

RESPONSES TO LETTER D-1

Riverside County Flood Control and Water Conservation District

Response to Comment D-1-1. It is noted that Riverside County Flood Control and Water Conservation District (District) comments are limited to items of specific interest to the District which is the Moreno Area Drainage Plan. It is also noted that the District has not reviewed the proposed project in detail nor does the District imply approval or endorsement of the project.

Response to Comment D-1-2. Draft Environmental Impact Report (DEIR) Section 4.9.6.1 *Drainage Pattern and Capacity Related Impacts*, discusses potential drainage facilities that are 36-inches and larger. At the time of final design, the project developer will coordinate with the District to discuss the District accepting ownership of these facilities. Facilities to be constructed that are agreed to be accepted and owned by the District will be constructed to District standards and appropriate plan checks, inspections and fees will be paid.

Response to Comment D-1-3. Portions of the World Logistics Center (WLC) project are in the Moreno Area Drainage Plan. Applicable fees will be paid prior to issuance of grading permits at the rate in effect at the time of issuance of the permit.

Response to Comment D-1-4. Encroachment permits will be obtained for any work occurring within the District's right-of-way.

Response to Comment D-1-5. It is noted that the Moreno Master Drainage Plan is currently being revised.

Response to Comment D-1-6. The project developer will comply with appropriate National Pollutant Discharge Elimination System permits and submit the Notice of Intent prior to grading. The WLC project is not within a mapped Federal Emergency Management Agency floodplain. The project developer will obtain appropriate 404 and 1602 agreements and a 401 certification from the United States Army Corps of Engineers, the California Department of Fish and Wildlife, and the Regional Water Quality Control Board.

**RE: NOTICE OF AVAILABILITY OF DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE
 WORLD LOGISTICS CENTER PROJECT**

Dear Mr. Gross,

Thank you for the opportunity to review the Draft Environmental Impact Report for The World Logistics Center Project (DEIR). The project proposes development of 3,918 acres allowing for approximately 41.4 million square feet of high-cube logistics warehouse distribution uses and 200,000 square feet of warehouse related uses. The Transportation and Land Management Agency (TLMA) has reviewed the DEIR and has the following comments:

Transportation:

As noted in the DEIR (page 4.15-24), the City's General Plan calls for a realignment of Alessandro Boulevard and a relocation of its intersection with Gilman Springs Road. Similarly, the project intends to connect Eucalyptus Avenue to Gilman Springs Road. TLMA requests that the City coordinate the realignments and connections of Alessandro Boulevard and Eucalyptus Avenue to Gilman Springs Road with the County.

Under the discussion of Project Direct Impacts of Road Sections in the DEIR and its traffic study, Gilman Springs Road between SR-60 and Bridge Street is identified as being impacted by the project. The mitigation identified to bring Gilman Springs Road to an acceptable level of service is to widen the road to 4-lanes. The DEIR indicates the project's fair share will be paid as mitigation. However, under the City's General Plan Circulation Element, Gilman Springs Road is identified as a 6-lane Divided Major Arterial.

The County is currently working with the City of Moreno Valley to implement safety improvements on Gilman Springs Road. TLMA staff requests that the City require the World Logistics Center project to make its half-width improvements to Gilman Springs Road (3 lanes to full width), plus reconstruct the northbound lane in the County jurisdiction to match grade in order to be able to fully stripe the road to 4 lanes, expanding upon the work being done now by the County and Moreno Valley.

For Intersection Direct Impacts under the *Existing Plus Project* scenario, the DEIR and traffic study indicate the project as having a direct impact on the following intersections:

Bridge Street at Ramona Expressway
 Gilman Springs Road at Bridge Street
 Both Ramps of SR-79 (Sanderson Avenue) at Gilman Springs Road
 Redlands Boulevard at San Timoteo Canyon Road

For each of the impacted intersections described above the improvement identified to reduce the impact to less than significant is through the installation of a traffic signal and associated street improvements. The City will require the developer to pay for the improvements in the form of fair share fees. RCTD requests that the mitigation fees be paid to the County at the time of building permit issuance, in order to mitigate project impacts, since these intersections are within County and/or Caltrans jurisdiction.

Air Quality:

The South Coast Air Basin (SCAB) is designated by the Environmental Protection Agency (EPA) as a nonattainment basin for ozone, nitrogen dioxide, PM10, and PM2.5. The goal of the 2012 Air Quality Management Plan adopted by the AQMD is to expand upon the progress made over the last 35 years in air quality management and improvements within the SCAB. The Federal nonattainment status, specifically for ozone and ozone precursors, has resulted in significant efforts undertaken throughout the basin to improve the regional air quality.

In order to reduce project air quality impacts, TLMA recommends that the City require that heavy duty trucks that will serve the project meet the Tier IV EPA emissions standards that have been adopted by AQMD, and work with AQMD to implement these standards at the earliest opportunity.

We also recommend that electric charging, CNG or LNG fueling stations be constructed to provide a meaningful alternative fuel infrastructure to serve the large truck fleet and on-site equipment that will be generated by this project.

If you have any questions or concerns please feel free to contact me at (951) 955-6749.

Sincerely,

Juan C. Perez
 Director of Transportation and Land Management

Cc: Marion Ashley, 5th District Supervisor
 Carolyn Syms Luna, Planning Director
 Frank Coyle, Planning Deputy Director
 Patricia Romo, Transportation Assistant Director
 Farah Khorashadi, Engineering Division Manager

JCP:fk/ar

RESPONSES TO LETTER D-2

Riverside County Transportation and Land Management Agency (TLMA)

Response to Comment D-2-1. The commenter notes that the World Logistics Center (WLC) proposes to develop 3,918 acres allowing for 41.1 million square feet of high-cube warehouse and 200,000 square feet of warehouse related uses.

The correct acreage is 3,714 (see Table 20 in the Transportation Impact Assessment (TIA)). It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment D-2-2. The commenter notes Gilman Springs Road is identified as 6-lane divided major arterial in City's General Plan and requests the City require the WLC to construct a half-width of the road (i.e. 3 southbound lanes) and reconstruct the northbound lane. The commenter also requests the Project's fair share contribution to improvements to four County intersections be collected at the time of building permit issuance.

The developer will pay for three southbound lanes and one northbound lane on Gilman Springs Road in accordance with Moreno Valley General Plan Policy 5.5.7. The developer will receive credit for the cost in excess of his fair share contribution. Please refer to revised TIA Chapter 11, Section E, sub-section on Road Section Direct Impacts (Final Environmental Impact Report (FEIR) Volume 2 Appendix L).

At present, the only mechanism for collecting payments from a developer for improvements outside the City of Moreno Valley is the Transportation Uniform Mitigation Fee (TUMF) program. Please refer to Mitigation Measure (MM) 4.15.7.4E in FEIR Volume 2 (based on MM Trans-5 in TIA Chapter 11, Section G (FEIR Volume 2 Appendix L). MM 4.15.7.4E, as revised in the FEIR, requires that the developer pay its fair share of the cost of constructing the traffic improvements required to mitigate the project's traffic impacts, identified in EIR Tables 4.15.AT through 4.15.AY, for intersections and road segments outside of the City's jurisdiction (i.e., under the jurisdiction of other cities, the County and Caltrans) in order to mitigate the identified programmatic impacts to less than significant levels. The fair share payment requirement shall be imposed as a condition of plot plan approval for each building within the project, and no certificate of occupancy for a building within the project shall be issued until the fair share payment for that building has been paid.

In addition, the EIR includes MM 4.15.7.F requiring that the City participate in a multi-jurisdictional effort with Caltrans and adjacent cities to develop a study to identify fair-share contribution funding sources to supplement other regional and State funding sources necessary to implement the State facility and extra-territorial improvements identified in the EIR. The EIR also includes MM 4.15.7.G requiring that the City coordinate with WRCOG with the goal of shifting TUMF funding priorities so they align with the improvements identified by the City and in the proposed project's TIA and EIR. Lastly, the EIR includes MM 4.15.7.H requiring that the City work with the WLCSP development and other jurisdictions to coordinate the funding and installation of intersection and roadway improvements outside of the City's jurisdiction. With these MMs, a process has been established that will provide the necessary first step towards the eventual multi-jurisdictional coordination needed to implement the traffic improvements that are outside of the City's jurisdiction. Even with such coordination, it is appropriate for the City to consider impacts to these State and extra-territorial transportation facilities significant and unavoidable.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment D-2-3. The TLM recommends the following measures. Please see the Mitigation Monitoring Reporting Program in FEIR Volume 1 for a list of the current mitigation measures.

Suggested Mitigation Measure	Response
<p>The City shall require that heavy-duty trucks that serve the project meet the Tier IV EPA emissions standards that have been adopted by AQMD, and work with AQMD to implement these standards at the earliest opportunity.</p>	<p>The commenter has incorrect terminology. The standards have not been adopted by the South Coast Air Quality Management District (SCAQMD). The U.S. Environmental Protection Agency (EPA) Tier 4 emissions standards apply to non-road engines, such as construction equipment (40 CFR, Section 1039). MM 4.3.6.2A requires Tier 4 construction off-road equipment.</p> <p>The EPA's Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements were phased in beginning in 2007 and ending in 2010. A PM emissions standard of 0.01 g/bhp-hr took full effect in 2007. Standards for NOx and non-methane hydrocarbons of 0.20 g/bhp-hr and 0.14 g/bhp-hr, respectively would be phased in between 2007 and 2010. Fifty percent of sales in 2007 needed to comply and 100 percent of sales in 2010.</p> <p>The DEIR included as a project design feature that the diesel trucks would incorporate the 2010 standards. This was changed from a project design feature to a mitigation measure (MM 4.3.6.3B) in the FEIR (refer to FEIR Volume 2 Section 4.3 Air Quality).</p>
<p>Electric charging, CNG or LNG fueling stations should be constructed to provide a meaningful alternative fuel infrastructure to serve the large truck fleet and onsite equipment.</p>	<p>Already Included. MM 4.3.6.3C requires an onsite alternative fueling station and MM 4.3.6.4A requires electric vehicle charging at each building. In addition, a project design feature in the Specific Plan (Section 12.3 of the WLC Specific Plan (SP) requires onsite equipment to use alternative fuel.</p>

RECEIVED

APR 10 2013

CITY OF MORENO VALLEY
Planning Division

SUBJECT: Comments on the World Logistics Center Project Draft Environmental Impact Report (SCH #2012021045)

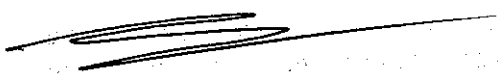

Dear Mr. Gross:

The City of Perris appreciates the opportunity to comment on the Notice of Availability for the proposed Draft Environmental Impact Report (EIR) regarding the World Logistics Center Specific Plan involving 41 million square feet of high-cube logistic uses located in the northeasterly area of the City of Moreno Valley. The project boundary is approximately five miles northeast of the City of Perris' northern limits. The City of Perris Planning Division does not have any specific environmental issues or mitigation alternatives to provide at this time.

The City does, however, have general concerns with the traffic study conclusion, which indicates that Highway 60 is projected to operate at a failing level of service but does not identify a mechanism to remedy this situation beyond TUMF and DIF. The City of Perris is concerned about congestion on the freeway, and whether it will lead drivers to divert onto surface streets, using routes such as Perris Boulevard, Evans Road and Ramona Expressway to connect to the I-215 Freeway. As such, the City of Perris requests an opportunity to review and comment on the Final EIR and the conclusion traffic study for the project.

The City of Perris looks forward to the opportunity to review the Final EIR and related supporting traffic study documents. Please include the City of Perris on any future mailing lists addressed to Clara Miramontes, Planning Manager, regarding these documents as well as future notifications of meetings/public hearings associated with the project and subsequent development implementation of the Specific Plan. The City of Perris would like to determine whether this project or subsequent developments will have an impact on Perris streets, and if mitigation alternatives should be considered. If you have any questions or concerns, please do not hesitate to contact me at (951) 943-5003, extension 257.

Sincerely,

Kenneth Phung
Interim Planning Manager

Cc: Richard Belmudez, City Manager
Ron Carr, Assistant City Manager
Eric Dunn, City Attorney
Habib Motlagh, City Engineer
Clara Miramontes, Planning Manager

RESPONSES TO LETTER E-1

City of Perris

Response to Comment E-1-1. The commenter has accurately summarized the indicated project characteristics and the City of Moreno Valley acknowledges that the City of Perris has no comments regarding environmental impacts, mitigation, or alternatives at this time. It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment E-1-2. The commenter expresses concern about congestion on freeway leading to traffic diverted onto city streets (in City of Perris) and that no mechanism for correcting this has been identified beyond Transportation Uniform Mitigation Fee (TUMF) and Development Impact Fees (DIF).

At present, the only mechanism for collecting payments from a developer for improvements outside the City of Moreno Valley is the TUMF program. MM 4.15.7.4E, as revised in the FEIR, Volume 2 Revised DEIR,, requires that the developer pay its fair share of the cost of constructing the traffic improvements required to mitigate the project's traffic impacts, identified in EIR Tables 4.15.AT through 4.15.AY, for intersections and road segments outside of the City's jurisdiction (i.e., under the jurisdiction of other cities, the County and Caltrans) in order to mitigate the identified programmatic impacts to less than significant levels.

Response to Comment E-1-3. As a commenting responsible agency, the City of Perris will be sent a copy of the FEIR with all responses to comments and updated technical studies, and a marked up copy of the Draft Environmental Impact Report (DEIR) indicating any additions or changes as a result of the responses to comments.

Letter E-2A: City of Riverside (April 8, 2013)

Community Development
Department
Planning Division

April 8, 2013

Mark Gross, AICP
City of Moreno Valley
Community and Economic Development Department - Planning Division
14177 Frederick Street
Moreno Valley, CA 92553

SUBJECT: World Logistics Center Project - Draft Environmental Impact Report (SCH# 2012021045)

Dear Mr. Gross:

The City of Riverside ("Riverside") appreciates the opportunity to comment on the World Logistics Center ("WLC") Draft Environmental Impact Report ("Draft EIR" or "DEIR") prepared by the City of Moreno Valley ("City"). The proposed World Logistics Center Project analyzed in the Draft EIR includes 41.6 million square feet of new logistics development and the associated infrastructure on 3,918 acres ("Proposed Project" or "Project"). The Draft EIR concludes that the Proposed Project would have numerous significant and unavoidable impacts to Traffic and Circulation, Aesthetics, Agriculture, Air Quality, Cultural Resources, Greenhouse Gases and Global Climate Change, Land Use and Planning, and Noise.

While the Proposed Project would undoubtedly provide economic benefits to the region, Riverside would like to ensure that health of its citizens and the environment have been adequately considered and mitigated in the Draft EIR. As described in greater detail below, Riverside has serious concerns regarding the adequacy of several analyses, particularly the traffic analysis. The Proposed Project will generate approximately 71,000 daily trips, many of which will travel through the City of Riverside. Riverside is concerned that this project will produce cut-through traffic on Riverside's road system, particularly Alessandro Blvd. and Van Buren Blvd., as freeways become overburdened by significant increases in truck traffic.

The Draft EIR uses incorrect and internally inconsistent growth assumptions for the traffic analysis and only accounts for a small fraction of the project's trip generation. Notwithstanding these errors, the Draft EIR concludes there would be numerous significant and unavoidable impacts to many of the intersections, some of which would increase delay at intersections by a factor of 40. Riverside believes there are numerous additional feasible mitigation measures

1
2
3

which should be made conditions of approval. For the reasons described in greater detail below and the attached comment letter from Riverside's Traffic Consultants, Linscott, Law & Greenspan, Engineers (Attachment 1), the Draft EIR should be revised and recirculated for additional public/agency review.

TRAFFIC

1. Traffic Methodology

a. The Draft EIR Traffic Impact Analysis Uses Incorrect and Inconsistent Cumulative Growth Assumptions

The Draft EIR Traffic Impact analysis uses incorrect and internally inconsistent cumulative growth assumptions which have understated the project's traffic impacts. Because the project's traffic impacts have been understated, all DEIR impact analyses that were based upon the traffic analysis have been understated as well, including but not limited to, air quality, greenhouse gas, and the noise analysis. (DEIR Page 4.15-30.)

The traffic analysis on page 4.15-28 of the Draft EIR states:

Per the City of Moreno Valley Traffic Impact Analysis Preparation Guideline ["TIAPG"] ...opening year cumulative traffic volumes were developed by adding a 2 percent per annum growth rate to existing baseline traffic volumes; therefore, a total ambient growth of 12 percent of the existing baseline conditions was added to develop opening year cumulative conditions.

This language is based upon the language in Exhibit B of the TIAPG which states "...assume growth rate of 2% per year..." However, the use of 12% (6 years \times 2%) for total growth over the six year period is an incorrect value for an annual 2% growth rate. If the analysis had actually applied the stated 2% annual growth rate, it should have assumed a total growth rate of 12.62% (i.e., 1.02^6) in the year 2017 in comparison to 2012. The analysis, therefore, understates the cumulative traffic impacts. Furthermore, the 2% annual growth assumption is internally inconsistent with the growth assumptions from the City's General Plan which the Draft EIR relies upon. Draft EIR Section 2.10.2 states:

Table 2.D summarizes the cumulative growth information from the Final Program EIR for the City General Plan Update from July 2006 (Section 7, Cumulative Impacts). Table 2.D shows that the City expects to grow at an average annual rate of 2–3 percent from 2000 to 2030. (Emphasis added.)

Table 2-D in fact shows an average annual population growth rate in the City of Moreno Valley of 2.24% and average annual household growth rate of 2.75%. Regional growth rate projections for Riverside County are also shown at 2.33%. Even assuming the smaller 2.33% average annual regional growth rate provided in this table, this yields a 14.82% (1.0233^6) growth rate in the year 2017 in comparison to 2012, rather than the 12% growth rate assumed

in the traffic analysis. Because the cumulative traffic analysis used the incorrect growth assumptions, the cumulative impacts of the project have been understated. The traffic analysis should, therefore, be revised to use internally consistent annual growth assumptions.

b. The Traffic Analysis Fails to Address the Project's Trip Peaking Characteristics Outside of the AM and PM Peak Hours

The traffic analysis in Draft EIR Section 4.15.6 inappropriately relies upon an a.m. and p.m. peak hour analysis,¹ based upon the existing peak hours in the City. The Draft EIR should be revised to provide additional traffic analyses: (1) based upon the project's peak trip generation time periods, and (2) based upon the ADT ("Average Daily Traffic") methodology. The Draft EIR concludes that "[t]he project is estimated to generate a net total of approximately 71,085 daily trips with approximately 4,672 occurring during a.m. peak hour and 5,101 occurring during the p.m. peak hour." (Draft EIR page 4.15-31.) In fact, the Draft EIR recognizes that "The WLC would create approximately 25,000 new jobs; nearly doubling the number of jobs in Moreno Valley," meaning that the project will be the single largest trip generator in the City. (Draft EIR page 4.15-32.) While, an a.m. and p.m. peak hour analysis might be appropriate in other contexts, it is not appropriate here given the nature and magnitude of this project. Use of the traditional a.m. and p.m. peak hour analysis has resulted in an understatement of the project's impacts. As described in greater detail below, the project will be the largest single trip generator in the City and will likely result in a new peak traffic hour which has not been analyzed in the Draft EIR.

The current traffic analysis has only analyzed 13.7% of the project's trip generation (i.e., trip generation in the a.m. and p.m. peak hours), the remaining 86.3% (61,312 trips), which occurs outside these peak hours, has not been analyzed. (Draft EIR page 4.15-31.) Just 13.7% of the project trips are sufficient to nearly double the delay at numerous intersections and result in a nearly a fortyfold increase at others. If only 13.7% of the project's trips can result in nearly a fortyfold increase in delay at intersections, imagine the amount of delay that would occur if the additional 61,312 trips had been accounted for in the traffic impact analysis.

For example, Table 4.15.AD-1 indicates that Intersection 10 (Redlands Blvd./Locust Ave.) is currently operating at a delay of 26.7 seconds. The project will result in a delay greater than 50 seconds (Level of Service ("LOS") F) at this intersection during the a.m. peak hour; at a minimum, doubling the delay. (Similar intersections would see a doubling of their delay during the a.m. peak hour in the 2012 scenarios, including Intersections 13, 14, 20, 46, 123, 124, 132, 133, 134.) In fact, intersection 27 (Redlands Blvd./Cactus Ave.) would result in a nearly fivefold increase in the delay during the a.m. peak hour and a nearly fortyfold increase during the p.m. peak hour in the 2012 scenarios. (Draft EIR Table 4.15-AD-2.) Similar increases are shown in

¹ While the time periods associated with the a.m. and p.m. peak hours do not appear to be included in the text of the Section 4.15 of the Draft EIR, Figure 28 in Appendix I suggests the a.m. peak hour occurs from 6 a.m. to 9 a.m., and the p.m. peak hour occurs from 3 p.m. to 6 p.m.

the 2017 scenario a.m. peak hour analysis [including but not limited to Intersections 12, 27, 122], the 2022 scenario am peak hour analysis [including but not limited to Intersections IN-6, IN-12, IN-19, IN-27, IN-19, IN-27, IN-46, IN-135], and the General Plan Buildout analysis [including but not limited to Intersections IN-6, IN-10, IN-11, IN-12, IN-18, IN-19, IN-27, IN-35, IN-132].

As described in the previous paragraph, just 13.7% of the project's daily trip generation (combined a.m. and p.m. peak hour trip generation) constitutes the primary source of trip generation and delay at numerous intersections. Typical² logistics centers have a truck trip maximum peak hour well outside of the a.m. and p.m. peak hours analyzed in the Draft EIR; from approximately 1 p.m. to 2 p.m. (Draft EIR Appendix I, Figure 28.) Furthermore, there are two additional smaller peak time periods from approximately 4 a.m. to 6 a.m. and from 10 p.m. to 12 a.m. Given that (1) 86.3% of the project's trip generation occurs outside the peak hours and have not been taken into account in the impact analysis and (2) the project will be the single largest trip generator in the City of Moreno Valley, it is important for the City to analyze the impacts of the *project's* peak hour, rather than the *traditional* peak hours which occurred before the project's implementation.

In addition to the traffic analysis based upon the Project's peak hours, an ADT analysis should also be included in the Draft EIR.³ The ADT methodology provides a total daily average of the various roadway segments' capacity. This would allow the City to determine whether the roadway segments have sufficient capacity for 100% of the Project's trip generation, rather than just 13.7.

The Draft EIR should be revised to (1) explain the project's traffic peaking characteristics assumptions, (2) the rationale for those assumptions, (3) additional traffic analysis that is based upon the Project's peak hours, (4) an ADT analysis, and (5) incorporation of feasible mitigation measures. Upon completion of these revisions, the Draft EIR should be recirculated for public and agency review. Additional comments regarding peaking characteristics and suggested methodology are included in the attached comments from Riverside's Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.)

c. The Draft EIR Fails to Disclose the Project's Impacts at Numerous Intersections

The Draft EIR measures the Project's traffic impacts based upon the delay caused by the Project. However, in many instances, the Draft EIR places an artificial numerical ceiling on the analysis and states that the delay is "> 50" seconds without the project, and "> 50" seconds with the project (e.g., Table 4.15.A1-1 [Intersections 9, 13, 20, 36, 45, 62, 103, 124, 125, 132,

² The Draft EIR does not actually provide the traffic peaking characteristics assumptions for the World Logistics Center Project. This information should be included in the DEIR and recirculated for public/agency review and comment.

³ As noted in the Riverside County Transportation Department Traffic Impact Analysis Preparation Guidelines (April 2008), ADT analysis is appropriate where "...intersection analyses are not the controlling factor or for general planning purposes." (Page 3.)

133, 134, 135, 136, etc.], Table 4.15.A1-2 [Intersections 10, 13, 20, 45, 60, 74, 94, 95, 122, 124, 125, 132, 133, 134, 135, 136, etc.]). This type of analysis fails to disclose the project's traffic impacts. The courts have held that a lead agency cannot travel the "legally impermissible easy road to CEQA compliance" by "simply labeling the effect 'significant' without accompanying analysis of the project's impact." (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners of the City of Oakland* (2001) 91 Cal.App.4th 1344, 1371.) Yet this is precisely what has been done here. The public and decision makers have no way of ascertaining whether the project is resulting in an increase or decrease in delay in these situations, or the severity of the change in delay. The traffic analysis should be revised to eliminate this artificial ceiling and recirculated for public/agency review.

d. The Draft EIR Traffic Impact Analysis Uses an Incorrect Geographic Scope

The Draft EIR artificially limits the geographic scope of the traffic analysis. As described in greater detail below, the analysis stops short of analyzing the impacts of routes to the Port of Los Angeles/Long Beach, and eliminates a huge portion of the analysis along Highway 215. The geographic scope of the traffic analysis should be revised.

CEQA Guidelines Section 15130(b)(3) states that "Lead agencies should define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic limitation used." The only discussion of the geographic scope of the traffic analysis is provided on Draft EIR page 4.15-2 through 4. While the discussion explains that surface street analysis was limited to streets where the project would "add 50 or more peak hour trips,"⁴ no such explanation was provided for the freeway analysis. The geographic scope of the freeway segment analysis is shown in Draft EIR Figure 4.15.3 but no rationale is provided for its selection.

The Draft EIR acknowledges that "The project would be bringing cargo containers from the Port of Los Angeles or the Port of Long Beach ["Ports"]" (Draft EIR page 4.7-43), however, the geographic scope of the freeway segment analysis stops well before the Port of Los Angeles/Long Beach, by nearly 34 miles (by line of site). It is reasonably foreseeable that these truck trips will drive to the Ports, therefore, the Draft EIR should expand the geographic scope of the traffic analysis to include freeway segments to the Ports.

It is unclear why the geographic scope of the freeway segment analysis did not include portions of the 215 between the 60 to the north and the 74 to the south (see DEIR Figure 4.15.3). Freeway segments along this southern portion of the freeway are significantly impacted; for example freeway segment F-70 on the 215 (DEIR Table 4.15.AK-2). There is a high likelihood other components of the freeway system will be significantly impacted, but these impacts have

⁴ As noted in the previous Section to this comment letter, Riverside believes that supplemental analysis should also be provided based upon the project's peak traffic hours rather than a.m. and p.m. peak hours. Given that the geographic scope of the surface street analysis was based upon the a.m. and p.m. peak hour trip generation, the geographic scope of the project's peak analysis should also be revised based upon 50 or more peak hour trips for the project.

not been addressed because they have been inexplicably left out of the analysis by artificially limiting the geographic scope.

We request that the geographic scope of the traffic analyses be revised, consistent with the discussion provided above and recirculated for public and agency review. Additional comments regarding geographic scope are included in the attached comments from Riverside's Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.)

e. The Draft EIR Fails to Disclose the Cumulative Transportation Improvements

While the Draft EIR purports to use growth projections for the cumulative analysis, as described earlier in this letter, the analysis also partially relies upon a list of projects approach, as it incorporates a number of specific future roadway improvements. For example, Draft EIR Section 4.15.3.1 states that the cumulative future year scenarios (including 2017, 2022, and 2035), include "improvements funded through local and regional transportation mitigation fee programs..." However, no specific regional roadway improvements are identified in the Draft EIR. This approach fails to comply with the requirements of CEQA Guidelines Section 15130(b)(1)(A). These roadway improvement assumptions should be identified, including the year these improvements will be completed and their funding sources.

Additional comments regarding cumulative transportation improvements are included in the attached comments from Riverside's Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.)

f. The Draft EIR Fails to Disclose the Trip Distribution Assumptions

While CEQA permits the use of reasonable assumptions, those assumptions must be based upon substantial evidence. (See Pub. Resources Code § 21080(e).) The Draft EIR states that "[t]he proposed project's trip distribution was developed for both passenger cars and trucks." (Draft EIR page 4.15-31.) While a general qualitative description of these assumptions is provided in the Draft EIR, none of the specific assumptions or supporting evidence is included.

For example, the Draft EIR page 4.15-33 states that "...all trucks must use established truck routes within the City of Moreno Valley..." however, no description of these established truck routes or their destinations (with the exception of the Ports) is provided in the Draft EIR, nor is this information provided in Appendix L. Detailed trip distribution assumptions should be incorporated into the Draft EIR. The Draft EIR should also be revised to account for trip diversions when intersections and roadway segments become so congested that individuals re-route. For example, the Draft EIR states that one intersection will have an average delay of 862.9 seconds (14.4 minutes). (See Draft EIR Table 4.15-AD-2.) Individual drivers are unlikely to continue the use of routes which have a 14 minute delay for an individual intersection.

Additional comments regarding trip distribution assumptions and diversions are included in the attached comments from Riverside's Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.)

2. Alternatives' Analysis of Traffic Impacts

a. The Draft EIR Alternatives' Analysis Provides an Insufficient Level of Detail

The Draft EIR provides inadequate analysis of the alternatives' impacts to traffic. CEQA Guidelines Section 15126.6(d) requires the alternatives analysis to "...include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." However, very little information is provided regarding the alternatives' significant traffic impacts.

For example, the No Project/Existing General Plan analysis (Draft EIR page 6-19) provides the total average daily trip generation for each alternative and notes "[i]t is reasonable to assume that an increase of 25 percent of traffic trips would increase traffic on local roadways and intersections." Such an assumption is not reasonable for these alternatives because the Proposed Project's traffic impact analysis is based upon unique trip distribution assumptions for a logistics center. As discussed on Draft EIR page 4.15-32:

The truck trip distribution patterns have been developed based on the anticipated travel patterns for the proposed project's high-cube logistics warehousing trucks. Since the internal trips, the port-related trips, and the majority of external trips (all but those on I-10) use routes west of the project site, it is anticipated that a large majority of the WLC truck traffic will be oriented to the west of the project, with a much smaller amount to and from the east.

These trip distribution assumptions are not applicable to residential/mixed-use/retail-uses included in the existing general plan alternative, and the other types of uses proposed in the various alternatives. These different uses will have vastly different peaking characteristics and distribution patterns (i.e., residential uses are unlikely to be driving to the Ports). While some intersections may be increased due to higher trip generation under this existing general plan alternative, other significantly impacted intersections/segments/freeways may be vastly improved because of the change in likely trip destinations. The level of detail provided in the analysis is insufficient to allow the public and decision makers the ability to determine which traffic impacts would be reduced by the selection of the various alternatives. The Alternatives' traffic analysis should be revised to fully describe the levels of service and delay for individual intersections/segments/freeways.

3. Traffic Mitigation Measures

The Proposed project creates numerous significant traffic impacts. For example, under the 2035 scenario the project would result in significant impacts at 39 intersections, 2 roadway segments, 53 freeway segments, and 15 freeway weaving segments. (Draft EIR Section 4.15.6.) While Section 4.15.7 contains discussion of several mitigation measures, many of these mitigation measures are dismissed as "infeasible." (For example, see Draft EIR page 4.15-189, Intersection IN-95.) Riverside believes there are additional feasible mitigation measures which should be incorporated into the Mitigation Monitoring and Reporting Program ("MMRP").

Furthermore, the Draft EIR should be revised to provide a concise listing of the suggested transportation improvements which have been determined to be feasible and which will be incorporated into the MMRP. The discussion of mitigation measures in Section 4.15.7.3 ("Required Improvements") includes discussion of feasible *and infeasible* transportation improvements.

Additional comments regarding mitigation measures are included in the attached comments from Riverside's Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.)

a. The Proposed Transportation Uniform Mitigation Fee ("TUMF") (Mitigation Measure 4.15.7.4D) is Inadequate to Fully Address the Project's Significant Impacts

The EIR states that "if the identified facility was already part of the TUMF or DIF Program, then payment into the TUMF or DIF program constitutes mitigation of impacts to the TUMF and DIF facilities." (Draft EIR Section 4.15.7.)

MM 4.15.7.4D proposes to mitigate the project's significant traffic impacts to facilities already included in the TUMF Program through payment of TUMF fees. This payment is insufficient to mitigate the project's significant traffic impacts. TUMF fees are allocated based upon specific assumptions, with 48.7% of the funds generated in each zone going back to that zone to be programmed for projects, and 48.7% of the funds allocated to regional inter-zone projects programmed by the Riverside County Transportation Commission ("RCTC"). The City of Moreno Valley is in the Central Zone, thus 48.7% of the project's TUMF fees will be allocated within the zone, while 48.7% will be distributed regionally. Additionally, fee revenues are split between the backbone network, or facilities of regional significance, and the secondary network, or facilities of zonal significance. (ES.4, 2009 TUMF Nexus Study.⁵) The split of fee revenues between the backbone and secondary highway networks is related to the proportion of highway vehicle travel that is local, i.e., between adjacent communities, and regional, i.e., between more distant communities within western Riverside County. (2009 TUMF Nexus Study, page 40.) A future travel forecast estimate was conducted to determine the appropriate distribution of fees between networks. (*Id.*) Based upon the travel forecast estimates of the vehicle trips in 2035, 65.5% of the trips originating in the Central Zone will remain within the zone, and 12.6% of the trips starting in the Central Zone will be to the Northwest Zone.

These estimates do not comport with the travel distribution assumptions in the Draft EIR. As noted in Section 4.15.3.1 of the Draft EIR, 82% of the project's truck trips would be to the west on one or more freeways. Presumably, a substantial portion of these trips would be destined for the Ports of Long Beach and Los Angeles, which would require travel outside the Central Zone. (See Draft EIR page 4.7-43.) As a result, the traffic distribution assumptions used in the TUMF Nexus Study are inconsistent with the traffic distribution assumed in the Draft EIR. This inconsistency means that the payment of TUMF, which are specifically allocated between

⁵ [http://www.wrcog.cog.ca.us/downloads/TUMFNexusStudy\(100210\).pdf](http://www.wrcog.cog.ca.us/downloads/TUMFNexusStudy(100210).pdf)

zones, as well as the backbone and secondary network, is inadequate to mitigate the significant traffic impacts of the project.

While Riverside agrees that fees should be paid into the TUMF mitigation program, these fees should not be relied upon to reduce significant traffic impacts to less than significant. Furthermore, given the number of significant and unavoidable traffic impacts resulting from the project, as additional mitigation, the applicant should be required to pay Western Riverside Council of Governments (“WRCOG”) for a reevaluation of the TUMF Nexus Study based upon the project’s changed land use designations/zoning on approximately 4,000 acres. This reevaluation would allow the County to re-prioritize transportation improvement to better mitigate the significant and unavoidable traffic impacts where mitigation was deemed infeasible.

Noise

Construction and operational noise/vibration associated with the Proposed Project have the potential to significantly affect Riverside’s Residents. Unwanted noise can interfere with our resident’s enjoyment of the community, interfere with their businesses, result in sleep deprivation, and if sufficiently loud, can result in hearing loss. Riverside would like to ensure that all noise impacts have been adequately analyzed and mitigated, and, therefore, provides the comments below.

1. Noise Significance Thresholds

a. The Draft EIR Fails to Analyze Whether the Proposed Project Would Conflict with Other Jurisdictions’ Noise Regulations

The Draft EIR includes a significance threshold which states that “Exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley General Plan, Moreno Valley Municipal Code, or *applicable standards of other agencies*.” (Emphasis added.) However, the associated text provides that “the applicable noise standards and guidelines governing the project are those specified previously in Sections 4.12.2.1 through 4.12.2.4.” These referenced sections only include the City of Moreno Valley’s noise standards and fail to address any of the noise standards from other agencies, such as the City of Riverside. (See City of Riverside Municipal Code, Title 7;⁶ see also City of Riverside General Plan Noise Element.⁷) Section 4.12.6.2 of the Draft EIR acknowledges that there will be noise increases near sensitive receptor locations in the City of Riverside (e.g., see Canyon Crest Drive & Country Club Drive), the analysis, therefore, should have included a discussion of whether the project is consistent with those noise standards.

⁶ <http://riversideca.gov/municode/pdf/07/title-7.pdf>

⁷ http://www.riversideca.gov/planning/gp2025program/GP/11_Noise_Element.pdf

b. The Draft EIR Fails to Analyze Whether the Proposed Project's Traffic Noise Would Result in Sleep Disturbance and the Associated Physiological Effects and Annoyance

Roadway noise from truck and car trips was described as having a significant impact on sensitive receptors under the Community Noise Equivalent Level ("CNEL") metric. (See Draft EIR Section 4.12.6.2.) However, no noise analysis was provided to address whether this increase in nighttime noise level would result in sleep disturbance/deprivation or the associated physiological response/annoyance. (See *Berkeley Keep Jets Over the Bay v. Board of Port Commissioners* (2001) 91 Cal.App.4th 1344.) While the sleep disturbance analysis performed in *Berkeley Keep Jets* was related to aircraft noise, there is no reason to distinguish between the sources of the noise. While the original FICAN 1997 sleep awakening curve⁸ was based upon aircraft noise, subsequent methodologies acknowledge that transportation noise can result in sleep disturbance. The more recent ANSI S12.9-200/Part 6 (2008)⁹ sleep disturbance curve is based on 75 data points associated with awakening due to aircraft noise intrusions in bedrooms, and 16 data points for other transportation noise sources.

15

The Draft EIR's noise analysis provides no explanation why these late night truck/car trips would not disturb the sleep of sensitive receptors, despite the fact that the Draft EIR acknowledges that construction would occur 24 hours a day for nine years, and the project's operations would occur 24 hours a day. (Draft EIR page 4.12-32 and Appendix I, Figure 28.) The Draft EIR should be revised to provide an analysis which determines whether the project would have a significant impact related to sleep disturbance.

Air Quality

As the City is aware, the South Coast Air Basin is in "Extreme Nonattainment" for O₃ and "Serious Nonattainment" for PM₁₀ under Federal Standards and in Nonattainment under State Standards for Ozone, PM₁₀, PM_{2.5}, NO₂. (Draft EIR Table 4.3.C.) The Draft EIR concludes that the Proposed Project would have significant and unavoidable impacts to Air Quality and would be inconsistent with the Air Quality Management Plan. These significant impacts will result in health effects to the citizens of Riverside, including the potential to result in respiratory illnesses, pulmonary dysfunction, cardiovascular disease, and premature death. (Draft EIR page 4.3-7 through 12.) Consequently, Riverside would like to see the Project's air quality impacts mitigated to the greatest extent feasible, and offers the recommendations provided below.

16

⁸ See Federal Interagency Committee on Aviation Noise (FICAN), June 1997, Figure 1; available at: http://www.fican.org/pdf/Effects_AviationNoise_Sleep.pdf

⁹ American National Standards Institute, Quantities and Procedures for Description and Measurement of Environmental Sound—Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes.

2. Construction and Operational Mitigation Measures

a. Mitigation Measure MM 4.3.6.3C Should be Revised to Provide Alternative Fueling Stations at Each Individual Warehouse, and Constructed Concurrently With the Project's Impacts

MM 4.3.6.3C requires the establishment of onsite alternative fueling infrastructure (electric charging stations and/or natural gas fueling), which purportedly will help facilitate the use of low emissions trucks. The alternative fueling facility, however, need only be developed prior to the issuance of building permits for 25 million square feet of logistics warehouse.

This mitigation measure should be revised to require both electric charging stations and natural gas fueling. Currently, the project applicant has discretion to determine whether electric charging stations and/or natural gas fueling should be included. The mandatory inclusion of both electric charging stations and natural gas fueling would more effectively facilitate the use of low emissions trucks because it would provide trucking companies with the option of using either electric or natural gas trucks, thereby reducing the project's significant air quality impacts.

The timing of the development and placement of the alternative fueling facility is problematic. MM 4.3.6.3C provides that the facility must be "in place prior to the issuance of building permits for more than 25 million total square feet of logistic warehousing within the WLC Specific Plan." This trigger would allow development of a substantial portion of the project prior to the placement of the alternative fuel facility, especially given the plan to develop the project site in phases. However, the project's air quality impacts would be significant immediately, as shown in Draft EIR Table 4.3.W. The mitigation measure should be revised to require construction of alternative fueling facilities prior to the issuance of the first certificate of occupancy for the site.

The inclusion of a single alternative fueling facility within the 3,814 acre site, as currently proposed, would be ineffective at providing alternative fuel for many of the on-site operators. The mitigation measure should be revised to require alternative fueling facilities for *each individual* warehouse facility. Given the long periods of time required to recharge electric vehicles, providing on-site facilities would further encourage alternative fuel vehicles, as it would allow vehicles to be recharged while the vehicles are being unloaded. Given the comments in this and previous paragraphs above, this mitigation measure should be revised as follows:

The 2012 Regional Transportation Plan includes a zero/near-zero emissions truck corridor along State Route 60. The WLC project shall provide for the establishment of onsite alternative fueling infrastructure (electric charging stations and/or natural gas fueling) for each individual logistics warehouse facility, which will help facilitate the use of these low-emitting trucks. An alternative fueling facility to serve the WLCSP will be in place and operational prior to the issuance of the first certificate of occupancy ~~building~~

~~permits for more than 25 million total square feet of logistics warehousing~~ within the WLC Specific Plan. This facility may be on or offsite, subject to review and approval by the City.

17

Similar revisions are recommended for Mitigation Measure 4.3.6.3D, which requires on-site sale of food, fuel, and convenience items.

b. Mitigation Measure 4.3.6.2A Should be Revised to Require Tier 4 Construction Equipment at the Start of Project Construction

MM 4.3.6.3A(a) states that “Prior to the year 2017, off-road diesel-powered construction equipment greater than 50 horsepower shall meet or exceed United States Environmental Protection Agency (EPA) Tier 3 off-road emissions standards.”

EPA Tier 4 emissions standards are currently being phased in between 2008 and 2015,¹⁰ and thus a mitigation measure requiring the use of Tier 4 equipment before 2017 is feasible and should be incorporated into MM 4.3.6.2A. We, therefore, recommend deletion of subsection (a), and revisions to subsection (b) as follows:

18

~~In the year 2017 and thereafter,~~All off-road diesel-powered construction equipment greater than 50 horsepower shall implement one of the following: meet EPA Tier 4 emissions standards, meet EPA Tier 4 Interim emissions standards, or meet EPA Tier 3 standards with California Air Resources Board verified Level 3 filters to reduce 85 percent diesel particulate matter. If a good faith effort to rent Tier 4 equipment within 200 miles of project has been conducted but has been unsuccessful, then Tier 3 equipment (without filters) can be used. Written verification of the Tier 4 equipment search of three or more rental companies shall be provided by the project applicant to the City verifying the results of the search prior to the use of Tier 3 construction equipment.

Incorporation of this revised mitigation measure would reduce the project’s significant air quality impacts which begin in the year 2013.

Biological Resources

Biological resources in the region are important to Riverside’s residents. Diverse biological resources are an essential part of a healthy ecosystem. Riverside is committed to working with the County and adjacent cities to preserve, protect, and enhance open space and natural resources. (City of Riverside General Plan Policy OS-1.3.) The City is also committed to promoting open space and recreation resources as a key reason to live in Riverside. (Id. Policy OS-1.9.) Protecting biological resources and diversity in the region is key to achieving these commitments. Biological resources in the region, including, for example, resources within or

19

¹⁰ <http://www.gpo.gov/fdsys/pkg/FR-2004-06-29/pdf/04-11293.pdf> (69 Fed. Reg. 38958 (June 29, 2004)).

reliant on the San Jacinto Wildlife area ("SJWA"), contribute to a natural aesthetic, and provide hunting, fishing, bird watching and recreation opportunities. The biological resources will be significantly compromised by the Proposed Project.

19

1. The DEIR Fails To Evaluate Potentially Significant Impacts to Birds that Will Result from Collisions

The DEIR fails to examine the project's impact to birds that would result from bird collisions with glass windows and reflective surfaces. The Specific Plan Design Guidelines indicate that onsite buildings will include [window] glazing, atriums, skylights and internal courtyards, thus ensuring that onsite development will include features known to pose hazards to birds. (Specific Plan Design Guidelines, Sec. 5.2.3.) While these are attractive design features, collisions with glass windows and other reflective building surfaces are a significant cause of bird mortality. Although bird mortality estimates vary widely, even at the low end of a published United States Fish and Wildlife Service ("USFWS") range the cumulative impact should be considered significant.¹¹ These estimates address bird mortality from building collisions on a national scale. The Draft EIR should be revised and recirculated to provide more information and analysis regarding bird collisions. Given the proximity to the SJWA (which "is recognized nationally and internationally for its bird population" DEIR p. 4.4-15), the Project's effects on bird collisions should not have been overlooked. In this revised analysis, particular attention should be paid to special status bird species, including species which meet the CEQA definition of endangered, rare or threatened. (See CEQA Guidelines §15380.) The proposed project's contribution to this cumulative impact should also be evaluated within an appropriate geographic scope, as described in greater detail below. The geographic scope of analysis for cumulative impacts to biological resources is inappropriately and arbitrarily restricted to the Multiple Species Habitat Conservation Plan ("MSHCP") area.

20

In addition to the Project itself, mitigation measure 4.12.6.2B, has the potential to result in significant bird mortality impacts. This measure, intended to reduce noise impacts at the closest residences within and adjacent to the WLCSP area, calls for removal of existing wrought iron fencing and replacement with a soundwall, specifically allowing that a glass barrier could be used to implement this measure.

Potential mitigation is available that would reduce this impact. Feasible mitigation for this impact includes requiring physical barriers that completely cover reflective surfaces and windows, uniform, patterned surface coverings, and potentially uniform coverings or

¹¹ USFWS estimates that building window strikes account for 97 to 976 million bird deaths each year. (<http://www.fws.gov/birds/mortality-fact-sheet.pdf>. See also Klem, D., Avian Mortality at Windows: The Second Largest Human Source of Bird Mortality on Earth, Proceedings of the Fourth International Partners in Flight Conference: Tundra to Tropics, pp. 244 – 251, also available from the USFWS at http://training.fws.gov/CSP/Resources/mig_birds/handouts/avian_mortality_at_windows.pdf).

embedded patterns that are visible to birds, but not humans. (See Avian Mortality at Windows, supra, pp. 246 – 247 for discussion of potentially feasible mitigation.)

2. The DEIR Fails to Explain Why Compliance with Applicable Regulations is Adequate to Ensure that Impacts Would Be Less Than Significant

The Draft EIR relies upon regulatory compliance in several instances to reduce impacts to less than significant. (Draft EIR page, 4.4-80.) A determination that regulatory compliance will provide adequate mitigation must be based on a project specific analysis of potential impacts and the effect of regulatory compliance. (*Californians for Alternatives to Toxics v. Dept. of Food and Agriculture* (2005) 136 Cal.App.4th 1.) The DEIR fails to provide this analysis in multiple instances. The following examples illustrate some of these failures, as well as other flaws in the analyses.

a. Nesting birds

Mitigation for impacts to birds addresses only impacts to nesting birds, but does not address non-special status birds and does not ensure compliance with the migratory bird treaty act. (Mitigation Measures 4.4.6.4A and 4.4.6.4B.) Mitigation measure 4.4.6.4A relies on compliance with the Migratory Bird Treaty Act (“MBTA”) and California Fish and Game code to reduce impacts to migratory and nesting birds to less than significant. However, the measure identifies circumstances under which no mitigation would be required, i.e., in the event “no special status avian species are identified within the limits of disturbance.” This exception means that compliance with California Fish and Game Code and the MBTA is not ensured. The exception should be eliminated. Fish and Game Code Section 3503 prohibits “needless” destruction of any nest, and the MBTA protects all migratory bird species, including relatively common species. Destruction of an active nest during nesting season could result in an unpermitted “take” under the MBTA. (See USFWS MBPM-2 (April 15, 2003) Migratory Bird Permit Memorandum.)

3. The Draft EIR Inadequately Addresses Air Quality Impacts on Wildlife

The DEIR indicates that diesel particulates and toxic air contaminants would have a significant effect on wildlife, and notes that diesel particulate deposition may occur within approximately 1,000 feet of truck activities within the project. (Draft EIR page 4.4-70.) The analysis concludes that the 250-foot setback and the California Department of Fish and Wildlife (“CDFW”) conservation buffer area will effectively mitigate potential indirect impacts of air pollutants, including diesel PM, on wildlife within the SJWA. This conclusion inappropriately attributes the entire CDFW conservation buffer area as mitigating the effects of diesel particulates on wildlife. However, as disclosed in (Draft EIR Section 4.4.1.5), wildlife will continue to use the CDFW conservation buffer area and thus the existence of a CDFW conservation buffer area, in and of itself, does not provide mitigation for this impact. In addition to the 250-foot development setback, additional mitigation should be considered, including restrictions on trucks and landscape plans that include trees or other vegetation to filter particulate matter. In

conjunction with the 250-foot setback, appropriate tree plantings (e.g., appropriate species, planting density) would help filter particulates that would otherwise disperse into the CDFW conservation buffer and the SJWA (in the absence of prevailing winds). Research conducted by UC Davis researchers indicates that the foliage characteristics of conifer species (needle shaped leaves, stickiness, and roughness) can effectively “capture” particulate matter. (<http://dn.engr.ucdavis.edu/images/AQMit-Report5.pdf>)

22

4. The Geographic Scope of the Cumulative Biological Resource Analysis is too Narrow

The geographic scope of analysis in Section 4.4.7 is inappropriately limited to the Western Riverside County MSHCP area. The project will affect a variety of biological resources that are not confined by the County’s boundaries, let alone the MSHCP area within the County. The analysis should be revised to take into account related effects on these resources within a more appropriately defined geographic scope. For example, habitat loss as a result of development in adjacent jurisdictions will contribute to cumulative impacts to wildlife movement, and impacts to sensitive species that are also affected by this project.

23

Greenhouse Gases and Climate Change

Greenhouse gas (GHG”) emissions have the potential to alter wind patterns, storms precipitation, and temperature. The secondary effects associated with GHG emissions have the potential to adversely affect Riverside’s water supply, wildfire hazards, food supply, biodiversity, air quality. (Draft EIR page 4.7-5.) Consequently, Riverside would like to see the Project’s climate change impacts mitigated to the greatest extent feasible, and offers the recommendations provided below.

24

1. The Draft EIR Should Incorporate Additional Mitigation Measures to Further Reduce the Project’s Significant and Unavoidable Impacts to Greenhouse Gases and Climate Change

The Draft EIR concludes impacts to Greenhouse Gas Emissions (“GHG”) and Climate Change would be significant and unavoidable. (Draft EIR Section 4.7.6.1 and 4.7.6.2.) Riverside believes additional feasible mitigation measures should be incorporated to further reduce this impact.

The transportation of potable water and the disposal of wastewater is a huge source of electricity demand, which the Draft EIR notes is a source of GHG emissions for the Proposed Project.¹² (Draft EIR Table 4.7.G) Therefore, to further reduce this significant impact, mitigation should be imposed requiring installation of waterless urinals in addition to low-flow fixtures provided under Mitigation Measure 4.16.1.6.1B rather than providing an option for installation of low water use urinals. The Proposed Project should also be required to install graywater systems for beneficial reuse of wastewater.

25

The Draft EIR also provides mitigation measures for “...solar ready building for possible PV facilities on project roofs.” The Proposed Project should be required to install electricity

¹² <http://www.epa.gov/region9/waterinfrastructure/waterenergy.html>

generating photovoltaic panels on the roofs and parking lots for these facilities as well as solar panels on roofs to provide hot water, rather than just making the project “solar ready.” Installation of PV panels in parking lots would also have the benefit of reducing radiation (heat) absorption, which is also a cause of climate change.¹³ Similarly, the project should be required to install low radiation absorption pavements (“Cool Pavements”) for the parking lots and other paved areas *with specific performance standards*.

The EPA notes that cool pavements would also have the added benefit of reducing aquatic wildlife impacts by reducing “thermal shock” of hotter runoff water and reducing “tire noise by two to eight decibels.” (*Id.*) While the project description notes that “light colored pavements” would be installed, no specific performance standards have been incorporated into mitigation measure 4.16.4.6.1A; this measure should be revised to provide minimum standards for cool pavement solar absorption.

The Project should also be required to install LED Lights in exterior and interior fixtures rather than relying upon the option of installing “*high pressure sodium or light-emitting diodes*” (Draft EIR page 4.1-74; see also Mitigation Measure 4.16.4.6.1B.) Numerous Cities have installed exterior LED lighting, and interior LED lighting is readily available at the consumer level.¹⁴ For example, the City of Los Angeles is currently replacing 140,000 streetlights with LED lighting.¹⁵

Given the large scale of the development, it is feasible for the developer to implement Ice Storage Air Conditioning (“ISAC”) systems. This is one of the measures suggested by the California Attorney General’s office,¹⁶ and which is being implemented in large projects such as Los Angeles World Airport’s Central Utility Plant which includes a 1.6 million gallon thermal-energy storage tank.¹⁷ ISAC systems would allow the Proposed Project to generate and store ice at night with off-peak electricity that would otherwise have gone to waste,¹⁸ thereby reducing peak hour electricity demand and its associated GHG and Air Quality emissions.

¹³ Climate Change is also caused by changes in ground cover which affect the absorption, scattering, and emission of radiation within the atmosphere and the Earth’s surface. See Intergovernmental Panel on Climate Change, Climate Change 2007: The Physical Science Basis, page 21.) The changes in ground cover associated with the Proposed Project were not taken into consideration in the Draft EIR’s Climate Change analysis. IPCC Report available at: http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4_wg1_full_report.pdf

¹⁴ <http://www.usa.philips.com/c/led-light-bulbs/30033/cat/en/>

¹⁵ <http://bsl.lacity.org/led.html>

¹⁶ http://ag.ca.gov/globalwarming/pdf/GW_mitigation_measures.pdf (See page 6.)

¹⁷ http://www.lawa.org/uploadedFiles/LAXDev/News_for_LAXDev/Fact%20Sheet%20-%20CUP%20Replacement.pdf

¹⁸ Many electrical generating facilities do not cease power generation during nighttime hours because of prolonged start up times. Consequently, use of off-peak electricity to generate stored air conditioning capacity allows the use of energy that may have otherwise gone to waste and precludes peak hour electricity demand, which, during summer heat waves, results in GHG and Air Quality emissions from Peaker Plants (quick start electrical facilities).

Mitigation Measure 4.16.4.6.1B should be revised to require installation of this technology, or to create a centralized thermal storage location to serve multiple warehouses.

25

Alternatives

1. The Draft EIR Uses Impermissible Factors in Determining the Environmentally Superior Alternative

One of the key factors in determining the environmentally superior alternative in the Draft EIR is whether the alternatives would “worsen [] the jobs/housing ratio” (Draft EIR page 6-44), this also happens to be one of the project objectives (Draft EIR page 6-3). While compliance with project objectives may be an appropriate ground for rejecting alternatives as infeasible, compliance with project objectives is inappropriate for determining the *environmentally* superior alternative. As discussed under CEQA Guidelines Section 15126.6(a), the purpose of the alternatives is to analyze alternatives which “avoid or substantially lessen any of the significant effects of the project,” and compliance with project objectives is not a significant impact on the environment. By including compliance with project objectives as a factor for determining the environmentally superior alternative, the alternatives comparison is artificially skewed in favor of alternatives that most closely resemble the proposed project. The determination of the environmentally superior alternative should be revised, eliminating all discussion of the ability to meet project objectives.

26

The Draft EIR should be revised and recirculated consistent with the comments above and the comments from Riverside’s Traffic Consultants Linscott, Law & Greenspan, Engineers. (Attachment 1.) Riverside looks forward to continued discussion and coordination with the City of Moreno Valley on this Project.

27

Very truly yours,

Steve Hayes, AICP
City Planner¹⁹

RESPONSES TO LETTER E-2A

City of Riverside

Response to Comment E-2A-1. The commenter has accurately described the project examined in the DEIR. Subsequent to circulation of the Draft Environmental Impact Report (DEIR), 100 acres was removed from the World Logistics Center Specific Plan (WLCSP) site which also removes 1 million square feet of high-cube logistics development of the proposed project. The revised DEIR document evaluates the impacts of the revised project, which are generally equivalent to those of the project evaluated in the DEIR. These changes will incrementally reduce overall impacts of the WLC project.

Response to Comment E-2A-2. The commenter expressed concern about the potential for cut-through traffic in the City of Riverside, particularly truck trips on Alessandro Blvd. and Van Buren Blvd.

The effects of project traffic in the City of Riverside have been fully analyzed in the Traffic Impact Analysis (TIA) and DEIR and appropriate mitigation measures have been identified. The Riverside County Traffic Analysis Model (RivTAM) model is sensitive to congestion so traffic is assigned to City arterials depending on the level of congestion on alternate routes. As such, the assessment appropriately accounts for impacts associated with cut-through trips.

In addition, it bears noting that in traffic engineering the term “cut-through traffic” refers to through traffic using a road that was intended to provide access to adjacent properties, such as traffic through a residential neighborhood that neither originates from nor is destined to a home there. Alessandro Blvd. and Van Buren Blvd are arterial streets whose primary purpose is to serve through traffic. To the extent that project traffic uses these roads, the roads would simply be used for their intended purpose. The Riverside County Transportation Commission (RCTC), of which the City is a member agency, has an adopted policy to encourage traffic to use the arterial network rather than place additional burdens on the freeways. Thus to the extent that project traffic uses the roads for these purposes it would be in accordance with the regional policy. Moreover, the City of Riverside already has the authority to place truck restrictions on streets within their City if they believe cut-through truck traffic to be an issue.

Response to Comment E-2A-3. The commenter asserts that the DEIR uses incorrect and inconsistent growth assumptions and includes other inaccurate information as detailed in the attachment to the comment letter. The responses to the attachment are detailed in Response to Letter E-2B.

Response to Comment E-2A-4. The commenter notes the TIA included use of a 2% per annum assumed growth rate for background traffic. The commenter asserts that the TIA’s use of the simple (i.e. not compounded) 2% growth rate understates traffic growth for 2017.

The TIA incorporated a 2% growth rate in traffic *in addition to* a separate incorporation of growth due to other known and foreseeable projects. Either of these growth assumptions would have been sufficient for the traffic analysis; including both assumptions was a deliberate step to ensure that the background traffic volumes are not underestimated. As a result, the TIA provides an over-estimate of the growth of background traffic.

In addition, in the TIA the 2017 scenarios have been eliminated because the project’s construction schedule has been extended. The 2017 scenarios are no longer relevant to the analysis.

Response to Comment E-2A-5. It is the commenter’s opinion by analyzing the ambient peak hour rather than the peak hour for warehouses shown in DEIR Appendix L-1 TIA Figure 28 (now Figure 31

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

in FEIR Volume 2 Appendix L-1) the TIA is understating the project's impacts. The commenter states off-peak or 24-hour analysis periods should have been used.

The City agrees a large percentage of the project's traffic occurs during off-peak hours. This is a highly desirable feature for a major employer. However the purpose of the traffic analysis is to identify where plus-project traffic levels might necessitate roadway improvements by analyzing and mitigating impacts for the worst-case scenario. The worst-case scenario will occur either in the AM or PM ambient peak period, but not during off-peak hours. If sufficient capacity is provided for the worst-case traffic periods then the capacity will also be sufficient for all other off-peak hours. The TIA followed this established procedure in conformance with official guidance ranging from Transportation Research Board's (TRB) *Highway Capacity Manual* (Chapter 3) to the City of Riverside's own *Traffic Impact Analysis Preparation Guide* (pages 5, 12, 20). Because of the conservatively high trip-generation rate used in the WLC analysis, along with the fact that the peak of trip generation was assumed to occur simultaneous with the peak of background traffic, the assumptions in the WLC analysis are far more conservative (i.e. assume worse conditions) than the field data in the National Association of Industrial and Office Properties (NAIOP) survey suggests is likely to occur. As can be seen in Exhibit E-2A-1 from the TIA, copied below, the TIA assumed peak-hour trip-generation rates far higher than those found in the highest hours of the NAIOP study cited by the commenter.

Exhibit E-2A-1: Time-of-Day Distribution, WLC Assumptions Compared to NAIOP

Besides roadway design, which was already addressed in the peak-hour analysis, the other purpose of the traffic forecasts was as an input into air quality analyses. The traffic data used for the air quality analysis covered both the peak periods and the full 24-hour period, as requested by the commenter.

Response to Comment E-2A-6. The commenter asserts that putting a ceiling value of 50 seconds on reported delay (i.e. values higher than that were reported as ">50") fails to disclose project impacts.

The TIA used the *Highway Capacity Manual* (HCM) methodologies to analyze traffic delay at intersections. This standard methodology is mandated in the traffic impact analysis guidelines for both the City of Moreno Valley and the City of Riverside. The HCM describes LOS "F" as "Intersection oversaturated; arrival rates exceed intersection capacity so queues build up." The methodology does not actually predict delays higher than 50 seconds for unsignalized intersections and 80 seconds for signalized intersections; it simply states the delays would be beyond those thresholds because at that point other things would start to occur such as re-routing and trip suppression. So when the TIA states that delay is ">50 seconds" it is correctly following the HCM procedure as required by both the Cities of Moreno Valley and Riverside. While the computational software will produce a numerical

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

estimate of delay beyond the 80 seconds limits, that number is sometimes meaningless, as the City's comment letter points out (page 6) for the single case where such an irrational number was inadvertently present in the report. However, in response to the comment the upper limit for reported delay for unsignalized intersections was revised from 50 seconds to 180 seconds.

Response to Comment E-2A-7. The commenter states that the TIA used an incorrect geographic scope in that the freeway analysis did not extend to the port and because certain sections of I-215 were not included in the analysis.

An additional section (Chapter 12, Section F) has been included in the TIA Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1 that analyzes project impacts on freeways to the ports. The analysis found that less than 10% of WLC truck traffic would be to and from the ports. See Table E-2A-A in the revised TIA (FEIR Volume 2 Appendix L-1), repeated below.

Table E-2A.A: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

No impacts were found that were not already covered in the TIA analysis. The segments of I-215 cited by the commenter were analyzed to determine if they met the threshold for further analysis. Tests using the Riverside County Traffic Analysis Model (RivTAM) model showed that this portion of I-215 did not meet the minimum threshold of 100 peak-hour trips and therefore it was not included for further analysis. This threshold was approved by the City of Moreno Valley based on Caltrans' guidelines. This portion of I-215 would attract few WLC trips because it is dominated by an alternate route that is 4.6 miles shorter (i.e., the travel distance from SR-60 at Perris Blvd to I-215 at Nuevo Rd is 14.6 miles using the SR-60/I-215 route but only 10.0 miles using Perris Blvd).

Response to Comment E-2A-8. The commenter states that the TIA failed to properly disclose the assumed future road improvements used in the cumulative analysis.

The TIA's assumptions regarding future roadway improvements are described in Chapter 2, Section A, the sub-section entitled "Network Assumptions." The assumptions were based on Southern California Association of Governments' (SCAG) approved Regional Transportation Plan (RTP) project lists, which include hundreds of projects, and which were included by reference. The document has been made available for public review.

Response to Comment E-2A-9. The commenter states that the DEIR failed to disclose the trip distribution assumptions and did not provide a map of truck routes. The commenter also states the analysis should take into account diversion of traffic away from congested routes.

The DEIR TIA in Appendix L-1 included Figure 25 (now Figure 28 FEIR Volume 2 Appendix L-1) and DEIR Appendix L-1 Figure 28 (now Figure 33 FEIR Volume 2 Appendix L-1) showing distribution of car and truck traffic, respectively. An additional figure (Figure 8) has been included in the TIA (FEIR Volume 2 Appendix L-1) showing the designated truck routes in and around Moreno Valley.

The TIA used the RivTAM model. The RivTAM model uses an iterative traffic assignment procedure whereby speeds and traffic volumes on each link are re-calculated several times with each new iteration taking into account any reductions in speed stemming from congestion in the previous

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

iteration. This is the accepted method for forecasting diversion of traffic due to congestion under future conditions.

Response to Comment E-2A-10. The commenter states the alternatives cannot be effectively evaluated because they do not provide enough information about traffic (trip generation and distribution) and do not show detailed impacts of each alternative on local streets, intersections, and freeways. The alternatives analysis in the DEIR did provide a comparison of trips generated by the various alternatives using the California Emissions Estimator Model (CalEEMod) air quality computer program developed by the South Coast Air Quality Management District (SCAQMD) which takes into account land uses such as those proposed in the proposed project as well as the project alternatives. The trip generation data provides an order of magnitude comparison of these “projects” at a programmatic level which is appropriate for the level of analysis in the DEIR. Table 6.G, DEIR page 6-19, indicates higher Average Vehicle Trips per Day (ADTs) for most of the alternatives. There is no requirement for a traffic study to be prepared for each alternative, or to provide detailed road or intersection impact data for each jurisdiction affected by project traffic, especially when such traffic would likely be much less than that estimated for the proposed project. California Environmental Quality Act (CEQA) specifically indicates the level of analysis for alternatives does not need to be at the same level as for the proposed project (State CEQA Guidelines Section 15168). Such detailed information is not necessary to be able to qualitatively compare the potential environmental impacts of the alternatives compared to the proposed project, including potential traffic impacts.

Response to Comment E-2A-11. The commenter questions why many of the mitigation measures identified in the TIA were deemed to be “infeasible”, and requests that a concise list of mitigation measures be provided.

The mitigation measures were identified according to the City of Moreno Valley *Traffic Analysis Guidelines* and are fully described in Chapter 11 of the TIA. Improvements were deemed to be infeasible if they would (1) require the acquisition of existing homes or businesses; (2) result in excessive air, noise, or vibration impacts on existing homes, businesses, or sensitive natural environments, or (3) create safety impacts that could be considered less acceptable than a reduced traffic LOS. In cases where feasibility is uncertain the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities so the project’s responsibilities would not be under-estimated.

Concise lists of mitigation measures were provided in TIA Tables 76 through 81 (renumbered as Tables 72 through 77 in the revised TIA contained in FEIR Volume 2 Appendix L-1) as well as text descriptions. The feasibility of each required measure was double-checked and a determination made based on the factors described above.

Response to Comment E-2A-12. The commenter questions the use of Transportation Uniform Mitigation Fee (TUMF) as a mitigation measure for cumulative impacts on TUMF-eligible facilities. The commenter describes the formula used to distribute TUMF funds and states that this formula is inappropriate for a project intended to serve the ports.

The comment is based on the incorrect premise that a high percentage of WLC traffic would be to and from the ports. An additional section (Chapter 12, Section F) has been included in the TIA that analyzes project truck traffic to the ports. The analysis found that only a small percentage of WLC truck traffic would be to and from the ports. See Table E-2A.B in the revised TIA (FEIR Volume 2 Appendix L-1), repeated below. This is based on SCAG survey data.

Table E-2A.B: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

No impacts were found that were not already covered in the TIA analysis.

The TUMF Program was established as the mechanism for mitigating inter-jurisdictional impacts of development projects in western Riverside County. Regarding the distribution formula for TUMF funds, the City of Riverside freely agreed to this formula when they became a partner in the TUMF program. Any changes to the formula would have to come from the County and the partner Cities; a private entity cannot make changes to an approved multi-agency program. Please note the City of Moreno Valley has also committed itself to work with the City of Riverside to implement the mitigation measures that are not part of the TUMF program as described in Mitigation Measure (MM) Trans-5, Chapter 11, Section G of the TIA (FEIR Volume 2 Appendix L-1).

Response to Comment E-2A-13. This is a general comment on “construction and operational noise/vibration.” The noise analysis contained in the EIR analyzes construction and operational noise and vibration impacts. Potential impacts are identified and mitigated when feasible.

Response to Comment E-2A-14. Due to the distance of the City of Riverside from the project site, the only potential noise impact to areas of Riverside would be from traffic generated by the project. The commenter raises the concern of whether the City’s noise standards were addressed and specifically cites Riverside Municipal Code, Title 7 and also the Riverside General Plan Noise Element. The Municipal Code, Title 7, commonly referred to as the Noise Ordinance, has no relevance to project traffic passing through the city. The Noise Ordinance is designed to limit noise generated on one private-property parcel impacting a nearby parcel. The City has no jurisdiction for limiting noise on public roadways and therefore, the City of Riverside Noise Ordinance has no relevance to the project. The City of Riverside Noise Element was also reviewed; however, the Noise Element does not contain any specific standards or requirements for traffic noise on public roadways. The analysis used a City of Moreno Valley noise standard of 65 CNEL for residential development. The City of Riverside does present a Noise/Land Use Noise Compatibility Criteria matrix (Figure N-10 of the Element). This matrix, which is not a standard, but rather a guideline, shows noise levels above 65 CNEL as “normally unacceptable” for single family residential uses. In conclusion, the City of Riverside does not have any standards that relate directly to the project related impacts. The analysis has been conducted using significance thresholds which are consistent with guidelines contained in the City of Riverside Noise Element.

Response to Comment E-2A-15. As the commenter noted, the Berkeley case related to sleep disturbance caused by aircraft noise. Aircraft noise at night occurs less frequently but has a much higher peak noise level than does truck noise. Truck traffic events generally occur more frequently and are much quieter than aircraft noise events. For Berkeley, the only aircraft noise was associated with the Oakland International Airport. For this project there is already truck traffic occurring on all of the public roadways involved, so this is not a new source of noise or a unique source of noise. As stated in the comment, the FICAN²² curve is based on aircraft noise, not truck noise. Its relevance to

²² The Federal Interagency Committee on Aviation Noise (FICAN) 1997 curve “represents the upper limit of the observed field data, and should be interpreted as predicting the “maximum percent of the exposed population expected to be

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

this project is questionable. Additionally, the FICAN curves present the percentage of sleep disturbance that occur with an aircraft noise event of a given loudness. Since trucks are already traveling on the public roadways, the FICAN curves are useless because the noise levels that will occur with a truck pass-by and cause a single noise event will not change from what is already occurring.

Response to Comment E-2A-16. The City of Riverside summarizes the findings in the DEIR. Refer to the revised air quality analysis; the construction and operational emissions have been revised. Please refer to Master Responses in Response to Comment Letter C-3.

The City of Riverside would like to see the Project's air quality impacts mitigated. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project's mitigation measures. Refer to the response to comments that follow.

Response to Comment E-2A-17. The City of Riverside suggests the following mitigation measure.

Suggested Mitigation Measure	Response
MM 4.3.6.3C should be revised to provide alternative fueling stations at each individual warehouse and constructed concurrently with the buildings.	Partially Included. The alternative fueling station will be added in Phase 1; however, there is not anticipated to be enough demand to necessitate alternative fueling stations at each building. However, MM 4.3.6.4A requires electric charging at each building. The developer will work with an alternative fuel provider and will install the station in as soon as they determine it is feasible, but no later than end of Phase 1.

Response to Comment E-2A-18. The City of Riverside suggests the following mitigation measure.

Suggested Mitigation Measure	Response
MM 4.3.6.2A should be revised to require Tier 4 construction equipment at the start of project construction.	Partially Included. MM 4.3.6.2A has been refined to require that the project use Tier 4 construction equipment.

Response to Comment E-2A-19. The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) was designed to consolidate areas of the Western Riverside County into core conservation areas where a viable community of all wildlife and plants, including sensitive species, could exist in a "natural" environment. As a result of this process multiple area were designated as targets for conservation through the establishment of 160-acre Criteria Cells in a variety of habitats. This was done to protect the 147 sensitive species covered under the MSHCP. It also provides coverage for numerous other species.

Not all lands were selected to be a part of the core conservation areas and not all lands are contained within criteria cells, but all lands developed in western Riverside County are subject to MSHCP requirements, generally through development fees. The World Logistics Center Specific Plan (WLCSP) lands, in general, were not selected for conservation, but rather are subject to the development fees. The project proponent has acknowledged those obligations and the funds derived from the MSHCP fees will be utilized to acquire lands designated for conservation.

behaviorally awakened", or the "maximum % awakened" for a given residential population." http://www.fican.org/pdf/Effects_AviationNoise_Sleep.pdf

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Most of the WLCSP 2,610 acres is either agricultural (2,257 (see FEIR Volume 2 Appendix C-2, Agricultural Resources Assessment)); non-native grassland (219); urban developed (92); or disturbed (48). Conservation of these lands, while possible, would not contribute to the conservation efforts associated with the MSHCP. An updated Draft Habitat Assessment, MSHCP Consistency Analysis and HANS Review (FCS-MBA 2013 FEIR Volume 2 Appendix E-1) (hereafter MSHCP Consistency Analysis) was prepared to document current site conditions and evaluate the loss of biological resources based on CEQA and MSHCP requirements.

Response to Comment E-2A-20. The potential for birds striking buildings is real and would result in an adverse, but less than significant impact with regard to common avian species. There are several project design features incorporated in the general concept of the WLCSP that will reduce the potential for bird strikes. Section 4.1.6.1 of the DEIR spells out building heights for the entire Specific Plan. The highest buildings would be no more than 80 feet tall, with “perimeter” buildings along the west north and south perimeters a maximum of 60 feet tall. These design features are specifically for aesthetic reasons, but also provide a gradual transition from open space areas and should allow for birds to acclimate to buildings both through the transition from shorter to taller buildings, but also through the gradual construction of facilities over a 15-year period.

Bird strikes associated with sensitive avian species, such as golden eagle and Cooper’s hawk, may be a potentially significant impact that requires mitigation. Mitigation for impacts to sensitive avian species that potentially occur within the WLCSP is covered under the MSHCP. MMs 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I will reduce the project related impacts to a level less than significant.

Response to Comment E-2A-21. The following mitigation measure is in place with regard to the protection of nesting birds as regulated by the Migratory Bird Treaty Act and California Fish and Game Code (Section 3503 and Section 3511). A more detailed description of these regulations can be found on Page 2 of Appendix G within the Habitat Assessment and MSHCP Consistency Analysis (FCS 2013 FEIR Volume 2 Appendix E-1).

In addition, MM 4.4.6.4A and revised 4.4.6.4B of the DEIR expand on the BIO-1 measure in the MSHCP Consistency Report. These two DEIR measures state:

4.4.6.4A Pursuant to the Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code (CFGF), site preparation activities (removal of trees and vegetation) shall be avoided during the nesting season of potentially occurring native and migratory bird species (generally February 1 to August 31). If site preparation activities must occur during the nesting season, a pre-activity field survey shall be conducted by a qualified biologist prior to issuance of grading permits for such development. The survey shall determine if active nests of species protected by the ~~MBTA~~Migratory Bird Treaty Act or ~~CFGF~~California Fish and Game Code are present in the construction zone. If active nests of these species are found, the developer shall establish an appropriate buffer zone with no grading or heavy equipment activity within of 500 feet from an active listed species or raptor nest, 300 feet from other sensitive or protected bird nests (non-listed), 250 feet from passerine birds, or 100 feet for sensitive or protected songbird nests. All construction activity within the vicinity of active nests must be conducted in the presence of a qualified biological monitor. Construction activity may encroach into the buffer area at the discretion of the biological monitor in consultation with CDFW. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, ~~Mitigation Measure~~mitigation measure 4.4.6.4B shall also apply. This measure shall be implemented to the satisfaction of the City Planning Division.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- 4.4.6.4B** If it is determined that project-related grading or construction will affect nesting ~~special-status-avian~~migratory bird species, no grading or heavy equipment activity shall take place within the limits established in Mitigation Measure 4.4.6.4A until it has been determined by a qualified biologist that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. This measure shall be implemented to the satisfaction of the City Planning Division.

Response to Comment E-2A-22. See Response to Comment G-69-2.

Response to Comment E-2A-23. The geographic scope of analysis in the EIR was not specifically associated with the MSHCP area or limited by the County boundaries. In fact, the MSHCP area contains a far greater area than the area affected by the WLCSP. The Badlands Area to the north and east of the WLCSP provides a significant physical barrier that provides a distinct geographic boundary that limits both direct and indirect project related impacts to areas further east. In addition, the existing residential development to the west also provides a significant barrier to both direct and indirect project related impacts to areas further west. Mount Russell provides a physical barrier along a portion of the southern WLCSP boundary. The rest of the southern boundary is adjacent to extensive agricultural lands extending up to 4,500 linear feet south of the WLCSP boundary. This is a sufficient distance that no direct or indirect impacts will affect habitat beyond the 4,500-linear foot area. It is for this reason that the area assessed within the DEIR is reasonable and sufficient to determine project related direct, indirect, and cumulative impacts.

Habitat loss as a result of the proposed development is not anticipated to occur within adjacent jurisdictions and therefore will not contribute to cumulative impacts to wildlife movement and sensitive plant and wildlife species. will be mitigated through The following mitigation measures are required under the City of Moreno Valley's General Plan to reduce project-related impacts to a level less than significant:

1. Private development projects within the City shall comply with the Long-term HCP for the Stephens' Kangaroo Rat (see DEIR Section 4.4.6.2a)
2. Private development projects shall comply with the Western Riverside County Multi-Species Habitat Conservation Plan (MSHCP) (DEIR Section 4.4.6.2b) and the associated state and federal permits (MMs 4.4.6.3A and 4.4.6.3B).
3. Where feasible, projects shall be designed to minimize impacts on sensitive habitat (MMs 4.4.6.2A and 4.4.6.2B).
4. Prior to physical disturbance of any natural drainage course or wetland determined to contain riparian vegetation or otherwise qualify as a "jurisdictional" wetland or Non-wetland Water of the U.S., the applicant shall obtain a Streambed Alteration Agreement and/or permit, or written waiver of the requirement for such an agreement or permit, from all resource agencies with jurisdiction over such areas California Department of Fish and Game and U.S. Army Corps of Engineers (CDFG and ACOE) (MMs 4.4.6.3A and 4.4.6.3B).

Response to Comment E-2A-24. The City of Riverside would like to see more greenhouse gas mitigation measures incorporated, as discussed in the comments that follow and as shown in the following mitigation measure.

- 4.16.1.6.1B** ~~Prior to issuance of any building permit for development within the WLCSP, the developer~~ All buildings shall submit building plans that demonstrate the project has include water-efficient design features outlined in Section 4.0 of the WLCSP including World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division/Public Works. These design features

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

shall include, but not be limited to the following:

- Instantaneous (flash) or solar water heaters;
- Automatic on and off water facets;
- Water-efficient appliances;
- Low-flow fittings, fixtures and equipment;
- Use of high efficiency toilets (1.28 gallons per flush [gpf] or less);
- Use of waterless or very low water use urinals (0.0 gpf to 0.25 gpf);
- Use of self-closing valves for drinking fountains;
- Infrared sensors on drinking fountains, sinks, toilets and urinals;
- Low-flow showerheads;
- Water-efficient ice machines, dishwashers, clothes washers, and other water-using appliances;
- Cooling tower recirculating system where applicable;
- Provide information to the public in conspicuous places regarding indoor water conservation; and
- Use of reclaimed water for wash down if it becomes available.

Response to Comment E-2A-25. The City of Riverside suggests the following mitigation measures.

Suggested Mitigation Measure	Response
Require the installation of waterless urinals in addition to low-flow fixtures provided under MM 4.16.1.6.1B rather than providing an option for installation of low water urinals.	<p>Incorporated. MM 4.16.1.6.1B has been edited to require waterless urinals as follows:</p> <p>4.16.1.6.1B Prior to issuance of any building permit for development within the WLCSP, the developer All buildings shall submit building plans that demonstrate the project has include water-efficient design features outlined in Section 4.0 of the WLCSP including World Logistics Center Specific Plan. <u>This measure shall be implemented to the satisfaction of the Land Development Division/Public Works. Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	<ul style="list-style-type: none"> • Use of self-closing valves for drinking fountains; • Infrared sensors on drinking fountains, sinks, toilets and urinals; • Low-flow showerheads; • Water-efficient ice machines, dishwashers, clothes washers, and other water-using appliances; • Cooling tower recirculating system where applicable; • Provide information to the public in conspicuous places regarding indoor water conservation; and • Use of reclaimed water for wash down if it becomes available.
Install graywater systems for reuse of wastewater.	Not Incorporated. The project would only use minimal indoor water usage. Graywater would not be feasible for the types of water usage anticipated for the project. In addition, the Eastern Municipal Water District (EMWD) and the County Health Department prohibit graywater discharge from industrial uses.
Install electricity generating photovoltaic panels on roofs.	Incorporated. The project is incorporating solar as MM 4.16.4.6.1C.
Install photovoltaic panels on parking lots, which would also reduce heat absorption.	Not Incorporated. The project is now proposing to install roof-mounted PV (see MM 4.16.4.6.1C) As a result, requiring the installation of PV on parking lots is unnecessary. In addition, the project would use cool pavements in all areas feasible (see MM 4.16.4.6.1A).
The project should install solar hot water heaters.	Already Included. Instantaneous or solar water heaters are required as part of MM 4.16.1.6.1B.
The project should install low radiation absorption pavements (cool pavements) for the parking lots and other paved areas with specific performance standards. (Revise MM 4.16.4.6.1A)	Partially Included. Cool pavements would be used throughout the project where feasible (see MM 4.16.4.6.1A). However, there are currently no specific performance standards for cool pavements; therefore, it is not feasible to specify standards. Source: U.S. Environmental Protection Agency. Reducing Urban Heat Islands: Compendium of Strategies, Cool Pavements. Website: www.epa.gov/hiri/resources/pdf/CoolPavesCompendium.pdf . Accessed November 11, 2013.
The project should install LED lights in exterior and interior fixtures rather than relying upon the option of installing “high pressure sodium or light-emitting diodes” (DEIR page 4.1-74 and MM 4.16.4.6.1B).	Incorporated. MM 4.16.4.6.1B has been revised to include this suggestion.
Implement Ice Storage Air Conditioning (ISAC) systems to generate and store ice at night with off-peak electricity. Alternatively, create a centralized thermal storage location to serve multiple warehouses. (Revise MM 4.16.4.6.1B)	Not Included. It is understood that co-generation is widely used on large campus single owner parcels to distribute power and provide heating and cooling opportunities for all buildings. This option has been reviewed during the DEIR process and while it may also be used on similar projects outside of California, currently the state does not allow private cogeneration systems such as this to cross Public right of way to serve individual property owners (California Public Utilities

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	<p>Code (CPUC) Section 218).</p> <p>The CPUC self-generation incentive program is available for all future buildings in the WLC if the gas company continues to offer it. It cannot be guaranteed at this stage of development. The appropriate means of conserving natural resources such as natural gas will be determined when a project specific plot plan is processed and details of the specific building proposals are known.</p> <p>With regard to ice storage air conditioning (ISAC) systems specifically, the proposed mitigation is unnecessary. The goal of ISAC systems is to reduce afternoon peak demand from the electrical grid by shifting electrical demand to the late evening hours when electrical demand drops significantly. However, as part of the MM 4.16.4.6.1C, a roof-based photovoltaic solar system will be deployed for each building to meet the electrical demand for office use. Since the office is the only portion of the warehouse that will be equipped with air-conditioning, the solar panels will provide all the necessary power for air conditioning, eliminating the need to shift the load. In addition, as described in Section 4.7 Greenhouse Gases and Master Response-1, there is no significant impact with regard to GHG that require further mitigation.</p>

Response to Comment E-2-26. The issue of jobs/housing balance was looked at in two ways for the alternatives analysis, because this is a critical focus of Western Riverside Council of Governments (WRCOG) and SCAG to encourage jobs in housing rich areas and housing in jobs rich areas to ultimately result in a better balance of commuter traffic and less congestion on area roadways. It is reasonable to look at a project's influence on local and regional jobs/housing balance, especially for large projects that may introduce thousands of new homes or jobs into a community. Certainly an important project objective is to create new jobs for the City of Moreno Valley and surrounding areas, but one major reason is that local workers now have to commute long distances because Moreno Valley is a housing rich/jobs poor area. The WLC project has the potential to substantially improve the City's jobs/housing ratio which is a City as well as a regional goal. Therefore, it is one appropriate environmental "yardstick" against which to measure the project as part of the alternatives analysis.

Response to Comment E-2-27. The City evaluated the many comments received on the DEIR. This FEIR provides additional information, mainly in the form of responding to the many questions and comments received on the DEIR. However, the changes to the DEIR included do not constitute "significant" new information because:

1. No new significant environmental impact would result from the project or from a new mitigation measure;
2. There is no substantial increase in the severity of an environmental impact that would result unless mitigation measures are adopted that reduce the identified significant impacts to a level of insignificance;
3. No feasible project alternative or mitigation measure considerably different from others previously analyzed has been proposed or identified that would clearly lessen the significant environmental impacts of the project; and
4. The DEIR is not fundamentally or basically inadequate or conclusory in nature such that meaningful public review and comment were precluded.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Therefore, this additional information does not rise to the level of significant new information, nor does it identify any new or substantially different significant environmental impacts from those identified in the DEIR.

Letter E-2B: City of Riverside (April 8, 2013) and Appendix 1 (On Flash Drive)

Attachment 1

MEMORANDUM

To:	Mr. Steve Hayes City of Riverside	Date:	April 7, 2013
From:	Keil D. Maberry, P.E. <i>KDM</i> Daniel A. Kloos, P.E. <i>DAK</i> LLG Engineers	LLG Ref:	2.13.3364.1
Subject:	TIA Peer Review The World Logistics Center Traffic Study, Moreno Valley		

As requested, Linscott, Law & Greenspan, Engineers (LLG) is pleased to provide our peer review comments on *The World Logistics Center Traffic Impact Analysis Report*, prepared by Parsons Brinckerhoff, dated January 2013. As we understand it, The World Logistics Center Project is a plan for the development of modern high-cube logistics warehouse distribution facilities on approximately 3,814 acres of land in the City of Moreno Valley, California. The following summarizes our comments on the traffic study for your consideration.

General Comment

As it relates to the potential traffic impact of the proposed World Logistics Center on the City of Riverside, it is our finding that the traffic impacts primarily consist of two components; 1) employment-based traffic [approximately 25,000 potential auto trips per day (round trips) through the City via the freeway and arterial network] that will utilize the arterial network through the City of Riverside, and 2) truck-based traffic [approximately 12,000 truck trips per day (round trips)] that will utilize the adjacent SR-91/I-215 Freeway through the City of Riverside. As a result, it is imperative that the traffic impact analysis for WLC adequately analyze and provide tangible mitigation measures that will provide corridor-wide benefits for both employees and trucks.

Inadequate Transportation Assumptions

- It is not clear how and when the traffic analysis considered the Mid County Parkway project as a future transportation improvement.
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Figure 3 on Page 6 – Cumulative Projects. From review of this figure, the traffic study did not include Glass Ranch Center in the cumulative background traffic setting. Glass Ranch Center is a 420,000 square foot (SF) shopping center located on the southwest quadrant of Van Buren Boulevard and Barton Street in the City of Riverside. Glass Ranch Center is forecast to generate approximately 12,945 daily trips, 325 AM peak hour trips and 1,231 PM peak hour trips. This project is anticipated to generate more than 50 project trips during the PM peak hour at several intersections that are also key study intersections analyzed for The World Logistics Center Project. These common key study intersections include the following City of Riverside locations:

- No. 79 – Trautwein Road at Alessandro Boulevard
- No. 95 – Alessandro Boulevard at Arlington Avenue/Chicago Avenue
- No. 96 – Alessandro Boulevard at Century Avenue
- No. 97 – Alessandro Boulevard at Via Vista Drive
- No. 98 – Alessandro Boulevard at Canyon Crest Drive

Failing to include Gless Ranch Center in the cumulative background setting may understate the impacts of The World Logistics Center Project. An explanation as to why this cumulative project was not included.

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Tables 1, 2 and 3 on Pages 7-9 – Cumulative Projects. Cumulative Project numbers 10, 14, 15, 23 and 81 are missing from the tables. However, some of these numbers are shown in Figure 3 (i.e. #14 and #15). Please clarify.
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Page 10 – Roadway Network Assumptions. Please clarify whether or not the “financially constrained project list improvements” are fully funded. The TIA should also be updated to clearly state which planned improvements are included in the analysis (i.e. intersection location, type of improvement, funding source and timing of improvement).
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Page 27 – Traffic Counts. A quick comparison of the existing traffic count data for the intersection of Alessandro Boulevard at Arlington Avenue/Chicago Avenue indicates that the traffic counts utilized in The World Logistics Center are significantly lower for this location than what was utilized in the Gless Ranch Center TIA. As shown in Table 1, the total intersection AM peak hour volumes and PM peak hour volumes utilized in the World Logistics Center TIA for this location are approximately 5% lower in the AM peak hour and 20% lower in the PM peak hour than the volumes utilized in the Gless Ranch Center TIA.

TABLE 1
TRAFFIC COUNT COMPARISON

Key Study Intersection: Alessandro Boulevard at Arlington Avenue/Chicago Avenue				
Movements	AM Peak Hour		PM Peak Hour	
	Dec. 2011 WLC TIA	Nov. 2010 Gless Ranch TIA	Dec. 2011 WLC TIA	Nov. 2010 Gless Ranch TIA
NBL	1,153	1,414	608	1,066
NBT	1,566	1,559	748	872
NBR	435	276	158	156
SBL	178	213	386	546

EBL	35	41	33	26
EBT	449	592	566	855
EBR	575	675	1,022	1,037
WBL	118	107	467	593
WBT	567	582	663	775
WBR	229	186	311	306
Total	5,755	6,100	6,453	7,708

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Page 78, Table 24. More detail needs to be provided in Table 24 so the Phase I and Phase II project trip generations can be verified. It is not clear as to how the PCE factors were applied to each proposed project land use (Phase I or Phase II).
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Pages 79 and 81 – Project Trip Distribution. Figures should be added to the report showing the detailed project trip distribution patterns for passenger cars and trucks. These figures need to be provided so the project assignment to the key study intersections and/or freeway segments can be verified.
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Pages 277-279, Figure 35. Comparing the lane geometrics assumed in the Year 2035 No-Project traffic condition to existing traffic conditions indicates that

intersection improvements have been assumed to be completed by the Year 2035 at the following City of Riverside locations.

- Arlington Avenue at Horace Street (#93) – A 3rd eastbound and 3rd westbound through lane has been included at this location. Only two eastbound and two westbound through lanes currently exist at this location.
- Arlington Avenue at Victoria Avenue (#94) – A 3rd eastbound and 3rd westbound through lane has been included at this location. Only two eastbound and two westbound through lanes currently exist at this location.
- Alessandro Boulevard at Chicago Avenue (#95) – A 3rd eastbound through lane has been included at this location. Only two eastbound through lanes currently exist at this location.

The traffic study needs to be revised accordingly to clearly indicate the funding source for these improvements. Only improvements that are fully funded should be considered and utilized.

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Pages 310-312, Figure 36. Comparing the lane geometrics assumed in the Year 2035 Plus-Project traffic condition to existing traffic conditions indicates that intersection improvements have been assumed to be completed by the Year 2035 at the following City of Riverside locations.

- Arlington Avenue at Horace Street (#93) – A 3rd eastbound and 3rd westbound through lane has been included at this location. Only two eastbound and two westbound through lanes currently exist at this location.
- Arlington Avenue at Victoria Avenue (#94) – A 3rd eastbound and 3rd westbound through lane has been included at this location. Only two eastbound and two westbound through lanes currently exist at this location.
- Alessandro Boulevard at Chicago Avenue (#95) – A 3rd eastbound through lane has been included at this location. Only two eastbound through lanes currently exist at this location.

The traffic study needs to be revised accordingly to clearly indicate the funding source for these improvements. Only improvements that are fully funded should be considered and utilized.

- The traffic impact analysis does not include a daily roadway segment analysis, which is recommended for this project considering that the AM and PM peak hours only consist of 13.7% of the project's daily traffic generation forecast. Furthermore, since it is likely that east-west traffic will be diverted from the SR-60/I-215 onto parallel arterials in the City of Riverside, it is recommended that

Martin Luther King Boulevard and Van Buren Boulevard be included in the ADT analysis. Should the analysis reveal significant traffic impacts, appropriate mitigation measures should be identified, such as contributions to the City of Riverside's Traffic Signal Mitigation Fee program. In addition, given that 86.3% of the project's traffic generation occurs outside the typical AM and PM peak hours and has not been analyzed in combination with the fact that the project will be the single largest trip generator in the City of Moreno Valley, it is recommended that the *Peak Hour of Generator* also be analyzed.

13

Inadequate Geographic Scope

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Page 2, Footnote #1. The report states that very little traffic associated with the proposed Project would utilize the section of the I-215 Freeway between the SR-60 Freeway and Perris Boulevard because of freeway congestion. The report also states that due to this congestion that project traffic will utilize surface street routes. The TIA needs to state how many project trips may utilize this section of freeway, so an appropriate fair-share contribution can be calculated and contributed by the World Logistics Center Project for future improvements.
- Given the forecast auto traffic volume that will traverse through the City of Riverside and surrounding communities, combined with the proposed Cajalco Road Improvement Project that will attract east-west regional traffic, Cajalco Road should be included in the analysis. Should the analysis reveal significant traffic impacts, appropriate mitigation measures should be identified.

14

15

Inadequate Mitigation Measures

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Section 12 Mitigation Measures - It is not clear why the mitigation measures for the cumulative condition only recognizes the Year 2035 condition and not the Year 2017 and Year 2022 cumulative conditions. This may reduce the potential mitigation measures that would be recommended if the interim year condition(s) can be mitigated, but not the Year 2035 condition.
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Tables 77 - The recommended mitigation measure for Intersection No. 95 (Alessandro Boulevard at Arlington Avenue/Chicago Avenue) is feasible. The EBR turn lane can be physically accommodated without significantly affecting any residential property. In addition, there are alternate feasible mitigation measures that could be considered, such as a 3rd Northbound Left ("NBL") and/or a 3rd Westbound Left ("WBL").

16

17

- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013) - The mitigation measures identified in Table 80 for Intersections Nos. 94 and 95 do not match the recommended mitigation measures in Table 69. 18
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Table 80 - While implementation of all recommended mitigation measure for Intersection No. 95 (Alessandro Boulevard at Arlington Avenue/Chicago Avenue) may not be feasible, there are additional feasible mitigation measures that could be considered, such as a 3rd NBL, 3rd WBL or 3rd Westbound Through (“WBT”) and 3rd Eastbound Through (“EBT”) or 3rd Eastbound Right (“EBR”). These improvements may mitigate the Year 2017 and/or Year 2022 condition. 19
- Fundamentally, the addition of approximately 12,000 truck trips (not PCE trips) per day to the I-215/SR-60 Freeway through the City of Riverside necessitates the addition of a corridor wide lane improvement to mitigate the impact on auto traffic similar to the traffic conditions on the I-710 Freeway in South Los Angeles County. 20
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Table 78 – Direct Impacts to Freeways and Mitigation: Freeway segment Nos. F-24, F-27, F-42, W-21, W-22, W23, and W-25, which are identified as not feasible, are feasible based on our review of existing conditions in the field. In addition, consideration should be given to the installation of ramp metering along the SR-60/I-215 Freeway corridor as freeway mitigation, which can provide significant benefit to the freeway mainline operation. 21
- Draft EIR Appendix I (Traffic Impact Analysis Report – January 2013): Table 81 – Direct Impacts to Freeways and Mitigation: Freeway segment Nos. F-19, F-46, F-42, F-49, W-21, W-22, and W-25 EB SR-60, which are identified as not feasible, are feasible based on our review of existing conditions in the field. In addition, consideration should be given to the installation of ramp metering along the SR-60/I-215 Freeway corridor as freeway mitigation, which can provide significant benefit to the freeway mainline operation. 22
- In light of the repeated infeasibility claims throughout the report regarding the addition of the recommended mitigation measure to provide a mixed-flow lane on the SR-60/I-215 and SR-91 Freeways, it is recommended that a mitigation measure be included that would require the Project to fund a Project Study Report (PSR) and Project Report (PR) through the Riverside County Transportation Commission (RCTC), with the City of Riverside included in the process, to develop an improvement project to add one mixed-flow lane and/or special truck lane in each direction on SR-60/I-215 Freeway between the I-15 Freeway and Gilman Springs Road as well as on the SR-91 Freeway between the SR-60/I-215 and the I-15 Freeway. 23

RESPONSES TO LETTER E-2B

City of Riverside

Response to Comment E-2B-1. The commenter asserts that the project would generate approximately 25,000 potential round-trip auto trips and 12,000 truck round trips per day through the City (of Riverside).

The commenter seems to claim that virtually all of the traffic generated by the World Logistics Center (WLC) will pass through the City of Riverside. This is incorrect. The Draft Environmental Impact Report (DEIR) Traffic Impact Analysis (TIA) in Appendix L-1 included Figure 25 (now Figure 28 FEIR Volume 2 Appendix L-1) showing that less than half of the project's car traffic would pass through the City of Riverside. A majority (not all as the commenter suggests) of project truck traffic will pass through the City of Riverside on the state-owned freeway system (not City of Riverside streets).

Response to Comment E-2B-2. The commenter says that the DEIR is not clear how and when the traffic analysis considered the Mid County Parkway project as a future transportation improvement.

As explained in the TIA, the analysis used the Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) as the basis for assumptions regarding future road projects. The assumptions regarding Mid-County Parkway follow the RTP's Federal Transportation Improvement Program (FTIP) (projects for which funding is expected to be available in the short term) listing for project RIV031218 which reads,

"IN WESTERN RIV CO – NEW MID CO PKWY: CONS 6 THRU LN (3 LNS IN EA DIR) APPROX 16 MI. BTWN I-215 IN PERRIS EAST TO SR79 IN SAN JACINTO, INC. CONS/RECONS OF APPROX 10 ICS, ADD OF AUX LN REDLANDS-EVANS & EB AUXILIARY LN EVANS-ANTELOPE. I-215 IMP: ADD 1 MF LN IN EA DIR NUEVO RD -VAN BUREN BLVD, & 1 AUX LN IN EA DIR MID CO PKWY-CAJALCO/RAMONA EXP & FROM MID CO PKWY-NUEVO."

RTP's FTIP available online at:

http://rtpscs.scag.ca.gov/Documents/2012/famendment/2012A01RTP_ModelList.pdf

Based on the SCAG 2012 RTP, the traffic analysis assumed the Mid County Parkway project would be completed by 2022.

Response to Comment E-2B-3. The commenter states that the DEIR failed to include Gless Ranch Center in the cumulative background traffic setting.

Tests with the Riverside County Traffic Analysis Model (RivTAM) traffic model found that there was very little project traffic in the vicinity of Gless Ranch Center, fewer than 20 project trips in the peak hours. Moreover, the land use assumptions used in the traffic analysis included both the land use developments and the 2012 RTP/SCS, and in addition more than 100 specifically identified projects in and around Moreno Valley. Although Gless Ranch was not explicitly input, 208 new jobs and 85 additional households were added to the Traffic Analysis Zone (TAZ) it is in, based on the approved land use assumptions in the 2012 Sustainable Communities Strategy (SCS). An additional 216 new jobs and 83 new households were also added to the adjacent TAZ, which loads onto the same intersection as Gless Ranch (the Van Buren Blvd./Barton Rd. intersection). Therefore, the total traffic volumes used in the analysis are considered conservative and as a result, traffic impacts were not underestimated.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment E-2B-4. The commenter states that the DEIR Appendix I: Tables 1-3 does not list project numbers 10, 14, 15, 23, and 81. This is not consistent with Figure 3.

As part of our effort to keep the list of other projects updated as new information became available, certain projects that were identified were later dropped. This occurred, for example, if the project no longer appeared likely to go forward. Figure 3 in DEIR Appendix L-1 (now Figure 4 Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1) has been revised to eliminate those projects.

Response to Comment E-2B-5. The commenter asks that the DEIR clarify whether the “financially constrained project list” is fully funded.

For the TIA study only the projects in the FTIP and the SCAG’s financially constrained project list were assumed to be implemented. A complete list of these projects can be found in SCAG’s 2012 RTP. The resources available to pursue these projects are based on a track record of funds available from various State, federal, and local sources and were approved by the regional funding agencies (SCAG and Western Riverside Council of Governments [WRCOG]) for use as a basis for planning. The projects in the Strategic Plan were not assumed because funding for those projects was considered to be too uncertain. Also, the proposed East-West Freight Corridor that was included in the financially constrained plan was not assumed to be implemented. This is because unlike the other projects which are based on funding mechanisms with a clear track record, the freight corridor is expected to be funded through a tolling mechanism that has not yet been established and whose future efficacy is unknown.

Response to Comment E-2B-6. The commenter states that traffic counts used for the analysis of Alessandro Blvd/Arlington Ave/Chicago Ave are lower than counts used for the Gless Ranch Center TIA.

Traffic varies on a daily basis within a predictable range at any given location. So it is quite possible, in fact probable, that traffic counts done for two different studies on two different days would be different. In any case, this intersection is considered operating at LOS “F” and therefore using different counts would not materially change the result of the analysis.

Response to Comment E-2B-7. The commenter asks that DEIR Appendix I Table 24 (*WLC Trips by Vehicle Type*) be revised to provide adequate detail on the trip generation of Phases I and II. He also states that it was unclear how PCE (passenger car equivalent) factors were applied.

Table 24 in the revised TIA provides data on trip generation by phase as requested. Detailed information on the use of PCEs is provided in the revised TIA, Chapter 2, Section A, in the subsection entitled “Passenger Car Equivalents.”

Response to Comment E-2B-8. The commenter states that the DEIR failed to disclose trip distribution information.

The TIA, an appendix of the DEIR, included Figure 25 (now Figure 28) and Figure 28 (now Figure 33) showing distribution of car and truck traffic, respectively. These figures were not included in the DEIR but they have been included in the FEIR. Also an additional figure (Figure 8) has been included showing the designated truck routes in and around Moreno Valley.

Response to Comment E-2B-9. The commenter states that the DEIR failed to clearly indicate the funding sources for improvements assumed in the No Project scenario for 2035 for Intersections 93, 94, and 95 in 2035.

For the TIA study only the projects in the FTIP and the SCAG’s financially constrained project list were assumed to be implemented. A complete list of these projects can be found in SCAG’s 2012

RTP. The resources available to pursue these projects are based on a track record of funds available from various State, federal, and local sources and were approved by the regional funding agencies (SCAG and WRCOG) for use as a basis for planning. The projects in the Strategic Plan were not assumed because funding for those projects was considered to be too uncertain. Also, the proposed East-West Freight Corridor that was included in the financially constrained plan was not assumed to be implemented. This is because unlike the other projects which are based on funding mechanisms with a clear track record, the freight corridor is expected to be funded through a tolling mechanism that has not yet been established and whose future efficacy is unknown.

The 2012 Regional Transportation Plan's Financially-Constrained Projects list shows that Arlington Avenue is to be widened from 4 to 6 lanes between Magnolia Avenue and Alessandro Boulevard (RTP ID 3A01WT112). Therefore, consistent with the RTP, the RivTAM 2035 network therefore assumes Arlington Avenue as 3 lanes in each direction between Magnolia Avenue and Alessandro Boulevard, where intersection 93, 94, and 95 are located.

Response to Comment E-2B-10. Please refer to Response to Comment E-2B-9.

Response to Comment E-2B-11. Please refer to Response to Comment E-2B-9.

Response to Comment E-2B-12. Please refer to Response to Comment E-2B-9.

Response to Comment E-2B-13. The commenter recommends that analyses of the off-peak and daily time periods be performed. The commenter also asserts, without any supporting evidence, that project traffic is likely to divert onto Martin Luther King Blvd. and Van Buren Blvd. and that these be included in the analysis for the daily period.

We agree that a large percentage of the project's traffic occurs during off-peak hours. This is a highly desirable feature for a major employer. However the purpose of the traffic analysis is to identify where plus-project traffic levels might necessitate roadway improvements by analyzing and mitigating impacts for the worst-case scenario. The worst-case scenario will occur either in the AM or PM ambient peak period, but not during off-peak hours. If sufficient capacity is provided for the worst-case traffic periods then the capacity will also be sufficient for all other off-peak hours. The TIA followed this established procedure in conformance with official guidance ranging from (TRB's) *Highway Capacity Manual* (Chapter 3) to the City of Riverside's own *Traffic Impact Analysis Preparation Guide* (pages 5, 12, 20). Because of the conservatively high trip-generation rate used in the WLC analysis, along with the fact that the peak of trip generation was assumed to occur simultaneous with the peak of background traffic, the assumptions in the WLC analysis are far more conservative (i.e. assume worse conditions) than the field data in the National Association of Industrial and Office Properties (NAIOP) survey suggests is likely to occur. As can be seen in Exhibit E-1B-1 from the TIA, copied below, the TIA assumed peak-hour trip-generation rates far higher than those found in the highest hours of the NAIOP study.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Exhibit E-2B-1: Time-of-Day Distribution, WLC Assumptions Compared to NAIOP

The impact of project traffic on Martin Luther King Blvd. were studied for the five intersections where the project was forecast to potentially add 50 or more peak-hour trips (study Intersections 81 through 85). No intersections were studied along Van Buren Blvd. because tests using RivTAM forecast project traffic to be less than the threshold for study.

Besides roadway design, which was already addressed in the peak-hour analysis, the other purpose of the traffic forecasts was as an input into air quality analyses. The traffic data used for the air quality analysis covered both the peak periods and the full 24-hour period, as requested by the commenter.

Response to Comment E-2B-14. The commenter states that the portion of I-215 between SR-60 and Perris Blvd. should be studied.

As discussed in the TIA (Chapter 1, Section B), the City of Moreno Valley approved a minimum threshold of 100 peak-hour trips to be used to determine whether or not a freeway segment needs to be further analyzed. This threshold was based on Caltrans' guidelines. The City of Riverside itself uses thresholds like this in its traffic analyses (see City of Riverside, "Traffic Impact Analysis Preparation Guidelines", page 3).

This portion of I-215 would attract few WLC trips because it is dominated by an alternate route that is 4.6 miles shorter (i.e. the travel distance from SR-60 at Perris Blvd to I-215 at Nuevo Rd is 14.6 miles using the SR-60/I-215 route but only 10.0 miles using Perris Blvd). That section was analyzed to determine if it met the threshold for further analysis. Tests using the RivTAM model showed that fewer than 100 project trips used this portion of I-215. It therefore did not meet the minimum threshold and therefore it was not included for further analysis. This logic is similar to that presumably used when the City of Riverside recently chose not to require that this same section of I-215 be analyzed in the traffic study for the Gless Ranch shopping center.

Response to Comment E-2B-15. The commenter states that Cajalco Road should be studied.

As discussed in the TIA (Chapter 1, Section B), the City of Moreno Valley approved a minimum threshold of 50 peak-hour trips to be used to determine whether or not a surface street or intersection needs to be analyzed. The City of Riverside uses the same threshold (City of Riverside, "Traffic Impact Analysis Guidelines", page 3). That portion was analyzed to determine if it met the threshold for further analysis. Tests using the RivTAM model showed that Cajalco Road did not meet the minimum threshold and therefore, it was not included for further analysis.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment E-2B-16. The commenter states that it is not clear why the mitigation measures for the cumulative condition consider only 2035 conditions and not 2017 and 2022 conditions.

The cumulative analysis is intended to show the impacts of all reasonably foreseeable future projects. As such, the appropriate timeframe is 2035, which is the time horizon limit of the SCAG adopted RTP/SCS. Therefore, the analyses of interim years, such as 2017 and 2022, were not described as "cumulative."

Response to Comment E-2B-17. The commenter states that the DEIR labels mitigation improvements to Intersection #95 "infeasible" when in the opinion of the commenter an eastbound right-turn lane could be accommodated without significantly affecting any residential property. He also suggests that other improvements are feasible such as adding third left-turn lanes to the northbound and westbound approaches.

Considering the residential community where this intersection is located it is unlikely that moving a large volume of traffic 12 feet closer to the corner houses would not significantly affect residential properties, as suggested by the commenter. Furthermore, the commenter's recommendation for triple-right and triple-left turns does not seem appropriate for this residential setting (all four quadrants of this intersection are communities of single-family homes as illustrated below). Nevertheless, the listing for this improvement has been revised to "feasible" and the project will pay its fair share for this improvement if the City of Riverside proceeds with this measure within the existing residential community and if a suitable mechanism can be established with the City. Please refer to Mitigation Measure (MM) Trans-5 in Chapter 11, Section G.

Exhibit E-2B-2: The Alessandro/Arlington/Chicago Intersection (IN-95)

Response to Comment E-2B-18. The commenter states that the mitigation measures identified in TIA Table 80 for Intersections 94 and 95 do not match the recommended mitigation measure in Table 69. Table 80 (now Table 76 in the revised TIA FEIR Volume 2 Appendix L-1) and 69 (now Table 65 in the revised TIA FEIR Volume 2 Appendix L-1) have been revised and now match in the revised TIA.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment E-2B-19. The commenter concedes that the mitigation measure identified as “infeasible” in the TIA for Intersection 95, and which the commenter suggested in Comment E-2B-17 is feasible, may in fact not be feasible. However he suggests that other improvements are feasible such as adding third left-turn lanes to the northbound and westbound approaches. Please see Response to Comment E-2B-17.

Response to Comment E-2B-20. The commenter states their opinion that that 12,000 daily truck trips on I-215/SR-60 necessitates corridor-wide lane improvement similar to I-710 in Southern LA County.

As previously addressed in the Response to Comment E-2B-1, the 12,000 figure is incorrect. The TIA has correctly analyzed the impact of project traffic on the freeway system, identified the necessary improvements, and recommended that the City work with Caltrans to implement the identified improvement measures.

Response to Comment E-2B-21. The commenter states their opinion that the mitigation measures identified for freeway segment Nos. F-24, F-27, F-42, W-21, W-22, W-23, and W-25 which were identified in the TIA as “infeasible” are feasible. He also suggests that consideration should be given to ramp metering.

We concur with the commenter that F-24, F-27, W-22, and W-23 may be feasible and have changed their descriptions in the TIA to reflect this. However, the City respectfully disagrees with the commenter’s suggestion that the mitigation measures identified for freeway segment Nos. F-42, W-21, and W-25 are feasible.

- **Westbound SR-91 from Magnolia Ave. to La Sierra Ave. (F-42)** would require an additional mixed-flow lane that could only be added by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible.
- **Eastbound SR-60 from SR-91 to W. Blaine St./3rd St. (W-21)** would require adding a mixed-flow lane. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Thus widening the freeway is infeasible.
- **Eastbound SR-60 from Central Ave. to Fair Isle Dr. /Box Springs Rd. (W-25)** would require the addition of a mixed-flow lane. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road.

We concur with the commenter that ramp metering may provide an improved LOS in some locations. However, because the State Freeway System is under the control of Caltrans, it is not within the City’s authority to implement ramp metering in this corridor.

Response to Comment E-2B-22. The commenter states their opinion that that the mitigation measures identified for freeway segment Nos. F-19 F-46, F-42, F-49, W-21, W-22, and W-25 which were identified in the TIA as “infeasible” are feasible. He also suggests that consideration should be given to ramp metering.

We concur with the commenter that F-19, F-49, and W-22 may be feasible and have changed their descriptions in the TIA to reflect this. However, the City respectfully disagrees with the commenter’s suggestion that F-42, F-46, W-21 and W-25 are feasible.

- **Westbound SR-91 from Magnolia Ave. to La Sierra Ave.** (F-42) would require an additional mixed-flow lane that could only be implemented by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible.
- **Eastbound SR-91 from Adam St. to Madison St.** (F-46) would require adding a mixed-flow lane. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. This mitigation is therefore infeasible.
- **Eastbound SR-60 from SR-91 to W. Blaine St./3rd St.** (W-21) would require adding a mixed-flow lane would reduce the impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. This mitigation is therefore infeasible.
- **Eastbound SR-60 from Central Ave. to Fair Isle Dr. /Box Springs Rd.** (W-25) would require the addition of a mixed-flow lane. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road. This mitigation is therefore infeasible.

We concur with the commenter that ramp metering may provide an improved LOS in some locations. However, because the State Freeway System is under the control of Caltrans, it is not within the City's authority to implement ramp metering in this corridor.

Response to Comment E-2B-23. The commenter states their opinion that in light of repeated claims of infeasibility regarding the provision of additional mixed-flow lanes on SR-60/I-215 and SR-91 freeways, the project should be required to fund a Project Study Report and Project Report through the Riverside County Transportation Commission (RCTC) and with the involvement of the City of Riverside for the development of additional lanes on these freeways.

Caltrans completed a Route Concept Report for the SR-60/I-215 corridor in September 2012. This report is available from Caltrans or from the City of Moreno Valley. The study focused on identifying the number of lanes required in each section of the corridor. Among other things, this report recommended adding one mixed-flow lane to SR-60 in each direction between Redlands Blvd and Gilman Springs Rd. Traffic demand on SR-91 was also recently studied leading to improvements that are currently under construction. Both RCTC and the City of Riverside were involved in that study. No additional study is warranted at this time.

Response to Appendix 1 (Qualifications of Keil D. Maberry, P.E.) The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide the engineering qualifications and references for Keil D. Maberry.

Response to Appendix 2 (Two Résumés of staff at Linscott Law, & Greenspan) The referenced appendix was not cited in the comment letter. The resume in the appendix has been reviewed and although the City appreciates the inclusion of professional resumes as part of comments, the City considers all technical comments equally regardless of qualifications of the commenter.

Subject: Comments on Draft Environmental Impact Report for World Logistics Center Project

Dear Mr. Gross:

The Moreno Valley Unified School District (District) welcomes this opportunity to comment on the Draft Environmental Impact Report for the World Logistics Center project. While the District has not taken the position of opposing the project, we have serious concerns about the project's impacts on the environment, particularly the impacts on air quality, and the health and safety of our students, and staff. As outlined in this letter, the DEIR is seriously flawed and should be revised and recirculated before any action is concerning the approval of this project.

PROJECT SUMMARY

The WLC project covers 3,918 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,814 acres of land which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development.

The proposed entitlements include general plan amendments, adoption of a specific plan, zone change, tentative parcel map, pre-annexation and development agreement. The WLC Specific Plan proposes a master-planned logistics campus to include up to 41.4 million square feet of high-cube logistics warehousing, up to 200,000 square feet of light logistics uses, a site for logistics support uses (LS designation), and 75 acres of Open Space in the southwest corner of the site. The Specific Plan includes extensive development standards, design guidelines, and review procedures for all development within the project.

GENERAL COMMENTS

The WLC DEIR does not provide adequate analysis of impacts to District schools or children attending schools. The District operates a total of 39 schools; 23 elementary, six middle, four high schools, four alternative education schools, one early childhood center, and one adult education school. Three schools are located within two miles just west of the WLC site: Ridge Crest Elementary School, La Jolla Elementary School, and Landmark Middle School. The District operates a number of schools along Alessandro, Cottonwood, and Eucalyptus just south of the SR-60.

1

2

3

Some land uses are considered more sensitive to air pollution, greenhouse gas emissions, health risks, noise and traffic impacts, than others due to the types of population groups or activities involved. Sensitive population groups include children, the elderly, the acutely ill, and the chronically ill, especially those with cardiorespiratory diseases. Schools are considered sensitive receptors.

The DEIR only analyzes sensitive receptors immediately adjacent to the WLC site. Due to the project size and the substantial increase in truck traffic, impacts must be analyzed for schools and other sensitive receptors within a larger context. For example, the project's contribution health risk along the SR-60 should also be evaluated with respect to risk to children attending schools in this area. Additionally, truck trips using Alessandro to access the freeway should be clearly depicted and associated cancer risk should be evaluate for schools along Alessandro and all other truck routes.

3

SPECIFIC COMMENTS

Specific Comments are provided below categorized by issue area.

Project Description

The WLC would result over 70,000 truck trips per day, which would have a substantial impact on the surrounding community in several environmental categories. The project description needs to include a figure and description of the preferred and allowable truck routes from the WLC site to the SR-60 and I-215 Freeways.

4

The project description states the Moreno Beach Substation will be expanded to 112 MW, and a new 60 MW substation will be constructed to serve the project (DEIR page 3-51). The description refers to Figure 3.16, which only shows one substation. The Moreno Beach Substation expansion should be clearly depicted on Figure 3.7 and described under energy. The location of this facility and surrounding uses are necessary to determining whether the off-site expansion will result in any health effects.

Air Quality and Community Risk and Hazards Comments

District schools nearest to the project site and along truck routes should be included in the air quality analysis and locations should be shown on Figure 4.3.7.

While the trip generation rate assumed in the Air Quality modeling is higher than the 1.44 trips per thousand square feet (TSF) identified in the 8th Generation of the Institute of Transportation Engineer's (ITE) Trip Generation Manual, it is still substantially lower than the reasonable worst-case trip rate recommended by SCAQMD of 2.59 trips/TSF. The following is stated in the California Emissions Estimator Model User's Guide (CalEEMod):

5

"..The trip rate value used in URBEMIS is 4.96 trips per 1,000 square feet (TSF) for warehouse projects (land use type 150). This value is from the 7th Edition of the Trip Generation manual, published in 2003. Several developers of high-cube warehouses in recent years have questioned the validity of this value for modern warehousing operations and have commissioned local studies to investigate these trip rates. As a result, in the most recent version of the Trip Generation manual (8th Edition, 2008), additional data has been included to provide a new high-cube warehouse (land use 152) trip rate of 1.44 trips/TSF. SCAQMD staff and other interested parties have questioned lead agencies about this lower rate because of concern that industrial warehouse project analyses may be underestimating the number of trucks serving them. If this were true, air quality impacts may be underreported in the corresponding CEQA analyses... In order

to avoid underestimating the number of trips associated with large warehouse / distribution center operations without rail service, AQMD staff recommends that lead agencies utilize a rate of 2.59 trips per TSF for large warehouse air quality analyses on a project specific basis. The value of 2.59 from the nationwide dataset is preferable instead of the SCAB rate of 3.68 due to the greater reliability of data based on the larger sample size. For warehouses with rail service, a rate of 1.63 trips per TSF may be used. These values provide reasonable worst case default rates for individual new warehouses in the absence of more project-specific data."

The Table below illustrates how a change in the trip generation assumption would significantly increase trips generated by the project, and correspondingly underreport the project's air quality and health risk impacts.

High Cube Warehouse Trip Generation Comparison

	Trips Rate	Trips from 41,400 TSF of Logistics
High Cube Warehouse Trip Rate Identified in the Draft EIR	1.68	69,552
High Cube Warehouse Trip Rate Identified in CalEEMod User's Guide	2.59	107,226
		37,674 trips

Table 17 of the DEIR, Daily Trips and Fleet Mix, indicates that there would be 71,085 daily trips associated with the project. Using the trip generation rates in Table 16, Trip Generation Rates, and the operational build-out schedule in Table 15, there would be 73,845 trips per day associated with the project. Therefore, trip generation is underreported, which results in underreporting the project's air quality and health risk impacts.

Trip Generation Comparison

Land Use	TSF	Trips Rate in Table 16	Trips
Logistics (High Cube Warehouse)	41,400	1.68	69,552
Light Logistics	200	3.56	712
Gas Station with Pumps	12	113.95	1,367
Convenience Store	3	737.99	2,214
	41,615 TSF	NA	73,845
Difference from 71,085 Daily Trips in Table 17			-2,760 trips

Additional mitigation that should be considered. There are currently several research and demonstration programs being conducted by the Port of Los Angeles, SCAQMD, California Energy Commission, Environmental

Protection Agency and the U.S. Department of Energy, to develop dedicated zero-emission trucks or hybrid electric trucks that will have zero-emission range. Such demonstrations are expected to be completed within the next several years and lay the foundation for commercialized products. According to SCAQMD, the first generation of zero-emission trucks will be available within the next five years. Build-out would occur well beyond 2022 due to the market demand for warehousing (even though emissions present a worst-case assumption that the project would be built out in 10 years). These trucks will be available within the build-out timeframe considered and should be considered to mitigate the project's significant unavoidable air quality impacts.

Health Impacts from Diesel and Ultra-fine Particulate Matter Emissions, Especially on Children, Are Not Fully Addressed. Diesel particulate matter (DPM) is responsible for most of the *cancer* risk in California from toxic air contaminants; as well as most of the cancer risk from the WLC Project. Significant *non-cancer* health effects also are known to result from diesel particulate emissions. Among the specific non-cancer health effects known to result from diesel particulate matter are:

- Aggravated Asthma
- Decreased lung function in children
- Respiratory and cardiovascular hospitalizations
- Premature death from non-cancer effects such as respiratory and heart diseases (which may occur at a greater frequency than death from cancer)

Adverse non-cancer health effects from DPM, such as those listed above, are not fully evaluated by the methods used in the DEIR.

The Health Risk Assessment (HRA) methodology used in the DEIR underestimates adverse *chronic* non-cancer health impacts known to result from exposure to diesel particulate matter. Health impacts are underestimated due to limitations in the methodology. The Reference Exposure Level (REL) for diesel PM used in the DEIR to calculate a chronic non-cancer Health Hazard Index (HHI) does not account for all of the known health effects from DPM exposure, especially in children. We recognize, and hasten to point out, this methodological deficiency is not unique to the World Logistics Center DEIR; it is present in similar DEIRs due to the fact that alternative quantification methods are lacking. However, it is critical that these limitations of the HRA methodology be clearly and prominently emphasized in the report. The Project DEIR fails in this regard.

The DEIR also downplays the known *acute* non-cancer risk from exposure to project emissions. The report asserts that there is insufficient exposure information to establish a short-term non-cancer health risk guidance value for respiratory effects (DEIR, p. 4.3-71). As a result, the DEIR incorrectly concludes "Therefore, the potential for short-term acute exposure from diesel exhaust are considered to be less than significant and no mitigation is required." Based on the known short-term health effects of DPM, as summarized above and below, this statement in the DEIR is erroneous and grossly misleading.

The DEIR does not account for the greater sensitivity of children to non-cancer health effects caused by diesel and ultra-fine particulate matter (UFP). Scientific studies have shown associations between traffic-related pollution and effects in children, including chronic bronchitis, allergic rhinitis, asthma induction, upper and lower respiratory tract infections, and impaired lung function growth (CARB, *Emission Reduction Plan for Ports and Goods Movement*, 2006).

In a 2001 report (Prioritization of Toxic Air Contaminants Under the Children's Environmental Health Protection Act) the Office of Environmental Health hazard Assessment (OEHHA) identified diesel exhaust particulate matter as one of the five "Tier 1" toxic air contaminants (out of a total of 200 candidate TACs evaluated) that may cause infants and children to be especially susceptible to illness. The 2001 OEHHA report describes diesel exhaust particulate as " ... ubiquitous in urban environments, and exposures are widespread. There are many studies demonstrating that diesel exhaust particulate can enhance allergic responses, and induce new allergies to airborne allergens. This raises concern for enhancement of allergic airway disease including asthma, and for development of new asthma. Diesel exhaust particles contribute to ambient PM₁₀. Ambient PM₁₀ has been shown to exacerbate asthma and has been associated with low birth weight and decreased lung function in children. Several studies provide evidence of adverse respiratory health impacts in children living near streets with heavy truck traffic. In addition, diesel exhaust particulate contains PAHs (and other mutagenic polycyclic organic matter).

The DEIR also fails to adequately disclose and analyze UFP emissions from the project and, as a result, there is insufficient information and analysis regarding the adverse health impacts to District students and staff caused by UFPs. In the decade before and the year since the DEIR was released, the scientific research pointing to the adverse health effects from UFPs, especially on children, has continued to grow¹². The project will route more than 71,000 average daily vehicle trips, including over 14,000 truck trips per day, in close proximity to District schools. Each of these new pollution sources will emit significant quantities of UFPs in the vicinity of District schools, students, and staff. The DEIR does not account for the wider dispersion zone of UFPs compared with larger particles (PM_{2.5} and PM₁₀). UFPs are 0.1 micron or less in size and will travel farther from the Project than larger particulates. According to one study of the I-10 freeway in Los Angeles, UFPs travel up to 8,500 feet downwind and 1,970 feet upwind from the emission site³.

Because of their smaller size, UFPs also are able to penetrate more rapidly and deeper into the lung and more readily translocate to other organs in the body than larger particles (PM_{2.5} and PM₁₀). By failing to account for the wider impact and significant health hazards of UFPs (both downwind and upwind), the DEIR improperly masks some of the most significant impacts of the Project. However, despite the troubling lack of data regarding UFPs in the DEIR, there is no doubt UFPs from the project pose a significant health threat to MWUSD students. This threat must be fully disclosed and evaluated in order to provide sufficient data for informed decision-making.

The District requests that the DEIR be revised to include additional efforts to adequately characterize—and mitigate—the un-quantified non-cancer health risks of diesel (DPM) and ultra-fine (UFP) particulate matter emissions from the project on school-age children.

Page 6

The Greater Sensitivity of Children to Toxic Air Contaminants and Cancer Risk is Not Evaluated. The DEIR shows significant and unavoidable cancer risks will result from the project, including for students and staff at District schools (see Figures 1 and 2, attached). However, due to the risk assessment methodology used, the presentation in the DEIR underestimates the cancer risk to children. The cancer risk factor for DPM used in the DEIR fails to adequately account for the greater sensitivity of children to Toxic Air Contaminants (TACs). Scientific research data from humans and animals suggest that exposure to a variety of carcinogens early in life may result in a greater lifetime risk of cancer than exposures later in life. Because of this, the State of California (OEHHA, 2012) now recommends that cancer risk factors be weighted by a factor of three for exposure of children ages two to sixteen (Air Toxics Hot Spots Program Risk Assessment Guidelines, Technical Support Document for Exposure Assessment and Stochastic Analysis; OEHHA, August 2012). Furthermore, the OEHHA has recommended the use of age-specific cancer risk factors since at least 2009. (OEHHA, Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures, May 2009.)

7

OEHHA guidelines also recommend that exposures from projects lasting more than six months be evaluated for the duration of the project. Given that District elementary schools, middle schools, and high schools are within the significant cancer risk contours of the project (see Figures 1 and 2, attached), the DEIR should be revised to include age specific risk factors and an appropriate exposure period in order to fully assess the risks to students.

The District requests that the DEIR include an analysis of health risks to schools – including cancer risks to students -- using appropriate exposure durations, and agency-recommended age-specific risk factors.

Health Risks from Diesel PM Remain Un-Quantified. Although the DEIR quantifies the cancer and non-cancer risks of diesel exhaust PM, additional health effects from diesel PM are not quantified in the DEIR's methodology. The list of health effects for diesel PM not captured in the DEIR is long (see CARB, 2006), and is rapidly evolving, with new scientific findings being published regularly.

8

The District requests the DEIR be revised to include additional efforts to adequately characterize—and mitigate—cancer and non-cancer health risks associated with diesel PM from the Project.

Additional Mitigation Required. The foregoing comments describe some of the DEIR's deficiencies in evaluating the project air quality impacts and associated health risks, including underestimating cancer risks and non-cancer hazards to students from particulate matter and other pollutants. Despite these deficiencies, the DEIR does identify significant and unavoidable cancer risk impacts to District school sites (see Figures 1 and 2, attached) from the "mitigated project". Where there is a significant unavoidable adverse impact, CEQA requires incorporation of all feasible mitigation to avoid or substantially less that effect (see CEQA Guidelines §15091). Additional mitigation beyond that proposed in the DEIR is necessary – and available --for these significant impacts.

9

The mitigation measures included in the DEIR fail to reduce project impacts to an acceptable level, and do not adequately protect the sensitive receptors at school sites that will be impacted by this project. As such, in addition to correcting the specific deficiencies in the DEIR noted above, we suggest that additional mitigation projects be developed that would balance community needs with goods movement to and through the project. The District

requests consultation with the City and project applicant so that the required additional mitigation measures can be developed and included as part of the project in an efficient and effective manner.

As a starting point for these future discussions, we point to the Mitigation Grant Programs that the ports of Long Beach and Los Angeles have funded and successfully implemented to address residual air quality impacts to schools and other receptors. The goods movement projects that prompted port area Mitigation Grant Programs are comparable in scope (e.g., thousands of trucks) and impacts (DPM emissions) to the World Logistics Center Project. To date, the port of Long Beach (POLB) alone has committed over \$17 million for goods movement mitigation grant programs. For example, the POLB has funded installation of high efficiency air filters in local schools in the amount of more than \$3 million; additional POLB funding for school air filtration projects is pending. The efficacy of high efficiency air filtration installations in schools as mitigation for residual air impacts from goods movement has been demonstrated by the SCAQMD⁴.

9

Mitigation grants associated with the WLC project could be used for a range of measures that have been proven successful in the ports and other areas. These measures include: 1) the installation of high performance air filtration units, 2) installation of new energy efficient windows and doors with low air leakage, and 3) landscaping with air filtration benefits. A working concept being considered on one port project with similar air quality impacts would dedicate at least 10 percent of the total project costs associated with the development of the project to the Mitigation Grant Program. Another approach would be to provide annual funding to the Mitigation Grant Program based on a percentage of gross revenues of project operations until such time that modeled emissions no longer impact sensitive receptors.

Greenhouse Gas Emissions

The project's operational GHG emissions would generate 751,787 mt CO₂e/year and 665,321 mt CO₂e/year with design features. The GHG section does not provide an analysis how this level of GHG emissions will impact the surrounding area or region.

This section must evaluate consistency of the project with the strategies proposed by the Southern California Association of Governments (SCAG) to reduce vehicle miles traveled (VMT) in the region, in accordance with Senate Bill 375 (SB 375). SCAG's 2012 SCS/RTC uses substantially different assumptions for population and employment for the site per the adopted Moreno Highlands Specific Plan. Therefore, consistency of the project must be analyzed with respect to the 2012 RTC/SCS.

10

CEQA requires incorporation of all feasible mitigation to avoid or substantially lessen significant unavoidable impacts (see CEQA Guidelines §15091). The project includes one mitigation measure related to reducing solid waste to mitigate GHG emissions. Project design features that mitigate GHG emissions should be outlined in the mitigation program to ensure enforceability.

Hazards and Hazardous Materials

The DEIR states that there are no existing school facilities within one-quarter of a mile of the project area. Due to the project size and the substantial increase in truck traffic, impacts must be analyzed for schools and other

11a

⁴ SCAQMD, 2009. Pilot Study of High Performance Air Filtration for Classrooms Applications, draft report, prepared by South Coast Air Quality Management District and IQAir North America, Inc., October 2009.

sensitive receptors within a larger context. Truck routes should be examined to ensure that truck-related risks will not impact schools along dedicated truck routes.

▲
 — 11a

The DEIR must identify the threshold for businesses required to prepare a Hazardous Materials Business Emergency Plan.

— 11b

High pressure natural gas lines cross the project site that will be relocated or protected in place. A pipeline risk assessment should be prepared to determine the risk of a catastrophic accident and its impact to the surrounding residents and nearest District schools.

— 11c

Population, Housing and Related School Impacts

The DEIR states that the project would not generate an increase in residential units or an increase in population. Further it states that no homes and no significant generation of school-aged children would be developed as part of the proposed project. However, the project would generate approximately 24,642 new permanent employees in addition to 7,583 indirect /induced permanent jobs and 13,128 short-term construction-related jobs.

The approximately 25,000 new jobs would nearly double the existing employment of 25,120 in the city. Doubling the number of jobs in the city would induce population growth in the area. The DEIR must quantify the increase in population resulting from new jobs in the area, the number of students that would be generated, and its impact on District schools.

— 12

The DEIR states that employees of the project who choose to live in the City would likely utilize the existing supply of housing. However, there is no analysis to support that statement. Employment and housing factors should be taken into account to substantiate the analysis, such as the existing housing inventory and surplus and the location of the where the anticipated workforce currently resides based on education and income.

Traffic and Circulation, Noise

The traffic study does not provide a description or illustration of truck routes going to and from the project site. The DEIR states that 82 percent for the truck trips will be oriented west via one or more freeways. The DEIR needs to state specifically which surface streets will be used. If east-west surface streets, such as Alessandro Boulevard, will be used to access the I-215 or SR-60, then the DEIR must analyze the impacts resulting from the substantial increase in truck traffic along these routes. The analysis must include, but is not limited to: the increase in traffic noise levels for schools and outdoor playgrounds, the potential traffic safety impact of truck trips along streets adjacent and near schools, and as stated above, DPM health risks.

— 13

CONCLUSION

The District strongly urges the City to revise and correct these deficiencies and recirculate the DEIR before considering approval of the project. The District will continue to actively participate in this process and looks forward to working with the City to ensure each of these concerns is sufficiently addressed prior to approval of the project.

RESPONSES TO LETTER E-3

Moreno Valley Unified School District

Response to Comment E-3-1. The City understands the Moreno Valley Unified School District (District) has strong concerns about the potential public safety and health risks of the World Logistics Center (WLC) project. The City evaluated the many comments received on the Draft Environmental Impact Report (DEIR), including those of the District. The revised technical studies and DEIR provide additional information, mainly in the form of responding to the many questions and comments received on the DEIR. However, this additional information does not rise to the level of significant new information, nor does it identify any new or substantially different significant environmental impacts from those identified in the DEIR. Therefore, the DEIR will not be recirculated.

Response to Comment E-3-2. The District has accurately summarized the project characteristics that were evaluated in the DEIR. Subsequent to circulation of the DEIR, 100 acres was removed from the WLC Specific Plan (SP) site which also removes 1 million square feet of high-cube logistics development of the proposed project. The revised DEIR document evaluates the impacts of the revised project, which are generally equivalent to those of the project evaluated in the DEIR.

Response to Comment E-3-3. The commenter stated that project truck trips using Alessandro Blvd should be clearly depicted.

As explained in Chapter 4, Section B, Alessandro Blvd. will be severed and will not connect to the project site (see Exhibit E-3-1 in the TIA, copied below). Project-related car traffic heading west will be directed towards Cactus Blvd. Trucks will not be permitted to use the Cactus Blvd. access point and would instead be directed to SR-60. For these reasons, there is no project-related truck traffic expected on Alessandro Blvd.

Exhibit E-3-1 Proposed Roadways and Phasing

Response to Comment E-3-4. The commenter asked that a figure showing the truck routes to the SR-60 and I-215 freeways be added. A figure (Figure 8 in the Traffic Impact Analysis (TIA) Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1) has been added showing the designated truck routes in and around Moreno Valley.

Response to Comment E-3-5. The commenter acknowledges that the trip generation rate used in the TIA (1.68 vehicular trips per thousand square feet per day (VT/KSF/day)) is higher than the rate recommended in the Institute of Transportation Engineer's Trip Generation Manual 8th Edition (1.44 VT/KSF/day) but nevertheless claims that the rate it is too low and results in underreporting the air quality impact and health risk impacts. The commenter cites a recommendation from the South Coast Air Quality Management District (SCAQMD) that a higher rate of 2.59 VT/KSF/day should be used instead. The commenter also notes what appears to be a small (3%) inconsistency between the trip generation rates and the total reported trips in Table 17 in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Report* prepared for the DEIR.

The figure cited by the commenter (2.59 VT/KSF/day) is recommended by SCAQMD for use in evaluating worst-case scenarios for individual warehouses. When ten or more warehouse buildings are evaluated as a group, as is the case for the WLC (Section 2.1 of the Specific Plan states that the WLC will have 15-to-30 logistics warehouses), then SCAQMD recommends the use of the average rate of 1.44 VT/KSF/day (*California Emissions Estimator Model, Appendix E Technical Source Documentation*, California Air Pollution Control Officers Association, page 14), which is lower than the rate of 1.68 VT/KSF/day that used in the TIA. As stated in Section 2.1 of the Specific Plan, it is anticipated that the WLC will have 15-to-30 logistics warehouses. As a result, the TIA takes a more conservative approach to traffic analysis than necessary.

It appears that the small inconsistency the commenter is referring to occurs due to the fact that a portion of trips to some destinations were considered pass-by trips. These are trips that, for example, stop at the fueling station as a side trip during the course of a primary trip or from their primary destination in the WLC. Standard engineering practice is to not count these as new trips but rather as part of the longer trip. This is discussed in the revised TIA (FEIR Volume 2, Appendix L-1) at Chapter 2, Section B, the subsection entitled Manual Trip Generation and Assignment for Fueling Station.

Response to Comment E-3-6. The commenter raised several issues dealing with availability and feasibility of demonstration-stage hybrid trucks as additional project mitigation, health impacts from diesel and ultra-fine particulate matter emissions; responses are discussed below.

Additional Mitigation: The commenter suggests that zero emission or hybrid electric trucks should be a mitigation measure. Please refer to Master Response-3 in Comment Letter C-3: Zero Emission or Hybrid Electric Trucks, Vehicles, and Equipment for why this would not be a feasible mitigation measure. The commenter states that there are demonstration projects conducted by the California Energy Commission, United States Environmental Protection Agency (EPA), and the United States Department of Energy. However, no references are provided. Even if there were demonstration programs, there are no commercially viable zero-emission or hybrid trucks available and it is not known whether any such demonstration project would be successful and lead to commercially viable zero-emission or hybrid trucks. In addition, these programs would have funding from those referenced agencies; the project and its tenants would not be guaranteed funding for such programs.

The commenter also claims, "according to SCAQMD, the first generation of zero-emission trucks will be available within the next five years." However, the commenter does not provide a reference for that statement. In its comment letter on this DEIR, the SCAQMD did not recommend zero-emission technologies. The SCAQMD did recommend installing the requisite electrical infrastructure for these trucks when they become commercially available, which is included in Mitigation Measure (MM) 4.3.6.4A. Even if zero-emission trucks are available within the next five years, it is not feasible to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

require zero emission trucks, as discussed in Master Response-3 in Comment Letter C-3, Zero Emission or Hybrid Electric Trucks, Vehicles, and Equipment.

Health Impacts from Diesel PM: The commenter points out that diesel PM is responsible for most of the cancer risk in California and is known to cause significant non-cancer health impacts. Discussions on the health risks associated with diesel PM were provided in the DEIR and as discussed in Master Response-2 in Letter C-3: Health Effects of Diesel Particulate Matter.

Assessment of Chronic Non-Cancer Hazards: The commenter also points out that the non-cancer health impacts dealing with chronic and acute non-cancer exposures were not fully estimated because of limitations in methodologies or no thorough analysis.

The assessment of the chronic non-cancer impacts from the project was included in the DEIR (see Section 4.3 of the DEIR) and followed the recommended methodology prescribed by the SCAQMD and the Air Resources Board (ARB), which is based on the concept of a reference exposure level or reference exposure level (REL). The REL is an exposure level of a pollutant below which the pollutant is assumed to not have a deleterious health impact. The assessment of chronic non-cancer hazards presented in the DEIR concluded that exposures to diesel PM from the project would result in exposure levels of diesel PM that are below the REL for diesel PM established by Office of Environmental Health Hazard Assessment (OEHHA) and thus would not result in a significant chronic non-cancer health hazard.

Assessment of Acute Non-Cancer Hazards: The assessment of acute non-cancer hazards contained in the DEIR was discussed qualitatively and has been expanded in the revised analysis by examining the potential hazards associated with the total organic gas (TOG) emissions from both gasoline vehicles and diesel vehicles. Exposures to several components (i.e., chemical species) that make up gasoline and diesel TOG emissions have been associated with acute non-cancer health impacts. For this purpose, estimates were made of the maximum 1-hour emission rates of TOG based on the peak-hour traffic volumes from the project's mobile sources over a network of nearly 500 roadway segments that covered the region from near Palm Springs, the project, and the ports of Los Angeles and Long Beach.

To estimate the levels of these chemical components from the project's TOG emissions, ARB speciation profiles were used to subdivide the estimated TOG impacts into their individual chemical species. Each chemical species has an associated acute non-cancer REL, which is the amount of that species below which that species will not have an acute non-cancer effect. Separate estimates were made for the potential chemical species hazards from the project's gasoline vehicles and diesel vehicles. This discussion and the results are provided in Section 5.2, Impact Analysis, and in Impact AIR-4 Sensitive Receptors of the revised analysis (FEIR Volume 2 Appendix D). The results demonstrate that even during the worst-case condition (assuming that the project would be fully built out in 2012), the project's maximum acute non-cancer hazard was found to be 0.07, substantially less than the SCAQMD's significance threshold of 1.0 at any location examined including residences, schools, and health care facilities.

Ultrafine Particles: The commenter indicates that the DEIR fails to adequately disclose and analyze ultrafine particles (UFP) from the project.

The commenter states, "Scientific research pointing to the adverse health effects from UFPs, especially on children, has continued to grow." The commenter then references the "2012 AQMD Draft Program EIR." It is presumed that the reference is for the 2012 Air Quality Management Plan (AQMP), Chapter 9. However, the 2012 AQMP also states, "New toxicological and epidemiological studies targeting exposure to controlled and uncontrolled emissions from gasoline and diesel vehicles are needed to better characterize the exposure-response relationships to UFPs and to help develop

health guidelines and potential regulations.” Although there have been some studies, more are needed in order to identify a level of concern or threshold.

The commenter states that the DEIR “does not account for the wider dispersion zone of UFPs compared with larger particles (PM_{2.5} and PM₁₀). UFPs are 0.1 micron or less in size and will travel farther from the project than larger particulates.”

Information regarding UFP has been added to the revised analysis and in the FEIR. However, UFP are not quantified and a significance finding is not presented in the FEIR. This is because the ARB, SCAQMD, and the EPA do not have standards, thresholds, consensus regarding how to standardize particle measurements, approved methodology to estimate emissions of UFP, or mathematical models to estimate the dispersion of these particles. The SCAQMD states further (Page 9-35) of the SCAQMD 2012 Air Quality Management Plan²³ “Currently, U.S. EPA notes that, in their assessment, there is not sufficient health evidence to support a separate standard for UFPs.” Thus, even if UFP were able to be quantified, there would be no standard or threshold to which it could be compared, so the significance of such emissions would be speculative.

Response to Comment E-3-7. The commenter provides a discussion indicating that the cancer risk analysis contained in the DEIR underestimates the cancer risk to children by not accounting for the greater sensitivity of children to exposures to toxic air contaminants compared with adults. The commenter points to the need to apply age-specific sensitivity factors and an appropriate exposure time period to assess cancer risks to students.

As discussed in Master Response-2 and Section 4.3 of the EIR, new technology diesel exhaust does not contribute to cancer. Nonetheless, the revised health risk assessment now fully incorporates the Current OEHHA Guidance recently adopted age sensitivity factors to address potential exposures to school-age children from air emissions from the project. The assessment of school-age health risks is discussed in FEIR Section 4.3.3 Risk Assessment Methodology. As discussed therein, the assessment accounted for the duration that children could potentially be exposure during their time at school. For this purpose, the assumptions applied in estimating cancer risks to school-age children were:

Time at School: 180 days per year
School Day: 9 hours per day
School Duration: 9 years
Daily Breathing Rate: 745 liters per kilogram per day as representative of school-age children at the 95th percentage breathing rate
Age Sensitivity Factor: 3

As noted above, the commenter also requested that the DEIR be revised to include exposure durations and age sensitivity factors that more appropriately assess the cancer risks to school-age children. These factors have been included as part of the Current OEHHA Guidance for estimating cancer risks. Age sensitivity factors have been developed by the OEHHA and apply to children in the context of the Current OEHHA Guidance includes both early-life exposures that may result in the occurrence of cancer during childhood and early-life exposures that may contribute to cancers later in life.

Cancer risks were estimated at 36 elementary, middle, and high schools located within the City of Moreno Valley applying the methodologies discussed above. The results of the risk calculations are shown in Table E-3.A (FEIR Volume 2 Appendix D). The results indicate that the SCAQMD cancer risk

²³ SCAQMD 2012. Air Quality Management Plan. Chapter 9. Near Roadway Exposure and Ultrafine Particles. Website: <http://www.aqmd.gov/aqmp/2012aqmp/Final-February2013/Ch9.pdf>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

significance threshold would not be exceeded at any of the schools analyzed, based on the exposure durations appropriate to school-age children. The results of this school-age risk assessment are provided in the table below and are contained in the revised analysis.

Table E-3.A: Estimated Cancer Risks at Nearby Schools

Source: Air Quality, Greenhouse Gas, and Health Risk Assessment, 2015.

Response to Comment E-3-8 The commenter requests that the DEIR be revised to include additional efforts to adequately characterize and mitigate the cancer and non-cancer health risks associated with diesel PM for the project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

This comment is addressed in Master Response-2: Health Effects of Diesel Particulate Matter and responses to other comments contained in Comment Letter C-3. The DEIR and the revised analysis examined in great detail the potential impacts of the project and identified both project design features and mitigation measures that would minimize the project's air quality impacts. Among the many mitigation measures designed to reduce the project's emissions include the following:

- The project has committed to requiring all diesel trucks to meet model year 2010 engine standards, the cleanest diesel engines available (see project design feature on page 3-33 of the DEIR, Mitigation Measure 4.3.6.3B(I) in the revised analysis, and Section 12.2 Engine Restrictions of the World Logistics Specific Plan).
- Limiting idling time of all diesel trucks to 3 minutes in accordance with proposed mitigation.
- Use of natural gas fired emergency generators.
- Use of yard hostler trucks that meet either Tier 4 or model year truck engine standards, the cleanest truck engines.
- Pallet jacks, forklifts, and other onsite equipment used during building operation (indoors or outdoors) shall be powered by electricity, natural gas, propane, or other non-diesel fuel.
- Use of off-road construction equipment greater than 50 horsepower meeting Tier 4 standards (MM 4.3.6.2A).
- Prohibiting heavy trucks from traveling on Redlands Boulevard south of Eucalyptus Street to keep trucks away from local residential areas; Cactus Avenue will be designed to prohibit use by heavy trucks.

Response to Comment E-3-9. The commenter suggests that additional mitigation projects be developed that would balance community needs with goods movement to and through the project. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project's mitigation measures.

Suggested Mitigation Measure	Response
The project could have a mitigation grant program. The Mitigation Grant Programs that the Ports of Long Beach and Los Angeles have funded and successfully implemented to address air quality impacts to schools and other receptors. The Port of Long Beach has committed over \$17 million for mitigation grant programs.	Not Included. As part of the revised Health Risk Assessment (HRA), a standard 9-year exposure analysis was conducted for the school sites, including modifications recommended by the Moreno Valley Unified School District (see Response to Comment E-3-7). No significant impacts were found (the incremental cancer risk was less than 10 in a million) and, therefore, no additional mitigation is necessary at those locations. In addition, there is no nexus nor can proportionality be established between a fixed percentage of project development costs and the funding of undetermined mitigation measures. In fact, neither Southern California port is considering a fixed percentage of project development costs to fund a mitigation program. Also see Master Response-5 regarding why air filtration systems are not feasible.
The project could fund high efficiency air filtration installations in local schools. The Port of Long Beach funded installation of high efficiency air filters in local schools in the amount of more than \$3 million.	
The project could fund the installation of new energy efficient windows and doors with low air leakage for offsite sensitive receptors.	
The project could install landscaping with air filtration benefits.	Not Included. It is not clear from the comment whether the commenter is suggesting this for offsite or onsite. If onsite, the project would plant a wide variety of landscaping features. However, the benefits of such landscaping in reducing pollutant impacts is highly variable depending on landscape variety, age, spacing, leaf density, and wind speed.

Response to Comment E-3-10. The commenter indicates that the greenhouse gas emissions as estimated in the DEIR are approximately 700,000 metric tons carbon dioxide equivalent (MTCO_{2e}) per year at buildout.

The greenhouse gas emissions analysis has been revised based on the use of forecasted project traffic volumes along the local and regional roadway network (see Master Response-1 in Letter C-3).

The commenter indicates that the greenhouse gas section does not provide an analysis on how this level of greenhouse gas emissions will impact the surrounding area or region. There are no models available to identify how the relatively small quantity of project emissions will influence the surrounding area. The current climate models look at the global climate and global emissions. The project's emissions compared with global emissions are relatively small; the emissions would not be perceptible in the global climate models. Pages 4.7-5 and 4.7-6 of the DEIR explain potential climate change effects to California. Pages 73 through 76 of Appendix D to the DEIR explain potential climate change effects (reduction in water supply, increased wildfires, flooding) to Moreno Valley.

The commenter indicates that the greenhouse gas section should evaluate consistency with the Southern California Association of Government (SCAG) strategies to reduce vehicle miles traveled in the region. Table 4.7.D in the DEIR identifies these strategies as well as the responsible party for implementing those strategies. The DEIR at page 4.7-22 states, "Many of the strategies are similar to the project's mitigation measures and project design features." This table has been expanded in the FEIR to demonstrate that the project is consistent with those strategies.

The commenter indicates that "SCAG's 2012 Regional Transportation Plan/ Sustainable Communities Strategy (RTC/SCS) uses substantially different assumptions for population and employment for the site per the adopted Moreno Highlands Specific Plan. Therefore, consistency of the project must be analyzed with respect to the 2012 RTC/SCS." A comparison of emissions for the Moreno Highlands Specific Plan and the project is shown in the FEIR (the alternatives section). In addition, it is unknown if the SCAG's SCS used the Moreno Highlands Specific Plan variables in its modeling.

Although there is only one mitigation measure required to reduce greenhouse gas (GHG) emissions, other mitigation measures and project design features in the DEIR would also reduce GHG emissions, as shown in Table 4.7.H in the DEIR and Table 4.7.I in the FEIR.

The commenter indicates that project design features that reduce GHG emissions should be outlined in the mitigation program to ensure enforceability. The project design features are included in the WLCSP and will be enforced in tenant leases.

Response to Comment E-3-11A. See Response to Comment E-3-7.

Response to Comment E-3-11B. DEIR Section 4.8.2.2, State Regulations – California Code of Regulations addresses the threshold for businesses to prepare a Hazardous Materials Business Emergency Plan. The California Hazardous Materials Management Act (HMMA) requires that businesses handling or storing certain amounts of hazardous materials prepare a Hazardous Materials Business Emergency Plan (HMBEP), which includes an inventory of hazardous materials stored on site (above specified quantities), an emergency response plan, and an employee training program. An HMBEP is a written set of procedures and information created to help minimize the effects and extent of a release or threatened release of a hazardous material. The intent of the HMBEP is to satisfy federal and State Community Right-to-Know laws and to provide detailed information for use by emergency responders.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Per the California Health and Safety Code (HSC), Chapter 6.95, Section 25500–25532, an HMBEP must be submitted by any business that handles a hazardous material or a mixture containing a hazardous material in quantities equal to, or greater than:

- A total weight of 500 pounds or a total volume of 55 gallons;
- 200 cubic feet of a compressed gas at standard temperature and pressure; and/or
- A radioactive material handled in quantities for which an emergency plan is required pursuant to Parts 30, 40, or 70 of Chapter 10, Title 10, Code of Federal Regulations (CFR), or equal to or greater than the amounts specified above, whichever amount is less.

An HMBEP must be prepared prior to facility operation. Any business subject to HMBEP requirements shall submit an amendment of its HMBEP to the local implementing agency when there is: A 100 percent or more increase in the quantity of a previously disclosed hazardous material; Any handling of a previously undisclosed hazardous material subject to the inventory requirements; Change of business address; Change of ownership; Change of business name; and/or Change of contact information.

In addition, any business subject to HMBEP requirements is also required to certify the inventory of hazardous materials handled at the business every year. Businesses are also required to review their HMBEP at least once every three years to determine if a revision is necessary. Once the review has been conducted, the business must certify in writing to the local implementing agency that a review has been completed and necessary changes were made. For businesses within the City of Moreno Valley, HMBEPs are submitted to and approved by the County of Riverside Community Health Agency, Department of Environmental Health.

Response to Comment E-3-11C. The California Department of Education (CDE) requires a Pipeline Risk Assessment to be conducted for all high-pressure pipelines within 1,500 feet of a proposed elementary or secondary school. No elementary or secondary schools currently exists, nor are any proposed, within 1,500 feet of the project and, therefore, no pipeline risk assessment is required. Relocation of existing natural gas lines is discussed at page 4.16-38 of the DEIR.

It should be noted that the California Public Utilities Commission (CPUC) ensures that the state's natural gas pipeline systems are designed, constructed, operated, relocated and maintained according to safety standards set by the CPUC and the federal government. CPUC gas safety inspectors are trained and certified by the federal government. The CPUC enforces safety regulations, inspects utility work, including the relocation of existing lines, and makes necessary additions and changes to regulations for promoting the safety of the public and the utility employees that work on the gas pipeline systems.

The CPUC created a comprehensive, high-level, Gas Safety Action Plan (<ftp://ftp.cpuc.ca.gov/safety/GasSafetyPlanApril2013.pdf>) to guide and promote the CPUC's shift in culture from the traditional compliance model to a regulatory structure that sets, monitors, and enforces rules for regulated utilities based on risk assessment and risk management. San Diego Gas and Electric company, which is regulated by the CPUC, currently provides, and will in the future provide, natural gas to the project site. The Gas Safety Action Plan also tracks the CPUC's implementation of improvements responsive to recommendations made by the Independent Review Panel and the National Transportation Safety Board in response to the tragic Pacific Gas and Electric (PG&E) San Bruno pipeline explosion that occurred on September 9, 2010. As part of the Plan, the CPUC engages in an in-depth review of its current practices and procedures to seek areas for improvement in gas pipeline safety.

All new and reconstructed gas piping systems and facilities are to be designed and tested according to the requirements of Title 49 CFR part 192 (PHMSA US Department of Transportation Pipeline and Hazardous Materials Safety Administration). These standards must be followed in connection with the

relocation of any lines and therefor compliance with the required regulations will reduce the risk of an accident to insignificance.

Response to Comment E-3-12. The commenter did not provide any empirical evidence to support the contention that the additional jobs created by the WLC project over the long-term would induce substantial housing or population growth in the City. The project economic studies, included in Appendix O of the DEIR, with revised versions in Appendix O of the FEIR, indicate that new jobs in the WLC project would most likely be filled by existing City residents who are currently out of work (i.e., the City's current unemployment rate varied from 10.7 to 13.3 percent during 2013 (Economagic.com website 2013)). In addition, Section 4.13, *Population and Housing*, of the DEIR discusses the potential housing and population impacts of the WLC project, both direct and indirect, and concludes those impacts are less than significant. According to the District's own School Facilities Impact Fee Justification Reports, industrial uses, especially warehouses, do not generate substantial amounts of new students who would attend local schools. In addition, according to Government Code Section 65995(h), payment of school impact fees is complete and full mitigation so there is no significant impact on the District.

Response to Comment E-3-13. The commenter asked that a figure showing the truck routes to the SR-60 and I-215 freeways be added. They also request that the safety impact of truck trips near schools be analyzed. The commenter also expressed concern about traffic noise near schools.

Figure 8 (FEIR Volume 2 Appendix L-1) has been added to the TIA showing the designated truck routes in and around Moreno Valley. An additional section (Chapter 12, Section B) has been included in the TIA to analyze potential project safety impacts on roads near schools. An additional memorandum dated July 2014 has been written to address the newly proposed high school site # 5 located north of the SR-60. No significant impacts were found. There are very few locations where considerable volumes of project traffic cross pedestrian traffic of any significance near schools. At these locations appropriate safety measures are already in place. Section 4.12 Noise of the EIR examined noise impacts of project traffic, including passenger vehicles and trucks, along the city streets and freeways analyzed in the TIA.

Response to Comment E-3-14. The EIR accurately express the many potential environmental impacts of the proposed WLC project and recommend appropriate feasible mitigation measures. For information on potential recirculation, see Response to Comment E-3-1. As a commenting responsible agency, the District will have a chance to review draft responses to all comments on the DEIR before action is taken on the project, as required under California Environmental Quality Act (CEQA).

Response to Appendix 1. This appendix provides the locations of the nearby schools in relation to the estimated cancer risks from the project as shown in the DEIR. In the revised analysis, an assessment was done that specifically addresses impacts to schoolchildren based on their representative exposures to air pollutants while attending school. The results of this analysis are provided in Response to Comment E-3-6.

Letter E-4: City Of San Jacinto (April 9, 2013)

**RECEIVED****APR 09 2013**CITY OF MORENO VALLEY
Planning Division

April 8, 2013

Mr. Mark Gross, AICP
Planning Division
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

Dear Mr. Gross,

The City of San Jacinto is pleased to provide this letter in response to the City of Moreno Valley's circulation of the Draft EIR for the World Logistics Center development project. We appreciate the opportunity to review and comment about such a large development, which will have a significant impact to the region.

At this time, the City of San Jacinto does not have any specific comments to offer regarding the environmental impacts discussed in the Draft EIR. We do note that the project will have many significant impacts to traffic congestion on both freeways and surface streets in the area, including roadways outside of Moreno Valley's city limits. The City of San Jacinto is interested in working with other local agencies and the developer to mitigate this project's impact by establishing a method for the finance and construction of infrastructure improvements outside of Moreno Valley. We ask that San Jacinto staff be invited to participate in all future efforts along these lines.

Thank you for the opportunity to comment on the World Logistics Center project.

Sincerely,

Tim Hults
City Manager

1

RESPONSES TO LETTER E-4

City of San Jacinto

Response to Comment E-4-1. The City of Moreno Valley thanks the City of San Jacinto for its positive and constructive comments, and looks forward to working with the City of San Jacinto and others on an appropriate offsite traffic mitigation program.

Letter E-5: City of Redlands (October 7, 2013)

DEVELOPMENT SERVICES
DEPARTMENT

City of REDLANDS

Incorporated 1888

John Terell, Planning Official
14177 Frederick Street
Moreno Valley, CA 92553

Re: Review and Comments on the World Logistics Center Project DEIR

Dear Mr. Terell

Thank you for the opportunity to comment on the World Logistics Center Draft Environmental Impact Report (DEIR) prepared by the City of Moreno Valley. The City of Redlands has concerns regarding the traffic analysis, particularly the road segments of San Timoteo Canyon Road and Alessandro Road. The DEIR fails to mention the circulation issues and policies for this area that are addressed within the City of Redland's General Plan. Staff from the City of Redlands, Development Service Department, offers the following responses:

- Intersections identified to be within the City of Redlands' jurisdiction include:
 - San Timoteo Canyon Road/Alessandro Road (Intersection -132)
 - San Timoteo canyon Road/Live Oak Canyon Road (Intersection -133)
 - W Crescent Avenue/Alessandro Road (Intersection-135)
 - W Sunset Drive/Alessandro Road (Intersection-136)

The City of Redlands General Plan policies that are not addressed in the DEIR are as follows:

5.20a Maintain LOS C or better as the standard at all intersections presently at LOS C or better

The DEIR identifies existing LOS at intersections No. 135 and 136 as operating with an LOS C or better; however, as indicated in Tables 4.15E, 4.15N, 4.15S, 4.15AN and 4.15AN, 4.15 AS-1 and 4.15 AS-2, the LOS Standard for these two intersections is LOS D. This is not consistent with policy 5.20a; and therefore the project must mitigate this increase in LOS to LOS C, or the project is found to be inconsistent with the Redlands General Plan.

5.20c Where the current level of service at a location within the City of Redlands is below the Level of Service (LOS) C standard, no development project shall be approved that cannot be mitigated so that it does not reduce the existing level of service at that location

1

2

The DEIR identifies the intersections of San Timoteo Canyon Road/Alessandro Road and San Timoteo Canyon Road/Live Oak Canyon Road as significant and unavoidable. The DEIR states that these intersections already exceed the LOS threshold in both the am and pm peak hours and traffic using the intersection would experience longer delays under Existing Plus Project conditions. Signalizing this intersection would reduce project impacts to a less than significant level. However, because the intersections are outside of the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City of Moreno Valley cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. This is inconsistent with Redlands General Plan policy 5.20c, and the project should be required to mitigate this intersection before the project is operational.

2

Alessandro Road is designated as a collector and pertains to the following policies:

5.32a Design collector streets and implement traffic control measures to keep traffic on collectors at 3,000 vehicles per day or less, where possible.

The DEIR fails to address this policy for Alessandro Road and projected traffic exceeds the 3,000 vehicles per day limitation for collector streets. This is inconsistent with Redlands General Plan policy 5.32a.

3

5.32e Avoid adding traffic to streets carrying volumes above the standards in Policies 5.20a, b, c and consider traffic control measures where volumes exceed the standards and perceived nuisance is severe.

According to the DEIR, LOS for existing (2012), 2017 without project and 2022 without project scenarios state that intersection 135 and 136 exceed the LOS of D for AM and PM peak hour. This is not consistent with Redlands General Plan policy 5.32e. Furthermore, the mitigation proposed within the DEIR fails to restore LOS to acceptable levels.

5.71 Southeast Area Circulation Issues and Policies

5.71c addresses the design of future roadways in the Southeast Area

The Redlands General Plan section 5.71 addresses circulation issues and policies specific to the Southeast Area of Redlands, in San Timoteo and Live Oak canyons. The DEIR fails to address this section within the circulation section; in particular Alessandro Road. The Alessandro Road bridge and its northern approach currently appear marginal and require major revision. The bridge width is inadequate to accommodate even the lowest projected traffic volumes and needs to be widened, and that the curve to the north of the bridge needs to be straightened out. The Traffic Section of the DEIR fails to address the current condition of Alessandro Road Bridge. Consideration should be given to the realignment of the roadway, widening of the bridge, and possibly the need for a relocated bridge.

4

Based on the above comments, the City of Redlands is opposed to the project as it is inconsistent with the Redlands General Plan, and poses traffic impacts that are considered significant and unavoidable, and no mitigation is proposed to reduce these significant impacts to a less than significant level. In addition, the City of Redlands requests that all notices regarding CEQA or public hearings on this project be sent to the City of Redlands. Your considerations of the City of Redlands comments are greatly appreciated.

5

Sincerely,

Tabitha Kevari
Associate Planner, Development Services Department

RESPONSES TO LETTER E-5

City of Redlands

Response to Comment E-5-1. The commenter states that the City of Redlands has concerns regarding the Draft Environmental Impact Report (DEIR). The concerns center on the four study intersections within the City of Redlands, namely: San Timoteo Canyon Rd/Alessandro Rd. (IN-132), San Timoteo Canyon Rd/Live Oak Canyon Rd. (IN-133), W. Crescent Ave. /Alessandro Rd (IN-135), W. Sunset Dr. /Alessandro Rd. (IN-136).

The commenter's general statement is acknowledged; responses are provided to comments about the specific intersections below.

Response to Comment E-5-2. The commenter states that Redlands General Plan sets a target Level of Service (LOS) for all intersections of LOS C or better, whereas the Traffic Impact Analysis (TIA) states that the target LOS is D for Intersection (IN)-135 and IN-136. The comment also states that where the current LOS at a location in the City of Redlands is below the LOS C standard, no development project shall be approved that cannot be mitigated so that it does not reduce the existing LOS at that location. The TIA states that the LOS for IN-132 and IN-133 already exceed the target LOS. The project should be required to mitigate this intersection before the project is operational. The TIA says that the project's impact at these intersections is significant and unavoidable because the intersections are outside of the jurisdiction of the City of Moreno Valley.

The TIA has been revised to show a target LOS of C for IN-135 and IN-136 refer to Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1. Both of these intersections have LOS C or better under both Existing Plus Project and 2035 Plus Project conditions, so the project has no direct or cumulative impact at either location. There are deficiencies in later years that are due to other development projects anticipated in the future.

The World Logistics Center (WLC) project cannot be held responsible for rectifying the existing deficiencies at IN-132 and IN-133. The TIA correctly assigns the project the responsibility for its fair share of the cost of improvements, and includes the payment of a fair share fee to mitigate project impacts to transportation facilities outside of the City of Moreno Valley (see Mitigation Measure (MM)-Trans-5 FEIR Volume 2 Appendix L-1). As stated in the revised TIA, since the City of Moreno Valley cannot guarantee the implementation of improvements for facilities not under its jurisdiction, impacts at these intersections must be identified as significant and unavoidable.

Response to Comment E-5-3. The commenter states that the TIA shows that the LOS for IN-132 and IN-133 would exceed the target LOS under Existing, 2017 No Project, and 2022 No Project conditions. This is not consistent with Redlands General Plan Policy 5.32e. The proposed mitigation fails to restore the LOS to acceptable levels.

As stated in the comment, the LOS problem already exists and this existing deficiency would continue into the future whether the WLC is built or not. The WLC project cannot be held responsible for correcting existing deficiencies. The TIA correctly assigns the project the responsibility for its fair share of the cost of improvements, and includes the payment of a fair share fee to mitigate project impacts to transportation facilities outside of the City of Moreno Valley (see MM-Trans-5 FEIR Volume 2 Appendix L-1). As stated in the revised TIA, since the City of Moreno Valley cannot guarantee the implementation of improvements for facilities not under its jurisdiction, impacts at these intersections must be identified as significant and unavoidable.

Response to Comment E-5-4. The commenter states that the TIA fails to address the current problems of Alessandro Road. The comment says that the Alessandro Road Bridge and its northern

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

approach currently appear marginal and require major revision. The bridge width is inadequate to accommodate even the lowest projected traffic volumes and needs to be widened, and the curve north of the bridge needs to be straightened out. Consideration should be given to the realignment of the roadway, widening the bridge, and possibly relocating the bridge.

The problems cited in this comment are of long standing; the comment's statement that, "*the bridge and its northern crossing currently appear marginal and require major revision*" comes from the Redlands' General Plan dated August 1998, as does the statement that, "*the bridge width is inadequate to accommodate even the lowest projected traffic volumes and needs to be widened, and the curve north of the bridge needs to be straightened out.*" The WLC project cannot be held responsible for correcting existing deficiencies. The TIA correctly assigns the project responsibility for its fair share of the cost of improvements, and includes the commitment of the City of Moreno Valley to work with the City of Redlands to establish a mechanism for collecting this fee (see MM-Trans-5 FEIR Volume 2 Appendix L-1). As stated in the TIA, since the City of Moreno Valley cannot guarantee the implementation of improvements for facilities not under its jurisdiction, impacts at these intersections must be identified as significant and unavoidable.

Exhibit E-5-1: The Alessandro Road Bridge and Curve

Response to Comment E-5-5. The commenter states that the City of Redlands is opposed to the project as it is inconsistent with the Redlands General Plan, has impacts that are significant and unavoidable, and does not propose to mitigate these impacts to less than significant levels. The comment also requests that all notices regarding CEQA or public hearings on the project be sent to the City of Redlands.

As stated in the responses to earlier comments in this letter, the City of Redlands cannot assign responsibility for fixing its existing road problems to warehouse projects in other cities. This is particularly notable considering that the City of Redlands continues to approve warehouse projects in their own city that would have a more direct impact on the deficient roads, such as the City of Redlands City Council's recent (September 2013) approval of a million square-foot warehouse.

The City of Redlands will be provided with all CEQA or public hearing notices regarding the proposed project.

F. LETTERS FROM COMMUNITY/CONSERVATION GROUPS

Letter F-1: Center For Biological Diversity/San Bernardino Valley Audubon Society (April 5, 2013) and Appendices 1-67 (on Flash Drive)

San Bernardino Valley
Audubon Society

April 5, 2013

**Re: Comments on the Draft Environmental Impact Report for the
World Logistics Center Project, State Clearinghouse No. 2012021045**

Dear Mr. Gross,

These comments are submitted on behalf of the Center for Biological Diversity, and San Bernardino Valley Audubon Society (collectively “Conservation Groups”) on the World Logistics Center Project (“Project”), located south of Interstate 60 on the eastern edge of Moreno Valley. The Project would be the largest master-planned warehouse development in U.S. history, totaling approximately 41.6 million square feet on 2,710 acres. The Project would result in significant impacts to air quality contributing tons of criteria pollutants into an area currently designated as non-attainment under the Clean Air Act, poses a significant impact to climate change, and threatens the adjacent San Jacinto Wildlife Area.

The Environmental Impact Report (“EIR”) fails to adequately describe the Project and the environmental setting, including the creation of a fictional “CDFW Conservation Buffer Area”, which effectively removes over 1000 acres from the San Jacinto Wildlife Area (“SJWA”) and core reserve lands under the Western Riverside County Multiple Species Habitat Conservation Plan (“MSHCP”). The EIR also fails to analyze a range of environmental impacts, mitigation measures, and alternatives. At a minimum, the EIR must be revised and recirculated to remedy these deficiencies. However, because of the permanent and irreconcilable conflicts with public health and environmental protection the project should be denied.

Jonathan Evans, Toxics and Endangered Species Campaign Director & Staff Attorney
351 California St., Ste. 600 • San Francisco, CA 94104
tel: (415) 436-9682 x 318 fax: (415) 436.9683 email: jevans@biologicaldiversity.org
www.BiologicalDiversity.org

The Center for Biological Diversity is a non-profit environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center for Biological Diversity has over 500,000 members and e-activists throughout California and the western United States, including residents of western Riverside County. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in the Inland Empire.

The San Bernardino Valley Audubon Society (“SBVAS”) is a local chapter of the National Audubon Society, a 501(c)3 corporation. The SBVAS chapter area covers almost all of Riverside and San Bernardino Counties and includes the project area. It has about 2,000 members, about half of whom live in Riverside County. Part of our chapter’s mission is to preserve habitat in our area, not just for birds, but for other wildlife, and to maintain the quality of life in the Inland Empire.

I. THE EIR FAILS TO PROVIDE AN ADEQUATE DESCRIPTION OF THE PROJECT AND ITS IMPACTS

The EIR for the Project fails to provide the public with a thorough, properly defined, and finite description of the Project and its environmental impacts. CEQA requires that an EIR analyze the whole of the Project including associated off site impacts and impacts that are further distant in the future. *See* CEQA Guidelines, §§ 15126 (impact from all phases of the project), 15358(a) (direct and indirect impacts). These requirements help ensure that the public and decision makers are reviewing and deciding on the Project know the full scope of the project and its impacts. EIRs that fail to provide these requirements undermine CEQA’s fundamental requirement of public disclosure. An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR. *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185 (an enigmatic or unstable project description impedes public input); *See also San Joaquin Raptor/Wildlife Reserve Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730. Unfortunately, the EIR contains an incomplete project description and analysis that fails to provide the public and decision makers with the necessary information in order to analyze impacts and mitigation measures.

The EIR fails to analyze the whole of the project by, among other things, failing to adequately disclose and analyze off-site improvements and the impacts of future developments and plot plans to be implemented after approval of the EIR. Off-site improvements are not adequately disclosed, analyzed, or mitigated. The EIR discusses approximately 104 acres of off-site improvements required as part of the Project. (DEIR at 1-5). These improvements include the following: debris Basins easterly of Gilman Springs Road; water reservoirs and access roads located northeast, north, and west of the project site; SR-60 interchange improvements; and roadway, water, sewer, drainage, and utility improvements extending north and west from the project. (DEIR at 3-19, 3-25). However, the exact locations, impacts, and mitigation for these off site improvements is not disclosed or analyzed. Where the EIR does contain analysis, it is perfunctory and defers any substantive analysis to a later date.

The EIR contains many failures to analyze and mitigate offsite impacts. Offsite improvements could potentially impact jurisdictional wetlands and should be analyzed. (DEIR at 4.4-59). Studies for the DEIR recognize that offsite improvements east of Redlands Boulevard may potentially impact drainage features likely considered jurisdictional by regulatory agencies. (DEIR App. E at 125). However, analysis of these impacts is deferred until another date and deprives the public and decision makers of a full and complete analysis of the project or its impacts. Even though these impacts are considered potentially significant, no analysis occurs.

6

The EIR fails to analyze the impacts to cultural, paleontological, and geotechnical off site impacts. The EIR defers analysis of these impacts to future studies when cultural resource assessments, paleontological resource assessments, or geotechnical constraints assessments “will be conducted.” (DEIR at 1-16 through 1-19). The EIR further fails to adequately disclose and analyze the significant off-site traffic improvements that would be required and their subsequent impacts. A Project of this scale would have tremendous off site improvements resulting in a broad range of impacts. The EIR’s failure to fully disclose and mitigate those impacts violates CEQA.

7

The EIR’s attempt to address off site impacts by employing a nebulous and narrow “off site analysis zone” doesn’t cure these impacts. (DEIR at 3-25, 7-27). Many of the off site impacts extend geographically beyond the off site analysis zone and the analysis itself is only focused on impacts to biological resources. So any impacts beyond the geographic scope of the off site analysis zone are not analyzed or disclosed and any non- biological resource impacts are not analyzed whatsoever. Even if the scope of the analysis covered all of the geographic and resource categories the vague and ill defined nature of the analysis does not allow for a focused site specific analysis.

8

The EIR figure 4.4.1 shows that the 1,000 foot “off-site analysis zone” is drawn not around the 2710 acre Specific Plan area, but around a misleading “CDFW Conservation Buffer Area” that is actually the SJWA itself. This map shows that the biological, jurisdictional, and MSHCP analysis in the EIR and Appendix were done with the wrong assumptions as to the project site and its boundaries. The erroneous “CDFW Conservation Buffer Area” must be removed from the EIR and all the biological analysis redone.

9

The EIR fails to disclose and analyze the project’s impacts from the specific plan and instead improperly defers analysis of impacts to a later approval of plot plans. The EIR proposes a specific plan to allow for the development of 41.4 million square feet of logistics warehousing, up to 200,000 square feet of light logistics uses, and a site for logistics support uses. (DEIR at 7-28). However, the detail regarding the nature, scope, and impacts of that specific plan and the project itself are deferred until later plot plans are proposed. For example, the EIR fails to disclose and analyze impacts to waterways, state or federal jurisdictional waterways, or watercourses. (See *e.g.* DEIR at 4.4-60; DEIR App.E. at 126). Instead of conducting an analysis now the EIR asserts that site specific jurisdictional delineation will occur later when future development will submit grading and drainage studies. (DEIR at 1-38, 4.4-76). The EIR’s failure to depict a stable and complete project and its impacts also leads to a failure to analyze impacts on specific resources as described more thoroughly in Section II below.

10

The EIR asserts that this deferral is proper because the jurisdictional delineation is programmatic in nature. (DEIR at 4.4-76). The EIR cannot improperly mask site specific impacts for a specific plan when the impacts should be analyzed at the phase when the whole project is approved, not at a later date when the impacts will be improperly piecemealed to mask the true impacts. The EIR cannot hide behind its own failure to seek out information. CEQA's requires that a lead agency must "use its best efforts to find out and disclose all that it reasonably can" Guidelines §§ 15144.

11

The EIR fails to disclose and analyze the nature, scope and impacts of the tentative parcel map. The EIR discloses that a tentative parcel map is being processed to subdivide 1,539 acres of the project site owned by the project applicant. (E.g. DEIR at 7-28.) The EIR further alleges that the parcel map is "for financing purposes only" and would "confer no development rights to the property." (E.g. DEIR at 7-28.) Despite numerous references to the same tentative parcel map there is no further discussion of the location, parcel size, layout, or elaboration of what "for financing purposes" actually means. Furthermore there are no provisions for limiting the development rights to the property that is the subject of the parcel map. The EIR's wholesale failure to provide a good faith analysis of what the tentative parcel map constitutes, the potential impacts of that tentative parcel map approval, and mitigation measures to assure that the parcel map approval confers no development rights runs contrary to CEQA.

12

II. THE EIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE IMPACTS TO BIOLOGICAL RESOURCES

The DEIR fails in providing the level of analysis mandated by CEQA because it fails to address numerous aspects of how the project will affect wildlife, as well as providing a thorough analysis of the project's impacts to sensitive species and ecological communities. The Project is also adjacent to several regionally important wildlife preserves including the San Jacinto Wildlife Area ("SJWA"), the San Jacinto/Lake Perris Core Reserve for the Stephens' Kangaroo Rat Habitat Conservation Plan, and Proposed Core 3 and Existing Core H under the Western Riverside County Multiple Species Habitat Conservation Plan. These areas contain a range of rare, sensitive, threatened, and endangered species that must be fully analyzed in the DEIR. (Morton 2008; CNDDB 2013 El Casco; CNDDB 2013 Lakeview; CNDDB 2013 Perris; CNDDB 2013 Sunnymead). The EIR must fully analyze the direct and indirect impacts of the project on biological resources on the project site as well as neighboring areas.

13

CEQA requires that an EIR adequately describe the environment in the area that will be affected by the project. An EIR must include a description of the physical environmental conditions in the vicinity of the project at the time the environmental analysis is commenced with special emphasis placed on environmental resources that are rare or unique to that region and would be affected by the project. Guidelines § 15125 (a), (c). An "inadequate consideration and documentation" in an EIR "of existing environmental conditions renders it impossible for the FEIR to accurately assess the impacts the project will have on wildlife and wildlife habitat or to determine appropriate mitigation measures for those impacts." *San Joaquin Raptor/Wildlife*

14

Rescue Center v. County of Stanislaus, 27 Cal. App. 4th 713, 722 (internal citation omitted). Unfortunately the EIR fails this requirement.

14

A. THE EIR FAILS TO ADEQUATELY ANALYZE RIPARIAN/RIVERINE FEATURES AND JURISDICTIONAL WATERWAYS

The EIR fails to provide an adequate analysis of the significant riparian and jurisdictional areas on the Project site and in the Project vicinity. As noted in Attachment A these remaining and limited wetland and riparian areas are of crucial importance to ecological resources in California. The Project will impact onsite riparian/riverine and jurisdictional areas by increasing non-point source pollution and contamination, altering hydrology, destroying sensitive habitat, and increasing road effects. The EIR fails to properly describe and analyze the total riparian and jurisdictional areas, including a proper jurisdictional delineation under the Clean Water Act §§ 401, 403, Porter Cologne Act (California Water Code § 13000 et seq.), and California Fish and Game Code §§ 1600, 1603.

15

One of the EIR's major flaws is the inconsistent and improper description of impacted riparian/riverine resources, the project environment, and the impacts of the project itself. The EIR claims that there are no areas that are subject to the jurisdiction of the U.S. Army Corps of Engineers, or the California Regional Water Quality Control Board. (DEIR at 1-13, 4.4-59, 4.4-76). However, the EIR's own studies contradict this assertion and acknowledge that Drainage Feature 12 "was determined to be jurisdictional waters of the U.S. under Section 404 and 401" of the Clean Water Act. (DEIR App. E at 124-125). The EIR must fully disclose and analyze the impacts to this jurisdictional waterway and discuss the potential alternatives and mitigation measures for this impact prior to project approval.

16

The failure of the EIR to properly disclose and analyze the impacts to riparian/riverine features prohibits the Project's compliance with the Western Riverside County MSHCP (WRCMSHCP, but herein after "MSHCP"). The MSHCP requires a specific analysis for riparian/riverine resources. (MSHCP Section 6.1.2). The MSHCP defines riparian/riverine areas as lands which contain habitat dominated by plants which occur close to or which depend upon soil moisture from a nearby fresh water source, or areas with fresh water flow during all or a portion of the year. (MSHCP Section 6.1.2). The biological studies for the Project recognize that riparian/riverine features occur in drainage features 7, 8, 9, and 14. (DEIR App. E at 124, 134-135, 137). Because the Project will impact these resources a Determination of Biologically Equivalent or Superior Preservation ("DBESP") is required. (MSHCP Section 6.1.2). A DBESP analysis requires, at a minimum, a determination of whether avoidance is feasible, minimization measures for indirect impacts, mitigation that would fully offset any impacts, and a determination that mitigation proposed is biologically equivalent or superior. (MSHCP Section 6.1.2).

17

The EIR fails to conduct the analysis of riparian/riverine features and DBESP analysis required by the MSHCP. Instead, the EIR defers a full analysis of the Project's impacts on riparian/riverine features and a DBESP analysis until the future. (DEIR App. E. at 120, 124, 134-135, 137). Several drainage features, including drainage features 7, 8, 9, and 14, may be

18

subject to the jurisdiction of the California Department of Fish and Wildlife, but site specific jurisdictional delineations, evaluations of impacts, and proposed mitigation measures are deferred. (DEIR at 4.4-76, 1-14, and 1-15). This runs contrary to the requirements of CEQA and the MSHCP regarding the proper timeframe for environmental review and disclosure of a Project's impacts. (MBA 2008; MBA 2009). There is no provision for public input and review when the DBESP is improperly deferred, and the EIR attempts to segment the whole of the project review by improperly avoiding analysis and disclosure of the project being approved.

18

The protection of riparian/riverine resources is also required by the City of Moreno Valley General Plan. General Plan Policy 7.4.3 requires that projects "[p]reserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels." (DEIR at 4.4-60). The EIR acknowledges that 14 drainages or basins occur but defers analysis to determine whether the project is consistent with this policy. (DEIR at 4.4-60; DEIR App. E at 126). The EIR cannot ignore local policies regarding the proper protection of natural resources.

19

The DEIR also fails to adequately disclose and analyze the riparian and riverine features. The DEIR claims that Drainage feature 14 contains "no native riparian habitat." (DEIR at 4.4-59). However, this is again contradicted by the biological surveys for the project, which indicated that the native habitat of "southern willow scrub" dominated Drainage feature 14 and provides habitat for least Bell's vireo, and southwestern willow flycatcher. (DEIR App. E at 54, 120). Attempts to dismiss the riparian areas in the text of the EIR by asserting that it does not provide suitable habitat for riparian/riverine planning species, when the studies for the EIR acknowledge that the area contains habitat that could be used by native wildlife runs contrary to CEQA. The EIR's incomplete and inconsistent analysis renders the EIR invalid.

20

B. THE EIR FAILS TO ADEQUATELY MINIMIZE AND MITIGATE THE IMPACTS OF LIGHT POLLUTION

The DEIR's conclusion that additional mitigation measures may be necessary for the impacts of light pollution on wildlife is inadequate. (DEIR at 4.4-67). This is insufficient to meet CEQA's requirement of fully disclosing impacts. Pub. Res. Code §§ 21061; 21005(a). CEQA Guidelines mandate that relevant information be presented so that agencies and the public are fully informed as to the ramifications of a project. *See e.g.* Pub. Res. Code § 21005(a). Here, the DEIR fails to adequately analyze and mitigate the impacts to wildlife from light pollution on and adjacent to the Project.

21

Light pollution is a major problem that can significantly confuse migratory birds and otherwise disturb and disrupt wildlife foraging and breeding. (CNN, "Light Pollution Threatens National Park," 1999). Light pollution can seriously threaten the continual survival of numerous species; "[t]he cumulative effects of behavioral changes induced by artificial night lighting on competition and predation have the potential to disrupt key ecosystem functions" (Longcore and Rich, 2004). Light pollution is not to be taken lightly in the DEIR, and should be afforded a weighty and detailed analysis.

22

Many bird species fly at night, and have evolved to navigate their migration paths in the dark, aided by star and moon light, which is of course blocked by artificial light sources. (American Bird Conservancy, 2008). Further, birds can be attracted to lit structures, including streetlights, and can become disoriented as a result. (American Bird Conservancy, 2008). Disorientation often results in collisions with the lit structures themselves or with other birds, leading to injury and death. (American Bird Conservancy 2008). More than 100 millions birds are affected by collisions each year in North America, and this includes many endangered species. (Deda, et al). Many such catastrophes have been documented, the worst incidents involving hundreds of birds killed at one building in a single night. (American Bird Conservancy, 2008). Bird species can also become “entrapped” within lighted areas, refusing to move for the night, and thus increasing their risk of predation. (Longcore and Rich, 2004).

23

Another aspect of light pollution that the DEIR does not address is that some species, including certain birds and reptiles, have begun to utilize artificial lights, such as streetlights to forage underneath for food. (Longcore and Rich, 2004). However, this can increase their risk of predation, as well as increase these species dependence on these human structures. (Longcore and Rich, 2004). The EIR should also analyze the potential for night lighting to impact SKR populations both on and off the Project site. SKR often forages and moves around at night. Natural and artificial lighting impacts kangaroo rats because it inhibits their nocturnal foraging and makes them more susceptible to the chance of predation. (COSEWIC 2006). The EIR must discuss the extent that the proposed lighting will reduce SKR habitat adjacent to the project because of predation or avoidance. Therefore, the presence of street lights within the VOL could actually attract some species into the development, prompting problematic interactions between these species and humans or their pets.

24

Plant species are also impacted by light pollution. Plants measure and react to night length, and duration of darkness can manipulate how frequently plants pollinate or flower, how they prepare for dormancy during winter, and even how much photosynthesizing they do. (Deda, et. al). Trees are similarly affected, for instance, an abundance of light pollution can keep a tree from losing its leaves at the correct time. (Deda, et. al). This also impacts animals that depend on these trees for habitat; for instance, birds are prevented from nesting in trees as a result of surrounding light pollution. (Deda, et. al).

25

Furthermore, light pollution need not be highly extensive to have a major impact on nearby plants and wildlife. For instance, one study found that desert rodents reduced foraging activity when exposed to the light of a single camp lantern. (Longcore and Rich, 2004). As well, light pollution has far reaching effects; a study of national parks found that artificial lights over *100 miles away* could still affect national parks and their wildlife. (CNN, “Light Pollution Threatens National Park,” 1999). Given this 100 miles perimeter, the buffer of mere acres established in the DEIR is nowhere near sufficient to protect species from light pollution.

26

The DEIR needs to fully disclose these risks; only then can the likely effectiveness of proposed mitigation measures be evaluated when compared to the severity of the risk. Given the impact that light pollution has on wildlife species, particularly migratory birds such as the many species that utilize the SJWA as habitat, the proposed mitigation measures are inadequate to

27

protect against this harm. This is especially true in light of evidence showing that light pollution can be felt as far as 100 miles away.

27

The relatively miniscule buffer the DEIR provides here to protect against light pollution is insufficient. Indeed, the DEIR recognizes that the mitigation measures would not fully mitigate the Project's significant cumulative impacts to biological resources from light pollution, (DEIR at 4.4-67), but fails to adequately propose or analyze additional mitigation measures to address that significant impact. CEQA requires that agencies "mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so." Pub. Res. Code § 21002.1(b). The EIR fails to meet this mandate.

28

C. THE EIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE AIR POLLUTION

The DEIR's analysis of the impacts of air pollution on biological resources and proposed mitigation is inadequate. (DEIR at 4.4-67 to 4.4-71). This data provided insufficient to meet CEQA's requirement of fully disclosing impacts. Pub. Res. Code §§ 21061; 21005(a). The DEIR recognizes some of the numerous impacts to wildlife that can occur from air pollution. (DEIR at 4.4-67 to 4.4-71). Reduced breeding performance of birds in the area close to air pollution due to the direct impacts of pollution on avian species as well as indirect effects due to reductions in prey. (Eeva 1996; Eeva). Air pollution also contributes increased toxicity and fertility problems due to smaller, lighter and thinner-shelled eggs. (Global Times 2011). Biomarkers of air pollution demonstrate connections between other physiological problems such as impaired bone structure. (Eeva 2000). Air pollution also leads to inheritable genetic mutations in wildlife. (Somers 2002). However, it fails to properly analyze the risks posed to wildlife, and in particular sensitive wildlife in adjacent areas.

29

As described in more detail below the DEIR cannot rely on the mitigation measures proposed in the MSHCP to address these impacts. Furthermore, by fabricating a "buffer" that is actually a wildlife area with sensitive resources the EIR improperly minimizes the Project's impacts and engages in a failure to adequately disclose the nature of the existing environment, which prohibits an adequate analysis and mitigation of the Project's impacts.

30

D. THE EIR FAILS TO ADEQUATELY MINIMIZE AND MITIGATE THE IMPACTS TO THE WESTERN BURROWING OWL

The Western Burrowing Owl (*Athene cunicularia hypugaea*) is considered to be a Bird of Conservation Concern by the U.S. Fish and Wildlife Service (USFWS). Burrowing Owls are listed as a Species of Concern in California. California's remaining burrowing owls are threatened primarily by habitat loss to urban development, persecution of ground squirrels, and intensive agricultural practices. The state-approved practice of evicting owls from development sites is accelerating local extinction of owls from rapidly urbanizing areas. Other factors contributing to the decline of owls statewide include destruction of burrows through disking and grading, impacts of pesticides, increased predation by nonnative or feral species, habitat

31

fragmentation, and other human-caused mortality from vehicle strikes, electrified fences, collisions with wind turbines, shooting, and vandalism of nesting sites.

31

The number of breeding owl colonies located in study areas in California has declined by nearly 60 percent from the 1980s to the early 1990s, and the statewide number of owls is currently thought to be declining at about 8 percent per year due to urban development. Breeding burrowing owls have been extirpated from almost one-quarter of their former geographic range in California over the past two decades. (CBD 2003). Surveys in California in 1986-91 found population decreases of 23-52% in the number of breeding groups and 12- 27% in the number of breeding pairs of owls. (DeSante et al. 1997). In southwestern California studies demonstrating overall decline of the burrowing owl populations also predict extirpation of burrowing owls from southwestern California. (Kidd 2007).

32

The EIR fails to adequately account for the Project threats to local and regional populations of the burrowing owl, or adequately mitigate for the loss of burrowing owl populations. Burrowing owls were found on the Project site. (DEIR at 4.4-29; DEIR App. E at 119). The mitigation measures of avoiding burrowing owls when they are present will not mitigate the decline in population and loss of habitat that the project contributes to. Considering the magnitude of threats, and ongoing population decline in the Project area the Project poses a substantial threat to the Burrowing Owl.

33

E. THE EIR'S PROPOSED MITIGATION MEASURES ARE INADEQUATE TO MITIGATE THE PROJECT'S IMPACTS

The EIR relies upon the MSHCP for mitigation of both direct and cumulative biological impacts related to this project. However, the EIR fails to disclose the uncertainty regarding the implementation of mitigation measures contemplated in the MSHCP to provide for the mitigation of potentially significant impacts to biological resources relied upon in the MSHCP and EIR. The failure to require binding and effective mitigation, disclose the uncertainties associated with mitigation, and analyze the provision of other sources of mitigation and the environmental impacts of those mitigation measures violates CEQA.

34

In order to address several issues related to the cost, revenue sources, and plan benefits associated with the MSHCP the Western Riverside County Regional Conservation Authority contracted with the RAND Corporation to provide an independent and objective analysis. (RAND 2008). Entitled "Balancing Environment and Development: Costs, Revenues, and Benefits of the Western Riverside County Multiple Species Habitat Conservation Plan" the study revealed some troubling issues related to the ability of projected revenue to acquire lands relied upon by the MSHCP for mitigation and the ability of the MSHCP to achieve the reserve strategy relied upon by the US Fish and Wildlife Service in their Biological Opinion and CEQA analysis.

35

First, the RAND study revealed that the operating cost "exceeds the original forecast in MSHCP planning documents by \$345 million (increasing from \$937 million to \$1,282 million)." (RAND 2008 at xxvi). This was due primarily to the failure to integrate costs into the original estimate. (RAND 2008 at xxvi). Second, the expected revenue sources do not correlate to the

36

strategy for acquiring land outlined in the MSHCP, and the RAND study did not conclude that “existing local revenue streams will be sufficient to finance the local share of reserve assembly and operation costs.” (RAND 2008 at xxvii). Notwithstanding these revenue shortages the RAND study further concluded that the “individual acreage goals cannot all be met using the USFWS CRD [conceptual reserve design].” (RAND 2008 at xxx). In other words, the reserve design relied upon by the US Fish and Wildlife Service and California Department of Fish and Wildlife in determining that biological impacts would be mitigated below a level of significance cannot be achieved. The EIR’s failure to disclose, analyze, and plan for the failure of the MSHCP to mitigate impacts does not meet CEQA’s information mandate on disclosure to the decision makers and the public or the substantive mandate to adopt all feasible mitigation measures for potentially significant impacts.

36

The DEIR cannot simply rely entirely on the MSHCP because there are areas of significant environmental and public concern that the MSHCP simply does not, and was not meant to, address. This includes the potentially significant impacts from direct deaths to special status species from vehicles. The impacts of vehicular deaths to species such as the Stephen’s Kangaroo Rat or burrowing owl for instance, are nowhere discussed in the DEIR or any supporting document. This is cause for concern as the identified impacts to species such as the burrowing owls from collisions with vehicles is documented within the MSHCP, and this project will significantly increase the amount of traffic in the area. (MSHCP, Volume 2 – Threats to Species). Undoubtedly, there will be vehicular caused death as a result of the project.

37

Additionally, the DEIR presents no information regarding impacts to covered species from pesticide use associated with the project. Pesticide use is currently harming many of the species covered in the MSHCP. (See generally, MSHCP §5.2.1) That the DEIR does not address these issues violates both the MSHCP and CEQA.

38

The DEIR cannot simply conclude that it complies with the MSHCP, and that even if the project does comply with the MSHCP, this compliance is enough to ensure that the long-term survival of special-status species will be ensured for the project. Instead, the DEIR needs to provide detailed analysis as to how it specifically complies with all of the MSHCP’s requirements. Further, it must insure that even with MSHCP compliance, and that the project still will not result in significant impacts to biological resources and protected species.

39

The EIR improperly treats the state owned property within the San Jacinto Wildlife Area as a buffer to mitigate the Project’s impacts. As the biological studies for the DEIR note, “this land cannot be used as MSHCP compensation for the proposed development...” (DEIR App. E at 101). However, the EIR improperly treats the state owned property within the San Jacinto Wildlife Area as a buffer. The biological studies call for a 400 foot setback within the Project site. (DEIR App. E at 134). However, the DEIR itself calls for only a 250 foot “clear zone” that will still permit project specific impacts related to water detention basins and project landscaping. (DEIR at 4.4-71). The EIR would not create a 400 foot buffer for those project impacts, but allow them up to the edge of the SJWA. The project attempts to fabricate a 400 foot setback by adding 150 foot building setback, which could include parking lots, fences, lighting, or other urban development, to the 250 foot clear zone. (DEIR at 4.4-71). The EIR’s

40

attempt to limit the setback and require the SJWA to provide the buffer outlined as mitigation measures in studies for the EIR runs contrary to CEQA's requirement that the EIR adopt all feasible mitigation measures.

40

III. THE EIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE IMPACTS TO GREENHOUSE GASES AND GLOBAL CLIMATE CHANGE

The CEQA Guidelines require the lead agency to "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project." Guidelines § 15064.4(a). Under CEQA, an EIR must reflect a good faith effort at full disclosure, including "detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." *Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, at 405; CEQA Guidelines § 15151. Its purpose is to give government agencies and the public the information needed to make informed decisions, thus "protect[ing] not only the environment but also informed self-government." *Laurel Heights I*, 47 Cal.3d at 392. The EIR fails to adhere to the standards of a good faith analysis to provide informed self government.

41

A. THE EIR FAILS TO ANALYZE CONFLICTS WITH APPLICABLE GREENHOUSE GAS REDUCTION PLANS

The EIR fails to adequately disclose and analyze conflicts with regional greenhouse gas reduction plans. CEQA requires that EIRs address the Project's potential to "[c]onflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases." CEQA Guidelines Appendix G, § VII(b). The studies supporting the EIR admit that the Project would be inconsistent with plans, policies, and regulations related to GHG reductions and result in a significant impact climate change impact. (DEIR App. D at 2, 234). However, the EIR tries to mask this significant impact and inconsistency with applicable plans by stating that the "proposed project is consistent with federal and state GHG reduction strategies, the CARB Scoping Plan, the City's General Plan, and the City's Climate Action Strategy." (DEIR at 1-20, DEIR at 4.7-43). The EIR's internal inconsistency and the failure to properly disclose significant impacts is contrary to CEQA.

42

The EIR specifically fails to adhere to several applicable greenhouse gas reduction plans. For example, the Project fails to comply with the City of Moreno Valley Climate Action Strategy and City of Moreno Valley General Plan policies related to the reduction of greenhouse gas emissions and air quality impacts. (See e.g. DEIR at 4.7-24, 4.7-25). The EIR admits that the Project is not consistent with local climate action strategy R2-E5 regarding New Construction Commercial Energy Efficiency Requirements that Require energy efficient design for all new commercial buildings to be 10% beyond the current Title 24 standards. (DEIR at 4.7-42). The EIR also asserts that it is consistent with vehicle miles traveled reduction strategies related to encouraging the development of transit priority projects along high quality transit corridors identified in the Southern California Association of Governments ("SCAG") Sustainable Communities Plan, to allow a reduction in vehicle miles traveled. (DEIR at 4.7-42). However,

43

the Project is not a transit priority project, not along a high quality transit corridor identified by SCAG, and does not reduce vehicle miles traveled. The EIR's 50 mile average for long haul trucks, which actually undercounts mileage, hardly qualifies for a reduction in vehicle miles traveled.

43

The EIR also incorrectly asserts that it is consistent with the Renewable Portfolio Standard of achieving a 33% renewable energy in California and California's Million Solar Roofs Initiative without requiring any renewable energy to be developed onsite or any requirements for renewable energy to be used for the construction or operation of the Project. The EIR also claims that it is consistent with a Sustainable Communities Strategy when no Sustainable Communities Strategy has been adopted for Riverside County and it fails to apply many of the strategies proposed by SCAG because it asserts they are not applicable to the Project. (DEIR at 4.7-22). Finally, there is no quantitative or logical analysis of how the Project's massive contribution to greenhouse gases could be consistent with the ambitious greenhouse gas reduction standards outlined in Executive Order S-3-05. (DEIR at 4.7-44).

44

///

///

///

The quantitative data provided by the EIR demonstrates that the sheer volume of emissions provided by the Project prohibit the compliance with greenhouse gas reduction strategies. A simple comparison of Table 4.7.B, which provides the Moreno Valley greenhouse gas reduction targets with Table 4.7.I, which provides the Project greenhouse gas emissions illustrates the Project's significant impacts to local greenhouse gas reduction plans.

4.7.1.4 Greenhouse Gas Inventories

The City of Moreno Valley estimated greenhouse gas emissions for the community for 2007 and 2010 and projected emissions for 2020 are shown in Table 4.7.B, which shows the reduced 2020 emissions are below the reduction target.

Table 4.7.B: City of Moreno Valley Projected Greenhouse Gas Emissions

Source Category	Moreno Valley Greenhouse Gas Emissions (MTCO ₂ e per year)			
	2007	2010	BAU 2020	Reduced 2020
Transportation	517,098	513,581	788,267	421,561
Energy	287,261	277,230	356,192	251,372
Area	69,390	69,437	84,665	73,046
Water and Wastewater	21,595	16,831	20,216	14,158
Solid Waste	44,294	43,633	49,203	38,000
Total	939,638	920,712	1,298,543	798,137
Reduction Target	—	—	798,693	798,693

Notes: MTCO₂e = metric tons of carbon dioxide equivalents BAU = business as usual
Source: Table 9, City of Moreno Valley Greenhouse Gas Analysis, 2012., MBA 2013

Table 4.7.B demonstrates that the total city greenhouse gas reduction targets total 798,693 metric tons of carbon dioxide equivalents per year in 2020.

Table 4.7.I: Project Operational GHG Emissions (Year by Year with Mitigation)

Source	Emissions with Mitigation and Project Design Features (MTCO ₂ e/year)								
	2014	2015	2016	2017	2018	2019	2020	2021	2022
Vehicles	10,638	21,784	28,283	39,632	52,154	57,836	61,228	65,730	66,329

Significant?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Reduction summary: local vehicles = 3 percent; waste = 35 percent
Source: Michael Brandman Associates 2013.

Table 4.7.I discloses that the 2020 greenhouse gas emissions attributed to the Project are 612,223 metric tons of carbon dioxide equivalents per year in 2020.

The Project's greenhouse gas emissions are 76% of the City's projected 2020 GHG emissions. The EIR must analyze how the Project would impact the ability of the City of Moreno Valley to achieve their greenhouse gas reduction targets. The EIR cannot hide behind the failure to seek out information regarding the emissions methodologies used by the City in

making this determination and whether the project was included in the City's greenhouse gas inventory. A lead agency must "find out and disclose all that it reasonably can". Guidelines § 15144.

46

B. THE EIR FAILS TO ANALYZE THE PROJECT'S FULL GREENHOUSE GAS IMPACTS

The EIR also fails to account for the total greenhouse gas emissions from the Project by omitting sources of energy used by the Project, improperly curtailing the vehicle miles traveled and scope of the traffic analysis, and omitting the analysis of global warming pollutants such as black carbon. CEQA requires that an EIR analyze the whole of the Project including associated off site impacts and impacts that are further distant in the future. *See* CEQA Guidelines, §§ 15126 (impact from all phases of the project), 15358(a) (direct and indirect impacts). The EIR's failure to address the full range of greenhouse gas impacts renders it invalid.

47

The EIR must fully disclose and analyze all of the energy used by the project, the pollution resulting from that use and the impacts resulting from that use. The EIR states that over 39 million square feet of industrial facilities will use no natural gas whatsoever. (DEIR at 4.16-36). This attempt to improperly omit energy usage runs contrary to CEQA's project description requirements that energy use by fuel type and end use be provided. CEQA Guidelines Appendix F. The EIR's attempt to omit energy uses from analysis, improperly minimize energy and greenhouse gas impacts, and distort the project description runs contrary to CEQA and analysis of natural gas usage by warehouse facilities. (E Source 2007, East LA College 2009, Center for Energy and Climate Solutions 2012).

48

The EIR improperly minimizes the trip length for vehicle emissions, which omits necessary components of the project's impacts and fails to adequately disclose and analyze the Project's impacts. The Project objective is to "[p]rovide a major logistics center to accommodate the ever-expanding trade volumes at the Ports of Los Angeles and Long Beach." (DEIR at 3-73). Port related long haul trips are 79 miles. (DEIR at App. D at 120, Table 20). However, the "[t]rip length used in regional analysis for long-haul trips 50." (DEIR at App. D at 120, Table 20). The EIR engages in this misleading minimization of impacts by stating that only a small percentage of the trips will be associated with port related traffic. (DEIR at App. D at 120, Table 20). This omits a large number of vehicle miles and their associated air quality impacts for the major project objective of accommodating port related traffic.

49

The EIR also undercounts other long haul routes by setting arbitrarily short distances to regional locations. For example, the EIR sets an arbitrarily short destination for long haul trips of the San Diego County line to the south, the Banning pass to the east, and the Cajon pass to the northeast. (DEIR at App. D at 120, Table 20). The EIR also improperly undercounts local travel by claiming that "the local vehicles travel between 9.6 and 15.4 miles per trip." (DEIR at 4.7-30). These estimates disregard the actual proximity of nearby cities serving the Project. The distance to Riverside is 18 miles; Beaumont is 10 miles, Perris is 21 miles on the freeway, and San Bernardino is 24 miles on the freeway. The EIR also masks full emissions projections by reducing the number of overall trips and truck trips for the facility. Improperly minimizing

50

vehicle miles undercounts numerous Project impacts including greenhouse gas emissions, traffic, and air quality. Importantly, the EIR fails to account for impacts air quality impacts within the Salton Sea Air Basin, Mojave Desert Air District, and the San Diego County Air Basin violating CEQA's requirements that an EIR must analyze whether the Project "[v]iolates any air quality standard or contributes substantially to an existing or projected air quality violation." CEQA Guidelines App. G § III(b).

50

The EIR must also conduct an analysis and quantification of the greenhouse gas emissions associated with water use related to the project. In order to mitigate the PM pollution from the Project during construction the contractors are required to dampen the graded and exposed material to reduce dust that worsens the existing air quality violations. The Project itself will use water related to landscaping, bathroom and kitchen uses, and cleaning. Transport of water throughout the state is extremely energy intensive. The water sector is the largest consumer of energy in California, estimated to account for 19 percent of total electricity and 32 percent of total natural gas consumed in the state. (CEC 2005). In the present case energy will be used to transport water needed for the project via pumps, to move water to southern California from the San Francisco Delta and Colorado River, and tanker trucks to transport and spray water on the project area.

51

The EIR also fails to account for the emissions associated with manufacturing and transport of building materials, and operational goods for the project. For example, construction of 41 million square feet of development will take thousands of cubic yards of construction material including concrete. Cement and concrete manufacture is extremely energy intensive producing a large amount of greenhouse gas emissions. The manufacture of concrete accounts for roughly 3% of California's greenhouse gas emissions. (Masanet 2005). In order to determine ways to reduce greenhouse gas emissions from concrete the Lawrence Berkeley National Laboratory and others have developed methods for analyzing the lifecycle emissions of concrete manufacture. (Manaset 2005, Flower 2007). The EIR also fails to account for the emissions associated with the transportation of goods to the ports that the Project is supposed to serve. (DEIR at 4.7-43).

52

These numbers must be integrated into the greenhouse gas emissions significance determination in order to perform the good faith analysis required under CEQA. CEQA requires that "an agency must use its best efforts to find out and disclose all that it reasonably can" (Guidelines § 15144), that an EIR must make "good faith effort at full disclosure" (Guidelines § 15151), and that an impact may only be deemed speculative "after thorough investigation." (Guidelines § 15145). The EIR cannot prematurely determine that the information is speculative if it does not attempt to compile and analyze the information. (DEIR at 4.7-43). By refusing to include necessary information on Project emissions in the EIR, the City violated the most basic and fundamental requirements of CEQA. *Protect the Historic Amador Waterways*, 116 Cal. App. 4th at 1106 (EIR invalid as a matter of law where "it omits material necessary to informed decision-making and informed public participation.").

53

C. AS PART OF ITS INVENTORY OF GLOBAL WARMING POLLUTION, THE EIR MUST ALSO ANALYZE BLACK CARBON EMISSIONS RESULTING FROM THE PROJECT

As part of its analysis of global warming impacts, the EIR must also address black carbon, an important short-lived pollutant that contributes to global and regional warming. Black carbon is produced by incomplete combustion and is the black component of soot. Although combustion produces a mixture of black carbon and organic carbon, the proportion of black carbon produced by burning fossil fuels, such as diesel, is much greater than that produced by burning biomass.

54

Black carbon heats the atmosphere through a variety of mechanisms. First, it is highly efficient at absorbing solar radiation and in turn heating the surrounding atmosphere. Second, atmospheric black carbon absorbs reflected radiation from the surface. Third, when black carbon lands on snow and ice, it reduces the reflectivity of the white surface which causes increased atmospheric warming as well as accelerates the rate of snow and ice melt. Fourth, it evaporates low clouds. Notably, black carbon is often complexed with other aerosols such as sulfates, which greatly increases its heating potential. (Ramanathan & Carmichael 2008; Jacobson 2001).

55

Due to black carbon's short atmospheric life span and high global warming potential, decreasing black carbon emissions offers an opportunity to mitigate the effects of global warming trends in the short term. (Ramanathan & Carmichael 2008). Black carbon is considered a 'short-lived pollutant' (SLP) because it remains in the atmosphere for only about a week in contrast to carbon dioxide, which remains in the atmosphere for over 100 years. Furthermore, the global warming potential of black carbon is approximately 760 times greater than that of carbon dioxide over 100 years (Reddy & Boucher 2007) and approximately 2200 times greater over 20 years. (Bond & Sun 2005). It is estimated that black carbon is the second greatest contributor to global warming behind carbon dioxide. (Ramanathan & Carmichael 2008).

56

Unlike traditional greenhouse gases, which become relatively uniformly distributed and mixed throughout the Earth's atmosphere, black carbon exerts a regional influence. The impacts of black carbon on a regional level include both atmospheric heating, as discussed above, and hydrological changes. Hydrological changes occur due to alterations in cloud formation and heat gradients. (Ramanathan & Carmichael 2008). For instance, aerosol pollution has been linked to decreases in the summer monsoon season in tropical areas as well as the drought in the Sahel region of Africa. (Ramanathan & Carmichael 2008). California is an area of particular concern because of the drought-fire cycle. The more drought conditions prevail, the more forest fires burn, and the forest fires in turn emit massive quantities of black and organic carbon. The release of these aerosols intensifies the drought effect.

57

Another impact of black carbon is accelerated snowmelt; for instance, black carbon is likely contributing to the retreat of Himalayan glaciers and the resulting water shortage in areas of Asia. (Id.). When black carbon settles on snow, it makes the snow darker so that it absorbs more solar radiation. This directly leads to snow melt. In addition, local atmospheric heating

58

due to black carbon increases the melting rate. These same effects may well be operating on the Sierra Nevada, which would reduce water availability throughout California at crucial times of the year. These localized impacts could also be contributing to a decreased snow pack and earlier snow melt for the San Gabriel, San Bernardino, and San Jacinto mountains.

58

Black carbon is also detrimental to human health. Black carbon has been linked to a variety of circulatory diseases. One study found an increased mortality rate was correlated with exposure to black carbon. (Maynard 2007). The same is true for heart attacks. (Tonne 2007). Another study found that residential black carbon exposure was associated with increased rates of infant mortality due to pneumonia, increased chronic bronchitis, and increased blood pressure. (Schwartz 2007).

59

In developed countries, diesel burning is the main source of black carbon. Diesel emissions include a number of compounds such as sulfur oxides, nitrogen oxides, hydrocarbons, carbon monoxide, and particulate matter. Diesel particulate matter is approximately 75% elemental carbon. The proposed project will require the use of diesel-powered heavy duty trucks, construction equipment, and warehouse equipment. Thus, it is crucial that black carbon be addressed as part of the environmental review for the Project.

60

(1) ANALYZING PARTICULATE MATTER IS INSUFFICIENT TO ADDRESS BLACK CARBON

Particulate matter (PM) refers to the particles that make up atmospheric aerosols. The primary constituents of PM are sulfates, nitrates, and carbon compounds. Sulfates and nitrates form in the atmosphere from the chemical reaction of sulfur and nitrogen dioxides. These may often be present as ammonium sulfate or nitrate salts. Carbon compounds may be directly emitted, e.g. black carbon emitted from combustion, or may form in the atmosphere from other organic vapors, e.g. oxidation of volatile organic compounds.

61

Because PM can be reduced through mitigation of other constituents of PM than black carbon, it is essential that black carbon emission reduction strategies be considered independently from PM reductions. The proportions of the constituents of PM vary over time and by location. According to a recent series of surveys conducted at various U.S. cities under the EPA's "Supersite" program, black carbon was often only about 10% of total measured PM_{2.5}.¹

62

In contrast to total PM_{2.5}, diesel PM is composed largely of black carbon. Nonetheless, some diesel PM reduction strategies do not affect black carbon. For instance, diesel oxidation catalysts can reduce diesel PM emissions as a whole by approximately 20 to 40%, yet they do not decrease black carbon emissions. (Walker 2004). In addition, while low-sulfur fuel will reduce sulfate emissions, in and of itself low-sulfur fuel will not reduce black carbon. Low-sulfur fuel is important because it *allows* for better technology to reduce black carbon. (See, e.g. 69 Fed. Reg. 38957, 38995 (June 29, 2004)). Yet those reductions can only occur once the technology has been implemented.

63

¹ For an overview of the program and initial results see <http://www.epa.gov/ttn/amtic/supersites.html>

(2) METHODS ARE AVAILABLE TO SPECIFICALLY QUANTIFY BLACK CARBON EMISSIONS FROM THE PROJECT

Like greenhouse gases, black carbon emissions from various types of engines and activities can be estimated through numerical calculations. (Bond 2004). Thus, there is no reason why black carbon can reasonably be omitted from these estimates.

The estimated black carbon emissions from the project can be inventoried similarly to other greenhouse gas emissions:

- Estimate the mass of diesel fuel consumed by each type of diesel engine, e.g. ship, machinery, truck, construction equipment, and locomotive.
- Calculate a black carbon emission factor (EF) using reference values available in the literature. For instance, an equation for “EF_{BC}” from various types of diesel engines that takes into account 4 different factors.²
- Multiply the emission factor times the mass of diesel (in kilograms) used for each engine type. This will provide the grams of black carbon emitted by that engine type.
- Sum all black carbon emissions from each engine category to obtain total black carbon emissions from the project.

After obtaining the total black carbon emissions from the project, the relative global warming impact of the emissions can be compared to other global warming pollutants. Carbon dioxide-equivalent values can be obtained by multiplying total black carbon emissions (in kilograms) from the project by the global warming potential (GWP) for black carbon. Although there is some variation in estimated GWP values, representative black carbon GWP values are: 760 over 100 years³ or 2200 over 20 years (Bond & Sun 2005).

The EIR fails to analyze the impacts of black carbon emissions during both the construction and operation phase of the project. The Project will result in a large increase in diesel exhaust from the existing conditions, which is a major source of black carbon. The Project will require the cut and fill of approximately 42 million cubic yards of earth material that will require thousands of hours of operation of heavy duty construction equipment. Nowhere in the EIR is any quantified analysis performed to determine how these significant impacts could be avoided, reduced, or mitigated.

It is incumbent on the City “disclose all it can” about project impacts and educate itself on methodologies that are available to measure project emissions. *Berkeley Keep Jets Over the Bay Comm. v. Board of Port Comm’rs* (“*Berkeley Jets*”), 91 Cal. App. 4th 1344, 1370 (2001). Without a complete inventory, the EIR cannot adequately inform the public and decision-makers about the Project’s impacts. Similarly, without a complete inventory and analysis of greenhouse

² See Bond et al. 2004 at 4 and Table 7.

³ The combined global average direct (480) and indirect (281) GWP for black carbon as reported in Reddy & Boucher (2007).

gas emissions that will result from the project, there is simply no way that the EIR can then adequately discuss avoidance and mitigation measures to reduce those impacts.

64

D. THE EIR MUST ANALYZE AND ADOPT ALL FEASIBLE MITIGATION MEASURES TO REDUCE THE PROJECT'S GREENHOUSE GAS EMISSIONS

In addition to thoroughly evaluating project alternatives, because it is clear that the project's greenhouse gas emissions will cumulatively contribute to global warming, "the EIR must propose and describe mitigation measures that will minimize the significant environmental effects that the EIR has identified." *Napa Citizens for Honest Gov't v. Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 360 (2001). CEQA requires that agencies "mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so." Pub. Res. Code § 21002.1(b). CEQA specifically requires lead agencies to "consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions." Guidelines § 15126.4 (c). Mitigation of a project's significant impacts is one of the "most important" functions of CEQA. *Sierra Club v. Gilroy City Council*, 222 Cal.App.3d 30, 41 (1990). Therefore, it is the "policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects." Pub. Res. Code § 21002.

65

There are any number of feasible measures that can be incorporated to reduce vehicle miles traveled, energy use, waste, water consumption and other sources of emissions. The California Air Pollution Control Officer's Association (CAPCOA) White Paper on CEQA and Climate Change identifies existing and potential mitigation measures that could be applied to projects during the CEQA process to reduce a project's GHG emissions. (CAPCOA 2008 at Appendix B). The California Office of the Attorney General also has developed a list of reduction mechanisms to be incorporated through the CEQA process. (California Office of the Attorney General 2010). These resources provide a rich and varied array of mitigation measures to be incorporated in both the programmatic and project level. These mitigation measures are included at Attachment B and must be analyzed to determine whether they are feasible in reducing the Project's significant greenhouse gas impacts. The EIR includes a paltry list of mitigation measures that fails to meet CEQA's substantive requirement to adopt all feasible mitigation. (DEIR at 1-54, DEIR App. D at 2-8).

66

When the EIR does discuss substantive mitigation measures to reduce greenhouse gases through project design it fails to demonstrate why feasible mitigation measures are not adopted. CEQA requires the adoption of all feasible mitigation measures to reduce significant impacts like climate change or there is substantial evidence as to why the mitigation measures are infeasible. Pub. Res. Code § 21081(a)(3). The specific plan allows for the future installation of solar photovoltaic panels (i.e., buildings will be "solar ready") or other alternative energy systems on the roof of each warehouse building to offset the energy demands of the building, up to full roof coverage. (DEIR at 4.16-36, 4.16-38). Unfortunately, the EIR fails to include the installation of solar photovoltaic panels in the first instance. California's programs like the Million Solar Roof

67

Initiative and Renewable Portfolio Standard provide applicable plans to encourage on-site renewable energy in the Project. With a range of federal and state incentives and financing options the EIR must adopt the feasible mitigation of on site renewable energy for the Project.

67

Importantly, mitigation measures must be “fully enforceable through permit conditions, agreements, or other measures” so “that feasible mitigation measures will actually be implemented as a condition of development.” *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles*, 83 Cal.App.4th 1252, 1261 (2000). The EIR fails to analyze and adopt LEED certification standards for the Project. The EIR instead claims that “the project intends to achieve applicable elements of certification from the U.S. Green Building Council Leadership in Energy and Environmental Design (LEED), and encourages LEED Certification.” (DEIR at 4.16-38). However, these type of non-binding mitigation measures fails to meet CEQA’s standards of full enforceability and fails to provide any analysis or demonstration that LEED is not feasible

68

The studies supporting the EIR also discuss other feasible mitigation measures that should be adopted. The greenhouse gas analysis proposes “onsite alternative fueling infrastructure (electric charging stations and/or natural gas fueling), which will help facilitate the use of these low-emitting trucks” and “a site for the sale of food, fuel, and convenience items to minimize the need for trucks to travel off-project to purchase these goods and services.” (DEIR App. D at 5). However, the EIR itself doesn’t propose these feasible mitigation measures. The greenhouse gas analysis also fails to ensure that the mitigation measures would be fully enforceable and only requires their adoption “as appropriate.” (DEIR App. D at 5).

69

A lead agency may only “disclaim[] responsibility to mitigate environmental effects . . . when the other agency said to have responsibility has *exclusive* responsibility” to mitigate that impact. *City of Marina v. Bd. of Trustees* (2006) 39 Cal.4th 341, 366; *Citizens for Quality Growth v. City of Mount Shasta* (1988) 198 Cal.App.3d 433, 442, fn. 8 (city cannot avoid responsibility to mitigate project impacts by pointing to potential action of another agency). Unfortunately, the EIR engages in this type of deceptive analysis in asserting that the “emissions from vehicle exhaust are controlled by the State and Federal governments and are outside the control of the City.... The proposed project is required to comply with existing State and Federal regulations...” (DEIR at 4.7-44). The City cannot absolve of responsibility to adopt other feasible mitigation measures simply because another agency could potentially mitigate similar impacts.

70

After all measures have been implemented to reduce emissions in the first instance, remaining emissions that cannot be eliminated may be mitigated through offsets. Preference should be given to offset mitigation measures in that are in close proximity to the project. (SCAQMD 2008). In other words project applicants should prioritize first on mitigation onsite, then on mitigation in the neighborhood or air district, next in state, then finally out of state. (SCAQMD 2008). Care should be taken to ensure that offsets purchased are real (additional), permanent, and verified, and all aspects of the offsets should be discussed in the EIR. As demonstrated by the Office of the Attorney General and SCAQMD offsets are a feasible CEQA

71

mitigation measures⁴ once all feasible mitigation measures have been adopted to reduce the Project's carbon footprint and produce energy using renewable sources. (SCAQMD 2008).

71

IV. THE EIR FAILS TO ANALYZE HOW GLOBAL WARMING WILL COMPOUND PROJECT IMPACTS OVER THE PROJECT'S LIFETIME

The EIR fails to address how the projected effects of global warming will exacerbate the impacts of the Project. CEQA requires that an EIR "analyze any significant environmental effects the project might cause by bringing development and people into the affected area." Guidelines § 15126.2(a). In recent guidance to local governments on the analysis of global warming in a general plan update, the Attorney General noted that "[l]ead agencies should disclose any areas governed by the general plan that may be particularly affected by global warming, e.g., coastal areas that may be subject to increased erosion, sea level rise, or flooding....General plan policies should reflect these risks and minimize hazards for current and future development." (Cal. Attorney General 2009 at 6). This guidance applies with equal force to developments like the Project.

72

A. The EIR Must Analyze Global Warming's Effects on Air Quality in Determining Project Air Quality Impacts

The rise in temperatures resulting from global warming will create a more conducive environment for air pollution formation (Cayan 2007). This will intensify the adverse effects the proposed project will already have on air quality in the project area and threaten residents' health (Cayan 2007). The air quality analysis must disclose how the increased temperatures in the project area will exacerbate the already severe air quality conditions.

Californians experience the worst air quality in the nation, with annual health and economic impacts estimated in at 8,800 deaths (3,000–15,000 probable range) and \$71 billion (\$36–\$136 billion) per year (Cayan 2006). Ozone and particulate matter (PM) are the pollutants of greatest concern (maximum levels are about double California's air quality standards) and the current control programs for motor vehicles and industrial sources cost about \$10 billion per year. In light of these underlying conditions it is critical that the air quality analysis be rigorous. The DEIR is required to properly analyze the Projects' direct, indirect, and cumulative contribution to deteriorating air quality.

73

Riverside County in particular, has some of the worst air quality in the nation, even when compared to other highly urban, populated counties in California. Riverside County is ranked as one of the "Dirtiest/Worst Counties" in the US for almost all criteria pollutants under the Clean Air Act. (Criteria Air Pollutant Report; American Lung Association 2005; American Lung Association 2008). Because of this, project proponents have a unique and heavy burden not to

74

⁴ The California Attorney General's Office has adopted CEQA settlements calling for the auditing, reduction, and offsetting of greenhouse gas emissions related with a Project demonstrating that offsets are a feasible way to reduce a Project's negative environmental effects on global warming. See

<http://ag.ca.gov/newsalerts/release.php?id=1466&category=global%20warming> See generally <http://oag.ca.gov/environment/ceqa/measures>

add to this already significant health and public safety threat. Given the severe status of air quality in the project area the contribution of global warming to increased ozone formation will only worsen this severe problem; it must be fully analyzed and mitigated.

74

B. The EIR Must Analyze Global Warming's Affect on Water Supply in Determining Project Water Supply Impacts

Significantly for the state, as well as the project area, is global warming's impact on water supply. The IPCC specifically identified the American West as vulnerable, warning, "Projected warming in the western mountains by the mid-21st century is very likely to cause large decreases in snowpack, earlier snow melt, more winter rain events, increased peak winter flows and flooding, and reduced summer flows" (IPCC 2007). Recently, researches found that an increase in atmospheric greenhouse gases has contributed to a "coming crisis in water supply for the western United States" (Barnett 2008). Using several climate models and comparing the results, the researches found that "warmer temperatures accompany" decreases in snow pack and precipitation and the timing of runoff, impacting river flow and water levels (Barnett 2008). These researchers concluded with high confidence that up to 60 percent of the "climate related trends of river flow, winter air temperature and snow pack between 1950-1999" are human-induced (Barnett 2008). This, the researchers wrote, is "not good news for those living in the western United States" (Barnett 2008).

75

The California Center on Climate Change has also recognized the problem global warming presents to the state's water supply and predicts that if greenhouse gas emissions continue under the business-as-usual scenario, this snowpack could decline up to 70-90 percent, affecting winter recreation, water supply and natural ecosystems (Cayan 2007). Global warming will affect snowpack and precipitation levels, and California will face significant impacts, as its ecosystems depend upon relatively constant precipitation levels and water resources are already under strain (Cayan 2007). The decrease in snowpack in the Sierra Nevada will lead to a decrease in California's already "over-stretched" water supplies (Cayan 2007). It could also potentially reduce hydropower and lead to the loss of winter recreation (Cayan 2007). All of this means "major changes" in water management and allocation will have to be made (Cayan 2007). Thus, global warming may directly affect the ability to supply clean, affordable water to the residents, or change how the project will utilize water, and it may also impact other activities outside the project area, such as agriculture.

76

Scientists indicate that climate change will also exacerbate the problem of flooding by increasing the frequency and magnitude of large storms, which in turn will cause an increase in the size and frequency of flood events (NRDC 2007). The increasing cost of flood damages and potential loss of life will put more pressure on water managers to provide greater flood protection (NRDC 2007). At the same time, changing climate conditions (decreased snowpack, earlier runoff, larger peak events, etc.) will make predicting and maximizing water supply more difficult (NRDC 2007). These changes in hazard risk and water supply availability must be considered during environmental review.

77

Water quality, in addition to water quantity and timing, will also be impacted. Changes in precipitation, flow, and temperature associated with climate change will likely exacerbate water quality problems (NRDC 2007). Changes in precipitation affect water quantity, flow rates, and flow timing (Gleick 2000). Shifting weather patterns are also jeopardizing water quality and quantity in many countries, where groundwater systems are overdrawn (Epstein 2005). Decreased flows can exacerbate the effect of temperature increases, raise the concentration of pollutants, increase residence time of pollutants, and heighten salinity levels in arid regions (Schindler 1997).

78

C. The EIR Must Analyze Global Warming's Affects on Biological Resources in Determining Project Impacts

Climate change is having a major adverse impact on numerous plant and animal species. (Cameron and Scheel, 2001). Climate change impacts species by altering the climatic conditions that species need to survive or use a particular location as habitat, including particular temperature, type of food, water levels and water abundance, or weather conditions. (Schwartz, et. al., 2006). This causes massive migration shifts, with species seeking out other areas featuring their needed climatic conditions. (Schwartz, et. al., 2006). However, such migration shifts are not simple. For many species, their habitat is already so limited that there is no other location they can practically relocate to. As well, major impediments such as urban areas can keep species from reaching other habitats. Species migration can also cause increased food and habitat competition as more species attempt to forage, hunt, or breed, in smaller areas. Migration also has the potential to cause many of the issues commonly associated with invasive species.

79

For many species of course, migration just is not possible and, as their habitats quickly change, they will be unable to adapt in time, and will become extinct. Extinction as a direct result of climate change is an imminent possibility for numerous species. (Cameron and Scheel, 2001).

80

The threat of climate change induced species extinction is found to be highest in species with a small current distribution, (Schwartz, et. al. 2006), such as the SKR. This makes sense given that the reason that these species have small habitats in the first place is that they are "habitat specialists," meaning they can only survive in a very specific set of climatic/habitat conditions. (Schwartz, et al., 2006).

81

The DEIR should have disclosed this threat to species, and discussed the potentiality of the project contributing to the massive problem. The lead agency must include such an analysis in their subsequent EIR. The EIR must use its best efforts to find out and disclose all it reasonably can about the impacts of climate change on the environment and—most importantly—use that information to form an educated opinion about how to plan and adapt for the impacts of climate change.

82

Such an analysis is particularly important to include given that the DEIR has already concluded that the project will have a significant contribution to climate change. Because the project will have a significant impact to climate change, the project will also have a significant

83

contribution to the various secondary effects resulting from climate change, including massive migration shifts and species extinction. Further, it is irrelevant that species that are currently receiving the most attention for being at risk of extinction, such as the pika or the polar bear, are not located anywhere near the project site. Climate change is not localized in its effects so that any GHG emissions will cumulatively contribute to climate change induced species extinction.

83

Further, we are just beginning to understand how climate change is impacting species. Little information exists as to how climate change is impacting species that currently exist within the vicinity of the project site such as the burrowing owl or the SKR. However, what data we do have indicates that these species may as well be feeling the effects of climate change. Here, the EIR has not conducted an adequate inquiry into what the potential impacts from climate change to species such as the burrowing owl may be.

84

V. THE EIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE IMPACTS FROM ENERGY USE AND ASSOCIATED FACILITIES

The EIR fails to adequately disclose, analyze, and mitigate the Project's related energy use and facilities including the impacts outlined in Appendix F of the CEQA Guidelines. Among other requirements, Appendix F requires an EIR to analyze the "effects of the project on local and regional energy supplies and on requirements for additional capacity" and the "effects of the project on peak and base period demands for electricity and other forms of energy." Unfortunately the EIR fails to conduct an adequate analysis of the project on local and regional energy supplies; instead it includes vague references to facility upgrades that may be required. (DEIR at 4.16-37, 4.16-38). The EIR similarly fails to analyze the effects of the Project on peak and base electrical demands. The EIR defers analysis of the effects until an undefined later date and will rely on local stations "as long as capacity is still available at that station." (DEIR at 4.16-37).

85

The EIR claims to analyze whether the "proposed WLC project require the construction of new electrical and/or natural gas facilities or expansion of existing facilities, the construction of which would cause significant environmental effects." (DEIR at 4.16-36). However, the EIR simply lists potential electrical upgrades that may be required but doesn't analyze any impacts of those new facilities. (DEIR at 4.16-37, 4.16-38). The failure to analyze all of the necessary components of the project improperly downplays the Project's impacts and fails to provide a stable description of the Project itself. The EIR also engages in an inconsistent analysis of whether the Moreno Valley Electric Utility or Southern California Edison will provide the necessary electrical upgrades for the Project, which fails to provide the public and decision makers with a stable and consistent project description. (DEIR at 3.51, DEIR at 4.16-37). Similarly the EIR's analysis provides a shifting and variable description of whether on-site solar energy would be integrated into the Project.

86

VI. THE EIR FAILS TO ADEQUATELY ANALYZE A REASONABLE RANGE OF ALTERNATIVES

The EIR fails to consider a meaningful analysis of reasonable alternatives to the Project in order to lessen or avoid the Project's significant impacts. CEQA mandates that significant environmental damage be avoided or substantially lessened where feasible. Pub. Res. Code § 21002; Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d). A rigorous analysis of reasonable alternatives to the project must be provided to comply with this strict mandate. "Without meaningful analysis of alternatives in the EIR, neither courts nor the public can fulfill their proper roles in the CEQA process." *Laurel Heights Improvement Ass'n v. Regents of University of California*, 47 Cal.3d 376, 404 (1988). Moreover, "[a] potential alternative should not be excluded from consideration merely because it 'would impede to some degree the attainment of the project objectives, or would be more costly' even when that alternative includes Project development on an alternative site. *Save Round Valley Alliance v. County of Inyo*, 157 Cal. App. 4th 1437, 1456-57 (2007) (quotations omitted).

87

As discussed in comments on the NOP the EIR must consider a reasonable range of alternatives including the feasibility of rail service to the project and a site served by rail. Unfortunately the EIR fails to conduct that analysis. The EIR also conducts a faulty alternative site analysis claiming that the only feasible alternative site would include "a contiguous 2,635-acre site for 41 million square feet." (DEIR at 6-38). This improperly narrow project objective fails to permit the EIR to conduct an analysis of a reasonable range of alternatives.

VII. THE EIR MUST BE RECIRCULATED FOR PUBLIC REVIEW AND COMMENT

A lead agency must re-circulate an EIR for further public comment under any of four circumstances:

- (1) When the new information shows a new, substantial environmental impact resulting either from the project or from a mitigation measure;
- (2) When the new information shows a substantial increase in the severity of an environmental impact, except that recirculation would not be required if mitigation that reduces the impact to insignificance is adopted;
- (3) When the new information shows a feasible alternative or mitigation measure that clearly would lessen the environmental impacts of a project and the project proponent declines to adopt the mitigation measure; or
- (4) When the draft EIR was "so fundamentally and basically inadequate and conclusory in nature" that public comment on the draft EIR was essentially meaningless.

88

CEQA Guidelines §15088.5.

Based on the comments above, it is clear that the EIR must be re-drafted and re-circulated. Conditions (1) and (2) above will be met by meaningful and adequate discussion of the project itself and the project's impacts to biological resources and greenhouse gases. Failure

to address these impacts is inadequate and requires further analysis and recirculation. The combined effect of these omissions makes it clear that the fourth condition has also been met.

88

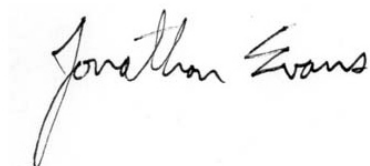

CONCLUSION

Thank you for your attention to these comments. We look forward to working with the County to assure that the EIR conforms to the requirements of CEQA to assure that all significant impacts to the environment are fully analyzed, mitigated or avoided. Should you have any questions feel free to contact Jonathan Evans at the contact information listed above.

89

The Center for Biological Diversity, and San Bernardino Valley Audubon Society wish to be placed on the mailing list for all future notices regarding this project. Please mail all notices to CBD at the address listed above (via email at jevans@biologicaldiversity.org); and San Bernardino Valley Audubon Society at drewf3@verizon.net and P. O. Box 10973, San Bernardino, California 92423-0973.

Best regards,

Jonathan Evans
Staff Attorney
Center for Biological Diversity

Attachment A

Ecological Value of Riparian Areas and Wetlands

Riparian areas support a disproportionate share of the State's biodiversity and preservation of these vegetation communities is critical to the survival of rare, sensitive, threatened and endangered plants and wildlife. CDFG 2003.

Over 225 species of birds, mammals, reptiles, and amphibians depend upon California's riparian habitats (Knopf et al. 1988, Saab et al. 1995, Dobkin et al. 1998). In addition, these beautiful examples of California's biodiversity can help reduce flood flows and flood damage, improve groundwater recharge, prevent damaging chemicals and other compounds from reaching open water, and reduce wind and erosion on adjacent lands. . . Unfortunately, human activities have destroyed or fragmented most of this valuable habitat over the past 150 years. No one has documented how much riparian habitat existed in California before 1850. However, a 1984 study estimated that riparian vegetation in the Central Valley and desert regions represented from two to five percent of the pre-1850 amount... Because they are both biologically rich and severely degraded, riparian areas have been identified as the most critical habitat for conserving neotropical migrant birds.

CDFG 2003. (emphasis added).

Wetlands and riparian habitats are truly among the rarest and most sensitive ecosystem types in California. These areas are critical for biodiversity, harboring high concentrations of threatened, endangered, and sensitive species. Krueper (1992) estimates that wetland and riparian habitat occupies less than 1% of the total land area in the western U.S., yet is critical for up to 80% of terrestrial vertebrate species. Riparian habitats are relatively rare in the California deserts, but extensively degraded. As noted above, more than 90% of the State's riparian areas and wetlands have already been lost, but while there are fewer acres of riparian habitat than other plant communities, riparian areas sustain a disproportionately high number of aquatic and terrestrial wildlife species (Faber et al. 1989). Riparian communities in the arid areas of the State are typically surrounded by far drier environments, and the water and riparian vegetation that they provide are vitally important to many species (Krueper 1992).

Terrestrial vertebrates in the State rely heavily on riparian habitats for various life stages, as noted above, the California Department of Fish and Game estimates that over 225 species of birds, mammals, reptiles, and amphibians depend upon California's riparian habitats. A recent study found that there are approximately 173 terrestrial vertebrates in the eastern United States alone that require riparian habitats for some lifehistory function (26 mammals, 27 birds, 50 reptiles, and 70 Amphibians) (Crawford 2007).

Direct and Indirect Impacts to Wetlands and Riparian Areas

Nonpoint source pollution from activities such as urban runoff, agriculture, and habitat modification are considered the primary source of pollutants to waters of the US (USEPA 2002). Many wetlands that persist are significantly degraded through contamination by pollution from urban and agricultural runoff (Dahl 2006).

It is important to recognize that the destruction and modification of riparian and wetland habitat can have broad indirect effects within a watershed and analyze the impacts of those impacts.

Artificial flow regulation with local or upstream dams and diversions, as well as channel alteration and containment with levees and channelization, can alter plant communities at watershed scales (Ohmart 1994, Hunter et al. 1999). Transportation departments may channelize or re-direct sheet flow to manage rainfall events, altering hydrologic input to desert wash habitats (The Nature Conservancy 2001). Vegetation, and therefore vegetation-dependent wildlife, can be dramatically affected by distant upstream water management practices (Ohmart 1994), so that restoration efforts at specific sites may depend ultimately on the cooperation of partners managing water in the wider landscape. (CalPIF, The Draft Desert Bird Conservation Plan, 2006).

Specific types of development can have broad ranging effects. Roads are responsible for a suite of indirect effects that impact species dynamics, soil characteristics, water flow regimes, and vegetation cover (Bashore et al. 1985; Reijnen et al. 1996, Forman et al. 2003). The degree of indirect effect varies in relation to the distance from a road, extending to what is known as the “road effect zone” or the outer limit of significant ecological effect (Forman et al. 1997; Forman and Deblinger 1998, 1999). Forman and Deblinger (2000) found that the effects of all nine ecological factors studied extended more than 100 m from the road, with some extending outwards of 1 km of the road. The road-effect zone was asymmetric, had convoluted boundaries and a few long fingers and averaged approximately 600m in width.

Indirect effects often have such broad implications because the “road effect zone,” or the outer limit of a significant ecological effect, extends much further than the actual road, route or trail (Forman 2000). Forman et al. (2003) state all roads not only have a physical footprint, but also a “virtual footprint” surrounding their actual location. This virtual footprint includes the “accumulated effect over time and space of all of the activities that roads induce or allow, as well as all of the ecological effects of those activities (Forman et al. 2003).” It is estimated that 19% of the land surface in the U.S. is directly affected by roads, while in total, 22% of the U.S may be ecologically altered by the road network (Forman 2000).

Mitigation for Impacts to Wetlands and Riparian Areas

To protect stream amphibians and other wildlife dependent on riparian areas and wetlands, land managers and policy makers must consider conserving more than aquatic

resources alone (Crawford 2007). Developing core terrestrial habitat estimates and buffer zone widths for wildlife populations is a critical first step in the conservation of many semiaquatic organisms and protecting biodiversity (Crawford 2007). Typically when buffer zones are determined to mitigate edge effects, they are based on criteria that protect aquatic resources alone and do not consider impacts to wildlife, semiaquatic species, and other terrestrial resources (Semlitsch & Bodie 1998; Semlitsch & Jensen 2001). For example, in Oregon, the minimum buffer strip required to protect water resources is 6.1 m, although a minimum buffer of 20 m is needed to protect certain salamander species (Vesely & McComb 2002).

Maintaining appropriate, fully protected buffer strips between streams and upland soil-disturbing activities is critical to sustaining aquatic and riparian ecosystems (Erman et al. 1996). Most of the current literature about estimating appropriate widths of riparian buffer strips takes into account the complexity of landscapes. Research conducted as part of the Sierra Nevada Ecosystem Project (Erman et al. 1996) provided guidance for designating riparian buffers that incorporate steepness of surrounding slopes and erodability of soils: this research concluded that if the average slope were 25 percent, the buffer width should be 524 feet on either side of the stream, and if the slope were 50 percent, the buffer should be 672 feet.

Riparian forests have been found to reduce delivery of nonpoint-source pollution to streams and lakes in many types of watersheds (Vellidis et al. 2002, 2003a; Lowrance et al. 1983, 1984a, 1984b, 1985a, 1985b, 1997). Riparian forest ecosystems are excellent nutrient and herbicide sinks that reduce the pollutant discharge from surrounding agroecosystems (Peterjohn and Correll 1984). For example, studies from coastal plain agricultural watersheds reveal that riparian forest ecosystems are excellent nutrient sinks and buffer the discharge from surrounding agroecosystems (Lowrance 1984a). Riparian buffers are especially important on small streams where intense interaction between terrestrial and aquatic ecosystems occurs (Vellidis et al., 2003b), because first- and second-order streams comprise nearly three-quarters of the total stream length in the US (Leopold et al., 1964).

Attachment B
Greenhouse Gas Mitigation Measures

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments	
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴				Logistical ⁵
Transportation								
Bicycle/Pedestrian/Transit Measures								
MM T-1: Bike Parking	LD (C, M), I, SP, TP, AQP, RR, P/Mobile	1%-5%/High: CCAP presents combined % reductions for a range of mitigation measures (Dierkers et al. 2007). SMAQMD allocates combined reductions among individual measures (e.g., 2.5% reduction for all bicycle-related measures and one-quarter of 2.5% for each individual measure) (TIAX 2005, EDAW 2006, SMAQMD 2007). VTPI presents % reductions for showers and combined measures in the TDM encyclopedia (VTPI	Yes: Lockers (\$1,200-\$2,950, \$700/bike on average), Racks (\$70-\$2,000, \$70/bike on average).	Yes (Caltrans 2005, Dierkers et al. 2007, VTPI 2007)	Yes (Caltrans 2005, Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	Caltrans, Portland Bicycle Master Plan (City of Portland 1998), CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, CA air quality management and control districts, and cities/counties.	Nonresidential projects provide plentiful short- and long-term bicycle parking facilities to meet peak season maximum demand (e.g., one bike rack space per 20 vehicle/employee parking spaces).
MM T-2: End of Trip Facilities	LD (C, M), I, SP, TP, AQP, RR, P/Mobile		Yes	Yes (Caltrans 2005, Dierkers et al. 2007, VTPI 2007)	Yes (Caltrans 2005, Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs		Nonresidential projects provide “end-of-trip” facilities including showers, lockers, and changing space (e.g., four clothes lockers and one shower provided for every 80 employee parking spaces, separate facilities for each gender for projects with 160 or more employee parking spaces).
MM T-3: Bike-Parking at Multi-	LD (R, M), SP, AQP, RR,		Yes: Lockers (\$1,200-	Yes (Caltrans 2005,	Yes (Caltrans	Adverse: No Beneficial:		Long-term bicycle parking is provided at apartment

Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)			Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
MM T-5: Pedestrian Network	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-10%/High: CCAP presents combined % reductions for a range of mitigation measures (Dierkers et al. 2007). SMAQMD allocates 1% for each individual measure (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, CA air quality management and control districts, and cities/counties.	The project provides a pedestrian access network that internally links all uses and connects to all existing/planned external streets and pedestrian facilities contiguous with the project site. Project design includes a designated pedestrian route interconnecting all internal uses, site entrances, primary building entrances, public facilities, and adjacent uses to existing external pedestrian facilities and streets. Route has minimal conflict with parking and automobile circulation facilities. Streets (with the exception of alleys) within the project have sidewalks on both sides. All sidewalks internal and adjacent to project site are minimum of five feet wide. All sidewalks feature vertical curbs. Pedestrian facilities and improvements such as grade separation, wider sidewalks, and traffic calming are implemented wherever feasible to minimize pedestrian barriers. All site entrances provide pedestrian access.
MM T-6: Pedestrian	LD (R, C, M), I, SP, TP,		Yes	Yes (Dierkers et al. 2007,	Yes (Dierkers et	Adverse: No Beneficial:		Site design and building placement minimize barriers to

Barriers Minimized	AQP, RR, P/Mobile			VTPI 2007)	al. 2007, VTPI 2007)	CAPs, TACs		pedestrian access and interconnectivity. Physical barriers such as walls, berms, landscaping, and slopes between residential and nonresidential uses that impede bicycle or pedestrian circulation are eliminated.
MM T-7: Bus Shelter for Existing/Planned Transit Service	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-2%/High: CCAP presents these % reductions (Dierkers et al., 2007). SMAQMD assigns from .25%-1%, depending on headway frequency (TIAx 2005, EDAW 2006, SMAQMD 2007).	Yes: \$15,000-\$70,000.	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, City of Calgary (City of Calgary 2004), CA air quality management and control districts, and cities/counties.	Bus or streetcar service provides headways of one hour or less for stops within one-quarter mile; project provides safe and convenient bicycle/pedestrian access to transit stop(s) and provides essential transit stop improvements (i.e., shelters, route information, benches, and lighting).

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)			Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
MM T-8: Traffic Calming	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-10%/High: CCAP presents combined % reductions for a range of mitigation measures (Dierkers et al. 2007). SMAQMD allocates .25%-1.0% for each individual measure depending on percent of intersections and streets with improvements (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, CA air quality management and control districts, and cities/counties.	Project design includes pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways are designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips by featuring traffic calming features. All sidewalks internal and adjacent to project site are minimum of five feet wide. All sidewalks feature vertical curbs. Roadways that converge internally within the project are routed in such a way as to avoid “skewed intersections,” which are intersections that meet at acute, rather than right, angles. Intersections internal and adjacent to the project feature one or more of the following pedestrian safety/traffic calming design techniques: marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, raised intersections, median islands, tight corner radii, and roundabouts or mini-circles. Streets internal and adjacent to the project feature pedestrian safety/traffic calming measures such as on-street parking, planter strips with street trees,

		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
							and chicanes/chokers (variations in road width to discourage high-speed travel).	
Parking Measures								
MM T-9: Paid Parking (Parking Cash Out)	LD (C, M), I, SP, TP, AQP, RR, P/Mobile	1%-30%/High: CCAP presents a range of 15%-30% reduction for parking programs (Dierkers et al. 2007). SMAQMD presents a range of 1.0%-7.2%, depending on cost/day and distance to transit (TIAX 2005, EDAW 2006, SMAQMD 2007). Shoupe presents a 21% reduction [\$5/day for commuters to downtown LA, with elasticity of -0.18 (e.g., if price increases 10%, then solo driving goes down by 1.8% more)] (Shoupe 2005). Urban Transit Institute	Yes: Vary by location and project size.	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, CA air quality management and control districts, and cities/counties.	Project provides employee and/or customer paid parking system. Project must have a permanent and enforceable method of maintaining user fees for all parking facilities. The facility may not provide customer or employee validations. Daily charge for parking must be equal to or greater than the cost of a transit day/monthly pass plus 20%.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16
Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴			
		presents a range of 1%-10% reduction in trips to central city sites, and 2%-4% in suburban sites (VTPI 2007).					
MM T-10: Minimum Parking	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-30%/High: CCAP presents a range of 15%-30% reduction for parking programs (Dierkers et al. 2007). SMAQMD presents a maximum of 6% (Nelson/Nygaard Consulting Associates, 2005, TIAX 2005, EDAW 2006).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007), Note that in certain areas of the state, the minimum parking required by code is greater than the peak period parking demand for most land uses. Simply meeting minimum code requirements in these areas would not result in an emissions reduction.	Adverse: No Beneficial: CAPs, TACs	CCAP Transportation Emissions Guidebook (Dierkers et al. 2007), SMAQMD Recommended Guidance for Land Use Emission Reductions (SMAQMD 2007), VTPI, Governor's Office of Smart Growth (Annapolis, Maryland) (Zimblar), CA air quality management and control districts, and cities/counties. Provide minimum amount of parking required. Once land uses are determined, the trip reduction factor associated with this measure can be determined by utilizing the ITE parking generation publication. The reduction in trips can be computed as shown below by the ratio of the difference of minimum parking required by code and ITE peak parking demand for the land uses multiplied by 50%. Percent Trip Reduction = 50 * [(min parking required by code – ITE peak parking demand)/ (ITE peak parking demand)]

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴			
MM T-11: Parking Reduction Beyond Code/Shared Parking	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-30%/High: CCAP presents a range of 15%-30% reduction for parking programs (Dierkers et al. 2007). SMAQMD presents a maximum of 12% (Nelson/Nygaard, 2005, TIAX 2005, EDAW 2006).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	Provide parking reduction less than code. This measure can be readily implemented through a shared parking strategy, wherein parking is utilized jointly among different land uses, buildings, and facilities in an area that experience peak parking needs at different times of day and day of the week.
MM T-12: Pedestrian Pathway Through Parking	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-4%/Moderate: CCAP presents combined % reductions for a range of mitigation measures (Dierkers et al. 2007). SMAQMD allocates 0.5% reduction for this measure (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	Provide a parking lot design that includes clearly marked and shaded pedestrian pathways between transit facilities and building entrances.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16
Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵		
MM T-13: Off - Street Parking	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-4%/Moderate: CCAP presents combined % reductions for a range of mitigation measures (Dierkers et al. 2007). SMAQMD allocates a range of 0.1%-1.5% for this measure (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	Parking facilities are not adjacent to street frontage.
MM T-14: Parking Area Tree Cover	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	Annual net CO ₂ reduction of 3.1 kg/m ² canopy cover/Moderate (McPherson 2001).	Yes: \$19 per new tree for CA, cost varies for maintenance, removal and replacement (McPherson 2001).	Yes	Yes	Adverse: VOCs Beneficial: CAPs, TACs	AG, State of CA Department of Justice (Goldberg 2007) and cities/counties (e.g., parking lot ordinances in Sacramento, Davis, and Los Angeles, CA). Provide parking lot areas with 50% tree cover within 10 years of construction, in particular low emitting, low maintenance, native drought resistant trees. Reduces urban heat island effect and requirement for air conditioning, effective when combined with other measures (e.g., electrical maintenance equipment and reflective paving material).
MM T-15: Valet Bicycle Parking	LD (C, M), SP, AQP, TP, RR, P/Mobile	NA/Low	Yes	Yes	Yes: Raley Field (Sacramento, CA)	Adverse: No Beneficial: CAPs, TACs	Raley Field (Sacramento, CA). Provide spaces for the operation of valet bicycle parking at community event “centers” such as amphitheaters, theaters, and stadiums.
MM T-16: Garage Bicycle Storage	LD (R, M), SP, AQP, TP, RR, P/Mobile	NA/Low	Yes: Less than \$200/multiple bike rack.	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	City of Fairview, OR Provide storage space in one-car garages for bicycles and bicycle trailers.

Miscellaneous Measure							
MM T-19: TMA Membership	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	1%-28%/High: CCAP presents a range of 3%-25% for TDMs with complementary transit and land use measures (Dierkers et al. 2007). VTPI presents a range of 6%-7% in the TDM encyclopedia (VTPI 2007). URBEMIS offers a 2%-10% range in reductions for a TDM that has 5 elements that are pedestrian and transit friendly and 1%-5% for 3 elements. SMAQMD presents a reduction of 5% (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007, VTPI 2007)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Include permanent TMA membership and funding requirement. Funding to be provided by Community Facilities District or County Service Area or other nonrevocable funding mechanism. TDMs have been shown to reduce employee vehicle trips up to 28% with the largest reductions achieved through parking pricing and transit passes. The impact depends on the travel alternatives.
MM T-20: ULEV	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	NA/Low	Yes: Higher than corresponding gasoline models.	Yes	Yes: Fueling stations might not be readily available depending on location. More than 900 E85 fueling	Adverse: No Beneficial: CAPs, TACs	DGS, CA air quality management and control districts and cities/counties (e.g., SMAQMD). Use of and/or provide ULEV that are 50% cleaner than average new model cars (e.g., natural gas, ethanol, electric).

		on FAR and headway frequencies (Nelson/Nygaard Consulting Associates 2005, EDAW 2006, SMAQMD 2007).				(e.g., SMAQMD).	safe and convenient pedestrian and bicycle access to all transit stops within one-quarter mile.
MM D-2: Orientation to Existing/Planned Transit, Bikeway, or Pedestrian Corridor	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	0.4%-1%/Moderate: CCAP attributes a 0.5% reduction per 1% improvement in transit frequency (Dierkers et al. 2007). SMAQMD presents a range of 0.25%-5% (JSA 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (Dierkers et al. 2007)	Yes (Dierkers et al. 2007)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Project is oriented towards existing transit, bicycle, or pedestrian corridor. Setback distance between project and existing or planned adjacent uses is minimized or nonexistent. Setback distance between different buildings on project site is minimized. Setbacks between project buildings and planned or existing sidewalks are minimized. Buildings are oriented towards existing or planned street frontage. Primary entrances to buildings are located along planned or existing public street frontage. Project provides bicycle access to any planned bicycle corridor(s). Project provides pedestrian access to any planned pedestrian corridor(s).
MM D-3: Services Operational	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	0.5%-5%/Moderate	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Project provides on-site shops and services for employees.

Table 16
Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵		
MM D-4: Residential Density (Employ Sufficient Density for New Residential Development to Support the Use of Public Transit)	LD (R, M), SP, TP, AQP, RR, P/Mobile	1%-40%/High: #7, EPA presents a range of 32%-40% (EPA 2006). SMAQMD presents a range of 1%-12% depending on density and headway frequencies (Nelson/Nygaard Consulting Associates 2005, JSA 2005, EDAW 2006, SMAQMD 2007). Nelson/Nygaard presents a trip reduction formula: Trip Reduction = $0.6 * (1 - (19749 * ((4.814 + \text{households per residential acre}) / (4.814 + 7.14))) ^ - 06.39) / 25914$.	Yes	Yes (VTPI 2007, Holtzclaw 2007)	Yes (VTPI 2007, Holtzclaw 2007)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Project provides high-density residential development. Transit facilities must be within one-quarter mile of project border. Project provides safe and convenient bicycle/pedestrian access to all transit stop(s) within one-quarter mile of project border.
MM D-5: Street Grid	LD (R, C, M), I, SP, TP, AQP, RR,	1%/Moderate: SMAQMD presents this % reduction (JSA	Yes	Yes (Dierkers et al. 2007, VTPI 2007)	Yes (Dierkers et al. 2007,	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties Multiple and direct street routing (grid style). This measure only applies to projects

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴			
	P/Mobile	2005, EDAW 2006, SMAQMD 2007).			VTPI 2007)	(e.g., SMAQMD).	with an internal CF ≥ 0.80 , and average of one-quarter mile or less between external connections along perimeter of project. [CF= # of intersections / (# of cul-de-sacs + intersections)]. Cul-de-sacs with bicycle/pedestrian through access may be considered “complete intersections” when calculating the project’s internal connectivity factor. External connections are bike/pedestrian pathways and access points, or streets with safe and convenient bicycle and pedestrian access that connect the project to adjacent streets, sidewalks, and uses. If project site is adjacent to undeveloped land; streets, pathways, access points, and right-of-ways that provide for future access to adjacent uses may count for up to 50% of the external connections. Block perimeter (the sum of the measurement of the length of all block sides) is limited to no more than 1,350 feet. Streets internal to the project should connect to streets external to the project whenever possible.

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴			
MM D-6: NEV Access	LD (R, C, M), SP, TP, AQP, RR, P/Mobile	0.5%-1.5%/Low: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes (Litman 1999, Sperling 1994)	Yes (Litman 1999, Sperling 1994)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Make physical development consistent with requirements for neighborhood electric vehicles. Current studies show that for most trips, NEVs do not replace gas-fueled vehicles as the primary vehicle.
MM D-7: Affordable Housing Component	LD (R, M), SP, TP, AQP, RR, P/Mobile	0.4%-6%/Moderate: SMAQMD presents this % reduction (Nelson/Nygaard Consulting Associates 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Residential development projects of five or more dwelling units provide a deed-restricted low-income housing component on-site (or as defined in the code). Developers who pay into In-Lieu Fee Programs are not considered eligible to receive credit for this measure. The award of emission reduction credit shall be based only on the proportion of affordable housing developed on-site because in-lieu programs simply induce a net increase in development. Percentage reduction shall be calculated according to the following formula:

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
								% reduction = % units deed-restricted below market rate housing * 0.04
MM D-8: Recharging Area	LD (R, M), SP, TP, AQP, RR, P/Mobile	NA/Low	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs		Provide residential buildings with a “utility” room or space for recharging batteries, whether for use in a car, electric lawnmower, other electric landscaping equipment, or even batteries for small items such as flashlights.
Mixed-Use Development Measures								
MM D-9: Urban Mixed-Use	LD (M), SP, TP, AQP, RR, P/Mobile	3%-9%/Moderate: SMAQMD presents this % reduction (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (EPA 2006)	Yes (EPA 2006)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Development of projects predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design.
MM D-10: Suburban Mixed-Use	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	3%/Moderate: SMAQMD presents this % reduction (TIAX 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (EPA 2006)	Yes (EPA 2006)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Have at least three of the following on site and/or offsite within one-quarter mile: Residential Development, Retail Development, Park, Open Space, or Office.
MM D-11: Other Mixed-Use	LD (R, M), SP, TP, AQP, RR, P/Mobile	1%/Moderate: SMAQMD presents this % reduction (TIAX 2005, EDAW	Yes	Yes (EPA 2006)	Yes (EPA 2006)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	All residential units are within one-quarter mile of parks, schools or other civic uses.

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴			
		2006, SMAQMD 2007).					
MM D-12: Infill Development	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	3%-30%/High: Infill development reduces vehicle trips and VMT by 3% and 20%, respectively (Fehr & Peers 2007). CCAP identifies a site level VMT reduction range of 20%-30% (Dierkers et al. 2007).	Yes	Yes (Dierkers et al. 2007)	Yes (Dierkers et al. 2007)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Project site is on a vacant infill site, redevelopment area, or brownfield or greyfield lot that is highly accessible to regional destinations, where the destinations rating of the development site (measured as the weighted average travel time to all other regional destinations) is improved by 100% when compared to an alternate greenfield site.
Miscellaneous Measures							
MM D-13: Electric Lawnmower	LD (R, M), SP, AQP, RR, P/Area	1%/Low: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD). Provide a complimentary electric lawnmower to each residential buyer.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
MM D-14: Enhanced Recycling/Waste Reduction, Reuse, Composting	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	NA/Low	Yes	Yes	Yes: Association with social awareness.	Adverse: No Beneficial: CAPs, TACs	CIWMB	Provide infrastructure/education that promotes the avoidance of products with excessive packaging, recycle, buying of refills, separating of food and yard waste for composting, and using rechargeable batteries.
MM D-15: LEED Certification	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	NA/Moderate	Yes: Receive tax rebates, incentives (e.g., EDAW San Diego office interior remodel cost \$1,700,000 for 32,500 square feet) (USGBC 2007)	Yes	Yes: More than 700 buildings of different certifications in CA (USGBC 2007).	Adverse: No Beneficial: CAPs, TACs	USGBC, CA air quality management and control districts and cities/counties (e.g., BAAQMD).	LEED promotes a whole-building approach to sustainability by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality.
MM D-16: Retro-Commissioning	LD (C, M), I, SP, AQP, RR, P/Stationary & Area	8%-10% reduction in energy usage/Moderate: (Mills et al. 2004)	Yes: Average \$0.28/square feet, varies with building size (Haasl and Sharp 1999).	Yes	Yes: 27 projects underway in CA, 21 more to be completed in 2007, mostly state buildings owned by DGS (DGS 2007).	Adverse: No Beneficial: CAPs, TACs	DGS, CA air quality management and control districts and cities/counties (e.g., BAAQMD).	The process ensures that all building systems perform interactively according to the contract documents, the design intent and the owner's operational needs to optimize energy performance.
MM D-17 Landscaping	LD (R, C, M), I, SP, AQP, RR,	NA/Low	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	Alliance for the Chesapeake Bay, EPA Green Landscaping	Project shall use drought resistant native trees, trees with low emissions and high carbon

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
	P/Stationary & Area						Resources	sequestration potential. Evergreen trees on the north and west sides afford the best protection from the setting summer sun and cold winter winds. Additional considerations include the use of deciduous trees on the south side of the house that will admit summer sun; evergreen plantings on the north side will slow cold winter winds; constructing a natural planted channel to funnel summer cooling breezes into the house. Neighborhood CCR's not requiring that front and side yards of single family homes be planted with turf grass. Vegetable gardens, bunch grass, and low-water landscaping shall also be permitted, or even encouraged.
MM D-18: Local Farmers' Market	LD (M), SP/Mobile, Stationary, &	NA/Low	Yes	Yes	Yes: Associated with social	Adverse: No Beneficial: CAPs, TACs	Cities/counties (e.g., Davis, Sacramento)	Project shall dedicate space in a centralized, accessible location for a weekly farmers' market.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
	Area				choice and public awareness.			
MM D-19: Community Gardens	LD (M), SP/Mobile, Stationary, & Area	NA/Low	Yes	Yes	Yes: Associated with social choice and public awareness.	Adverse: No Beneficial: CAPs, TACs	Cities/counties (e.g., Davis)	Project shall dedicate space for community gardens.
Energy Efficiency/Building Component								
MM E-1: High-Efficiency Pumps	LD (R, C, M), SP, AQP, RR, P/Stationary & Area	NA/Low	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., BAAQMD).	Project shall use high-efficiency pumps.
MM E-2: Wood Burning Fireplaces/Stoves	LD (R, M), SP, AQP, RR, P/Stationary & Area	NA/Low: EDAW 2006	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project does not feature fireplaces or wood burning stoves.
MM E-3: Natural Gas Stove	LD (R, M), SP, AQP, RR, P/Stationary & Area	NA/Low: EDAW 2006	Yes: Cost of stove—\$350 (gas) and \$360 (electric) same brand, total yearly cost of \$42.17 as opposed to \$56.65 for electric (Saving Electricity 2006).	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project features only natural gas or electric stoves in residences.

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments	
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴				Logistical ⁵
MM E-4: Energy Star Roof	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	0.5%-1%/Low: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes	Yes: 866 Energy Star labeled buildings in California (Energy Star 2007)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project installs Energy Star labeled roof materials.
MM E-5: On-site Renewable Energy System	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	1%-3%/Moderate: SMAQMD presents this % reduction (USGBC 2002 and 2005, EDAW 2006, SMAQMD 2007).	Yes	Yes (USGBC 2002 and 2005)	Yes (USGBC 2002 and 2005)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project provides onsite renewable energy system(s). Nonpolluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments	
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴				
MM E-6: Exceed Title 24	LD (R, C, M), I, GSP, AQP, RR, P/Stationary & Area	1%/Moderate: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes (PG&E 2002, SMUD 2006)	Yes (PG&E 2002, SMUD 2006)	Adverse: No Beneficial: CAPs, TACs	PG&E, SMUD, CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project exceeds title 24 requirements by 20%.
MM E-7: Solar Orientation	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	0.5%/Low: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project orients 75% or more of homes and/or buildings to face either north or south (within 30° of N/S). Building design includes roof overhangs that are sufficient to block the high summer sun, but not the lower winter sun, from penetrating south facing windows. Trees, other landscaping features and other buildings are sited in such a way as to maximize shade in the summer and maximize solar access to walls and windows in the winter.
MM E-8: Nonroof Surfaces	LD (R, C, M), I, GSP, AQP, RR, P/Stationary & Area	1.0%/Low: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes (USGBC 2002 and 2005)	Yes (USGBC 2002 and 2005)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Provide shade (within 5 years) and/or use light-colored/high- albedo materials (reflectance of at least 0.3) and/or open grid pavement for at least 30% of the site's nonroof impervious surfaces, including parking lots, walkways, plazas, etc.; OR place a minimum of 50% of parking spaces underground or covered by structured parking; OR use an open-grid pavement system (less than 50% impervious) for a minimum of

**Table 16
Mitigation Measure Summary**

Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
								50% of the parking lot area. The mitigation measure reduces heat islands (thermal gradient differences between developed and undeveloped areas to minimize impact on microclimate and human and wildlife habitats. This measure requires the use of patented or copyright protected methodologies created by the ASTM. The SRI is a measure of the constructed surface's ability to reflect solar heat, as shown by a small rise in temperature. It is defined so that a standard black (reflectance 0.05, emittance 0.90) is "0" and a standard white (reflectance 0.80, emittance 0.90) is 100. To calculate SRI for a given material, obtain the reflectance value and emittance value for the material. SRI is calculated according to ASTM E 1980-01. Reflectance is measured

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
								according to ASTM E 903, ASTM E 1918, or ASTM C 1549. Emittance is measured according to ASTM E 408 or ASTM C 1371. Default values for some materials will be available in the LEED-NC v2.2 Reference Guide.
MM E-9: Low-Energy Cooling	LD (C, M), I, SP, AQP, RR, P/Stationary & Area	1%-10%/Low: EDAW presents this percent reduction range (EDAW 2006).	Yes	Yes (USGBC 2002 and 2005)	Yes (USGBC 2002 and 2005)	Adverse: No Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Project optimizes building's thermal distribution by separating ventilation and thermal conditioning systems.
MM E-10: Green Roof	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	1.0%/Moderate: SMAQMD presents this % reduction (EDAW 2006, SMAQMD 2007).	Yes	Yes (USGBC 2002 and 2005)	Yes (USGBC 2002 and 2005)	Adverse: Increased Water Consumption Beneficial: CAPs, TACs	CA air quality management and control districts and cities/counties (e.g., SMAQMD).	Install a vegetated roof that covers at least 50% of roof area. The reduction assumes that a vegetated roof is installed on a least 50% of the roof area or that a combination high albedo and vegetated roof surface is installed that meets the following standard: (Area of SRI Roof/0.75)+(Area of vegetated roof/0.5) >= Total Roof Area. Water consumption reduction measures shall be considered in the design of the green roof.
MM E-11: EV Charging Facilities	LD (C, M), SP, AQP, RR, P/Stationary & Area	NA/Low	Yes: \$500-\$5000/ vehicle site (PG&E 1999)	Yes	Yes: 381 facilities in CA (Clean Air Maps 2007).	Adverse: No Beneficial: CAPs, TACs	DOE, EERE, CA air quality management and control districts and cities/counties (e.g., BAAQMD).	Project installs EV charging facilities.
MM E-12:	LD (R, C, M),	NA/Low: Increasing	Yes: Light	Yes	Yes: Apply	Adverse: No		Project provides light-colored

Table 16
Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
Light-Colored Paving	I, SP, AQP, RR, P/Stationary & Area	the albedo of 1,250 km of pavement by 0.25 would save cooling energy worth \$15M per year.	colored aggregates and white cement are more expensive than gray cement. Certain blended cements are very light in color and may reflect similarly to white cement at an equivalent cost to normal gray cement.		natural sand or gravel colored single surface treatments to asphalt (EOE 2007).	Beneficial: CAPs, TACs		paving (e.g., increased albedo pavement).
MM E-13: Cool Roofs	LD (R, C, M), I, SP, AQP, RR, P/Stationary & Area	NA/Low	Yes: 0.75–1.5/square feet coating (EPA 2007a)	Yes	Yes: Over 90% of the roofs in the United States are dark colored	Adverse: No Beneficial: CAPs, TACs	CEC	Project provides cool roofs. Highly reflective, highly emissive roofing materials that stay 50-60°F cooler than a normal roof under a hot summer sun. CA's Cool Savings

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
					(EPA 2007a).			Program provided rebates to building owners for installing roofing materials with high solar reflectance and thermal emittance. The highest rebate went to roofs on air conditioned buildings, while buildings with rooftop ducts and other nonresidential buildings were eligible for slightly less. The program aimed to reduce peak summer electricity demand and was administered by the CEC.
MM E-14: Solar Water Heaters	LD (R, M), SP, AQP, RR, P/Stationary & Area	20%–70% reduction in cooling energy needs/Moderate	Yes: \$1675/20 square feet, requires a 50 gallon tank, annual operating cost of \$176 (DOE 2007).	Yes	Yes: Based on solar orientation, building codes, zoning ordinances.	Adverse: No Beneficial: CAPs, TACs	Europe	Project provides solar water heaters.
MM E-15: Electric Yard Equipment Compatibility	LD (R, M), SP, AQP, RR, P/Stationary & Area	NA/Low	Yes: \$75–\$250/outlet from existing circuit (Cost Helper 2007).	Yes	Yes	Adverse: No Beneficial: CAPs, TACs		Project provides electrical outlets at building exterior areas.
MM E-16: Energy Efficient Appliance Standards	LD (R, C, M), SP, AQP, RR, P/Stationary & Area	NA/Low	Yes: Varies for each appliance—higher capital costs, lower operating costs (Energy	Yes	Yes: Major retail stores.	Adverse: No Beneficial: CAPs, TACs		Project uses energy efficient appliances (e.g., Energy Star).

Star 2007).							
MM E-17: Green Building Materials	LD (R, C, M), SP, AQP, RR, P/Stationary & Area	NA/Low: 25-30% more efficient on average.	Yes	Yes: BEES software allows users to balance the environmental and economic performance of building products; developed by NIST (NIST 2007).	Yes	Adverse: No Beneficial: CAPs, TACs	Project uses materials which are resource efficient, recycled, with long life cycles and manufactured in an environmentally friendly way.
MM E-18: Shading Mechanisms	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low: Up to \$450 annual energy savings (Energy Star 2007).	Yes: Higher capital costs, lower operating and maintenance costs (Energy Star 2007).	Yes	Yes: Major retail stores.	Adverse: No Beneficial: CAPs, TACs	Install energy-reducing shading mechanisms for windows, porch, patio and walkway overhangs.

Table 16
Mitigation Measure Summary

Mitigation Measure	Applicable Project/Source Type ¹	Effective	Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵		
MM E-19: Ceiling/Whole-House Fans	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low: 50% more efficient than conventional fans (Energy Star 2007).	Yes: \$45-\$200/fan, installation extra (Lowe's 2007).	Yes	Yes: Major retail stores.	Adverse: No Beneficial: CAPs, TACs	Install energy-reducing ceiling/whole-house fans.
MM E-20: Programmable Thermostats	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low: \$100 annual savings in energy costs (Energy Star 2007).	Yes: \$60/LCD display and 4 settings for typical residential use (Lowe's 2007).	Yes	Yes: Major retail stores.	Adverse: Yes, Mercury Beneficial: CAPs, TACs	Install energy-reducing programmable thermostats that automatically adjust temperature settings.
MM E-21: Passive Heating and Cooling Systems	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low	Yes: \$800 (wall heaters) to \$4,000+ (central systems)	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	Install energy-reducing passive heating and cooling systems (e.g., insulation and ventilation).
MM E-22: Day Lighting Systems	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low	Yes: \$1,300 to \$1,500 depending upon the kind of roof (Barrier 1995), installation extra.	Yes	Yes: Work well only for space near the roof of the building, little benefit in multi-floor buildings.	Adverse: No Beneficial: CAPs, TACs	Install energy-reducing day lighting systems (e.g., skylights, light shelves and interior transom windows).
MM E-23: Low-Water Use Appliances	LD (R, C, M), I, SP, AQP, RR, P/Stationary, & Area	NA/Low: Avoided water agency cost for using water-efficient kitchen pre-rinse spray valves of \$65.18 per acre-foot.	Yes: Can return their cost through reduction in water consumption,	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	Require the installation of low-water use appliances.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments
		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵			
			pumping, and treatment.					
MM E-24: Goods Transport by Rail	LD (C, M), I, SP, AQP, RR, P/Mobile	NA/Moderate	Yes	Yes	Yes	Adverse: No Beneficial: CAPs, TACs	ARB Goods Movement Plan (ARB 2007)	Provide a spur at nonresidential projects to use nearby rail for goods movement.
Social Awareness/Education								
MM S-1: GHG Emissions Reductions Education	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile, Stationary, & Mobile	NA/Low	Yes	Yes	Yes: Similar programs currently exist in CA.	Adverse: No Beneficial: CAPs, TACs		Provide local governments, businesses, and residents with guidance/protocols/information on how to reduce GHG emissions (e.g., energy saving, food miles).
MM S-2: School Curriculum	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile, Stationary, & Mobile	NA/Low	Yes	Yes	Yes: Similar programs currently exist in CA.	Adverse: No Beneficial: CAPs, TACs		Include how to reduce GHG emissions (e.g., energy saving, food miles) in the school curriculum.
Construction								
MM C-1: ARB-Certified Diesel Construction Equipment	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile	NA/Low	Yes: Oxidation Catalysts, \$1,000-	Yes	Yes	Adverse: Yes, NO _x Beneficial: CAPs, TACs	AG, EPA, ARB, and CA air quality management and pollution control districts.	Use ARB-certified diesel construction equipment. Increases CO ₂ emissions when trapped CO and carbon particles

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

		Emissions Reduction/Score ²	Cost (Yes/No) ³	Technical ⁴	Logistical ⁵		
Miscellaneous							
MM M-1: Off-Site Mitigation Fee Program	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile & Area	NA/Moderate-High: Though there is currently no program in place, the potential for real and quantifiable reductions of GHG emissions could be high if a defensible fee program were designed.	Yes	Yes	No: Program does not exist in CA, but similar programs currently exist (e.g., Carl Moyer Program, SJVAPCD Rule 9510, SMAQMD Off-Site Construction Mitigation Fee Program).	Adverse: No Beneficial: CAPs, TACs	Provide/Pay into an off-site mitigation fee program, which focuses primarily on reducing emissions from existing development and buildings through retro-fit (e.g., increased insulation).
MM M-2: Offset Purchase	LD (R, C, M), I, SP, TP, AQP, RR, P/Mobile, Stationary, & Area	NA/Low	Yes	Yes	No: ARB has not adopted official program, but similar programs	No	Provide/purchase offsets for additional emissions by acquiring carbon credits or engaging in other market “cap and trade” systems.

AG=Attorney General; ARB=California Air Resources Board; ASTM=American Society for Testing and Material; BAAQMD=Bay Area Air Quality Management District; BEES= Building for Environmental and Economic Sustainability; CA=California; Caltrans=California Department of Transportation; CAPs=Criteria Air Pollutants; CCAP=Center for Clean Air Policy; CF=Connectivity Factor; CIWMB=California Integrated Waste Management Board; CO= Carbon Monoxide; CO₂=Carbon Dioxide; DGS=Department of General Services; DOE=U.S. Department of Energy; DPF=Diesel particulate Filter; E85=85% Ethanol; EERE=Energy Efficiency and Renewable Energy; EOE=Encyclopedia of Earth; EPA=U.S. Environmental Protection Agency; ETC=Edmonton Trolley Coalition; EVs/CNG=Electric Vehicles/Compressed Natural Gas; FAR=Floor Area Ratio; GHG=Greenhouse Gas; ITE=Institute of Transportation Engineers; kg/m²=kilogram per square meter; km=Kilometer; lb=pound; LEED=Leadership in Energy and Environmental Design; M=Million; NA=Not Available; NEV=Neighborhood Electric Vehicle; NIST=National Institute of Standards and Technology; NO_x=Oxides of Nitrogen; NREL=National Renewable Energy Laboratory; N/S=North/South; PG&E=Pacific Gas and Electric; PM=Particulate Matter; SJVAPCD=San Joaquin Valley Air Pollution Control District; SMAQMD=Sacramento Metropolitan Air Quality Management District; SMUD=Sacramento Municipal Utilities District; SO_x=Sulfur Oxides; SRI=Solar Reflectance Index; TACs=Toxic Air Contaminants; TDM=Transportation Demand Management; TMA=Transportation Management Association; THC=Total Hydrocarbon; ULEV=Ultra Low Emission Vehicle; USGBC=U.S. Green Building Council; and VTPI=Victoria Transit Policy.

Table 16 Mitigation Measure Summary								
Mitigation Measure	Applicable Project/Source Type ¹	Effective		Feasible (Yes/No)		Secondary Effects (Yes/No)	Agency/Organization/Other ⁶	Description/Comments

						currently exist.		
Regional Transportation Plan Measures								
MM RTP-1: Dedicate High Occupancy Vehicle (HOV) lanes prior to adding capacity to existing highways.	RTP		Yes	Yes	Yes	Adverse: possible local CO Beneficial: regional CAPs, TACs	Caltrans, local government	Evaluate the trip reduction (and GHG reduction) potential of adding HOV lanes prior to adding standard lanes.
MM RTP-2: Implement toll/user fee programs prior to adding capacity to existing highways.	RTP		Yes	Yes	Yes	Adverse: possible local CO. Beneficial: regional CAPs, TACs	Caltrans	Evaluate price elasticity and associated trip reduction (and GHG reduction) potential with adding or increasing tolls prior to adding capacity to existing highways.
Note: ¹ Where LD (R, C, M) =Land Development (Residential, Commercial, Mixed-Use), I=Industrial, GP=General Plan, SP=Specific Plan, TP=Transportation Plans, AQP=Air Quality Plans, RR=Rules/Regulations, and P=Policy. It is important to note that listed project types may not be directly specific to the mitigation measure (e.g., TP, AQP, RR, and P) as such could apply to a variety of source types, especially RR and P. ² This score system entails ratings of high, moderate, and low that refer to the level of the measure to provide a substantive, reasonably certain (e.g., documented emission reductions with proven technologies), and long-term reduction of GHG emissions. ³ Refers to whether the measure would provide a cost-effective reduction of GHG emissions based on available documentation. ⁴ Refers to whether the measure is based on currently, readily available technology based on available documentation. ⁵ Refers to whether the measure could be implemented without extraordinary effort based on available documentation. ⁶ List is not meant to be all inclusive. Source: Data compiled by EDAW in 2007								

Addressing Climate Change at the Project Level California Attorney General's Office

Under the California Environmental Quality Act (CEQA), local agencies have a very important role to play in California's fight against global warming – one of the most serious environmental effects facing the State today. Local agencies can lead by example in undertaking their own projects, insuring that sustainability is considered at the earliest stages. Moreover, they can help shape private development. Where a project as proposed will have significant global warming related effects, local agencies can require feasible changes or alternatives, and impose enforceable, verifiable, feasible mitigation to substantially lessen those effects. By the sum of their actions and decisions, local agencies will help to move the State away from “business as usual” and toward a low-carbon future.

Included in this document are various measures that may reduce the global warming related impacts at the individual project level. (For more information on actions that local governments can take at the program and general plan level, please visit the Attorney General's webpage, “CEQA, Global Warming, and General Plans” at <http://ag.ca.gov/globalwarming/ceqa/generalplans.php>.)

As appropriate, the measures can be included as design features of a project, required as changes to the project, or imposed as mitigation (whether undertaken directly by the project proponent or funded by mitigation fees). The measures set forth in this package are examples; the list is not intended to be exhaustive. Moreover, the measures cited may not be appropriate for every project. The decision of whether to approve a project – as proposed or with required changes or mitigation – is for the local agency, exercising its informed judgment in compliance with the law and balancing a variety of public objectives.

Mitigation Measures by Category

Energy Efficiency

Incorporate green building practices and design elements.	<p>The California Department of Housing and Community Development's Green Building & Sustainability Resources handbook provides extensive links to green building resources. The handbook is available at http://www.hcd.ca.gov/hpd/green_build.pdf.</p> <p>The American Institute of Architects (AIA) has compiled fifty readily available strategies for reducing fossil fuel use in buildings by fifty percent. AIA “50 to 50” plan is presented in both guidebook and wiki format at http://wiki.aia.org/Wiki%20Pages/Home.aspx.</p>
---	---

<p>Meet recognized green building and energy efficiency benchmarks.</p>	<p>For example, an ENERGY STAR-qualified building uses less energy, is less expensive to operate, and causes fewer greenhouse gas emissions than comparable, conventional buildings. http://www.energystar.gov/index.cfm?c=business.bus_index.</p> <p>California has over 1600 ENERGY STAR-qualified school, commercial and industrial buildings. View U.S. EPA's list of Energy Star non-residential buildings at http://www.energystar.gov/index.cfm?fuseaction=labeled_buildings locator. Los Angeles and San Francisco top the list of U.S. cities with the most ENERGY STAR non-residential buildings. http://www.energystar.gov/ia/business/downloads/2008_Top_25_cities_chart.pdf.</p> <p>Qualified ENERGY STAR homes must surpass the state's Title 24 energy efficiency building code by at least 15%. Los Angeles, Sacramento, San Diego, and San Francisco-Oakland are among the top 20 markets for ENERGY STAR homes nationwide. http://www.energystar.gov/ia/new_homes/mil_homes/top_20_markets.html. Builders of ENERGY STAR homes can be more competitive in a tight market by providing a higher quality, more desirable product. See http://www.energystar.gov/ia/partners/manuf_res/Horton.pdf.</p> <p>There are a variety of private and non-profit green building certification programs in use in the U.S. See U.S. EPA's Green Building / Frequently Asked Questions website, http://www.epa.gov/greenbuilding/pubs/faqs.htm.</p> <p>Public-Private Partnership for Advancing Housing Technology maintains a list of national and state Green Building Certification Programs for housing. See http://www.pathnet.org/sp.asp?id=20978. These include the national Leadership in Energy and Environmental Design (LEED) program, and, at the state level, Build it Green's GreenPoint Rated system and the California Green Builder program.</p> <p>Other organizations may provide other relevant benchmarks.</p>
<p>Install energy efficient lighting (e.g., light emitting diodes (LEDs)), heating and cooling systems, appliances, equipment, and control systems.</p>	<p>Information about ENERGY STAR-certified products in over 60 categories is available at http://www.energystar.gov/index.cfm?fuseaction=find_a_product.</p> <p>The California Energy Commission maintains a database of all appliances meeting either federal efficiency standards or, where there are no federal efficiency standards, California's appliance efficiency standards. See http://www.appliances.energy.ca.gov/.</p> <p>The Electronic Product Environmental Assessment Tool (EPEAT) ranks computer products based on a set of environmental criteria, including energy efficiency. See http://www.epeat.net/AboutEPEAT.aspx.</p> <p>The nonprofit American Council for an Energy Efficient Economy maintains an Online Guide to Energy Efficient Commercial Equipment, available at http://www.aceee.org/ogeece/ch1_index.htm.</p> <p>Utilities offer many incentives for efficient appliances, lighting, heating and cooling. To search for available residential and commercial incentives, visit Flex Your Power's website at http://www.fypower.org/.</p>

Use passive solar design, e.g., orient buildings and incorporate landscaping to maximize passive solar heating during cool seasons, minimize solar heat gain during hot seasons, and enhance natural ventilation. Design buildings to take advantage of sunlight.	<p>See U.S. Department of Energy, Passive Solar Design (website) http://www.energysavers.gov/your_home/designing_remodeling/index.cfm/mytopic=10250.</p> <p>See also California Energy Commission, Consumer Energy Center, Passive Solar Design (website) http://www.consumerenergycenter.org/home/construction/solardesign/index.html.</p> <p>Lawrence Berkeley National Laboratories' Building Technologies Department is working to develop innovative building construction and design techniques. Information and publications on energy efficient buildings, including lighting, windows, and daylighting strategies, are available at the Department's website at http://btech.lbl.gov.</p>
Install light colored "cool" roofs and cool pavements.	<p>A white or light colored roof can reduce surface temperatures by up to 100 degrees Fahrenheit, which also reduces the heat transferred into the building below. This can reduce the building's cooling costs, save energy and reduce associated greenhouse gas emissions, and extend the life of the roof. Cool roofs can also reduce the temperature of surrounding areas, which can improve local air quality. See California Energy Commission, Consumer Energy Center, Cool Roofs (webpage) at http://www.consumerenergycenter.org/coolroof/.</p> <p>See also Lawrence Berkeley National Laboratories, Heat Island Group (webpage) at http://eetd.lbl.gov/HeatIsland/.</p>
Install efficient lighting, (including LEDs) for traffic, street and other outdoor lighting.	<p>LED lighting is substantially more energy efficient than conventional lighting and can save money. See http://www.energy.ca.gov/efficiency/partnership/case_studies/TechAsstCity.pdf (noting that installing LED traffic signals saved the City of Westlake about \$34,000 per year).</p> <p>As of 2005, only about a quarter of California's cities and counties were using 100% LEDs in traffic signals. See California Energy Commission (CEC), Light Emitting Diode Traffic Signal Survey (2005) at p. 15, available at http://www.energy.ca.gov/2005publications/CEC_400_2005_003/CEC_400_2005_003.PDF.</p> <p>The California Energy Commission's Energy Partnership Program can help local governments take advantage of energy saving technology, including, but not limited to, LED traffic signals. See http://www.energy.ca.gov/efficiency/partnership/.</p>
Reduce unnecessary outdoor lighting.	<p>See California Energy Commission, Reduction of Outdoor Lighting (webpage) at http://www.energy.ca.gov/efficiency/lighting/outdoor_reduction.html.</p>

Use automatic covers, efficient pumps and motors, and solar heating for pools and spas.	<p>During the summer, a traditional backyard California pool can use enough energy to power an entire home for three months. Efficiency measures can substantially reduce this waste of energy and money. See California Energy Commission, Consumer Energy Center, Pools and Spas (webpage) at http://www.consumerenergycenter.org/home/outside/pools_spas.html.</p> <p>See also Sacramento Municipal Utilities District, Pool and Spa Efficiency Program (webpage) at http://www.smud.org/en/residential/saving-energy/Pages/poolspa.aspx.</p>
Provide education on energy efficiency to residents, customers and/or tenants.	<p>Many cities and counties provide energy efficiency education. See, for example, the City of Stockton's Energy Efficiency website at http://www.stocktongov.com/energysaving/index.cfm. See also "Green County San Bernardino," http://www.greencountysb.com at pp. 4-6.</p> <p>Businesses and development projects may also provide education. For example, a homeowners' association (HOA) could provide information to residents on energy-efficient mortgages and energy saving measures. See The Villas of Calvera Hills, Easy Energy Saving Tips to Help Save Electricity at http://www.thevillashoa.org/green/energy/. An HOA might also consider providing energy audits to its residents on a regular basis.</p>

Renewable Energy and Energy Storage

Meet "reach" goals for building energy efficiency and renewable energy use.	<p>A "zero net energy" building combines building energy efficiency and renewable energy generation so that, on an annual basis, any purchases of electricity or natural gas are offset by clean, renewable energy generation, either on-site or nearby. Both the California Energy Commission (CEC) and the California Public Utilities Commission (CPUC) have stated that residential buildings should be zero net energy by 2020, and commercial buildings by 2030. See CEC, 2009 Integrated Energy Policy Report (Dec. 2009) at p. 226, available at http://www.energy.ca.gov/2009publications/CEC-100-2009-003/CEC-100-2009-003-CMF.PDF; CPUC, Long Term Energy Efficiency Strategic Plan (Sept. 2008), available at http://www.cpuc.ca.gov/PUC/energy/Energy+Efficiency/eesp/.</p>
Install solar, wind, and geothermal power systems and solar hot water heaters.	<p>The California Public Utilities Commission (CPUC) approved the California Solar Initiative on January 12, 2006. The initiative creates a \$3.3 billion, ten-year program to install solar panels on one million roofs in the State. Visit the one-stop GoSolar website at http://www.gosolarcalifornia.org/. As mitigation, a developer could, for example, agree to participate in the New Solar Homes program. See http://www.gosolarcalifornia.org/builders/index.html.</p> <p>The CPUC is in the process of establishing a program to provide solar water heating incentives under the California Solar Initiative. For more information, visit the CPUC's website at http://www.cpuc.ca.gov/puc/energy/solar/swh.htm.</p> <p>To search for available residential and commercial renewable energy incentives, visit Flex Your Power's website at http://www.fypower.org/.</p>

<p>Install solar panels on unused roof and ground space and over carports and parking areas.</p>	<p>In 2008 Southern California Edison (SCE) launched the nation's largest installation of photovoltaic power generation modules. The utility plans to cover 65 million square feet of unused commercial rooftops with 250 megawatts of solar technology – generating enough energy to meet the needs of approximately 162,000 homes. Learn more about SCE's Solar Rooftop Program at http://www.sce.com/solarleadership/solar-rooftop-program/general-faq.htm.</p> <p>In 2009, Walmart announced its commitment to expand the company's solar power program in California. The company plans to add solar panels on 10 to 20 additional Walmart facilities in the near term. These new systems will be in addition to the 18 solar arrays currently installed at Walmart facilities in California. See http://walmartstores.com/FactsNews/NewsRoom/9091.aspx.</p> <p>Alameda County has installed two solar tracking carports, each generating 250 kilowatts. By 2005, the County had installed eight photovoltaic systems totaling over 2.3 megawatts. The County is able to meet 6 percent of its electricity needs through solar power. See http://www.acgov.org/gsa/Alameda%20County%20-%20Solar%20Case%20Study.pdf.</p> <p>In 2007, California State University, Fresno installed a 1.1-megawatt photovoltaic (PV)-paneled parking installation. The University expects to save more than \$13 million in avoided utility costs over the project's 30-year lifespan. http://www.fresnostatenews.com/2007/11/solarwrapup2.htm.</p>
<p>Where solar systems cannot feasibly be incorporated into the project at the outset, build "solar ready" structures.</p>	<p>U.S. Department of Energy, A Homebuilder's Guide to Going Solar (brochure) (2008), available at http://www.eere.energy.gov/solar/pdfs/43076.pdf.</p>
<p>Incorporate wind and solar energy systems into agricultural projects where appropriate.</p>	<p>Wind energy can be a valuable crop for farmers and ranchers. Wind turbines can generate energy to be used on-site, reducing electricity bills, or they can yield lease revenues (as much as \$4000 per turbine per year). Wind turbines generally are compatible with rural land uses, since crops can be grown and livestock can be grazed up to the base of the turbine. See National Renewable Energy Laboratory, Wind Powering America Fact Sheet Series, Wind Energy Benefits, available at http://www.nrel.gov/docs/fy05osti/37602.pdf.</p> <p>Solar PV is not just for urban rooftops. For example, the Scott Brothers' dairy in San Jacinto, California, has installed a 55-kilowatt solar array on its commodity barn, with plans to do more in the coming years. See http://www.dairyherd.com/directories.asp?pgID=724&ed_id=8409 (additional California examples are included in article.)</p>

<p>Include energy storage where appropriate to optimize renewable energy generation systems and avoid peak energy use.</p>	<p>See National Renewable Energy Laboratory, Energy Storage Basics (webpage) at http://www.nrel.gov/learning/eds_energy_storage.html.</p> <p>California Energy Storage Alliance (webpage) at http://storagealliance.org/about.html.</p> <p>Storage is not just for large, utility scale projects, but can be part of smaller industrial, commercial and residential projects. For example, Ice Storage Air Conditioning (ISAC) systems, designed for residential and nonresidential buildings, produce ice at night and use it during peak periods for cooling. See California Energy Commission, Staff Report, Ice Storage Air Conditioners, Compliance Options Application (May 2006), available at http://www.energy.ca.gov/2006publications/CEC-400-2006-006/CEC-400-2006-006-SF.PDF.</p>
<p>Use on-site generated biogas, including methane, in appropriate applications.</p>	<p>At the Hilarides Dairy in Lindsay, California, an anaerobic-lagoon digester processes the run-off of nearly 10,000 cows, generating 226,000 cubic feet of biogas per day and enough fuel to run two heavy duty trucks. This has reduced the dairy's diesel consumption by 650 gallons a day, saving the dairy money and improving local air quality. See http://www.arb.ca.gov/newsrel/nr021109b.htm; see also Public Interest Energy Research Program, Dairy Power Production Program, Dairy Methane Digester System, 90-Day Evaluation Report, Eden Vale Dairy (Dec. 2006) at http://www.energy.ca.gov/2006publications/CEC_500_2006_083/CEC_500_2006_083.PDF.</p> <p>Landfill gas is a current and potential source of substantial energy in California. See Tom Frankiewicz, Program Manager, U.S. EPA Landfill Methane Outreach Program, Landfill Gas Energy Potential in California, available at http://www.energy.ca.gov/2009_energy/policy/documents/2009-04-21_workshop/presentations/05-SCS_Engineers_Presentation.pdf.</p> <p>There are many current and emerging technologies for converting landfill methane that would otherwise be released as a greenhouse gas into clean energy. See California Integrated Waste Management Board, Emerging Technologies, Landfill Gas-to-Energy (webpage) at http://www.ciwmb.ca.gov/LEACentral/TechServices/EmergingTech/default.htm.</p>

Use combined heat and power (CHP) in appropriate applications.	<p>Many commercial, industrial, and campus-type facilities (such as hospitals, universities and prisons) use fuel to produce steam and heat for their own operations and processes. Unless captured, much of this heat is wasted. CHP captures waste heat and re-uses it, e.g., for residential or commercial space heating or to generate electricity. See U.S. EPA, Catalog of CHP Technologies at http://www.epa.gov/chp/documents/catalog_of_%20chp_tech_entire.pdf and California Energy Commission, Distributed Energy Resource Guide, Combined Heat and Power (webpage) at http://www.energy.ca.gov/distgen/equipment/chp/chp.html.</p> <p>The average efficiency of fossil-fueled power plants in the United States is 33 percent. By using waste heat recovery technology, CHP systems typically achieve total system efficiencies of 60 to 80 percent. CHP can also substantially reduce emissions of carbon dioxide. http://www.epa.gov/chp/basic/efficiency.html.</p> <p>Currently, CHP in California has a capacity of over 9 million kilowatts. See list of California CHP facilities at http://www.eea-inc.com/chpdata/States/CA.html.</p> <p>The Waste Heat and Carbon Emissions Reduction Act (Assembly Bill 1613 (2007), amended by Assembly Bill 2791 (2008)) is designed to encourage the development of new CHP systems in California with a generating capacity of not more than 20 megawatts. Among other things, the Act requires the California Public Utilities Commission to establish (1) a standard tariff allowing CHP generators to sell electricity for delivery to the grid and (2) a "pay as you save" pilot program requiring electricity corporations to finance the installation of qualifying CHP systems by nonprofit and government entities. For more information, see http://www.energy.ca.gov/wasteheat/.</p>
--	--

Water Conservation and Efficiency

Incorporate water-reducing features into building and landscape design.	<p>According to the California Energy Commission, water-related energy use – which includes conveyance, storage, treatment, distribution, wastewater collection, treatment, and discharge – consumes about 19 percent of the State's electricity, 30 percent of its natural gas, and 88 billion gallons of diesel fuel every year. See http://www.energy.ca.gov/2007publications/CEC_999_2007_008/CEC_999_2007_008.PDF. Reducing water use and improving water efficiency can help reduce energy use and greenhouse gas emissions.</p>
Create water-efficient landscapes.	<p>The California Department of Water Resources' updated Model Water Efficient Landscape Ordinance (Sept. 2009) is available at http://www.water.ca.gov/wateruseefficiency/landscapeordinance/technical.cfm.</p> <p>A landscape can be designed from the beginning to use little or no water, and to generate little or no waste. See California Integrated Waste Management Board, Xeriscaping (webpage) at http://www.ciwmb.ca.gov/organics/Xeriscaping/.</p>

<p>Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and use water-efficient irrigation methods.</p>	<p>U.S. Department of Energy, Best Management Practice: Water-Efficient Irrigation (webpage) at http://www1.eere.energy.gov/femp/program/waterefficiency_bmp5.html.</p> <p>California Department of Water Resources, Landscape Water Use Efficiency (webpage) at http://www.water.ca.gov/wateruseefficiency/landscape/.</p> <p>Pacific Institute, More with Less: Agricultural Water Conservation and Efficiency in California (2008), available at http://www.pacinst.org/reports/more_with_less_delta/index.htm.</p>
<p>Make effective use of graywater. (Graywater is untreated household waste water from bathtubs, showers, bathroom wash basins, and water from clothes washing machines. Graywater to be used for landscape irrigation.)</p>	<p>California Building Standards Commission, 2008 California Green Building Standards Code, Section 604, pp. 31-32, available at http://www.documents.dgs.ca.gov/bsc/2009/part11_2008_calgreen_code.pdf.</p> <p>California Department of Water Resources, Dual Plumbing Code (webpage) at http://www.water.ca.gov/recycling/DualPlumbingCode/.</p> <p>See also Ahwahnee Water Principles, Principle 6, at http://www.lgc.org/ahwahnee/h2o_principles.html. The Ahwahnee Water Principles have been adopted by City of Willits, Town of Windsor, Menlo Park, Morgan Hill, Palo Alto, Petaluma, Port Hueneme, Richmond, Rohnert Park, Rolling Hills Estates, San Luis Obispo, Santa Paula, Santa Rosa, City of Sunnyvale, City of Ukiah, Ventura, Marin County, Marin Municipal Water District, and Ventura County.</p>
<p>Implement low-impact development practices that maintain the existing hydrology of the site to manage storm water and protect the environment.</p>	<p>Retaining storm water runoff on-site can drastically reduce the need for energy-intensive imported water at the site. See U.S. EPA, Low Impact Development (webpage) at http://www.epa.gov/nps/lid/.</p> <p>Office of Environmental Health Hazard Assessment and the California Water and Land Use Partnership, Low Impact Development at http://www.coastal.ca.gov/nps/lid-factsheet.pdf.</p>
<p>Devise a comprehensive water conservation strategy appropriate for the project and location.</p>	<p>The strategy may include many of the specific items listed above, plus other innovative measures that are appropriate to the specific project.</p>
<p>Design buildings to be water-efficient. Install water-efficient fixtures and appliances.</p>	<p>Department of General Services, Best Practices Manual, Water-Efficient Fixtures and Appliances (website) at http://www.green.ca.gov/EPP/building/SaveH2O.htm.</p> <p>Many ENERGY STAR products have achieved their certification because of water efficiency. See California Energy Commission's database, available at http://www.appliances.energy.ca.gov/.</p>

Offset water demand from new projects so that there is no net increase in water use.	For example, the City of Lompoc has a policy requiring new development to offset new water demand with savings from existing water users. See http://www.cityoflompoc.com/utilities/pdf/2005_uwmp_final.pdf at p. 29.
Provide education about water conservation and available programs and incentives.	See, for example, the City of Santa Cruz, Water Conservation Office at http://www.ci.santa-cruz.ca.us/index.aspx?page=395 ; Santa Clara Valley Water District, Water Conservation at http://www.valleywater.org/conservation/index.shtm ; and Metropolitan Water District and the Family of Southern California Water Agencies, Be Water Wise at http://www.bewaterwise.com . Private projects may provide or fund similar education.

Solid Waste Measures

Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).	Construction and demolition materials account for almost 22 percent of the waste stream in California. Reusing and recycling these materials not only conserves natural resources and energy, but can also save money. For a list of best practices and other resources, see California Integrated Waste Management Board, Construction and Demolition Debris Recycling (webpage) at http://www.ciwmb.ca.gov/condemo/ .
Integrate reuse and recycling into residential industrial, institutional and commercial projects.	<p>Tips on developing a successful recycling program, and opportunities for cost-effective recycling, are available on the California Integrated Waste Management Board's Zero Waste California website. See http://zerowaste.ca.gov/.</p> <p>The Institute for Local Government's Waste Reduction & Recycling webpage contains examples of "best practices" for reducing greenhouse gas emissions, organized around waste reduction and recycling goals and additional examples and resources. See http://www.ca-ilg.org/wastereduction.</p>
Provide easy and convenient recycling opportunities for residents, the public, and tenant businesses.	Tips on developing a successful recycling program, and opportunities for cost effective recycling, are available on the California Integrated Waste Management Board's Zero Waste California website. See http://zerowaste.ca.gov/ .
Provide education and publicity about reducing waste and available recycling services.	<p>Many cities and counties provide information on waste reduction and recycling. See, for example, the Butte County Guide to Recycling at http://www.recyclebutte.net.</p> <p>The California Integrated Waste Management Board's website contains numerous publications on recycling and waste reduction that may be helpful in devising an education project. See http://www.ciwmb.ca.gov/Publications/default.asp?cat=13. Private projects may also provide waste and recycling education directly, or fund education.</p>

Land Use Measures

<p>Ensure consistency with “smart growth” principles – mixed-use, infill, and higher density projects that provide alternatives to individual vehicle travel and promote the efficient delivery of services and goods.</p>	<p>U.S. EPA maintains an extensive Smart Growth webpage with links to examples, literature and technical assistance, and financial resources. See http://www.epa.gov/smartgrowth/index.htm.</p> <p>The National Oceanic and Atmospheric Administration’s webpage provides smart growth recommendations for communities located near water. See Coastal & Waterfront Smart Growth (webpage) at http://coastalsmartgrowth.noaa.gov/. The webpage includes case studies from California.</p> <p>The California Energy Commission has recognized the important role that land use can play in meeting our greenhouse gas and energy efficiency goals. The agency’s website, Smart Growth & Land Use Planning, contains useful information and links to relevant studies, reports, and other resources. See http://www.energy.ca.gov/landuse/.</p> <p>The Metropolitan Transportation Commission’s webpage, Smart Growth / Transportation for Livable Communities, includes resources that may be useful to communities in the San Francisco Bay Area and beyond. See http://www.mtc.ca.gov/planning/smart_growth/.</p> <p>The Sacramento Area Council of Governments (SACOG) has published examples of smart growth in action in its region. See Examples from the Sacramento Region of the Seven Principles of Smart Growth / Better Ways to Grow, available at http://www.sacog.org/regional/funding/betterways.pdf.</p>
<p>Meet recognized “smart growth” benchmarks.</p>	<p>For example, the LEED for Neighborhood Development (LEED-ND) rating system integrates the principles of smart growth, urbanism and green building into the first national system for neighborhood design. LEED-ND is a collaboration among the U.S. Green Building Council, Congress for the New Urbanism, and the Natural Resources Defense Council. For more information, see http://www.usgbc.org/DisplayPage.aspx?CMSPageID=148.</p>
<p>Educate the public about the many benefits of well-designed, higher density development.</p>	<p>See, for example, U.S. EPA, Growing Smarter, Living Healthier: A Guide to Smart Growth and Active Aging (webpage), discussing how compact, walkable communities can provide benefits to seniors. See http://www.epa.gov/aging/bhc/guide/index.html.</p> <p>U.S. EPA, Environmental Benefits of Smart Growth (webpage) at http://www.epa.gov/dced/topics/eb.htm (noting local air and water quality improvements).</p> <p>Centers for Disease Control and Prevention (CDC), Designing and Building Healthy Places (webpage), at http://www.cdc.gov/healthyplaces/. The CDC’s website discusses the links between walkable communities and public health and includes numerous links to educational materials.</p> <p>California Department of Housing and Community Development, Myths and Facts About Affordable and High Density Housing (2002), available at http://www.hcd.ca.gov/hpd/mythsnfacts.pdf.</p>

<p>Incorporate public transit into the project's design.</p>	<p>Federal Transit Administration, Transit-Oriented Development (TOD) (webpage) at http://www.fta.dot.gov/planning/planning_environment_6932.html (describing the benefits of TOD as “social, environmental, and fiscal.”)</p> <p>California Department of Transportation (Caltrans), Statewide Transit-Oriented Development Study: Factors for Success in California (2002), available at http://transitorienteddevelopment.dot.ca.gov/miscellaneous/StatewideTOD.htm</p> <p>Caltrans, California Transit-Oriented Development Searchable Database (includes detailed information on numerous TODs), available at http://transitorienteddevelopment.dot.ca.gov/miscellaneous/NewHome.jsp.</p> <p>California Department of Housing and Community Development, Transit Oriented Development (TOD) Resources (Aug. 2009), available at http://www.hcd.ca.gov/hpd/tod.pdf.</p>
<p>Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.</p>	<p>U.S. EPA, Smart Growth and Open Space Conservation (webpage) at http://www.epa.gov/dced/openspace.htm.</p>
<p>Develop “brownfields” and other underused or defunct properties near existing public transportation and jobs.</p>	<p>U.S. EPA, Smart Growth and Brownfields (webpage) at http://www.epa.gov/dced/brownfields.htm.</p> <p>For example, as set forth in the Local Government Commission’s case study, the Town of Hercules, California reclaimed a 426-acre brownfield site, transforming it into a transit-friendly, walkable neighborhood. See http://www.lgc.org/freepub/docs/community_design/fact_sheets/er_case_studies.pdf.</p> <p>For financial resources that can assist in brownfield development, see Center for Creative Land Recycling, Financial Resources for California Brownfields (July 2008), available at http://www.cclr.org/media/publications/8-Financial_Resources_2008.pdf.</p>
<p>Include pedestrian and bicycle facilities within projects and ensure that existing non-motorized routes are maintained and enhanced.</p>	<p>See U.S. Department of Transportation, Federal Highway Administration, Bicycle and Pedestrian Program (webpage) at http://www.fhwa.dot.gov/environment/bikeped/.</p> <p>Caltrans, Pedestrian and Bicycle Facilities in California / A Technical Reference and Technology Transfer Synthesis for Caltrans Planners and Engineers (July 2005), available at http://www.dot.ca.gov/hq/traffops/survey/pedestrian/TR_MAY0405.pdf. This reference includes standard and innovative practices for pedestrian facilities and traffic calming.</p>

Transportation and Motor Vehicles

<p>Meet an identified transportation-related benchmark.</p>	<p>A logical benchmark might be related to vehicles miles traveled (VMT), e.g., average VMT per capita, per household, or per employee. As the California Energy Commission has noted, VMT by California residents increased “a rate of more than 3 percent a year between 1975 and 2004, markedly faster than the population growth rate over the same period, which was less than 2 percent. This increase in VMT correlates to an increase in petroleum use and GHG production and has led to the transportation sector being responsible for 41 percent of the state’s GHG emissions in 2004.” CEC, <i>The Role of Land Use in Meeting California’s Energy and Climate Change Goals</i> (Aug. 2007) at p. 9, available at http://www.energy.ca.gov/2007publications/CEC-600-2007-008/CEC-600-2007-008-SF.PDF.</p> <p>Even with regulations designed to increase vehicle efficiency and lower the carbon content of fuel, “reduced VMT growth will be required to meet GHG reductions goals.” <i>Id.</i> at p. 18.</p>
<p>Adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation.</p>	<p>For example, reduce parking for private vehicles while increasing options for alternative transportation; eliminate minimum parking requirements for new buildings; “unbundle” parking (require that parking is paid for separately and is not included in rent for residential or commercial space); and set appropriate pricing for parking.</p> <p>See U.S. EPA, <i>Parking Spaces / Community Places, Finding the Balance Through Smart Growth Solutions</i> (Jan. 2006), available at http://www.epa.gov/dced/pdf/EPAParkingSpaces06.pdf.</p> <p>Reforming Parking Policies to Support Smart Growth, Metropolitan Transportation Commission (June 2007) at http://www.mtc.ca.gov/planning/smart_growth/parking_seminar/ToolboxHandbook.pdf.</p> <p>See also the City of Ventura’s Downtown Parking and Mobility Plan, available at http://www.cityofventura.net/community_development/resources/mobility_parking_plan.pdf, and Ventura’s Downtown Parking Management Program, available at http://www.ci.ventura.ca.us/depts/comm_dev/downtownplan/chapters.asp.</p>
<p>Build or fund a major transit stop within or near the development.</p>	<p>“Major transit stop’ means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.” (Pub. Res. Code, § 21064.3.)</p> <p>Transit Oriented Development (TOD) is a moderate to higher density development located within an easy walk of a major transit stop. http://transitorienteddevelopment.dot.ca.gov/miscellaneous/NewWhatisTOD.htm.</p> <p>By building or funding a major transit stop, an otherwise ordinary development can become a TOD.</p>

Provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers.	<p>See U.S. Department of Transportation and U.S. EPA, Commuter Choice Primer / An Employer's Guide to Implementing Effective Commuter Choice Programs, available at http://www.its.dot.gov/JPODOCS/REPTS_PR/13669.html.</p> <p>The Emery Go Round shuttle is a private transportation service funded by commercial property owners in the citywide transportation business improvement district. The shuttle links a local shopping district to a Bay Area Rapid Transit stop. See http://www.emerygoround.com/.</p> <p>Seattle, Washington maintains a public transportation "ride free" zone in its downtown from 6:00 a.m. to 7:00 p.m. daily. See http://transit.metrokc.gov/tops/accessible/paccessible_map.html#fare.</p>
Promote "least polluting" ways to connect people and goods to their destinations.	<p>Promoting "least polluting" methods of moving people and goods is part of a larger, integrated "sustainable streets" strategy now being explored at U.C. Davis's Sustainable Transportation Center. Resources and links are available at the Center's website, http://stc.ucdavis.edu/outreach/ssp.php.</p>
Incorporate bicycle lanes, routes and facilities into street systems, new subdivisions, and large developments.	<p>Bicycling can have a profound impact on transportation choices and air pollution reduction. The City of Davis has the highest rate of bicycling in the nation. Among its 64,000 residents, 17 percent travel to work by bicycle and 41 percent consider the bicycle their primary mode of transportation. See Air Resources Board, Bicycle Awareness Program, Bicycle Fact Sheet, available at http://www.arb.ca.gov/planning/tsaq/bicycle/factsht.htm.</p> <p>For recommendations on best practices, see the many resources listed at the U.S. Department of Transportation, Federal Highway Administration's Bicycle and Pedestrian website at http://www.fhwa.dot.gov/environment/bikeped/publications.htm.</p> <p>See also Caltrans Division of Research and Innovation, Designing Highway Facilities To Encourage Walking, Biking and Transit (Preliminary Investigation) (March 2009), available at http://www.dot.ca.gov/research/researchreports/preliminary_investigations/docs/pi-design_for_walking_%20biking_and_transit%20final.pdf.</p>
Require amenities for non-motorized transportation, such as secure and convenient bicycle parking.	<p>According to local and national surveys of potential bicycle commuters, secure bicycle parking and workplace changing facilities are important complements to safe and convenient routes of travel. See Air Resources Board, Bicycle Awareness Program, Bicycle Fact Sheet, available at http://www.arb.ca.gov/planning/tsaq/bicycle/factsht.htm.</p>

<p>Ensure that the project enhances, and does not disrupt or create barriers to, non-motorized transportation.</p>	<p>See, e.g., U.S. EPA's list of transit-related "smart growth" publications at http://www.epa.gov/dced/publications.htm#air, including Pedestrian and Transit-Friendly Design: A Primer for Smart Growth (1999), available at www.epa.gov/dced/pdf/ptfd_primer.pdf.</p> <p>See also Toolkit for Improving Walkability in Alameda County, available at http://www.acta2002.com/ped_toolkit/ped_toolkit_print.pdf.</p> <p>Pursuant to the California Complete Streets Act of 2008 (AB 1358, Gov. Code, §§ 65040.2 and 65302), commencing January 1, 2011, upon any substantive revision of the circulation element of the general plan, a city or county will be required to modify the circulation element to plan for a balanced, multimodal transportation network that meets the needs of all users.</p>
<p>Connect parks and open space through shared pedestrian/bike paths and trails to encourage walking and bicycling. Create bicycle lanes and walking paths directed to the location of schools, parks and other destination points.</p>	<p>Walk Score ranks the "walkability" of neighborhoods in the largest 40 U.S. cities, including seven California cities. Scores are based on the distance to nearby amenities. Explore Walk Score at http://www.walkscore.com/.</p> <p>In many markets, homes in walkable neighborhoods are worth more than similar properties where walking is more difficult. See Hoak, <i>Walk appeal / Homes in walkable neighborhoods sell for more: study</i>, Wall Street Journal (Aug. 18, 2009), available at http://www.marketwatch.com/story/homes-in-walkable-neighborhoods-sell-for-more-2009-08-18.</p> <p>By creating walkable neighborhoods with more transportation choices, Californians could save \$31 million and cut greenhouse gas emissions by 34 percent, according to a study released by Transform, a coalition of unions and nonprofits. See <i>Windfall for All / How Connected, Convenient Neighborhoods Can Protect Our Climate and Safeguard California's Economy</i> (Nov. 2009), available at http://transformca.org/windfall-for-all#download-report.</p>
<p>Work with the school districts to improve pedestrian and bike access to schools and to restore or expand school bus service using lower-emitting vehicles.</p>	<p>In some communities, twenty to twenty-five percent of morning traffic is due to parents driving their children to school. Increased traffic congestion around schools in turn prompts even more parents to drive their children to school. Programs to create safe routes to schools can break this harmful cycle. See California Department of Public Health, <i>Safe Routes to School</i> (webpage) and associated links at http://www.cdph.ca.gov/HealthInfo/injviosa/Pages/SafeRoutestoSchool.aspx.</p> <p>See also U.S. EPA, <i>Smart Growth and Schools</i> (webpage), available at http://www.epa.gov/dced/schools.htm.</p> <p>California Center for Physical Activity, <i>California Walk to School</i> (website) at http://www.cawalktoschool.com</p> <p>Regular school bus service (using lower-emitting buses) for children who cannot bike or walk to school could substantially reduce private vehicle congestion and air pollution around schools. See Air Resources Board, <i>Lower Emissions School Bus Program</i> (webpage) at http://www.arb.ca.gov/msprog/schoolbus/schoolbus.htm.</p>

<p>Institute teleconferencing, telecommute and/or flexible work hour programs to reduce unnecessary employee transportation.</p>	<p>There are numerous sites on the web with resources for employers seeking to establish telework or flexible work programs. These include U.S. EPA's Mobility Management Strategies: Commuter Programs website at http://www.epa.gov/otaq/stateresources/rellinks/mms_commpromgrams.htm; and Telework, the federal government's telework website, at http://www.telework.gov/.</p> <p>Through a continuing FlexWork Implementation Program, the Traffic Solutions division of the Santa Barbara County Association of Governments sponsors flexwork consulting, training and implementation services to a limited number of Santa Barbara County organizations that want to create or expand flexwork programs for the benefit of their organizations, employees and the community. See http://www.flexworks.com/read_more_about_the_fSBp.html. Other local government entities provide similar services.</p>
<p>Provide information on alternative transportation options for consumers, residents, tenants and employees to reduce transportation-related emissions.</p>	<p>Many types of projects may provide opportunities for delivering more tailored transportation information. For example, a homeowner's association could provide information on its website, or an employer might create a Transportation Coordinator position as part of a larger Employee Commute Reduction Program. See, e.g., South Coast Air Quality Management District, Transportation Coordinator training, at http://www.aqmd.gov/trans/training.html.</p>
<p>Educate consumers, residents, tenants and the public about options for reducing motor vehicle-related greenhouse gas emissions. Include information on trip reduction; trip linking; vehicle performance and efficiency (e.g., keeping tires inflated); and low or zero-emission vehicles.</p>	<p>See, for example U.S. EPA, SmartWay Transport Partnership: Innovative Carrier Strategies (webpage) at http://www.epa.gov/smartway/transport/what-smartway/carrier-strategies.htm. This webpage includes recommendations for actions that truck and rail fleets can take to make ground freight more efficient and cleaner.</p> <p>The Air Resources Board's Drive Clean website is a resource for car buyers to find clean and efficient vehicles. The web site is designed to educate Californians that pollution levels range greatly between vehicles. See http://www.driveclean.ca.gov/.</p> <p>The Oregon Department of Transportation and other public and private partners launched the Drive Less/Save More campaign. The comprehensive website contains fact sheets and educational materials to help people drive more efficiently. See http://www.driveless.savemore.com/.</p>
<p>Purchase, or create incentives for purchasing, low or zero-emission vehicles.</p>	<p>See Air Resources Board, Low-Emission Vehicle Program (webpage) at http://www.arb.ca.gov/msprog/levprog/levprog.htm.</p> <p>Air Resource Board, Zero Emission Vehicle Program (webpage) at http://www.arb.ca.gov/msprog/zevprog/zevprog.htm.</p> <p>All new cars sold in California are now required to display an Environmental Performance (EP) Label, which scores a vehicle's global warming and smog emissions from 1 (dirtiest) to 10 (cleanest). To search and compare vehicle EP Labels, visit www.DriveClean.ca.gov.</p>

Create a ride sharing program. Promote existing ride sharing programs e.g., by designating a certain percentage of parking spaces for ride sharing vehicles, designating adequate passenger loading and unloading for ride sharing vehicles, and providing a web site or message board for coordinating rides.	<p>For example, the 511 Regional Rideshare Program is operated by the Metropolitan Transportation Commission (MTC) and is funded by grants from the Federal Highway Administration, U.S. Department of Transportation, the Metropolitan Transportation Commission, the Bay Area Air Quality Management District and county congestion management agencies. For more information, see http://rideshare.511.org/.</p> <p>As another example, San Bernardino Associated Governments works directly with large and small employers, as well as providing support to commuters who wish to share rides or use alternative forms of transportation. See http://www.sanbag.ca.gov/commuter/rideshare.html.</p> <p>Valleyrides.com is a ridesharing resource available to anyone commuting to and from Fresno and Tulare Counties and surrounding communities. See http://www.valleyrides.com/. There are many other similar websites throughout the state.</p>
Create or accommodate car sharing programs, e.g., provide parking spaces for car share vehicles at convenient locations accessible by public transportation.	There are many existing car sharing companies in California. These include City CarShare (San Francisco Bay Area), see http://www.citycarshare.org/ ; and Zipcar, see http://www.zipcar.com/ . Car sharing programs are being successfully used on many California campuses.
Provide a vanpool for employees.	Many local Transportation Management Agencies can assist in forming vanpools. See, for example, Sacramento Transportation Management Association, Check out Vanpooling (webpage) at http://www.sacramento-tma.org/vanpool.html .
Create local "light vehicle" networks, such as neighborhood electric vehicle systems.	<p>See California Energy Commission, Consumer Energy Center, Urban Options - Neighborhood Electric Vehicles (NEVs) (webpage) at http://www.consumerenergycenter.org/transportation/urban_options/nev.html.</p> <p>The City of Lincoln has an innovative NEV program. See http://www.lincolnev.com/index.html.</p>
Enforce and follow limits idling time for commercial vehicles, including delivery and construction vehicles.	Under existing law, diesel-fueled motor vehicles with a gross vehicle weight rating greater than 10,000 pounds are prohibited from idling for more than 5 minutes at any location. The minimum penalty for an idling violation is now \$300 per violation. See http://www.arb.ca.gov/enf/complaints/idling_cv.htm .
Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles.	<p>For a list of existing alternative fuel stations in California, visit http://www.cleancarmaps.com/.</p> <p>See, e.g., Baker, <i>Charging-station network built along 101</i>, S.F. Chron. (9/23/09), available at http://articles.sfgate.com/2009-09-23/news/17207424_1_recharging-solar-array-tesla-motors.</p>

Agriculture and Forestry (additional strategies noted above)

<p>Require best management practices in agriculture and animal operations to reduce emissions, conserve energy and water, and utilize alternative energy sources, including biogas, wind and solar.</p>	<p>Air Resources Board (ARB), Economic Sectors Portal, Agriculture (webpage) at http://www.arb.ca.gov/cc/ghgsectors/ghgsectors.htm. ARB's webpage includes information on emissions from manure management, nitrogen fertilizer, agricultural offroad equipment, and agricultural engines.</p> <p>"A full 90% of an agricultural business' electricity bill is likely associated with water use. In addition, the 8 million acres in California devoted to crops consume 80% of the total water pumped in the state." See Flex Your Power, Agricultural Sector (webpage) at http://www.fypower.org/agri/.</p> <p>Flex Your Power, Best Practice Guide / Food and Beverage Growers and Processors, available at http://www.fypower.org/bpg/index.html?b=food_and_bev.</p> <p>Antle et al., Pew Center on Global Climate Change, Agriculture's Role in Greenhouse Gas Mitigation (2006), available at http://www.pewclimate.org/docUploads/Agriculture's%20Role%20in%20GHG%20Mitigation.pdf.</p>
<p>Preserve forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits.</p>	<p>"There are three general means by which agricultural and forestry practices can reduce greenhouse gases: (1) avoiding emissions by maintaining existing carbon storage in trees and soils; (2) increasing carbon storage by, e.g., tree planting, conversion from conventional to conservation tillage practices on agricultural lands; (3) substituting bio-based fuels and products for fossil fuels, such as coal and oil, and energy-intensive products that generate greater quantities of CO₂ when used." U.S. EPA, Carbon Sequestration in Agriculture and Forestry, Frequently Asked Questions (webpage) at http://www.epa.gov/sequestration/faq.html.</p> <p>Air Resources Board, Economic Sectors Portal, Forestry (webpage) at http://www.arb.ca.gov/cc/ghgsectors/ghgsectors.htm.</p>
<p>Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance.</p>	<p>Tree preservation and planting is not just for rural areas of the state; suburban and urban forests can also serve as carbon sinks. See Cal Fire, Urban and Community Forestry (webpage) at http://www.fire.ca.gov/resource_mgt/resource_mgt_urbanforestry.php.</p>

Off-Site Mitigation

If, after analyzing and requiring all reasonable and feasible on-site mitigation measures for avoiding or reducing greenhouse gas-related impacts, the lead agency determines that additional mitigation is required, the agency may consider additional off-site mitigation. The project proponent could, for example, fund off-site mitigation projects that will reduce carbon emissions, conduct an audit of its other existing operations and agree to retrofit, or purchase verifiable carbon "credits" from another entity that will undertake mitigation.

The topic of off-site mitigation can be complicated. A full discussion is outside the scope of this summary document. Issues that the lead agency should consider include:

- The location of the off-site mitigation. (If the off-site mitigation is far from the project, any additional, non-climate related co-benefits of the mitigation may be lost to the local community.)
- Whether the emissions reductions from off-site mitigation can be quantified and verified. (The California Registry has developed a number of protocols for calculating, reporting and verifying greenhouse gas emissions. Currently, industry-specific protocols are available for the cement sector, power/utility sector, forest sector and local government operations. For more information, visit the California Registry's website at <http://www.climateregistry.org/>.)
- Whether the mitigation ratio should be greater than 1:1 to reflect any uncertainty about the effectiveness of the off-site mitigation.

Offsite mitigation measures that could be funded through mitigation fees include, but are not limited to, the following:

- Energy efficiency audits of existing buildings.
- Energy efficiency upgrades to existing buildings not otherwise required by law, including heating, ventilation, air conditioning, lighting, water heating equipment, insulation and weatherization (perhaps targeted to specific communities, such as low-income or senior residents).
- Programs to encourage the purchase and use of energy efficient vehicles, appliances, equipment and lighting.
- Programs that create incentives to replace or retire polluting vehicles and engines.
- Programs to expand the use of renewable energy and energy storage.
- Preservation and/or enhancement of existing natural areas (e.g., forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, and groundwater recharge areas) that provide carbon sequestration benefits.
- Improvement and expansion of public transit and low- and zero-carbon transportation alternatives.

RESPONSES TO LETTER F-1

Center for Biological Diversity/San Bernardino Valley Audubon Society

Response to Comment F-1-1. The commenter has correctly characterized the World Logistics Center (WLC) project components, and the Draft Environmental Impact Report (DEIR) did examine the potential air quality impacts of the project, as well as potential impacts to the adjacent San Jacinto Wildlife Area (SJWA). The DEIR identified several mitigation measures or actions for air quality and health risks, one extensive measure for greenhouse gas emissions, and 16 measures or actions for potential impacts to biological resources.

It should be noted the Specific Plan (SP) area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment F-1-2. Several commenters expressed concern regarding the designation of 910 acres of state-owned land within the project area as permanent open space, and “taking credit” for such a designation. This land is referenced as the “CDFW Conservation Buffer Area” in the DEIR. The following information is provided in response to those comments.

The readers need to be aware that prior to being purchased by the state in 2001, these 910 acres were owned by Highland Fairview and were a part of the Moreno Highlands Specific Plan project, approved by the City in 1995. These 910 acres were designated for residential development in the General Plan. Notwithstanding the fact that the California Department of Fish and Wildlife (CDFW) has owned this land since 2001, the 910 acres remain within the City of Moreno Valley and remain a part of the City’s General Plan, and remain designated for residential development. The proposed General Plan Amendment will revise the General Plan designation for this property from residential to Open Space but will not change the disposition of the property.

An identical situation exists relative to the City’s zoning for the property. These 910 acres continue to be zoned for residential development as a part of the Moreno Highlands Specific Plan. The Zone Change that is part of this project will apply an open space zoning to the property to accurately reflect its long-term use as a part of the SJWA, owned and operated by the CDFW.

In addition to correcting the planned long-term use for this property in the City General Plan and zoning, this General Plan Amendment and Zone Change will allow the City to eliminate this residential designation from its long-range development projections used locally and regionally to predict development trends.

The proposed project applications and the accompanying EIR do not “take credit” for amending the General Plan and zoning to accurately reflect the planned long-range use for these 910 acres. The EIR does not contain any such “credit” statements as there is no such “credit” to be sought. There is no suggestion in the EIR that the CDFW property should be considered for mitigation of any WLCSP impacts. The EIR’s discussions regarding this property relate simply to the correction of the City’s land use designations for the property and to confirm that the project proposes no development of any kind on the 910 acres.

Additionally, concern has been expressed about the use of the term, “CDFW Conservation Buffer Area” to describe this 910-acre area. That term is used in the EIR to distinguish this land from the remainder of the SJWA and other lands owned by the CDFW in Section 3.4.1 of the DEIR. The “buffer” reference comes from the minutes of the May 18, 2001 meeting of the Wildlife Conservation Board at which the Board authorized the purchase of land (including the subject 910 acres). The minutes state, “The acquisition of the subject properties are important to the wildlife area as *they will*

serve as a buffer from development north of the WLA [wildlife area] and add significant wildlife benefits to the WLA.” (emphasis added).

At the time of the acquisition, the 910 acres were already designated for urban development under the Moreno Highlands Specific Plan and protected by a Development Agreement with the City. Nothing has changed since the 910 acres were acquired to suggest that the adjacent property would not be ultimately developed, either with the logistics uses proposed as part of the WLC or as allowed by the Moreno Highlands Specific Plan.

Response to Comment F-1-3. The City acknowledges the makeup of the two commenting organizations and their interests in environmental conservation in the Inland Empire region.

Response to Comment F-1-4. The EIR does provide a complete description of the proposed project (DEIR Section 3.0 with 38 pages of text, 4 tables, and 18 figures). The commenter must remember that the DEIR is a programmatic document and thus project-level data such as actual building footprints are not yet available. In addition, each of the 17 environmental issues that could be affected by development of the project were examined in considerable detail (i.e., approx. 1,100 pages for the entire DEIR) especially considering this is a programmatic EIR because specific information on building size and location is not yet available for this project.

Response to Comment F-1-5. The EIR does provide a complete description of the proposed project with text, tables and figures (DEIR Section 3.0) including a figure showing the locations of the many proposed offsite improvements that would be needed to support future development on the project site (DEIR Section 3.4.11 and Figure 3-7). The Project Description (DEIR Section 3.0) also describes these potential offsite improvements within the limits of knowledge about the project at this time. It must be remembered that this DEIR is a programmatic document and thus project-level data such as actual building footprints are not yet available. In addition, each of the 17 environmental issues that could be affected by development of the project is examined in considerable detail (i.e., approx. 1,100 pages for the entire DEIR) especially considering this is a programmatic EIR because specific information on building size and location is not yet available for this project.

Response to Comment F-1-6. The commenter should note the DEIR contains several mitigation measures (e.g., cultural resources, geotechnical constraints, etc.) that specifically address future work for offsite improvements. The commenter also refers to deferring mitigation, but it must be remembered this is a programmatic document which is providing environmental information on this project at the earliest time, as specifically encouraged by CEQA. A mitigation measure has been added as follows to address potential effects to wetlands for offsite improvements.

4.4.6.3C Prior to issuance of any grading permit for any offsite improvements that support development within the World Logistics Center Specific Plan, the developer shall retain a qualified biologist to prepare a jurisdictional delineation (JD) for any drainage channels affected by construction of the offsite improvements. This jurisdictional delineation shall be submitted to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the offsite improvements will not affect any identified jurisdictional areas, no United States Army Corps of Engineers permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (i.e., Streambed Alteration Agreement) may still be required for these improvements. The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife and Regional Water Quality Control Board to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with any altered offsite drainages shall

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

be in agreement with the permit conditions. Any landscaping associated with these offsite improvements shall use only native species to help protect biological resources residing within or traveling through these drainages per Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Table 6.1.2. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the U.S. Fish and Wildlife Service, U.S. Army Corps. of Engineers, and the California Department of Fish and Wildlife.

The EIR clearly states in many places that future development will require subsequent studies when more specific project information is available, but the DEIR provides adequate programmatic mitigation for anticipated programmatic impacts of overall project development. This “tiering” process is clearly outlined in California Environmental Quality Act (CEQA) Guidelines Sections 15152 and 15385 and encouraged to allow for sequential evaluation of development based on the project information available at the time. The DEIR does not defer mitigation for either onsite or offsite impacts identified in the EIR.

Response to Comment F-1-7. The DEIR does examine potential impacts from offsite improvements and recommends a number of mitigation measures to address geotechnical, cultural, and paleontological impacts (see Mitigation Measure (MM) 4.6.6.1C, MM 4.5.6.1B, and MM 4.5.6.3B, respectively). It must be remembered the DEIR is a programmatic document which evaluates the program-level impacts of WLC development, but a more detailed assessment of specific on- or offsite impacts must wait until specific development information is available (e.g., size and location of logistics warehouse buildings, actual site and size of new reservoir tanks, etc.). The DEIR clearly states that more specific CEQA analysis will be done when more specific project development information is available, which is the appropriate time and process as outlined in CEQA Guidelines Section 15152. The commenter is also incorrect about the analysis of traffic impacts, the DEIR Section 4.15 (pages 4.15-85 through 4.15-226) and the project Traffic Impact Analysis (TIA) (DEIR Appendix L-1) go into tremendous detail about potential traffic impacts from the project on roadways and intersections both in the City of Moreno Valley and many within other jurisdictions.

Response to Comment F-1-8. The WLCSP, as described in the DEIR, includes all project related impacts as well as proposed off-site improvements. Offsite environmental impacts are associated with roadway and utility improvements, several drainage improvements, a water reservoir, and access roads. These off-site improvements are part of the over-all concept of the WLCSP, but have not been completely designed. Specific designs of off-site improvements will not be completed until a project-specific design is proposed. There are no off-site improvements or project related impacts that extent geographically beyond the off-site analysis zone. The DEIR is a programmatic document and the request for site-specific analyses is not possible and not required, but will follow the guidelines outlined in the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). Additional environmental analysis will be conducted with each project-specific proposal. Please refer to Responses to Comments F-1-4 through F-1-7 above.

Response to Comment F-1-9. All areas of the WLCSP study area were examined at some level. Early surveys of the CDFW Conservation Buffer Area were completed however, when FCS-MBA requested permission to survey the lands within the SJWA an email from Dr. Heather Pert at CDFW (June 18, 2013) indicated that since there would be no impacts to the area, she felt that surveys would not be necessary. The burrowing owl surveys completed in July 2013 included a 500-foot buffer area that incorporated a portion of the SJWA (refer to FEIR Volume 2 in Appendix E-7). While there are no impacts associated with the rezoning and general plan amendment changes on the CDFW Conservation Buffer Area, existing conditions were documented for the DEIR and are justified.

Response to Comment F-1-10. An assessment of potential jurisdictional drainages was completed in 2012 and was revised in 2013 as a part of the MSHCP Consistency Analysis (FCS-MBA 2013 FEIR Volume 2, Appendix E-1). These data are reflected in the Section 4.4 *Biological Resources* of

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

the FEIR Volume 2 and FEIR Appendix E-1. The FEIR depicts a stable and complete project and its impacts are analyzed appropriately. CEQA requires that the impacts be mitigated and the mitigation measure must be clear and feasible. However, in cases where regulatory guidelines and definition of jurisdictional limits change, the impacts and required mitigation may also change. For instance, as a result of the 2001 Solid Waste Agency of North Cook County (SWANCC) case, a wetland must show connectivity to a stream course in order for such a feature to be considered jurisdictional, where previously, all wetland features were under United States Army Corps of Engineers (USACE) jurisdiction. If USACE, CDFW, and/or Regional Water Quality Control Board (RWQCB) guidelines change during the build-out of the WLCSP, the undeveloped projects will be required to follow the most current regulatory requirements.

As noted in the comment, the DEIR is a program level document, as site-specific development will occur over a period of time. Permit requirements cannot be completed until such time that site-specific plans are developed to assess impacts and determine the types of permits required. As an example, the USACE 404 permit structure for Nation Wide Permits (NWP) is revised and evaluated every 5 years. There could be at least three revisions to the NWP process over the life of the project.

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the DEIR and the draft wetland delineation. Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the 1987 Regional Supplement to the USACE of Engineers Wetland Delineation manual: Arid West Region and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the RWQCB and CDFW.

The applicant shall secure a jurisdictional determination with the USACE and confirm with the RWQCB and CDFW if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Jurisdictional features will be avoided and unavoidable impacts will be mitigated through the construction of compensatory wetland construction. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the USACE/ United States Environmental Protection Agency (USEPA's) "Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios."

The updated Jurisdictional Delineation report (refer to FEIR Volume 2 Appendix E-13) assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. In addition these areas are also under the jurisdiction of the RWQCB. A maximum of 5.0 acres of streambed are under CDFW and RWQCB jurisdiction. It should also be noted that Drainages 12 and 15 are both hydrologically connected to downstream waters of the US and are therefore under the USACE jurisdiction.

Impacts to drainage features under USACE, CDFW, and RWQCB jurisdiction are significant impacts requiring mitigation. project related mitigation will be negotiated on a project-by-project basis. Drainage feature impacts will be replaced at a minimum of 1:1 mitigation ratio through the creation of on-site riparian habitat, off-site habitat conservation, or off-site purchase of mitigation credits. Final mitigation requirements will be negotiated during the approval of the appropriate regulatory permits. A project related analysis of the on-site drainage features will be completed on a project-by-project basis.

In summary, as outlined in Responses to Comments F-1-4 and F-1-7 above, the DEIR is a programmatic document which evaluates the program-level impacts of WLC development, but a more detailed assessment of specific on- or offsite impacts must wait until specific development information

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

is available (e.g., size and location of logistics warehouse buildings, actual site and size of new reservoir tanks, etc.).

Response to Comment F-1-11. The revised DEIR (FEIR Volume 2) takes into consideration the extended amount of time for project build-out with regard to changes to regulatory permitting. The updated data includes estimated jurisdictional limits with regard to USACE, RWQCB, and CDFW, as mentioned above in Response to Comment F-1-10. The DEIR is not attempting to hide information or defer mitigation. Jurisdictional permitting occurs after the CEQA process is complete. The regulatory permitting process can occur concurrently with the CEQA process, but permits cannot be issued until a CEQA document is approved. At this point, a general jurisdictional delineation of waters of the US and waters of the State has been completed, but has not been verified by regulatory agencies. Verification of a jurisdictional delineation report is typically done at project-level when specific designs are available and permits are requested. The WLCSP contains drainage features that are subject to USACE, CDFW, and RWQCB permitting. As currently designed the WLCSP may potentially impact 0.6 acres of waters of the US and up to 5.0 acres of waters of the State, this is subject to agency verification. Mitigation for impacts to drainage features will be a minimum of a 1:1 mitigation ratio to ensure a no net loss of riparian habitat. However, final mitigation requirements will be negotiated during permit acquisition during the project-level development process. The EIR sets performance standards for impacts to jurisdictional drainage features that must be satisfied during the permit acquisition project and is included in MMs 4.4.6.3A and 4.4.6.3B refer to Response to Comment F-1-15.

Response to Comment F-1-12. The attached parcel map (see FEIR Volume 2, Appendix H-2) clearly shows it has no development entitlements associated with it, it simply establishes the legal boundaries of the new parcels within the WLCSP.

Response to Comment F-1-13. Both the DEIR and the MSHCP Consistency Analysis (FCS-MBA 2013 – FEIR Volume 2, Appendix E-1) covered all biological aspects of the project. The study area encompassed 5,970 acres, which included the entire WLCSP (2,610 acres), the areas within the General Plan amendment and zone change (1,104 acres) and 302 acres of potential off site infrastructure and 502 acres of indirect impacts associated with the project near lands with Criteria Cells and/or Public Quasi-Public (PQP) lands.

The analyses included all sensitive plant and wildlife species both covered and not covered by the MSHCP to assure that all impacts to both plant and wildlife species would be examined. This is set forth in both the DEIR (Section 4.4) and Appendix E (Biological Resources). Information from California Natural Diversity Database, California Native Plant Society Electronic Inventory, and the Biological Monitoring Program (BMP) of the MSHCP were included in Tables 3 and 4 of the MSHCP Consistency Analysis (FCS-MBA 2013 FEIR Volume 2, Appendix E-1). While there are many species that appear on the CNDDDB and BMP, both the distances to these species and suitable habitat must be used to assess the potential of the species occurring. Tables 3 and 4 of the MSHCP Consistency Analysis (FCS-MBA 2013) provide that assessment (refer to FEIR Volume 2, Appendix E-1).

Response to Comment F-1-14. Both Appendix E in the DEIR and the Appendix E in Volume 2 in the FEIR set forth the physical environment, not only of the areas to be impacted by the proposed action but an area more than double the size of the proposed action (WLCSP is 2,610 acres, plus another 104 acres for potential off site infrastructure). The biological studies covered 5,970 acres inclusive of the 1,104-acre area to be rezoned (with no physical impacts to the land) and 302 acres of offsite infrastructure and an additional 502 acres of indirect impact zone. Tables 2, 3 and 4 of Appendix E of Volume 2 of the FEIR provide information on all of the vegetation communities studied in the 5,970 acres and a breakdown of the impacts on each of the categories. Tables 3 and 4 provide information on all species (both plant and wildlife) that have a potential to occur within seven miles of the boundaries of the study area. The tables include both published data from the California Natural Diversity Data Base (CNDDDB) and California Native Plant Society Electronic Inventory (CNPSEI) and

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

unpublished Geographic Information Systems (GIS) data from the Regional Conservation Authority (RCA). These data, coupled with data on the habitat requirements of each species (covered or not covered by the MSHCP) were used to assess the potential for a species to occur within the WLCSP. This was verified with physical on-ground surveys of the study area as presented in Table B-3.A in Response to Comment B-3-4.

Response to Comment F-1-15. A programmatic Determination of a Biologically Equivalent or Superior Preservation (DBESP) for the WLCSP has been prepared and is an Appendix E Volume 2 of the FEIR. In addition, a jurisdictional assessment of the property was completed for USACE, CDFW, and RWQCB and included as Appendix E-13 Volume 2 of the FEIR.

Section 3.7 of Appendix E-13 provides details on USACE jurisdictional features. Only two of the 15 drainages have connectivity to Traditional Navigable Waters of the U.S. and include Drainage 12 and Drainage 15.

Section 4.12.5 in FEIR Volume 2 Appendix E-13 provides details on riparian/riverine features as defined by the MSHCP. The report states:

“The WLCSP and offsite facilities contain two types of riparian/riverine habitat. The first type consists of unvegetated drainage features, which are described as riverine systems. The second type consists of drainage features with riparian vegetation such as mule fat scrub and southern willow scrub. Both of these riverine/riparian types within the WLCSP are isolated, disturbed, low to moderate in vegetative cover, and generally of poor to moderate habitat quality. Fifteen drainage features were evaluated to determine if they meet the requirements to be considered a riparian/riverine area (Exhibit 8). Nine of the drainage features (Drainage Features 1, 2, 3, 4, 5, 6, 10, 11, and 13) were determined to be upland erosion features and sheet flow within the project site. These features do not provide any function or value as drainage features. Drainage 14 includes two isolated basins that were previously used to collect run-off from a cattle-holding facility. These basins were artificially created as isolated, human-made, catch basin that receives nuisance flows and agricultural runoff from concrete cattle containment areas adjacent to the basin, which have subsequently been removed. There is no evidence of prolonged ponding within the Drainage 14 basins and for this reason, it is not suitable habitat for any of the sensitive fairy shrimp species. The vegetation in the western catch basin comprises sparse southern willow scrub but is not sufficient enough to support any sensitive riparian species. Since Drainage 14 is a man-made feature created in an upland area it is not a riparian/riverine area. The abovementioned 10 features do not meet the minimum criteria to be riverine/riparian and no further discussion is required.

Riverine/Riparian areas are included in Drainages 7, 8, 9, 12, and 15. These features either have riparian habitat or are moderate quality drainage features with a clearly defined bed and bank feature. Drainage 7, 8, and 9 terminate as sheet flow in offsite locations, but are described as riverine because of the function and value of the drainage features. Mule fat scrub, a riparian plant community occurs intermittently in small patches within Drainage Features 7 and 9. Drainage Feature 7 and 8 are both narrow and bordered on each side by disked agricultural fields. Drainage Feature 9 also contains a narrow band of mule fat scrub, but is bordered by relatively undisturbed Riversidean sage scrub. Over time, the drainage feature has been fragmented and currently contains isolated patches of riparian vegetation. Within the mule fat scrub community, tree tobacco and other non-native plant species, have established in approximately equal quantity as mule fat.”

An assessment of waters of the state was conducted and Section 4.2.8 of Appendix E-13 Volume 2 FEIR contains the following information:

“Drainages 7, 8, 9, 12, and 15 were determined to be waters of the state and subject to the jurisdiction of both the CDFW and RWQCB. The jurisdictional limits of waters of the state are not

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

required to have downstream connectivity. There are approximately 3.0 acres of waters of the state, which includes areas with a clearly defined bed and bank feature within the WLCSP and offsite facilities. However, the CDFW makes all final Section 1600 jurisdictional determinations.

Project components affecting stream bed and bank subject to CDFW jurisdiction, including riparian habitat, would require a Streambed Alteration Agreement (SAA) from CDFW.”

While impacts cannot be determined as this time, up to 5 acres of riparian/riverine and/or jurisdictional waters could be impacted by the projects. Details on each development are not available and further development of the discussion is speculative. Section 6.8.3 of Appendix E-13 states:

“Fifteen primary drainage features were evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; Porter Cologne as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by CDFW.

Only Drainage Features 12 and 15 were determined to be jurisdictional waters of the U.S. under Section 404 and 401 of the Clean Water Act (CWA), as they connect with the Perris Drain, which flows into Canyon Lake and the San Jacinto River. The remaining 13 drainage features onsite lack direct connectivity to any downstream navigable waters of the US or relatively permanent waters. The drainage features onsite also do not flow into any tributaries of the above-mentioned features. Therefore, 13 drainage features onsite are considered upland erosion features and are isolated from any downstream drainage features that are under the jurisdiction of the USACE. The eroded features onsite eventually sheet flow within the active agricultural areas or non-native grassland areas prior to flowing into Mystic Lake or San Jacinto River. No jurisdictional wetlands were identified. Projects affecting drainage features 12 and 15 will require regulatory permits under Section 404 and 401 of the CWA as administered by USACE and RWQCB as well as a permit under Section 1600 of the Fish and Game Code. There is approximately 0.6 acres of drainage features under the jurisdiction of the USACE, CDFW, and RWQCB.

Five drainage features (Drainages 7, 8, 9, 12 and 15) were determined to be waters of the state subject to CDFW and RWQCB jurisdiction under Section 1600 of the Fish and Game Code and Porter Cologne Act respectively. There are 3.0 acres of jurisdictional streambed and bank found within Drainage Features 7, 8, 9, 12, and 15. Projects affecting clearly defined bed and bank features, subject to CDFW and RWQCB jurisdiction, would require a stream alteration agreement (SAA) from CDFW and Waste Discharge Requirements respectively. In addition to the 0.6 acres of water of the U.S. under the jurisdiction of the CDFW and RWQCB mentioned above, there is a maximum of 5.0 acres of waters of the State potentially under the jurisdiction of only the CDFW and RWQCB.

MM BIO-2a of Appendix E-7, Volume 2 FEIR provides for mitigation for Riparian/Riverine impacts and it replaces MM 4.4.6.3B in the FEIR Volume 2, Section 4.4.6.3:

~~**4.4.6.3B** As an alternative to Mitigation Measure 4.3.6.3A, the project developer shall retain a qualified biologist to prepare a Determination of Biologically Equivalent or Superior Project (DBESP) relative to development along Drainage 9 in order to maximize protection or preservation of the drainage, otherwise the DBESP must demonstrate why protection or preservation is not possible. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the County Resource Conservation Agency (RCA).~~

~~The DBESP shall be prepared to document measures to reduce impacts to riparian/habitats in accordance with the MSHCP as well as CDFW and USFWS guidelines. The DBESP shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of on-site preservation of riparian areas and/a combination of compensation through purchase and placement of lands with~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

~~riparian/habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at off-site or on-site locations.~~

4.4.6.3B ~~As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the Resource Conservation Agency prior to project approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.~~

~~If impacts to riparian habitat within the World Logistics Center Specific Plan (WLCSP) cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.3A.~~

~~A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. Therefore, mitigation required for compensation for impacts to riparian/ riverine areas will require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.~~

~~As outlined in the WLC programmatic DBESP, erosion control improvements will be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat will be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).~~

MM BIO-3a of Appendix E-13, Volume 2 FEIR provides for programmatic mitigation of jurisdictional impacts and a new mitigation measure (MM 4.4.6.3A) has been added to the FEIR Volume 2, Section 4.4.6.3 to replace DEIR MM 4.4.6.3A.

4.4.6.3A ~~Prior to the approval of any Plot Plans proposing development adjacent to any on-site drainage channels identified in the project programmatic Jurisdictional Delineation (MBA 2012), the developer shall retain a qualified biologist to prepare a site specific jurisdictional delineation and submit it to the U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the development plan will not affect identified jurisdictional areas, no USACE permitting is required. However, permitting through the Regional Water Quality Control Board (RWQCB) and CDFW (i.e., Streambed Alteration Agreement) may still be required for this development.~~

~~The applicant shall consult with USACE, CDFW and RWQCB to establish the need for permits based on the results of the 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with the altering of drainages on-site shall be in agreement with the permit conditions.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Any development adjacent to Drainage 9 shall be designed with the channel in its relatively natural condition, and shall provide a minimum 25-foot open space setback from the top of each bank. Any landscaping of this setback area shall use only native species to help protect resources residing within or traveling through these drainages between the SJWA and the Badlands, and to protect any riparian vegetation along this drainage. This measure shall be implemented to the satisfaction of the City Planning Division.

4.4.6.3A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.

The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.

Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).

The proposed project will increase non-point source pollution and contamination, which may alter hydrology and increase road effects. The increase in non-point pollution and contamination will not destroy sensitive habitat. Mitigation measures outlined throughout the DEIR will be imposed by the City of Moreno Valley through its processing of entitlements on a project-by-project basis regarding light, noise, trash, emissions, vectors, fuel management, runoff, water quality, etc. All project

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

operations within the WLCSP will be required to prepare a Water Quality Management Plan (WQMP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of toxic contamination to any downstream water body.

All project construction activities within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of construction related contamination to any downstream water body. All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program.

The NPDES requirements are discussed in detail in Section 4.9 of the DEIR, Hydrology and Water Quality. The vegetated buffer mentioned above as well as a perimeter walls will be used to reduce the emissions leaving the WLCSP. All drainage improvements will be designed to facilitate water quality improvements and will require assessments by vector control to reduce or eliminate standing water, and The SWPPP and NPDES for each project will adequately address all fuel management, runoff water quality requirements.

Response to Comment F-1-16. The DEIR previously stated that no areas subject to USACE and/or RWQCB were identified within the WLCSP. This has been corrected with the revised DEIR (FEIR Volume 2) and the MSHCP Consistency Analysis (FCS-MBA 2013 FEIR Volume 2, Appendix E-1) have been updated to include an updated description of drainage features within the WLCSP. In addition, a revised Jurisdictional Delineation of Waters and Wetlands was also completed to assess all potentially jurisdictional features within the WLCSP. For additional information please refer to Response to Comment F-1-15 above.

Response to Comment F-1-17. A Program-level DBESP was prepared and included as a part of Appendix E-7 (updated Habitat Assessment and MSHCP Consistency Analysis, 2013), Volume 2 FEIR. These MSHCP and DBESP documents have been submitted to the City of Moreno Valley for a Joint Project Review (JPR) and a determination of consistency with the MSHCP.

Response to Comment F-1-18. A programmatic DBESP for the WLCSP has been prepared and is included as part of the Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013) in Appendix E of Volume 2 of the FEIR. See Response to Comment F-1-15, which provides the DBESP response and the process for approval. Section 4.12.5 of Appendix E-7 (FEIR Volume 2) provides details on riparian/riverine features as defined by the MSHCP.

Riparian/Riverine areas are known to occur in Drainages 7, 8, 9, 12, and 15. These features either have riparian habitat or are moderate quality drainage features with a clearly defined bed and bank feature. Drainage 7, 8, and 9 terminate as sheet flow in offsite locations, but are described as riverine because of the function and value of the drainage features. Mule fat scrub, a riparian plant community occurs intermittently in small patches within Drainage Features 7 and 9. Drainage Feature 7 and 8 are both narrow and bordered on each side by disked agricultural fields. Drainage Feature 9 also contains a narrow band of mule fat scrub, but is bordered by relatively undisturbed Riversidean sage scrub. Over time, the drainage feature has been fragmented and currently contains isolated patches of riparian vegetation. Within the mule fat scrub community, tree tobacco and other non-native plant species, have established in approximately equal quantity as mule fat.

While project specific impacts cannot be determined as this time, it is estimated that up to 5 acres of riparian/riverine and/or jurisdictional waters could be impacted by future projects. Details on each development are not available and further development of the discussion is speculative. Section 6.8.3 of Appendix E-13 of Volume 2 FEIR states:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

“Fifteen primary drainage features were evaluated for jurisdiction under Section 404 and 401 of the CWA as administered by USACE and RWQCB, respectively; Porter Cologne as administered by the RWQCB; and Section 1600 of the Fish and Game Code as administered by CDFW.

Five drainage features (Drainages 7, 8, 9, 12 and 15) were determined to be riparian/riverine under MSHCP guidelines and waters of the state subject to CDFW and RWQCB jurisdiction under Section 1600 of the Fish and Game Code and Porter Cologne Act respectively, but have yet to be verified by resource agencies. Any impacts to drainage features considered riparian/riverine or waters of the state is a significant impact requiring mitigation. It is estimate that no more the 5.0 acres of drainage features that occur within the WLCSP as well as off-site improvement areas will be impacted. Drainage feature impacts will be replaced at a minimum of 1:1 mitigation ratio through the creation of on-site riparian habitat, off-site habitat conservation, or off-site purchase of mitigation credits. Final mitigation requirements will be negotiated during the approval of the appropriate regulatory permits. A project related analysis of the on-site drainage features will be completed on a project-by-project basis.”

Response to Comment F-1-19. The City of Moreno Valley General Plan includes the following Objective and Policy regarding natural drainage features. Objective 7.4 says *“Maintain, protect, and preserve biologically significant habitats where practical, Including the San Jacinto Wildlife Area, riparian areas, habitats of rare and endangered species, and other areas of natural significance.”* In addition, Policy 7.4.3 states...*“Preserve natural drainage courses in their natural state and the natural hydrology, unless the protection of life and property necessitate improvement as concrete channels.”*

It should be noted that the drainage features on site are not natural occurring features. These drainage features are artificially created channels constructed in previous upland areas to protect the surrounding agricultural fields from erosion during storm events. There is no riparian habitat within the Specific Plan area. Drains 7, 8, 9, 12, and 15 support some facultative-wetland species, such as mule fat (*Baccharis salicifolia*). These features are not considered biologically significant habitat due to the lack of natural vegetative cover and poor quality habitat and therefore are not being covered under General Plan Policy 7.4.3. Although these drainage features do not support high-quality habitat, they may be under USACE, CDFW, and/or RWQCB jurisdiction and may require regulatory permits and compensatory mitigation if impacted.

Response to Comment F-1-20. Drainage 14 was originally listed as a riparian/riverine feature based on the presence of riparian plant species. Upon further review of the definition of riparian/riverine in the MSHCP document, the MSHCP clearly states, *“With the exception of wetlands created for the purpose of providing wetlands Habitat or resulting from human actions to create open waters or from the alteration of natural stream courses, areas demonstrating characteristics as described above which are artificially created are not included in these definitions.”* Therefore, based on the requirements under the MSHCP, this artificially created ponded area is not considered to be a riverine/riparian area. Appendix E-13 of Volume 2 FEIR Section 4.12.5 states:

“Drainage 14 includes two isolated basins that were previously used to collect run-off from a cattle-holding facility. These basins were artificially created as isolated, human-made, catch basin that receives nuisance flows and agricultural runoff from concrete cattle containment areas adjacent to the basin, which have subsequently been removed. There is no evidence of prolonged ponding within the Drainage 14 basins and for this reason it is not suitable habitat for any of the sensitive fairy shrimp species. The vegetation in the western catch basin comprises sparse southern willow scrub but is not sufficient enough to support any sensitive riparian species. Since Drainage 14 is a fabricated feature created in an upland area it is not a riparian/riverine area.”

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-1-21. Section 4.1.6.4 (Aesthetics) of the DEIR provides a discussion on light and glare. Section 4.4.1.14(f) of the Revised Draft EIR, discusses lighting impact in relationship to the MSHCP Urban/Wildland Interface Analysis. The Specific Plan also contains requirements for off-site lighting (Specific Plan Section 4.3):

“Section 4.1.3 indicates one of the main objectives of the project lighting is “... all lighting in the vicinity of the San Jacinto Wildlife Area shall be designed to confine all direct light rays to the project site and preclude the visibility of direct light rays from the wildlife area” (page 78). The project will also have to comply with the City’s new Nighttime Lighting Ordinance 851, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines.”

There are numerous requirements that must be applied on a project specific basis. These include compliance with the City of Moreno Valley Ordinance 851 on lighting. The DEIR refers to Moreno Valley Municipal Code Section 9.08.100(c)(3), which prohibits lighting in excess of 0.25 foot candles within 5 feet of any property lines.

The purpose and intent of City Ordinance 851 *“is to establish regulations and standards for outdoor lighting which will reduce light pollution and trespass generated by residential and non-residential lighting fixtures and devices, while maintaining dark skies.”* Based on application of this ordinance and a review of individual projects adjacent to the SJWA during specific project approval, the project would be in compliance with the established mitigation and no significant impacts would remain.

The original MM 4.1.6.4C recommended low pressure sodium lights on WLCSP buildings that face the San Jacinto Wildlife Area (SJWA). This measure was intended to minimize night lighting impacts on biological resources within the SJWA. However, the measure was eliminated due to low pressure sodium lights being prohibited in the City’s recently adopted Ordinance 851 which amends City Municipal Code Section 9.08.100. The project will still need to minimize white light spillage into the adjacent SJWA and will comply with Ordinance 851. Light intensity levels will be maintained at levels outlined in that ordinance (i.e., prohibit lighting in excess of 0.25 foot candles within 5 feet of adjacent property lines).

As a result of this discussion, the following MM 4.4.6.4K has been added to address night lighting impacts on the SJWA:

4.4.6.4K Prior to approval of any plot plans for development adjacent to the SJWA, the applicant shall demonstrate that direct light rays have been contained within the development area, per requirements of the MSHCP Section 6.0 which states, “Night lighting shall be directed away from the MSHCP Conservation Area to protect species within the MSHCP Conservation Area from direct night lighting.” This measure shall be implemented to the satisfaction of the City Planning Division.

Response to Comment F-1-22. Light pollution is a major problem around large urban developments with regard to its effects on wildlife species. The WLCSP is an extensive area of generally unlighted land, but it is not completely free of existing lighting. Existing light sources include an extensive residential area on the western border of the WLCSP from the base of Mt. Russell to SR-60. The existing Skechers facility is present north of the SJWA boundary and was designed in compliance with City Ordinance 851 (See Response F-1-22). The existing San Diego Gas & Electric (SDG&E) Compressor Station also has extensive lighting along the southern WLCSP boundary.

In addition to these permanent light sources, there is traffic lighting associated with Gilman Springs Road and SR-60 as well as associated night traffic along Eucalyptus Street, Alessandro Boulevard, and other roads through the area. All of these existing light sources are a part of the existing condition and, although speculative, do not appear to have had a significant impact on either migratory birds or

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

wildlife. Extensive biological studies of the survey area since 2005 have not seen evidence of extensive use of the agricultural lands within the WLCSP by avian species. The area does not contain high densities of either migratory birds or any terrestrial wildlife species.

The development of the WLCSP is projected to occur over a 15-year period and would not immediately subject the entire 2,610 acres to an increase in lighting. The gradual increase in light, which shall be in accordance to both City Ordinance and mitigation measures, will be directed and focused on specific building activities and will not subject wildlife in the area to a radical change that could result in changes to existing foraging and predatory systems in the region.

Response to Comment F-1-23. The potential for birds flying at night and becoming confused by lighting and potentially striking buildings is a reality that cannot be ignored. However, with the lighting efforts incorporated in the Specific Plan Guidelines on Lighting and compliance with City Ordinance 851, lighting impacts would be reduced to insignificant levels. The potential for birds striking buildings is real. Section 4.1.6.1 of the DEIR spells out building heights for the entire Specific Plan. The highest buildings would be no more than 80 feet tall, with “perimeter” buildings along the west north and south perimeters a maximum of 60 feet tall. These requirements are for aesthetic reasons, but also provide a gradual transition from open space areas and should allow for birds to acclimate to buildings both through the transition from shorter to taller buildings, but also through the gradual construction of facilities over 15 years. The Specific Plan guidelines contain standards and design guidelines that require the minimal use of lighting for building visibility and safety at night. These guidelines, which minimizes the extensive use of lighting, should reduce the potential for collisions with buildings by reducing confusion for birds.

Response to Comment F-1-24. Design guidelines and mitigation with regard to lighting have been designed to reduce offsite illumination. This, together with a buffer of 250 feet from buildings and the low design of lighting within the facility at less than 30 feet with building heights of a maximum of 80 feet should reduce the potential for predators taking advantage of night lighting by reducing the available off-site lighting. With regard to predation of Stephens’ kangaroo rat (SKR) predation, the species does not currently occupy the WLCSP and while there are numerous trappings of the species nearby, none have been found within the WLCSP. Since light spillage will be minimized and a buffer is provided along the wildlands areas along the southern boundary of the WLCSP, it is unlikely that the increased lighting associated with the development would impact Stephen’s kangaroo rat (SKR).

The reader should also see Response F-1-21 for additional information regarding night lighting. It should be noted the WLCSP is within the Mitigation Fee Area for SKR, and payment of the SKR mitigation fee will be required on a project-by-project basis. The fees will be used to purchase off-site lands within core conservation areas that can be used for the long-term conservation of SKR.

Response to Comment F-1-25. Regulations in the WLCSP prohibit direct light rays from being directed off of the project site. While plants may be sensitive to light pollution, the project site is in an area where light sources are already present. Existing plants in the project site consist primarily of ruderal species and/or planted grains. These plants would be removed by the gradual construction of facilities within the WLCSP and would not be impacted by light pollution as they would be removed with the construction of the facilities.

Trees both within the WLCSP and the 5,970-acre study area in general are very limited. There are some ornamental trees associated with the SDG&E compressor station that would remain following the full build-out of the WLCSP, but they are over 1,500 feet from the southernmost edge of proposed development. A series of tamarisk associated with Drainage Feature 14 could be impacted by the additional lighting as could trees in the residential development along Redlands Blvd. The residential areas are already subject to existing light sources. Based on the minimal amount of trees and the location of trees, even the potential for changes to tree activity should not cause any changes to bird nesting activities in the study area.

Response to Comment F-1-26. Light activities on National Parks and desert habitat is completely different than the effects of light pollution on a relatively urbanized area like the City of Moreno Valley. Many of the nation's National Parks and deserts are extremely isolated with no nearby development. Light impacts associated at a 100-mile distance in an urban area seem unlikely and impossible to detect and are therefore speculative at best. Low levels of light pollution in an otherwise urbanized area is not a significant impact.

The WLCSP is located within the second largest city in Riverside County and not in an isolated wilderness area. The article cited (Letter F-1 Appendix 22) discusses light pollution with regard to "star-gazing." The references for wildlife involved sea turtles hatchlings being confused on a return to the sea and migratory waterfowl. With regard to waterfowl, the existing light pollution in southern California in general should not radically increase with the application of City Ordinance 851 and proposed mitigation. City Ordinance 851 requires a reduction of light pollution generated by the proposed WLCSP, while maintaining dark skies.

Response to Comment F-1-27. The City of Moreno Valley is extremely conservative when it comes to project related effects with regard to light pollution impacts. Project-specific lighting requirements will include compliance with the City of Moreno Valley Ordinance 851 on lighting and two mitigation measures provided in the DEIR. See Responses to Comments F-1-21 and F-1-26 for additional information. Citing light pollution up to 100 miles away in an urbanized area is not applicable to this project.

Response to Comment F-1-28. The DEIR provides a variety of measures to reduce the effect of lighting off site. Application of City Ordinance 851 provides a guideline for light pollution. This will be followed by the Specific Plan Lighting guidelines. MM 4.1.6.4A and MM 4.1.6.4B are required to meet the City of Moreno Valley's requirements regarding potential lighting impacts. The buffer area along the southern portion of the WLCSP is part of the overall project concept and is a project design feature that provides an additional barrier to reduce off-site glare from the proposed development.

Response to Comment F-1-29. See Response to Comment F-13-51 regarding indirect air quality impacts and biological resources.

Response to Comment F-1-30. See Response to Comment F-1-2.

Response to Comment F-1-31. Focused burrowing owl surveys conducted within the study area since 2005 have found burrowing owls within the WLCSP, but only in very limited numbers (no more than a single breeding pair) and only sporadically (not every year). No more than a single pair of burrowing owl has ever been observed or recorded within the boundaries of the WLCSP. Based on the Biological Monitoring Program Burrowing Owl Survey Report 2011 for the SJWA/Mystic Lake/Lake Perris Area (Table 1 pg. 7, FEIR Volume 2, Appendix E-5), no breeding pairs of burrowing owl were found within the SJWA. Burrowing owls have only been identified outside of the breeding season within the SJWA. The report states that this is a decline from the 21 detections in 2006 and the 14 detections in 2007. These sightings are within existing conservation areas but generally more than 1 mile from the WLCSP boundaries. The lack of suitable habitat for burrowing owls in the WLCSP is due to the extensive disking and ground disturbance associated with the dry land agriculture. Suitable burrows for occupancy by burrowing owl have been identified in all surveys conducted by FCS-MBA, but only a single pair has ever been found in a survey season within the WLCSP.

This suggests that the habitat of dry land agriculture (the existing condition of most of the WLCSP area) is moderately suitable for burrowing owls and the loss of this moderately suitable land would not have a long-term impact on the survival of burrowing owls. Notwithstanding these conditions, pre-

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

construction surveys will be required within 30-days of any vegetation removal or soil impacts for future projects as described in MM 4.4.6.4D in Response to Comment F-1-33.

Response to Comment F-1-32. While the City agrees there has been a decline in the population of burrowing owls throughout California, the causes do not appear to be apparent. The RCA study mentioned in Response to Comment F-1-31 indicates that a decline in burrowing owls occurred in an area that was in conservation for three consecutive years of study (2006, 2007, and 2011). The cause is not from a change in habitat status on MSHCP Core Lands, but could be related to weather conditions, prey base, or a combination of factors. Burrowing owls, while found within the WLCSP, were not found every year and were found in limited numbers. The limited number of owls found on the WLCSP site has also varied from year to year, reflecting the conditions of the surrounding area, which tend to be subject to less disturbance. Based on the MSHCP requirements, the loss of a single pair or breeding burrowing owls is not considered a significant impact since the portion of the WLCSP that the burrow owls were observed is considered a non-Criteria Cell area. If a single pair of burrowing owl is observed within a Criteria Cell, then 90% of the area must be conserved until the mitigation goal for burrowing owl has been met. However, if during the project-level protocol surveys, more than three pairs of burrowing owl are observed, conservation of 90% of the occupied habitat will be required and a Determination of a Biologically Equivalent or Superior Preservation (DBESP) will be prepared. Neither is the case within the WLCSP.

Response to Comment F-1-33. Mitigation measures requiring preconstruction surveys prior to construction (MM Bio 6b) would provide for protection to both breeding burrowing owls as well as owls found during the non-breeding season. MM BIO-6b from the MSHCP Consistency Report will reduce the impacts to burrowing owl to a less than significant level. This measure became MM 4.4.6.4D in the DEIR.

4.4.6.4DC ~~Prior to issuance of any grading permits, a~~ A pre-construction clearance survey for burrowing owl shall be prepared and conducted by a qualified biologist and submitted to the City. This survey shall be required and conducted no more than thirty (30) days prior to initiation of any grading or ground disturbing activities within the project area.

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the study disturbance area during the 30-day pre-construction survey, ~~consultation with the CDFW and USFWS shall take place and no construction activity shall take place within~~ maintain a 500-foot-of-an-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the California Department of Fish and Wildlife (CDFW) shall take place and an appropriate avoidance distance established. No disturbance to active burrows shall occur without appropriate permitting through the ~~MBTA~~ Migratory Bird Treaty Act and/or ~~GDFW~~ California Department of Fish and Wildlife.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the ~~CDFW and USFWS~~ California Department of Fish and Wildlife. A relocation plan may be required by California Department of Fish and Wildlife if active and/or passive relocation is necessary. The relocation plan will outline the basic process and provides options for avoidance and mitigation. Artificial burrows -may be constructed within the buffer area south of the World Logistics

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Center Specific Plan. Construction activity may occur within 500 feet of the active nests/burrows at the discretion of the biological monitor in consultation with CDFW.

~~If active nests are identified in a development area, the nests shall be avoided or the owls actively or passively relocated to the 250-foot setback area in the southern portion of the Specific Plan site (see Mitigation Measure 4.4.6.1A). This setback area shall be considered a “conservation area” for burrowing owl or other species of animals or plants that need to be relocated from the portions of the WLCSP site to be developed. In the event no burrowing owls have been identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, Mitigation Measure 4.4.6.4D shall apply. To avoid active nests adequately, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season. This measure shall be implemented to the satisfaction of the City Planning Division.~~

- 4.4.6.4D** — ~~If active burrowing owl burrows are detected outside the breeding season, passive and/or active relocation may be undertaken following consultation with and approval by the CDFW and/or USFWS. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re-enter the holes/dens. Owls may also be actively relocated on-site to the 250-foot clear buffer zone along the southern boundary of the WLCSP, as outlined in Mitigation Measure 4.4.6.1A. This measure shall be implemented to the satisfaction of the City Planning Division.~~

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor

This series of measures would protect the loss of individuals. The WLCSP does not have more than moderately suitable foraging habitat for the loss of 2,610 acres of foraging habitat in a region with thousands of acres of foraging habitat would not be considered significant with the implementation of the following new MM 4.4.6.4C has been added to FEIR Volume 2 Section 4.4.6.3:

- 4.4.6.4C** The loss of foraging habitat for golden eagle and white-tailed kite will be mitigated by payment of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) fee and the creation of a landscaped buffer area adjacent to the San Jacinto Wildlife Area property (SJWA). First, the payment of the Western Riverside County Multiple species Habitat Conservation Plan fee will be required on a project-by-project basis. Second, a 250-foot setback as described in Mitigation Measure 4.4.6.1A will be established within the World Logistics Center Specific Plan area. This area will reduce impacts to raptor species foraging in the adjacent San Jacinto Wildlife Area open space areas.

Response to Comment F-1-34. There is no evidence that the MSHCP will fail to protect biological resources in western Riverside County. The RAND Report (2008) discussed the potential for an imbalance in conservation dollars being available. This was primarily due to the changes to the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

housing industry and lack of development throughout the County causing a reduction in lands put into conservation. The converse of this is that less land is being impacted. The RCA 2012 Annual Report discusses issues associated with the MSHCP. One area of concern is that one of the 37 rough step vegetation categories is out of Rough Step. Rough Step Unit 8: Grasslands is not sufficiently conserved. The RCA will continue to work toward acquiring properties with the appropriate vegetation category to address the Rough Step Unit that is not currently in Rough Step.

While the target for conservation is currently below originally established thresholds, the acres of loss are also below projected numbers. The 2012 report also states that *“The RCA Board received the Fiscal Year 2011-12 (July 1, 2011 to June 30, 2012) Financial Statements and Independent Auditors’ Report of the RCA with no reportable findings.”* Therefore, it is reasonable to assume that the mitigation measures proposed in the DEIR, with regard to MSHCP, will remain viable during the 15-year build-out period for the WLCSP.

Response to Comment F-1-35. There have been no follow-up studies to the RAND study over the past 5 years. In the report, costs assumptions regarding the MSHCP program were discussed in terms of the 2007 market value of land. These assumptions are the key statement of the RAND study and must be evaluated under current land values, which are substantially lower than they were in 2007 (RAND Report 2008). To speculate on current and future land values associated with acquisition is unwarranted. There have been no statements by either the United States Fish and Wildlife Service (USFWS) or CDFW on the MSHCP program being in jeopardy. The MSHCP program does regulate the fee-to-land values and these are updated on a regular basis. Furthermore, land values will most likely change over the 15-year build out of the WLCSP.

Response to Comment F-1-36. The DEIR is not responsible for speculating on the long-term life of the MSHCP. Since the WLCSP EIR is a program level document, and development is projected to occur over a 15 year period and individual analyses of projects as they require permits and approvals is necessary, there should be no issue. The WLCSP lands were never considered for Reserve Assembly (Conservation with the MSHCP) and therefore, the losses were not considered significant. The payment of fees for the right to develop has regularly been adjusted and fee payment would occur at the time of project specific development. To speculate on the “what ifs” of a collapse of the MSHCP is beyond the scope of this EIR. The general paucity of sensitive species within the WLCSP must also be considered. There will be very little biological impact and substantial mitigation included in the EIR adequately provides for these impacts.

Response to Comment F-1-37. The relatively small population of burrowing owl in the region, as discussed in Responses to Comments F-1-31 through F-1-33, indicates that indirect impacts associated with vehicle collisions is extremely unlikely. Although the City cannot completely rule out the possibility that a vehicle may strike burrowing owl, the possibility of severe losses of burrowing owl due to vehicular deaths is highly unlikely.

While traffic will increase along Theodore Street and SR-60, there is no data on the current number of “road kills” in the area therefore, it is difficult to project increases or decreases caused by changes in traffic patterns and new development. However, due to the disturbed nature of the WLCSP, it is unlikely that a significant amount of wildlife species will be impacted by an increase in traffic. However, as a project design feature, several culverts beneath Gilman Springs Road and SR-60 will be maintained or replaced, which will provide a crossing to greatly reduce impacts to smaller, more mobile, wildlife species.

A similar statement can be made for the SKR. The WLCSP habitat of primarily dry land agriculture is not suitable habitat for the SKR. There are currently no figures on “road kill” of SKR for the general project area. Speculation on increased “kills” due to increased traffic on the roadways in the vicinity cannot be made. Regardless, SKR is covered under the SKR HCP and payment of the SKR Mitigation Fee is required on a project-by-project basis and will reduce project related impacts to a

level less than significant. The SKR mitigation fees will be used to purchase off-site land that is currently occupied and within the Core Reserve Area for SKR.

Response to Comment F-1-38. Since the vast majority of the WLCSP and a large portion of the CDFW Conservation Buffer Area is currently in agriculture, the current level of pesticide use, particularly herbicides for weed control would be reduced by implementation of the WLCSP.

Currently any pesticides would be washed into the drainages present on the site and carried offsite. BMPs will be put in place as a requirement for any future project. If and when rodenticides are used, the applicant will only use bait products for rodent elimination, which must contain chlorophacinone or diphacinone as requested by CDFW and included in Response to Comment B-3-32.

Section 4.9.6 of the DEIR provides a number of measures, primarily associated with water quality concerns, to reduce the effects of pesticides on biological resources (MMs 4.9.4.1A, 4.9.6.2A, 4.9.6.2B, 4.9.6.3A, and 4.9.6.3C).

Site design Best Management Practices (BMPs) are implemented to create a hydrologically-functional project design that attempts to mimic the natural hydrologic regime. In accordance with the Riverside County WQMP, projects shall implement site design concepts that achieve each of the following:

1. Minimize Urban Runoff
 - a. Maximize the permeable area.
 - b. Incorporate landscaped buffer areas between sidewalks and streets.
 - c. Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
 - d. Use natural drainage systems.
 - e. Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.
 - f. Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.
2. Minimize Impervious Footprint
 - a. Maximize the permeable area.
 - b. Construct streets, sidewalks, and parking lot aisles to the minimum widths necessary, provided that public safety and a walk able environment for pedestrians are not compromised.
 - c. Reduce widths of street where off-street parking is available.
 - d. Minimize the use of impervious surfaces such as decorative concrete, in the landscape design.
3. Conserve Natural Areas
 - a. Conserve natural areas.
 - b. Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
 - c. Use natural drainage systems.
4. Minimize Directly Connected Impervious Areas (DCIAs)
 - a. Runoff from impervious areas will sheet flow or be directed to treatment control BMPs.
 - b. Streets, sidewalks, and parking lots will sheet flow to landscaping/bio retention areas.

All of these measures reduce the potential for pesticide use to cause impact to the biological resources that would be onsite after full development and the surrounding area.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Response to Comment F-1-39. The DEIR provides several appropriate mitigation measures that will reduce significant biological resource impacts to a less than significant level. Compliance with the MSHCP guidelines is only one portion of the required mitigation for project related impacts, however, it is the only mitigation measure that is required that ensures long-term conservation of special status plant and wildlife species.

As designed and negotiated with federal and state resource agencies, the MSHCP provides incidental take authority for sensitive plant and wildlife species and the payment of the MSHCP Development Fee is used to purchase lands within Core Conservation Areas for the long-term conservation of high-quality habitat for those species. All MSHCP requirements are discussed in the Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013 FEIR Volume 2, Appendix E-1) and compliance with the MSHCP will reduce the potentially significant impacts to a less than significant level. There will be no impacts to vernal pools, narrow endemic plants, and/or riparian bird species due to a lack of suitable habitat. Under the MSHCP, the only required survey and assessment is for burrowing owl and riparian/riverine areas and appropriate mitigation measures are discussed in MMs 4.4.6.4C and 4.4.6.4D regarding burrowing owl and MM 4.4.6.3B regarding riparian/riverine.

Response to Comment F-1-40. See Response to Comment F-1-2.

Response to Comment F-1-41. The commenter indicates that the EIR fails to adhere to the standards of a good faith analysis. The DEIR quantifies greenhouse gas emissions (see Section 4.7.6.1 in DEIR). In addition, the greenhouse gas analysis was refined in the FEIR and addresses concerns raised by the commenter (refer to FEIR Volume 2 Section 4.7).

Response to Comment F-1-42. The commenter claims that the EIR fails to disclose and analyze conflicts with regional greenhouse gas plans. However, the DEIR conducted a good faith effort to address consistency with the applicable plans, as shown in Impact 4.7.6.2 (pages 4.7-36 through 4.7-43) in the DEIR. Please refer to Master Response-1 in Response to Comment C-3, which explains the differences in the greenhouse gas approach between the DEIR and the FEIR.

Response to Comment F-1-43. The commenter questions whether the project is consistent with vehicle miles traveled (VMT) reduction strategies in that it is not along a high quality transit corridor. The commenter also states that a 50-mile average truck trip, which he believes is an under-estimate, *“hardly qualifies for a reduction in vehicle miles traveled.”*

The TIA concurs with the commenter that transit service to the project site is poor, but points out that this is due to the current lack of demand at a site that currently consists of dry-agriculture fields and seven houses. The project would include transit-supportive features (see Chapter 12, Section D of the TIA, FEIR Volume 2, Appendix L-1) and it is expected that transit service will be provided once the project reaches a transit-supportable level of operations.

The project is consistent with VMT reduction strategies because it improves jobs-housing balance in the City of Moreno Valley (See Chapter 3, Section E sub-section entitled Moreno Valley’s Economy of the TIA, FEIR Volume 2, Appendix L-1). In doing so, the project would reduce VMT for workers who would otherwise travel to more distant employment locations (See Chapter 4, Section D sub-section entitled WLC Auto Traffic of the TIA, FEIR Volume 2, Appendix L-1).

The 50 mile figure for average truck distance is a default value suggested by the SCAQMD for use when modeling data is not available. Tests with the Riverside County Traffic Analysis Model (RivTAM) model suggest that the actual average truck trip length for the WLC would be 30 to 40 miles, so the 50-mile figure is a conservative estimate since it over-states rather than under-states project impacts. The commenter claims that the project fails to comply with the City of Moreno Valley General Plan policies.

The analysis of consistency with greenhouse gas related Moreno Valley General Plan policies is contained in the DEIR (see Table 4.7.L, page 4.7-41) and in the revised analysis and concludes that the project does comply with the General Plan policies.

The commenter claims that the project fails to comply with the City of Moreno Valley Climate Action Strategy (Strategy). The project was inconsistent with the Strategy because it was not required to exceed Title 24 requirements. However, MM 4.16.4.6.1C requires that the project exceed Title 24 by 10 percent. Therefore, the project is now consistent with the Strategy. The DEIR included a thorough analysis of the project consistency with the Strategy (the table is contained in Appendix D of Appendix D of the DEIR). The revised report also contains this analysis (FEIR Volume 2 Appendix D).

The commenter indicates that the project would not be consistent with the City's Strategy R2-T1, Land Use Based Trips and VMT Reduction Policies. The DEIR stated that the project would be consistent with the strategy with MM 4.3.6.4A (page 4.7-41 of the DEIR). However, this is a typographical error. As shown in the January 2013 air quality report (Appendix D of the DEIR, page 226), this is shown as not applicable. This change has been made in the FEIR. (refer to EIR Volume 2 Section 4.7)

The commenter makes reference to the DEIR assumption that trucks would travel 50 miles per trip. This has been refined in the revised analysis pursuant to substantial evidence provided in the revised TIA and now reflects roadway and freeway project-specific traffic volumes and provides a more specific and detailed analysis (refer to Response to Comment F-1-50).

Response to Comment F-1-44. The commenter states that the project would not be consistent with the Renewable Portfolio Standard of achieving a 33 percent renewable energy. The project would be required to comply with MM 4.16.4.6.1C, which requires that the project provide solar power generation. In addition, the Renewable Portfolio Standard requires that energy utilities, not electricity users, incorporate at least 33 percent renewable energy; therefore, the standard is not technically applicable to the project. Please see the Mitigation Monitoring Reporting Program in the FEIR Volume 1 for a list of the project's mitigation measures.

The commenter questions why the EIR claims to be consistent with a Sustainable Communities Strategy (SCS) when one has not been adopted for Riverside County and because the project fails to apply SCAG strategies because they are not applicable to the project. The greenhouse gas section in the DEIR does not make this claim; it is not clear to what the commenter is referring.

The commenter indicates that there is no quantitative or logical analysis of how the project's greenhouse gas emissions could be consistent with Executive Order S-3-05. This has been clarified in the FEIR, see Section 4.7.6.2.

Response to Comment F-1-45 and F-1-46. The commenter indicates that the volume of project emissions of greenhouse gases would prohibit Moreno Valley's compliance with greenhouse gas (GHG) reduction strategies. The commenter states that the project's greenhouse gas emissions are 76 percent of the City's projected 2020 GHG emissions. This percent comparison is incorrect for the following reasons:

- a) As discussed in the DEIR (App. D at page 215), the City inventory and the project emissions cannot be directly compared because the emissions estimation methodology differs between the two analyses and because the project's emissions include emissions in the entire South Coast Air Basin (SCAB), not only the City. This is further clarified in the revised air quality analysis:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The project's operational emissions cannot be directly compared with the citywide community emissions inventory prepared for the City of Moreno Valley for the following reasons. First, the City's future inventory does not include the project's greenhouse gas emissions. The City's inventory was prepared prior to the Notice of Preparation of this project's EIR. The Notice of Preparation was released in January 2012 and the inventory was finalized in February 2012 (it was prepared in 2011).

Second, the methodology used to derive the City's inventory is different. The motor vehicle estimates in the City inventory use the Transportation Analysis and Simulation System (TRANSIMS) model, and includes trips that begin and/or end within the City limits and includes miles from all trips within Moreno Valley and half of the miles from trips that begin or end in Moreno Valley. The project's motor vehicle emissions include emissions throughout the entire SCAB. Due to the fundamental differences in approach of estimating emissions, comparisons between the two inventories are meaningless. (refer to the revised air quality analysis in FEIR Volume 2 Appendix D)

- b) *If the emissions were compared, the mitigated emissions at the year 2020 should be used, not the emissions at buildout (after year 2031).* In addition, the project's emissions were not included in the City's greenhouse gas inventory; therefore, the project's emissions should be added to the City's emissions for a direct comparison. The revised greenhouse gas analysis estimated greenhouse gas emissions in the year 2020 at approximately 164,000 metric tons carbon dioxide equivalent (MTCO_{2e}) (total AB 32 capped and uncapped emissions, mitigated, including construction). Added to the City's emissions would be approximately 962,000 MTCO_{2e} (164,000 + 798,000). Therefore, project emissions would be 17 percent, not 76 percent. The project's buildout emissions (after the year 2031) should not be compared with the City's inventory because the City did not estimate emissions after the year 2020. However, as discussed in (a) above, the project's emissions include emissions outside of the City's jurisdiction and boundaries so a direct comparison should not be made, with the 17 percent resulting in a grossly overestimated project contribution to the City's greenhouse gas inventory. For this reason and those stated earlier, such comparisons lack meaningful value.
- c) As stated above, the project is not included in the City's GHG inventory. If the project was included, both the City's business as usual emissions in 2020 and the reductions would be greater.

The commenter questions how the project would impact the ability of the City to achieve its greenhouse gas reduction targets. As shown in the DEIR, the project is consistent with the policies in the City's Climate Action Strategy. The Strategy states, "The purpose and intent of these policies is to achieve compliance with AB 32 and reduce GHG by 15 percent by 2020" (Strategy, page 6). Regulations are included in both the unmitigated and mitigated project greenhouse gas emissions; therefore, it is difficult to identify the percent reduction from regulation. For the greenhouse gas emissions that are not covered by AB 32 (the uncapped emissions), mitigation would reduce these emissions by approximately 70 percent at build out. For the AB 32 capped emissions, mitigation would reduce those emissions by 4 percent. This exceeds the greenhouse gas emission reduction goal identified in the City's Climate Action Strategy.

Response to Comment F-1-47. This is an introductory paragraph that outlines the comments that follow; see Responses to Comments F-1-48 through F-1-53.

Response to Comment F-1-48. The analysis of the energy use by fuel type was included in the DEIR and is summarized in Tables 4.16.I and 4.16.J. It is expected that natural gas distribution systems will need to be installed to accommodate gas usage within the project. It is assumed that gas usage will be limited to the office space included within the logistics buildings. The warehouse portion of the building is typically un-air conditioned spaces (no heating or cooling other than fans), the other

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

energy demands come from the lighting and the material handling equipment neither of which utilizes natural gas. Therefore the warehousing portion of the building is not expected to produce a demand for natural gas. Table F-1.A (Table 4.16.J of Section 4.16 of the FEIR Volume 2) has been updated to reflect that office space is a use within the logistic building not a stand-alone land use. In addition, the revised Specific Plan requires future users to install photovoltaic solar panels to generate electricity.

There are back-up generators that are used to power the Information Technologies (IT) systems in the event of a brown/blackout. Single or interim demands from back-up generators are typically not included in calculating yearly natural gas demands. However, for a typical air quality analyses, it is assumed that each generator will operate 50 hours per year (for testing).

Table F-1.A: Natural Gas Demand and Consumption

Use within Logistics Building	% of Total Square Footage	Building Area (sf)	Natural Gas Consumption Factor (cf/yr/sf) ¹	Natural Gas Consumption (cf/yr) ¹
Warehouse	97	39,382,000	—	—
Office Space	3	1,218,000	12.00	14,616,000
Total	100	40,600,000	—	14,616,000

1. cf = cubic feet.

Source: Technical Memorandum – Dry Utilities, Utility Specialists, October 24, 2013.

Response to Comment F-1-49. The commenter states the TIA used an incorrect geographic scope in that the freeway analysis did not extend to the ports of Los Angeles (ports).

An additional section (Chapter 12, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes project impacts on freeways to the ports. The analysis found that only a small percentage of WLC truck traffic would be to and from the ports. See Table 86 in the revised TIA (FEIR Volume 2 Appendix L-1), repeated below as Table F-1.B. This is based on SCAG survey data.

Table F-1.B: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

No impacts were found that were not already covered in the DEIR.

Response to Comment F-1-50. The commenter claims the DEIR undercounts long haul routes by setting arbitrarily short distance to regional locations. For example, the DEIR sets an arbitrarily short distance for long haul trips of the San Diego County line to the south, Banning Pass to the east, and the Cajon Pass to the northeast (Air Quality, Greenhouse Gas, and Health Risk Assessment Report, DEIR, Appendix D, Table 20). The DEIR also improperly undercounts local traffic by claiming that “the local vehicles travel between 9.6 and 15.4 miles per trips.” These estimates disregard the actual proximity of nearby cities serving the project. The distance to Riverside is 18 miles, Beaumont is 10 miles, Perris is 21 miles on the freeway, and San Bernardino is 24 miles on the freeway. The DEIR also masks full emissions projections by reducing the overall number of trips and truck trips for the facility.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The truck trip percentages shown in Table 20 in Appendix D of the DEIR, copied below, are from a SCAG survey of truck trips (see *Draft Regional Transportation Plan 2012-2035, Goods Movement*). In the right-most column of the table the DEIR uses this distribution and an estimated trip length to compute an illustrative weighted average trip length of 36 miles (see box in blue below). As was described in both the text and the table, this was not used in the analysis. Instead, a default figure of 50 miles was used (see red box below) in the DEIR.

Table 20: Heavy Duty Truck Long-Haul Trip Lengths

Type of Trip	Direction	Determination of Trip Length within the South Coast Air Basin	Truck Trips (%)		Trip Length (miles)
			SCAG Region	RC	
Internal	SCAG region	From the 2012 RTP, take daily truck vehicle miles traveled throughout SCAG counties from Table A12 of the Highways and Arterials chapter (30,201,000) and divide by the internal truck trips for all counties in Table 5 of the Goods Movement Chapter (1,011,993). This is a method identified by the SCAQMD in its CEQA comment letter for the Bandini Industrial Center (South Coast Air Quality Management District 2012d).	87.3	87.9	30
External	North	Project to Lebec, California (northern border of South Coast Air Basin) along I-210 and I-5	2.7	4.0	140
	Northeast Southeast	Distance from project to Cajon Pass along CA-60, I-215, and I-15	1.5	2.2	47
	East	Distance from project to Banning Pass along CA-60 and I-10	0.8	1.1	23
	South	Distance from project to San Diego County line along CA-60, I-215, and I-15	2.0	3.0	50
Port-related/intermodal	Ports	Distance from project to Ports of Los Angeles/Long Beach along CA-60 and Highway 91	5.7	1.8	79
Weighted average trip length based on values above for SCAG Region					36
Weighted average trip length based on values above for Riverside County (RC)					36
Trip length used in regional analysis for long-haul trips					50
Notes: SCAG = Southern California Association of Governments; RC = Riverside County. 2012 RTP = SCAG's 2012 Regional Transportation Plan. Source of truck trip percentage from project specific traffic study, the table "Daily Truck Trips by Major Category" and the figure "Major Truck Flows in the SCAG Region, 2010" (Parsons Brinckerhoff 2012). Source of trip length: Michael Brandman Associates using methodology described in determination of trip length column.					

The 50-mile figure for average truck distance is a default value suggested by the South Coast Air Quality Management District (SCAQMD) for use when modeling data is not available. The traffic analysis did not use this figure but instead used the RivTAM model to determine the distribution of origins and destinations for project-related trips. This is in accordance with City guidance and with best industry practice. The air quality analysis originally used the 50 mile figure but the analysis has since been revised using the trip distribution pattern from the RivTAM model since it more realistic and better reflects the anticipated change in travel patterns over time.

The figures cited in the comment for trip distances for local trips came from California Emissions Estimator Model (CalEEMod) 2011, an emissions forecasting model. These were originally used in the air quality analysis but the analysis has since been revised using the trip distribution pattern from the RivTAM model since it more realistic and better reflects the anticipated change in travel patterns over time.

Response to Comment F-1-51. The commenter questions how much greenhouse gas emissions would be associated with the water used during construction. This analysis has been incorporated into the revised analysis. The greenhouse gas emissions associated with water used during grading is 6,703 MTCO_{2e} (refer to FEIR Volume 2 Section 4.7).

The greenhouse gas emissions from operational water use were estimated in the DEIR (Table 4.7.F and 4.7.I) are approximately 2,320 MTCO_{2e} per year at buildout (unmitigated), which is less than 1 percent of the total unmitigated emissions. The refined amount in the FEIR is approximately 2,000 MTCO_{2e} (refer to FEIR Volume 2 Section 4.7).

Response to Comment F-1-52. The commenter states that the EIR does not estimate emissions associated with manufacturing of building materials and operational goods. As stated on page 215 of Appendix D of the DEIR, lifecycle emissions were not estimated in the DEIR or the revised analysis, pursuant to (California Air Pollution Control Officers Association (CAPCOA) (see pages 29-30 of CAPCOA's document, Quantifying Greenhouse Gas Mitigation Measures, <http://capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf>) and State Office of Planning and Research (OPR) guidance as well as CEQA Guidelines Sections 15144 and 15145 regarding upstream/lifecycle emissions.

Response to Comment F-1-53. The commenter indicated that “these numbers” must be integrated into the greenhouse gas analysis. It is assumed that “these numbers” refer to the emissions from water transport (Response to Comment F-1-51) and lifecycle emissions (Response to Comment F-1-52). As stated in those responses to comments, emissions from water use are included. Lifecycle emissions are not included.

Response to Comment F-1-54, F-1-55, F-1-56, F-1-57, F-1-58, F-1-59, F-1-60. The commenter requests that black carbon emissions be estimated in the analysis. Estimates of black carbon have been included in the revised analysis (FEIR Volume 2 Section 4.7 and Appendix D), even though the DEIR (Appendix D, pages 79-80) discusses how methods for estimating black carbon are still in the initial stages of development. The International Panel for Climate Change, the U.S. Environmental Protection Agency (EPA), the Air Resources Board (ARB), and the SCAQMD have not identified a global warming potential for black carbon. Nonetheless, the global warming potential as suggested by the commenter is used in this analysis (760).

The commenter identified global warming potential value for a 20 year interval (2,100) is not used in this analysis to be consistent with the global warming potentials for the other greenhouse gases, which are those for a 100-year interval.

The commenter discusses the health effects of black carbon. Black carbon is a component of PM₁₀ and PM_{2.5}; the health effects of PM₁₀ and PM_{2.5} were identified and discussed in the DEIR (i.e., pages 4.3-6 and 4.3-9), in the FEIR Volume 2 Section 4.7, and in Master Response-2 – Health Effects of Diesel Particulate Matter in Response to Comment Letter C-3.

Estimation of black carbon has also been added to the revised analysis (FEIR Volume 2 Section 4.7). The findings of the analysis indicate that black carbon during construction constitutes approximately 14 and 2 percent of the total unmitigated and mitigated construction emissions, respectively. Black carbon during operation constitutes approximately 1.3 and 0.2 percent of the total unmitigated and mitigated operational greenhouse gas emissions, respectively.

Response to Comment F-1-61, F-1-62. The commenter indicates that black carbon emission reduction strategies be considered independently from particulates matter (PM) reductions. The EIR's

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

mitigation measures are quantified and are accounted to black carbon emissions where appropriate, as discussed in Response to Comment F-1-63.

Response to Comment F-1-63. The commenter discusses mitigation strategies that would reduce diesel particulate matter but do not reduce black carbon emissions. Black carbon emissions were estimated in the FEIR Volume 2 Section 4.7. Construction MM 4.3.6.2A would reduce black carbon emissions by 87 percent during construction by requiring Tier 4 construction equipment (1.78 tons unmitigated to 0.23 ton mitigated, averaged over 30 years). The total construction emissions would be reduced by 17 percent (264,900 MTCO_{2e} total unmitigated and 219,500 MTCO_{2e} total mitigated).

MM 4.3.6.3A, requires 2010 model year or later trucks would reduce black carbon mobile source emissions after completion of Phase 1 by 1.4 percent (0.663 ton unmitigated and 0.654 ton mitigated). Reductions at buildout are not as large because the emission factors for 2030 and 2035 assume newer heavy-duty trucks on the road. Additionally, as a project design feature, the project would require non-diesel onsite forklifts and MM 4.3.6.3B requires non-diesel emergency generators and yard trucks which would also reduce black carbon emissions. At buildout, unmitigated total black carbon emissions are 2.97 tons and after mitigation are 0.91 tons (69 percent reduction) – see Table 4.7.G in revised analysis in FEIR Volume 2 Section 4.7.

Response to Comment F-1-64. The commenter identifies a variety of methods that could be used to estimate black carbon. While the global warming potential identified by the commenter (760) is used to convert tons of black carbon to metric tons of carbon dioxide equivalents (MTCO_{2e}), the revised analysis used other quantification methods identified by the U.S. EPA in its *Report to Congress on Black Carbon*, dated March 2012.²⁴ The time interval for the global warming potential is 100 years, to be consistent with the global warming potential time frames for the other greenhouse gases. The commenter suggested estimating black carbon emissions based on the mass of diesel fuel consumed. However, since the air quality analysis estimates PM_{2.5} emissions from diesel fueled vehicles, the black carbon emissions are estimated based on a percentage of the PM_{2.5} emissions, consistent with the Environmental Protection Agency's (EPA) document. Additionally, activity-based estimates of emissions, used in this analysis, provide better estimates of emissions than energy-based estimates. Activity-based estimates can better take into account factors such as vehicle type, vehicle speed, and emissions controls, all of which impact the emissions estimate. Energy-based emissions estimates are generally used when insufficient information is available to conduct an activity-based emissions estimate. Conducting an energy-based emissions estimate here would provide no value since it would generally be less accurate than the activity-based emissions estimate and would not be comparable to any other information presented in the air quality analysis.

Response to Comment F-1-65. The commenter indicates that feasible mitigation measures should be incorporated to reduce greenhouse gas emissions. The revised analysis has added mitigation measure 4.16.4.6.1C, which requires onsite solar, exceeding Title 24 requirements by at least 10 percent, and Leadership in Energy and Environmental Design (LEED) certification (refer to FEIR Volume 2 Section 4.7). The other mitigation measures in the air quality analyses have been refined as well.

Response to Comment F-1-66. The commenter indicates that there are potential mitigation measures in the California Air Pollution Control Officers Association (CAPCOA) white paper and the Attorney General's list.

²⁴ U.S. Environmental Protection Agency. 2012. Report to Congress on Black Carbon, March 2012. Department of the Interior, Environment, and Related Agencies Appropriations Act, 2010. EPA-450/R-12-001. Website: <http://www.epa.gov/blackcarbon/2012report/fullreport.pdf>.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

As stated in the DEIR (App. D, page 219), these sources were reviewed during mitigation measure identification: “Several different sources were explored for feasible mitigation measures that may apply to the project, including the following:

- Office of the California Attorney General (Attorney General 2010).
- California Air Pollution Control Officers Association, CEQA & Climate Change, Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act (California Air Pollution Control Officers Association 2008).
- The Governor’s Office of Planning and Research Technical Advisory (Governor’s Office of Planning and Research 2008).
- California Air Pollution Control Officers Association (2010), Quantifying Greenhouse Gas Measures.
- Notice of Preparation comment letter for the project from the Sierra Club, March 26, 2012.”

Nevertheless, the Attorney General suggested measures are explored for feasibility in the table below.

Attorney General Suggested Mitigation Measure	Response
Incorporate green building practices and design elements.	Already Included. MM 4.16.4.6.1A, MM 4.16.4.6.1B, MM 4.16.4.6.1C require additional energy efficiency, lighting, and green building features that would exceed current requirements.
Meet recognized green building and energy efficiency benchmarks.	
Install energy efficient lighting (e.g., light emitting diodes (LEDs)), heating and cooling systems, appliances, equipment, and control systems.	
Use passive solar design, e.g., orient buildings and incorporate landscaping to maximize passive solar heating during cool seasons, minimize solar heat gain during hot seasons, and enhance natural ventilation. Design buildings to take advantage of sunlight.	Included. Page 4.16-39 of the DEIR states, “The project will encourage passive heating and cooling opportunities into the design or modification of the high-cubed warehouse developments and ancillary land uses.” Page 3-59 of the DEIR project description also states, “The Specific Plan will incorporate the use of passive heating and cooling into the design or modification of the high-cube warehouse development (e.g., white building colors and roof insulation to minimize heat gain, and landscaping to help shade buildings). These requirements are included in MM 4.16.4.6.1A and MM 4.16.4.6.1B.
Install light colored “cool” roofs and cool pavements.	Already Included. MM 4.16.4.6.1A requires cool roofs and cool pavements.
Install efficient lighting, (including LEDs) for traffic, street and other outdoor lighting.	Already Included. MM 4.16.4.6.1B includes high efficiency outdoor lighting.
Reduce unnecessary outdoor lighting.	Included. Section 5 of the Specific Plan includes the following guidelines regarding lighting: 5.4.2.2 All exterior on-site lighting must be shielded and confined within site boundaries. No direct rays or glare are permitted to shine onto public streets or adjacent lots. 5.4.2.3 Lighting fixtures are to be of clean, contemporary design.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
	<p>5.4.2.4 Lighting must meet all requirements of the City of Moreno Valley.</p> <p>5.4.2.5 Tilted wall fixtures (i.e., light fixtures which are not 90 degrees from vertical) are not permitted. Lights mounted to the roof parapet are not permitted. Wall-mounted light fixtures used to illuminate vehicular parking lots are not permitted.</p> <p>5.4.2.6 Wall-mounted utility lights that cause off-site glare are not permitted. "Shoebox" lights are preferred.</p> <p>MM 4.16.4.6.1B has been edited to require no more outdoor lighting than is necessary to ensure safety.</p>
Use automatic covers, efficient pumps and motors, and solar heating for pools and spas.	Not applicable. The project would not have pools or spas.
Provide education on energy efficiency to residents, customers and/or tenants.	Incorporated. MM 4.3.6.4A incorporates this suggested mitigation measure.
Meet "reach" goals for building energy efficiency and renewable energy use.	Incorporated. The project would require onsite solar through MM 4.16.4.6.1C. Other forms of alternative energy are not necessary for the project because the project is incorporating solar.
Install solar, wind, and geothermal power systems and solar hot water heaters.	
Install solar panels on unused roof and ground space and over carports and parking areas.	Partially Incorporated. The project is now proposing to install sufficient roof-mounted PV (see MM 4.16.4.6.1C) . As a result, requiring the installation of PV on parking lots is unnecessary. In addition, the project would use cool pavements in all areas feasible (see MM 4.16.4.6.1A).
Where solar systems cannot feasibly be incorporated into the project at the outset, build "solar ready" structures.	Not Incorporated. The project would install solar (MM 4.16.4.6.1C); therefore, this mitigation measure is unnecessary.
Incorporate wind and solar energy systems into agricultural projects where appropriate.	Incorporated. The proposed project is not an agricultural project. In addition, the project is incorporating solar (MM 4.16.4.6.1C). Wind power is not feasible or necessary.
Include energy storage where appropriate to optimize renewable energy generation systems and avoid peak energy use.	Not Incorporated. Although the project is incorporating onsite solar.
Use onsite generated biogas, including methane, in appropriate applications.	Not Incorporated. The project would not produce the components necessary for onsite generated biogas (such as manure). In addition, onsite solar is required by mitigation.
Use combined heat and power (CHP) in appropriate applications.	Not Incorporated. The project would install onsite solar to generate electricity; this suggested mitigation measure is therefore not required. Combined heat and power (CHP) systems are used in campus facilities where fuel is used to produce steam. CHP captures the waste heat for reuse. The WLC will not be using fuel to produce steam and to operate as a campus facility would mean several buildings are linked with piping to a common heat source. Linking buildings means piping is crossing public streets and Public Utilities Commission (PUC) Rule 218 prohibits such crossings of public streets.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
Incorporate water-reducing features into building and landscape design.	Already Included. MM 4.16.1.6.1A and 4.16.1.6.1B require outdoor and indoor water efficiency. In addition, the WLCSP requires use of native and drought tolerant plants, minimizing the use of irrigation and encourages non-irrigated landscape.
Create water-efficient landscapes.	
Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls and use water-efficient irrigation methods.	
Make effective use of graywater. Graywater is untreated household wastewater from bathtubs, showers, bathroom washbasins, and water from clothes washing machines. Graywater to be used for landscape irrigation.)	Not Incorporated. The project would not generate sufficient quantities of graywater to support this system. Graywater is more feasible to residential projects. In addition, Eastern Municipal Water District (EMWD) and the County Health Department prohibit graywater in industrial and commercial uses.
Implement low-impact development practices that maintain the existing hydrology of the site to manage storm water and protect the environment.	Already Included. Project design features would manage storm water effectively, which are enforced by MM 4.9.6.2A, MM 4.9.6.2B, MM 4.9.6.3A, MM 4.9.6.3B, and MM 4.9.6.3C.
Devise a comprehensive water conservation strategy appropriate for the project and location.	Already Included. The WLCSP includes a section on Water Conservation Measures. MM 4.16.1.6.1A and MM 4.16.1.6.1B also contain water conservation measures.
Design buildings to be water-efficient. Install water-efficient fixtures and appliances.	Already Included. MM 4.16.1.6.1B requires this.
Offset water demand from new projects so that there is no net increase in water use.	Not Incorporated. The project is incorporating multiple water conservation features and mitigation measures to reduce water use. It is not feasible to have no net increase in water use as the current site is dry land farmed with little to no water use.
Provide education about water conservation and available programs and incentives.	Already Included. MM 4.16.1.6.1B requires that information regarding indoor water use be provided.
Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).	Already Included. The California Green Buildings Standards Code requires the following: Recycle and/or salvage for reuse a minimum 50 percent of the nonhazardous construction and demolition waste (5.408.1) 100 percent of trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled (5.408.3).
Integrate reuse and recycling into residential industrial, institutional and commercial projects.	Already Included. MM 4.7.6.1A requires additional waste reduction measures.
Provide easy and convenient recycling opportunities for residents, the public, and tenant businesses.	
Provide education and publicity about reducing waste and available recycling services.	
Ensure consistency with “smart growth” principles – mixed-use, infill, and higher density projects that provide alternatives to individual vehicle travel and promote the efficient delivery of services and goods.	Already Included. The project consists of 40.6 million square feet of warehouse development, allowing for the potential consolidation of smaller warehouses distributed throughout Southern California, thereby promoting the efficient delivery of goods. Typical smart growth benchmarks are for residential, retail, and commercial/office land use placement to reduce vehicle miles traveled. In the case of warehouse and distribution centers, the addition of residential is not always desired by the local jurisdictions.
Meet recognized “smart growth” benchmarks.	

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
Educate the public about the many benefits of well-designed, higher density development.	Not applicable. This measure was meant for residential development or mixed use development where people could be in closer proximity to where they work or shop or for residential development where it may be feasible to cluster homes and leave more open space onsite. This measure is not appropriate for a high-cube warehouse development. The City has Greenhouse Gas Emissions policies in its General Plan and its Climate Action Strategy. The DEIR discusses in Section 4.7 Greenhouse Gas Emission Subsection 4.7.2.6 City of Moreno Valley Climate Action Strategy contains policies concerning the reduction of greenhouse gas emissions in the City. The one that relates to land development” is R2-T1 Land Use Based Trips and VMT Reduction Policies. Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled. It is beyond the scope of this project to provide this information to the public.
Incorporate public transit into the project’s design.	Included. The project would include transit-supportive features (see Chapter 12, Section D of the revised TIA in FEIR Volume 2 Appendix L-1) and it is expected that transit service will be provided once the project reaches a transit-supportable level of operations.
Preserve and create open space and parks. Preserve existing trees, and plant replacement trees at a set ratio.	Already Included. The project would incorporate open space and would plant onsite trees (see WLCSP Section 4.2.3.1 and 5.4).
Develop “brownfields” and other underused or defunct properties near existing public transportation and jobs.	Not Applicable. The project site is not a “brownfield.”
Include pedestrian and bicycle facilities within projects and ensure that existing non-motorized routes are maintained and enhanced.	Already Included. The project would provide bicycle lanes, bicycle parking, pedestrian facilities (MM 4.3.6.4A), and a multi-use trail (project design feature).
Meet an identified transportation-related benchmark. A logical benchmark might be related to vehicles miles traveled (VMT), e.g., average VMT per capita, per household, or per employee. As the California Energy Commission has noted, VMT by California residents increased “a rate of more than 3 percent a year between 1975 and 2004, markedly faster than the population growth rate over the same period, which was less than 2 percent. This increase in VMT correlates to an increase in petroleum use and GHG production and has led to the transportation sector being responsible for 41 percent of the state’s GHG emissions in 2004.”	Not Applicable. To our knowledge, there is no identified transportation-related benchmark such as a VMT per capita for the project area. However, the project would be providing employment opportunities in a housing rich area, thereby providing the potential to reduce VMT from home/work trips. Please refer to the revised TIA in FEIR Volume 2 Appendix L-1).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
Adopt a comprehensive parking policy that discourages private vehicle use and encourages the use of alternative transportation.	Partially Included. Employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter. In addition, MM 4.3.6.4A requires preferential parking spaces for fuel-efficient vehicles and carpools.
Build or fund a major transit stop within or near the development.	Included. Public transit would be incorporated into the design of the WLC. See Section 3.4.6.2 of the FEIR Volume 2.
Provide public transit incentives such as free or low-cost monthly transit passes to employees, or free ride areas to residents and customers.	Already Included. MM 4.3.6.4A requires that tenants participate in Riverside County's rideshare program. According to the information contained at: www.rctc.org/commuters/commuter-assistance/employer-programs , the program provides incentives to employees to try ridesharing and a commuter club that rewards those who already share the ride. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
Promote "least polluting" ways to connect people and goods to their destinations.	Already Included. The project would encourage alternative fuels through the following: MM 4.3.6.3C, which provides an alternative fueling station onsite; electric vehicle charging stations onsite (MM 4.3.6.4A); and the project design, which allows companies to maintain efficiency in distributing goods.
Incorporate bicycle lanes, routes and facilities into street systems, new subdivisions, and large developments.	Already Included. MM 4.3.6.4A requires bicycle lanes.
Require amenities for non-motorized transportation, such as secure and convenient bicycle parking.	Already Included. MM 4.3.6.4A includes bicycle parking, lockers, and showering facilities.
Ensure that the project enhances, and does not disrupt or create barriers to, non-motorized transportation.	Already Included. Section 3.4.6.2 of the DEIR states that in addition to public sidewalks provided adjacent to project streets, Section 3.3.1 of the WLCSP, Pedestrian Circulation and Trails, requires the construction of a trail connection between the Redlands Boulevard / Cottonwood Avenue intersection and the existing Cactus Avenue trail connection to the Lake Perris Recreational Area. This new trail will continue across the Open Space area and connect to the San Jacinto Wildlife Area at the former Davis Road alignment (see Figure 3.12). Engineering details of the new trail will be provided with project-specific development applications in this portion of the project area.
Connect parks and open space through shared pedestrian/bike paths and trails to encourage walking and bicycling.	
Create bicycle lanes and walking paths directed to the location of schools, parks and other destination points.	
Work with the school districts to improve pedestrian and bike access to schools and to restore or expand school bus service using lower-emitting vehicles.	Not Applicable. The project does not involve schools or school districts.
Institute teleconferencing, telecommute and/or flexible work hour programs to reduce unnecessary employee transportation.	Partially Included. MM 4.3.6.4A allows for some of these activities which may be appropriate for some office workers, but warehouse workers must be onsite for specific shifts, even if they are during off-peak times. Future development will also comply with the City's established greenhouse gas policies.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
Provide information on alternative transportation options for consumers, residents, tenants and employees to reduce transportation-related emissions.	Incorporated. This is incorporated into MM 4.3.6.4A.
Educate consumers, residents, tenants and the public about options for reducing motor vehicle-related greenhouse gas emissions. Include information on trip reduction; trip linking; vehicle performance and efficiency (e.g., keeping tires inflated); and low or zero-emission vehicles.	Partially Included. MM 4.3.6.4A requires that information be provided to tenants regarding onsite alternative transportation information. In addition, the Riverside County's rideshare program could provide some of this information to the tenants.
Purchase, or create incentives for purchasing, low or zero-emission vehicles.	Not Included. It is beyond the scope of the project to provide incentives for low emission vehicles. However, MM 4.3.6.4A requires electric charging stations and MM 4.3.6.3C requires alternative fueling.
Create a ride-sharing program. Promote existing ride sharing programs e.g., by designating a certain percentage of parking spaces for ride sharing vehicles, designating adequate passenger loading and unloading for ride sharing vehicles, and providing a web site or message board for coordinating rides.	Already Included. The project is not going to create a ride-sharing program but is to be part of Riverside County's program (MM 4.3.6.4A). In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
Create or accommodate car sharing programs, e.g., provide parking spaces for car share vehicles at convenient locations accessible by public transportation.	Already Included. MM 4.3.6.4A and the California Green Building Standards Code requires priority parking for low-emitting, fuel-efficient, and carpool/van pool vehicles. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
Provide a vanpool for employees.	Already Included. MM 4.3.6.4A requires that tenants participate in the Riverside County rideshare program, which coordinates vanpools. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
Create local "light vehicle" networks, such as neighborhood electric vehicle systems.	Partially Included. The project would provide infrastructure for electric vehicles (MM 4.3.6.4A). There is not expected to be any relationship between tenants at the WLC. As result, there is no need for individuals to travel between buildings on a routine basis. As such, there is no need for a neighborhood electric vehicle system.
Enforce and follow limits idling time for commercial vehicles, including delivery and construction vehicles.	Already Included. MM 4.3.6.3B prohibits idling for longer than 3 minutes and state law prohibits idling more than five minutes.
Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles.	Already Included. MM 4.3.6.4A would provide this infrastructure.
Require best management practices in agriculture and animal operations to reduce emissions, conserve energy and water, and utilize alternative energy sources, including biogas, wind and solar.	Not Applicable. The project would not involve animals. However, the project would be providing solar (MM 4.16.4.6.1C).
Preserve forested areas, agricultural lands, wildlife habitat and corridors, wetlands, watersheds, groundwater recharge areas and other open space that provide carbon sequestration benefits.	Partially Included. The project would convert some agricultural land to urban uses. However, the project will also provide open space and storm water basins that will retain runoff and allow for infiltration.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Attorney General Suggested Mitigation Measure	Response
Protect existing trees and encourage the planting of new trees. Adopt a tree protection and replacement ordinance.	Partially Included. The project would plant new trees. However, it is not feasible for the project to adopt a tree protection ordinance.

The Attorney General's list of potential mitigation measures also discusses carbon offsets, as follows:

"Off-Site Mitigation (offsets). If, after analyzing and requiring all reasonable and feasible onsite mitigation measures for avoiding or reducing greenhouse gas-related impacts, the lead agency determines that additional mitigation is required, the agency may consider additional off-site mitigation. The project proponent could, for example, fund off-site mitigation projects that will reduce carbon emissions, conduct an audit of its other existing operations and agree to retrofit, or purchase verifiable carbon "credits" from another entity that will undertake mitigation.

The topic of off-site mitigation can be complicated. A full discussion is outside the scope of this summary document. Issues that the lead agency should consider include:

- The location of the off-site mitigation. (If the off-site mitigation is far from the project, any additional, non-climate related co-benefits of the mitigation may be lost to the local community.)
- Whether the emissions reductions from off-site mitigation can be quantified and verified. (The California Registry has developed a number of protocols for calculating, reporting and verifying greenhouse gas emissions. Currently, industry-specific protocols are available for the cement sector, power/utility sector, forest sector and local government operations. For more information, visit the California Registry's website at <http://www.climateregistry.org/>.)
- Whether the mitigation ratio should be greater than 1:1 to reflect any uncertainty about the effectiveness of the off-site mitigation.

Offsite mitigation measures that could be funded through mitigation fees include, but are not limited to, the following:

- Energy efficiency audits of existing buildings.
- Energy efficiency upgrades to existing buildings not otherwise required by law, including heating, ventilation, air conditioning, lighting, water heating equipment, insulation and weatherization (perhaps targeted to specific communities, such as low-income or senior residents).
- Programs to encourage the purchase and use of energy efficient vehicles, appliances, equipment and lighting.
- Programs that create incentives to replace or retire polluting vehicles and engines.
- Programs to expand the use of renewable energy and energy storage." (Attorney General).

Please refer to Master Response 1 (located in Response to Comment C-3), which explains the differences in the approach for greenhouse gas emissions. The project's significance finding is based on emissions that are not capped by AB 32. The emissions that are capped (such as emissions from fuel combustion and electricity generation) are not compared with the threshold. The project's uncapped emissions are less than the South Coast Air Quality Management District's significance

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

threshold; therefore, emissions are not cumulatively considerable and therefore require no further mitigation, including the purchase of carbon offsets.

The proposed project is implementing mitigation measures to reduce the projects impacts related to greenhouse gas emissions from the generation of waste. In addition, although it is not required to reduce emission to below significance. New MM 4.16.4.6.1C, would also reduce greenhouse gas emission which is as follows:

4.16.4.6.1C Prior to the issuance of a building permit, new development shall demonstrate that each building has implemented the following:

- 1) Install solar panels with a capacity equal to the peak daily demand for the ancillary office uses in each warehouse building;
- 2) Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24's energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and
- 3) Require the equivalent of "Leadership in Energy and Environmental Design Certified" for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.

This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions.

In addition, currently, the following are not exchanges currently in operation:

- The South Coast Air Quality Management District's SoCal Climate Solutions Exchange (Rule 2701) is not in operation.
- The Climate Action Reserve is not an exchange and focuses on developing standardized GHG reduction project protocols, serving as a registry for GHG reduction projects, and tracking GHG offsets through a publicly accessible database.
- In 2011, many states and jurisdictions dropped out of the Western Climate Initiative; California remained. The Initiative restructured and now provides administrative and technical services to support the implementation of state and provincial GHG emissions trading programs.²⁵ It is not an exchange.
- The Chicago Climate Exchange (CCX) traded GHG emission allowances from 2003 but trading ended in 2010 due to a flawed system.²⁶ In December 2011, a group of investors sued the CCX alleging fraud and violations of Illinois' Consumer Fraud and Deceptive Business Practices Act.²⁷

California's Cap-and-Trade Regulation (Regulation) took effect on January 1, 2012, with amendments to the Regulation effective September 1, 2012. The enforceable compliance obligation began on January 1, 2013. The project is not defined as a covered entity because it does not have one or more of the processes or operations listed in the Regulation and because it does not have stationary sources that emit more than 25,000 MTCO_{2e} per year. The current price per allowance (or MTCO_{2e})

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

is approximately 11 dollars.²⁸ A voluntarily associated entity (VAE) is defined in the Regulation as any entity which does not meet the requirements of a covered entity or an opt-in covered entity and that intends to purchase, hold, sell, or voluntarily retire compliance instruments. A voluntarily associated entity is not obligated to surrender any allowances or offset credits to ARB in order to comply with the Cap-and-Trade Program. A voluntarily associated entity can be an organization or an individual. Therefore, the developer could be a VAE.

The following is a feasibility analysis of the mitigation measures in CAPCOA's 2010 report, "Quantifying Greenhouse Gas Mitigation Measures."

CAPCOA Mitigation Measure		Response
BE-1	Buildings exceed Title 24 building envelop energy efficiency standards.	Included. MM 4.16.4.6.1A requires that the project exceed Title 24 requirements.
BE-2	Install programmable thermostat timers for residential dwellings.	Not applicable. The project does not contain residential dwellings.
BE-3	Obtain third-party HVAC commissioning and verification of energy savings.	Already Included. This would be fulfilled as part of meeting LEED requirements.
BE-4	Install energy efficient appliances.	Already Included. MM 4.16.4.6.1A requires energy-efficient appliances.
BE-5	Install energy efficient natural gas boilers.	Included. However, as a separate mitigation measure (MM 4.16.1.6.1B) to accomplish the same goals, the project will be using flash water heaters or solar heating and is not expected to use natural gas boilers.
LE-1	Install higher efficacy public street and area lighting.	Included. WLCSP Section 5.5.3 requires that driveways and parking area lighting be metal halide or Light-Emitting Diode (LED). Metal halide lights can be 3 to 5 times more efficient than incandescent lights. WLCSP Section 4.3.2 requires that street lighting be high pressure sodium or LED, which both have high efficacy.
LE-2	Limit outdoor lighting requirements.	Included. Outdoor lighting is required for safety reasons; however, MM 4.16.4.6.1B has been edited to require no more outdoor lighting than is necessary to ensure safety.
LE-3	Replace traffic lights with LED traffic lights.	Included. MM 4.16.4.6.1B has been amended to include installing LED traffic signals that meet City standards.
AE-1	Establish onsite renewable or carbon-neutral energy systems.	Included. MM 4.16.4.6.1C requires onsite solar.
AE-2	Establish onsite renewable energy systems – solar power.	Included. MM 4.16.4.6.1C requires onsite solar.
AE-3	Establish onsite renewable energy systems – wind power.	Not Included. This measure is not necessary because the project is incorporating onsite solar.
AE-4	Utilize a combined heat and power system.	Not Included. The project is installing onsite solar; therefore, this is not necessary. Also refer to Response to Comment F-3-21.
AE-5	Establish methane recovery in landfills.	Not Applicable. The project is not a landfill project.
AE-6	Establish methane recovery in wastewater treatment plants.	Not Applicable. The project is not a wastewater treatment plant.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
LUT-1	Increase density. The reductions for this mitigation measure are related to jobs per acre greater than 20.	Not Included. It is not in the project design to provide a greater density. The Fiscal and Economic Impact Study contained in Appendix O of the DEIR indicates that the number of jobs from the project would be approximately 20,300 at full development (page 22). That value divided by the acreage allocated for the WLCSP (2,610 acres) is approximately 7.8 jobs/acre. In order to receive an emissions reductions for this measure, the density needs to be greater than 20; therefore, no reduction is applied.
LUT-2	Increase location efficiency. This measure is not intended as a separate strategy but rather a documentation of empirical data to justify the “cap” for all land use/location strategies. The location of the Project relative to the type of urban landscape such as being located in an urban area, infill, or suburban center influences the amount of VMT compared to the statewide average. This is referred to as the location of efficiency since there are synergistic benefits to these urban landscapes. To receive the maximum reduction for this location efficiency, the project will be located in an urban area/ downtown central business district	Not Included. The project is not located in an urban area/downtown central business district.
LUT-3	Increase diversity of urban and suburban developments (mixed use).	Not Applicable. The project’s land uses are not suitable for mixed use.
LUT-4	Increase destination accessibility. The project will be located in an area with high accessibility to destinations. Destination accessibility is measured in terms of the number of jobs or other attractions reachable within a given travel time, which tends to be highest at central locations and lowest at peripheral ones. The location of the project also increases the potential for pedestrians to walk and bike to these destinations and therefore reduces the VMT.	Not Applied. No reductions were applied for this measure, even though the project would have pedestrian and bicycle features.
LUT-5	Increase transit accessibility.	Incorporated. Public transit would be incorporated into the design of the WLC. See Section 3.4.6.2 of the FEIR Volume 2.
LUT-6	Integrate affordable and below market rate housing. (Appropriate for residential and mixed-use projects.)	Not applicable. The project is not a residential project.
LUT-7	Orient project toward non-auto corridor. A project that is designed around an existing or planned transit, bicycle, or pedestrian corridor encourages alternative mode use. For this measure, the project is oriented towards a planned or existing transit, bicycle, or pedestrian corridor. Setback distance is minimized.	Partially Included. The project would incorporate transit, bicycle, and pedestrian uses. See above responses.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
LUT-8	Locate project near bike path/bike lane.	Included. MM 4.3.6.4A requires that the project incorporate bike lanes.
LUT-9	Improve design of development. The project will include improved design elements to enhance walkability and connectivity. Improved street network characteristics within a neighborhood include street accessibility, usually measured in terms of average block size, proportion of four way intersections, or number of intersections per square mile. Design is also measured in terms of sidewalk coverage, building setbacks, street widths, pedestrian crossings, presence of street trees, and a host of other physical variables that differentiate pedestrian-oriented environments from auto-oriented environments.	Already Included. Project design features (i.e., the onsite trail) and MM 4.3.6.4A requires pedestrian features. See responses to the attorney general suggested measures, above.
SDT-1	Provide pedestrian network improvements.	Already Included. MM 4.3.6.4A requires pedestrian access and features.
SDT-2	Provide traffic calming measures. Providing traffic calming measures encourages people to walk or bike instead of using a vehicle. This mode shift will result in a decrease in VMT. Project design will include pedestrian/bicycle safety and traffic calming measures in excess of jurisdiction requirements. Roadways will be designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips with traffic calming features. Traffic calming features may include: marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, raised intersections, median islands, tight corner radii, roundabouts or mini-circles, on-street parking, planter strips with street trees, chicanes/chokers, and others.	Included. The project includes the incorporation of sidewalks, median islands, roundabouts, and planter strips with street trees. Some measures such as count-down signal timers are mutually exclusive with measures such as roundabouts, where there will be no signalized control. Additionally, some measures such as tight corner radii are infeasible due to the need to serve trucks that require wide turning radii.
SDT-3	Implement a neighborhood electric vehicle network.	Not Included. There is not expected to be any relationship between tenants at the WLC. As result, there is no need to for individuals to travel between buildings on a routine basis. As such, there is no need for a neighborhood electric vehicle system.
SDT-4	Create urban non-motorized zones.	Partially Included. The project would have an onsite trail, which would not allow motorized vehicles.
SDT-5	Incorporate bike lane street design (onsite)	Already Included. MM 4.3.6.4A requires bike lanes.
SDT-6	Provide bike parking in non-residential projects.	Included. MM 4.3.6.4A requires bicycle parking.
SDT-7	Provide bike parking with multi-unit residential projects.	Not Applicable. The project does not contain residential uses.
SDT-8	Provide electric vehicle parking.	Included. MM 4.3.6.4A requires preferential parking for low-emitting vehicles and electric vehicle charging.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
SDT-9	Dedicate land for bike trails.	Included. MM 4.3.6.4A requires bicycle lanes on the streets. The trail connection (WLCSP Section 3.3.5) would be designed to accommodate pedestrian and bicycle use.
PDT-1	Limit parking supply.	Not Included. These measures are intended to reduce the number of single occupant trips that occur at the site. That goal will be achieved through other measures. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
PDT-2	Unbundle parking costs from property cost.	
PDT-3	Implement market price public parking (on-street).	
PDT-4	Require residential area parking permits.	Not Included. The project does not consist of residential uses and project trucks would not park in the surrounding residential areas.
TRT-1 TRT-2	Implement commute trip reduction program.	Partially Included. MM 4.3.6.4A requires that the project participate in Riverside County's rideshare program.
TRT-3	Provide ride-sharing programs.	Included. MM 4.3.6.4A requires that the project participate in Riverside County's rideshare program.
TRT-4	Implement subsidized or discounted transit program. This project will provide subsidized/discounted daily or monthly public transit passes. The project may also provide free transfers between all shuttles and transit to participants. These passes can be partially or wholly subsidized by the employer, school, or development. Many entities use revenue from parking to offset the cost of such a project.	Partially Included. MM 4.3.6.4A requires that the project participate in Riverside County's rideshare program, which currently provides a \$2/day incentive for alternative transportation for the first three months. (www.ie511.org/commuter-incentives.aspx).
TRT-5	Provide end of trip facilities (showers, bike lockers, changing spaces).	Included. MM 4.3.6.4A requires these facilities.
TRT-6	Encourage telecommuting and alternative work schedules.	Included. MM 4.3.6.4A requires this measure. May be appropriate for some office workers, but warehouse workers must be onsite for specific shifts, even if they are during off-peak times.
TRT-7	Implement commute trip reduction marketing. The project will implement marketing strategies to reduce commute trips. Information sharing and marketing are important components to successful commute trip reduction strategies. Implementing commute trip reduction strategies without a complementary marketing strategy will result in lower VMT reductions. Marketing strategies may include: - New employee orientation of trip reduction and alternative mode options - Event promotions - Publications	Included. This has been incorporated into MM 4.3.6.4A.
TRT-8	Implement preferential parking permit program.	Partially Included. The project would provide preferential parking according to MM 4.3.6.4A.
TRT-9	Implement car-sharing program.	Partially Included. The project would participate in

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
		Riverside County's rideshare program pursuant to MM 4.3.6.4A.
TRT-10	Implement a school pool program (applicable to residential and mixed-use projects).	Not Applicable. The project is not a residential or mixed use project.
TRT-11	Provide employer-sponsored vanpool-shuttle. This project will implement an employer-sponsored vanpool or shuttle. A vanpool will usually service employees' commute to work while a shuttle will service nearby transit stations and surrounding commercial centers. Employer-sponsored vanpool programs entail an employer purchasing or leasing vans for employee use, and often subsidizing the cost of at least program administration, if not more. The driver usually receives personal use of the van, often for a mileage fee. Scheduling is within the employer's purview, and rider charges are normally set on the basis of vehicle and operating cost.	Not Included. This measure is intended to reduce the number of single occupant trips that occur at the site. That goal will be achieved through other measures. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter. Finally, transit-oriented design is being incorporated into the design in order for the Riverside Transit Agency (RTA) to provide service to the site and access to transit hubs (WLCSP Section 3.3.4).
TRT-12	Implement bike-sharing program. Establish a bike sharing program. Stations should be at regular intervals throughout the project site. The number of bike-share kiosks throughout the project area should vary depending on the density of the project and surrounding area. Paris' bike share program places a station every few blocks throughout the city (approximately 28 bike stations/square mile). Bike-station density should increase around commercial and transit hubs.	Not Included. This measure is intended to reduce the number of single occupant trips that occur at the site. That goal will be achieved through other measures. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter. In addition, bicycle sharing at this location would not achieve the goals the sought by the commenter. Bike sharing is useful in mixed-use urban cores where individuals can take advantage of short distance trips. However, since the proposed project is not a mixed-use development, people would need to travel to the site by other means to take advantage of bike sharing, which defeats the purpose of bike sharing.
TRT-13	Implement school bus program.	Not applicable. The project does not involve residential or school uses.
TRT-14	Price workplace parking.	Not Included. These measures are intended to reduce the number of single occupant trips that occur at the site. That goal will be achieved through other measures. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
TRT-15	Implement employee parking "cash-out."	
TST-1	Provide a bus rapid transit system.	Not Included. This measure is typically only productive in an urban setting and not for this type of project.
TST-2	Implement transit access improvements.	Already Included. As described in the WLCSP Section 3.3.4, the project already incorporates transit-oriented design.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
TST-3	Expand transit network.	Already Included. As described in the WLCSP Section 3.3.4, the project already incorporates transit-oriented design that will allow the Riverside Transit Authority to expand their transit service.
TST-4	Increase transit service frequency/speed.	Partially Included. The proposed project would be served by the RTA. As an independent agency, the RTA would determine in what manner to best serve the project site in terms of service frequency/speed.
TST-5	Provide bike parking near transit. Provide short-term and long-term bicycle parking near rail stations, transit stops, and freeway access points. The benefits of Station Bike Parking have no quantified impacts as a standalone strategy and should be grouped with Transit Network Expansion (TST-3) and Increase Transit Service Frequency and Speed (TST-4) to encourage multimodal use in the area and provide ease of access to nearby transit for bicyclists.	Already Included. Bicycle parking would be provided throughout the project site as described in WLCSP Sections 5.2.7.3 and 5.2.7.4.
TST-6	Provide local shuttles.	Not Included. Measures TST-6 and RPT-1 are intended to reduce the number of single occupant trips that occur at the site. That goal will be achieved through other measures. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter. Finally, transit-oriented design is being incorporated into the design in order for the RTA to provide service to the site and access to transit hubs (WLCSP 3.3.4).
RPT-1	Implement area or cordon pricing.	
RPT-2	Implement improvements to smooth traffic flow, reduce idling, eliminate bottlenecks, and management speed.	Already Included. The proposed project already incorporates all feasible mitigation to improve traffic flow. In addition, the proposed project would also pay DIF and TUMF fees to ensure that further mitigates traffic impacts from the proposed project. See Chapter 11 of the Final Traffic Impact Analysis for a detailed listing all the traffic mitigation that is part of the proposed project and a discussion of DIF and TUMF fees that would be paid.
RPT-3	Required project contributions to transportation infrastructure improvement projects.	
RPT-4	Install park and ride lots near transit stops and HOV lanes.	Not Included. The proposed mitigation is not applicable to the project as the proposed project is not a transit hub or origin of commuter trips.
VT-1	Electrify loading docks and/or require idling-reduction systems. Heavy-duty trucks transporting produce or other refrigerated goods will idle at truck loading docks and during layovers or rest periods so that the truck engine can continue to power the cab cooling elements. Idling requires fuel use and results in GHG emissions. The Project Applicant should implement an enforcement and education program that will ensure compliance with this measure. This includes posting signs regarding idling restrictions as	Included. MM 4.3.6.3E states: <u>"Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan application proposing refrigerated space. Any such proposal</u>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
	well as recording engine meter times upon entering and exiting the facility.	<u>shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).</u> Therefore, refrigeration hookups and amenities for refrigerated warehouses are required by MM 4.3.6.3E. In addition, MM 4.3.6.2A and MM 4.3.6.3B requires that equipment and vehicles idle no more than 3 minutes.
VT-2	Utilize alternative fueled vehicles.	Partially Included. MM 4.3.6.3B requires alternative fueled yard trucks and emergency generators. WLCSP Section 12.3 requires pallet jacks, forklifts and other onsite equipment be powered by non-diesel fuel. Refer to Master Response-3 in Response to Comment Letter C-3 for reasons why requiring all vehicles and trucks to be alternative fueled is not feasible.
VT-3	Utilize electric or hybrid vehicles.	
WSW-1	Use reclaimed water.	Partially Included. MM 4.16.1.6.1C requires that the project install the infrastructure for recycled water.
WSW-2	Use gray water.	Not Included. The project would only use minimal indoor water usage. Graywater would not be feasible for the types of water usage anticipated for the project. In addition, it is unlikely that the EMWD and the County Health Department would allow graywater discharge from industrial uses.
WSW-3	Use locally sourced water supply.	Partially Included. MM 4.16.1.6.1C requires that development provide separate irrigation lines for recycled water if it becomes available in the future.
WUW-1	Install low-flow water fixtures.	Included. MM 4.16.1.6.1B requires indoor low-flow appliances.
WUW-2	Adopt a water conservation strategy.	Partially Included. The project includes water conservation features (see MM 4.16.1.6.1A, MM 4.16.1.6.1B, and MM 4.16.1.6.1C).
WUW-3	Design water-efficient landscapes.	Included. MM 4.16.1.6.1A requires outdoor water-efficient landscapes.
WUW-4	Design water-efficient landscape irrigation systems.	Included. MM 4.16.1.6.1A requires outdoor water-efficient irrigation systems.
WUW-5	Reduce turf in landscapes and lawns.	Already Included. As discussed in Section 5.2.3 Sustainable Design of the WLCSP, the proposed project incorporates the use of native landscaping to reduce water usage.
WUW-6	Plant native or drought-resistant trees and vegetation.	Included. As discussed in Section 5.2.3 Sustainable Design of the WLCSP, the proposed project incorporates the use of native landscaping to reduce water usage.
A-1	Prohibit gas powered landscape equipment.	Not Included. The air quality analysis had negligible emissions from landscaping using the CalEEMod defaults.
A-2	Implement lawnmower exchange program.	Not Included. This measure is more applicable to residential projects.
A-3	Electric yard equipment compatibility.	Not Included. The air quality analysis had negligible emissions from landscaping using the CalEEMod defaults.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
SW-1	Institute or extend recycling and composting services.	Included. MM 4.7.6.1A requires that recycling be provided to the project during operation.
SW-2	Recycle demolished construction material.	Included. The project would not require demolition. The California Green Building standards require that at least 50 percent of waste during construction be recycled.
V-1	Urban tree planting.	Included. The project would plant new trees (see WLCSP Section 4.2.3.1, Section 5.2.7.7).
V-2	Create new vegetated open space.	Partially Included. The project would conserve some open space; however, the project would not demolish development to create open space.
C-1	Use alternative fuels for construction.	Not Included. The project would be requiring the most efficient fleet of construction equipment, pursuant to MM 4.3.6.2A.
C-2	Use electric and hybrid construction equipment.	Partially Included. There are some hybrid Tier 4 construction equipment, which may be used by the project pursuant to MM 4.3.6.2A (as an example, the CAT 336E H Hybrid, www.cat.com/en_US/products/new/equipment/excavators/large-excavators/18378156.html). However, the project is not requiring all equipment to be hybrid because testing of hybrid construction vehicles finds a reduction in fuel consumption but an increase in emissions (University of California, Riverside. Hybrid Not Always Greener. Website: http://ucrtoday.ucr.edu/18506).
C-3	Limit construction equipment idling beyond regulation requirements. Heavy duty vehicles will idle during loading/unloading and during layovers or rest periods with the engine still on. Idling requires fuel use and results in emissions. The ARB Heavy-Duty Vehicle Idling Emission Reduction Program limits diesel-fueled commercial motor vehicles idling time to 5 minutes. There are some exceptions to the regulation such as positioning or providing a power source for equipment or operations such as lift, crane, pump, drill, hoist or other auxiliary equipment. Reduction in idling time beyond required under the regulation would further reduce fuel consumption and thus emissions. The project applicant should develop an enforceable mechanism that monitors the idling time to ensure compliance with this mitigation measure.	Partially Included. MM 4.3.6.2A requires that equipment and vehicles idle less than 3 minutes, which is beyond what the regulation requires. In addition, being consistent with state regulation increases the probability that individual drivers will comply with a requirement they are already familiar with and are already required to implement.
C-4	Institute a heavy-duty off-road vehicle plan. The Project Applicant should provide a detailed plan that discusses a construction vehicle inventory tracking system to ensure compliances with construction mitigation measures.	Partially Included. The Mitigation Monitoring and Reporting Plan (MMRP) would serve as the tool to ensure that all construction equipment meet the requirements of the mitigation measures. In addition, compliance with the mitigation measures would be documented on an on-going basis in the MMRP.
C-5	Implement a construction vehicle inventory tracking system.	
Misc-1	Establish a carbon sequestration project.	Not Included (Misc. 1, 2, 5, 6). As discussed in

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

CAPCOA Mitigation Measure		Response
Misc-2	Establish off-site mitigation.	Master Response 1 (Response to Comment C-3), the project's greenhouse gas emissions are less than significant after implementation of mitigation. Therefore, offsets are not required.
Misc-5	Require environmentally responsible purchasing.	
Misc-6	Implement an innovative strategy for GHG mitigation.	
Misc-3	Use local and sustainable building materials.	Partially Included. WLCSP Section 1.3.2 indicates that the project would use local sources of building materials to the extent feasible.
Misc-4	Require best management practices in agriculture and animal operations.	Not applicable. The project would not have animal operations or agriculture.

Response to Comment F-1-67. The commenter states that the EIR fails to include the installation of solar panels. Solar panels are now incorporated into the FEIR as part of MM 4.16.4.6.1C (refer to FEIR Volume 2 Section 4.16).

Response to Comment F-1-68. The commenter indicates that the EIR fails to adopt LEED certification standards for the project. However, LEED certification is now required by the project pursuant to MM 4.16.4.6.1C (refer to FEIR Volume 2 Section 4.16).

Response to Comment F-1-69. The commenter indicates that the greenhouse gas analysis proposes onsite alternative fueling infrastructure and a site for the sale of food, fuel, and convenience items but those measures are not included in the DEIR. However, the measures were included in the DEIR as MM 4.3.6.3C and MM 4.3.6.3D, respectively (DEIR page 1-43). Refinements were made to the measures in the FEIR for clarity. Although these measures are not required to reduce greenhouse gas emissions to less than significant, they could reduce emissions.

The commenter also indicates that the analysis fails to ensure that the mitigation measures would be fully enforceable and only requires their adoption “as appropriate.” It is unknown what mitigation measures the commenter is referring to. The air quality and greenhouse gas mitigation measures in the DEIR do not use the words “as appropriate.” The only air quality or greenhouse gas related measures that include the words “where feasible” in the DEIR are as follows:

- MM 4.3.6.2A(e), which requires that onsite electrical hook ups be provided for construction tools where feasible. This is because to require that all construction tools be electric is not feasible because there are instances where fueled equipment may be required.
- MM 4.3.6.2A(l), which requires that forklifts used during construction be electric, propane, or natural gas where feasible.
- MM 4.7.6.1A(h), which requires that existing onsite street material be recycled for new project streets to the extent feasible. It would not be feasible for all new streets to use existing onsite street material for the following reasons. First, there is likely not enough existing street material to use for all the new project streets. Secondly, the quality of the existing material may not meet current street standards.

Response to Comment F-1-70. The commenter indicates that the DEIR points to the potential action of another agency for mitigating environmental effects, as in the regulation of vehicle exhaust.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

It is a fact that motor vehicle exhaust is regulated by state and federal regulations; the City is not absolving responsibility because the EIR is implementing all feasible measures to reduce motor vehicle emissions, including the following:

- MM 4.3.6.3B(l), which requires that diesel duty trucks be model year 2010 or later. (This was a project design feature in the DEIR.)
- MM 4.3.6.3B(k), which requires that yard trucks be non-diesel and meet 2010 or Tier 4 Interim engine standards.
- MM 4.3.6.4A(g), which requires the project to install electric vehicle charging stations.

Response to Comment F-1-71. The commenter indicates that the project should implement carbon offsets. The commenter claims that the SCAQMD have demonstrated that carbon offsets are a feasible mitigation measure and the commenter provides reference to the SCAQMD's 2008 Draft Greenhouse Gas Significance Thresholds. The SCAQMD document does not specifically state that offsets are a feasible mitigation measure. The SCAQMD document does state the following regarding offsets: *"offset markets not well established"* (page 2-11) and *"it is currently uncertain how offsite mitigation measures, including purchased offsets, interact with future AB 32 Scoping Plan measures..."* (page 3-16). The SCAQMD did not recommend carbon offsets in its comment letter on this project.

The commenter claims that the California Attorney General has adopted CEQA settlements calling for the auditing, reduction, and offsetting of greenhouse gas emissions related with a project demonstrating that offsets are a feasible way to reduce a project's negative environmental effects on global warming. The commenter then references what is apparently the ConocoPhillips settlement (http://ag.ca.gov/newsalerts/print_release.php?id=1466). The ConocoPhillips project's emissions of 500,000 MTCO₂e are from the expansion of an oil refinery (hydrogen plant). The source of the emissions differs from the project's main source of emissions. The WLC's emissions are primarily from offsite motor vehicle/truck travel on offsite roads. The "onsite" greenhouse gas emissions from the project would consist of a small percentage of the mobile emissions (from onsite travel), yard trucks, generator, refrigerants, natural gas, and forklifts. Solar would be generated onsite. All other emissions would be emitted offsite.

Response to Comment F-1-72. This comment is an introductory comment indicating that the EIR fails to address how the projected effects of global warming will exacerbate the impacts of the Project. Refer to Response to Comments F-1-73 through F-1-84.

Response to Comment F-1-73. The commenter discusses research that predicts that a rise in temperatures from global warming will create a more conducive environment for air pollution formation. The commenter requests that the air quality analysis must disclose how the increased temperatures in the project area will exacerbate the already severe air quality conditions. The commenter indicates that the contribution of global warming to increased ozone formation must be fully analyzed and mitigated.

The DEIR (page 4.7-5) states that if temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles. However, as discussed on pages 4.3-12 through 4.3-20 of the DEIR, in Section 4.3 of the FEIR, and in Master Response-1 in Response to Comment Letter C-3, air quality in the region has been improving and is projected to improve. It has been improving because of various efforts by the state and local agencies, in addition to increased vehicle and truck control. MM 4.3.6.3B requires that the diesel trucks that access the project would be model year 2010 or later; those trucks have greater controls on particulate matter and NO_x and have achieved a 96 and 90 percent emission reduction in NO_x and particulate matter, respectively, as compared to 1994 model year trucks.

In addition, the DEIR (page 4.3-83 and page 4.3-87) and the revised analysis (refer to FEIR Volume 2 Section 4.3 conclude that the project's contribution to ozone is significant and unavoidable. The DEIR does not specify under which conditions or days of the year impacts to ozone are significant; to do so would not be possible with the current air quality and climate models and would be speculative.

Also refer to Master Response-2 in Response to Comment Letter C-3, which discusses health impacts from air pollution.

Response to Comment F-1-74. The commenter suggests the DEIR address climate change impacts on the project and the project's overall effects on climate change. CEQA does not require that an EIR analyze the impacts of the environment on the project. The DEIR has adequately dealt with all the effects that can be expected from climate change nonetheless, and is consistent with recommendations to respond to the impacts of climate change outlined in the DEIR Water Supply Assessment (WSA) contained in Appendix M of the DEIR the project has reduced its water supply needs by implementing water use efficiencies throughout the project. These efficiencies include the use of low water use fixtures in the buildings, drought tolerant landscaping, and recycled water where available. As outlined in the WSA Section 3.2 *project Demand* the projected water demand for the project is made up of two components, building demand and irrigation demand. As stated in the WSA, *"A majority of the estimated demand would be for landscape irrigation. The developers of this project are proposing very low water use landscaping which would reduce the projected project demand significantly."*

Climate Change is discussed in Appendix A of the WSA, Section 7. The WSA states *"EMWD has considered the impact of climate change on water supplies as part of our long term strategic planning. Climate change has the potential to affect not only local demand and supplies, but to reduce the amount of water available for import. Potential changes that may impact water supply include:*

- *Warmer temperatures leading to higher demand for water within EMWD's service area and throughout California;*
- *Reduction in the Sierra Nevada snow pack;*
- *Increased intensity and frequency of extreme weather events; and*
- *Rising sea levels resulting in increased risk of damage from storms in the Delta, high tide event and the erosion of levees in the Delta.*

"To limit the impact of climate change, EMWD's long term planning focuses on the development of reliable local recourses and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD's service area."

As discussed above, this project is consistent with these water use efficiencies and MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C will be implemented to mitigate the water supply impacts, including the impacts of climate change on the project, to less than significant.

DEIR Section 4.16.1.6.1 Adequate Water Supply

The City is amending the text in Draft EIR Section 4.16.1.6.1 to clarify the inclusion of impacts to the project from climate change. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the Draft EIR is as follows:

The Water Supply Assessment considered the impact of climate change on water supplies. Climate change has the potential to affect not only local demand and supplies, but to reduce

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

the amount of water available for import. Potential changes that may impact water supply include:

- Warmer temperatures leading to higher demand for water within EMWD's service area and throughout California;
- Reduction in the Sierra Nevada snow pack;
- Increased intensity and frequency of extreme weather events; and
- Rising sea levels resulting in increased risk of damage from storms in the Delta, high tide event and the erosion of levees in the Delta.

One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD's long term planning focuses on the development of reliable local recourses and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD's service area. The project developer is committed to water use efficiency and minimizing the use of potable water for landscape irrigation by using low water use fixtures, drought tolerant plants and recycled water where available as outlined in MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C.

Response to Comment F-1-75. The commenter suggests the DEIR address the climate change impacts on the project and the projects overall effects on climate change. CEQA does not require that an EIR analyze the impacts of the environment on the project. The DEIR has adequately dealt with all the effects that can be expected from climate change nonetheless consistent with the recommendations to respond to the impacts of climate change outlined in the WSA contained in the DEIR Appendix M the project has reduced its water supply needs by implementing water use efficiencies throughout the project. These efficiencies include the use of low water use fixtures in the buildings, drought tolerant landscaping and recycled water where available. As outlined in the WSA Section 3.2 *Project Demand* the projected water demand for the project is made up of two components, building demand and irrigation demand. As stated in the WSA, *"A majority of the estimated demand would be for landscape irrigation. The developers of this project are proposing very low water use landscaping which would reduce the projected project demand significantly."*

Climate Change is discussed in Appendix A of the WSA, Section 7. Refer to Response to Comment F-1-74 on a discussion on climate change and water supply. As discussed above, this project is consistent with these water use efficiencies and MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C will be implemented to mitigate the water supply impacts, including the impacts of climate change on the project, to less than significant.

Response to Comment F-1-76. See Response to Comment F-1-75.

Response to Comment F-1-77. The commenter suggests the DEIR address the climate change impacts on the project and the projects overall effects on climate change. CEQA does not require that an EIR analyze the impacts of the environment on the project. The DEIR has adequately dealt with all the effects that can be expected from climate change nonetheless climate change is taken into account as part of the rainfall characteristics and is accounted for in the hydrologic and hydraulic analysis of the drainage facilities. As stated in Section 3.2 Design Guidelines of the DEIR Master Drainage Report (Appendix J-1) *"Drainage facilities shall be designed in accordance with the Riverside County Hydrology Manual and Design Manual Standard Drawings."* The Hydrology Manual includes the most up-to-date rainfall characteristics as required by the local, state, and federal regulations. The design of the drainage facilities include a factor of safety in the form of freeboard to account for uncertainties due to climate change, rainfall patterns, friction factors and other

uncertainties. One foot of freeboard was included in the detention basins and drainage facilities to account for these uncertainties. At the time of final design the amount of freeboard to account for these uncertainties will be finalized. MM 4.9.6.1.A below requires the project to mitigate its impacts, including any impacts to the project as a result of climate change.

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, ~~combined~~ detention and infiltration basin(s), bioretention areas, and spreading area(s) ~~as appropriate~~ within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

DEIR Section 4.9.6.1 Drainage Pattern and Capacity-Related Impacts - Project or Specific Plan Design Features

The City is amending the text in Draft EIR Section 4.9.6.1 to clarify the inclusion of impacts to the project from climate change. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the Draft EIR is as follows:

These facilities will be designed based on the most up-to-date hydrology based on the latest rainfall to runoff patterns in compliance with local, state, and federal regulations. The design of the drainage facilities include a factor of safety in the form of freeboard to account for uncertainties due to climate change, rainfall patterns, friction factors and other uncertainties. One foot of freeboard was included in the detention basins and drainage facilities to account for these uncertainties. At the time of final design the amount of freeboard to account for these uncertainties will be finalized. The facilities are being designed to provide both detention and infiltration to mitigate increases in runoff volume, velocity and peak discharge as outlined in the following mitigation measure.

See also Response to Comment F-1-75 for mitigation of impacts for water supply.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-1-78. The commenter suggests the DEIR address climate change impacts on the project and the projects overall effects on climate change. CEQA does not require that an EIR analyze the impacts of the environment on the project. The DEIR has adequately dealt with all the effects that can be expected from climate change nonetheless the project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of Low Impact Development (LID) BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area. The effects of climate change on pollutant loadings and residence time will be addressed in accordance with the requirements at the time of final design. LID BMPs have been shown to maximize the benefit for improved water quality. This would include the design based on the appropriate pollutant loads for the project from all sources including climate change.

The Water Quality Management Plan Guidance Document for the Santa Ana Region of Riverside County discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted Total Maximum Daily Loads (TMDLs) in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

DEIR Section 4.9.6.3 Operational Related Water Quality Impacts Treatment Control BMPS

The City is amending the text in DEIR Section 4.9.6.3 to clarify the inclusion of impacts to the project from climate change. This change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the DEIR is as follows:

All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master WQMP's water quality requirements identified previously. This would include the design based on the appropriate pollutant loads for the project from all sources including climate change.

Response to Comment F-1-79. Global warming and climate change is of growing concern, but is often difficult to determine if a proposed project has a potentially significant impact. The project site is located within a Mediterranean climate, which varies in temperature from 40 to 90 degree Fahrenheit. Any incremental increase in local temperatures will not likely have a noticeable change with regard to vegetation communities in the general vicinity of the project site. Any change in vegetation community would be speculative at best without specific data that would indicate that global warming was responsible for a vegetation community conversion. MM 4.7.6.1A is specifically designed to reduce greenhouse gas (GHG) emissions, and cumulative impacts regarding GHG emission are less than significant after mitigation.

Response to Comment F-1-80. The incremental change in global warming over the next 15 to 20 years is not likely to cause a quick conversion of a plant community. Typically, vegetation community changes, with the exception of natural disasters can take many decades. Any change in vegetation

community would be speculative at best without specific data that would indicate that reason for the conversion. MM 4.7.6.1A is specifically designed to reduce GHG emissions, and cumulative impacts regarding GHG emission are less than significant after mitigation.

Response to Comment F-1-81. This comment seems to be informative and does not require a response. The City generally agrees with the statement that habitat specialists can only survive in very specific set of climatic/habitat conditions. That is one of the major reasons why the MSHCP was designed to incorporate large areas of occupied habitat to account for slight changes in the climate. This allows for sensitive wildlife species to adjust to slight shifts in micro-habitat without the threat of development within the conservation areas.

Response to Comment F-1-82. The commenter asks what effects climate change will have on project resources. Global climate change will have a variety of direct and indirect effects on biological resources including streambeds, riparian areas, wetland, vernal pools, alluvial fan habitats, wildlife corridors, wildlife foraging habitats, or wildlife movement areas, aquatic habitats, sensitive species, and other sensitive habitats, open lands, open space, and adjacent natural habitats. These effects will occur as global temperatures slowly increase regional rainfall decreases climate patterns change and wildfire threats increase. Beyond this it is overly speculative to attempt to predict what specific impacts global climate change will have on the WLC project. A complete discussion of the impacts to biological resources can be found in the project MSHCP/DBESP document contained in Appendix E of the FEIR.

Response to Comment F-1-83. See Response to Comment F-1-82.

Response to Comment F-1-84. See Response to Comment F-1-82. The list of potential impacted resources from global climate change include SKR and burrowing owl.

Response to Comment F-1-85. The DEIR does address the peak demand of electricity for the project (DEIR page 4.16.36) in Table 4.16.I. It further explains that the project will require the addition of two new 28 megawatt (MW) distribution banks to be built out at the existing Moreno Valley substation to accommodate construction beyond the first three logistics buildings (DEIR page 4.16.37). It goes on to state that in order to meet the project's ultimate demands, Moreno Valley Utility (MVU) will require the addition of a new 112 MW substation within the project. The determining factors of timing and location of the new substation will be determined by MVU based on the growth of Moreno Valley and the direction of needed expansion within its service area. The analysis of the WLC project on the overall MVU system is ongoing by MVU as their needs change based on additional demands to its system from all current and future customers within its service area.

Response to Comment F-1-86. Since the loading of MVU's current circuits is proprietary and can only be changed by MVU, it is impossible for WLC to determine the exact timing of the need for any new systems. It is described (page 4.16.37 of the DEIR) that based on the current projected demand for the project; a new substation will be required. Potential locations of this substation have been shown on pages 7-9 of the Dry Utility Final Memo "Substation Location" within Appendix N-1 of the DEIR. The CEQA impacts of these improvements on-site have been analyzed throughout the EIR. Any off site impacts to SCE's system in order to serve MVU with additional capacity cannot be analyzed by this project since SCE's system loading and circuit information is also proprietary. The assumption that would be necessary to analyze them would create highly speculative information that may not conform to SCE's current and or future required construction and/or circuit demands on their system.

To address concerns about solar power, MM 4.16.4.6.1C *includes requirements to incorporate onsite solar (refer to the FEIR Volume 2 Revised DEIR for the exact wording)*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-1-87. The commenter is merely stating that a reasonable range of alternatives must be evaluated in an EIR, and the EIR does evaluate a reasonable range of alternatives, based on the potential significant environmental impacts of the project identified in the DEIR and the project objectives. The commenter has failed to state why the alternatives selected for analysis in the DEIR are not reasonable. The revised TIA (FEIR Volume 2, Appendix L-1) clearly shows rail service is not only not available to the WLC project site, but would cause considerable environmental damage to residential neighborhoods to the west of the WLC site, and would not be physically feasible given the topographic limitations of any potential connection to available rail service to the west. In addition, rail service for a project that would mainly serve the Inland Empire would not be cost effective. Finally, there is no CEQA requirement cited to that requires the EIR to examine a rail alternative for this project if it is not feasible and would create additional significant environmental impacts.

Two of the most important project objectives of the project is to “*create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities and to significantly improve the City’s jobs/housing balance and help reduce unemployment within the City.*” These objectives cannot be met if the high-cube logistics center is located outside the City limits.

Response to Comment F-1-88. The new information provided on the project, the various technical studies, and in the DEIR does not meet any of the four requirements outlined in CEQA and cited by the commenter. The City evaluated the many comments received on the DEIR, including those of these two commenting organizations. The revised technical studies and DEIR provide additional information, mainly in the form of responding to the many questions and comments received on the DEIR. However, this additional information does not rise to the level of significant new information, nor does it identify any new or substantially different significant environmental impacts from those identified in the DEIR. Therefore, the DEIR will not be recirculated.

Response to Comment F-1-89. The Center for Biological Diversity and San Bernardino Valley Audubon Society are on the City’s CEQA mailing list for this project and will continue to receive notices and documents as appropriate relative to the WLC project. All commenters on the DEIR will be provided a copy of the Response to Comments Volume I of the FEIR 10-days prior to the public hearing before the City Council of the proposed project. The City looks forward to any additional comments these two organizations may have regarding this project.

Response to Appendix 1. The commenter provided a Federal Register article regarding the Control of Emissions of Air Pollution from Non-road Diesel Engines and Fuel (69 Fed. Reg.). This reference discusses EPA’s adoption of Tier 4 non-road standards and is referenced in Comment F-1-63.

Perhaps the commenter provided this reference to recommend Tier 4 standards for off-road construction equipment to reduce black carbon emissions. As stated in MM 4.3.6.2A(a), Tier 4 construction equipment are required in the revised mitigation measure.

Response to Appendix 2 (Earth Hour: Turning Lights Off Reduces Greenhouse Emissions, Protects Migratory Birds). This appendix was not directly referenced in the comment letter. The project biologist assumes that the appendix is intended to provide additional information about effect of turning off lights in a city for even just one hour in reducing greenhouse gas emissions, saving energy and benefiting migratory birds. The information was considered in preparing the response to comments.

Response to Appendix 3. The commenter provided an American Lung Association State of the Air in 2005 in Riverside County, in support of Comment F-1-74. The reference indicates that ozone and particle pollution in 2005 received a grade of “F.” The DEIR discusses the poor air quality in the project area; however, it also discusses how air quality has been improving. See Response to Comment F-1-74 and G-49-2.

Response to Appendix 4. The commenter provided an American Lung Association State of the Air in 2008 report to support Comment F-1-74, in stating that Riverside County is ranked as one of the worst counties in the US for criteria pollutants. The DEIR (page 4.3-69, 4.3-83, and 4.3-87) and the revised analysis (FEIR Volume 2 Section 4.3 Air Quality) concluded significant impacts for ozone and particulate matter and also discussed the existing air setting in the project area and in the South Coast Air Basin.

Response to Appendix 5. The commenter provided *Human-Induced Changes in Hydrology of the Western United States* (Barnett 2008). See Response to Comment F-1-75.

Response to Appendix 6 (Analysis of Deer-Vehicle Collision Sites in Pennsylvania). This appendix was not directly referenced in the comment letter. The project biologist assumes that the appendix is intended to provide additional information about factors that increase the likelihood of deer-vehicle collisions. The information was considered in preparing the response to comments.

Response to Appendix 7. The commenter provided an article, *Can Reducing Black Carbon Emissions Counteract Global Warming?* (Bond and Sun 2005). Please refer to Response to Comments F-1-54 through F-1-64.

Response to Appendix 8. The commenter provided the California Attorney General's list of mitigation measures. For an analysis of project feasibility to those measures, please refer to Response to Comment F-1-66.

Response to Appendix 9 (The Riparian Bird Conservation Plan - A strategy for reversing the decline of riparian associated birds in California). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to explain strategies for conservation of riparian habitat especially in connection to birds living in these habitats. The information was considered in preparing the response to comments.

Response to Appendix 10 (The Desert Bird Conservation Plan - A Strategy for Protection and Managing Desert Habitats and Associated Birds in the Mojave and Colorado Desert). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to explain strategies for protecting desert birds and their habitats. The information was considered in preparing the response to comments.

Response to Appendix 11. The commenter provided an article titled, *Getting Warmer: Effect of Global Climate Change on Distribution of Rodents in Texas*. Please refer to Response to Comment F-1-79 through F-1-84.

Response to Appendix 12. The commenter provided CAPCOA's *CEQA and Climate Change* report that was published in 2008. See Response to Comment F-1-66, which contains a feasibility analysis of the measures.

Response to Appendix 13. The commenter provided a white paper prepared by the California Climate Change Center in 2006, *Scenarios of Climate Change in California: an Overview*. Please refer to Response to Comments F-1-72 through F-1-84.

Response to Appendix 14. The commenter provided a paper, *Our Changing Climate, Assessing the Risks to California*. The DEIR included this reference as "Climate Change Center 2006" and incorporated the information (Appendix D of DEIR page 72).

Response to Appendix 15 (Contraction of California Burrowing Owl Range). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

provide additional information about the population of burrowing owls in California. The information was considered in preparing the response to comments.

Response to Appendix 16 (Staff Report on Burrowing Owl Mitigation). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about burrowing owls and strategies for conservation and mitigation. The information was considered in preparing the response to comments.

Response to Appendix 17. The commenter provided a paper on natural gas. Please refer to Response to Comment F-1-48.

Response to Appendix 18 (Unprocessed CNDDDB Data for EL CASCO Quad). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about special status plant and wildlife species recorded to occur within the El Casco, California USGS 7.5-minute topographic quadrangle map based on information within the California Natural Diversity Database (CNDDDB). The information was considered in preparing the response to comments.

Response to Appendix 19 (Unprocessed CNDDDB Data for LAKEVIEW Quad). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about special status plant and wildlife species recorded to occur within the Lakeview, California USGS 7.5 minute topographic quadrangle map based on information within the CNDDDB. The information was considered in preparing the response to comments.

Response to Appendix 20 (Unprocessed CNDDDB Data for PERRIS Quad). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about special status plant and wildlife species recorded to occur within the Perris, California USGS 7.5 minute topographic quadrangle map based on information within the CNDDDB. The information was considered in preparing the response to comments.

Response to Appendix 21 (Unprocessed CNDDDB Data for SUNNYMEAD Quad). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about special status plant and wildlife species recorded to occur within the Sunnymead, California USGS 7.5 minute topographic quadrangle map based on information within the CNDDDB. The information was considered in preparing the response to comments.

Response to Appendix 22 (Light pollution threatens National Parks). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the negative impacts of light pollution on National Parks. The information was considered in preparing the response to comments.

Response to Appendix 23 (COSEWIC Assessment and Update Status Report on the Ord's kangaroo rat *Kipodomys orii* in Canada). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about light impacts on endangered kangaroo rats. The species documented in the report is from Canada. The information was considered in preparing the response to comments.

Response to Appendix 24. The commenter provided a criteria air pollutant report for Riverside County, which indicates that Riverside County is one of the dirtiest counties in the United States. The DEIR (page 4.3-69, 4.3-83, and 4.3-87) and the revised analysis (FEIR Volume 2 Section 4.3 Air Quality) concluded significant impacts for ozone and particulate matter and also discussed the existing air setting in the project area and in the South Coast Air Basin.

Response to Appendix 25 (Status and Trends of Wetlands in the Conterminous United States 1998 to 2004). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about wetland habitats. The information was considered in preparing the response to comments.

Response to Appendix 26 (Light Pollution and the Impacts on Biodiversity, Species and Their Habitats). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about light pollution effects on biodiversity, species and their habitats. Darkness has a functional importance and is indispensable for a healthy ecosystem. This information was considered in preparing the response to comments.

Response to Appendix 27 (South Gate Educational Center Draft EIR - Table 4.11-12: Estimated Project Natural Gas Usage from Project Site) The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about natural gas consumption.

Response to Appendix 28 (Direct and Indirect Effects of Air Pollution on Two Hole-Nesting Bird Species). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the effects of air pollution on bird species. The study was conducted in town of Harjavalta, SW Finland. The purpose of the study was to measure individual and population level effects of air pollution, both heavy metal contamination and acidification. The project site will not likely contain heavy metal contamination and/or acidification and the likelihood of having hole-nesting birds on the project site is highly unlikely. The information was considered in preparing the response to comments.

Response to Appendix 29 (Air pollution impacts on birds and insects). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the effects of air pollution on bird species. This report is an updated on recent results of studies that have been ongoing at copper smelter in Harjavalta, SW Finland. Breeding success of great tit and pied flycatcher were markedly decreased when heavy metal emissions markedly decreased. In addition, birds did not show reduced immuno-competence in polluted areas. The project site is not associated with a copper smelter and the likelihood of having heavy metals similar to those in a copper smelter, occurring with the WLCSP is highly unlikely. The information was considered in preparing the response to comments.

Response to Appendix 30 (Biomarkers and fluctuating asymmetry as indicators of pollution-induced stress in two hole-nesting passerines). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the effects of air pollution on bird species. The study was conducted in town of Harjavalta, SW Finland and included the effects of air pollution gradients of a copper smelter on hole-nesting passerines. The project site is not associated with a copper smelter and the likelihood of having hole-nesting birds on the project site is highly unlikely. The information was considered in preparing the response to comments.

Response to Appendix 32 (Riparian Areas and Wetlands). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about riparian areas including the needs they serve and the impact humans have on them. The information was considered in preparing the response to comments.

Response to Appendix 31 (Climate Change Futures - Health, Ecological and Economic Dimensions). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about the overarching impacts of climate change.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 32 (Riparian Areas and Wetlands). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about riparian areas including the needs they serve and the impact humans have on them.

Response to Appendix 33 (Improving Energy Efficiency in Warehouses). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about way to improve energy efficiency in warehouses.

Response to Appendix 34. The commenter provided an article written in Australia regarding greenhouse gas emissions from concrete manufacturing. As discussed in Response to Comment F-1-52, lifecycle emissions are not quantified because they are speculative.

Response to Appendix 35 (Roads and Their Major Ecological Effects). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about effects roadways have on the environment and its inhabitants. The information was considered in preparing the response to comments.

Response to Appendix 36 (Estimate of the Area Affected Ecologically by the Road System in the United States). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about how large the ecological effects of roadways are in the United States. The information was considered in preparing the response to comments.

Response to Appendix 37 (The Ecological Road-Effect Zone of a Massachusetts (U.S.A.) Suburban Highway). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the road-effect zone and the ecological impacts within it. The information was considered in preparing the response to comments.

Response to Appendix 38. The commenter provided a report on the potential consequences of climate variability and change for water resources in the United States. Please refer to Response to Comments F-1-75 through F-1-78.

Response to Appendix 39. The commenter provided an article regarding the impacts of air pollution on birds. Please refer to Response to Comment F-1-79 through F-1-84.

Response to Appendix 40. The commenter provided a report accepted by the Intergovernmental Panel on Climate Change (IPCC 2007), to indicate that the west coast is vulnerable to changes in water events. This reference and information is contained in the DEIR (Appendix D, pages 72-75). See Response to Comment F-1-75 through F-1-78.

Response to Appendix 41. The commenter provided a letter regarding radiative heating due to black carbon. Please refer to Response to Comments F-1-54 through F-1-64.

Response to Appendix 42 (Status of Burrowing Owls in Southwestern California). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the population of burrowing owls in southwestern California. Based on the study, burrowing owl populations occur in very small colonies and are so fragmented and diminished that long-term persistence is unlikely. The study recommends large-scale conservation efforts to preserve existing populations. The information was considered in preparing the response to comments.

Response to Appendix 43 (Ecological Light Pollution). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the effects of light pollution on natural habitats. Based on the report conclusion, the understanding of the effects of artificial night lighting is still limited and additional investigation on artificial night lighting is required. The information was considered in preparing the response to comments (e.g., see Response F-1-21).

Response to Appendix 44 (Riparian Forests as Nutrient Filters in Agricultural Watersheds). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the benefits of riparian vegetation as nutrient filters near agro-ecosystems. The information was considered in preparing the response to comments.

Response to Appendix 45. The commenter provided a report regarding reducing greenhouse gas emissions through product life-cycle optimization for personal computers and concrete. Please refer to Response to Comment F-1-52.

Response to Appendix 46. The commenter provided an article, *Mortality Risk Associated with Short-Term Exposure to Traffic Particles and Sulfates*. The article is referenced in regard to black carbon. Please refer to Response to Comment F-1-59.

Response to Appendix 47 (Determination of Biologically Equivalent or Superior Preservation (DBESP) Alessandro Commerce Center). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide a comparison DBESP within Moreno Valley. The proposed Alessandro Commerce Center impacted a total of 0.32 acres of riparian/riverine habitat and restored 0.64 acres of riparian/riverine habitat. The mitigation required for impacts to riparian/riverine habitat was biological superior to existing conditions. The information was considered in preparing the response to comments.

Response to Appendix 48 (Environmental Impact Report for the Alessandro Commerce Center). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide a comparison EIR within Moreno Valley. Only the biological resources section was included in the appendix. Mitigation measures include conducting a nesting bird survey, preparing a DBESP, Payment of the SKR HCP Fee. The information was considered in preparing the response to comments.

Response to Appendix 49 (San Jacinto Wildlife Area Bird List (including Lake Perris State Recreation Area)). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about birds living in the surrounding area. A list of 319 species were identified as occurring within the SJWA and Lake Perris State Recreation Area. The information was considered in preparing the response to comments.

Response to Appendix 50. The commenter provided a report, *Water Management Strategies to Weather the Effects of Global Warming*. Please refer to Response to Comment F-1-75 through F-1-78.

Response to Appendix 51 (Nutrient Dynamics in an Agricultural Watershed: Observations on the Role of a Riparian Forest). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the benefits of riparian vegetation as nutrient filters in agricultural watersheds. The information was considered in preparing the response to comments.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 52. The commenter provided an article regarding black carbon. Please refer to Response to Comment F-1-54 through F-1-64.

Response to Appendix 53 (RAND - Balancing Environment and Development: Costs, Revenues, and Benefits of the Western Riverside County Multiple Species Habitat Conservation Plan). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the costs and benefits of the MSHCP with regard to mobility and mobility projects. The analysis does not consider benefits that result from faster improvement of the region's major roads or the faster completion of road safety and maintenance projects. The information was considered in preparing the response to comments.

Response to Appendix 54 (RAND - Balancing Environment and Development: Costs, Revenues, and Benefits of the Western Riverside County Multiple Species Habitat Conservation Plan). Contained within Appendix 53.

Response to Appendix 55 (Final MSHCP- Section 6.0 MSHCP Implementation Structure). This appendix was directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the implementation strategies for the MSHCP. Section 6.0 of the MSHCP describes the implementation structure of the MSHCP with regard to property needed for MSHCP Conservation. Projects that are not included in a Criteria Cell are not required for MSHCP conservation. Discretionary projects within Criteria Cells are subject to review under the HANS process. The information was considered in preparing the response to comments.

Response to Appendix 56. The commenter provided an article regarding the climate impact of black carbon. Please refer to Response to Comment F-1-54 through F-1-64.

Response to Appendix 57 (San Jacinto Valley Crownscale Map). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide a map of the USFWS designated Critical Habitat for San Jacinto Valley crownscale. The information was considered in preparing the response to comments.

Response to Appendix 58. The commenter provided SCAQMD's Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (2008). Please refer to Response to Comment F-1-71.

Response to Appendix 59. The commenter provided an article, *Effects of Climate Change on In-Stream Biology and Freshwater Ecosystems*. Please refer to Response to Comments F-1-79 through F-1-84.

Response to Appendix 60. The commenter provided a paper, *Predicting Extinctions as a Result of Climate Change*. Please refer to Response to Comments F-1-79 through F-1-84.

Response to Appendix 61. The commenter provided information on black carbon and climate change. Please refer to Response to Comment F-1-54 through F-1-64.

Response to Appendix 62 (Are Small, Isolated Wetland Expendable?). This appendix was not directly referenced in the comment letter. The project biologist assumes the appendix is intended to provide additional information about the importance of small wetlands for biodiversity. The information was considered in preparing the response to comments.

Response to Appendix 63 (Air pollution induces heritable DNA mutations). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about the connection between air pollution and heritable DNA mutations.

Response to Appendix 64 (A Case-Control Analysis of Exposure to Traffic and Acute Myocardial Infarction). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about the association of traffic exposure to risk of AMI.

Response to Appendix 65. The Fact Sheet Nonpoint Source Pollution: The Nation's Largest Water Quality Problem, Pointer No. 1, EPA841-F-96-004A was reviewed. The Fact Sheet states that non-point source pollution is a problem. The Fact Sheet states that significant improvements have been made over the last 10 years as a result of compliance with the Nonpoint Source Management Program established by the 1987 Clean Water Act Amendments. The Program established the National Pollution Discharge Elimination System (NPDES) permit.

As part of the requirements of the NPDES permit, a Water Quality Management Plan was prepared for the project which analyzes the potential for non-point source pollution due to the project. A number of potential sources of pollution were identified in DEIR Section 4.9.3.1 *Pollutants of Concern and Assessment Methodology*, Table 4.9.C: *Anticipated and Potential Pollutants Generated by Land Use Type*. These pollutants of concern include bacterial indicators, metals, nutrients, pesticides, toxic organic compounds, sediments, trash & debris, and oil & grease). Best Management Practices to mitigate these impacts have been incorporated into the project and are identified in DEIR Sections 4.9.6.2 *Construction-Related Water Quality Impacts* and 4.9.6.3 *Operational-Related Water Quality Impacts*.

Although adherence to the NPDES requirements is required of all development within the City, the incorporation of these requirements as MMs 4.9.6.2A and 4.9.6.2B (refer to Responses to Comments F-5-13 and F-5-23) are designed to ensure that any future development within the WLCSP area obtains coverage under the NPDES General Construction permit, and to track compliance with these requirements as part of the Mitigation Monitoring and Reporting Plan or Program.

Response to Appendix 66 (Impact and Control of Agricultural RUNOFF). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about the benefits of riparian vegetation as nutrient buffers near agricultural land uses.

Response to Appendix 67. The commenter provided the first two pages of an article, *Controlling particulate emissions from diesel vehicles*. This article was published in the United Kingdom and discusses legislation in the United Kingdom. The article was provided in support of black carbon mitigation. Please refer to Response to Comment F-1-54 through F-1-64.

Letter F-2: American Lung Association (April 5, 2013)

Re: World Logistics Center DEIR

Dear Mr. Gross,

The American Lung Association in California is submitting this letter in response to our concerns about the significant air pollution-related health impacts of the proposed World Logistics Center (WLC) development and the need for the draft Environmental Impact Report (DEIR) to fully address those impacts.

After reviewing the DEIR, we are extremely concerned that the proposed project will generate significant health risks to the community, one that is already burdened by significant air pollution. The American Lung Association *State of the Air* report lists Riverside County as having a failing grade for both ozone and particle pollution, and among the worst air pollution in the nation. The DEIR states that air pollution-related cancer risks from the proposed project would exceed the threshold of 10 in one million and that the daily and annual emissions of all pollutants would exceed the South Coast Air Quality Management District's regional emissions significance levels and would also continue to exceed the localized significance thresholds. In addition to cancer risk, emissions from the project will also impact sensitive receptors, including those living with chronic cardiovascular and respiratory illnesses, the elderly and our children. In Riverside County, more than 160,000 people suffer from asthma, including 41,000 children. An additional 66,000 have chronic bronchitis and 28,000 have emphysema, who suffer even further when breathing polluted air. The DEIR fails to address these impacts.

Air pollution is a critical public health issue; everyone is at risk, but people with lung disease, children and the elderly are most vulnerable. The DEIR fails to analyze the health impacts of this

1

2

411 Mac Kay Drive
San Bernardino, CA 92408
909-884-5864 phone
909-884-6249 fax

project on these vulnerable populations, including those with respiratory disease, or the impact of cumulative emissions from this project and others in the vicinity that are also being planned. We ask the City of Moreno to seek a full analysis of the potential health impacts from the increased pollution from the proposed project and to request additional project alternatives that would mitigate those impacts.

Sincerely,

Terry M. Roberts
Area Director

RESPONSES TO LETTER F-2

American Lung Association

Response to Comment F-2-1 and F-2-2. The commenter notes concerns regarding the significant health impacts to the community from the project and that the Draft Environmental Impact Report (DEIR) fails to address these impacts. The commenter requests additional analyses of potential health impacts and identification of project alternatives that would mitigate those impacts.

Health effects of diesel particulate matter (PM) are discussed in Master Response-2: Health Effects of Diesel Particulate Matter (refer to Response to Letter C-3). The DEIR has presented a comprehensive evaluation of the project's air quality and health impacts. The DEIR used emission and assessment methods and tools approved by the Air Resources Board (ARB) and South Coast Air Quality Management District (SCAQMD). Detailed estimates were made of the project's construction and operational emissions as part of the project's localized air quality assessment, regional emission assessment, and health risk assessment. The project's potential impacts were then compared with the significance thresholds established by the SCAQMD from which it was determined that the project would result in significance air quality impacts. These thresholds are designed to protect public health. The project's impacts are fully disclosed in the DEIR and in the revised analysis, including the identification of project design features and mitigation measures designed to minimize the project's pollutant impacts.

Letter F-3: California Clean Energy Committee (April 8, 2013) and Appendix List, Petition, and Appendices 1-187 (on Flash Drive)

California Clean Energy Committee

*"We're all working together
to do a better job for the country."*

April 8, 2011

Mr. Mark Gross, Senior Planner
City of Moreno Valley
14177 Frederick Street
Moreno Valley, California 92553

Re: Comments on Draft Program Environmental Impact Report
World Logistics Center Project
(SCH # 2012021045)

Dear Mr. Gross:

This letter will constitute comments by the California Clean Energy Committee on the Draft Environmental Impact Report for the World Logistics Center Project (EIR).

The California Clean Energy Committee is a California non-profit corporation headquartered in Davis which seeks to promote energy conservation, greenhouse gas reduction, and the development of clean-energy resources in California. It actively supports the application of the California Environmental Quality Act (CEQA) to energy conservation and related impacts.

Over 20 individuals in the Moreno Valley area have joined Clean Energy's campaign to request that that city require robust energy conservation and environmental stewardship in the World Logistics Center project design.

All notices regarding this project are requested to be sent to 3502 Tanager Avenue, Davis, California 95616-7531. Please feel free to contact the undersigned for additional information.

Accompanying this letter is a USB flash drive containing electronic copies in pdf format of all the documents listed in the appendix to this letter. Please contact us if you have any difficulty displaying the documents.

The EIR should be amended to incorporate an analysis of energy conservation, to include feasible mitigation for GHG emissions, to fully address transportation impacts and mitigation, and to incorporate a reasonable range of alternatives and then recirculated. The

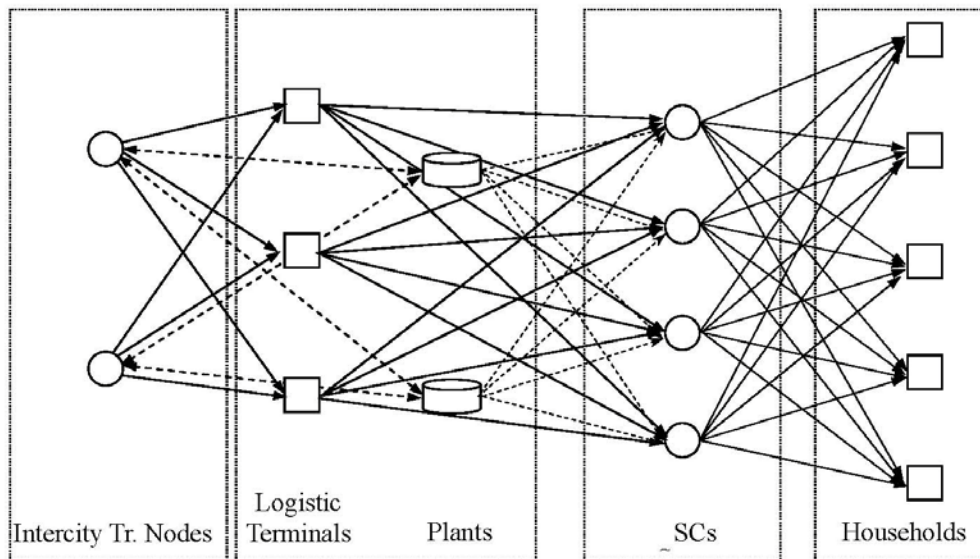

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 2

logistics industry is uniquely situated to enable a wide variety of companies to pursue corporate responsibility and environmental sustainability goals in a cost-effective way. Sustainability is a key buying criterion for a growing number of consumers and a key factor in determining the reputation and success of companies. The development of sustainable logistics solutions should be a key element of the planning and development of the World Logistics Center.

1. Logistics Sprawl

According to the Southern California Association of Governments (SCAG), Southern California already faces severe congestion on its transportation routes with truck traffic as one of the major culprits. SCAG projects that warehousing in western Riverside County will increasingly serve the ports of Los Angeles and Long Beach. This will entail increased hauling distances and will contribute to traffic congestion and will lead to greater environmental and economic impacts on the region.

Figure 1: Supply Chain Network for Retail Goods in a City.

SCAG expects truck traffic to grow significantly on key east-west freeway segments. Increased truck traffic will cause longer delay to both trucks and general traffic. SCAG has planned a new East-West Freight Corridor that would run adjacent to SR-60 in an effort to accommodate truck traffic generated by projects such as this one.

The EIR should evaluate the potential cumulative impact of increased heavy-duty truck traffic from the ports. SCAG provides a Heavy Duty Truck modeling program which is a four-step data model for projecting the effects of increased trucking to the Inland Empire.

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 3

Urban package delivery is connected with increasing levels of traffic congestion, climate impacts, air quality impacts, and energy use. By locating the WLC at a considerable distance from the businesses and consumers that will ultimately receive the products, the project increases the amount of travel required to deliver goods and the related impacts to their ultimate destination. The EIR should evaluate the impact of increasing the total net distance travelled by trucks to reach their final destinations in the region.

2. Mitigation of Transportation Impacts

The project will have significant and unmitigated impacts to SR-60, SR-91, and I-215. The Perris Valley Line, which is now under development in Riverside County, projects that it will serve 4,350 riders daily and that the diversion from private car use to rail will reduce VMT by approximately 34 million miles per year reducing GHG emissions in the region. Riverside Transit Authority (RTA) has numerous transit routes serving the area.

The city should implement a transit funding charge on the project to fund mass transit operation expenses, van pools, real-time ridesharing, alternative mode marketing, transit pass programs, guaranteed ride home, truck routing and scheduling information, and management time to implement a traffic demand management measures that to mitigate freeway impacts. Transportation system impacts can be off-set by programs that increase transit mode share. Additional transit ridership would reduce congestion caused by the project.

Impacts could further reduced by implementing a transit-oriented development (TOD) design. TOD integrates transit service into the layout for the project so that transit services are convenient and obvious at employment sites. The proposed project should be designed around an effective transit plan which would encourage transit by designing it as a simple, convenient, clean, and economic way for employees to commute to work. This requires that the land use plan for the project be designed to integrate transit and that upgraded transit facilities be required so as to maximize transit mode share.

The project should subsidize transit fees, promote transit ridership, insure adequate transit service, and improve transit intermodal connections so as to increase transit ridership and reduce impacts to transportation system, air quality, energy, and GHG emissions.

ITE trip generation rates for a traditional warehouse are about 4.96 trips per thousand square feet. The trip generation analysis for the project is estimating .11 per thousand square feet. This means that a warehouse on site is projected to have about 2 percent as much traffic as a traditional warehouse. This is unreasonable and unsupported given that the number of truck trips would be similar for the two uses and given that employment, while much lower at this project, is not expected to be only 2 percent of a traditional warehouse.

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 4

The project concludes that certain transportation impacts are mitigated by the TUMF fee. However, TUMF mitigation does not account for the additional trips generated by the project being disproportionately truck trips which require considerably more infrastructure investment due to their greater traffic congestion impacts.

9

3. Transportation Management District

A Mello-Roos district should be established for the project to fund the design and operation of an on-going transportation management district and a commuter benefits program to serve the project's transportation demand. Employers should be required to contribute on either a square footage basis or an employee formula. A commuter benefits program provides alternatives and incentives that encourage commuting by more sustainable modes such as transit, rail, biking, van pools, and car-pooling. Commuter benefits programs are based on a traffic mitigation plan that includes public outreach to commuters through various media including workplace promotion, social media, on-line ride matching, signage, on-site transit pass sales, on-site transit information, discounted transit passes, and coordination with transit agencies. Employers located at the project site should mitigate transportation impacts by actively participating in a commuter benefits program. Such a program could be operated under the joint supervision of the City of Moreno Valley and the Riverside County Transportation Agency. By securing the participation of all employers on site through a Mello-Roos district and CC&Rs, companies can minimize the expense and administrative burdens of setting up individual programs while providing a more effective and responsive program under the supervision of specialized staff working with RTA.

10

4. Freight Rail

The EIR should analyze mitigation that would require the project applicant to develop freight facilities in along the San Jacinto Branch Line or take advantage of the intermodal facilities in San Bernardino to reduce impacts to regional freeways resulting from the shipment of cargo by truck to the project site from the San Pedro Bay ports, from other intermediate distance locations, and from elsewhere in the United States and Canada. The EIR should discuss whether the selection of the proposed site forecloses future use of energy efficient freight rail transportation.

11

5. Vehicle Miles Travelled

The EIR assumes that there will be no traffic impact other than trip generation because the jobs/housing balance in Moreno Valley will be improved by the project. At the same time the EIR claims that the project will involve high-cube warehouse space that will employ only a few people resulting in a very low trip generation rate. These are contradictory assumptions.

12

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 5

The EIR should specify what a high-cube warehouse is and assure that only warehouses with the projected low levels of employment would actually be built on site. Monitoring should be provided that would insure that high-employment uses would not be accommodated or that additional mitigation would be required if traffic counts ultimately exceeded the low-employment levels that the traffic analysis projects.

The number of employees expected to work at the project should be projected along with a how many of those employees would be expected to live in Moreno Valley, how many of them would be new residents, and how the jobs-housing ratio would be affected in view of those numbers.

The project is expected to generate 71,085 vehicle trips daily. Those are trips that will either begin or end at the project site. There is no support for the proposition that 71,085 less auto trips will be made elsewhere in the Los Angeles Basin as a result of this project. The EIR must analyze the vehicle miles travelled (VMT) associated with this project. SB 375 provides that regional transportation plans must lay out a land use pattern with the goal of reducing GHG emissions through VMT reductions. (Cal. Gov. Code Section 65080(b)(2)(B)(vii).) Locating the warehousing on the periphery of the urbanized area may increase the distance trucks are required to travel thus off-setting any potential reduction resulting from an improved jobs-to-housing ratio. The analysis should consider that some trips generated by the project will be made by delivery vehicles which may travel hundreds of miles, frequently stopping, before returning to the project site.

6. Alternative Fuels

Shippers operating from the project should be required to use alternative fuels to reduce the air pollution, energy, and climate impacts of the project. This includes zero-emission vehicles such as electric delivery vans and trucks operating on natural gas for as many of the new vehicles acquired for the project as feasible as well as for equipment operating on the site such as forklifts.

Heavy fleet operation can be based on fuel cell vehicles using hydrogen as a fuel source. The alternative fueling station for the project should provide for H2 fueling to be incorporated. The project should provide funding to Riverside Transit Authority to provide H2-powered transit taking advantage of the H2 fueling station. Fleet operations may make hydrogen fuel cell vehicles

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 6

cost-effective. The EIR should evaluate mitigation that requires companies to operate with sustainably-fueled, zero-emissions vehicles. Solar photovoltaic on warehouse roofs can charge vehicle batteries or operate hydrogen electrolysis to power zero-emissions fleet vehicles.

14

7. Parking

All employers owning or leasing buildings in the project site should be required to offer parking cash-out to employees. Parking cash out requires employers to offer employees the option to choose cash in lieu of any parking subsidy offered. Implementation of parking cash-out by individual employers can be used to reduce transportation impacts whether or not employers are able to reduce the number of parking spaces they own or rent.

15

The project should adopt shared parking through either a parking district or public parking in lieu of minimum parking requirements. Employers should be allowed to reduce the number of shared parking spaces they construct or lease based upon (i) the likelihood that multiple facilities will not all require maximum parking at the same time and (ii) the extent to which individual facilities can implement cash-out parking. This reduces costs to employers and moderates single-occupant vehicle demand.

8. Co-Loading and Back-Hauling

The project should require companies locating at the project site to participate in the VICs Empty Miles program or an equivalent program to reduce empty backhauls and to facilitate co-loading opportunities. The design of the program should be tailored to take advantage of economies of scale at the WLC site.

16

9. SmartWay

Companies operating at the project should be required to participate in the U.S. EPA's Smart Way Program. Under that program freight shippers commit to use SmartWay freight carriers for 50 percent or more of their shipping resulting in more freight being carried by freight companies that are taking steps to reduce energy consumption and emissions.

17

Smart Way allows ground shippers to track supply chain emissions using data supplied to the SmartWay system by trucking and rail companies. It also allows shippers to model strategies to reduce emissions. The EPA is continually upgrading this tool, and it is being

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 7

integrated into logistics programs. The SmartWay shippers can pick carriers to meet performance targets for emissions reductions. This allows shippers to drive efficiency in the supply chain and encourages freight carriers to adopt strategies such as idle reduction, improved aerodynamics, improved freight logistics, automatic tire inflation systems, single wide-base tires, and driver training.

↑
 17

10. Evaluation of Energy Resources

The EIR should evaluate the economic viability of potentially-feasible renewable energy strategies and energy efficiency tools available that could reduce energy demand from the project. The EIR should evaluate options for putting the entire project on 100 percent renewable electrical energy, or some lesser percentage as may be feasible, and evaluate the extent to which transportation systems associated with the construction and operation of the project can be fueled from renewable electrical generation or other reduced-emission fuels.

↑
 18

The EIR should compare the relative efficiency of different technologies to could provide energy to the project for operation, construction, transportation, and other uses. The EIR should discuss the projected energy use of the project and the impact of requiring additional generation facilities to serve the anticipated load. Project loads should be estimated based upon typical high-cube warehouse space operations including lighting, space conditioning, battery recharging, equipment, transportation, water heating, etc. Energy resources potentially available include natural gas, solar radiation, grid-sourced electricity, petroleum, wind, geothermal, biofuels, and biomass. The EIR should evaluate ways in which the projected electric demand can be served in an efficient and environmentally-sustainable way. The EIR should evaluate strategies for reducing reliance on fossil fuels, increasing reliance on renewable resources, reducing peak loads, and reducing the impacts of reliance on remote generation facilities.

↑
 19

The planned 40,000,000 square feet of commercial space comprising the project would yield 28,000,000 square feet of rooftop solar PV at a 70 percent coverage ratio. At an average of 4 mWh daily produced per mW of solar generation capacity, the available solar generation would produce 204,400 mWh annually. The cost of purchasing an equivalent amount of power using \$0.1401 per kWh, which is the time-of-use rate for summer peak for large commercial users of the Moreno Valley Electric Utility, is over \$28 million per year.

↑
 20
 ↓

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 8

SOLAR ENERGY PER YEAR	
Gross Floor Space (sf)	40,000,000
Available Roof Space for Solar PV (sf) ¹	28,000,000
Roof Space Required per MW of Generation (sf) ²	200,000
Solar Generation Capacity (mW) ³	140
Annual Solar Generation (mWh) ⁴	204,400
Annual Cost of an Equivalent Amount of Electric Power purchased from Moreno Valley Utility ⁵	\$28,636,400

Using the CPUC-determined starting price for the SB32 feed-in-tariff of \$89.23/mWh and a 20 percent adder for solar time-Of-use characteristics, the annual wholesale value is \$21,829,920. The shading effect of rooftop solar arrays reduces cooling demand and should be included in the energy benefits.

The addition of solar generation to the project could be centrally managed by a third party or under contract with Moreno Valley Utility. Excess power could be sold to the Moreno Valley Utility under a long-term power purchase agreement or sold to SCE. Moreno Valley Utility could enter a long-term lease agreement and finance the solar at municipal bond rates. Ratepayers would benefit because the Moreno Valley Utility would meet its renewable portfolio standard (RPS) obligation at no additional cost, rather than being required to pay a premium for renewable energy purchased through the RAM auction.

The EIR should discuss how failing to implement reliable and efficient local energy generation would pre-empt future clean energy development. By failing to adopt renewable energy when the project is implemented, project occupants become subject to administrative and financial obstacles as well as additional construction costs associated with retro-

¹ 40,000,000 square feet of commercial space would yield 28,000,000 square feet of usable roof space at a 70 percent usable ratio.

² Solar generation at Orange County Convention Center delivers 1.016 MW from 200,000 s.f. of roof space.

³ 28,000,000 square feet of roof space used for solar panels would generate 140 mW (28,000,000/200,000=140).

⁴ Assuming conservatively 4 mWh per day of generation for each mW of solar generation capacity, 140 mW of capacity would produce 204,400 mWh of electricity per year (4 mWh * 140 * 365).

⁵ 204,400,000 kWh * \$0.1401.

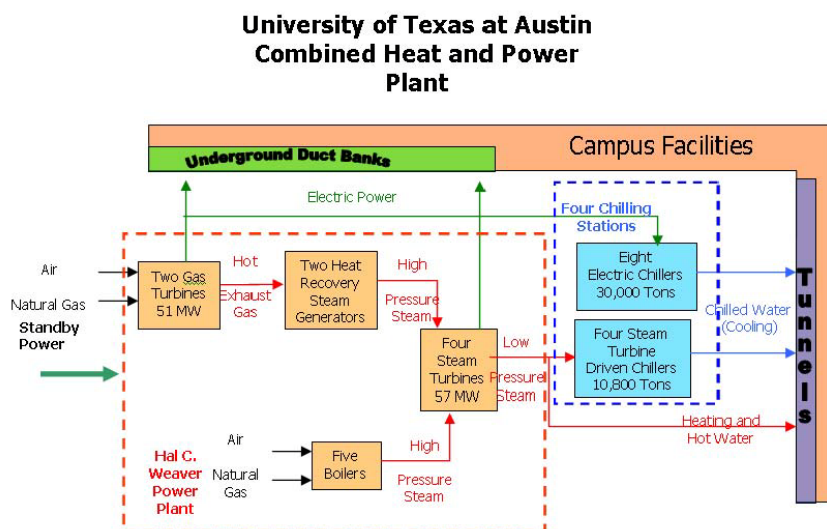

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 9

fitting renewable generation to an operating commercial building, rather than installing it as a component of the initial construction. 20

11. District Heating and Cooling

District heating and chilled water should be evaluated for use project-wide in lieu of packaged HVAC units. Either centrifugal chillers or centralized solar collection technology driving single or double effect absorption chillers should be considered. Chilled water and hot water service could be produced via one or more solar thermal installations. The payback period on such a system can be less than five years. Chilled water can also provide cost-effective thermal storage taking advantage of off-peak electricity rates and solar thermal resources.

District heating and cooling should also be evaluated based on implementing combined-cycle gas turbine generation with a combined heat and power application that uses waste heat to power an absorption chiller. To the extent that new natural-gas-fired generation would serve the project's electrical demand, generation should be located close to project load in order to reduce the cumulative impact of requiring additional long-distance transmissions lines, to reduce transmission line losses, and to facilitate combined heat and power applications using waste heat. The EIR should also consider the GHG impacts from sulfur hexafluoride emissions (SF6), a human-made chemical that is used as an electrical insulating fluid for power distribution. In 1998, atmospheric concentrations of SF6 were 4.2 ppt and steadily increasing in the atmosphere. SF6 is the most powerful GHG listed in IPCC studies with a GWP of 23,900 (Intergovernmental Panel on Climate Change 1996). Avoiding reliance on grid-sourced power also increases power reliability avoiding costly power outages for business locating in the WLC. CHP is especially attractive in hotter inland areas because of high cooling loads. 21

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 10

Investment tax credits and municipal bonding by a cooperative agreement with the Moreno Valley Electric Utility can be combined with a Mello-Roos district reduce capital costs to approximately 4 percent while taking advantage of tax incentives available only to the private sector. The combination is considerably less than the cost of financing separate HVAC units as part of the construction take-out financing. A Mello-Roos district and appropriate mitigation provisions as a condition of project approval would insure adequate project demand to insure financial viability and justify financing.

As noted, capital costs are substantially reduced for renewable energy systems integrated into the initial project design and installed during initial construction, as opposed to being retrofitted at some later date. Chilled water distribution piping installed as a component of the initial project is another good example of this. Piping would be sequenced into construction of underground utilities such as water, sewer, natural gas, electricity, data services, recycled water, etc. using an appropriate joint trench design.

District chilled water reduces capital costs and maintenance costs for individual warehouses the cost to purchase and install large HVAC units, the cost of structural components required to support heavy HVAC equipment on roofs, the cost of sizing substations and power distribution systems to serve peak demand for numerous large HVAC systems, the costs to construct floor space for HVAC equipment, and the cost of duct work throughout warehouses. HVAC maintenance costs and replacement costs are reduced because individual buildings do not have HVAC systems to maintain or replace. Air handler units and chilled-water piping are used. The overall cooling capacity that must be purchased is reduced because system size is based on overall peak demand rather than by equipping each building to meet peak cooling demand individually. Further cost savings could be achieved by selling credits from the project under the AB 32 cap and trade program.

12. Ground Source Heat Pumps and Solar Water Heating

Ground source or geothermal heat pumps can reduce heating and cooling expenditures for buildings by 40 to 70 percent. Ground source heat pumps take advantage of relatively consistent ground temperatures. The city should evaluate the use of ground source heat pumps and solar water heating to increase project efficiency and reduce impacts. Horizontal or vertical loops could be installed quickly and efficiently prior to initiating foundation work. Applicable federal tax credits increase the economic returns. Ground source heat pumps can supply hot water, or they can be paired with solar water heating to provide an alternative design to district heating and cooling.

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 11

13. Lighting and Energy Efficiency

The total cost of ownership of LED lamps is considerably less than incandescent and florescent lamps. Up to 80% of the electrical energy used in warehouses is consumed by electric lighting. The EIR should consider requiring LED lighting throughout including the use of LED lighting in parking lots because of the reduced energy requirements of LED lighting. Many projects now exceed Title 24, Part 6. The EIR should also evaluate incorporating additional energy efficiency up to 40 percent beyond Title 24.

23

14. Microgrid and Storage

A microgrid is a cluster of electricity sources and possibly controllable loads that are connected to the traditional wider power system but which may, as circumstances dictate, disconnect from it and operate as an island for short periods of time. Microgrids can consist of multiple buildings or locations. Micro-grids provide the power quality and reliability benefits of on-site generation with semiautonomous control as well as cost, efficiency and environmental benefits. The EIR should evaluate the use of a microgrid for the WLC project area. Microgrids are suitable for projects that require high reliability and availability of electricity supply. Microgrids allow the efficient integration of project-wide renewable energy resources, enable consumption shift to off-peak hours, facilitate energy storage, reduce environmental impacts, and enhance the safety, reliability and affordability of electric service to business users. Energy storage should be evaluated for combinations of thermal storage, vehicle batteries (V2G), and hydrogen electrolysis for vehicle and equipment use.

24

Chilled Water Storage

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 12

15. Ancillary Benefits

The combination of solar photovoltaic, energy conservation, a district chilled water system and enhanced Title 24 plus compliance would bring the project near to net zero with no additional lifecycle cost. Clean energy systems provide on-going, long-term savings to companies operating on the project site. They also make the project more attractive to companies intending to meet sustainability goals. Sustainability has become a key buying criteria for consumers, and sustainability is a critical factor in shaping the reputation of a company. Sustainable projects sell more quickly because they provide economic benefits to prospective owners. Faster sales reduce the developer's project carrying costs.

Renewable energy facilities provide additional value for the invested dollar because they increase the reliability of the energy supply. Black-outs cause considerable economic losses to businesses and typically require expensive, inefficient, and decentralized back-up power supplies. Incorporating micro-grid technology into the WLC grid would greatly increase the resilience of the Moreno Valley electric grid and allow for islanding the site and maximizing local generation while shedding of non-essential load during power emergency conditions. The combined-cycle gas turbine/chilled water plant at the UC Davis Medical Center in Sacramento was to a large extent initiated because of the reliability of locally-sourced generation.

Buildings that incorporate on-site renewable generation have increased market value and that market value grows over time. By contrast, brown power is only an expense and carries no investment return. Further, an investment in renewable energy locks in the cost of energy for the lifetime of a project. It provides companies a hedge against energy price increases resulting from factors such as volatile fossil fuel prices or the cost of decommissioning nuclear facilities.

16. Mello-Roos District

The city should condition approval of the World Logistic Center on the formation of a Mello-Roos district encompassing the project site to generate long-term funding sufficient to insure the operating cost for more efficient and more economical project operation.

The Mello-Roos Community Facilities Act of 1982 (Gov. Code, § 53311 et seq.) authorizes local government agencies to form community facilities districts to “finance the purchase, construction, expansion, improvement, or rehabilitation of any real or other tangible property with an estimated useful life of five years or longer,” as well as related planning and design work. (Gov. Code, § 53313.5.) The financed facilities need not be physically located within the Mello-Roos district. (Gov. Code, § 53313.5.) Funding under the act is through the use of special taxes, submitted to a two-thirds voter approval. (Gov. Code, §§ 53326, 53328.)

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 13

The Legislature has recognized importance of dramatically reducing California's reliance on fossil-fuel powered electrical generation by adopting the California Renewable Portfolio Standard, which will help to reduce air pollution in the state, meet the state's climate change goals, promote stable retail rates for electric service, meet the state's need for a diversified and balanced energy generation portfolio, assist meeting the state's resource adequacy requirements, contribute to the safe and reliable operation of the electrical grid, provide a predictable electrical supply, voltage support, lower line losses, and congestion relief, and to implement the state's transmission and land use planning activities related to development of eligible renewable energy resources. (Pub. Utilities Code, § 399.1(b).)

Proceedings for the formation of a community facilities district are initiated by adoption of a resolution of intention to establish the district. The resolution of intention sets a time for a public hearing on the establishment of the district, at which time interested persons may protest or otherwise comment on formation of the district. (Gov. Code, §§ 53321, 53323.) If a majority protest has not been made, the legislative body may adopt a resolution of formation establishing the district. (Gov. Code, § 53325.1.) Following establishment of the community facilities district, an election must be held within the district to authorize the proposed special tax. If fewer than 12 registered voters reside within the boundaries of the district on the date 90 days before the date of the hearing, then the tax is voted on by persons who own property within the district on the date of the hearing, each receiving 1 vote for each acre of land owned. If 12 or more registered voters reside within the district, then the election is by registered voters within the district. (Gov. Code, § 53326.)

26

17. Farmland Impact

The project will have a significant impact on conversion of unique farmland and farmland of local importance. The city should provide mitigation for the farmland impacts by requiring the purchase of conservation easements for an amount of land equivalent to the farmland that will be occupied by the project. The easements should be held by the city or by a suitable land trust.

27

18. Alternate Sites

The EIR should fully evaluate alternative sites, or a combination of alternative sites, that are capable of supporting a large-scale, logistics warehouse project. The City of Beaumont contains at least three parcels that would support large-scale logistics warehousing. The City of Calimesa has a large amount of vacant land near Singleton Road and I-10. Union Pacific's El Paso Line runs through Beaumont. The City of Perris has considerable land that could be used for large-scale logistics warehousing. Riverside County has considerable land already zoned for light industrial or business park uses along the I-215 corridor south of Moreno Valley where logistics warehousing would be appropriate. The March Joint Powers Authority has over 700 acres of developable land. San Jacinto has

28

Mr. Mark Gross, Senior Planner
 April 8, 2013
 Page 14

considerable land available for a large logistics warehouse. BNSF has trackage rights for freight service on the San Jacinto Branch Line, which runs parallel to I-215 from Riverside through Perris and Hemet to San Jacinto.

28

Exhibit 2.10: GHG Emissions per Freight Ton-Mile by Freight Transportation Mode, 2006

Source: U.S. EPA, 2008, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990 to 2006*; and Bureau of Transportation Statistics, *National Transportation Statistics*.

19. Mixed-Use Design

The EIR does not contain a plausible mixed-use alternative. Modeling should be done to develop an optimized mixed-use design. The EIR should analyze the vehicle-miles travelled reduction for the mixed-use alternative. Trip counts should be reduced for the mixed-use alternatives based on the resulting internal capture of vehicle trips on the project site.

29

The Mixed-Use A alternative contains no residential and thus fails to achieve the reduced travel impacts that are associated with locating residential development close to commercial and business uses. Mixed Use B alternative eliminates all commercial development and again fails to locate commercial and residential near to each other where trip generation and vehicle miles travelled would be reduced. The mixed use alternatives have not been design in a manner that would achieve the benefits of mixed-use design.

The project should be evaluated for consistency with AB 32, the SCAG Sustainable Communities Strategy and with Executive Order S-03-05.

30

20. Covenants, Conditions and Restrictions

The project applicant should be required to record a set of CC&Rs on the entire project site that implements cost-effective energy and climate mitigation including the various components described in this comment letter. Particular focus should be given to energy

31

Mr. Mark Gross, Senior Planner
April 8, 2013
Page 15

efficient designs, development of renewable energy resources, the use of transportation energy, smart-grid integration, and the implementation of district heating and cooling.

Respectfully submitted,

/s/ Eugene S. Wilson

Eugene S. Wilson

Enclosures

RESPONSES TO LETTER F-3

California Clean Energy Committee

Response to Comment F-3-1. The City acknowledges that the Committee has expressed interest in energy conservation as it applies to the World Logistics Center (WLC) project. The City is interested in finding ways to conserve various forms of energy and help reduce the emission of greenhouse gases.

Response to Comment F-3-2. The City did receive the cited information on the flash drive and it has been incorporated as various appendices to this comment letter. Much of the appended materials were general articles on energy conservation, air pollution control, etc. this may or may not bear a direct relationship to the WLC project. Since the commenter did not indicate how these materials relate to the WLC project and Environmental Impact Report (EIR), the City will not speculate as to their appropriateness, but simply conclude that many measures to conserve energy through building design, reduce vehicle fuel consumption, and provide for alternatives to traditional internal combustion and diesel engines onsite will be implemented as appropriate, and as outlined in various sections of the Draft Environmental Impact Report (DEIR) (e.g., 4.3, *Air Quality*, 4.7, *Greenhouse Gases*, and 4.16, *Transportation*). The World Logistics Center Specific Plan (WLCSP) also has a section on sustainability that addresses building design, landscaping, water use, lighting, etc. (WLCSP Section 1.3.2).

Response to Comment F-3-3. The DEIR contains a number of measures to conserve energy through building design, reduce vehicle fuel consumption, and provide for alternatives to traditional internal combustion and diesel engines onsite have been proposed in various sections of the DEIR (e.g., 4.3, *Air Quality*, 4.7, *Greenhouse Gases*, and 4.16, *Transportation*).

Response to Comment F-3-4. The commenter discusses the expected growth in truck traffic on the freeway system and suggests the Traffic Impact Analysis (TIA) analysis of truck traffic should be extended to the Los Angeles ports.

An additional section (Chapter 12, Section F) has been included in the revised TIA (FEIR Volume 2, Appendix L-1) that analyzes project impacts on freeways to the ports. The analysis found only a small percentage of WLC truck traffic would be to and from the ports. See Table 86 in the revised TIA (FEIR Volume 2 Appendix L-1), repeated below as Table F-3.A. This is based on Southern California Association of Governments (SCAG) survey data.

Table F-3.A: Percentage of WLC Trucks to or from the Ports

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

No impacts were found that were not already covered in the TIA. The freeway analysis in the TIA takes into account the cumulative effect of reasonably foreseeable future development that would affect the overall volume of truck traffic. The growth in truck traffic stems from a variety of factors including population and economic growth, increasing internal and external trade, and locational decisions dependent on the availability and cost of land.

Response to Comment F-3-5. The commenter is correct that the project TIA identifies significant impacts to the identified freeways which cannot be mitigated because the Lead Agency (City) does not have control over how improvement funds are spent in other jurisdictions. However, the revised TIA (Chapter 4, Section F, Volume 2, Appendix L-1) does fully evaluate the potential for rail service to this site and concludes it is not physically feasible, practical, and would result in substantial environmental impacts to residential neighborhoods west of the WLC project if a new rail line were brought in to serve this project. The analysis showed rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, terrain, and capacity constraints within the rail system.

Response to Comment F-3-6. The project is proposing to increase transit ridership and decrease single-occupant vehicle demand through strategies other than through a transit funding charge, though the outcomes are expected to be similar. Section 3.4.6.2 of the DEIR describes various ways the project would incorporate strategies to reduce congestion. Specifically, the DEIR states “*The Specific Plan states that project site development will support alternative transportation options for employees through implementation of onsite bicycle storage, preferred parking for low-emitting and fuel-efficient cars, carpool high-occupancy vehicles, and access to public transit.*” These requirements can be found in the WLCSP at Sections 3.3.4 – Mass Transit Circulation, 3.3.5 – Emergency Access/Trail Connection, 3.4.2 Multi-Use Trails, 3.4.3 – Bicycle Circulation, and 6.0 – Sustainability.

In addition, all facilities at the WLC would be required to participate in programs that will achieve the goal sought by the commenter. A requirement already contained within the DEIR is Mitigation Measure (MM) 4.3.6.4A requires that tenants participate in Riverside County’s rideshare program, which has an established program to distribute information and coordinate carpooling and public transportation. In addition, all tenants will need to comply with the requirements of South Coast Air Quality Management District (SCAQMD) Rule 2202, which accomplishes the same goals as requested by the commenter. All of the methods identified above are means to comply with SCAQMD Rule 2202.

With regard to truck routing, trucks are required to use designated truck routes within the City of Moreno Valley. Other jurisdictions have the option of establishing truck routes or prohibiting trucks from selected streets as it meets their jurisdiction’s need to do so. Since this is programmatic document and it is not known what tenants would occupy the proposed buildings or their business needs, it is speculative to determine that a truck scheduling system would be compatible with their operations. Additionally, as indicated in the TIA, Section 4.D, the vast majority of truck traffic would occur outside peak traffic times and scheduling system would not eliminate the need for truck trips that do occur during peak traffic times.

Response to Comment F-3-7. The commenter requests that the project use a transit-oriented development (TOD) design.

The TIA concurs with the commenter that transit service to the project site is poor, but points out that this is due to the current lack of demand at a site that currently consists of dry-agriculture fields and seven houses. The project would include transit-supportive features (see Chapter 12, Section D of the revised TIA, FEIR Volume 2, Appendix L-1) and it is expected that transit service will be provided once the project reaches a transit-supportable level of operations.

Response to Comment F-3-8. The commenter states the TIA’s trip generation rates of 0.11 vehicular trips per thousand square feet per day (VT/KSF/day) is too low when compared to Institute of Transportation Engineers’ (ITE’s) warehouse rate for traditional warehouses (4.96 VT/KSF/day).

The commenter misstates the trip generation rate that was used in the TIA analysis. The commenter seems to have mistaken the 0.11 VT/KSF/day figure from the fifth column in TIA Table 22, which refers to the AM peak hour only, for the daily rate. The correct figure for the daily rate is presented in

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

the right-most column of TIA Table 22 and is 1.68 trips per thousand square feet per day. This figure is appropriate for high-cube warehouses and is supported by studies from the ITE. ITE has established separate trip generation rates for traditional and high-cube warehouses because the latter typically involve a much higher degree of automation and so have a smaller labor force, and consequently fewer commute trips, than traditional warehouses. The WLCSP would include restrictions on the types of operations allowed on site to maintain consistency with the trip generation assumptions.

Response to Comment F-3-9. The commenter states that TUMF fee mitigation does not adequately account for the project being disproportionately truck trips due to their greater traffic congestion impact.

The TUMF fee schedule adheres to the "rough proportionality" requirement in the Mitigation Fee Act. It is not within the City's authority to change this formula.

Response to Comment F-3-10. A transportation management district and commuter benefits program were included as part of the DEIR through MM 4.3.6.4A and through the requirements of Air Quality Management District (AQMD) Rule 2022. A requirement already contained within the DEIR is MM 4.3.6.4A requires that tenants participate in Riverside County's rideshare program, which has an established program to distribute information and coordinate carpooling and public transportation. In addition, all tenants will need to comply with the requirements of SCAQMD Rule 2202, which accomplishes the same goals as requested by the commenter.

The commenter discusses Mello-Roos Districts as a vehicle to fund design and operation of an on-going transportation management district, the commenter makes no connection between Mello-Roos Districts and any environmental issue and no response is required. The City Council will consider all comments on the project before making a decision on the project.

Response to Comment F-3-11. The commenter states the TIA should address using rail as a mitigation measure.

An additional section (Chapter 4, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes the potential for serving project trips by rail. The analysis showed rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, terrain, and capacity constraints within the rail system.

Response to Comment F-3-12. The commenter questions the seeming contradiction between the project helping the jobs/housing balance in Moreno Valley and the low employee trip generation rate. The commenter also wants assurances that employment levels will actually be as low as forecasted. The commenter claims that there is no support for the proposition that if the project generates 71,085 trips daily that these would substitute for work trips that would otherwise go to other parts of the Los Angeles Basin and that SB-375 requires land use plans that reduce greenhouse gas emissions through vehicle miles traveled (VMT) reductions.

The TIA correctly shows the WLC would improve the jobs-housing imbalance in the City of Moreno Valley by creating needed employment opportunities (Chapter 4, Section D, FEIR Volume 2, Appendix L-1). However, it is clear that the project would not in-itself resolve the entire issue of out-commuting from Moreno Valley and no such claim was made in the report. The specific plan for the project includes a definition of high-cube warehouse that would prohibit labor-intensive activities in areas zoned for high-cube warehouse, which will result in employment levels as forecasted.

The commenter's contention that there is "no support" for the proposition that work trips to the WLC would substitute for work trips that would otherwise go to other parts of the Los Angeles Basin is not correct. The very heart of SB-375 and subsequent sustainable community strategies is to redress the

current problem of long commutes caused by jobs being located in urban cores while housing spreads out to suburbs and exurbs. Moreno Valley, which has one of the lowest jobs-to-housing ratios in the six-county SCAG region, is an extreme example of this problem. A large majority (70%) of Moreno Valley workers commute to jobs outside the city, and many commute long distances far outside the city. According to the U.S. Census Bureau, 20.2% of Moreno Valley workers commute more than 50 miles one way to work, and another 22.2% drive 25 to 50 miles one way (U.S. Census Bureau. 2013. OnTheMap Application. Longitudinal-Employer Household Dynamics Program. <http://onthemap.ces.census.gov/>). There is every reason to foresee that if 20,000 jobs, closely matching the skill set of the Moreno Valley labor force, were to become available in Moreno Valley many residents of the city would take up those jobs in lieu of working at more distant locations, thus reducing the amount of long-distance commuting. While not every job at WLC would be taken by a local resident, the TIA made no claim to such effect. Census data suggests that something like one-third of the jobs in Moreno Valley are taken by residents of the city; some similar percentage may also occur for WLC employees, depending on how much new housing is developed in the city.

Response to Comment F-3-13. The proposed Specific Plan contains regulations which directly address the alternative fuels issues raised by the commenter. Section 1.3.2 “Green Building – Sustainable Development” contains specific design features that will reduce the project’s environmental footprint including accommodating alternative means of transportation, requiring the establishment of an on-site fueling facility for alternative fuels, and providing for alternative power sources including roof-top solar systems on individual buildings. To encourage the use of such fuels, MM 4.3.6.3C and 4.3.6.3D requires the alternative fueling site to be operational prior to the end of the first phase of the WLC.

It is infeasible to require that all trucks utilize alternative fuels exclusively. Trucking operators need to make business decisions to remain viable, one of which relates to selecting a type of fuel suited to its particular needs. The fuel market is dominated by fossil-fuel based vehicles and these vehicles need to be accommodated as well as alternatively fueled trucks. As stated above, the WLC project is imposing the highest current restrictions on all trucks accessing the individual sites and is committing to provide fueling facilities for alternative fuels.

It is not possible at this time to commit to a phase-in for alternative fueled vehicles for the WLC for several reasons. First, it is unknown who the tenants of the WLC will be and the specific nature of their operations (e.g., long-haul trucking versus regional trucking), which would determine the availability of alternatively-fueled vehicles. Furthermore, the trucks serving the WLC are not under the control of the developer and, most likely, would not be under the control of tenants. It is typical that trucking needs would be arranged by the ultimate cargo owner through the use of third parties, such as third-party logistics providers (more commonly known as 3PLs). As a result, the tenant would not have the necessary control to require a phase-in schedule for alternatively-fueled trucks. Additionally, phase-in schedules for alternative-fueled vehicles are unworkable in the context of the WLC. Since most tenants are not expected to have direct control over the trucks that call the WLC facilities, there would be no practical way to allocate responsibility for alternative-fueled vehicles among a multitude of trucking companies, whom the tenants may not even have prior knowledge of. It is for implementation reasons such as this that the WLC has committed that all medium-heavy and heavy duty trucks, those weighing 15,000 pounds (Gross vehicle weight (GVW)) or more, serving WLC facilities must be 2010 compliant to engine emission standards of the State of California and United States Environmental Protection Agency (USEPA), a standard that can be easily communicated and equitably enforced. The WLC project is believed to be the first project of its size to mandate this standard. Finally, while the economics of alternatively-fueled trucking may be changing, there is yet not significant enough market penetration of alternatively-fueled trucks (for instance, no alternatively-fueled trucks have been added to the ports of Long Beach and Los Angeles’ drayage fleet since the ports have ended subsidies for alternatively-fueled trucks) to expect them to reliably serve the WLC through a phase-in schedule.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-3-14. The commenter indicates that the EIR should evaluate mitigation that requires sustainable zero-emissions vehicles; solar can charge vehicle batteries or operate hydrogen electrolysis to power zero-emission fleet vehicles.

Refer to Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, which discusses the reasons for why zero-emissions vehicles are not feasible for this project (see Comment Letter C-3).

Response to Comment F-3-15. There is no evidence that shared or district parking will, in itself, reduce or moderate single-occupant vehicle demand. It is merely a method of organizing parking among multiple of tenants/owners. It would have no impact on the demand by employees for parking and is speculative that multiple facilities would not require maximum parking at the same time. However, all facilities at the WLC would be required to participate in programs that will achieve the goals sought by the commenter. A requirement already contained within the DEIR is MM 4.3.6.4A requires tenants participate in Riverside County's rideshare program, which has an established program to distribute information and coordinate carpooling and public transportation. In addition, all tenants will need to comply with the requirements of SCAQMD Rule 2202, which accomplishes the same goals as requested by the commenter. Specifically, it contains a provision for parking cash-out programs as one method to reduce single-occupant vehicle demand.

Response to Comment F-3-16. The proposed project is programmatic in nature. As a result, it is unknown which specific companies will choose to operate at the WLC or the nature of their operations. As a result, it is impossible to determine if a program like VICS Empty Miles is compatible with future possible tenants. There are too many possible participants and possible variations of participants (trucking companies, cargo owners, facility managers, beneficial cargo owners, 3PLs (third party logistics providers), ocean carriers, and others to understand how they could work with a program like Voluntary Interindustry Commerce Solutions (VICS) Empty Miles at this stage. To a large degree, such programs are unnecessary because to the extent that there are economic opportunities for backhaul, companies already take advantage of them. No trucking company chooses to drive empty. Even so, there are many backhaul trips that remain empty because there are major logistical and liability issues associated with interchanging equipment or cargo, which these programs essentially require to work. To a large degree, some companies are not expected to have any control over the truck fleets that call on their facility. This is because some companies do not own their own trucks. While other companies may be engaged in a proprietary operation that is not suited to coordination with other companies' cargo operations. Historically, these programs have not been successful for the reasons indicated and, in fact, the VICS Empty Miles program website (www.emptymiles.org) is unreachable at the time this response was prepared.

For these reasons, it is unknown whether the VICS Empty Miles program or similar programs would successfully reduce empty backhaul miles. The use of the VICS Empty Miles program or equivalent would be best evaluated at the project level, should any exist at that time. Therefore, the following mitigation measure will be added to the traffic section to encourage future users to take advantage of this program if they are able:

~~**4.15.7.4G** City shall work directly with WRCOG to request that TUMF funding priorities be shifted to align with the improvements identified in this TIA.~~

4.15.7.4G City shall work directly with Western Riverside Council of Governments to request that Transportation Uniform Mitigation Fee funding priorities be shifted to align with the needs of the City, including improvements identified in the World Logistics Center Specific Plan traffic impact analysis. Toward this end, City shall meet regularly with Western Riverside Council of Governments.

Response to Comment F-3-17. The commenter indicates that the project should be required to participate in the Environmental Protection Agency's (EPA's) SmartWay Program.

The diesel trucks that would access the project site would be required to be model year 2010 or newer. SmartWay features (low rolling resistance tires and aerodynamic devices) are required through California's Tractor-Trailer Greenhouse Gas Regulation. In addition, MM 4.3.6.3B encourages tenants to become SmartWay partners and maximize the number of SmartWay trucks. Tenants will be encouraged through the terms in the lease agreement but the developer cannot require them to become SmartWay partners. Participation in this program would be of benefit to many but not all potential tenants of the WLC project, so MM 4.3.6.3B only encourages and does not require participation in this program. If participation is economically feasible and advantageous, many WLC project businesses will certainly want to participate in it, but is unknown at this time what that would mean to a specific business and/or operations since no specific uses or users are proposed at this time. Please see the Final Environmental Impact Report (FEIR) Mitigation Monitoring Reporting Program for a list of the project's mitigation measures.

Response to Comment F-3-18. A comparison of the relative efficiency of different feasible renewable energy technologies is unnecessary to achieve the goal sought by the commenter, which is fueling the construction and operation of the project from renewable electric generation of reduced emission fuels. Regardless of the specific incentive or measure identified above, the various proposed mitigation measures proposed in the FEIR Volume 2 Sections 4.3 and 4.7 share the same goal of a reduction in greenhouse gas emissions.

The proposed project is implementing mitigation measures to reduce the project's impacts related to greenhouse gas emissions, other than those arising from vehicles which are not under the City's control. In the FEIR, the project has incorporated a new MM 4.16.4.6.1C, which requires the following:

- 4.16.4.6.1C** Prior to the issuance of a building permit, new development shall demonstrate that each building has implemented the following:
- 1) Install solar panels with a capacity equal to the peak daily demand for the ancillary office uses in each warehouse building;
 - 2) Increase efficiency for buildings by implementing either 10 percent over the 2008 Title 24's energy saving requirements or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict; and
 - 3) Require the equivalent of "Leadership in Energy and Environmental Design Certified" for the buildings constructed at the World Logistics Center based on Leadership in Energy and Environmental Design Certified standards in effect at the time of project approval.
- This measure shall be implemented to the satisfaction of the Building and Safety and Planning Divisions.

Taken together, these measures exceed the goals established by AB 32 for reducing greenhouse gas emissions, reduce reliance on fossil fuels, increases reliance on renewable resources, and reduce peak loads as suggested by the commenter. The greenhouse gas and climate change impacts analyzed in the FEIR as it relates to the project's incremental use of onsite electricity and corresponding generation of greenhouse gases is not cumulatively considerable and therefore requires no further mitigation. With regard to using onsite power generation to power electric vehicles,

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

please refer to Master Responses (refer to Response to Letter C-3) regarding the feasibility and availability of electric vehicles.

The commenter also indicates that the EIR should evaluate options for 100 percent renewable electrical energy or a lesser percentage. The project is implementing solar, according to MM 4.16.4.6.1C. Also refer to Response to Comment F-3-20.

The commenter also indicates that the EIR should evaluate the extent to which transportation systems can be fueled by renewable electricity or other reduced emission fuels. The project requires yard trucks, generators, and onsite equipment during operation to be powered by non-diesel fuel. In addition, electric vehicle charging infrastructure is being installed in the project. However, requiring additional transportation related measures is not feasible as discussed in Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, and Response to Comment C-3-8.

Response to Comment F-3-19. Since this project falls within MVU's service territory, it is the serving utilities responsibility to secure additional power from Southern California Edison (SCE). WLC has provided all of the current information to Moreno Valley Utility (MVU) for their use in evaluating what additional power requirements they will have in the area. MVU will work with SCE to do a complete and thorough review of SCE's systems in order to properly serve MVU's needs. Any off site impacts to SCE's system in order to serve MVU with additional capacity cannot be analyzed by this project since SCE's system loading and circuit information is also proprietary.

The project's electrical demand is based on typical high-cube warehouses energy demands provided by MVU (see full analysis in Appendix N-1 of FEIR Volume 2). An analysis of twelve similar operations within the utility's service territory was evaluated to establish the projected energy demands for the project.

The benefits of providing various types of renewable energy for this project have been evaluated. In making the evaluation, the project has taken into consideration current California Public Utilities Commission (CPUC) requirements. Currently this project is committed to providing renewable energy through solar panels that will be installed on the rooftops of buildings to help offset the power requirements within the project (MM 4.16.4.6.1C). A detailed solar analysis is included in Appendix N-2 of FEIR Volume 2.

Response to Comment F-3-20. The project has done extensive research in evaluating the energy requirements necessary for the project as well as the possibility of providing solar power options to help offset the electrical demand. Currently the project does have a solar commitment (refer to Response to Comment F-3-18).

Response to Comment F-3-21. It is understood that District heating and cooling facilities is widely used on large campus single owner parcels to distribute power and provide heating and cooling opportunities for all buildings. While it may also be used on similar projects outside of California, the state currently does not allow private District heating and cooling systems such as those that have been suggested by the commenter to cross Public rights of way to serve individual property owners (California Public Utilities Code Section 218). All of the streets within the WLC will be public.

District heating and cooling facilities provide an environmental benefit when heat waste from power generation can be utilized for ancillary uses. However, the project will be required to use solar panels to reduce the projects reliance on grid source power (see MM 4.16.4.6.1C and Responses to Comments F-3-18 thru 20).

Response to Comment F-3-22. The facilities planned for the WLC will generally have limited domestic hot water requirements and only seasonal space heating requirements. Ideally geo-exchange loops would be located in an area of the site where they could be maintained in the future.

The commenter suggests the horizontal or vertical loops can be placed below the foundation this is problematic since the loop may interfere with the location of future foundations for the racking and material handling equipment that is typically installed after the construction of the core and shell of the building. Citing Geo exchange loops within parking or truck yard areas would be problematic to maintain or repair because they would require interruption of the operations of the building.

Solar thermal systems are not viable for the proposed project because there is a limited demand for domestic hot water during the times where the solar thermal system would be able to produce heated water. In addition, the project will require future users to install photovoltaic panels to generate electricity, so many of the systems, like hot water, that typically use natural gas, may use electricity instead, such as flash heaters.

Response to Comment F-3-23. The facilities planned for the WLC will include energy efficient interior lighting systems that will exceed the 2013 California Building Energy Efficiency Standards (Title-24 Part 6) by 10%. Light-Emitting Diode (LED) lighting for interior applications will be incorporated into the project as a part fulfillment of MM 4.16.4.6.1C (exceeding Title 24 by 10%).

Section 4.1.6.4 in the DEIR (Aesthetics) provides a discussion on light and glare and the effect not only on the adjacent residential areas, but also specifically addresses issues of the SJWA to the south and other “natural” areas. There are numerous requirements that must be applied on a project specific basis. These include compliance with the City of Moreno Valley Ordinance 851 on lighting and two mitigation measures to minimize “white” light spillage into the SJWA. LED lighting for exterior applications will be incorporated into project to the extent it meets the requirements outlined above. Also refer to Responses to Comment F-3-18 through F-3-20 and also to Responses F-1-21 regarding low pressure sodium lighting.

Response to Comment F-3-24. It is understood that Microgrid facilities is widely used on large campus single owner parcels to distribute power for all buildings. While it may also be used on similar projects outside of California, the state currently does not allow private District heating and cooling systems such as those that have been suggested by the commenter to cross public rights of way to serve individual property owners (California Public Utilities Code Section 218). All of the streets within the WLC will be public.

Thermal storage allows excess thermal energy to be collected for later use, hours, days or many months later, at individual building, multiuser building, district, town or even regional scale depending on the specific technology. This is not possible since the project is not using co-generation or district heating and cooling (See Response to Comment F-3-21).

Vehicle Batteries (V2G) is a system in which plug-in electric vehicles, such as electric cars (BEVs) and plug-in hybrids (PHEVs), communicate with the power grid to sell demand response services by either delivering electricity into the grid or by throttling their charging rate. This is not possible for this project as MVU does not have a smart grid (based on a phone call with the Jeannette Olko Electric Utility Division Manager for MVU).

Hydrogen Electrolysis for vehicle and equipment use is an automobile that hypothetically derives its energy directly from water. Please see Master Response in Letter C-3 regarding use of alternative fuel vehicle as part of the project.

Response to Comment F-3-25. The WLC is proposing to provide a combination of solar photovoltaic, energy conservation, and enhanced Title 24 plus compliance to reduce the impacts of the project. These clean energy systems will make the project more attractive to companies intending to meet sustainability goals.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Please see Responses to Comments F-3-20 through F-3-24 regarding the feasibility of implementing mitigation measures summarized in this comment.

Response to Comment F-3-26. The commenter discusses Mello-Roos Districts as a vehicle to fund project infrastructure but does not make any specific suggestions for how this funding mechanism might be utilized in connection with the WLC project. Further, the commenter makes no connection between Mello-Roos Districts and any environmental issue regarding the WLC project other than a general statement relative to the State's push to reduce reliance on fossil-fuel powered electrical generation. Further because a Mello-Roos District requires voter approval, the City can't force anyone to vote in favor of setting one up.

Response to Comment F-3-27. The commenter has suggested the project mitigate the loss of farmland by a conservation easement. In fact, a new MM 4.2.6.1A has been added to the FEIR Volume 2 requiring the acquisition of a conservation easement be recorded over land of comparable productive value to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland. It should be noted the revised Parsons Brinckerhoff report and the *California (California) Land Evaluation and Site Assessment (LESA) Model* report (FEIR Volume 2, Appendix C-1 through C-4) have determined that conversion of the Farmland of Local Importance does not represent a significant impact based on the results of the revised LESA model assessment (see also Response F-7A-39 to Letter F-7A for more information on agricultural impacts).

Response to Comment F-3-28. The commenter is referred to Section 6.3.9 of the DEIR that provides a detailed analysis of potential alternative sites in eleven different jurisdictions up to 20 miles from the WLC project site, including several sites mentioned by the commenter. DEIR Figure 6.1 shows the locations of the various jurisdictions that were contacted and/or analyzed for alternative sites and Table 6.R presents the results of that analysis. The DEIR concluded that there were no adequate sites available for various reasons, including size, freeway accessibility (project will not be rail served as explained previously), etc.

Response to Comment F-3-29. An EIR is not required to provide detailed and costly land use plans or designs as part of its analysis of alternatives, but rather the level of detail is dictated by the results of the environmental assessment (i.e., what significant environmental impacts were identified) and what is the overall level of detail provided in the EIR. In this case, this is a programmatic EIR so therefore analysis of land uses at a programmatic level are appropriate and reasonable. Similarly, CEQA does not require a detailed traffic study be prepared for each alternative developed, but a general assessment of impacts (e.g., trip generation comparison) rather than an expensive and detailed traffic study for each alternative that would not yield substantial new information relative road and intersection impacts. Impacts of alternatives are necessarily characterized relative to the proposed project, so a percentage more or less than the impacts of the proposed project is sufficient for a programmatic environmental analysis such as in this EIR.

Response to Comment F-3-30. The commenter is referred to Section 4.7 of the DEIR which specifically addresses consistency with AB 32, SCAG Sustainable Communities Strategy (SCS), Executive Order S-3-05, and the various implementation guidelines developed subsequent to 2006 when the law was signed. In addition, it must be remembered this is a programmatic EIR and future specific development will have to comply with more specific energy conservation requirements in the future. Pages 4.7-38 through 4.7-40 of the DEIR discusses project consistency with the AB 32 Scoping Plan. In Appendix D of the DEIR (pages 229-230), the Sustainable Communities Strategy is discussed. The revised report contains additional information regarding consistency with the Regional Transportation Plan (RTP).

Response to Comment F-3-31. Covenants, conditions and restrictions (CC&Rs) are a normal element of master-planned projects that will ultimately be owned or leased by multiple entities. CC&Rs ensure that a mechanism is in place to manage the overall project and any properties owned

in common. The WLC project will have a comprehensive set of CC&Rs to ensure these functions are properly managed.

The commenter's concerns with issues such as energy efficiency and climate mitigation are more properly regulated and enforced by the applicable land use regulations, not through CC&Rs. Section 11.3.2 of the WLCSP requires site-specific discretionary Plot Plan approvals which will evaluate the details of each building proposed in the WLC and provides the opportunity for the City to impose and enforce appropriate conditions of approval to address these issues and any others that may arise. In addition, each Plot Plan will have its own CEQA evaluation to ensure that environmental issues are appropriately evaluated prior to a project approval.

Response to Appendix 1 (Energy Design Resources Design Brief Chiller Plant Efficiency). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to District Heating and Cooling.

Response to Appendix 2 (Application Opportunities for Absorption Chillers by Johnson Controls). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to District Heating and Cooling.

Response to Appendix 3 (Optimize your facility's energy utilization with free heat by Johnson Controls). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to District Heating and Cooling.

Response to Appendix 4 (Improve your HVAC-energy utilization by Johnson Controls). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Heat Pumps.

Response to Appendix 5 (Use Low-Grade Waste Steam to Power Absorption Chillers by US Department of Energy). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to District Heating and Cooling.

Response to Appendix 6 (CASE STUDY: Central Plant District Cooling and Heating on College Campus). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to District Heating and Cooling.

Response to Appendix 7 (Project Profile - Toyota Motor Sales South Campus Office Development Torrance, California). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LEED.

Response to Appendix 8 (Macy's Goes Solar and Improves Energy Efficiency in 28 California Stores with SunPower - Case Study). The appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 9 (FedEx Goes Solar with SunPower - Case Study). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 10 (USGBC Project Profile - OFFICE DEPOT AUSTIN, TX). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LEED.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 11 (USGBC Project Profile - EMERYVILLE MARKETPLACE EMERYVILLE, CALIFORNIA). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LEED.

Response to Appendix 12 (USGBC Project Profile - JACKSON SQUARE REDEVELOPMENT INITIATIVE ROXBURY AND JAMAICA PLAIN, ROXBURY AND JAMAICA PLAIN, MASSACHUSETTS). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LEED.

Response to Appendix 13 (Tiffany's saves \$450,000 annually with SunPower - Case Study). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 14 (Same as Appendix 13). Same as Appendix 13.

Response to Appendix 15 (Wal-Mart Renewable Energy: Ohio). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 16 (Talbot Solar & Radiant Estimate). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 17 (California's Transition To Local Renewable Energy: 12,000 Megawatts By 2020). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Renewable Energy.

Response to Appendix 18 (Solar Means Business: Top Commercial Solar Customers in the U.S.). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 19 (Clean Power Estimator). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 20 (Solar, Renewable Grid Parity Reached in California – Clean Technical). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 21 (Solar energy measurement - message board). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 22 (Case study Orange County Convention Center Orlando, Florida). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Solar Power.

Response to Appendix 23 (Cost of electricity by source From Wikipedia, the free encyclopedia). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the cost of electricity.

Response to Appendix 24 (Understanding the Cost of Power Interruptions to U.S. Electricity Consumers). The appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the cost of electricity.

Response to Appendix 25 (U.S. Energy Information Administration - FAQ: How much electricity does an American home use?). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the average home's electricity use.

Response to Appendix 26 (Decision Revising Feed-In Tariff Program, Implementing Amendments to Public Utilities Code). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the feed-in tariff program.

Response to Appendix 27 (Moreno Valley Utility Electric Rates). The appendix provides electric rates for the comparison calculation of annual cost of electric power, Chart "Solar Energy Per Year." The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the cost of solar energy.

Response to Appendix 28 (Moreno Valley Resident Services: MV Utilities). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the background of Moreno Valley Electric Utility.

Response to Appendix 29. It is assumed the appendix is intended to provide additional information related to the service area of Moreno Valley Electric Utility.

Response to Appendix 30. The commenter provided the City of Moreno Valley Energy Efficiency and Climate Action Strategy. This was incorporated into the analysis of WLC project impacts in DEIR Section 4.7 (DEIR pages 4.7-25, 4.7-41, 4.7-42).

Response to Appendix 31 (International District Energy Association-Combined Heat and Power: Essential for a Cost Effective Clean Energy Standard). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended as a source for information in the District Heating and Cooling section.

Response to Appendix 32 (International District Energy Association-Community Energy: Planning, Development and Delivery). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to community energy efficiency planning.

Response to Appendix 33 (District heating From Wikipedia, the free encyclopedia). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to district heating systems.

Response to Appendix 34 (Vancouver Green Capital - Neighborhood Energy Utility). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide an example of a city already implementing renewable, innovative and adaptable energy solutions.

Response to Appendix 35 (City of Boise - Geothermal Heating District). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide an example of a city using geothermal heating rather than grid power.

Response to Appendix 36 (The University of Texas at Austin - A Study in the Benefits of Efficiency Improvements to Emissions and Fuel Costs). The appendix provides the graphic

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

"Combined Heat and Power Plant" and information about the University of Texas's efficiency measures.

Response to Appendix 37 (The University of Texas at Austin - Power Plant and Chilling Stations). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide an example of energy efficiency measures being taken at the University of Texas at Austin.

Response to Appendix 38 (District Energy St. Paul - Combined Heat and Power). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to combined heat and power (CHP).

Response to Appendix 39 (District Energy St. Paul - Solar Thermal). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to solar thermal integration into district heating.

Response to Appendix 40 (District Energy St. Paul - Thermal Storage). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to thermal storage.

Response to Appendix 41 (District Energy St. Paul - District Heating). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to district heating systems.

Response to Appendix 42 (District Energy St. Paul - District Cooling). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to district cooling.

Response to Appendix 43 (District Energy St. Paul – Customers). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about companies giving customers a choice in energy supply.

Response to Appendix 44 (District Energy St. Paul – History). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information about the history of District Energy St. Paul.

Response to Appendix 45 (Central Solar Hot Water Systems Design Guide). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to hot water systems design.

Response to Appendix 46 (“Potential for Combined Heat and Power and District Heating and Cooling from Waste-to-Energy Facilities in the U.S. – Learning from the Danish Experience”). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to combined heat and power (CHP) and heating and cooling from waste-to-energy facilities.

Response to Appendix 47 (U.S. Department of Energy International District Energy Association - District Energy, CHP First Order Screening Tool). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to district energy, CHP first order screening tool.

Response to Appendix 48 (Oak Ridge National Laboratory: Combined Heat and Power - Effective Energy Solutions for a Sustainable Future). The appendix was not directly referenced in

the comment letter. It is assumed the appendix is intended to provide additional information related to combined heat and power (CHP).

Response to Appendix 49. The commenter provided a letter from the California Air Resources Board to the California State Assembly regarding combined heat and power facilities. Please refer to Response to Comment F-3-21 regarding this issue.

Response to Appendix 50. The commenter provided California Energy Commission, The Carbon Dioxide Abatement Potential of California's Mid-Sized Commercial Buildings (www.energy.ca.gov/2010publications/CEC-500-2010-050/CEC-500-2010-050.pdf). The article is regarding medium-sized commercial buildings, while this project consists of large warehouses, therefore the information in this article does not apply to the WLC project.

Response to Appendix 51 (ICF International, Inc. Combined Heat and Power: Policy Analysis 2011-2030 Market Assessment). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to combined heat and power (CHP) systems in California.

Response to Appendix 52 (Case Study: U.S. Marine Corps Air Ground Combat Center Twentynine Palms, California). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to energy and facility upgrades with lasting energy efficiencies.

Response to Appendix 53 (Case Study: Whitehall/Coplay School District Whitehall, Pennsylvania). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to energy and facility upgrades with lasting energy efficiencies.

Response to Appendix 54 (Geothermal Heat Pump From Wikipedia, the free encyclopedia). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide background information related to geothermal heat pumps.

Response to Appendix 55 (U.S. Department of Energy - Geothermal Technologies Office). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide background information related to geothermal technologies.

Response to Appendix 56 (U.S. Department of Energy - Guide to Geothermal Heat Pumps). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide background information related to geothermal heat pumps.

Response to Appendix 57 (FEMP's Geothermal Heat Pump Program). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to geothermal heat pump programs.

Response to Appendix 58 (Office of Geothermal Technologies - Geothermal Heat Pumps for Medium and Large Buildings). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to geothermal heat pumps.

Response to Appendix 59 (Commercial Geothermal Heat Pumps). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to geothermal heat pumps.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 60. The commenter provided an article regarding the first DHL carbon neutral warehouse in the United Kingdom. The warehouse uses a ground source heat pump for heating and cooling and motion sensors for electric lighting systems. The warehouse switched to a green energy tariff. The United Kingdom has different energy standards and electricity generation facilities than Southern California. The project will be incorporating onsite and will meet LEED certified standards (MM 4.16.4.6.1C).

Response to Appendix 61 (ICLEI: City Planners' Energy Action Resource Guide - Greenhouse Gas Reduction Measures for New Development). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to energy efficiency in community design.

Response to Appendix 62 (Department of Energy - Estimating the Cost and Energy Efficiency of A Solar Water Heater). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to cost and energy efficiency of a solar water heater.

Response to Appendix 63 (Solar Water Heating From Wikipedia, the free encyclopedia). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to solar water heating.

Response to Appendix 64 (Energy Efficiency and Renewable Energy - Solar Water Heating). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to solar water heating.

Response to Appendix 65 (White Paper: Solar Thermal Energy: The Time Has Come). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to solar thermal energy.

Response to Appendix 66 (U.S. Department of Energy - Building Technologies Office). The appendix provides information about LEDs and specifications for parking lots referenced in Section 13. Lighting and Energy Efficiency. The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LEDs and energy consumption.

Response to Appendix 67 (Product Snapshot: LED Replacement Lamps). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LED lamps.

Response to Appendix 68 (My LED Lighting Guide). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to LED lamps.

Response to Appendix 69 (California Energy Commission - Local Ordinances Exceeding 2008 Building Energy Efficiency Standards). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to local ordinances exceeding building energy efficiency standards.

Response to Appendix 70 (City of Malibu Local Energy Efficiency Standards). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Malibu's building energy efficiency standards.

Response to Appendix 71 (Santa Monica Municipal Code - Green Building Standards Code). The appendix was not directly referenced in the comment letter. It is assumed the appendix is

intended to provide additional information related to Santa Monica's building energy efficiency standards.

Response to Appendix 72. The commenter provided the City of Mountain View's application to the California Energy Commission for Green Building Standards Code Local Amendments. This application was not directly referenced in the commenter's letter, so it is unclear why the material was provided, however, MM 4.16.4.6.1C in Section 4.16 of the DEIR requires the project to exceed Title 24 standards by 10 percent.

Response to Appendix 73. The commenter provided a City of Healdsburg ordinance, which adopts Title 24 California Code of Regulations, "2010 California Green Building Standards Code." The comment letter did not discuss why this reference was provided. As discussed in the DEIR (Table 4.7.J, page 4.7-36), the project would be required to comply with all existing requirements, including the California Green Building Standards Code, and MM 4.16.4.6.1C in Section 4.16 of the DEIR requires the project to exceed Title 24 standards by 10 percent.

Response to Appendix 74 (Galvin Electricity Initiative - What are Smart Microgrids?). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to microgrids.

Response to Appendix 75 (Galvin Electricity Initiative - Understanding Microgrids). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to microgrids.

Response to Appendix 76 (Galvin Electricity Initiative - The Value of Smart Distribution and Microgrids). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to microgrids.

Response to Appendix 77 (Southern California Association of Governments, Regional Transportation Plan, Goods Movement Appendix (2012)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide support to the comment that Port-related truck activity is expected to increase in the future.

Response to Appendix 78 (SCAG, Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities (Task 5 Report) (Jul. 2010)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide support to the comment that "warehousing in western Riverside County will increasingly serve the ports of Los Angeles and Long Beach."

Response to Appendix 79 (Chapter 7 – Heavy Duty Truck Model from SCAG 2008 Regional Model: SCAG Regional Travel Demand Model and 2008 Model Validation). The appendix was mentioned in the comment letter when stating that the EIR "should evaluate the potential cumulative impact of increased heavy-duty truck traffic from the ports."

Response to Appendix 80 (A presentation on the Southern California Association of Governments, Southern California Region Heavy Duty Truck Model). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide support to the comment stating that the EIR "should evaluate the potential cumulative impact of increased heavy-duty truck traffic from the ports."

Response to Appendix 81 (Southern California Association of Governments, On the Move: Southern California Delivers the Goods (Dec. 2012)). The appendix was not directly referenced in

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

the comment letter. It is assumed the appendix is intended to provide support to the comments relating to goods movement in the Southern California region.

Response to Appendix 82 (Wikipedia, Transportation Forecasting). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide support to the comments relating to travel demand forecasting.

Response to Appendix 83. The commenter did not indicate what the purpose was of including this document as an appendix to its comment letter. While the City will not overly speculate on its purpose, it appears to suggest a methodology for estimating indirect effects of growth since it is entitled “Guidance for Preparers of Growth-Related, Indirect Impact Analyses” produced by FHWA, US EPA, and Caltrans. However, the introduction of Section 2 in this report clearly states “This guidance refers to a specific type of indirect effect—the effects of growth that can be linked to the development of a Caltrans’ transportation project.” Therefore, this information is not relevant to a large logistics warehouse project such as WLC and will not be investigated further.

Response to Appendix 84 (Delivering Tomorrow Towards Sustainable Logistics by Deutsche Post DHL). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to sustainable logistics.

Response to Appendix 85 (UPS: Shipping Green by Environmental Defense Fund). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to improve the environmental characteristics of the company’s express packaging.

Response to Appendix 86. The commenter did not indicate what the purpose was of including this document as an appendix to their comment letter. While the City will not overly speculate on its purpose, it appears to suggest ways that logistics shipping can be made more efficient. It was prepared by the Environmental Defense Fund and does not appear to have had any direct industry input or review. While this information may be of general relevance to the logistics industry as a whole, the commenter has made no effort to connect it to a logistics warehouse project such as WLC. Therefore, this information will not be investigated further.

Response to Appendix 87 (How To Stay Clean In A Dirty World: A Vision For A Smarter, Healthier Supply Chain by Environmental Defense Fund). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Improving Supply Chain Efficiency And Sustainability.

Response to Appendix 88 (Dablanc, L. & Rakotonarivo, D., The Impacts of Logistics Sprawl: How Does the Location of Parcel Transport Terminals Affect the Energy Efficiency of Goods’ Movements in Paris and What Can We Do About It? (2010)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the environmental impact of goods movements related to warehousing.

Response to Appendix 89 (Riverside County Transportation Commission, Draft Environmental Impact Report Perris Valley Line (Apr. 2010)). The appendix was mentioned in the comment letter when discussing the mitigation of transportation impacts. Facts from the Perris Valley Line study were included in the comment letter, such as: “the diversion from private car use to rail will reduce VMT by approximately 34 million miles per year reducing GHG emissions in the region.”

Response to Appendix 90 (Texas A&M Transportation Institute, TTI’s 2012 Urban Mobility Report (Dec. 2012)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to general changes in levels of truck congestion.

Response to Appendix 91 (Texas A&M Transportation Institute, Carpooling). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that a “Mello-Roos district should be established for the project to fund the design and operation of an on-going transportation management district and a commuter benefits program to serve the project’s transportation demand.”

Response to Appendix 92 (Texas A&M Transportation Institute, Vanpool). Same comment as Appendix 91.

Response to Appendix 93 (Texas A&M Transportation Institute, Real-Time Ride Sharing). Same comment as Appendix 91.

Response to Appendix 94 (Federal Highway Administration, Mitigating Traffic Congestion: The Role of Demand-Side Strategies). Same comment as Appendix 91.

Response to Appendix 95 (City and County of San Francisco, Memo to Planning Commission: Information Presentation on the Transportation Sustainability Program (Jan. 2012)). Same comment as Appendix 91.

Response to Appendix 96 (City and County of San Francisco, San Francisco Transportation Sustainability Fee Nexus Study (Mar. 2012)). Same comment as Appendix 91.

Response to Appendix 97 (California Air Resources Board, ARB 1998 Criteria and Guidelines for the Use of Motor Vehicle Registration Fees: Design of Successfully Demonstrated Projects: Design of Successfully Demonstrated Projects). Same comment as Appendix 91.

Response to Appendix 98 (City of Riverside, Riverside Go Transit Program Guidelines). Same comment as Appendix 91.

Response to Appendix 99 (City of Riverside, Riverside Go Transit Frequently Asked Questions). Same comment as Appendix 91.

Response to Appendix 100 (Riverside Transit Agency, RTA Awarded \$2.4 Million in Federal Grant). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that RTA has “numerous transit routes serving the area” and that the compressed natural gas buses intended to be purchased with the grant mentioned in the appendix would help to reduce GHG emissions in the region.

Response to Appendix 101 (Riverside Transit Agency, System Map). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that the Project “should subsidize transit fees, promote transit ridership, insure adequate transit service, and improve transit intermodal connections so as to increase transit ridership and reduce impacts to transportation system, air quality, energy, and GHG emissions.”

Response to Appendix 102 (Texas A&M Transportation Institute, Express Bus Service). Same comment as Appendix 91.

Response to Appendix 103 (Victoria Transport Policy Institute, Transit Station Improvements). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that the Project could further reduce impacts by implementing a transit oriented development design.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 104 (Victoria Transport Policy Institute, Trip Reduction Tables). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that the Project should subsidize transit fees.

Response to Appendix 105 (U.S. DOT. Public Transportation’s Role in Responding to Climate Change (January, 2010)). Same comment as Appendix 101.

Response to Appendix 106 (Google, Maps of Freeway Segments). The appendix was not referenced in the comment letter. We have reviewed the maps and provided similar maps in the FEIR Volume 2 Appendix L-1.

Response to Appendix 107 (Riverside Transit Agency, Short Range Transit Plan (May, 2012)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment that RTA has “numerous transit routes serving the area” and that the project should subsidize transit fees. The appendix could also be provided to support the request that the City of Moreno Valley and the RTA operate a transportation management district for the project.

Response to Appendix 108 (Riverside County Transportation Commission, Strategic Analysis of Express Bus Service for Western Riverside County (2011)). Same comment as Appendix 91.

Response to Appendix 109. The commenter provided *Moving Cooler, an Analysis of Transportation Strategies for Reducing Greenhouse Gas Emissions*. The comment letter did not discuss why this reference was provided. The DEIR and FEIR considered options to reduce greenhouse gas emissions and many are included as project design features and mitigation measures (see Master Response-1).

Response to Appendix 110 (City of Seattle, Best Practices in Transportation Demand Management). Same comment as Appendix 91.

Response to Appendix 111 (Texas A&M Transportation Institute, Transportation Management Associations). Same comment as Appendix 91.

Response to Appendix 112 (Online TDM Encyclopedia - TDM Marketing). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related Transportation Demand Management.

Response to Appendix 113 (Victoria Transport Policy Institute, Transport Management Associations). Same comment as Appendix 91.

Response to Appendix 114 (Montgomery County Code, Article II, Sections 42A). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Montgomery County's ridesharing and transportation management code.

Response to Appendix 115 (Victoria Transport Institute, Transit-Oriented Development). Same comment as Appendix 103.

Response to Appendix 116 (Caltrans. Transit-Oriented Development Compendium (June, 2005)). Same comment as Appendix 103.

Response to Appendix 117 (Caltrans. Transit-Oriented Development Compendium (June, 2005)). Same comment as Appendix 103.

Response to Appendix 118 (Western Riverside Council of Governments, Transportation Uniform Mitigation Fee: Fee Calculation Handbook (2012)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comments that the “TUMF mitigation does not account for the additional trips generated by the project being disproportionately truck trips which require considerably more infrastructure investment due to their greater traffic congestion impacts.”

Response to Appendix 119 (Western Riverside Council of Governments, Transportation Uniform Mitigation Fee Nexus Study Final Report (2009)). Same comment as Appendix 118.

Response to Appendix 120 (Al-Kaisy, A. & Jung, Y., Examining the Effect of Heavy Vehicles During Congestion Using Passenger Car Equivalents). Same comment as Appendix 118.

Response to Appendix 121 (City of San Jose, Envision San Jose 2040, Transportation Analysis (2011)). The appendices are not referenced in the comment letter. The appendices are transportation sections of EIRs, with two of the PDFs being over a hundred pages. It is not clear what is unique about the included transportation sections of the EIR and how it relates to the WLC EIR.

Response to Appendix 122 (Southern California Association of Governments, 2012-2035 RTP/SCS Draft Program EIR, Transportation, Traffic & Security (2012)). The appendices are not referenced in the comment letter. The appendices are transportation sections of EIRs, with two of the PDFs being over a hundred pages. It is not clear what is unique about the included transportation sections of the EIRs and how it relates to the WLC EIR.

Response to Appendix 123 (Tahoe Regional Planning Agency, Homewood Mountain Resort Ski Area Master Plan EIR/EIS, Transportation, Parking and Circulation (2011)). The appendices are not referenced in the comment letter. The appendices are transportation sections of EIRs, with two of the PDFs being over a hundred pages. It is not clear what is unique about the included transportation section of the EIR and how it relates to the WLC EIR.

Response to Appendix 124. The commenter provided the Southern California Association of Governments 2012-2035 Regional Transportation Plan (RTP). This document is discussed in the DEIR (Appendix D, pages 229-231). The FEIR also contains an analysis of how the project is consistent with the strategies in the RTP.

Response to Appendix 125. The commenter provides an article regarding how the UPS fleet will add 100 electric delivery vehicles to its fleet. The Electric Vehicles International (EVI) trucks cost about \$150,000 each and have a 75-mile range. As discussed in Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, it is not feasible to require electric trucks/vehicles for the WLC project.

Response to Appendix 126. The commenter provides an article regarding hydrogen fuel-powered forklifts at a Coca-Cola location. As discussed in the DEIR (page 3-33) and in the WLCSP (Section 12.3), the WLC project requires non-diesel forklifts during operation of the project. If the tenants find it feasible, they may implement hydrogen fueled forklifts as well.

Response to Appendix 127. The commenter provided a report by the California Governor’s Working Group on Zero-Emission Vehicles, *2013 ZEV Action Plan, a roadmap toward 1.5 million zero-emission vehicles on California roadways by 2025*. As discussed in Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, it is not feasible for the project to require zero-emission vehicles. However, MM 4.3.6.4A requires electrical charging stations at future buildings within the WLCSP.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 128 and Appendix 129. The commenter provides information regarding hydrogen fuel cell and zero emission buses, but the project would not likely have many buses. In addition, Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, indicates that it is not feasible for the project to require non-diesel trucks.

Response to Appendix 130. The commenter provides information on well to tank hydrogen fuel cells. Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, indicates that it is not feasible for the project to require non-diesel trucks.

Response to Appendix 131 through Appendix 138. The commenter provides information about hydrogen fuel stations and locations. Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, indicates that it is not feasible for the project to require non-diesel trucks.

Response to Appendix 139. The commenter provided a report regarding bringing hydrogen fuel cell electric vehicles to California. It is not feasible to require electric or hydrogen fuel cell vehicles as part of the project (refer to Master Response-3). However, MM 4.3.6.4A requires electric vehicle charging stations.

Response to Appendix 140. The commenter provided an article regarding ACE Hardware providing 65 hydrogen fuel cell power lift trucks (forklifts). The project prohibits diesel powered forklifts during operation of the project (MM 4.3.6.3B). If future tenants find it feasible to implement hydrogen fuel cell forklifts, they may do so.

Response to Appendix 141. The commenter provided a reference regarding parking management. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 142. The commenter provided a report on an overview of U.S. parking management policies. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 143. The commenter provided a report on parking cash out. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 144. The commenter provided draft text of Senate Bill No. 582 which was vetoed by the Governor on August 1, 2011. Consideration of Governor's veto stricken from file on February 2, 2012. The comment letter did not discuss why this reference was provided.

Response to Appendix 145. The commenter provided information on California's parking cash-out program. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 146. The commenter provided a definition on shared parking, a parking management strategy. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 147. The commenter provided information on commuter financial incentives. MM 4.3.6.4A requires that the project's tenants participate in Riverside County's Rideshare Program, which encourages alternative forms of transportation.

Response to Appendix 148. The commenter provided information on parking management. MM 4.3.6.4A requires that the project participate in Riverside County's Rideshare Program and requires preferred parking for low-emitting, fuel-efficient, and carpool/van pool vehicles.

Response to Appendix 149 (Voluntary Interindustry Commerce Solutions, VICS Collaboration Zone: Frequently Asked Questions). The appendix was indirectly referenced in the comment letter in the Co-Loading and Back-Hauling section. The appendix provides additional information on the VCIS Empty Miles program.

Response to Appendix 150 (Voluntary Interindustry Commerce Solutions, VICS Empty Miles). Same comment as Appendix 149.

Response to Appendix 151 (GS1 US, National Retail Systems: Doing What's Good for Clients). Same comment as Appendix 149.

Response to Appendix 152 through Appendix 154. The commenter provided information on SmartWay. Please refer to Response to Comment F-3-17.

Response to Appendix 155 (U.S. EPA, Overview of Carrier Strategies). Same comment as Appendix 152.

Response to Appendix 156 (U.S. EPA, Ship Smarter - You and the Environment Both Win (June 2007)). Same comment as Appendix 152.

Response to Appendix 157 (U.S. EPA, Shipper Partner 2.0.11 Tool: Technical Documentation 2011 Data Year - United States Version). Same comment as Appendix 152.

Response to Appendix 158 (Moreno Valley General Plan Final Program EIR - 5.8 Agricultural Resources). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide Moreno Valley's original General Plan's EIR agricultural resources section.

Response to Appendix 159 (California Farmland Conservancy Program Funded Easements, 1997 to 2012). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to California farmland easements from 1997 to 2012.

Response to Appendix 160 (Riverside County Agricultural Production Report 2011). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Riverside County's agricultural production.

Response to Appendix 161 (Riverside County Important Farmland 2010 (Sheet 1 of 3)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the farmland distribution in Riverside County.

Response to Appendix 162 (Riverside County Important Farmland 2010 (Sheet 2 of 3)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the farmland distribution in Riverside County.

Response to Appendix 163 (Riverside County Important Farmland 2010 (Sheet 3 of 3)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the farmland distribution in Riverside County.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 164 (Riverside County 2008-2010 Land Use Conversion). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Riverside County's land use conversion from 2008 to 2010.

Response to Appendix 165 (Riverside Land Conservancy). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Riverside Land Conservancy.

Response to Appendix 166. The commenter did not indicate what the purpose was of including this document as an appendix to their comment letter. While the City will not overly speculate on its purpose, it is a resolution by the City of Perris approving a FEIR and Statement of Overriding Considerations for the Perris Marketplace project. The commenter has made no effort to explain a connection between this document and the proposed WLC project, and it is from another jurisdiction. Therefore, this information will not be investigated further.

Response to Appendix 167 (American Farmland Trust - California Agricultural Land Loss & Conservation: The Basic Facts). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to agricultural land use in California.

Response to Appendix 168 (Letter from the Department of Conservation - Division of Land Resource Protection to City of Perris Planning Department). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the DEIR for Perris Valley Commerce Center from the Division of Land Resource Protection.

Response to Appendix 169 (Surrounding City Maps showing rail transit lines). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to local rail lines.

Response to Appendix 170. The April 8, 2013 Letter F-3 from the California Clean Energy Commission discusses the need for energy conservation and the use of clean energy, and includes an attachment not cited in the Letter's text that is entitled "*Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities.*" This study, which was prepared by the Southern California Association of Governments ("SCAG"), was not discussed in the Letter, so it is unclear why it was attached. However, in summary, this study supports the need for more warehousing space. The study's Executive Summary states the following:

- "According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet.
- During the year 2035, there will be a **projected shortfall of space of about 228 million square feet**, unless other land not currently zoned for warehousing becomes available."

The WLC will contribute to the supply of warehouse space necessary to satisfy a portion of this demand. This SCAG Report supports other data presented by David Tausig and Associates (DTA) in its responses to DEIR comments that there will be more than sufficient demand to support the WLC.

Response to Appendix 171 (Sperry, B., Comparing Methodologies to Estimate Internal Trip Capture at Mixed-Use Developments). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comments on mixed-use design.

Response to Appendix 172 (Bochner, B. & Sperry, B., Internal Trip Capture Estimator for Mixed-Use Developments (Feb. 2010)). Same comment as Appendix 171.

Response to Appendix 173 (Nelson/Nygaard Consulting. Crediting Low-Traffic Developments: Adjusting Site-Level Vehicle Trip Generation Using URBEMIS (Aug. 2005)). Same comment as Appendix 171.

Response to Appendix 174 (BNSF, BNSF California Operating Division). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comments on freight rail, specifically that the Project should develop freight facilities along nearby freight lines, such as the San Jacinto Branch Line.

Response to Appendix 175 (The Environmental Benefits of Moving Freight by Rail by the Association of American Railroads). The appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to environmental advantages of moving freight by rail. However, Response F-3-5 explains why rail service to the project site is not feasible and would produce its own environmental impacts.

Response to Appendix 176 (Freight Railroads Help Reduce Greenhouse Gas Emissions). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to freight rail environmental significance.

Response to Appendix 177 (Riverside County Transportation Commission, San Jacinto Branchline/I-215 Corridor Study (2004)). Same comment as Appendix 174.

Response to Appendix 176. The commenter provides a reference, *Freight Railroads Help Reduce Greenhouse Gas Emissions*. An additional section (Chapter 4, Section F) has been included in the TIA that analyzes the potential for serving project trips by rail. That analysis shows that rail service to the project site is not viable due to a range of physical and economic factors, including high fixed costs, onsite topographic constraints, secondary impacts on the community, terrain, and capacity constraints within the rail system.

Response to Appendix 179 (Sperry, B., Comparing Methodologies to Estimate Internal Trip Capture at Mixed-Use Developments). Same comment as Appendix 174.

Response to Appendix 180 (Nelson/Nygaard Consulting. Crediting Low-Traffic Developments: Adjusting Site-Level Vehicle Trip Generation Using URBEMIS (Aug. 2005)). Same comment as Appendix 171.

Response to Appendix 181 (Institute of Transportation Engineers, Trip Generation Handbook, Chpt. 7 (2001)). Same comment as Appendix 171.

Response to Appendix 182 (City of Moreno Valley, Moreno Valley General Plan: Circulation Element). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the Moreno Valley transportation-related comments. The appendix was reviewed and is reflected in the analysis of in the revised TIA and Section 4.15 of the FEIR Volume 2.

Response to Appendix 183 (City of Moreno Valley, General Plan Final Environmental Impact Report: 5.2 Traffic/Circulation (Oct. 2006)). Same response as Appendix 182.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 184. The commenter provided ARB's Climate Change Scoping Plan. This reference was included and discussed in the DEIR (pages 4.7-17, 4.7-23, and 4.7-38-4.7-40).

Response to Appendix 185. The commenter provided the Office of Planning and Research technical advisory, CEQA and Climate Change. This document was referenced in the DEIR (page 4.7-26).

Response to Appendix 186. The commenter provided a report regarding technologies and policies to consider for reducing greenhouse gas emissions in California. The commenter did not indicate why this reference was included. The project is incorporating mitigation measures and project design features to reduce project emissions of greenhouse gases.

Response to Appendix 187. The commenter provided the text of California's Executive Order S-3-05. It is unknown why the commenter included this reference. This reference is discussed in the DEIR (page 4.7-17).

Letter F-4: California Outdoor Heritage Alliance (April 8, 2013)

Letter F-4

April 8, 2013

Mr. John Terell
City of San Moreno
Community & Economic Development Department
14177 Frederick Street
Post Office Box 88005
Moreno Valley, CA 92553

Re: World Logistic Center - DEIR

Dear Mr. Terell,

The California Outdoor Heritage Alliance (COHA) – an organization representing the interests of over 50 organizations and entities dedicated to the promotion of wildlife conservation – has serious concerns regarding the Draft Environmental Impact Report (DEIR) prepared to evaluate the environmental impacts associated with the proposed World Logistics Center Project (“project”) in Rancho Belago in the eastern portion of the City of Moreno Valley.

California once boasted over 5 million acres of naturally occurring wetland habitats. Today – largely due to development, flood control and other projects – over 90% of these critical habitats have been destroyed, resulting in significant impacts on all wetland-dependent species. In fact, as a direct result of the substantial loss of this important habitat type, roughly 50% of our state’s threatened and endangered species are, in some way, wetland-dependent. Due to the significant changes in California’s natural hydrology, our remaining interior wetlands must now be artificially irrigated and intensely managed – at a significant cost to the landowner – to recreate seasonal wetland habitat for these special status species.

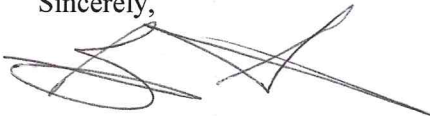

This proposed project covers 3,918 acres – including 3,814 acres of land which is the subject of various entitlements, and an additional 104 acres of land affected by off-site improvements needed to support the proposed development. Any development of this substantial size would have serious environmental impacts. However, in this case, the proposed project area is located in one of the most environmentally important and sensitive wetland habitat complexes remaining in California. The project’s environmental impacts to our already severely impacted wetland base and wetland-dependent species would be significant and unacceptable without substantial appropriate mitigation measures. Specifically, in the case of this gigantic project, as just one example, the DEIR woefully understates the project’s impacts on waterbirds and other species on the Department of Fish and Wildlife’s (DFW) San Jacinto Wildlife Area (SJWA) and adjacent privately owned and managed wetland habitats. It follows that the mitigation measures proposed, including requiring a minimum 250-foot setback from environmentally sensitive areas, are substantially inadequate and unacceptable.

Making matters worse, the DEIR incorrectly designates an area adjacent to the SJWA and part of the World Logistic Center project as a “conservation buffer”. However, the area described within this

“conservation buffer” is owned and maintained by DFW as part of their SJWA. This area was acquired by the Wildlife Conservation Board over a decade ago for addition to the SJWA for endangered and threatened species habitat and associated wildlife conservation efforts in the county of Riverside. Designating this area as a “conservation buffer” and mitigation in the DEIR is not only incorrect, it is inappropriate and misleading.

On behalf of the general public of California, and the natural resources of our state that they hold in public trust, DFW, the Wildlife Conservation Board and others have invested over \$100 million in the SJWA and surrounding unique habitats that would be unacceptably impacted by this project. As a result of the location, substantial size, inadequate analyses of wildlife impacts and the overly insufficient mitigation offered within the DEIR, our organization has no choice but to take serious issue with the document and strongly urge it be wholly rejected by the City of Moreno

Sincerely,

A handwritten signature in black ink, appearing to read 'Bill Gaines', with a large, sweeping flourish extending to the right.

Bill Gaines, President

RESPONSES TO LETTER F-4
California Outdoor Heritage Alliance

Response to Comment F-4-1. The City acknowledges this organization has an interest in wildlife conservation.

Response to Comment F-4-2. Both the Draft Habitat Assessment and (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013, FEIR Volume 2, Appendix E-1) (hereafter MSHCP Consistency Analysis) and Section 4.4 of the Draft Environmental Impact Report (DEIR) adequately assess all impacts to biology. The statement that 3,918 acres would be impacted by the World Logistics Center Specific Plan (WLCSP) is incorrect. Approximately 2,610 acres are a part of the WLCSP, with another 1,104 acres analyzed as a part of a General Plan Amendment to further protect these acres within the San Jacinto Wildlife Area (SJWA) by changing the zoning to open space.

Since there are no wetlands on any of the analyzed areas, (5,970 acres were included in the WLCSP study area) the potential impacts to wetland and wetland-based species is not likely to occur. The northern portions of the SJWA identified as the California Department of Fish and Wildlife (CDFW) Conservation Buffer Area in the DEIR and MSHCP Consistency Analysis (FCS-MBA 2013 FEIR Volume 2, Appendix E-1) document was purchased by the state to serve as a buffer between the SJWA and future development areas to the north and to protect resources associated with the wetland areas. This project does nothing to jeopardize this and in fact by providing the appropriate zoning (Open Space) for the CDFW property further protects the resources. The 250-foot buffer at the southern edge of the WLCSP is intended to reduce indirect impacts associated with the Urban/Wildlands Interface sections of the MSHCP and appropriately reduces impacts from light, noise, toxics, and water pollution/sedimentation.

Repeated biological surveys of the area only identified six sensitive species within the WLCSP or in the SJWA within the CDFW Conservation Buffer Area. All six of these species are either California species of concern or California fully protected species. The loss of low quality foraging habitat for avian species not listed as federally or state threatened or endangered species is not a significant impact. However, impacts to a fully protected species is considered a significant impact.

The MSHCP anticipated the loss of habitat in lands not originally slated for conservation through the use of Criteria Cells. The funds provided through the MSHCP mitigation fees can be used by the Regional Conservation Authority to purchase lands slated for conservation within these Criteria Cells that will contribute to the overall conservation of large areas of high quality habitat. All six of the sensitive species identified within the WLCSP and adjacent SJWA are all covered under the MSHCP and payment of the fee will reduce impacts to a less than significant level.

With regard to the comment on reference to the CDFW Conservation Buffer Area, it is a defined term in DEIR Section 4.3.1:

The term “CDFW buffer area” is not a CDFW term. It is a term used by the consulting biologist to identify the 910-acre portion of the project area owned by the state that is being rezoned to “open space.” It is CDFW land and it was acquired as a buffer (and for other reasons as well). Calling it the CDFW buffer is not inaccurate or misleading.

The General Plan Amendment provides for the designation of the CDFW and portions of the San Diego Gas and Electric (SDG&E) lands as open space. If impacted, the CDFW Conservation Buffer Area would have a greater potential impact on species of the region, due to the distance from the high-quality habitat of the SJWA. The WLC project does not “take credit” for re-zoning this area as open space. The current General Plan and zoning for the property is a mix of residential, public, and

open space designations that need to be revised since those uses are no longer planned and will never be developed.

The May 18, 2001 Wildlife Conservation Board Agenda (page 43) recommended that 5 separate parcels totaling approximately 1,000 acres (910 acres of which were part of the Moreno Highland Specific Plan) be purchased as expansions of the California Department of Fish and Game's San Jacinto Wildlife Area.

"Acquisitions of the proposed expansions will allow for the protection of a portion of Mystic Lake and its associated upland habitat which is important to a number of sensitive plant and animal species." "The DFG has identified the subject properties as being a Significant Natural Area and has recommended the purchase of the property as an addition to the existing WLA. The acquisition of the subject properties are important to the wildlife of the area as they will serve as a buffer from development north of the WLA and add significant wildlife benefits to the WLA. It is anticipated that the addition of these properties will enhance public recreational opportunities, as the upland habitat and wetland areas are restored."

The "CDFW Conservation Buffer Area" was incorporated into the San Jacinto Wildlife Area following the sale of the subject lands to the State in 2001. As stated previously, the "CDFW Conservation Buffer Area has been incorrectly zoned for more than 12 years. The proposed General Plan Amendment corrects the designation of this land to Open Space.

These lands, while a part of the SJWA are currently used by CDFW for agricultural use and generally consists of disked fields with winter grain crops, planted and harvested yearly. Development of the WLCSP will have no direct impact on the CDFW Conservation Buffer Area. A buffer of 400 feet has been provided in the Specific Plan between the conservation area and the warehouse buildings. The 250 foot buffer would exclude buildings but would allow for roads, landscaping, and drainage facilities. The commenter is referred to Mitigation Measures (MMs) 4.4.6.1A through 4.4.6.1B and 4.4.6.4F for details regarding the buffer to be established between the WLCSP and the SJWA, and also to Draft EIR Section 4.4.1.18, *Other Issues – Setbacks*, that explains why 250 feet is appropriate for this project buffer.

The lands within the CDFW Conservation Buffer Area are further protected by the MSHCP by being included within a series of Criteria Cells (1364, 1370, 1377, 1386, 1389, 1390, 1483, 1482, 1477, and 1577). Under the MSHCP, each Criteria Cell has a specific conservation goal. In addition to the Criteria Cell protections, the land within the CDFW is also considered Public/Quasi Public Lands according to the MSHCP. Lands designated as Public/Quasi Public Lands are typically lands that are set aside by Cities and/or Counties as conservation areas and are typically part of Core Conservation Areas or Proposed Core Conservation Areas. Sections of the DEIR correctly spell out measures associated with the requirements of Section 6.1.4 of the MSHCP on the Urban/Wildlands Interface to protect adjacent resources. These include, light, noise, toxics, and water quality. Project design features and mitigation measures have been incorporated into the Specific Plan and CEQA document to protect the resources associated with the CDFW Conservation Buffer Area and the SJWA and are included as MM 4.4.6.1A.

Response to Comment F-4-3. Section 4.4.1.11 of the DEIR went into great detail as to the history and use of the conservation area between the WLC project and the SJWA and Mystic Lake. The term CDFW Conservation Buffer Area is a term that is used to identify the 910-acre parcel owned by the State adjacent and south the WLC site (refer to DEIR page 3-19). Regardless of what this area is called, it was originally part of the Moreno Highlands Specific Plan property and was acquired by the state (refer to Response to Comment F-4-2) at least in part to act as a buffer between the SJWA/Mystic Lake area and future suburban development within the City (i.e., the currently proposed WLCSP). It is currently being dry farmed just like the adjacent WLCSP property. The DEIR does not indicate the WLC project is "taking credit" or is otherwise accounting for this "buffer" area in an

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

inappropriate way. In fact, the WLCSP and DEIR establish a new 400-foot buffer between the northern boundary of CDFW conservation land and any new warehouse buildings within the WLCSP.

Letter F-5: Inland Empire Waterkeeper (April 8, 2013)

Inland Empire Waterkeeper

Re: World Logistics Center Project, Draft Environmental Impact Report, State Clearinghouse No. 2012021045.

Dear Mr. John C. Terell,

Inland Empire Waterkeeper (Waterkeeper) is a non-profit environmental organization dedicated to advocacy, education, restoration and enforcement in the Santa Ana River Watershed. Waterkeepers' members use and enjoy the unique waterways of the Inland Empire and rely on our region's surface and groundwater on an everyday basis. We write on behalf of our collective membership to express our concerns with the World Logistics Center Project Draft Environmental Impact Report, released on February 4, 2013 (DEIR). Waterkeeper participated in the scoping process, and submitted written comments on March 7, 2012 regarding the Notice of Preparation of the Draft Environmental Impact Report for the World Logistics Center Specific Plan. Waterkeeper supports responsible development and seeks to ensure that the World Logistics Center (WLC) goes forward in a manner that is both economically viable and environmentally responsible.

1

Waterkeeper has reviewed the DEIR in its entirety, but we have largely confined our comments to the Hydrology and Water Quality Section of the DEIR, Section 4.9, and Appendix J, the Project Specific Water Quality Management Plan required by Riverside County. However, we comment on other sections of the DEIR when relevant to the analysis of water quality impacts.

2

The purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of a project might be minimized; and to indicate alternatives to such a project.¹ With this in mind, the primary focus of this letter is to assess whether direct and indirect impacts to water resources are adequately addressed and analyzed, the project is consistent with the applicable Water Quality Management Plan, R8-2010-0033, October

3

¹ CA Pub. Res. Code § 2106.

22, 2012; and Riverside County Flood Control and Water Conservation District's Design Handbook for Low Impact Development, Best Management Practices, and that the proposed mitigation is adequate to compensate for project impacts.

Waterkeeper finds that the DEIR is deficient because it is overly speculative regarding the project's effect on groundwater recharge; does not describe treatment and control methods for surface water runoff in sufficient detail; and fails to adequately address cumulative impacts to the San Jacinto Wildlife Area.

I. The Project Area.

The proposed WLC project covers 3,918 acres in the eastern portion of the City of Moreno Valley, in northwestern Riverside County. The project site is immediately south of State Road 60, between Redlands Boulevard and Gillman Springs Road. The site slopes at approximately 2% from north to south. (DEIR, § 3.2, p. 3-1.)

Immediately south of the project site is the San Jacinto Wildlife Area, which includes the Upland Game Hunting Area, Mystic Lake, and the Lake Perris State Recreation Area." (DEIR p. 3-7.) Most of these lands are owned by various state agencies. The San Jacinto Wildlife Area is owned and operated by the California Department of Fish and Wildlife and contains approximately 20,000 acres of restored wetlands and ponds. The project's Specific Plan extends to the northern border of the San Jacinto Wildlife Area. (DEIR, § 3.2.3, pp. 3-7 - 3-11.) The San Jacinto Wildlife Area contains several habitat areas, including rare inland wetland, which provides habitat for many wetland plant and wildlife species. The San Jacinto Wildlife Area has a very high diversity and abundance of bird species, and is recognized nationally and internationally for its bird population. (DEIR, § 4.4.18, p. 4.4-15.)

Mystic Lake, which pools in a shallow depression of the San Jacinto River, is one of the last ephemeral water bodies that once covered 5 million acres of inland California, today, about 90% of all such wetlands are gone.² Mystic Lake is an important stop on the Pacific Flyway, with more than 150 species of birds visiting annually.³ At its fullest, Mystic Lake can cover more than 3,000 acres as it spills over surrounding roads and floods the ponds and reconstructed wetlands of the San Jacinto Wildlife Area.

Runoff entering the Project area originates upstream in the foothill area known as "The Badlands," as well as a small swath of moderately developed area and open space. The flows from upstream collect in natural drainage courses and flow south under State Road 60 and Gilman Springs Road, through existing drainage culverts and onto the project site.⁴

Runoff leaving the project area flows south to the San Jacinto River. There is a topographic divide in the project area, located just west of Theodore Street, which separates storm water flows to the San Jacinto River in two directions. For planning purposes, the lead agency has divided the project's

² California Wetlands Conservation Policy, Executive Order W-59-93.

⁴ Draft Master Plan of Drainage Report § 2.1.2, p. 2.

study area into six distinct watershed (drainage) subareas. Two drainage subareas, west of the divide, drain to the Perris Valley Storm Drain and eventually to the Perris Valley Hydrologic Subarea. The remaining four drainage subareas, east of the divide, drain directly to the San Jacinto Wildlife Area and Mystic Lake, and then south to the Gilman Hot Springs Hydraulic Subarea. Both Hydrologic Subareas eventually flow to the San Jacinto River, about 10 miles south of the project site.⁵ The San Jacinto River, a major tributary to the Santa Ana River, is ephemeral, flowing only during large storm events. The San Jacinto River flows through Canyon Lake and typically terminates in Lake Elsinore.⁶ Lake Elsinore and Canyon Lake are currently on the Environmental Protection Agency's 303(d) list of Impaired Waters.

The proposed project will impact water resources and alter the hydrologic characteristics of the watershed through: increased percentage of impervious area, increased peak flow, reduced time to reach peak flow, increased hydraulic efficiency of the drainage systems from natural drainage courses to improved underground drainage systems and detention basins.⁷

II. The Project Will Substantially Interfere With Groundwater Recharge and No Mitigation Measures are Proposed.

The California Department of Water Resources identifies groundwater wells located within the project area.⁸ Groundwater measurements from 1939 to 1985 indicate a depth range from approximately 100 to 150 feet below ground surface. Groundwater was measured at 106 feet below ground surface within an onsite well.⁹ The DEIR does not contemplate the groundwater wells in the project area and the Draft Master Drainage Report does not explain how the wells will be incorporated into the project area. The Water Supply Assessment prepared for the proposed project indicates that development of the project will not include groundwater for water supply, however Waterkeeper urges the City of Moreno Valley to identify in the DEIR who is responsible for the maintenance of groundwater wells in the project area.

The DEIR finds that the project will not substantially interfere with groundwater recharge, "as any decreased groundwater recharge due to increased impervious surface area will be offset by infiltration due to irrigation." (DEIR, § 4.9.5.3, p. 4.9-19.) In order to offset groundwater recharge through irrigation, the project area must have the capacity to hold all precipitation on site. Furthermore, there must be sufficient demand for the stored water in order to draw down the supply and allow for additional capture volume. The DEIR does not describe a method to capture and store all precipitation that falls upon the project area and the proposed use for landscape irrigation is inadequate because the Specific Plan calls for the instillation of drought tolerant landscape which requires minimal irrigation, especially after storm events when most precipitation will be captured on the project area.

Therefore, this finding is speculative and requires further investigation by the City of Moreno Valley. The Project Description is contrary to a finding of no substantial interference with groundwater

⁵ Draft Master Plan of Drainage Report § 2.1.2, p. 2.

⁸ Draft Master Plan of Drainage Report, § 2.1.2, p. 2.

⁹ *Id.*

recharge. The Specific Plan requires the developer to install xeriscape, or drought-tolerant landscaping, which involves minimal irrigation. (DEIR, § 3.4.7.2, p. 3-59) Without more information, it is unreasonably speculative to conclude that irrigation of the planned xeriscaping will fully replace the natural rate of groundwater recharge in the project area. Speculation or unsubstantiated opinion is not substantial evidence. Substantial evidence includes “facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.”¹⁰ Given the size of the project area, it is foreseeable that the proposed project will substantially interfere with groundwater recharge; the DEIR does not provide substantial evidence that irrigation of landscaping will offset the effects of the project on groundwater recharge. A project has a significant effect on the environment when it will potentially degrade the quality of the environment.¹¹ The recharge of groundwater is an important factor in the San Jacinto River Watershed and for floodplain management; on site recharge is promoted in the San Jacinto River Watershed Management Plan.¹² The project’s interference with groundwater recharge could potentially degrade the quality of the environment.

10

The California Environmental Quality Act requires that mitigation plans be established for all impacts. No mitigation measure has been proposed for the potential impact to groundwater recharge in the project area. The Environmental Impact Report must identify mitigation measures that could minimize significant adverse impacts.¹³ The Project Specific Water Quality Management Plan (in Appendix J of the DEIR) acknowledges that infiltration testing has not been performed at the project site but that a preliminary review of the feasibility of infiltration has been conducted, finding that the majority of the study area consists of a Hydrologic Soil Group which is considered appropriate for infiltration. (DEIR Appendix J-2 and WQMP, p. 16, Section D.1.) Currently, the majority of the precipitation, particularly in smaller storms, infiltrates into the subsurface of the project area. (DEIR, § 4.9.6, p. 4.9-29.) The project area covers 3,198 acres (the Specific Plan covers 2,710), the majority of which is currently unpaved. As of the writing of this letter, the area of the impervious project footprint has not been determined. The Project Specific Water Quality Management Plan states that it will be determined in the final Water Quality Management plan. The project description calls for the construction of impervious surfaces, such as roadways, parking lots, and buildings, over the majority of the specific plan area yet the DEIR speculates that irrigation will offset “any decreased groundwater recharge.” (DEIR § 4.9.5.3.) Given that the project area will undergo a massive increase in impervious surface area, it is overly speculative to assume that the loss of groundwater recharge will be offset by irrigation of the project’s drought tolerant landscaped areas.

11

III. The Project Will Significantly Increase Surface Water Runoff, and Treatment Methods are Inadequately Described.

12

The project may significantly increase off-site runoff. (DEIR § 4.9.6, p. 4.9-22.) Currently, the project site has a low runoff coefficient, meaning that runoff during storms represents a relatively

¹⁰ CA Pub. Res. Code § 21082.2(c).

¹¹ CA Pub. Res. Code § 21083 (b)(1).

¹² San Jacinto River Watershed management Plan, available at http://www.cityofcanyonlake.com/uploads/files/sanjacintoirwmp_entiredocument.pdf

¹³ CA Pub. Res. Code, §§ 21002, 21002.1, subd. (a)(b), 21100, subd. (b)(3)(4).

small portion of the total rainfall. (DEIR, § 4.9.6, p. 4.9-29.) The Specific Plan calls for development of the project area with impervious surfaces, such as roadways, parking lots, and buildings. This development would result in a condition in which nearly all rainfall becomes runoff. (DEIR § 4.9.6, p. 4.9-29.) The majority of the runoff from the project site flows south to Mystic Lake and during times of high storm flow, and reaches the San Jacinto River south of the San Jacinto Wildlife Area. Conditions resulting from the project will include increased runoff volumes and velocity; reduced infiltration; increased flow frequency, duration, and peak; shorter time to reach peak flow; and degradation in water quality. However, the City of Moreno Valley finds that this increase in runoff will be reduced to a less than significant impact because volume is to be stored in basins and released at a controlled rate after the storms. (DEIR § 4.9.6, p. 4.9-29.) Releasing contaminated storm water at a controlled rate after a storm event will change the hydrology of downstream areas such as Mystic Lake by providing a more regular flow of water into the ephemeral lake. The DEIR is insufficiently detailed in its description of the type of treatment captured water will undergo before it is released into Mystic Lake.

↑
— 12

Mitigation measures must be feasible, measurable and specific.¹⁴ Mitigation Measure 4.9.6.1A, purports to “reduce potential impacts associated with runoff from the project site to less than significant levels” through the construction of “drainage structures” at the downstream end of the drainage subareas flowing to the San Jacinto Wildlife Area “to control the runoff and spread the flow in such a way that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition.” This mitigation measure is unreasonably vague because it does not specify the type of “drainage structures” suitable for the project or how effective “drainage structures” are at releasing runoff to mimic natural sheet flow. Furthermore, this mitigation measure ignores the changes in the quality of the runoff that will flow to Mystic Lake and the San Jacinto Wildlife Area.

— 13

All runoff from the site must be treated before it leaves the project area and enters the San Jacinto Wildlife Area. The Specific Plan for the project area does not address the changes in the quality of water that will run off the project area during a storm event. The Specific Plan describes a “system of underground drainage lines and detention basins” that will convey the storm water runoff and “manage the increased flow due to the proposed development.” (World Logistics Center Specific Plan, § 3.5.4, p. 41.) This statement is general and does not adequately describe how the “increased flow” will be managed in order to protect the quality of the water in Mystic Lake or the San Jacinto Wildlife Area. The DEIR fails to describe what types of “detention basins” are contemplated and whether they will have the capacity to treat polluted runoff before release. The DEIR must specify the type of treatment captured storm water will undergo prior to release into Mystic Lake and the San Jacinto Wildlife area.

— 14

According to the Specific Plan, peak flows at downstream discharge points, at the southerly project boundary with the San Jacinto Wildlife Area, will not exceed the peak flows for the existing condition. Concentrated flows released from detention basins will be spread to mimic existing sheet flow patterns. (World Logistics Center Specific Plan, § 3.5.4, pp. 42-43.) This is overly speculative because the Plan does not describe how or if the storm water runoff will be filtered or treated according to Low Impact Development Best Management Practices (BMPs.) The DEIR simply lists

— 15
↓

¹⁴ Cal. Code Reg. Tit. 14, § 15126.4

treatment control BMPs (in section 4.9.6.3) but fails to describe where, specifically, these BMPs will be implemented or how effective these treatments will be at mimicking existing sheet flow patterns or treating water before release.

15

The degree of specificity in an EIR must correspond to the degree of specificity involved in the underlying activity which is described in the EIR.¹⁵ Since this is a construction project, the effects of construction can be predicted with a fair amount of accuracy and therefore must be described in sufficient detail.¹⁶ The DEIR is too general because it describes detention basins and spreading areas designed “to account for the amount of sediment transported through the project boundary so that the existing sediment carrying capacity is maintained,” but the DEIR does not describe what the existing carrying capacity for sediment is or whether it is feasible to maintain this capacity with mitigation. (DEIR § 4.9, p. 4.9-30.)

16

IV. Construction Related Water Quality Impacts Will Be Significant.

The project may cause surface water pollution during construction. (DEIR §4.9.6.2, p. 4.9-31.) The Environmental Protection Agency has cited sediment-laden runoff from construction projects as one of the most potentially damaging forms of water pollution. Sediment leaving construction sites may deliver toxic chemicals and nutrients into waterways. The threat of increased sedimentation to Mystic Lake must be analyzed in the DEIR. Treatment Control BMPs listed in the DEIR do not include treatment for sediment. Instead, the DEIR relies on the future acquisition of an NPDES permit to address the control of sediment discharges from the project site.

17

The DEIR finds that short term water pollutant discharges from the project area will be mitigated through compliance with the required NPDES permits, however, National Pollution Discharge Elimination permits are an issue that should be addressed early in the planning process so that methods for compliance with the Total Maximum Daily Loads (TMDLs) can be determined. In order to comply with the TMDLs, the project may need to keep all water on site or face penalties under the NPDES program.

18

Waterkeeper is further concerned about the status of necessary permits for the project site. In Appendix J of the DEIR, the status of the United States Army Corps of Engineers Clean Water Act section 404 permit for the discharge of dredged and fill material into waters of the United States is “To Be Determined.” (DEIR, Appendix J, p. 8.) It is more than likely that grading of the construction site will release dredged or fill material into navigable waters, this activity is prohibited without a permit from the Army Corps of Engineers. Waterkeeper urges the City of Moreno Valley to comply with the Clean Water Act and prepare to apply for all applicable permits.¹⁷

¹⁵ Cal. Code Reg. Tit. 14, § 15146.

¹⁶ Cal. Code Reg. Tit. 14, § 15146.

¹⁷ 33 U.S.C.A. § 1344(a)

V. Operational Water Quality Impacts: The Project Must Comply With Total Maximum Daily Loads and The DEIR Must Specifically Address Methods of Compliance With LID BMPs.

The project may result in surface water pollution during operation. (DEIR §4.9.6.3, p. 4.9-33.) During the operational phase of any urban use, the major source of pollution is storm water runoff, which carries contaminants that have accumulated on the land surface over which runoff passes. Storm water runoff from the roadways, parking lots, and commercial and industrial buildings can carry a variety of pollutants such as sediment, petroleum products, commonly utilized construction materials, landscaping chemicals, and trace metals such as zinc, copper, lead, cadmium, and iron, which may lead to the degradation of downstream water bodies and channels. Runoff from landscaped areas may contain elevated levels of phosphorus, nitrogen, and suspended solids. (DEIR §4.9.6.3, p. 4.9-33.)

a) Receiving Waters from the Project Site are on the 303(d) List of Impaired Waters; the Project Must Comply with TMDLs.

Runoff from the project area drains to the San Jacinto River, approximately 10 miles south of the proposed project. The San Jacinto River flows through Canyon Lake and typically terminates in Lake Elsinore.¹⁸ Storm water runoff from the roadways, parking lots, and commercial and industrial buildings can carry a variety of pollutants, including nutrients. (DEIR § 4.9.6.3, p. 4.9-33). Lake Elsinore and Canyon Lake are currently on the Environmental Protection Agency's 303(d) list of Impaired Waters. The California Regional Water Quality Control Board - Santa Ana Region established a Resolution Amending the Water Quality Control Plan for the Santa Ana River Basin to Incorporate Nutrient Total Maximum Daily Loads (TMDLs) for Lake Elsinore and Canyon Lake, Resolution No. R8-2004-0037. A TMDL is the amount of a pollutant a water body can receive in a day and still meet water quality standards.¹⁹ The TMDL program is a complicated process, typically spanning 19 years, and requires all agencies and developers in the watershed to commit to the program under threat of penalty. The proposed WLC project would increase the volume of water and pollutants entering Canyon Lake and Lake Elsinore.

Table 4.9.1 of the DEIR lists the adopted TMDL pollutants in Canyon Lake (phosphorus and nitrogen) and in Lake Elsinore (phosphorus, nitrogen, and dissolved oxygen.) (DEIR §4.9.6.3, p. 4.9-34.) The table also identifies pollutants associated with operation of the proposed project: sediments, nutrients (such as nitrogen and phosphorous), toxic organic compounds, trash and debris, bacterial indicators, oil and grease, pesticides, and metals. (DEIR § 4.9.6.3, p. 4.9-34.) The DEIR addresses this impact to water quality with assurance that as "specific developments within the project are developed," updates to the Master Water Quality Management Plan for the World Logistics Center Specific Plan "will be required to ensure that water quality treatment is being maintained per city requirements." (DEIR, § 4.9.6.3, p. 4.9-35.) In order for the environmental review process to be meaningful, the method of water quality treatment should be discussed in the DEIR. Methods for complying with city and county Water Quality Management Plans should be specifically analyzed early in the planning process so that cost projections are accurate and potential environmental

¹⁸ California Regional Water Quality Control Board, Region 8 Fact Sheet.

¹⁹ United States Environmental Protection Agency, Laws and Regulations, Total Maximum Daily Loads (303d); available at: <http://water.epa.gov/lawsregs/lawsguidance/cwa/tmdl/overviewoftmdl.cfm>

impacts can be addressed. NPDES permits are also an issue that should be addressed at this stage, so that methods for compliance with the TMDLs can be determined. In order to comply with the TMDLs, the project may need to keep all water on site, or face penalties applicable in the NPDES program.²⁰

20

b) Methods for Compliance with Low Impact Development Best Management Practices are Not Sufficiently Addressed in the EIR.

The Water Quality Management Plan for the project identifies Best Management Practices (BMPs) that have the potential to minimize the project's effect on hydrology; however, the DEIR does not specify how these BMPs will be integrated into the project; where on the project site the BMPs will be incorporated; or how effective these BMPs are at mitigating the specific environmental effects of the project. An EIR for a specific development project must be specific, because it focuses on site-specific effects that can be predicted with some accuracy.²¹ The specific locations in the project area of the BMPs are not shown in the current Specific Plan. (Project Specific Water Quality Management Plan, p. 16.)

21

Waterkeeper urges the City of Moreno Valley to implement Site Design BMPs from highest to lowest priority: (1) infiltration, (2) harvest and reuse and (3) bioretention.²² Infiltration BMPs have advantages over other types of BMPs, including reduction of the volume and rate of runoff, as well as full treatment of all potential pollutants contained in storm water runoff. Site Design BMPs require the maximization of permeable surfaces such as permeable pavement with infiltration beds, infiltration trenches and surface and sub-surface infiltration basins. Permeable Pavement provides infiltration and evaporation by reducing the volume and peak of storm water runoff as well as mitigates pollutants from storm water runoff.

The DEIR indicates multiple site design BMPs that, in accordance with Riverside County's Water Quality Management Plan, should be implemented. Neither the DEIR or the Specific Plan provide specific details about how these site design BMPs will be implemented or whether or not they will be effective in ensuring the project has as little impact as possible on the local hydrology. Waterkeeper commends the City of Moreno Valley for encouraging minimization of urban runoff, minimization of impervious footprint, conservation of natural areas and minimization of directly connected impervious areas, but is concerned that the practical implementation of these concepts is not fully addressed in the DEIR. The DEIR should detail how Low Impact Development practices will be implemented, where specific designs will be used and the potential effectiveness of such designs.

²⁰ Where a water body is already impaired by a pollutant, a developer may not be entitled to an NPDES permit for a discharge of that pollutant that is the cause of the water body being listed on the 303(d) list. *Friends of Pinto Creek v. United States Environmental Protection Agency*, 504 F.3d 1007 (9th Cir. 2007).

²² California Regional Water Quality Control Board, Santa Ana Region, Order No. R8-2010-0033, NPDES No. CAS 618033, § E. 8. A, p. 95

c) Water Quality Impacts to San Jacinto Wildlife Area Are Significant and the Proposed Mitigation is Inadequate.

The majority of the project area drains towards the Gillman Hot Springs Hydrologic Subarea, which lies south of the San Jacinto Wildlife Area (SJWA.) The WLC project borders the northern boundary of the SJWA and four of the six drainage subareas identified in the DEIR flow directly to the SJWA. The hydraulic conditions of wetlands, such as the SJWA, are strongly influenced by sources and distribution of water. The project may result in surface water pollution during operation. (DEIR, § 4.9.6.3, p. 4.9-33). Storm water runoff from the roadways, parking lots, and commercial and industrial buildings can carry a variety of pollutants such as sediment, petroleum products, construction materials, landscaping chemicals and trace minerals. (DEIR, § 4.9.6.3, p. 4.9-33).

The DEIR lists multiple design features such as detention basins and bioswales but fails to analyze how effective these design features will be in capturing and treating polluted runoff before release into the SJWA. The proposed drainage system identifies seven “basins” along the southern border of the project area, facing the SJWA. (DEIR, § 4.9.6.1, Figure 4.9.3, p. 4.9-27.) The detention basins have outlets that drain directly to the SJWA. The DEIR does not describe what types of detention basins are contemplated and whether they will have the capacity to treat polluted water before release. Riverside County Flood Control and Water Conservation District’s Design Handbook for Low Impact Development Best Management Practices recommends the use of Extended Detention Basins, which are designed to detain storm water and maximize opportunities for volume losses through infiltration, evaporation, evapotranspiration and surface wetting. Pollutant removal is provided by sedimentation inside the basin so that pollutants are not released with the water. Infiltration Basins are more effective BMPs than concrete detention basins (or reinforced concrete boxes) because they provide infiltration, evapotranspiration, evaporation and sedimentation.²³

The DEIR is insufficient because it does not designate specific site design BMPs, rather it lists possible BMPs that the developer “should implement as appropriate.” (DEIR p. 4.9-37). Implementation of these BMPs should be mandatory and not a part of the developer’s discretionary decision making. “Reliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA’s goals of full disclosure and informed decision making;” mitigation plans have been overturned on judicial review as constituting “improper deferral of environmental assessment.”²⁴

Mitigation Measure 4.9.6.3 C states that a pre-construction survey must be “completed to determine general water quality baseline conditions prior to and during development of the southern portion” of the project. (DEIR, § 4.9.6.3, p. 4.9-41). The baseline water quality conditions on the project site, especially the southern border that abuts the San Jacinto Wildlife Area, should be established before any development on the project site is approved because a study conducted after the approval of a project “will inevitably have diminished influence on decision making.”²⁵

²⁵ *Id.*

VI. The Cumulative Impacts of Development in the Region are Not Adequately Addressed in the DEIR.

Cumulative impacts, by definition, are the impacts of other projects combined with the project's direct and indirect impacts.²⁶ Cumulative impacts include other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.²⁷ Development within the watershed will result in an increase in impervious surfaces in addition to changes in land use and associated pollutant runoff characteristics. Increased impervious surfaces are likely to alter existing hydrology and increase potential pollutant loads. (DEIR §4.9.7, p. 4.9-42.) The DEIR does not contemplate other reasonably foreseeable future projects that may have direct or indirect impacts on receiving waters and the adjacent San Jacinto Wildlife Area, such as the proposed Mid County Parkway Project.

In the DEIR, the City of Moreno Valley dismisses the possibility of cumulative environmental impacts on receiving waters by assuming that since “all new developments will be required to mitigate for impacts to water quality, a less than significant impact to water quality will occur.” This analysis is insufficient. A cumulative impact analysis must be substantively meaningful.²⁸ A cumulative impact analysis “which understates information concerning the severity and significance of cumulative impacts impedes meaningful public discussion and skews the decision-maker's perspective concerning the environmental consequences of the project, the necessity for mitigation measures, and the appropriateness of project approval.”²⁹ For purposes of its cumulative impacts analysis, the City of Moreno Valley should either list other reasonably foreseeable probable future projects that produce related or cumulative impacts, including other projects that are currently under environmental review, or it should contain a summary of projections from previously adopted or certified planning or environmental documents.³⁰ Not only must reasonably anticipated future projects be considered in an environmental impact report, but they also must be discussed in a cumulative analysis.³¹ The DEIR does not contain a discussion of reasonably anticipated future projects and their potential impact on hydrology in the watershed. There are currently numerous development projects planned throughout the San Jacinto River watershed, including improvements to three regional roadways: Cajalco Road, I-215, and SR-79.

Potential cumulative impacts to the San Jacinto Wildlife Area are significant. The WLC project area borders the northern boundary of the SJWA, and the project contemplates a 250-foot “safe zone” set back to help minimize potential impacts on biological resources of the SJWA. (DEIR, § 4.4.6, p. 4.4-63 - 64.) However, the DEIR fails to consider encroachment on the southern border of the SJWA by other reasonably foreseeable future projects. The proposed Mid County Parkway Project would require the acquisition of 3.4 acres of land within the SJWA.³² This would destroy an important ecological buffer zone on the south side of the SJWA, which protects important

³² Mid County Parkway Project, Re-circulated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement, Appendix B, Section 7.4.2.)

biological resources. The SJWA is facing a potential loss of habitat on both its north and south sides due to proposed development in the area; the consequences to biological resources in the wildlife area must be analyzed in light of the cumulative impacts of all reasonably foreseeable future development. The potential effects of increased sound and light to the SJWA should be considered in a cumulative analysis. The northern portion of the SJWA will experience increased noise levels during construction and operation and given the potential impacts from other foreseeable projects, a 250-foot set back may not be sufficient to mitigate effects such as behavioral changes in wildlife. (DEIR § 4.4.6 p. 4.4-66.) Lighting associated with the planned development on the southern portion of the project area may also have significant direct and indirect impacts to wildlife in the SJWA. (DEIR § 4.4.6, p. 4.4-67.) These effects, along with all other potential impacts, should be considered in a cumulative impacts analysis.

25

VII. Necessary Findings: The DEIR Identifies Significant Environmental Effects.

The City of Moreno Valley cannot approve or carry out a project when the EIR identifies significant effects on the environment, unless it makes a finding supported by substantial evidence that: (1) there are no feasible alternatives to the project as proposed; (2) changes have been required which mitigate the adverse effects; or (3) such changes are within the jurisdiction of another agency which has adopted, or should adopt, them; or (4) economic, social, or other considerations make mitigation infeasible.³³

26

VIII. Conclusion

Waterkeeper supports responsible development and encourages the City of Moreno Valley to develop a DEIR that more specifically addresses how the direct and indirect impacts of the project to the region's water quality will be mitigated.

27

Please do not hesitate to contact me directly at (714) 850-1965 ext. 307 or email me at colin@iewaterkeeper.org with any questions or comments on our WLC position. We look forward to working with the City of Moreno Valley on resolving these and other issues with this priority project.

Regards,

Colin Kelly
 Staff Attorney
 Inland Empire Waterkeeper

³³ CA Pub. Res. Code § 21081. *City of Marina v. Board of Trustees of the California State University*, 39 Cal. 4th 341, 346 (2006).

RESPONSES TO LETTER F-5

Inland Empire Waterkeeper

Response to Comment F-5-1. The City understands the commenter's interest in clean water and environmental resource protection through the CEQA process.

Response to Comment F-5-2. Again, the City understands your commenter's orientation to water quality. The commenter should also refer to the many comments by other conservation organizations and public agencies that also deal with water quality. For more information regarding water quality, see Responses to Comments B-3-37 through B-3-39 to Letter B-3 from the California Department of Fish and Wildlife (CDFW).

Response to Comment F-5-3. The analysis of potential water quality impacts of the World Logistics Center (WLC) project have been adequately addressed at a programmatic level, as outlined in Section 1.0, *Introduction*, of the Draft Environmental Impact Report (DEIR). Section 4.9, *Hydrology and Water Quality*, of the DEIR examines these potential impacts in detail, and proposes a number of measures to mitigate the anticipated impacts from construction with Mitigation Measures (MMs) 4.9.6.2A and 4.9.6.2B and operations with MMs 4.9.6.3A, 4.9.6.3B, and 4.9.6.3C. In addition, the DEIR clearly indicates that future development within the WLC Specific Plan (SP) will have subsequent environmental analysis which is allowed under the tiering requirements of CEQA.

Response to Comment F-5-4. The commenter has accurately characterized the habitat areas south of the WLCSP development area, and the Specific Plan and DEIR establish a 400-foot buffer zone without logistics buildings to provide additional setback from the San Jacinto Wildlife Area (SJWA) area.

Response to Comment F-5-5. The commenter has accurately characterized the Mystic Lake habitat areas south of the WLCSP development area. Section 4.4.1.10, *Wildlife, SJWA and Mystic Lake*, of the DEIR describe the Mystic Lake and SJWA resources, and Section 4.4.1.14, *MSHCP Consistency Analysis*, and Section 4.4.6.1 of the DEIR analyze the potential impacts of the WLC project on these resource areas. Based on the project design, and with implementation of the recommended mitigation measures, the DEIR concluded that impacts to these areas would be less than significant.

Response to Comment F-5-6. The commenter has accurately characterized the surface drainage regime in the project area and downstream areas. However, the project hydrology study indicates the WLC project would not result in increased runoff or water pollution downstream of the project site through the creation of a number of detention basins along the southern portion of the WLCSP site. These basins are outlined in the Specific Plan, the project hydrology study (DEIR Appendix J-1), and described in MMs 4.9.6.1A and 4.9.6.3A through 4.9.6.3C dealing with water quality and MMs 4.4.6.1B and 4.4.6.4F dealing with biological resources. These measures are sufficient to protect regional water quality, and the DEIR concluded that project impacts would be less than significant.

Response to Comment F-5-7. The commenter is correct, Lake Elsinore is on the U.S. Environmental Protection Agency (EPA's) 303(d) list of Impaired Water Bodies. However, as previously stated, the project hydrology study indicates that the WLC project would not result in increased runoff or water pollution downstream of the project site through the creation of a number of detention basins along the southern portion of the WLCSP site (see Response to Comment F-5-6). Therefore, the WLC project will not have any demonstrable impacts on Lake Elsinore.

Response to Comment F-5-8. The commenter is correct the project will change the stated hydrology conditions of the area, however, the project hydrology study indicates the WLC project would not result in increased runoff or water pollution downstream of the project site through the creation of a

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

number of detention basins along the southern portion of the WLCSP site (see Response to Comment F-5-6).

Response to Comment F-5-9. There are five existing water wells on the project site. All of the wells, with the exception of the well located at the southwest corner of Alessandro Boulevard and Virginia Street, will be abandoned due to their low production and poor condition. Use of the remaining well for domestic water is not viable due to the high costs and energy demands to treat the well water to bring it into compliance with drinking water standards. Additionally, the high salt content of the well water makes it unsuitable for irrigation purposes. However, this well water is suitable for construction uses and may be used for those purposes on the project site in conformance with the West San Jacinto Groundwater Basin Groundwater Management Plan 2012. The well will remain in private use or may be transferred to a property owners' association for long-term ownership, operation, and maintenance.

Response to Comment F-5-10. Text was added to the DEIR Section 4.9 *Hydrology and Water Quality*, page 4.9-19 (FEIR Volume 2) to clarify the changes in infiltration will not be compensated by irrigation at the project site. The document entitled *World Logistics Center Specific Plan Infiltration Analysis* (CH2M HILL 2013 - FEIR Volume 2, Appendix J-1) explains in detail the post project expected change in the water balance based on available 23 years of historical precipitation data. The key findings of the Infiltration analysis are as follows:

Infiltration in pre-project conditions occurs over large areas, which typically results in only partially saturating the soil column after most rainfall events. Then, plants draw this widely dispersed infiltrated water from storage in the soil column, further reducing soil moisture storage, such that infiltrated water does not percolate beyond the root depth. Therefore, only a fraction of infiltrated water becomes groundwater recharge. On the other hand, for the post-project conditions, increases in infiltration are occurring at focused areas with volumes of water that can easily fill the soil column beyond root zone depths, so that much of the infiltrated water will percolate and contribute to groundwater recharge.

The main differences between Pre and Post Project conditions, presented in Figures 3 and 4 of the WLCSP Infiltration Analysis document (CH2M HILL, 2013 - FEIR Volume 2, Appendix J-1), are the shift between run off and direct infiltration, and the reduction in evapotranspiration. Under pre-project conditions, approximately 82 percent of the precipitation, which was on average 2010 acre-feet per year (af/yr) for the 1990 through 2012 period, becomes infiltration. The Post Project Conditions will reduce the direct infiltration to approximately 13 percent of the precipitation. The reduction in direct infiltration will be compensated by reduction in evapotranspiration and the increase of infiltration through the implementation of bio retention areas and detention basins.

The reduction in evapotranspiration from the original 15 percent to approximately 2 percent of the total precipitation will be the result of the project's use of drought-tolerant landscaping. With less water consumed by vegetation, more will be available for infiltration. The implementation of bio retention and detention Basin areas will make possible for approximately 92 percent to 97 percent of the precipitation will be infiltrated, a range that is consistent with the historical infiltration at the site. The remaining direct infiltration, reduction of evapotranspiration, and implementation of bio retention and detention basins can not only offset the direct loss in Infiltration when compared to baseline, but also increase the groundwater recharge at the proposed project site.

Response to Comment F-5-11. In response to this and other earlier comments regarding water quality, MMs 4.9.6.1A and 4.9.6.1B were modified as shown in Response to Comment B-3-39 in Letter B-3 from the California Department of Fish and Wildlife (refer to Response to Comment F-5-23).

Response to Comment F-5-12. The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of Low Impact Development (LID) Best

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Management Practices (BMPs) that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the SJWA.

The *Water Quality Management Plan Guidance Document for the Santa Ana Region of Riverside County* discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted Total Maximum Daily Loads (TMDLs) in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

Response to Comment F-5-13. As outlined in DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 3.2 Proposed Drainage Systems* and Figures 8 and 9 of the report the “drainage structures” refer to the basins and energy dissipaters constructed at the downstream end of the drainage subareas flowing to the SJWA. The outflow from the energy dissipation area will weir flow over a level curb. The basins will reduce flow to below or equal to pre-development conditions, and the energy dissipaters and level curbs at the basin spillways will reduce the runoff velocity and dissipate the flow energy to mimic natural sheet flow conditions. MM 4.9.6.1.A has also been revised to be more specific as follows:

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) ~~as appropriate~~ within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

MMs 4.9.6.3.A, 4.9.6.3B and 4.9.6.3C address water quality. MM 4.9.6.3C has been revised to be more specific as follows:

4.9.6.3C Prior to issuance of future discretionary permits for any development along the southern boundary of the World Logistics Center Specific Plan (WLCSP), the project developer of such sites, in cooperation with the Property Owners Association (POA), shall establish and annually fund a Water Quality Mitigation Monitoring Plan (WQMMP) to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (SJWA). This program shall include at least quarterly sampling along the southern boundary of the site (i.e., at the identified outlet structures of the project detention basins) during wet season flows and/or when water is present, as well as sampling of any dry-season flows that are observed entering the San Jacinto Wildlife Area property from the project property, including Drainage "H," 9, which is planned to convey only clean off-site flows from north of the World Logistics Center Specific Plan site across Gilman Springs Road. The program shall also include at least twice yearly sampling after completion of construction, and a pre-construction survey must be completed to determine general water quality baseline conditions prior to and during development of the southern portion of the World Logistics Center Specific Plan. This sampling shall be consistent with and/or comply with the requirements of applicable Storm Water Pollution Prevention Plans (SWPPPs) for the development site.

The project developer of sites along the southern border of the World Logistics Center Specific Plan shall be responsible for preventing or eliminating any toxic pollutant (not including sediment) found to exceed applicable established public health standards. In addition, the discharge from the project shall not cause or contribute to an exceedance of Receiving Water Quality Objectives for the potential pollutants associated with the project as identified in Table 4.9.J. Once development is complete, the developer shall retain qualified personnel to conduct regular (i.e., at least quarterly) water sampling/testing of any basins and their outfalls to ensure the San Jacinto Wildlife Area will not be affected by water pollution from the project site. ~~The City Planning and/or Land Development Division shall file an annual water quality report with the Moreno Valley City Council, State Department of Recreation (Mystic Lake Manager), and Eastern Municipal Water District.~~ This measure shall be implemented to the satisfaction of the City ~~Planning and/or Land Development~~ Land Development Division Manager based on consultation with the project developer, Eastern Municipal Water District, the Regional Water Quality Control Board-Santa Ana Region, and the Mystic Lake Manager.

Response to Comment F-5-14. All runoff from the site will be treated by LID BMPs and then routed through detention basins with 2 feet of dead storage for infiltration and energy dissipaters before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area. The outflow from the energy dissipation areas will weir flow over a level curb. The basins will reduce flow to below or equal to pre-development conditions, and the energy dissipaters and level curbs at the basin spillways will reduce the runoff velocity and dissipate the flow energy to mimic natural sheet flow conditions. The LID BMPs located upstream of the infiltration and detention basins will consist of infiltration, bio retention, and/or biotreatment BMPs. The project will implement LID BMPs in compliance with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), and will design the LID BMPs

according to the Riverside County Flood Control and Water Conservation District (RCFCWCD) Design Handbook for Low Impact Development Best Management Practices. This will mitigate water quality impacts to the San Jacinto Wildlife Area.

Response to Comment F-5-15. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. Detailed site plans showing the location of treatment BMPs will be prepared as part of the Tentative Tract plans and provided as part of the final project-specific Water Quality Management Plan (WQMP). Currently, the WQMP is at a Specific Plan level and details cannot be provided at this stage. The locations of the LID BMPs are not shown in the current Specific Plan phase, but will be shown in the final project-specific WQMP.

Response to Comment F-5-16. The project is the construction and operation of the WLC. The approvals currently being sought are only the first of many. Section 6 in the *Master Plan of Drainage Report* of Appendix J-1 Hydrology and Water Quality in the DEIR analyzed the sediment carrying capacity of the existing and proposed conditions as outlined below.

Sediment Analysis for Existing Condition

Under the existing condition, offsite tributary areas north of SR-60 and Gilman Springs Road have the potential to generate sediment. This is shown by the accumulation of sediment and debris at the culverts crossing SR-60 and Gilman Springs Road. Recent field visits found that some of the culverts do not function properly or are completely buried due to the accumulation of sediment and debris. Ultimately, the culverts will need to be cleaned out and increased in size to convey the 100-year offsite runoff.

The amount of sediment generated was estimated for each drainage course. In general, sediment is carried by flows in the existing drainage courses. When velocities are high the channel erodes and picks up sediment. When flow velocities are low the sediment drops out and deposition occurs. An estimation of the existing drainage courses flow capacity and velocities was conducted to determine whether the existing drainage courses are eroding or depositing sediment. Depending on the vegetative cover, eroding channels generally have velocities greater than 3 to 7 feet per second (fps). Vegetated channels will begin carrying sediment at velocities from 5 to 7 fps. Clean, sandy or silty channels will begin to erode with velocities ranging from 3 to 5 fps. Velocities greater than 8 fps generally cause significant erosion. Each of the existing drainage courses is analyzed in order to determine their ability to erode or deposit sediment.

The existing drainage course in watershed "A" downstream of the outlet of the existing reinforced concrete box (RCB) is heavily vegetated and consists of a channel with a bottom width of 5 feet and a depth of 4 feet. The top width of the channel is 37 feet. Through normal depth calculations, it is estimated that the drainage course can convey 375 cubic feet per second (cfs) flow at a velocity of 4.5 fps. Because the velocity is less than 5 fps sediment will generally deposit in the existing drainage course and the majority of the sediment generated from Watershed "A" will be deposited along traveling routes due to the vegetated soil cover.

The existing drainage course in watershed "B" is vegetated and consists of a bottom width of 2 feet and a depth of 2 feet. The top width of the drainage course is 18 feet. Through normal depth calculations, it is estimated that the existing drainage course can convey 55 cfs flow at a velocity of 2.8 fps. Because the velocity is less than 5 fps sediment will generally deposit in the existing drainage course and the majority of the sediment generated from Watershed "B" will be deposited along traveling routes due to the vegetated soil cover.

The existing drainage course in watershed "C" is heavily vegetated and consists of a bottom width of 3 feet and a depth of 3 feet. The top width of the drainage course is 27 feet. Through normal depth

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

calculations, it is estimated that the existing drainage course can convey 163 cfs flow at a velocity of 3.6 fps. Because the velocity is less than 5 fps sediment will generally deposit in the existing drainage course and the majority of the sediment generated from Watershed “C” will be deposited along traveling routes due to the vegetated soil cover.

The existing drainage course in watershed “D” is heavily vegetated and consists of a bottom width of 3 feet and a depth of 2 feet. The top width of the existing drainage course is 19 feet. Through normal depth calculations, it is estimated that the existing drainage course can convey 63 cfs flow at a velocity of 2.9 fps. Because the velocity is less than 5 fps sediment will generally deposit in the existing drainage course and the majority of the sediment generated from Watershed “D” will be deposited along traveling routes due to the vegetated soil cover.

The existing drainage course in watershed “E” is heavily vegetated and consists of a channel with a bottom width of 30 feet and a depth of 10 feet. The top width of the existing drainage course is 110 feet. Through normal depth calculations, it is estimated that the existing drainage course can convey 6,220 cfs flow at a velocity of 8.9 fps. Because the flow velocities are above 5 fps, erosion within the channel will occur. However, it is proposed to leave this facility as is and as such the sediment carrying capacity will remain the same.

The existing drainage course in watershed “F” is heavily vegetated and consists of a bottom width of 4 feet and a depth of 2 feet. The top width of the channel is 20 feet. Through normal depth calculations, it is estimated that the existing drainage course can convey 70 cfs flow at a velocity of 2.9 fps. Because the velocity is less than 5 fps sediment will generally deposit in the existing drainage course and the majority of the sediment generated from Watershed “F” will be deposited along traveling routes due to the vegetated soil cover.

Sediment Analysis for Proposed Condition

It is important to avoid excessive sediment transported downstream, which could cause sediment filling the downstream channel, leading to a decrease in channel capacity and an increase in flooding and overbank deposition. The culverts at Gilman Springs Road should be maintained by the County of Riverside to ensure proper conveyance of the offsite flows. The majority of the sediment will deposit upstream of Gilman Springs Road. Ultimately, sediment basins could be constructed upstream of Gilman Springs Road to contain the existing sediment and minimize the total suspended solids in the runoff. However, because sediment basins upstream of Gilman Springs Road are not to be constructed as part of this project, it is expected that some of the offsite sediment will continue to be transported through the culverts along Gilman Springs Road.

Response to Comment F-5-17. As required by MM 4.9.6.2B, a project-specific Storm Water Pollution Prevention Plan (SWPPP) will be prepared during the final design phase of the project.

“The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. In addition, the SWPPP shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and nonvisible discharges from the site.” (Page 4.9-31).

Table 4.9.H (DEIR Section 4.9) lists possible construction site BMPs for runoff control, sediment control, erosion control, and housekeeping that may be used during the construction phases of the proposed WLC project. The implementation of an approved SWPPP with appropriate construction site BMPs will control erosion and sediment transport such that contaminated sediment and runoff will not significantly affect the water quality at Mystic Lake. According to *the Comprehensive Nutrient Reduction Plan for Lake Elsinore and Canyon Lake*, which is the implementation plan for the Lake Elsinore and Canyon Lake Nutrient Total Maximum Daily Loads, there are no requirements for the project to keep all water on site during construction. The inspector is required to verify that a SWPPP is on-site and check that construction BMPs are being implemented properly.

Response to Comment F-5-18. At such time as a grading permit is requested permits for the filling of drainages (USACE 404 and 401 permits); stream alteration permits (California Department of Fish and Wildlife (Section 1600 permits) and permits from the Santa Ana Regional Quality Control Board will be necessary. Since the DEIR is a program-level environmental document, the details of these permits and exact impacts on the drainages cannot be determined until project-level permits are requested and a detailed analysis has been completed.

Project-related impacts to any Waters of the U.S. or Waters of the State are considered significant and mitigation measures are required. Based on the 2013 wetland delineation report (FCS-MBA 2013 – Final (F)EIR Volume 2, Appendix E-13), Drainage features 12 and 15 are considered waters of the U.S. and Drainage Features 7, 8, 9, 12, and 15 are considered Waters of the State. These impacts will be mitigated through on-site creation, or offsite conservation, and/or purchase of in kind habitat at replacement ratios established during the permit process. Habitat replacement will be no less than a 1:1 mitigation ratio to ensure a no net loss of habitat.

As specific projects are designed, new jurisdictional delineations will be required and impacts to jurisdictional drainages will be calculated and permit requirements met. Since the proposed development will take place over a 15 year period and permitting requirements by the United States Army Corps of Engineers (USACE) are revised frequently, it is impossible to know what the permit requirements will be. All projects will comply with the regulations in effect at the time permits are issued, which will include mitigation to reduce project related impacts to a less than significant level. Also refer to Responses to Comments F-1-6 and F-1-15.

Response to Comment F-5-19. The comment repeats text taken from the DEIR Section 4.9.6.3, p. 4.9-33. No response is required.

Response to Comment F-5-20. The project will comply with the Nutrient TMDL for Lake Elsinore and Canyon Lake by implementing LID-based BMPs. According to the Comprehensive Nutrient Reduction Plan for Lake Elsinore and Canyon Lake, *“Post-construction LID-based BMPs required for new development and significant re-development projects are the only structural watershed-based BMPs currently included in the CNRP. The newly developed WQMP requirements ensure that a portion of the wet weather runoff will be contained onsite for all future development projects subject to WQMP requirements. Implementation of WQMP requirements over time coupled with the in-lake remediation projects (described below) are expected to provide sufficient mitigation of nutrients.”* (p. 2-3)

Response to Comment F-5-21. As stated in the Preliminary WQMP (DEIR, Appendix J-2) and also in Section 4.9 of the DEIR, the BMP strategy for the project is to select LID BMPs that promote infiltration and evapotranspiration. Infiltration BMPs will be preferred, but may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. In situations where infiltration BMPs are not appropriate, bio retention and/or biotreatment BMPs that provide opportunity for evapotranspiration and incidental infiltration will be required based on soil conditions. considered. All of these BMPs are considered as LID BMPs and will treat a wide range of pollutants, including the Pollutants of Concern that have been identified for the project.

Response to Comment F-5-22. The purpose of the basins along the southern border of the project area, facing the SJWA, is to reduce the flow to below or equal to pre-development conditions. These basins will be designed to reduce the runoff quantities and volumes and not specifically as Extended Detention Basins according to the RCFCWCD Design Handbook for Low Impact Development Best Management Practices. However, they will provide water quality benefits and all runoff will be treated by LID BMPs prior to flowing to these basins. These LID BMPs will consist of infiltration, bio retention, and/or biotreatment BMPs. The project will implement LID BMPs in compliance with the Water Quality Management Plan for the Santa Ana Region of Riverside County, and will design the LID BMPs

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

according to the RCFCWCD Design Handbook for Low Impact Development Best Management Practices. This will mitigate water quality impacts to the San Jacinto Wildlife Area.

Response to Comment F-5-23. The project is required to perform a Water Quality Monitoring Program on the adjacent SJWA. MM 4.9.6.3C (refer to Response to Comment F-5-13) a very detailed process that must be implemented to ensure the SJWA will not be affected by water pollution from the project site. The pre-construction survey will be performed prior to issuance of future discretionary permits.

Changes to DEIR, Section 4.9 Hydrology and Water Quality, page 4.9-19.

The City of Moreno Valley is amending the text in DEIR Section 4.9, Page 4.9-19, to correct the text related to the infiltration of precipitation for the proposed project. This change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The revision to the text of the DEIR is as follows:

~~As identified in the City's General Plan, the proposed project will not substantially interfere with groundwater recharge as any decreased groundwater recharge due to increased impervious surface area will be offset by infiltration due to irrigation.~~ The proposed project will not substantially interfere with groundwater recharge due to the project implementation of bio retention areas and detention basins with infiltration capacity that mitigates the impact of reduced pervious areas. ~~Bioretention~~Bio retention areas and detention basins will be implemented in addition to the remaining impervious areas. The only use of groundwater may be to support continued agriculture on portions of the WLCSP property that have not yet been developed. The Eastern Municipal Water District (EMWD) developed the West San Jacinto Groundwater Basin Management Plan to help ensure that local groundwater resources are conserved and groundwater overdraft does not occur, based on projections of future growth and expected water supply conditions. The Plan projects the water consumption demands of existing and future development based on rates of growth assumed by regional planning organizations (i.e., Southern California Association of Governments (SCAG) and Western Riverside Council of Governments (WRCOG)) and estimates water demand versus available supply under different water supply scenarios (e.g., multiple dry years).

Consistent with the comments provided by Letter F-5 (Inland Empire Waterkeeper), the text in DEIR Section 4.9.6.1, (refer to FEIR Volume 2) is amended to include more specific requirements to MM 4.9.6.1A. MM 4.9.6.1B has been added to ensure the performance and monitoring of the drainage and infiltration facilities. The modified mitigation measures resulting from the comment is not considerable, and is considered to be a minor refinement of the existing measures. The change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The revisions to the text of the DEIR are as follows:

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) as appropriate within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term "construct" shall mean to substantially complete construction so as to function for its intended purpose during construction with

complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

4.9.6.1B

The bioretention areas and detention/infiltration basins shall be designed to assure infiltrations rates. The monitoring plan will follow the guidelines presented by the California Storm Water Quality Association (CASQA) in the California Storm Water Best Management Program (BMP) Handbook, Municipal, January 2003 Section 4, Treatment Control Best Management Programs Fact Sheets TC-11 Infiltration Basin and TC-30 Vegetated Swale).

For the Bioretention areas, as needed maintenance activities shall be conducted to remove accumulated sediment that may obstruct flow through the swale. Bioretention areas shall be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 48 72 hours.

For the detention/infiltration basins, a 3-5 year maintenance program shall be implemented mainly to keep infiltration rates close to original values since sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by scraping the bottom of the detention basin, seed or sod to restore groundcover, aerate bottom and dethatch basin bottom (CASQA 2003).

Response to Comment F-5-24. The commenter is stating “cumulative impacts of development in the region are not adequately addressed in the DEIR and the DEIR did not contemplate other reasonably foreseeable future project that may have a direct or indirect impact on receiving waters and the adjacent San Jacinto Wildlife Area, such as the proposed Mid County Parkway.”

The commenter should note that DEIR Section 1.6, Cumulative Impacts, explains that CEQA (Guidelines Section 15130) allows two different types of cumulative analyses to be conducted, and the lead agency is responsible to choose the most appropriate method based on the project and other local conditions. In this case, the City chose to use the “summary of projections” method (CEQA Guidelines Section 15130b.1.B) rather than the “list” method due to the size, location, and development phasing or horizon of the project. For the WLC project, the DEIR used the City’s General Plan buildout projections as a basis to characterize cumulative impacts.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The programmatic EIR for this project examined general project-type impacts of the WLC project as an incremental part of regional water quality impacts that will eventually occur as the general area develops with more suburban-level development (refer to DEIR Sections 4.9.6.2 *Construction-Related Water Quality Impacts* and 4.9.6.3 *Operational-Related Water Quality Impacts*). It was determined “although adherence to NPDES requirements is required of all development within the City for construction, the incorporation of these requirements as MMs 4.9.6.2A and 4.9.6.1B are designed to ensure that any future development within the WLCSP area obtains coverage under the National Pollutant Discharge Elimination System (NPDES) General Construction permit.” DEIR Page 4.9-32. While on-site grading and development activities will increase the potential for the erosion of soils, adherence to the BMPs mandated by MM 4.9.6.2A and 4.9.6.2B will reduce impacts associated with short-term (construction) storm water discharges during project construction to a less than significant level.

As identified in Table 4.9.I (DEIR page 4.9-34), pollutants associated with the operations of the proposed logistics land uses include sediments, nutrients, toxic organic compounds, trash and debris, bacterial indicators, oil and grease, pesticides, and metals. Based on the *Water Quality Management Plan* (WQMP) prepared for the project (DEIR Appendix J-2), all downstream receiving waters to which a project directly or indirectly discharges have been identified. The selection of treatment controls for the project shall be based primarily on the potential pollutants associated with the project that are also present in impaired receiving waters. The WQMP identifies the following BMPs to be implemented that will minimize the project’s effects on site hydrology, urban runoff flow rates, and pollutant loads. This comprehensive water quality approach will be implemented throughout the project and will establish a three-tier program for achieving water quality goals through the enforcement of site design, source control, and treatment control BMPs. For operation the proposed project is required to implement MM 4.9.6.3A which requires each subsequent plot plan approval prepare a site-specific WQMP. The WQMP shall specifically identify site design, source control, and treatment control BMPs that shall be used on site to control pollutant runoff and to reduce impacts to water quality to the maximum extent practicable. MM 4.9.6.3C (refer to Response to Comment F-5-13) also requires for any development along the southern boundary of the WLCSP, the project developer of such sites, in cooperation with the Master Property Owners Association (MPOA), shall establish and annually fund a Water Quality Monitoring Plan to confirm that project runoff will not have deleterious effects on the adjacent San Jacinto Wildlife Area (refer to DEIR pages 4.9-37 through 4.9-42).

It is reasonable to assume that if each individual cumulative project mitigates its own water quality impacts, then the cumulative water quality impacts of even extensive development can be effectively mitigated to less than significant levels, which is what was indicated in DEIR Section 4.9.7 *Cumulative Impacts*, page 4.9-42.

Response to Comment F-5-25. DEIR Section 4.4.6 *Cumulative Impacts*, pages 4.4-63 – 64, discusses the cumulative impacts of the project on biological resources. The DEIR correctly assesses impacts for the SJWA. There would be no direct impacts to biological resources within the SJWA as a result of the implementation of the WLCSP. This is further strengthened by Criteria Cells along the northern section of the SJWA (the CDFW Conservation Buffer Area) and by Criteria Cells along Gilman Springs Road. The DEIR correctly assessed those areas and provided an analysis of the potential offsite impacts through the Urban/Wildlands Interface analysis discussed in both the MSHCP Consistency Analysis Document (Sections 5.2; 6.2; and 6.8.6) and in Sections 4.4.6.1 and 4.4.6.2 of the DEIR.

The objective of the MSHCP is to provide plant and wildlife species in Western Riverside County with secured lands to support the continued existence of the species. This is being done through conservation of existing lands with the SJWA being a major part of this effort in the San Jacinto Valley region through Existing Core H and the conservation of major portions of the Badlands to the east of the WLCSP in proposed Core 3.

Full development of the WLCSP could under the current fee schedule of the MSHCP provide more than \$16,000,000 toward the purchase of lands.

The loss of lands of the SJWA through the Mid County Parkway project within the southern area is an activity that was planned for in the MSHCP and the losses of 3.4 acres is a minor but expected loss. There is no loss on the northern boundary as a result of the WLCSP. A buffer has been created of 250 feet and within that buffer habitat enhancements are proposed as development occurs. These enhancements in the way of increased riparian habitat in the detention basins would replace current agricultural lands. Proposed detention basins in this buffer area would further control erosion and sedimentation that moves toward Mystic Lake and would improve water quality. There is an additional 150-foot building setback for structures, making the total setback from structures of 400 feet.

Response to Comment F-5-26. The City understands its obligations under CEQA relative to approving projects with significant environmental impacts, and the City will comply with CEQA in this regard.

Response to Comment F-5-27. The organization will be sent responses to all comments prior to any action being taken on the WLC project.

Letter F-6: Endangered Habitats League (April 8, 2013)

RE: World Logistics Center DEIR Comments

Dear Mr. Gross:

The Endangered Habitats League (EHL) submits the following comments on the Draft Environmental Impact Report (DEIR) for the World Logistics Center (Project), a proposal to construct over 42 million square feet of warehouse space in a location where there is insufficient infrastructure to support it. For the last two decades, EHL has participated extensively in planning for sustainability and natural resource protection in Riverside County was a key stakeholder in the development of the County’s Multiple Species Habitat Conservation Plan (MSHCP), and has played a prominent role in regional transportation planning through participation in the Southern California Association of Governments’ development of Regional Transportation Plans. As we explain below, the Project constitutes an ill-conceived attempt to facilitate private investment return by burdening already congested local and regional highways with massive additional truck traffic that these highways cannot bear without heavy external congestion and pollution costs imposed on the public. Despite significant and purportedly unavoidable adverse traffic, climate change and air quality impacts, neither the Project proponent nor the City of Moreno Valley—the Lead Agency under CEQA—have made any attempt to explore the feasibility of environmentally superior alternatives involving direct rail access and egress to reduce the number of truck trips on highways.

— 1

Unless this flaw is addressed, the final EIR will violate CEQA. It is well settled that under CEQA, a lead agency must make two sets of findings to approve a project with significant unavoidable impacts. The first finding must address how the agency responds to significant effects identified in the environmental review process, either by finding that these effects will be mitigated, or that “[s]pecific economic, legal, technological, or other considerations . . . make

— 2
↓

infeasible the mitigation measures *or project alternatives* identified in the final EIR.” (CEQA Guidelines § 15091, subd. (a)(3).) The second set concerns any statement of overriding considerations, permitting an agency to approve a project despite the existence of significant environmental impacts. (CEQA Guidelines, § 15093.) Because the findings requirements implement CEQA’s substantive mandate that public agencies refrain from approving projects with significant environmental impacts when there are feasible alternatives or mitigation measures that can lessen or avoid these impacts, an agency is prohibited from reaching the second set until it has properly addressed the first. (See CEQA Guidelines, § 15091, subd. (f), subd. (c); *Mountain Lion Foundation v. Fish & Game Commission* (1997) 16 Cal. 4th 105, 134.)

Both sets of findings must be supported by substantial evidence in the record. (Pub. Res. Code § 21081.5; CEQA Guidelines, § 15091, subd. (b).) Any finding that an alternative is infeasible must not only reflect a reasoned analysis, but must be based on specific and concrete evidence. For example, in *Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, the court rejected a finding of infeasibility of alternatives based on conclusory assertions of unacceptable cost, noting that “[t]he fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is *evidence* that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.” (Id. at p. 1181.) Only if this finding of infeasibility can properly be made may a lead agency rely on a statement of overriding considerations.

Applying these principles here, the DEIR does not even attempt to explore the feasibility of working with rail companies to extend a rail spur to connect with the Project. Whether couched as an alternative or mitigation, direct rail access to and from the Project site has the potential to take many thousands of polluting and dangerous trucks off of local highways, thereby substantially reducing air, GHG and traffic impacts that the DEIR without basis concludes are unavoidable. Because direct rail access is potentially feasible, it must be analyzed as an alternative or as mitigation to comply with CEQA.

Thank you for your attention to our concerns.

Very truly yours,

Michael D. Fitts

Staff Attorney

RESPONSES TO LETTER F-6

Endangered Habitats League

Response to Comment F-6-1. The commenter declared,

“The Endangered Habitats League (EHL) submits the following comments on the Draft Environmental Impact Report (DEIR) for the World Logistics Center (project), a proposal to construct over 42 million square feet of warehouse space in a location where there is insufficient infrastructure to support it. For the last two decades, EHL has participated extensively in planning for sustainability and natural resource protection in Riverside County was a key stakeholder in the development of the County’s Multiple Species Habitat Conservation Plan (MSHCP), and has played a prominent role in regional transportation planning through participation in the Southern California Association of Governments’ development of Regional Transportation Plans. As explained below, the project constitutes an ill-conceived attempt to facilitate private investment return by burdening already congested local and regional highways with massive additional truck traffic that these highways cannot bear without heavy external congestion and pollution costs imposed on the public. Despite significant and purportedly unavoidable adverse traffic, climate change and air quality impacts, neither the project proponent nor the City of Moreno Valley—the Lead Agency under CEQA—have made any attempt to explore the feasibility of environmentally superior alternatives involving direct rail access and egress to reduce the number of truck trips on highways.”

Rail was not considered a viable component of the proposed project for number of reasons. In response to this comment and other similar comments, a detailed response regarding the infeasibility of rail serving the WLC site is now included in the revised Traffic Impact Analysis (TIA) as Section 4.F (FEIR Volume 2, Appendix L-1). An additional section (Chapter 4, Section F, FEIR Volume 2, Appendix L-1) has been included in the TIA that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, terrain, and capacity constraints within the rail system (refer to Responses to Comments G-53-4 and G-70-5).

It should be noted the Specific Plan area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment F-6-2. The commenter is citing California Environmental Quality Act (CEQA) law as it relates to the City’s obligation to adopt a statement of overriding considerations and to make findings for impacts that are significant and unavoidable and for rejecting alternatives, specifically the environmentally superior alternative to the proposed project. The commenter states the City must first “mitigated significant environmental impacts or make findings that specific economic, legal, technological or other considerations make infeasible the mitigation measures or project alternatives identified in the Final (F)EIR. In addition, the Lead Agency can adopt a statement of overriding considerations permitting an agency to approve a project only after providing substantial evidence in the record that all feasible alternatives and mitigation measures to lessen or avoid impacts are properly addressed. The rail alternative identified by the commenter in Comment F-6-1 above, would not lessen the significant impacts of the proposed project and a rail alternative is not feasible. The revised TIA did analyze a rail alternative. That analysis is contained in Appendix L-1 in the FEIR Volume 2 (also refer to Responses to Comments G-53-4 and G-70-5). The City understands its obligations under CEQA relative to approving projects with significant environmental impacts, alternatives, etc., and the City will comply with CEQA in this regard.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-6-3. The commenter requests that the study address using rail as a mitigation measure. An additional section (Chapter 4, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, terrain, and capacity constraints within the rail system (refer to Responses to Comments G-53-4 and G-70-5).

RE: Comment on the Draft Environmental Impact Report for the World Logistics Center Project (SCH # 2012021045)

Dear Mr. Gross:

I am writing on behalf of Laborers International Union of North America, Local Union No. 1184 and its members living in Riverside County (collectively "LIUNA Local Union No. 1184" or "LIUNA" or "Commenters") regarding the Draft Environmental Impact Report ("DEIR") prepared for the World Logistics Center Project, State Clearinghouse No. 2012021045 ("Project").

We have reviewed the DEIR with the assistance of:

1. Hydrogeologist, Matthew Hagemann, C.Hg., MS.
2. Biologist, Scott Cashen, M.S.
3. Agricultural Consultant, Gregory A. House.

These experts have prepared written comments that are attached hereto, and which are incorporated in their entirety. The City of Moreno Valley ("City") should respond to the expert comments separately. These experts and our own independent review demonstrate that the DEIR is woefully inadequate and that a new supplemental EIR is required to be prepared and recirculated for public comment. In particular, the EIR suffers from the following significant errors and omissions, among others:

1
2

- **BASELINE:** The DEIR fails to establish an accurate baseline for hazardous materials and biological resources by failing to conduct and/or rely on adequate surveys and/or assessments. 2
- **LOSS OF FARMLAND:** The DEIR acknowledges that the Project's conversion of approximately 3,500 acres of active and designated farmland is a significant impact, but the DEIR fails to adequately mitigate for the loss of farmland. Its conclusion that agricultural mitigation banks are infeasible is unsupported by substantial evidence. 3
- **AIR QUALITY:** The DEIR fails to adequately mitigate significant construction and operational air quality impacts. The DEIR also fails to adequately analyze and mitigate significant indirect source pollution. 4
- **BIOLOGICAL RESOURCES:** The DEIR fails to adequately analyze and mitigate the Project's impacts on biological resources. 5
- **GREENHOUSE GAS EMISSIONS:** The DEIR fails to adequately analyze and mitigate the Project's construction and operational GHG emissions. 6
- **HAZARDOUS MATERIALS:** The DEIR fails to establish an adequate environmental baseline for the Project site because (1) it relies on inadequate sampling of pesticides in Project site soils from past uses and (2) it failed to evaluate the entire Project site for potential hazards. 7
- **HYDROLOGY AND WATER QUALITY:** The DEIR fails to adequately analyze and mitigate stormwater impacts on water quality. 8
- **CUMULATIVE IMPACTS ANALYSIS:** The DEIR's entire cumulative impacts analyses are based on outdated and inaccurate summary of projections. The DEIR also fails to adequately analyze and mitigate the Project's cumulative impacts for the following topics: (1) agricultural resources, (2) biological resources, and (3) air quality. 9
- **ALTERNATIVES:** The DEIR fails to adequately analyze Project alternatives and fails to implement the environmentally superior Alternative 1. 10

Commenters urge the City to revise the EIR to adequately describe, analyze, and mitigate the Project and its impacts.¹ The revised EIR should be recirculated to allow public review and comment. 11

¹ We reserve the right to supplement these comments at later hearings and proceedings for this Project. (See, *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109.)

I. PROJECT DESCRIPTION

The Project site encompasses 3,918 acres of land located in Rancho Belago, the eastern portion of the City of Moreno Valley, and is situated directly south of State Route 60 (SR-60) with the Badlands area to the east and northeast, the Mount Russell Range to the southwest, and Mystic Lake and the San Jacinto wildlife Area to the southeast. (DEIR, p. 3-19.)

This mega-scale Project proposes to construct a maximum of 41.4 million square feet of “high-cube logistics” warehouse distribution uses classified as “Logistics Development” (LD) and 200,000 square feet (approx. 0.5%) of warehousing-related uses classified as “Light Logistics” (LL) on 2,710 acres within the World Logistics Center (“WLC”) Specific Plan. (DEIR, p. 3-19.) The Project will be used primarily for the storage and/or consolidation of manufactured goods, imported through the Ports of Los Angeles and Long Beach, prior to their distribution to secondary retail outlets. (DEIR, p. 3-26.)

In addition to the Specific Plan area, the Project site includes (1) 910 acres of the California Department of Fish and Wildlife (CDFW) Conservation Buffer area to the south, (2) 194 acres of Public Facilities Lands area, and (3) 104 acres of Off-site Improvement Area. (DEIR, p.3-26.)

The Project site primarily consists of active farmland. (DEIR, pp.3-1, 3-2.) Approximately 3,389 acres, or 89 percent of the 3,814-acre project area, are designated as Farmland of Local Importance and approximately 25 acres are designated as Unique Farmland. (DEIR, p. 4.2-7.) The site is also scattered with seven residences. (DEIR, p. 3-2.)

The Project would require significant changes to the General Plan, overhaul of the existing Specific Plan and zoning changes, including:

- **General Plan Amendment:** The Project includes an amendment to the General Plan that will permit the establishment of logistics land uses on the 3,814-acre property. The following General Elements will be amended: Community Development; Circulation; Parks, Recreation and Open Space; Safety; Conservation; and General Plan Goals and Objectives. (DEIR, p.3-25.)
- **Adoption of a Specific Plan:** The Project includes a Specific Plan, the World Logistics Center Specific Plan, to implement the amended General Plan and is a master plan for the 2,710-acre site for the development of up to 41.6 million square feet of modern high-cube logistics and related warehouse distribution facilities defined as Logistics Development and Light Logistics. (DEIR, p.3-74.) The Project will also replace most of the currently approved Moreno Highlands Specific Plan (“MHSP”), which covers 3,038 acres of the project area. (DEIR, p.3-25.) The MHSP contemplates the development of a mixed-use community

consisting of up to 7,763 residential dwelling units and approximately 603 acres of business, retail, institutional, and other uses. (Id.)

- **Zone Change:** The Project includes a Zone Change covering the Project's entire 3,814-acre property, which will designate 2,710 acres for the World Logistics Center Specific Plan, 1,084 acres of land for Open Space, and 20 acres for Public Facilities. (DEIR, p.3-74.)

The Project also encompasses pre-annexation zoning for an 85-acre parcel of land and a Development Agreement between the City and Highland Fairview (the project applicant).

II. STANDING

Members of Local Union No. 1184 live, work, and recreate in the immediate vicinity of the Project site. These members will suffer the impacts of a poorly executed or inadequately mitigated Project, just as would the members of any nearby homeowners association, community group, or environmental group. Hundreds of LIUNA Local Union No. 1184 members live and work in areas that will be affected by traffic, air pollution, and water pollution generated by the Project.

In addition, construction workers will suffer many of the most significant impacts from the Project as currently proposed, such as from air pollution emissions from poorly maintained or controlled construction equipment, possible risks related to hazardous materials on the Project site, and other impacts. Therefore, LIUNA Local Union No. 1184 and its members have a direct interest in ensuring that the Project is adequately analyzed and that its environmental and public health impacts are mitigated to the fullest extent feasible.

III. LEGAL STANDARDS

A. EIR

CEQA requires that an agency analyze the potential environmental impacts of its proposed actions in an environmental impact report ("EIR") (except in certain limited circumstances). (See, e.g., Pub. Resources Code, § 21100.) The EIR is the very heart of CEQA. (*Dunn-Edwards v. BAAQMD* (1992) 9 Cal.App.4th 644, 652.) "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Communities for a Better Environment v. Cal. Resources Agency* (2002) 103 Cal.App.4th 98, 109 ("CBE v. CRA").)

CEQA has two primary purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. (14 Cal. Code Regs. ("CEQA Guidelines") § 15002(a)(1).) "Its purpose is to inform the

12

13

14

15

public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR ‘protects not only the environment but also informed self-government.’” (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564.) The EIR has been described as “an environmental ‘alarm bell’ whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.” (*Berkeley Keep Jets Over the Bay v. Bd. of Port Comm’rs.* (2001) 91 Cal. App. 4th 1344, 1354 (“*Berkeley Jets*”); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810.)

Second, CEQA requires public agencies to avoid or reduce environmental damage when “feasible” by requiring “environmentally superior” alternatives and all feasible mitigation measures. (CEQA Guidelines, § 15002(a)(2) and (3); See also, *Berkeley Jets, supra*, 91 Cal. App. 4th at p. 1354; *Citizens of Goleta Valley, supra*, 52 Cal.3d at p. 564.) The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to “identify ways that environmental damage can be avoided or significantly reduced.” (CEQA Guidelines, §15002(a)(2).) If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has “eliminated or substantially lessened all significant effects on the environment where feasible” and that any unavoidable significant effects on the environment are “acceptable due to overriding concerns.” (Pub. Resources Code, § 21081; CEQA Guidelines, § 15092(b)(2)(A) & (B).)

While the courts review an EIR using an “abuse of discretion” standard, “the reviewing court is not to ‘uncritically rely on every study or analysis presented by a project proponent in support of its position. A ‘clearly inadequate or unsupported study is entitled to no judicial deference.’” (*Berkeley Jets*, 91 Cal. App. 4th at p. 1355 (emphasis added), quoting, *Laurel Heights Improvement Assn. v. Regents of University of California*, 47 Cal. 3d 376, 391 409, fn. 12 (1988).) As the court stated in *Berkeley Jets*, 91 Cal. App. 4th at p. 1355:

A prejudicial abuse of discretion occurs “if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process.” (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal. App. 4th 1109, 1117; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 946.)

B. SUPPLEMENTAL EIR

Recirculation of an EIR prior to certification is required “when the new information added to an EIR discloses: (1) a new substantial environmental impact resulting from the project or from a new mitigation measure proposed to be implemented (cf. CEQA Guidelines, § 15162, subd. (a)(1), (3)(B)(1)); (2) a substantial increase in the severity of

15

16

an environmental impact unless mitigation measures are adopted that reduce the impact to a level of insignificance (cf. CEQA Guidelines, § 15162, subd. (a)(3)(B)(2)); (3) a feasible project alternative or mitigation measure that clearly would lessen the environmental impacts of the project, but which the project's proponents decline to adopt (cf. CEQA Guidelines, § 15162, subd. (a)(3)(B)(3), (4)); or (4) that the draft EIR was so fundamentally and basically inadequate and conclusory in nature that public comment on the draft was in effect meaningless." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal. 4th 1112, 1130, citing *Mountain Lion Coalition v. Fish & Game Comm'n* (1989) 214 Cal.App.3d 1043.)

Significant new information requiring recirculation can include:

- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.
- (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(CEQA Guidelines, § 15088.5(a).)

The DEIR fails to analyze significant environmental impacts pertaining to the Project and to fully consider available mitigation measures to address those impacts. A revised EIR is required to be prepared and recirculated to address these deficiencies.

IV. THE DEIR FAILS TO ACCURATELY ESTABLISH THE PROJECT'S ENVIRONMENTAL SETTING OR "BASELINE."

A. CEQA BASELINE STANDARD

To facilitate its informational goals, an EIR must contain an accurate description of the project's environmental setting, or "baseline." The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. (*Communities for a Better Environment v. So Coast Air Qual. Mgmt. Dist.* (2010) 48 Cal. 4th 310, 321.) CEQA Guidelines section 15125(a) states, in pertinent part, that a lead agency's environmental review under CEQA:

...must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant.

(See, *Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 (“*Save Our Peninsula*”).) As the court of appeal has explained, “the impacts of the project must be measured against the ‘real conditions on the ground,’” and not against hypothetical permitted levels. (*Id.* at 121-123.) The court has explained, using such a skewed baseline “mislead(s) the public” and “draws a red herring across the path of public input.” (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 656; *Woodward Park Homeowners v. City of Fresno* (2007) 150 Cal.App.4th 683, 708-711.)

B. THE DEIR FAILS TO ADEQUATELY ANALYZE HAZARDS AND HAZARDOUS MATERIALS AND ESTABLISHES AN ERRONEOUS BASELINE.

1. Residual Pesticides in the Soil May Pose Health Risks to Workers and Nearby Residents.

The DEIR recognizes that the Project area has been historically used for dry farming and livestock grazing, and almost all of the Project area (3,238 acres or 97%) is currently dry farmed. (DEIR, pp. 4.4-4, 4.8-2.) Based on these uses of the Project site, there is a potential that residual pesticides remain in the soil, which may pose health risks to workers and nearby residents. However, the DEIR and supporting documents fail to provide any information reflecting the “real conditions on the ground” on the types of pesticides that have been used on the Project site in association with these agricultural operations. (*Save Our Peninsula, supra*, 87 Cal.App.4th at pp. 121-123.) Therefore, the DEIR fails to adequately describe the environmental setting for the Project and fails to serve its informational purpose.

According to Mr. Hagemann, the DEIR and the eighteen Phase I Environmental Site Assessments (“Phase I ESAs”) did not conduct adequate sampling of pesticides in Project site soils from past uses:

Eighteen Phase I Environmental Site Assessments (“Phase I ESAs”) were completed for the site from May 2003 to January 2013 and are included as Appendix I to the DEIR. The January 2013 Phase I ESA, which includes a summary of the findings of the previous Phase I ESAs, states that past uses of the site included a chicken ranch, three dairies, and agriculture (2013 Phase I ESA, p. 1).

The 2013 Phase I ESA states that there are no recognized environmental conditions (RECs)² associated with the Project site (2013 Phase I ESA, p. 35). Our review shows that the Phase I ESA and the DEIR do not thoroughly evaluate current soil conditions at the site. Failure to adequately disclose baseline conditions at the Project site that may result in significant impacts to construction workers and nearby residents.

18

Inadequate sampling of pesticides in Project site soils from past uses

Currently, the Project site is used for dry farming and wheat is typically grown on the Project site (DEIR, p. 4.2-2). The DEIR states that dry farming does not typically use pesticides (DEIR, p. 4.8-4) but our review of data for the Project site from the California Department of Pesticide Regulation (CDPR) shows that pesticides such as 2,4-D, 2-ethylhexyl ester were used on the site for wheat cultivation (see Attachment A).

The 2013 Phase I ESA, however, does not mention recent pesticide usage. The 2013 Phase I does include sampling results for organochlorine pesticides (OCPs). The ESA notes that OCP sampling results were below regulatory levels (2013 Phase I ESA, p. 2). However, only 52 samples were collected from the Project site in previous investigations.

19

The “Interim Guidance for Sampling Agricultural Properties” prepared by the Department of Toxic Substances Control (DTSC) recommends that, when testing for OCPs, samples for sites over 50 acres should be collected at over 60 locations.³ The Project site, at 2,710 acres, is well over 50 acres. Therefore, the 52 samples collected over the last ten years⁴ are likely insufficient to provide an accurate assessment of the Project site’s soil conditions and collecting such a limited number of samples may not reliably disclose current environmental concerns associated with Project site soils. In addition, because these samples were collected a minimum of eight years ago, sampling results are outdated and cannot be used to baseline conditions.

The Project site has been used for agricultural purposes since at least 1948 (2013 Phase I ESA, p. 15). OCPs such as DDT and DDE were used

² A REC is defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. See <http://www.astm.org/Standards/E1527.htm>

³ Department of Toxic Substances Control, Interim Guidance for Sampling Agricultural Properties (Third Revision). <http://www.dtsc.ca.gov/Schools/upload/Ag-Guidance-Rev-3-August-7-2008-2.pdf>, p. 8

⁴ 42 samples were collected in 2003, 9 samples were collected in 2004, and one sample was collected in 2005.

starting in 1940s.⁵ Although their use was banned in the 1970s, these compounds can persist in soil for hundreds of years.⁶

The limited number of samples collected on the Project site may not fully show the total extent of OCP concentrations throughout the Project site. The Applicant should disclose how many acres of the 2,710-acre site were historically and currently used for agricultural activities and should collect 60 soil samples per 50-acre portion. For example, if 100 acres of the Project site was used for agriculture, 60 samples on each 50-acre portion should be collected for a total of 120 samples.

(Exhibit 1, pp. 1-3.)

Based on Mr. Hagemann's findings, the DEIR fails to adequately disclose baseline conditions at the Project site by relying on inadequate sampling of pesticides in Project site soils. If contaminated soil exists at the Project site, construction workers, such as LiUNA members are likely to suffer some of the most significant exposures since they may come in contact with soil contamination during excavation, site grading and earth movement during Project construction.

2. The Phase I Environmental Site Assessments Completed for the Project are Outdated and Inadequate.

Additionally, the DEIR relies on Phase I Environmental Site Assessments (ESAs) which are outdated and inadequate, establishing an erroneous baseline for hazards and hazardous materials. (DEIR, p. 4.8-1; Appendix I.) According to Mr. Hagemann,

The Project site is currently used for wheat cultivation but no samples were collected in association with the 2013 Phase I ESA. Because the Project site is still used for agricultural purposes, relying on sampling results from eight years ago will not reflect pesticide residuals that may exist in site soils from agricultural use of the site from 2005 to present-day. Additional pesticide sampling, to include 2, 4-D, 2-ethylhexyl ester and any other pesticides that may have been used for wheat farming, should be conducted.

Project construction will require grading, excavation, vegetation removal, and trenching. Construction workers can be exposed, via inhalation and dermal contact, to pesticides in soil that can become airborne during these ground-disturbing activities. Exposure to these pesticides can pose significant health risks. Oral exposure to 2, 4-D, 2-ethylhexyl ester can

⁵ U.S. EPA, DDT – A Brief History and Status. <http://www.epa.gov/pesticides/factsheets/chemicals/ddt-brief-history-status.htm>

⁶ *Ibid.*, p. 3

result in vomiting, diarrhea, headache, confusion, and bizarre behavior. Dermal exposure can result in irritation and inhalation exposure can lead to coughing and burning sensations in the upper respiratory tract and chest.⁷ Exposure to DDT can result in headaches, nausea, and convulsions⁸ as well as damage the liver, nervous, and reproductive system.⁹

There are seven residences located onsite (DEIR, p. 4.5-12) and residences are also located directly adjacent to the Project site along the western boundary of the Project site (DEIR, Figure 3.8). These residents may also be adversely affected from exposure to pesticide-containing soil during Project construction. Inhalation of pesticide-contaminated soil has been linked to asthma in recent research.¹⁰ A report prepared by the California Department of Health identifies pesticides as an asthma trigger.¹¹

Limited soil sampling was conducted on the Project site eight years ago. Sampling did not target pesticides used for wheat cultivation, such as 2, 4-D, 2-ethylhexyl ester. Project soils should be tested for all pesticides that may have been used on the site. All sampling results should be compared to appropriate human health regulatory levels¹² as well as construction worker thresholds¹³ to determine if the Project may pose significant health risks. A revised DEIR should be prepared to disclose sampling results and any mitigation, if necessary, to ensure that the Project will not result in significant public health impacts.

3. The DEIR's Hazardous Conditions Baseline Does Not Include the Entire Project Area.

Moreover, the DEIR's hazardous conditions baseline is inaccurate since the DEIR and the eighteen Phase I ESAs failed to survey the entire Project site for potential hazards. According to Mr. Hagemann,

Our review of the areas evaluated in the 18 Phase I ESAs shows that an approximately 50-acre portion of the Project site located south of Alessandro Blvd., east of Merwin St., and north of Brodiaea Ave has not been surveyed (see Attachment B). The land use map in the DEIR shows that this area will be used for logistics development (DEIR, Figure 3.8).

Project construction will occur in areas that have not been surveyed by the Phase I ESA. Therefore, conclusions in the DEIR about the absence of environmental concerns on the Project site are not completely substantiated. If environmental hazards exist on this portion of the site, Project construction may pose significant risks to workers and other site personnel.

A new Phase I ESA should be prepared to survey, identify and disclose baseline conditions of the entire Project site, to be included with a revised DEIR. If hazardous conditions are found, all appropriate mitigation measures should be identified to prevent the exposure of workers to conditions that would present health risks during construction and operation of the Project.

(Exhibit 1, p. 4.)

Pursuant to Mr. Hagemann's recommendations, new sampling of Project soil must be conducted for all pesticides that may have been used on the Project site to establish an accurate hazardous conditions baseline. The entire Project site must also be evaluated for potential hazards. Thereafter, a revised DEIR must then be prepared to analyze and mitigate potential hazards and establish an accurate hazardous conditions baseline.

C. THE DEIR FAILS TO ESTABLISH AN ACCURATE BASELINE FOR SENSITIVE BIOLOGICAL RESOURCES.

Establishing an accurate baseline is the sine qua non to adequately analyzing and mitigating the significant environmental impacts of the Project. (See CEQA Guidelines, § 15125(a); *Save Our Peninsula, supra*, 87 Cal.App.4th at pp. 121-123.) Unfortunately, the DEIR's failure to investigate and identify the occurrences of sensitive biological resources at the Project site resulted in a skewed baseline. Such skewed

23

24

baseline ultimately “mislead(s) the public” by engendering skewed and inaccurate analyses of environmental impacts, mitigation measures and cumulative impacts for biological resources. (See *San Joaquin Raptor Rescue Center*, *supra*, 149 Cal.App.4th at p. 656; *Woodward Park Homeowners*, *supra*, 150 Cal.App.4th at pp. 708-711.)

1. The DEIR Fails to Accurately Disclose the Value of Project Site to Raptors.

The DEIR fails to adequately assess the value of the Project site as raptors’ habitat. Mr. Cashen, a biological expert, states,

The DEIR identifies the Project site as providing “marginal foraging habitat for some raptors species.”¹⁴ This statement is not substantiated by survey data. Indeed, two different studies that were conducted in the Project area demonstrate (or strongly suggest) that the Project site provides very important habitat for raptors.

McCrary et al. (1985) conducted a 2-year fall and winter study of raptors in the San Jacinto Valley to provide baseline data on populations in southern California and to quantify the importance of the valley as a wintering area for raptors.¹⁵ The study area was predominately agricultural lands (alfalfa and grain crops) and dairy farms, and it included the southern half of the Project site.¹⁶ The investigators detected 14 raptor species during their study, and raptor densities were 5 to 17 times higher than those reported for other regions. This led the authors to conclude that “*the San Jacinto Valley and similar surrounding areas are of major importance to wintering birds of prey.*”¹⁷

Beckman et al. (2011) replicated the raptor surveys between 2005 and 2009 and derived a comparable conclusion regarding the importance of the region to raptor species.¹⁸ Furthermore, both studies indicate the San Jacinto Valley provides important wintering grounds for the white-tailed kite, northern harrier, ferruginous hawk, golden eagle, and prairie falcon—all of which are special-status species. The State of California indicates 22 overwintering raptor species are known to utilize the San Jacinto Valley, and that the San Jacinto Valley consistently ranks in the top one to

¹⁴ DEIR, p. 4.4-28.

two percent in species diversity for the North American Christmas Bird Counts.¹⁹

(Exhibit 2, p. 2.)

2. The Burrowing Owl Surveys are Incomplete and Failed to Adhere to Survey Protocols.

The DEIR relies on burrowing owl surveys which are incomplete and failed to adhere to the MSHCP's survey protocols. (DEIR, p. 4.4-29; Appendix D.) Thus, the DEIR's biological resources baseline for burrowing owl is inaccurate. According to Mr. Cashen:

The Western Riverside County Multiple Species Habitat Conservation Plan ("MSHCP") identifies the Project site as being within an area requiring focused surveys for burrowing owls. The Applicant did not conduct surveys throughout all portions of the Project site that provide suitable habitat for burrowing owls, nor did it conduct surveys according to the protocol established by the MSHCP.²⁰

Burrowing owls occur in open habitat types (e.g., grassland, shrub steppe, desert, agriculture, and ruderal, among others) if the vegetation structure is suitable and there are useable burrows and foraging habitat in proximity.²¹ As the DEIR acknowledges, almost all of the Project site and surrounding buffer area provide potentially suitable habitat for burrowing owls.²² The DEIR suggests protocol surveys for the burrowing owl were conducted throughout the entire Project site, and that much of the Project site has been subject to several years of protocol-level surveys. To the contrary, the survey reports that accompany the DEIR suggest the burrowing owl surveys were cursory, and that some portions of the Project site providing suitable burrowing owl habitat were never surveyed.

2005 Surveys

In 2005, the Applicant's consultants used aerial photographs to categorize the potential (i.e., low, moderate, and high potential) for burrowing owls to occur in various portions of the 1,778-acre Bel Lago Property (a subset of the Project site). The consultants then conducted four surveys "on foot

²² DEIR, p. 4.4-29.

and by vehicle within suitable habitat on the Project site and within a 100-foot buffer around the suitable habitat.”²³ In my opinion, those surveys were insufficient for documenting habitat suitability; and the presence, abundance, and distribution of burrowing owls in the survey area.

First, the presence and abundance of suitable burrows is an essential element of burrowing owl habitat, and thus, the suitability of the habitat as a whole. It would have been impossible for the Applicant’s consultants to use aerial photographs to map the presence of burrows. This issue is confounded because the conclusions in the survey report pertaining to habitat suitability are internally inconsistent and/or are not supported by scientific literature. For example, the report first states habitat within the “low potential” area had little to no vegetation, but it subsequently states “low potential” habitat typically contained 100% vegetation coverage that provided poor habitat for burrowing owls due to limited visibility of ground dwelling species.²⁴

Second, the surveys did not adhere to the methods described in the California Department of Fish and Wildlife’s (“CDFW”) Staff Report on Burrowing Owl Mitigation, as required by the MSHCP. CDFW’s 2005 Staff Report states: “[s]urveys should be conducted by *walking* suitable habitat on the entire project site and (where possible) in areas within 150 meters (approx. 500 ft.) of the project impact zone.”²⁵ Indeed, administrators of the MSHCP have established that burrowing owl surveys that are conducted while driving are unacceptable.²⁶ Although the surveyors detected a breeding pair of burrowing owls on the Project site they did not conduct additional surveys to identify the location of the nest site.²⁷

2007 Surveys

The Applicant’s consultant conducted additional surveys for burrowing owls in 2007. However, the surveys were limited to the site for the 158.4-acre Highland Fairview Corporate Park and the surrounding 500-foot buffer zone.²⁸ The surveys did not encompass the location where

burrowing owls were detected in 2005, and thus they were incapable of determining continued use of the site by the breeding pair.²⁹

2010 Surveys

In 2010, the Applicant's consultant conducted surveys within the 4,321-acres Highlands Specific Plan area. According to the survey report, a single biologist conducted the burrow survey (Part A of the protocol) and first focused burrowing owl survey (Part B of the protocol) between 0630 and 0730 hours on June 9, 2010.³⁰ Only areas identified in the initial survey as having potential burrows and adjacent foraging habitat for owls were surveyed during the remaining three surveys.³¹ As a result, the survey effort was limited to four drainages within the entire Project site and surrounding buffer zone.³² Such an effort would have been insufficient for documenting the presence, abundance, and distribution of burrowing owls within the Project site.

First, it would have been impossible for a single biologist to identify the presence of potentially suitable burrows across several thousand acres of potentially suitable habitat within one hour. Furthermore, the "Sensitive Plant Focused Survey" report indicates the biologist was conducting sensitive plant surveys within four drainages at the exact same time and date. Consequently, he could not have been conducting the burrow and burrowing owl survey across the entire Project site and buffer—as the report indicates.

Second, each of the remaining three focused surveys was limited to two biologists conducting surveys for one hour per day.³³ At the same time, one of the two biologists was reported to have been conducting surveys for sensitive plant species.³⁴ It would have been impossible for the biologists to reliably survey the four drainages for burrowing owls and sensitive plants during such a short period of time, especially given that there were numerous burrows throughout the survey area.³⁵

²⁹ *Ibid*, Exhibit 4. See also DEIR, Appendix E. Michael Brandman Associates. 2005 Sep 12. DRAFT Focused Burrowing Owl Survey Report for the 1,778-acre Bel Lago Property, Exhibit 4.

³⁰ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Burrowing Owl Focused Survey: Highlands Specific Plan, p. 18.

³¹ *Ibid*, p. 13.

³² *Ibid*, Exhibit 4.

³³ *Ibid*, Table 2.

³⁴ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, Table 3.

³⁵ *Ibid*. Michael Brandman Associates. 2010 Dec 13. Burrowing Owl Focused Survey: Highlands Specific Plan, p. 18.

The survey report indicates: “[t]here is no additional suitable habitat within 500 feet surrounding the project site. Therefore, although evaluated, protocol burrowing owl surveys were not conducted within the 500-foot buffer area.”³⁶ This statement is misleading and undermines the information presented in the DEIR. First, it is clear the Applicant’s consultant did not walk through (evaluate) the entire Project site and 500-foot buffer zone to determine the presence of potentially suitable burrows for burrowing owls. Second, the survey area appears to have been dictated by habitat suitability for sensitive plant species, which does not necessarily coincide with that for burrowing owls.³⁷ Third, the consultant’s statement conflicts with information presented in its 2005 survey report, which identifies most of the Project site as having “moderate potential habitat” for burrowing owls.³⁸ Fourth, the consultant’s statement conflicts with: (a) its map of vegetation communities; (b) imagery available through Google Earth (Figures 1 and 2); and (c) information provided in the DEIR.³⁹ These sources suggest there is considerably more suitable habitat for burrowing owls than suggested in the consultant’s 2010 survey report.

2007 and 2012 Surveys

The DEIR indicates focused burrow and burrowing owls surveys also were conducted in 2006 (750 acres) and 2012 (3,300 acres).⁴⁰ However, the DEIR does not provide survey reports or any other information that describes and documents the survey efforts. As a result, I am unable to evaluate the value of those survey efforts in providing information pertaining to the burrowing owl.

A single burrowing owl was observed within the temporary detention basin located south of the Highland Fairview Corporate Park during a March 2012 site visit associated with the Jurisdictional Delineation.⁴¹ Although this observation was important given the scarcity of owls in the MSHCP plan area, the Applicant’s consultant apparently made no attempt to determine the breeding status of the owl.

The Applicant’s consultant has concluded the burrowing owl “is not considered a permanent resident within the entire study area.”⁴² The

³⁶ *Ibid.*

³⁷ *Ibid.*, Exhibit 4. See also DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 10 and Exhibit 5.

⁴⁰ *Ibid.*

⁴¹ *Ibid.*, Appendix E, p. 46.

⁴² *Ibid.*

consultant has no basis for its conclusion because it did not conduct any surveys to evaluate winter residency. Moreover, it appears that at least one burrowing owl was detected south of the Highland Fairview Corporate Park (Skecher's Logistic Center) each time the area was surveyed.⁴³ This information, and the knowledge that burrowing owls have high site fidelity, strongly suggests that the burrowing owl is a breeding season resident on the Project site.

Figure 1. Potentially suitable burrowing owl habitat at proposed debris basin site east of Gilman Springs Road.

⁴³ *Ibid.*

Figure 2. Potentially suitable burrowing owl habitat at proposed debris basin site east of Gilman Springs Road.

(Exhibit 2, pp. 2-7.)

3. The DEIR's Baseline Fails to account for the Presence of Los Angeles Pocket Mouse.

The DEIR's baseline fails to account for the occurrences of Los Angeles Pocket Mouse at the Project site and consequently, fails to analyze and mitigate the Project's impacts on such species. According to Mr. Cashen,

The Los Angeles pocket mouse is a state listed Species of Special Concern and a MSHCP Group 3 species. The Los Angeles pocket mouse is associated with fine, sandy soils in intermittent drainages, non-native grassland, Riversidean sage scrub, Riversidean alluvial fan sage scrub, chaparral and redshank chaparral habitats.⁴⁴ The DEIR relays the opinion of the Applicant's consultant that the species is absent from the Project area.⁴⁵ That conclusion is unjustified for two reasons.

⁴⁴ MSHCP, Vol II-B, Species Accounts: Mammals. Available at: <http://www.wrc-rca.org/library.asp>

⁴⁵ DEIR, p. 4.4-30.

First, focused surveys for the Los Angeles pocket mouse were not conducted throughout all potentially suitable habitats. In 2005, trapping surveys were limited to nine acres of suitable habitat within "Drainage Feature 9."⁴⁶ In 2010, surveys were limited to trapping along approximately 1,000 feet of Drainage Feature 9, and within two ephemeral drainages (each also approximately 1,000 feet) dominated by mule fat but within an agricultural field.⁴⁷ Trapping surveys were never conducted in other portions of the Project area that contain potentially suitable habitat for the Los Angeles pocket mouse. These include: (a) the northern portion of "Drainage Feature 7" where it is associated with native vegetation; (b) the drainages and native vegetation communities east of Gilman Springs Road and north of Highway 60; (c) the grassland community within the Project area; and (d) the remaining scrub communities in the Project area.

Second, it is well established in the field of wildlife science that it is nearly impossible to prove absence. This is especially true for the Los Angeles pocket mouse, which appears to occur at low densities and is difficult to trap.⁴⁸

Potentially significant Project impacts to the Los Angeles pocket mouse cannot be properly disclosed, analyzed, and mitigated until trapping surveys have been completed throughout all potentially suitable habitats in the Project area and buffer zone.

(Exhibit 2, pp. 9-10.)

4. The DEIR Fails to Provide Sufficient Information on Special-Status Plant Species Which May be Impacted by the Project.

The DEIR never conducted protocol-level plant surveys. The surveys that the DEIR did rely on (1) did not encompass the entire Project area and (2) used inappropriate methodology. Therefore, the DEIR's baseline fails to account for all special-status plant species and as a result, fails to adequately analyze the Project's impacts on such species. According to Mr. Cashen,

Protocol-Level Plant Surveys Were Not Conducted

Failure to survey the entire Project area and buffer-

⁴⁶ *Ibid*, Appendix E. Michael Brandman Associates. 2005 Sep 26. DRAFT Focused Los Angeles Pocket Mouse Survey Report for the 1,778-Acre Bel Lago Property, p. 7.

⁴⁷ *Ibid*, p. 10.

⁴⁸ MSHCP, Vol II-B, Species Accounts: Mammals, p. M-92. Available at: <http://www.wrc-rca.org/library.asp>

The Applicant's consultant conducted rare plant surveys in June 2010. These surveys, however, were based on the footprint for the Highlands Specific Plan, and they were limited to four drainages within the Project site.⁴⁹ The Applicant's consultant did not survey any other portions of the Project area, including the Riversidean Sage Scrub communities, which the DEIR identifies as having the potential to support rare plant species that are not covered by the MSHCP.⁵⁰

CDFW survey guidelines indicate focused botanical surveys should be conducted *whenever natural or naturalized vegetation occurs on a project site* and the project has the potential for direct or indirect effects on vegetation.⁵¹ Natural and naturalized vegetation occur on and adjacent to the Project site, and the Project will have direct and indirect impacts on that vegetation.⁵² Therefore, to establish existing conditions and comply with CDFW guidelines, the Applicant needs to conduct appropriately timed botanical surveys throughout all portions of the Project area and buffer zone containing natural or naturalized vegetation. Data from those surveys are required to fully assess existing conditions, analyze Project impacts, and formulate appropriate mitigation for impacts to sensitive botanical resources.

Inappropriate methodology-

The methods used to survey special-status plants on the Project site had numerous flaws that have resulted in unreliable information on baseline conditions and Project impacts.

The Applicant's consultant concluded that three sensitive plant species have a "moderate" potential to occur on the Project site. The sensitive plant surveys were limited to a search for those three species.⁵³ The "list approach" implemented by the Applicant's consultant is not an accepted technique for disclosing and analyzing the impacts of a project. Indeed, the CDFW specifically advises against the "list approach" for botanical inventories. Its survey guidance states:

⁴⁹ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 2. and Exhibit 5.

⁵⁰ *Ibid*, pp. 4.4-26 and -27.

⁵¹ CDFG. 2009. Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities. Available at: http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html#Plants.

⁵² DEIR, Figure 4.4-1.

⁵³ *Ibid*, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 1.

This list [of special-status plants with potential to occur within a particular region] can serve as a tool for the investigators and facilitate the use of reference sites; however, special status plants on site might not be limited to those on the list. Field surveys and subsequent reporting should be comprehensive and floristic in nature and *not restricted to or focused only on this list*...“Focused surveys” that are limited to habitats known to support special status species or are restricted to lists of likely potential species are not considered floristic in nature and **are not adequate** to identify all plant taxa on site to the level necessary to determine rarity and listing status.⁵⁴

As the survey report acknowledges, “[t]he focused plant survey...is not considered a comprehensive botanical survey to record all observed species within the survey areas.”⁵⁵

According to the survey report, the 2010 surveys were conducted within the known flowering period of the special-status species potentially occurring within the Project footprint.⁵⁶ However, the phenology of plants can vary considerably within the known flowering period depending on environmental conditions. Contrary to guidance issued by the CDFW, the Applicant’s biologist did not visit reference sites to determine the phenology of the target species and to confirm they were identifiable at the time of the surveys.⁵⁷

The sensitive plant surveys were limited to seven man-hours, during which time the biologist was also searching for burrowing owls.⁵⁸ In my opinion, it would have been impossible for the biologist to reliably survey the four drainages for burrowing owls and sensitive plants during such a short period of time.

Due to the issues described above, the DEIR lacks reliable information on existing conditions, and it is not possible for the City of Moreno Valley

⁵⁴ CDFG. 2009. Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities. Available at: http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html#Plants. [emphasis added].

(“City”) to conclude special-status plant species are absent from the Project site.

(Exhibit 2, pp. 7-9.)

5. The DEIR’s Baseline Fails to Account for All Special-Status Species.

The DEIR fails to account for the presence of all special-status species, including Northwestern San Diego Pocket Mouse, San Diego Desert Woodrat, American Badger, Western Yellow Bat, Bell’s Sage Sparrow, Grasshopper Sparrow, White-tailed Kite, and Ferruginous Hawk and Merlin. Therefore, the DEIR’s biological resources baseline fails to account for such special-status species and as a result, fails to analyze the Project’s impacts on such species. More specifically, according to Mr. Cashen,

Northwestern San Diego Pocket Mouse

The Northwestern San Diego pocket mouse is a state listed Species of Special Concern. According to the DEIR, the Northwestern San Diego pocket mouse has a low potential of occurring in the Project area.⁵⁹ This conclusion is incorrect. The Applicant’s consultant captured seven Northwestern San Diego pocket mice during its 2010 trapping surveys on the Project site.⁶⁰ Development of the Project will have an adverse effect on the Northwestern San Diego pocket mouse. The City must disclose, analyze, and provide mitigation for this potentially significant impact.

San Diego Desert Woodrat

The San Diego Desert woodrat is a state listed Species of Special Concern. The Applicant’s consultant captured eight San Diego desert woodrats during its trapping surveys on the Project site.⁶¹ The DEIR does not disclose the presence of San Diego desert woodrats on the Project site, nor does it analyze potentially significant impacts to the (sub)species.

American Badger

The American badger is a state listed Species of Special Concern that is not covered under the MSHCP. The DEIR incorrectly states that the Project area does not contain habitat for the American badger.⁶² The

⁵⁹ DEIR, Table 4.4.D.

⁶⁰ *Ibid*, Appendix E. Michael Brandman Associates. 2010 Dec 13. Focused Los Angeles Pocket Mouse Survey Report: Highlands Specific Plan, Table 2.

⁶¹ *Ibid*. Michael Brandman Associates. 2005 Sep 26. Focused Los Angeles Pocket Mouse Survey Report for the 1,778-acre Bel Lago Property, Table 1.

⁶² *Ibid*, p. 4.4-27.

American badger occurs in herbaceous, shrub, and open stages of most habitats with dry, friable soils.⁶³ American badgers have the potential to occur on the Project site, especially in the patches of habitat that have not been subject to periodic discing. As a result, the City must disclose, analyze, and provide mitigation for potentially significant Project impacts to the American badger.

Western Yellow Bat

The western yellow bat is a state listed Species of Special Concern that is not covered under the MSHCP. The DEIR states there is no suitable habitat for the species in the Project area even though (a) no bat surveys were conducted for the Project; and (b) the species has been documented occurring in the Project region.⁶⁴

The western yellow bat is a “tree-roosting” species commonly found roosting in the skirt of dead fronds in both native and non-native palm trees.⁶⁵ It is believed to form small maternity groups in trees and palms, including in ornamental plantings in residential areas and orchards.⁶⁶ One of the primary threats to the species in the U.S. is the cosmetic trimming of palm fronds.⁶⁷ Palms occur in the Project area and presumably may be impacted by the Project.⁶⁸

Bats are very vulnerable to disturbance.⁶⁹ Construction activities associated with the Project have the potential to cause bats to abandon roosts and maternity colonies. The DEIR does not disclose, assess, or provide mitigation for this potentially significant impact.

31

32

Bell's Sage Sparrow

The Bell's sage sparrow is a U.S. Fish and Wildlife Service ("USFWS") Bird of Conservation Concern, a CDFW Watch List species, and a MSHCP Group 2 species. The DEIR states there is no suitable habitat for the Bell's sage sparrow within the Project area.⁷⁰ The DEIR fails to acknowledge that the subspecies was detected during small mammal trapping surveys on the Project site.⁷¹ As a result, the City must disclose and analyze potentially significant Project impacts to the Bell's sage sparrow.

33

Grasshopper Sparrow

The grasshopper sparrow is a state listed Species of Special Concern. The species is not covered by the MSHCP because the species-specific conservation objectives defined in the MSHCP have not yet been met.⁷² The grasshopper sparrow was detected on the Project site.⁷³ However, the DEIR does not disclose, analyze, or provide mitigation for potentially significant Project impacts to the species.

34

White-tailed Kite

The DEIR concludes "[n]o suitable nesting habitat for white-tailed kite or American peregrine falcon occurs within the area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation."⁷⁴ This conclusion conflicts with scientific information. White-tailed kites are known to nest in a variety of different tree species.⁷⁵ Furthermore, agricultural habitat, especially dryland field crops (e.g., wheat and barley), may play an important role as foraging habitat for nesting white-tailed kites because the fields are known to provide prey for foraging raptors. The City must disclose and analyze potentially significant Project impacts to the white-tailed kite.

⁷⁴ *Ibid*, p. 4.4-26.

⁷⁵ Niemela CA. 2007. Landscape characteristics surrounding white-tailed kite nest sites in Southwestern California. MS Thesis, Humboldt State University, Arcata, California.

Ferruginous Hawk and Merlin

The ferruginous hawk is a USFWS Bird of Conservation Concern and a CDFW Watch List species. The merlin is a CDFW Watch List species. The DEIR states the Project site provides suitable foraging habitat for these two species, but no suitable nesting habitat.⁷⁶ Both the ferruginous hawk and merlin are known to occur in the Project region.⁷⁷

It is well established that ferruginous hawks and merlins do not nest in California, and that the special-status designations for these two species apply to birds on their *wintering* grounds. Therefore, the lack of nesting habitat on the Project site is irrelevant to the potential for Project impacts under CEQA. As a result, the City must disclose and analyze Project impacts to the ferruginous hawk and merlin, and it must identify how potentially significant impacts to the two species would be mitigated.

(Exhibit 2, pp. 10-12.)

6. The DEIR Inaccurately Characterizes the Jurisdictional Status of Drainages of the Project area.

According to Mr. Cashen,

The DEIR states the drainage features in the Project area are not subject to the jurisdiction of the CDFW.⁷⁸ This statement is inconsistent with information provided in the Jurisdictional Delineation report, which identifies portions of Drainages 7 and 9 as being jurisdictional under 1600 of the Fish and Game Code.⁷⁹

The DEIR states that the Project site does not contain any features under the jurisdiction of the Regional Water Quality Control Board ("RWQCB").⁸⁰ This statement appears to be based on the false impression that features not under the jurisdiction of the U.S. Army Corps of Engineers are also not under the jurisdiction of the RWQCB.⁸¹

⁷⁶ DEIR, p. 4.4-27.

⁷⁷ eBird. 2011. eBird: An online database of bird distribution and abundance [web application]. Version 2. eBird, Ithaca, New York. Available: <http://www.ebird.org>. (Accessed: 2013 Feb 2).

⁷⁸ DEIR, p. 4.4-51.

⁷⁹ *Ibid*, Appendix E. Michael Brandman Associates. 2012 Apr 23. Assessment of Jurisdictional Waters and Wetlands, p. 42.

⁸⁰ *Ibid*, p. 4.4-59.

⁸¹ *For example*, see: DEIR, Appendix E. Michael Brandman Associates. 2012 Apr 23. Assessment of Jurisdictional Waters and Wetlands, p. 32.

The jurisdictional reach of Porter-Cologne Water Quality Control Act (i.e., RWQCB) extends to all “waters of the state.”⁸² That term is defined as “any surface water or groundwater, including saline waters, within the boundaries of the state.”⁸³ Because Porter-Cologne applies to any water and the federal Clean Water Act only applies to certain waters, California’s jurisdictional reach is broader and more comprehensive than the federal government’s.⁸⁴

(Exhibit 2, p. 13.)

In sum, the DEIR failed to adequately investigate and identify in sufficient detail the existence of all sensitive biological resources at the Project site. Consequently, the DEIR established a skewed biological resources baseline, ultimately resulting in the DEIR’s failure to analyze and mitigate the Project’s potential impacts on sensitive plants and wildlife. A revised DEIR must conduct the necessary surveys and investigations to establish an accurate baseline for biological resources.

V. THE DEIR FAILS TO ANALYZE AND MITIGATE ALL POTENTIALLY SIGNIFICANT IMPACTS.

An EIR must disclose all potentially significant adverse environmental impacts of a project. (Pub. Resources Code, § 21100(b)(1); CEQA Guidelines, § 15126(a); *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354.) CEQA requires that an EIR must not only identify the impacts, but must also provide “information about how adverse the impacts will be.” (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831). The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692 (“*Kings County*”).)

CEQA requires public agencies to avoid or reduce environmental damage when “feasible” by requiring mitigation measures. (CEQA Guidelines, § 15002(a)(2) and (3); See also, *Berkeley Jets*, *supra*, 91 Cal. App. 4th at p. 1354; *Citizens of Goleta Valley*, *supra*, 52 Cal.3d at p. 564.) The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to “identify ways that environmental damage can be avoided or significantly reduced.” (CEQA Guidelines, §15002(a)(2).) If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has “eliminated or substantially lessened all significant effects on the environment where feasible” and that

⁸² State Water Resources Control Board. 2013 Jan 28. PRELIMINARY DRAFT: WATER QUALITY CONTROL POLICY for Wetland Area Protection and Dredged or fill Permitting, p. 4. Available at: http://www.waterboards.ca.gov/water_issues/programs/cwa401/docs/wrapp/policy_draft.pdf

⁸³ *Ibid.*

⁸⁴ *Ibid.*

any unavoidable significant effects on the environment are “acceptable due to overriding concerns.” (Pub. Resources Code, § 21081; CEQA Guidelines, § 15092(b)(2)(A) & (B).)

In general, mitigation measures must be designed to minimize, reduce, or avoid an identified environmental impact or to rectify or compensate for that impact. (CEQA Guidelines, § 15370.) Where several mitigation measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. (*Id.*, at § 15126.4(a)(1)(B).) A lead agency may not make the required CEQA findings unless the administrative record clearly shows that all uncertainties regarding the mitigation of significant environmental impacts have been resolved.

CEQA requires the lead agency to adopt feasible mitigation measures that will substantially lessen or avoid the Project’s potentially significant environmental impacts (Pub. Resources Code, §§ 21002, 21081(a)), and describe those mitigation measures in the CEQA document. (Pub. Resources Code, § 21100(b)(3); CEQA Guidelines, § 15126.4.) A public agency may not rely on mitigation measures of uncertain efficacy or feasibility. (*Kings County, supra*, 221 Cal.App.3d at p. 727 (finding groundwater purchase agreement inadequate mitigation measure because no record evidence existed that replacement water was available).) “Feasible” means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. (CEQA Guidelines, § 15364.) To demonstrate economic infeasibility, “evidence must show that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.” (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1181.) The EIR must provide evidence and analysis to show project cannot be economically implemented. (*Kings County, supra*, 221 Cal.App.3d at pp. 734-737.) This requires not just cost data, but also data showing insufficient income and profitability. (See *Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322, 327 (infeasibility claim unfounded absent data on income and expenditures showing project unprofitable); *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 694 (upholding infeasibility finding based on analysis of costs, projected revenues, and investment requirements).) Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments. (CEQA Guidelines, § 15126.4, subd. (a)(2).)

A lead agency may not conclude that an impact is significant and unavoidable without requiring the implementation of all feasible mitigation measures to reduce the impacts of a project to less than significant levels. (CEQA Guidelines, §§ 15126.4, 15091.)

A. THE DEIR FAILS TO ADEQUATELY MITIGATE FOR THE LOSS OF FARMLAND.

1. Preservation is an Appropriate Mitigation Measure for the Loss of Agricultural Resources.

Preservation can be used as a tool to mitigate impacts of urbanizing land and it is encouraged and supported by legislative pronouncements and case law. For example,

[s]ee the following legislative pronouncements to the effect that conversion of agricultural land is of significant concern, and that the preservation of agricultural land is significant goal of the state. Gov. Code, § 51220 (Williamson Act findings that agricultural preservation is valuable and necessary); Civ. Code, § 815 (legislative declaration that preservation of agricultural lands “is among the most important environmental assets of California”); Pub. Resources Code, § 10200 *et seq.* (California Farmland Conservancy Program Act (formerly the Agricultural Land Stewardship Program of 1995), promoting the establishment of agricultural easements as a means to preserve agricultural land); Pub. Resources Code, §§ 21031.1, 21061.2, 21095 (CEQA provisions requiring the Resources Agency to take steps it to ensure that the environmental effects of agricultural land conversion are quantitatively and consistently considered in the environmental review process); Stats. 1993, ch. 812, § 1, subd. (d) (declaring a legislative intent that CEQA should play an important role in the preservation of agricultural lands).

In *Mira Mar [Mobile Community v. City of Oceanside]* (4th Dist. 2004) 119 Cal. App. 4th 477 [14 Cal. Rptr. 3d 176]], the court heard a challenge to the City of Oceanside’s approval of a condominium project on 7.5 acres of private property. The project would cause the loss of about .86 acres of coastal sage scrub, which was identified as a significant impact to a sensitive resource. The EIR required the applicant to mitigate for this loss at a ratio of 3 to 1 (or 2.58 acres of mitigation for .86 acres of lost habitat). In implementing this mitigation measure, the city required the preservation of .65 acres of undisturbed coastal sage scrub, the restoration and preservation of 2.3 acres of disturbed coastal sage scrub, and the creation of .63 acres of new coastal sage scrub on site. Petitioners argued that this mitigation was inadequate because *preservation* of coastal sage scrub does not mitigate for lost habitat, making the measure “illusory and inadequate.” 119 Cal. App. 4th 477, 495. The Court of Appeal disagreed, citing CEQA Guidelines section 15370, as well as the opinions of various resource agencies, for the proposition that preservation can be a feasible means of reducing or eliminating the impact of lost habitat.

While the *Mira Mar* case deals specifically with biological and habitat resources, the reasoning of this case seems to have more general applicability to mitigation for lost resources, including agricultural resources.

(Guide to CEQA, Michael H. Remy, et. al., eleventh edition, p. 549-550.)

2. The City Should Preserve Agricultural Land To Prevent Continual and Systematic Losses of Such Land.

According to Mr. Gregory House, an agricultural expert, there are many reasons to preserve agricultural land in the City of Moreno Valley:

— Moreno Valley, including the subject property has many physical advantages for agricultural production including a benign climate, good soils and sufficient [*sic*] water at a cost competitive in southern California and many areas of the Central Valley of California.

— Moreno Valley's location creates huge marketing opportunities for direct marketing of agricultural produce to the four-county area of Los Angeles, Orange, Riverside and San Bernardino urban area.

— Moreno Valley's location also creates a cost of transportation advantage for commodity crops and products needing processing, such as fresh milk in the nearby metropolitan areas. For several years California dairies have participated in a price pooling that attempts to standardize raw milk prices to milk processors throughout the state. Since the cost of transporting the raw milk to the bottling plants is a significant cost, the farther the milk source is from the plants, the higher the transportation cost charged to the dairyman. With the increasing costs of fuel for transport, milk processors south of the Techacapi Mountains are finding it increasingly difficult to source adequate amounts of raw milk. The situation is a growing problem without an immediate solution.⁸⁵ This creates an opportunity for Riverside County dairyman that a decade ago did not exist.

— Agriculture is a vibrant industry that is very adaptable and quickly changes to meet new challenges and opportunities. New opportunities on the horizon include dry farming of biofuel crops; urban farming and direct marketing of high value food crops such as fruits, vegetables, eggs and honey; and changing economics in milk production. Moreno Valley has potential in all of these agricultural opportunities.

⁸⁵ See *Milk must move farther to serve south-state plants*, Ag Alert, March 27, 2013.

— There is a huge and growing interest in urban agriculture and small farming among people of all ages, but especially young people under 30 years of age. The Secretary of Agriculture recently called for the development of 100,000 new farmers during his tenure at USDA, most of whom are acknowledged to be, and intended to be, young persons. USDA has implemented many new programs to effect this sea-change, including a new program of low-interest micro-loans for new and beginning farmers.

— Growing interest in sustainable urban planning is examining the importance of local agriculture to the long term food security and resilience of local economies. With the inevitable increases in food transportation costs, it is incumbent upon the City of Moreno Valley to plan for its long term sustainability. As food is essential, so is agriculture to a sustainable and vibrant local economy.

(Exhibit 3, pp. 11-12.)

3. The DEIR Fails to Adequately Mitigate the Loss of Farmland.

The Project proposes to convert vast acres of farmland to industrial uses. Over 90 percent of the Project site is designated farmland – 25 acres designated as Unique Farmland and 3,389 acres of Farmland of Local Importance. (DEIR, p. 4.2-7.) 97%, or 3,238 acres, of the Project site is currently used for dry farming. Not surprisingly, the DEIR admits that the loss of approximately 3,500 acres of active and designated farmland will result in significant impacts on agricultural resources. (DEIR, pp. 4.2-16 ~20, 4.4-4, 4.8-2.)

For reasons set forth below, the DEIR fails to adequately mitigate the Project's significant impacts to valuable agricultural resources.

(a) The DEIR's Conclusion that it is Economically Infeasible to Mitigate the Significant Loss of Farmland is Unsupported.

The DEIR cites to the decline of agricultural industry in the Inland Empire to conclude that any mitigation that would artificially preserve or prolong agricultural activities on the Project site would be infeasible and unnecessary. (DEIR, p. 4.2-17.) However, the DEIR fails to offer any concrete analysis of the economic feasibility of agricultural production in the Project area. Moreover, the DEIR blatantly ignores the important fact that over 90% of the Specific Plan site is currently farmed and contributing to the local economy.

Mr. House agrees:

The studies do not offer any tangible analysis of the economics of agricultural production in the area, however, and this is a serious deficiency of the “significant and unavoidable impact” finding of the DEIR. How can the DEIR conclude no agriculture is viable without an analysis of its feasibility? The very fact that agriculture in the form of dry farmed wheat continues on the subject property begs the question that if it is not economically remunerative, why does it continue?

Information is available to conduct a well documented, considered feasibility study of agricultural enterprises in the Moreno Valley area. The University of California Cooperative Extension (UCCE) publishes an extensive collection of studies on the costs, income and profitability of hundreds of crops. A brief view of the archives for the Southeast Interior area of California, which includes Riverside County, lists indicates that UCCE studies are available on the profitability of such crops as alfalfa, avocados, barley, beans, broccoli, cabbage, cantaloupes, carrots, corn, grain, grapefruit, lemons, lettuce, melons and wine grapes. Any real attempt to analyze the feasibility of agriculture in Moreno Valley would reference these studies and examine them for relevant information concerning the viability of agriculture in the Moreno Valley area.

While it is clear that local trends are reducing agriculture in the area, what is not been examined is any new trends that might affect the viability of agriculture in the Moreno Valley area. For instance, the price of most agricultural commodities has risen substantially, some 30 to 50 percent, in the last several years. The Riverside County Agricultural Commissioner reports for 2011:

This year's report represents a total gross valuation of \$1,282,256,116, an increase of \$188.6 million (17.2%) over the 2010 value and a new record for Riverside County. Agricultural crops rose 15.4% to \$990,225,736, while Livestock and Poultry production increased nearly 24% to \$202,030,380.

This does not sound like a dying industry.

In that previous mentioned economic feasibility study of a small property in Moreno Valley which we conducted last October, We concluded that the operation, which would utilize irrigation water from Eastern Municipal Water District (EMWD), would likely produce an annual net profit of approximately \$60,000 per acre, after all expenses were paid.

(Exhibit 3, pp. 8-9.)

The DEIR's conclusion that mitigating the loss of farmland is economically infeasible is not supported by substantial evidence. (See CEQA Guidelines, § 15364; *Citizens of Goleta Valley, supra*, 197 Cal.App.3d at p. 1181; *Kings County, supra*, 221 Cal.App.3d at pp. 734-737.) On the contrary, evidence supports a finding that such mitigation is not only economically feasible but could actually be economically beneficial for the City.

42

(b) The DEIR's Conclusion that an Agricultural Mitigation Bank is Infeasible is Not Supported by Substantial Evidence.

The DEIR hastily considers contributing to an agricultural mitigation bank (or agricultural conservation easements) to mitigate the loss of farmland and just as quickly dismisses it. (DEIR, p.4.2-17.) The DEIR rationalizes that since Riverside County had deemed mitigation banks infeasible, it would be infeasible to carry out such a mitigation measure on a citywide basis. (*Id.*) However, Riverside County's dismissal of mitigation banks back in 2003 is not sufficient evidence to support a finding that agricultural mitigation bank for this Project is infeasible for the City for this Project in this instance.

According to Mr. House, countless cities have demonstrated that agricultural mitigation is feasible at the municipal level:

43

There are numerous examples of cities in California that have chosen to conserve their agricultural resources independently of local county policies. The City of Davis, for instance, where we live, established an agricultural land mitigation requirement in 1995 and in 2007 increased the mitigation ratio such that 2 acres of farmland are conserved for every one acre converted to urban uses.

Numerous other cities in California also have agricultural mitigation requirements, including Stockton, Lathrop, Manteca, and Tracy in San Joaquin County; Brentwood in Contra Costa County; Elk Grove in Sacramento County; and Woodland in Yolo County. Bakersfield in Kern County in 2007 began requiring mitigation of agricultural land loss in 2007, Salinas in Monterey County has used agricultural conservation easements to limit its urban growth, and the City of Morgan Hill in Santa Clara County, a rapidly urbanizing area within Silicon Valley, is in the process of establishing an agricultural mitigation program that will utilize agricultural conservation easements paid for by developers.⁸⁶

(Exhibit 3, pp. 9-10.)

⁸⁶ Gregory House, co-author of this report is consultant to Morgan Hill on the creation of this program

Additionally, conservation easements are widely accepted as a feasible way to mitigate a project's impacts to agricultural resources. Agricultural conservation easements can be accomplished in two ways: (1) by permanently preserving farmland or (2) by requiring conservation fees from developers. According to Mr. House,

Conservation easements have been used for decades to conserve agricultural land where it is threatened by conversion to other uses. The American Farmland Trust has recently written a paper entitled Saving Farmland, Growing Cities which describes conservation easements in easy to understand terms.

Conservation easements area means of permanently preserving farmland under legal covenants voluntarily agreed to by landowners. Their purchase provides compensation to landowners who want to recover equity from their property while continue to farm it, something that would be impossible if they were to sell the land for non-agricultural purposes. Not only does this provide an innovative solution that recognizes private property rights, but it also provides an injection of capital into the agricultural economy.

...Funding for conservation easements can come from many sources...

An increasingly popular alternative is to require developers who convert farmland to pay a fee to preserve a comparable amount of land or to acquire the land itself for preservation.

This can also satisfy the requirement that environmental impacts of development be offset or mitigated [u]nder the California Environmental Quality Act."

(Exhibit 3, p. 10.)

Mr. House also provides details on ways to implement such agricultural conservation easements:

The California cities mentioned above have a variety of strategies to implement their agricultural preservation programs. Some have opted for a in-lieu mitigation fee (which will later be used by the city to purchase a conservation easement), others require the develop to purchase a conservation easement directly. The ratio of land conserved to land converted is typically 1:1 although the City of Davis has a 2:1 requirement. The latter method of requiring developers to purchase the conservation easements, utilized by both Yolo County and the City of Davis, has several advantages: low administration costs, the cost of the easement is current market value for the developer, and there is less likely to be a

closed or fixed market of available properties as easement sources; the former method, a mitigation in-lieu fee, involves greater administrative costs by the governing agency, and can lead to a price floor on the purchase price of the conservation easements such as experienced in Elk Grove in the late 2000's.

A successful strategy to keep the price of the conservation easements affordable for developers (who typically plan to factor the cost of the easements into their overall finished home or commercial real estate product sales price) is for the municipality to permit the conserved agricultural land to be some distance from the city limits, thus reducing speculative influence on the price of the easement. Simply put, it is common to find property that is second or third tier from the city limits to be less costly than property immediately adjacent. Since the principal effect of the agricultural conservation easement is to extinguish any current or future potential subdivision or urban development rights, the further a property is from development in space and time, the less costly will be the price of the conservation easement.

We recently conducted a study of 25 conservation easements in northern and central California which supports the observation that the farther from existing development the lower the cost of the easement. Our study, which included easements in seven counties from Merced to Yolo and several urban areas with high land costs (agricultural land values at \$30,000 to \$50,000 per acre), indicated there is a wide range in the cost of the easement relative to the fee value of the land. The range (of the cost of the agricultural conservation easement as a percent of the fee value of the property) spanned from a low of 15 percent in Monterey County in 2000 to a high of 73 percent in Solano County in 2006. At the high end were properties immediately adjacent to urban areas, freeways, etc. At the low end were properties in largely rural areas, much less or not at all affected by real estate speculation on urban development.

Agricultural land-conversion mitigation is feasible and being conducted by numerous cities, as well many counties in California. It is a serious lack of the DEIR that it does not examine any of the current mechanisms being employed in so many parts of California, nor attempt to consider the feasibility of implementing an agricultural mitigation program.

(Exhibit 3, pp. 10-11.)

Therefore, the DEIR's conclusion that agricultural mitigation bank is infeasible is unsupported by sufficient analysis and evidence. (See CEQA Guidelines, § 15364; *Citizens of Goleta Valley*, *supra*, 197 Cal.App.3d at p. 1181; *Kings County*, *supra*, 221 Cal.App.3d at pp. 734-737.)

(c) The DEIR's Mitigation Measure to Dedicate 5-acres to Heritage Farming is Inadequate.

In lieu of implementing the more appropriate agricultural mitigation bank, the DEIR provides one mitigation measure to address the loss of over 3,400 acres of active farmland.⁸⁷ (DEIR, p. 4.2-17.) The mitigation measure proffers to dedicate meager 5-acres to "heritage farming." (*Id.*) However, at a minimum, the acceptable mitigation ratio is 1:1, conserving 1 acre of farmland for 1 acre lost. (See *Citizens for Open Gov't v. City of Lodi* (2012) 205 Cal.App.4th 296, 323.) Mr. House corroborates that the typical mitigation ratio is 1:1, with the City of Davis demonstrating that 2:1 is also feasible. (Exhibit 3, pp. 10-11.) Thus, 5 acres for "heritage farming" falls vastly short of the 1:1 minimum ratio and is insufficient to mitigate the permanent loss of almost 3,500 acres of active and designated farmland at the Project site.

44

(d) The DEIR Overlooks the Development of Irrigation as a Potential, Feasible Mitigation Measure.

According to Mr. House, a potential, feasible way to mitigate the sweeping loss of farmland at the Project site is to develop irrigation on the highly rated soils of farmland in the Project's vicinity. Mr. House states:

If Moreno Valley is serious about conserving agricultural land, it might consider requiring as a mitigation measure the development of irrigation on the very highly rated soils of the nearby dry land farming areas. This could be done with the recycled irrigation water discussed in the Agricultural Resource Assessment prepared by Parsons Brinckerhoff for the DEIR, which notes that "EMWD plans to continue to extending the distribution infrastructure for recycled water." Nothing would be more supportive of agriculture in the area than to increase the availability of irrigation water, and then place a conservation easement on that land which prohibits urban development.

45

(Exhibit 3, p. 11.)

Mr. House's comments are premised on the fact that recycled water could be used to irrigate a wide variety of crops:

The DEIR presents conflicting information concerning the price and availability of water for crops and livestock in Moreno Valley. The Agricultural Resources Assessment prepared by Parsons Brinckerhoff in section 1.4 states that the cost of agricultural water is \$53 per acre-foot in

⁸⁷ Although the DEIR mentions another mitigation measure in the Agricultural Resources section, Mitigation Measure 4.2.6.1B, it is not detailed in the DEIR and appears to have been mentioned in error.

the winter and \$90 per acre foot in the summer. It later states in section 2.2.2 that the cost of recycled water varies from \$38 per acre foot to \$250 per acre foot, and that additional pipeline would be required to service the project site with recycled water bring the cost of the water to well over \$100 per acre foot.

The same study summarily states that the “cost of irrigation Water makes the production of irrigated crops economically infeasible in the Moreno Valley area.” This is unsupported, and easily refuted by inquiry into the cost of water in such areas as the Central Valley of California. For instance, the water cost in the Arvin Edison Water Storage District (southern Kern County), the cost per acre foot of irrigation Water is \$130,⁸⁸ in Westlands Water District (Fresno County) the cost per acre foot is \$100 to \$400,⁸⁹ in the Del Puerto Water District (Merced County), irrigation water costs \$55 to \$225 per acre foot,⁹⁰ and in the Fallbrook Water District (San Diego County), irrigation water costs \$1,400 per acre foot.⁹¹ From this we discern that the stated EMWD rates for irrigation water would not be excessive relative to many highly productive agricultural areas of California, and do not pose a substantial competitive disadvantage for Moreno Valley agriculture especially for the higher value crops such as fruits and vegetables suitable for growing in Moreno Valley as described in section 4.1.1, above.

The Agricultural Resources Assessment prepared by Parsons Brinckerhoff also states, again without support, “Commonly, in a low-rainfall area like Moreno Valley, a crop requires three acre feet of water per year and the profit from a majority of crops in California ranges from \$0 to \$500 per acre per year.” This supposition does not take into account the wide variation in water usage by the many different crops that could be grown in Moreno Valley (see section 4.1.1 above) nor the timing of planting and harvest of such crops, nor rainfall that becomes stored soil moisture and thus contributes to crop evapotranspiration needs; nor advances in irrigation technology that could be utilized in Moreno Valley agriculture such as drip irrigation that reduce total irrigation water needs of crops.

We have recently (October, 2012) conducted a economic feasibility study of a 4-acre property in Moreno Valley that a local farmer wishes to use for the production of certified organic fruits and vegetables for sale to local stores and at farmers’ markets. As part of that analysis we investigated

⁸⁸ source: personal files of AEWS water bills

⁸⁹ source: (<http://science.kqed.org/quest/2012/05/04/q-a-with-jason-peltier-of-wwd/>) and Notice to Landowners of Proposed Water Rates, Charges and Land-Based Charges, Westlands Water District, January 4, 2013

⁹⁰ source: personal communication with landowner and water user, 2013

⁹¹ source: As Water prices rise, farmers face the ‘tipping point’, Ag Alert, June 8, 2011

water sources and concluded that water from Eastern Municipal Water District (EMWD) was the most reliable source. We calculated the crop water needs based on local Riverside area evapotranspiration data available from the University of California and the California Irrigation Management Information Service.⁹² From this we concluded that the wide variety of fruits and vegetables intended to be grown on the property would require approximately 1.7 acre feet of applied irrigation water per year using drip irrigation, only about half of the 3 acre feet supposed in the Parsons Brinckerhoff report.

As an aside, it should be noted that a wide variety of crops can be grown with recycled water; the DEIR correctly notes there are strict guidelines for its use and prohibition for use in growing food crops; however this does not affect feed crops, fiber crops, biofuel crops, and high value crops such as vegetable seeds.

(Exhibit 3, pp. 7-8.)

In conclusion, the DEIR fails to adequately analyze all feasible ways to adequately mitigate the loss of extensive agricultural land. Moreover, the fact remains that the very cause of the decline of agricultural industry in the Inland Empire, and within the City, is projects like the current one, which have converted or seek to convert valuable farmland to urban uses without adequate mitigation. As the City would have it, its continued failure to preserve farmland to make way for urbanization will eventually result in the complete eradication of all farmland within the City limits. To prevent such a catastrophic result, the DEIR must sufficiently analyze all potential mitigation measures and implement them to the extent feasible.

Thus, a supplemental EIR is required to analyze and require implementation of these feasible mitigation measures to reduce the Project's impacts on agricultural land.

B. AIR QUALITY IMPACTS HAVE NOT BEEN ADEQUATELY ANALYZED OR MITIGATED.

1. The DIER Fails to Mitigate Significant Particulate Matter Emissions from Project Construction to the Extent Feasible.

The DEIR recognizes that the impacts from emissions of particulate matter (PM10) during project construction will be significant. To mitigate such impacts, the DEIR requires compliance with regional rules, including portions of SCAQMD Rule 403, and adoption of Mitigation Measures 4.3.6.2A through 4.3.6.2D. The DEIR then concludes that despite mitigation, the Project's PM10 emissions will be significant and unavoidable (DEIR, p. 4.3-57.) However, the DEIR's conclusion of significant and

⁹² (www.ipm.ucdavis.edu/weather)

45

46

47

unavoidable PM10 impact is flawed because it ignores other applicable and feasible mitigation measures. (*Id.*)

According to Mr. Hagemann,

Additional mitigation for particulate matter should be incorporated

Particulate matter (PM10) emissions from Project construction will exceed the South Coast Air Quality Management District (SCAQMD) thresholds throughout the construction period (DEIR, p. 4.3-55). The DEIR discusses SCAQMD Rule 403, established to reduce fugitive dust emissions, and provides the following four measures from Rule 403 as mitigation for the Project's significant emissions of PM10:

- all clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions;
- the contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day;
- cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meter (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicular Code Section 23114; and
- the contractor shall ensure that traffic speeds on unpaved roads and project site areas are 15 miles per hour or less to reduce fugitive dust haul road emissions (DEIR, p. 4.3-55).

Mitigation measures 4.3.6.2A through 4.3.6.2D also address PM10 emissions. However, the Project's PM10 emissions will be significant even after mitigation (DEIR, 4.3-57). Additional mitigation measures to reduce fugitive dust emissions are identified in Rule 403 but not in the DEIR. These measures should be identified in a revised DEIR to ensure that all applicable and feasible measures will be implemented to reduce Project emissions, to include:

- limiting fugitive dust emissions from any active operation, open storage pile, or disturbed surface area if the dust emission exceeds 20 percent opacity;
- prohibiting track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift; and

- not disturbing an area of five or more acres, or with a daily import or export of 100 cubic yards or more of material, without utilizing at least one of the following measures at each vehicle driveway from the site to a paved public road:
 - installation of gravel pads;
 - pave any surface extending at least 100 feet and at least 20 feet wide;
 - utilize a wheel shaker and wheel washer to remove dirt and mud from tires and vehicles before they exit the site.⁹³

Rule 403 also states that active operations cannot be conducted unless all applicable best available control measures included in Table 1 are included.⁹⁴ Table 1 provides mitigation measures for trenching, cut-and-fill, truck loading, road maintenance, and earth-disturbing activities.⁹⁵ Project construction will require these types of activities. Review of the DEIR shows that not all measures listed in Table 1 are included as mitigation. A revised DEIR should be prepared that includes all applicable measures in Table 1. The Project, defined as a large operation⁹⁶ under Rule 403, should also follow all the applicable dust control measures listed in Table 2.⁹⁷

(Exhibit 1, pp. 5-6.)

2. The DIER Fails to Mitigate Significant Localized Construction and Operational Air Quality Impacts to the Extent Feasible.

The DEIR also recognizes that the construction and operation of the proposed Project has the potential to exceed localized thresholds that may affect sensitive receptors. (DEIR, p. 4.3-58.) However, the DEIR erroneously concludes, despite the availability of additional feasible mitigation measures, that such localized air quality impacts are significant and unavoidable.

According to Mr. Hagemann:

Air dispersion modeling shows that localized concentrations of PM10 emissions also exceed SCAQMD thresholds (DEIR, p. 4.3-66). Significant localized PM10 emissions will pose adverse health risks to nearby residents and construction workers. The DEIR, however, only states that

⁹⁵ *Ibid.*, p. 403-13.

⁹⁶ *Ibid.*, p. 403-3.

⁹⁷ *Ibid.*, p. 403-19.

air quality impacts remain “significant and unavoidable” in the absence of feasible mitigation (DEIR, p. 4.3-66).

We have identified additional feasible mitigation measures that can further reduce PM10 emissions and mitigate these impacts to the extent feasible. For example, a recent ruling by the California Attorney General for construction of an industrial project in Jurupa Valley, a city located 17 miles west of the Project site, required the following measures:

- installation of air filtration systems in home of adjacent residents;
- air quality monitoring in surrounding area; and
- a “green” project site, including a 100kW capacity solar photovoltaic system, LEED Silver certified project buildings, and electric vehicle charging stations.⁹⁸

The press release accompanying the settlement⁹⁹ notes that Riverside County is home to numerous warehouse projects whose associated truck trips are negatively impacting resident health. Because the above-referenced mitigation measures were required for a similar project in a nearby city, it seems reasonable that these measures are feasible and should be implemented by the Applicant to protect resident health and local air quality.

Other mitigation, such as use of newer technology, should also be implemented to ensure that all feasible mitigation measures are being used to reduce emissions. Tier 4 technology, which applies to diesel engines used for off-road equipment,¹⁰⁰ uses new higher pressure fuel injection systems and electronic engine controls¹⁰¹ and can reduce PM10 emissions by 90% as compared to older technology.¹⁰² The DEIR discusses this technology but states that it will not be required until 2013 (DEIR, p. 4.3-57) and allow for the use of older Tier 3 technology in mitigation measure 4.3.6.2A (DEIR, p. 4.3-56). However, review of 40 CFR Part 1039, which establishes regulation about emissions standards, shows that Tier 4 technology will be phased in starting in 2011.¹⁰³ The

¹⁰³ See <http://www.epa.gov/otaq/standards/nonroad/nonroadci.htm>; and <http://www.ecfr.gov/cgi-bin/text-idx?c=ecfr&SID=0a57ac29b59ade8455648e60e739a181&rqn=div5&view=text&node=40:34.0.1.1.5&idno=40#40:34.0.1.1.5.1.2>

U.S. EPA has recommended the use of Tier 4 technology on other projects under CEQA review.¹⁰⁴ Because Project emissions are still significant even after mitigation, equipment used for the Project should meet Tier 4 standards to achieve maximum reduction in emissions.

The Project is located in the South Coast Air Basin, which is designated non-attainment for PM10. Because the air basin suffers from poor air quality from PM10, significant emissions of PM10 can worsen regional air quality. Because the Project will result in significant PM10 emissions, all feasible mitigation measures should be implemented to reduce emissions to the maximum extent feasible to ensure that Project construction will not contribute to a degradation of air quality. A revised DEIR should be prepared to implement all recommended mitigation measures, to include air filtration systems in residents' homes, equipment with Tier 4 technology, and all applicable Rule 403 measures.

(Exhibit 1, pp.6-7.)

Pursuant to Mr. Hagemann's findings and conclusions, a revised DEIR should be prepared to implement all applicable and feasible mitigation measures to address localized air quality impacts to sensitive receptors.

3. The DIER Fails to Analyze or Mitigate Significant Indirect Source Pollution.

CEQA requires analysis of both direct and indirect environmental impacts. "Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects." (CEQA Guidelines, § 15126.2, subd. (a).) The Project will be a major source of indirect pollution since it will attract thousands of diesel trucks to the area. The emissions from these trucks will result in significant levels of diesel particulate matter, nitrogen oxides (NOx), reactive organic compounds (ROCs), greenhouse gases (GHGs) and other pollutants.

The EIR should analyze a requirement that the Project be required to implement mitigation measures similar to those required by San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 9510 – the Indirect Source Rule ("ISR"). Rule 9510 requires large sources of indirect air pollution to implement measures to reduce particulate matter and NOx pollution by approximately 50%.

¹⁰⁴ U.S. EPA Detailed Comments on the Draft Environmental Impact Statement for the Proposed Alta East Wind Project, Kern County, California, September 27, 2012.
<http://www.epa.gov/region9/nepa/letters/blm/ca/alta-east-wind-project-kern-county-deis.pdf>, p. 2.

Although the Project is not located in the San Joaquin Air Basin, and the SCAQMD does not have a similar rule, there is no question that the rule is “feasible,” which is the standard under CEQA. The fact that the rule is being implemented just over the county line in the SJVAPCD indicates that it is “feasible.” (See, *Hall v. U.S. Environmental Protection Agency* (9th Cir. 2001) 263 F.3d 926.) The rule has been upheld in court as within the Air District’s powers. There is no legal or technological reason that the rule could not be enforced as a CEQA mitigation measure as a way to reduce pollution from the Project by up to 50%.

The San Joaquin Air District promulgated Rule 9510, the “Indirect Source Rule,” on December 15, 2005. EPA approved SJVAPCD Rule 9510 as part of the California State Implementation Plan (“SIP”) May 9, 2011. (76 Fed. Reg. 26609 (May 9, 2011); 40 C.F.R. §52.220(c)(348)(i)(A)(3).) Industry groups challenged Rule 9510, but the District Court, Ninth Circuit Court, and California Courts upheld the rule. (*Cal. Bldg. Indus. Ass’n. v. San Joaquin Valley Air Pollution Control Dist.* (“*CBIA v. SJVAPCD*”) (2009) 178 Cal.App.4th 120, 126-127; *NAHB v. SJVAPCD*, 2008 U.S. Dist. LEXIS 70931 (E.D.Cal. 2008); *Nat’l Ass’n of Home Builders v. San Joaquin Valley Unified Air Pollution Control Dist.*, 627 F.3d 730 (9th Cir. 2010).) In upholding Rule 9510, the Court stated:

The District determined that increase in indirect source emissions, including new residential and commercial development, nullified emissions reductions achieved from other regulations...

In short, Rule 9510 targets indirect sources of air pollution. Rule 9510 sets target reductions for emissions associated with construction (“construction emissions”) and future operation of development projects (“operational emissions”). For construction, Rule 9510’s target is to reduce PM10 emissions by 45 percent and NOx by 20 percent as compared to emissions generated using “average” construction equipment in California. For future operation, Rule 9510’s target is to incorporate mitigation measures into project design to reduce emissions that would be otherwise indirectly caused by the project (e.g., increased traffic) over a 10-year period. The PM10 target is to reduce unmitigated operational emissions by 50 percent. The NOx target is to reduce emissions by 33.3 percent.

(*NAHB, supra*, US. Dist. LEXIS 70931, at *13-14.)

Rule 9510 defines an indirect source as “any facility, building, structure, or installation, or combination thereof, which attracts or generates mobile source activity that results in emissions of any pollutant, or precursor thereof, for which there is a state ambient standard.” (Rule 9510, §3.17; see also 42 U.S.C. §7410(a)(5)(C).)

Rule 9510 provides that any heavy industrial facility of 100,000 square feet or larger in size must apply for an Indirect Source Rule or “ISR” permit, Rule 9510 §2.1.4, prior to receiving final discretionary approval for its project. *Id.* at §5.0. The Rule

requires the Air District to formulate a list of site-specific pollution reduction measures to reduce construction emissions by 20% for nitrogen oxides (“NOx”) and 45% for particulate matter under 10 microns in diameter (“PM10”). (Rule 9510 at §6.1.) It also requires the Air District to formulate a list of site-specific measures to reduce operational emissions by 33% for NOx and 50% for PM10. (*Id.* at §6.2.)

A facility subject to Rule 9510 may achieve all or part of its emission reductions by paying a fee that the Air District must use to achieve pollution reductions elsewhere in the air basin. Rule 9510 §3.24 states, “Off-Site Fees shall only apply to off-site emission reductions required, and shall only be used for funding off-site emission reduction projects.” Off-site reductions achieved through the fee must be “obtained reasonably contemporaneous with emissions increases associated with the project.” (*Id.* at §5.5.) Rule 9510 contains a complex formula intended to achieve equivalent emission reductions off-site as would have occurred through direct compliance on-site, based on the average statewide cost of emission reductions. (*Id.* at §7.0.) The current cost of off-site pollution reductions is over \$9000 per ton. (*Id.* at §7.2.)

The DEIR should analyze and implement requirements similar to those set forth in Rule 9510, in an effort to mitigate the Project’s impacts of indirect source pollution. The rule is feasible as is evidenced by the fact that it is being implemented in the adjacent county. Requiring the Project to comply with the rule would reduce pollution by almost 50%.

C. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE IMPACTS TO BIOLOGICAL RESOURCES.

It is the policy of the State of California to “[p]revent the elimination of fish and wildlife species due to man’s activities, insure that fish and wildlife populations do not drop below certain self-perpetuating levels, and preserve for future generations representations of all plant and animal communities.” (Pub. Resources Code, § 21001, subd. (c).)

As discussed below, the DEIR contravenes the state preservation policy and fails to adequately assess the Project’s impacts to wildlife, especially sensitive species and native plants. As a result, the DEIR did not adequately mitigate the potential impacts to the extent feasible. The DEIR must be revised to analyze and evaluate all potential impacts to biological resources and, where appropriate, propose adequate mitigation measures with definite terms and verifiable performance standards.

1. The DEIR Fails to Adequately Analyze the Full Extent of the Project’s Impacts Due to lack of Survey Data.

Due to the inaccurate biological resources baseline (see Part IV.C, *supra*), the DEIR fails to adequately analyze the Project’s impacts to such resources. According to Mr. Cashen,

50

51

For reasons previously discussed, project impacts to the burrowing owl, Los Angeles pocket mouse, and special-status plants cannot be sufficiently assessed due to the lack of comprehensive survey data. The lack of comprehensive survey data on burrowing owls is especially problematic because it is a MSHCP "Group 3" species (with additional survey needs and procedures), and because the species is known to occur on the Project site.

Burrowing Owl

Burrowing owls have been documented occurring on the Project site.¹⁰⁵ As a result, the Project is likely to have significant direct and indirect impacts on burrowing owl resources (including burrows, foraging habitat, and individual owls). However, the extent and magnitude (e.g., number of afflicted owls) cannot be fully evaluated and mitigated until surveys that comply with CDFW's 2012 survey requirements have been conducted. Moreover, it is not possible to rule out the potential for the Project to significantly impact burrowing owls until surveys that adhere to the protocol have been conducted.

(Exhibit 2, pp. 13-14.)

2. The DEIR Fails to Sufficiently Analyze Impacts to Raptor Habitat.

According to Mr. Cashen,

The City's analysis of Project impacts to raptor foraging habitat is limited to the following statements:

The WLCSP [World Logistics Center Specific Plan] and off-site facilities contain flat, open areas with sparse vegetation, which could be considered foraging habitat for some raptor species. Due to the regular, heavy disturbance associated with the various agricultural activities in the WLCSP and off-site facilities resulting in a rather limited prey base, and the limited size of the site in relation to the expansive foraging habitat in the near vicinity including both the CDFW Conservation Buffer Area and the SJWA [San Jacinto Wildlife Area], LSSRA [Lake Perris State Recreation Area] and the extensive Badlands to the east, the foraging habitat on site is considered marginally suitable and an adverse but not significant impact to raptor foraging habitat is anticipated.¹⁰⁶

¹⁰⁵ DEIR, Appendix E, p. 46.

¹⁰⁶ *Ibid*, p. 4.4-75.

51

52

These statements are not supported by actual analysis.

First, neither the Applicant nor the City conducted any studies to quantify the prey base for raptors. Whereas agricultural activities can reduce the prey base, certain activities (e.g., harvesting, discing, mowing, flood irrigation, and burning) increase hunting efficiency by reducing cover or otherwise increasing the exposure of prey to foraging raptors. Indeed, some raptor species (e.g., Swainson's hawk) have learned to exploit the abundance of prey made available by agricultural activities. For example, Estep (1989) reported that Swainson's hawks in the Central Valley spent 52.8% of their foraging time hunting in apparent response to harvesting, discing, mowing, or irrigation.¹⁰⁷

Second, the Project site cannot be characterized as being of "limited size" in relation to the expansive foraging habitat in the vicinity. Indeed, the Applicant's consultant identified the study area as containing "extensive raptor foraging habitat."¹⁰⁸ The consultant also concluded that impacts to the large amount of raptor foraging habitat on the site may be a significant impact under CEQA.¹⁰⁹

Whereas I do not contest that there is a considerable amount of foraging habitat in the Project vicinity, it is overly simplistic for the City to conclude that the loss of over 2,700 acres of foraging habitat would not have a significant impact on raptors. Some raptor species are intolerant of even small amounts of urban development.¹¹⁰ For example, Berry et al. (1998) concluded that even small amounts of urbanization usually rendered *whole landscapes* unacceptable to bald eagles, ferruginous hawks, rough-legged hawks, and prairie falcons.¹¹¹ In addition, raptors that are displaced from the Project site to suboptimal habitats would likely experience reduced survivorship. Thus, the City's analysis of Project impacts to raptors must consider (a) the size and configuration of remnant foraging habitat in relation to urbanization; and (b) the quality and carrying capacity of the habitat remaining in the region.

3. The DEIR Fails to Disclose, Analyze, or Mitigate Biological Resources Impacts Associated with the Proposed Relocation.

According to Mr. Cashen,

The DEIR indicates burrowing owls, Los Angeles pocket mice, and perhaps other sensitive species may be “relocated” to the 250-foot setback zone along the southern boundary of the Project site. Relocating sensitive wildlife to the setback zone defeats its intent, which is to provide a buffer between the Project and sensitive biological resources. Moreover, relocating wildlife outside of the construction area does not ensure impacts are mitigated.

In a comprehensive review of translocation projects involving birds and mammals, Griffith et al. (1989) concluded overall success rates were apparently dependent on a variety of ecological factors, including the quality of the habitat where animals were released.¹¹² When an animal is moved to an unfamiliar location, it has no knowledge of the habitat resources essential for its survival (e.g., food, water, and cover). The lack of cover in an unfamiliar setting makes a prey species (e.g., Los Angeles pocket mouse) an easy target for predators. In addition, many animals exhibit an intrinsic homing response that is energetically taxing, and that may preclude procurement of food and cover resources. Elevated stress hormone levels an organism generates when it is handled and moved may synergistically interact with increased energetic demands to further reduce possibility of survival. Even if the translocated animal is placed in an area with readily available resources, aggressive competitors may prevent the displaced animal from accessing the resources, and from mating.

Burrowing owl-

Consistent with CDFW guidelines, passive relocation is a potentially significant impact under CEQA that must be analyzed.¹¹³ Specifically, the temporary or permanent closure of burrows may result in: (a) significant loss of burrows and habitat for reproduction and other life history requirements; (b) increased stress on burrowing owls and reduced reproductive rates; (c) increased depredation; (d) increased energetic costs; and (e) risks posed by having to find and compete for available burrows.¹¹⁴ The City must thoroughly analyze the effects of passive relocation if it may be implemented at the Project site.

¹¹² Griffith B, JM Scott, JW Carpenter, C Reed. 1989. Translocation as a species conservation tool: status and strategy. Science 245:477-480. (Attachment D).

¹¹³ CDFG. 2012. Staff Report on Burrowing Owl Mitigation, p. 10.

¹¹⁴ *Ibid.*

The need for full analysis of potential impacts from passive relocation is further supported by research that indicates most translocation projects have resulted in fewer breeding pairs of burrowing owls at the mitigation site than at the original site, and that translocation projects generally have failed to produce self-sustaining populations.¹¹⁵ Investigators attribute the limited success of translocation to: (a) strong site tenacity exhibited by burrowing owls, and (b) potential risks associated with forcing owls to move into unfamiliar and perhaps less preferable habitats.¹¹⁶

Each of these issues exemplifies the need for the Applicant to prepare a detailed translocation plan that is approved by the resource agencies before translocation occurs. At a minimum, the plan should contain:

1. an assessment of potential release sites, with special attention dedicated to estimating the size of the receiving population.
2. an assessment of threats at the release site (e.g., predators, pesticide use, land management activities), and a discussion of how these threats have been (or will be) mitigated.
3. a detailed description of the monitoring and adaptive management measures that will be implemented after animals are released.

(Exhibit 2, pp. 15-16.)

4. The DEIR Fails to Establish Adequate Buffers to Mitigate Potentially Significant Impacts of Air Pollution on Biological Resources.

The DEIR admits that buffer zones, or setbacks, are necessary to adequately mitigate the Project's potentially significant air pollution impacts to biological resources. (DEIR, pp. 4.4-62~72.) The South Coast Air Quality Management District ("SCAQMD") and the California Air Resources Board ("CARB") both recommend that a project's setbacks to sensitive receptors should be 1,000 ft.¹¹⁷ Contrary to such recommendation, the DEIR concludes that 250 ft setbacks would suffice. (*Id.* at p. 4.4-71.)

The DEIR's proposed 250 ft setback is inadequate for the following reasons: (1) the setback zones are insufficient to adequately mitigate the Project's air pollution impacts to biological resources, (2) the DEIR erroneously concludes that the

¹¹⁵ Smith BW, JR Belthoff. 2001. Burrowing owls and development: short-distance nest burrow relocation to minimize construction impacts. J. Raptor Research 35:385-391. (Attachment E).

¹¹⁶ *Ibid.*

¹¹⁷ SCAQMD's Review of the Draft Specific Plan for the Proposed World Logistics Center Project, p. 3, available at <http://www.aqmd.gov/ceqa/igr/2012/May/DSPworldlogistics.pdf>

recommended 1,000 ft setbacks are not necessary, and (3) the DEIR fails to explain why the recommended 1,000 ft setbacks are infeasible.

First, Mitigation Measure 4.4.6.1A's 250 ft setbacks are inadequate to serve their purpose of "buffering" biological resources from the Project's significant air pollution impacts. Mr. Cashen agrees:

According to the DEIR, "[t]he most significant potential environmental impact on local wildlife (i.e., within the SJWA and Badlands) may be exposure to vehicular exhaust and especially diesel particulates and toxic air contaminants from truck exhaust as the WLCSP project builds out. New development will produce *significant amounts* of diesel-related air pollutants that will be released into the atmosphere, including gases and particles of various sizes."¹¹⁸ Nevertheless, the City has concluded "[t]he 250-foot setback identified in Mitigation Measure 4.4.6.1A, and the presence of the CDFW Conservation Buffer Area, will effectively mitigate potential indirect impacts of air pollutants, including diesel particulate matter, on wildlife within the SJWA."¹¹⁹

The DEIR fails to establish a monitoring and reporting program to ensure the proposed buffer mitigates the effects of air pollution on wildlife, vegetation, and aquatic resources. Moreover, information provided in the DEIR does not support the City's conclusion that a 400-foot buffer is sufficient to mitigate Project impacts to a less-than-significant level. Specifically, the DEIR cites research by the California Air Resources Board ("CARB") that indicates 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of the emission source.¹²⁰ Analyses by both the CARB and the South Coast Air Quality Management District indicate that providing a buffer of 1,000 feet would substantially reduce diesel PM concentrations and public exposure downwind of a distribution center.¹²¹ Because wildlife may be more susceptible to air pollutant impacts than humans, one can infer that a buffer of at least 1,000 feet is needed to protect wildlife from air pollutants.¹²²

(Exhibit 2, pp. 17-18.)

Additionally, the DEIR admits that burrowing owls, Los Angeles pocket mice, and perhaps other sensitive species may be "relocated" to the 250-foot setback zone along

¹¹⁸ DEIR, Appendix E, p. 128. [emphasis added].

¹¹⁹ *Ibid*, p. 4.4-72.

¹²⁰ *Ibid*, p. 4.4-70.

¹²¹ California Air Resources Board (CARB) and California Environmental Protection Agency (CEPA). 2005. Air Quality and Land Use Handbook: A Community Health Perspective. Available at:

<http://www.arb.ca.gov/ch/landuse.htm>

¹²² DEIR, Appendix E, p. 129.

the southern boundary of the Project site. (DEIR, pp. 4-71~72.) However, as Mr. Cashen notes, relocating sensitive wildlife to the setback zone eviscerates the very purpose of establishing setbacks, which is to provide a buffer between the Project and sensitive biological resources. (See Exhibit 2, p. 15.) Therefore, the relocation component of Mitigation Measure 4.4.6.1A renders the setbacks, regardless of amount, ineffective to mitigate the Project's air pollution impacts on biological resources.

Second, the DEIR appears to conclude that the recommended 1,000 ft setbacks are not necessary. The DEIR rationalizes that the CDFW Conservation Buffer Area would function as an additional buffer to the 250 ft setback along the Project's southern boundary. (DEIR, pp. 4.4-69~70.) However, such rationale overlooks the fact that the CDFW Conservation Buffer Area may support the very wildlife that the setbacks are intended to protect. (DEIR, p. 4.4-11 [the DEIR admitting that the CDFW Conservation Buffer Area may support wintering raptors and game birds].) Therefore, the CDFW Conservation Buffer Area cannot be used in place of establishing the recommended 1,000 ft setback.

Finally, the DEIR does not provide sufficient reasons as to why the recommended 1,000 ft setbacks are infeasible. Accordingly, a revised DEIR must (1) revise Mitigation Measure 4.4.6.1A to prohibit the relocation of any impacted biological resources to setback zones and (2) adequately analyze the feasibility of 1000 ft setbacks to mitigate air pollution impacts to sensitive biological resources.

5. The DEIR Fails to Adequately Mitigate Project's Impacts to Special-Status Plant Species.

According to Mr. Cashen,

Mitigation proposed by the City for Project impacts to special-status plant species includes:

Prior to the approval of any Plot Plans for development within the project area, the applicant shall submit a biological assessment of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, or thread-leaved brodiaea) are present on the proposed development site. If plants are found in the proposed development area, they may be relocated to the 250-foot clear setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, an appropriate impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species on the WLC project site.¹²³

¹²³ *Ibid*, pp. 4.4-74 and -75.

The proposed measures do not ensure Project impacts to special-status plant species are mitigated to a less-than-significant level.

First, Coulter's goldfields, smooth tarplant, and thread-leaved brodiaea are MSHCP Group 3 species. As a result, if any of these species occur within a proposed development area, the City must require the project proponent to conform to the procedures listed in Section 6.3.2 in the MSHCP. Section 6.3.2 states: "[f]or locations with positive survey results, 90% of those portions of the property that provide for long-term conservation value for the identified species shall be avoided until it is demonstrated that conservation goals for the particular species are met."¹²⁴

Second, the special-status plant species with the potential to occur in the Project area are not limited to the three species identified in the mitigation measure.¹²⁵ In accordance with CDFW guidelines, the City must require surveys that are floristic in nature, meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status.¹²⁶

Third, the DEIR suggests mitigation may be limited to relocating plants to the buffer area. Although salvage and relocation have some merits as a last resort, it is generally not an effective means of mitigating impacts. Fiedler (1991) conducted a thorough review of mitigation-related transplantation, relocation and reintroduction attempts involving special-status plants in California.¹²⁷ The author reported only 8 of the 53 (15%) attempts reviewed in her study should be considered fully successful.¹²⁸ Although Fiedler reported several causes for the failed attempts, the common result was that the plants died. Unless the City can provide evidence that potentially impacted plants can be transplanted and/or propagated successfully, it must require fee payment to the Regional Conservation Authority.

Fourth, the City must identify the specific mitigation measure (or suite of potential measures) that will be required if a sensitive plant or animal

¹²⁸ *Ibid*.

species that is not covered under the MSHCP is detected within a proposed development area.

(Exhibit 2, pp. 18-19.)

6. The DEIR Fails to Adequately Mitigate Impacts to Burrowing Owls.

According to Mr. Cashen,

The conservation goals established in the MSHCP have not yet been met for the burrowing owl, and thus sites with burrowing owls appear to be subject to the provisions listed in Section 6.3.2 in the MSHCP.¹²⁹ Because the burrowing owl was recently (2012) detected on the Project site, the City needs to clarify whether the Project is subject to the provisions of MSHCP Section 6.3.2. If the Project is subject to those provisions, the City must identify how the Project will be capable of avoiding 90% of those portions of the site that provide for the long-term conservation value for the burrowing owl.

Burrowing owls have the potential to occupy the Project site prior to development.¹³⁰ The DEIR indicates “[t]his is a potentially significant impact requiring mitigation.”¹³¹ However, it fails to define the impact(s) or provide any mitigation to offset the impact(s). Instead, it simply requires a pre-construction survey, establishment of buffer zones around active burrows, and the exclusion of owls from their burrows during the non-breeding season (which in itself is a potentially significant impact).

Pre-construction Survey

The DEIR requires a pre-construction survey for burrowing owls no more than 30 days prior to initiation of ground-disturbing activities.¹³² This condition is not consistent with CDFW guidelines, which recommend an initial preconstruction survey within the 14 days prior to ground disturbance, followed by a subsequent survey within 24 hours prior to ground disturbance.¹³³ As the CDFW’s 2012 Staff Report acknowledges, “burrowing owls may re-colonize a site after only a few days.”¹³⁴ As a

¹²⁹ MSHCP 2011 Annual Report, Table 25. Available at: <http://www.wrc-rca.org/library.asp>

¹³⁴ *Ibid.*, p. 30.

result, a single pre-construction survey up to 30 days in advance of construction is insufficient to avoid and minimize take of burrowing owls.

The City must clarify that “take avoidance” (i.e., pre-construction) surveys for the burrowing owl are not a substitute for the four surveys required to assess Project impacts and formulate appropriate mitigation. The City must require the Applicant to conduct the protocol surveys described by CDFW, and the results of those surveys need to be released in a revised DEIR.¹³⁵

Buffers

The DEIR provides inconsistent information on the buffer distance required around active burrows (i.e., 250 feet or 500 feet).¹³⁶ Furthermore, the CDFW no longer uses the default standard of 250-foot buffers during the breeding season and 160-foot buffers during the non-breeding season. Instead, CDFW indicates that indirect impacts and appropriate mitigation should be determined through site-specific analyses that incorporate the wide variation in natal area, home range, foraging area, and other factors influencing burrowing owls and burrowing owl population persistence in a particular area.¹³⁷ CDFW guidelines indicate buffers may need to be up to 500 meters, depending on the level of disturbance.¹³⁸

Burrow Exclusion

In accordance with CDFW guidelines, burrowing owls should not be excluded from burrows unless or until the Applicant:

1. develops a Burrowing Owl Exclusion Plan that is approved by the CDFW;
2. secures off-site compensation habitat and constructs artificial burrows in close proximity (< 100 m) to the eviction sites;
3. mitigates the impacts of temporary exclusion according to the methods outlined by CDFW;
4. conducts site monitoring prior to, during, and after exclusion of burrowing owls from their burrows; and,
documents excluded burrowing owls using artificial or natural burrows on an adjoining mitigation site.¹³⁹

D. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE THE PROJECT'S GREENHOUSE GAS EMISSIONS.

The DEIR also recognizes that greenhouse gas emissions ("GHG") from the construction and operation of the proposed Project are potentially significant. (DEIR, pp. 4.7.29~31.) However, the DEIR fails to adequately mitigate the significant impacts from greenhouse gas emissions.

1. The DEIR Underestimates the Project's Operational GHG Emissions and Fails to Mitigate the Actual Extent of GHG Impacts.

According to Mr. Hagemann:

Operational emissions

The DEIR estimates project operational emissions to be 752,000 mt CO₂e/year, more than 75 times the SCAQMD's significance threshold of 10,000 mt CO₂e per year. The DEIR correctly concludes that emissions are significant (p. 4.7-30) and provides mitigation. Even after mitigation, operational GHG emissions are nearly 70 times greater than the thresholds (Table 4.7.I). As high as these emissions remain, even after mitigation, the estimate of post-mitigation GHG emissions is based on incorrect assumptions. If correct estimates of long-haul truck trips were used, estimates of GHG emissions would even be higher. Because emissions are so high, a revised DEIR should be prepared to identify additional mitigation measure to attempt to reduce GHG impacts.

Underestimating the GHG emissions in the DEIR stems largely from incorrectly estimating long haul truck trip distances which make up more than half of all Project operational emissions (DEIR, p. 4.7-30). The DEIR states that long-haul trucks travel an average of 50 miles per trip (p. 4.7-30). No basis for making this estimate of long-haul travel distances is provided in the DEIR.

The DEIR states the project would be haul cargo containers from the Port of Los Angeles or the Port of Long Beach (p. 4.7-43). Google maps show routes to the Project average about 80 miles from the Ports of Los Angeles Long Beach, a distance 60% greater than the 50 mile distance estimated in the DEIR (Attachment C). Long-haul trips, even as underestimated in the DEIR, constitute the biggest component of operational emissions, by far, from Project operation (DEIR, p. 4.7-30).

The Project operational emissions are so significant, they constitute significant majority of the entire City of Moreno Valley's GHG emissions

estimates for the year 2020. The DEIR states that the City of Moreno Valley's mitigated GHG emissions in 2020 will be 798,000 mt CO₂e/year (DEIR, p.4.7-9). In 2020, Project's emissions, after mitigation, are estimated to be 612,000 mt CO₂e/year (DEIR, p, 4.7-35), or 77% of the entire business as usual estimate for the City of Moreno Valley.

Because emissions vastly exceed thresholds, additional mitigation, in the form of offsets, should be included in a revised DEIR. The Project applicant should obtain emission reduction credits, or carbon offsets, to reduce the Project's emissions to a less than significant level. Offsets should be chosen in a revised DEIR to show that offsets are verifiable and efficient. The DEIR should not be certified until the Applicant discloses that the Project's GHG emissions are significant during the construction period and mitigates emissions through the purchase of carbon offsets.

(Exhibit 1, pp. 9-10.)

The Project should be required to implement all of the GHG reductions measures set forth in the Greenhouse Gas reduction guidelines published by the California Attorney General. (Exhibit 5.) These measures are feasible and would help reduce the Project's GHG impacts.

2. The DEIR Fails to Mitigate Significant Construction GHG Emissions.

The DEIR acknowledges that there would be significant GHG emissions during the Project's construction. (DEIR, pp. 4.7-29~30, Table 4.7.E.) However, the DEIR fails to mitigate such significant GHG emissions in any way. According to Mr. Hagemann:

Construction emissions

Construction GHG emissions from 2013 to 2021 are estimated to total 434,126 mt CO₂e. The DEIR uses an amortization technique for a 30 year period to estimate emissions of 14,000 mt CO₂e (p. 4.7-30). The emissions are significant in that they exceed the threshold of South Coast AQMD threshold of 10,000 mt CO₂e.¹⁴⁰

The DEIR does not identify any mitigation measures for construction GHGs in excess of thresholds. Many mitigation measures for construction GHGs are commonly recommended by the South Coast AQMD in their review of DEIRs.¹⁴¹ A revised DEIR should be prepared to include all mitigation measures that would be feasible in reducing GHG emissions. If

¹⁴⁰ <http://www.aqmd.gov/ceqa/handbook/signthres.pdf>

¹⁴¹ <http://www.aqmd.gov/ceqa/igr/2012/December/DEIRglenarm.pdf>, p. 3

these measures are not sufficient, carbon offsets should be purchased to reduce emissions to reduce GHG emissions to below the threshold.

(Exhibit 1, p. 10.)

The Project should be required to implement all of the GHG reductions measures set forth in the Greenhouse Gas reduction guidelines published by the California Attorney General. (Exhibit 5.) These measures are feasible and would help reduce the Project's GHG impacts.

E. STORMWATER IMPACTS ON WATER QUALITY HAVE NOT BEEN ADEQUATELY ANALYZED OR MITIGATED.

1. Construction-Related Stormwater Impacts Have Not Been Adequately Analyzed.

The DEIR admits that during Project construction, storm runoff containing large volumes of sediment may cause significant water quality impacts to adjacent waterways. (DEIR, p. 4.9-31.) The DEIR also recognizes that such storm runoff from the Project site would ultimately reach Lake Elsinore. (DEIR, p. 4.9-2.) However, the DEIR fails to disclose that Lake Elsinore is impaired for sedimentation and sedimentation toxicity. (DEIR, p. 4.9-5.) As a result, the DEIR fails to analyze how the storm runoff containing sediment would further degrade the water quality at Lake Elsinore.

According to Mr. Hagemann,

Project construction will require extensive grading, vegetation removal, and excavation. Approximately 42 million cubic yards of cut-and-fill will be required to grade the entire site (DEIR, p. 3-61). Project construction may lead to erosion of site soils. The DEIR states that pollutants associated with the Project include sediments, nutrients, bacteria, toxic organic compounds, and pesticides (DEIR, p. 4.9-34). During periods of rainfall, water that washes over eroded soil can entrain these contaminants and discharge into adjacent waterways.

The DEIR states that Project runoff from the western portion flows into the Perris Valley storm drain while runoff from the eastern portion flows into Mystic Lake and the San Jacinto River (DEIR, p. 4.9-22) which is located ten miles south of the Project site. From the San Jacinto River, flow ultimately reaches Lake Elsinore (DEIR, p. 4.9-2). The DEIR identifies that Lake Elsinore is listed under the California Regional Water Quality Control Board's 303(d) List of Impaired Water Bodies for nutrients, low dissolved oxygen, and PCBs (DEIR, p. 4.9-5). The DEIR, however, does not disclose that Lake Elsinore is also impaired for sedimentation and

58

59

sediment toxicity.¹⁴² If rainfall washes over disturbed soil stockpiled on site during Project construction, contaminated sediment and runoff can eventually drain to Lake Elsinore, further degrading water quality.

(Exhibit 1, p. 4.)

2. The DEIR Fails to Adequately Mitigate Construction-Related Soil Erosion and Storm Runoff Impacts on Water Quality.

The DEIR also fails to adequately mitigate the Project's construction-related impacts of soil erosion and storm runoff on water quality. Based on current and historical uses of the Project site, there is a high potential for the presence of OCPs and other pesticides in the soil. Despite the high potential, the DEIR fails to include any feasible best management practices (BMPs) or mitigation measures to address these potentially significant water quality impacts on adjacent waterways.

According to Mr. Hagemann,

The DEIR states that during operational activities, stormwater runoff can carry trace metals such as zinc, copper, lead, cadmium, and iron and that treatment controls will be based on these pollutants (DEIR, pp. 4.9-33-4.9-34). However, the DEIR does not consider the possibility that ground-disturbing activities during Project construction can also lead to erosion and transport of these contaminants deposition to adjacent waterways.

The DEIR states that a SWPPP will be prepared and identifies measures that will be implemented to reduce impacts from soil erosion (DEIR, p. 4.6-13). Mitigation measure 4.9.6.3A lists best management practices (BMPs) that will be implemented to reduce water quality impacts (DEIR, p. 4.9-37). However, no measures or BMPs are provided that specifically identify that OCPs and other pesticides, which may exist from previous uses of the site, can flow into the adjacent waterways. To ensure that Project construction will not result in significant impacts to hydrological resources, the SWPPP should be prepared prior to Project construction to include BMPs such as erosion control and treatment measures specifically designed to address OCPs and other pesticides.

(Exhibit 1, pp. 4-5.)

Pursuant to Mr. Hagemann's conclusions, the DEIR should be revised to require the preparation of a SWPPP to address the potentially significant impacts of soil erosion and storm runoff to valuable hydrological resources. The SWPPP should be included

¹⁴² Search for Elsinore, Lake at http://www.waterboards.ca.gov/water_issues/programs/tmdl/2010state_ir_reports/category5_report.shtml

as a mitigation measure in a recirculated DEIR so that the public and decisionmakers may analyze the SWPPP to determine its adequacy.

60

VI. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE CUMULATIVE IMPACTS.

A. LEGAL STANDARDS

An EIR must discuss significant cumulative impacts. (CEQA Guidelines, § 15130(a).) This requirement flows from Public Resources Code section 21083, which requires a finding that a project may have a significant effect on the environment if “the possible effects of a project are individually limited but cumulatively considerable... ‘Cumulatively considerable’ means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” “Cumulative impacts” are defined as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.” (CEQA Guidelines, § 15355(a).) “[I]ndividual effects may be changes resulting from a single project or a number of separate projects.” (CEQA Guidelines, § 15355(a).)

“The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.” (*CBE v. CRA*, *supra*, 103 Cal.App.4th at p. 117.) A legally adequate cumulative impacts analysis views a particular project over time and in conjunction with other related past, present, and reasonably foreseeable probable future projects whose impacts might compound or interrelate with those of the project at hand. “Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.” (CEQA Guidelines, § 15355(b).)

61

As the court stated in *CBE v. CRA*, 103 Cal. App. 4th at p. 114:

Cumulative impact analysis is necessary because the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact.

(Citations omitted.)

In *Kings County, supra*, 221 Cal.App.3d at p. 718, the court concluded that an EIR inadequately considered an air pollution (ozone) cumulative impact. The court said: “The EIR concludes the project’s contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR’s analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project’s impact.” The court concluded: “[t]he relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin.”¹⁴³ The *Kings County* case was reaffirmed in *CBE v. CRA*, 103 Cal.App.4th at 116, where the court rejected cases with a narrower construction of “cumulative impacts.”

Similarly, in *Friends of Eel River v. Sonoma County Water Agency*, (2003) 108 Cal. App. 4th 859, the court held that the EIR for a project that would divert water from the Eel River had to consider the cumulative impacts of the project together with other past, present and reasonably foreseeable future projects that also divert water from the same river system. The court held that the EIR even had to disclose and analyze projects that were merely proposed, but not yet approved. The court stated, CEQA requires “the Agency to consider ‘past, present, and probable future projects producing related or cumulative impacts’” (Guidelines, § 15130, subd. (b)(1)(A).) The Agency must interpret this requirement in such a way as to ‘afford the fullest possible protection of the environment.’” (*Friends of Eel River, supra*, at pp. 867, 869.) The court held that the failure of the EIR to analyze the impacts of the project together with other proposed projects rendered the document invalid. “The absence of this analysis makes the EIR an inadequate informational document.” (*Id.*, at p. 872.)

The Court in *Citizens to Preserve the Ojai v. Bd. of Supervisors*, 176 Cal.App.3d 421 (1985), held that an EIR prepared to consider the expansion and modification of an oil refinery was inadequate because it failed to consider the cumulative air quality impacts of other oil refining and extraction activities combined with the project. The court held that the EIR’s use of an Air District Air Emissions Inventory did not constitute an adequate cumulative impacts analysis. The court ordered the agency to prepare a new EIR analyzing the combined impacts of the proposed refinery expansion together with the other oil extraction projects.

¹⁴³ *Los Angeles Unified v. City of Los Angeles*, 58 Cal.App.4th at pp. 1024-1026 found an EIR inadequate for concluding that a project’s additional increase in noise level of another 2.8 to 3.3 dBA was insignificant given that the existing noise level of 72 dBA already exceeded the regulatory recommended maximum of 70 dBA. The court concluded that this “ratio theory” trivialized the project’s noise impact by focusing on individual inputs rather than their collective significance. The relevant issue was not the relative amount of traffic noise resulting from the project when compared to existing traffic noise, but whether any additional amount of traffic noise should be considered significant given the nature of the existing traffic noise problem.

In sum, an EIR's cumulative impacts analyses are critical in taking a project out of its artificial vacuum. By evaluating the true extent of a project's environmental impacts, taking into consideration all relevant past, present, and probable future projects in the project's vicinity, the EIR could serve its informational purpose adequately.

61

B. THE DEIR'S ENTIRE CUMULATIVE IMPACTS ANALYSES ARE IMPROPERLY BASED ON OUTDATED AND INACCURATE SUMMARY OF PROJECTIONS.

The CEQA Guidelines set forth two methods for satisfying the cumulative impacts analysis requirement: the list-of-projects approach and the summary-of-projections approach. (CEQA Guidelines, § 15130(b).) But either way, an EIR must analyze a project's cumulative impacts in conjunction with other related past, present, and reasonably foreseeable future projects whose impacts might compound or interrelate with those of the project at hand. (Pub. Resources Code, § 21083, subd. (b); CEQA Guidelines, §§ 15130, 15355; *San Joaquin Raptor/Wildlife Rescue Center*, *supra*, 27 Cal.App.4th at pp. 739-741.)

At the outset, the DEIR explains that it would rely solely on the summary-of-projections method in analyzing the Project's cumulative impacts. (DEIR, p. 2-22.) The DEIR's summary-of-projections consists of the growth projections contained in the Moreno Valley General Plan and regional growth projections based on Regional Transportation Plan. (DEIR, p. 2-22, 2-23.) Using these projections, the DEIR analyzes cumulative impacts for each environmental topic in the respective sections (EIR Sections 4.1 through 4.16.)

62

Courts have recognized that the use of the summary-of-projections method can be problematic. "Use of a planning document does not preclude challenge to the accuracy or sufficiency of the cumulative impacts analysis. As recognized in a respected CEQA treatise, '[t]he summary-of-projections approach may present problems if the projections in the general plan or related planning document are inaccurate or outdated.'" (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1217 [emphasis added].) In this instance, the growth projections that the DEIR utilizes are both outdated and inaccurate because they are based on the 2006 General Plan which does not account for the recent influx of similar warehouse projects in the City.

The Inland Empire is home to the nation's biggest concentration of warehouses. In recent years, the City has been setting aggressive economic goals to pursue new development in logistics and distribution.¹⁴⁴ The City has followed through with those goals and the latest Economic Development Summary highlights the multitude of

¹⁴⁴ Moreno Valley Economic Development Action Plan 1/18/2012, p. 11, available at http://www.moreno-valley.ca.us/city_hall/departments/econ-dev/pdfs/forum/CITY-PPT.pdf

recent, large scale warehouse projects. (Exhibit 4, Moreno Valley Economic Development Summary 3/2013, pp. 5-7.) The following is a list of 20 similar projects in the City that are approved, undergoing environmental review, in construction or have recently opened:

<u>Logistics-Warehouse Projects in Moreno Valley, CA</u>				
	Name	Size	Description	Location
Recently Opened				
1	Highland Fairview Corporate Park (HFCP)/Skechers Distribution Center	1.82 million sq. ft.	Highland Fairview, the Project's developer, has recently opened a large scale distribution center for Skechers USA.	Just northwest of the Project site, between Redlands Boulevard and Theodore Street.
2	Ross Stores Moreno Valley Distribution Center	1.58 million sq. ft.	Second phases added 612,000 sq. ft., plus additional 285,000 sq. ft. mezzanine to the existing 686,000 sq. ft. building.	17800 Perris Blvd, Moreno Valley
3	United Natural Foods Inc. Distribution Center	613,174 sq. ft.	An expansion of the distribution facility for United Natural Foods Inc.	Goldencrest Drive
In Planning/Pending Environmental Review				
4	Prologis Eucalyptus Industrial Park	2,224,419 sq. ft.	This project would include the construction of a warehouse facility comprising six buildings and is currently undergoing environmental review.	South of Highway 60 to Eucalyptus Avenue between Pettit and Quincy streets
5	Westridge Commerce Center	943,800 sq. ft.	The proposed project is currently on hold, pending a challenge to the EIR by Sierra Club in Riverside Superior Court.	Located just west of the Project site, at north of Eucalyptus Avenue and Redlands Boulevard.
Approved/In Plan Check				
6	Inland Empire Global Logistics Center	1.56 million sq. ft.	Distribution center developed by Panattoni Development Company	SWC of Indian St. and Iris Ave.
7	Lowe's Distribution Center	746,340 sq. ft.	A Lowe's distribution center by Alere Property Group.	Located on the east side of Heacock St. north of Cardinal Way.

8	San Michele Distribution Center	423,015 sq. ft.	A distribution center by Alere Property Group.	Indian St. and San Michele Rd.
9	First Apache Warehouse	569,200 sq ft.	Industrial complex warehouse facilities by First Industrial Realty Trust	Perris and Storm Channel
10	Harbor Freight Tools at Centerpointe Business Park	1.28 million sq. ft.	Currently occupies 779,016 sq. ft. with plans to expand by 507,720 sq. ft. totaling 1.28 million sq. ft.	NWC of Cactus Ave. and Graham St.
11	Distribution/warehouse facility at Centerpointe Business Park	607,430 sq. ft.	A distribution/ warehouse facility located at Centerpointe Business Park	NWC of Brodiaea Ave. and Graham St.
12	Nandina Distribution Center – Building A	413,598 sq. ft.	Part of a two building complex with total of 1.82 million sq. ft.	NWC of Nandina Ave. and Indian St.
13	Komar	283,100 sq. ft.	Industrial/distribution building on 13.75 acres.	SEC of Heacock Ave. and San Michele Rd.
14	Rados – Warehouse distribution center	409,598 sq. ft.	Part of a seven building project with total of 619,127 sq. ft.	NEC of Heacock St. and Iris Ave.
15	Vogel Engineers Inc/Sares-Regis warehouse distribution building	1.62 million sq. ft.	A warehouse distribution building on 71.15 acres.	North of Oleander Storm Drain between Indian St. and Perris Blvd.
16	March Business Center	1.48 million sq. ft.	Four buildings total, three of which (1.32 million sq. ft.) would be used for warehouse distribution uses.	SEC of Iris Ave. and Heacock St.
Under Construction				
17	First Inland Logistics Center	865,960 sq. ft.	An industrial/distribution facility in two buildings. Tenant improvements underway.	Located on the north side of Nandina Ave., west of Perris Blvd.
18	Nandina Distribution Center – Building B	769,320 sq. ft.	Part of a two building complex with total of 1.82 million sq. ft.	NWC of Nandina Ave. and Indian St.
19	Centerpointe Logistics Center	522,774 sq. ft.	Logistics-distribution building on 25.9 acres developed by Overton Moore Properties.	NWC of Cactus Ave. and Frederick St.
20	I-215 Logistics Center	1.25 million sq. ft.	Industrial warehouse in two buildings developed by Trammell Crow Company.	Heacock St. and San Michele Rd.

(Exhibit 4, Moreno Valley Economic Development Summary 3/2013, pp. 5-7.)

To accommodate the recent surge of large warehouse projects within the City, the City's General Plan was amended multiple times. For example, ProLogis Eucalyptus Industrial Park Project is currently undergoing environmental review and requires amendments to the City's General Plan and zoning designations to the Project Site from Residential to Business Park.¹⁴⁵ A recently-approved March Business Center Project also included an adoption of a General Plan Amendment.¹⁴⁶ These are mere examples of the numerous amendments to the General Plan that have occurred or will occur to make way for the warehouse projects in the City.

The General Plan amendments that postdate the 2006 Update are not accounted for in the growth projections contained in the general plan.¹⁴⁷ Thus, the General Plan fails to account for the City's recent growth spurt in the warehouse industry and contains outdated and inaccurate growth projections. (See *Bakersfield Citizens for Local Control, supra*, 124 Cal.App.4th at pp. 1217-1218.) The DEIR's use of inaccurate growth projections means that the resultant cumulative impacts analyses are underinclusive.

Proper cumulative impacts analysis is absolutely critical to meaningful environmental review. The DEIR's cumulative impact analyses are inadequate in their entirety because they did not take into account the environmental impacts of other past, present and reasonably foreseeable projects in the Project's vicinity. As a result, the cumulative impacts analyses are underinclusive and misleading. The DEIR must revise its cumulative impacts analyses for each and every environmental issue (DEIR Sections 4.1 through 4.16) using updated and accurate growth projections or a list-of-projects approach, or a combination of both. (CEQA Guidelines, § 15130(b).)

C. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE CUMULATIVE AGRICULTURAL RESOURCE IMPACTS.

In addition to using inaccurate projections, the DEIR's cumulative agricultural resources impacts analysis fails to consider other related present and reasonably foreseeable future projects. The DEIR only focuses on past projects, primarily relying on past inventories of farmland in Riverside County from 2000 to 2010, which illustrate a steady loss of farmland. (DEIR, p. 4.2-21, Tables 4.2B, 4.2.C.) Relying on these past inventories, the DEIR concludes that the countywide decline in farmland will continue and rationalizes the Project's removal of over 3,500 acres of Important Farmland and the lack of any mitigation efforts. (DEIR, pp. 4.2-20~21.)

As previously noted, an EIR must analyze a project's cumulative impacts in conjunction with other related past, present, and reasonably foreseeable future projects

¹⁴⁵ ProLogis Draft EIR, at p. 1-2, available at <http://www.moval.org/misc/pdf/prologis/ProLogis%20DEIR-min.pdf>

¹⁴⁶ March Business Center Final EIR, at p. S-3, available at <http://www.moval.org/misc/pdf/march/MBCDraftEIR04-26-12.pdf>

¹⁴⁷ Moreno Valley General Plan, Final Program EIR, pp. 3-8, 3-9, available at http://www.moreno-valley.ca.us/city_hall/general-plan/06gpfinal/ieir/eir-tot.pdf

whose impacts might compound or interrelate with those of the project at hand. (Pub. Resources Code, § 21083, subd. (b); CEQA Guidelines, §§ 15130, 15355 [emphasis added].) The DEIR admits that the cumulative area for agricultural resource impacts is Riverside County. (DEIR, p. 4.2-21.) Therefore, the DEIR's cumulative agricultural resource analysis is inadequate and fails to analyze the Project's agricultural resource impacts in conjunction with other related present and reasonably foreseeable future projects within Riverside County.

Moreover, the DEIR fails to mitigate the significant cumulative agricultural impacts in any way. (DEIR, pp. 4.2-20~21.) Such failure is improper for the same reasons as provided in Part V.A.3, *supra* (discussing the DEIR's failure to mitigate the Project's significant agricultural impacts.)

D. THE DEIR FAILS TO ADEQUATELY ANALYZE AND MITIGATE CUMULATIVE IMPACTS TO BIOLOGICAL RESOURCES.

The DEIR fails to provide any analysis on how the Project, in combination with all relevant past, present and potential future projects, can cause cumulative impacts to biological resources. According to Mr. Cashen,

The DEIR provides virtually no analysis of the Project's contribution to cumulative impacts to sensitive biological resources. It simply concludes: "the regional (cumulative) implications of the project can be addressed through the fee payment program of the MSHCP because it provides a regional and comprehensive approach to conservation planning," and that "no significant cumulative effect on biological resources would result from the development of the proposed uses with implementation of the identified program mitigation measures."¹⁴⁸

The City's justification fails to consider the Project's contribution to potentially significant impacts to species not covered by the MSHCP. Indeed, the Final EIR/EIS for the MSHCP states: "implementation of the MSHCP will result in cumulatively significant impacts on the Non-Covered Species because the issuance of incidental take permits will remove an impediment to development outside of the MSHCP Conservation Area. Non-Covered Species would receive little or no protection outside the reserves under existing ordinances and regulations."¹⁴⁹ In my opinion, the Project may contribute to cumulatively considerable impacts to Non-Covered Species, and those impacts would not be mitigated by the measures proposed by the City.

¹⁴⁸ DEIR, p. 4.4-81.

¹⁴⁹ MSHCP, p. 5.1-7. [emphasis added].

Many assumptions were incorporated into the MSHCP. The assumptions pertain to biological conditions (and relationships), development within the plan area, and actual implementation of the MSHCP. Some of the assumptions that were incorporated into the MSHCP have proven to be incorrect. For example, the MSHCP has been unsuccessful in the conservation of burrowing owls within the plan area.¹⁵⁰ This example highlights the flaws with the City's conclusion that the MSHCP will eliminate any potential for cumulative impacts.

Ultimately, the Project's contribution to cumulative impacts cannot be analyzed because the City has not identified the other projects within the cumulative effects analysis area. At a minimum, the City must identify the other projects may contribute to cumulatively considerable impacts to raptors, jurisdictional waters, the Northwestern San Diego pocket mouse, and other sensitive biological resources in the Project region.

(Exhibit 2, pp. 16-17.)

E. THE DEIR FAILS TO ADEQUATELY MITIGATE CUMULATIVE AIR IMPACTS.

The DEIR also fails to adequately mitigate significant cumulative air quality impacts to human health. According to Mr. Hagemann:

Cumulative air impacts are inadequately mitigated

The DEIR predicts cumulative impacts to human health from the Project and other nearby projects to exceed risk thresholds set by the SQAQMD. The DEIR (p. 4.3-88) includes modeling results that estimate health impacts as follow:

Table 4.3.AC: Comparison of Cancer Risk Values

Receptor Location	Cancer Risk (risk per million)		
	Project Increment	Cumulative	MATES-III
Maximum affected receptor located outside of the boundaries of the WLC Specific Plan	45 ¹	193 ¹	1,029 ²
Maximum affected sensitive receptor located within of the boundaries of the WLC Specific Plan	76.8	121.1	496
Existing residences located across Redlands Boulevard	20.9	45.9	496

¹⁵⁰ *Ibid*, Burrowing Owl Survey Report 2011. Available at: <http://www.wrc-rca.org/library.asp> See also Wilkerson RL and RB Siegel. 2010. Assessing changes in the distribution and abundance of burrowing owls in California, 1993-2007. Bird Populations 10: 1-36. (Attachment F).

The table shows that the incremental impacts from the Project range from 20.9 to 76.8 cancer risks which greatly exceed the SCAQMD threshold of 10 additional cancer risks in a population of one million.¹⁵¹ The table also shows that a sensitive receptor who already faces a risk level well in excess of the SCQAQMD threshold (496 in a million) will have that risk increased by an increment of 121 in a population of a million (or 12 in a population of 100,000), a 24% increase, from cumulative project construction. Existing residences across Redlands Blvd. will see cumulative risk levels increase 9% (existing cancer risk of 45.9/MATES III risk of 496 = 9.3%).

Cancer risks that residents currently face in the area of the Project are primarily driven by diesel particulate matter (DEIR, 4.3-87). The California Air Resources Board has classified diesel particulate matter as a toxic air contaminant for both its cancer and non-cancer health effects.¹⁵² In addition the California Office of Environmental Health Hazard Assessment found that exposure to diesel particulate resulted in an increased risk of cancer and an increase in chronic non-cancer health effects including a greater incidence of cough, labored breathing, chest tightness, wheezing, bronchitis, and asthma.¹⁵³

Emissions of diesel particulate matter from cumulative project emissions will increase, driven by an increase in truck traffic from the Project and from other cumulative projects in the area. The DEIR offers no mitigation for diesel particulate matter emissions. Because current cancer risks greatly exceed thresholds, and will get significantly worse from cumulative impacts, all feasible mitigation should be considered for nearby residents, especially sensitive receptors. The mitigation should target reductions in diesel particulates, the most significant contributor to health risks.

Other projects, where risks from diesel particulates are as high as those estimated in the DEIR, have instituted mitigation that is considered to be Best Available Control Technologies for Toxics and which are capable of reducing potential cancer and non-cancer risks to an acceptable level. These Best Available Control Technologies and other mitigation measures include:

- Installation of Minimum Efficiency Reporting Value (MERV) filters rated at 13 or better at all residential units where incremental cancer risk exceeds one in one hundred thousand¹⁵⁴;

¹⁵¹ <http://www.aqmd.gov/ceqa/handbook/signthres.pdf>

¹⁵² http://www.oehha.ca.gov/public_info/facts/dieselfacts.html

¹⁵³ Ibid.

¹⁵⁴ http://cityplanning.lacity.org/EIR/CornfieldArroyo/RDEIR/RP-DEIR_Volume%20I.pdf,
http://www.ci.berkeley.ca.us/uploadedFiles/Planning_and_Development/Level_3_-_Redevelopment_Agency/West%20Berkeley%20MMP.pdf

- Plant tiered vegetation along the project site boundaries -- laboratory studies show that cedar trees can remove some of the fine particulate matter emitted from traffic under low wind speeds¹⁵⁵;
- Providing notification to nearby residents in areas of estimated cumulative risk that exceeds one in one hundred thousand population that operation of the project may have detrimental health impacts as noted by California Air Resources Board and the South Coast Air Quality Management District.

A revised DEIR should be prepared to identify additional mitigation to reduce cancer risks from diesel particulates from cumulative project construction. The DEIR should include all feasible mitigation and should include modeling estimates to show risk reduction to levels less than the SCAQMD threshold of one in a million cancer risk.

(Exhibit 1, pp. 7-9.)

VII. THE DEIR FAILS TO PROVIDE ADEQUATE ALTERNATIVES ANALYSIS AND FAILS TO IMPLEMENT THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE 1.

A. LEGAL STANDARDS

One of CEQA's fundamental requirements is that the DEIR must identify the "environmentally superior alternative," and require implementation of that alternative unless it is infeasible. (CEQA Guidelines, §15126.6(e)(2); Kostka & Zischke, *Practice Under the California Environmental Quality Act* §15.37 (Cont. Educ. Of the Bar, 2008).) Typically, a DEIR identifies the environmentally superior alternative, which is analyzed in detail, while other project alternatives receive more cursory review.

The analysis of project alternatives must contain an accurate quantitative assessment of the impacts of the alternatives. In *Kings County, supra*, 221 Cal.App.3d at pp. 733-735, the court found the EIR's discussion of a natural gas alternative to a coal-fired power plant project to be inadequate because it lacked necessary "quantitative, comparative analysis" of air emissions and water use.

Additionally, when project objectives are defined too narrowly, the EIR's alternatives analysis may be inadequate. (*City of Santee v. San Diego* (1989) 214 Cal.App.3d 1438; *Preservation Action Council v. San Jose* (2006) 141 Cal.App.4th 1336.)

¹⁵⁵ http://www.ci.berkeley.ca.us/uploadedFiles/Planning_and_Development/Level_3_-_Redevelopment_Agency/West%20Berkeley%20MMP.pdf, p. 3

A “feasible” alternative is one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. (Pub. Res. Code, § 21061.1; CEQA Guidelines, § 15364.) California courts provide guidance on how to apply these factors in determining whether an alternative or mitigation measure is economically feasible.

The lead agency is required to select the environmentally preferable alternative unless it is infeasible. As explained by the Supreme Court, an environmentally superior alternative may not be rejected simply because it is more expensive or less profitable:

The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

(*Citizens of Goleta Valley, supra*, 197 Cal.App.3d at pp. 1180-81; see also, *Burger, supra*, 45 Cal.App.3d 322 [county’s approval of 80 unit hotel over smaller 64 unit alternative was not supported by substantial evidence].)

As discussed below, the DEIR fails to meet the legal standards for an adequate CEQA alternatives analysis.

B. THE DEIR IMPROPERLY DISMISSES THE LESS ENVIRONMENTALLY DAMAGING AND FEASIBLE REDUCED DENSITY ALTERNATIVE (ALTERNATIVE 1).

The DEIR considers the Reduced Density Alternative (Alternative 1) as an alternative to the proposed Project. Alternative 1 would decrease logistics use by 28 percent, which would result in corresponding decreases in environmental impacts. For one, Alternative 1 would reduce the operational emissions all across the board, including approximately 30% reductions for CO, VOC, NOx, PM10, and PM2.5.¹⁵⁶ (DEIR, Table 6.L.) Traffic impacts would also decrease by 30% under Alternative 1. (DEIR, pp.6-25, 6-26.)

The DEIR admits that Alternative 1 is “environmentally superior” to the proposed Project. As such, the environmentally superior Alternative 1 must be selected unless it is infeasible. (*Citizens of Goleta Valley, supra*, 197 Cal.App.3d at 1180-81; see also, *Burger, supra*, 45 Cal.App.3d 322.) Instead, the DEIR improperly dismisses it as not meeting “most of the major goals of the proposed project mainly because of the reduced total square footage by 30 percent....” (DEIR, pp.6-22, 6-44.) Such reasoning, or lack

¹⁵⁶ The DEIR contains a calculation error which in effect downplays the reduction of NOx emissions for Alternative 1 from the Proposed project. Table 6.L provides the net change in emissions of NOx from the proposed project (3,059) and Alternative 1 (2,141) as -645 when it should in fact be -918. (DEIR, Table 6.L.)

thereof, does not amount to substantial evidence to support a conclusion that Alternative 1 is infeasible. To put it simply, a reduced scale alternative cannot be rejected solely because it is reduced in scale. Such circular reasoning makes a mockery of the alternatives analysis.

Furthermore, the DEIR downplays the significant environmental benefits of Alternative 1 by illogically concluding that despite the 30 percent reduction in operational emissions, the impacts from emissions would be significant and unavoidable in “approximately the same manner as the proposed project.” (DEIR, p. 6-24.) Similarly, the DEIR deemphasizes Alternative 1’s 30 percent decrease in traffic as being similar to those impacts identified for the Proposed Project. (DEIR, pp. 6-25, 6-26.) On the whole, the DEIR dismisses Alternative 1’s substantial reductions of environmental impacts by concluding that all impacts identified as significant and unavoidable under the Proposed Project would still be significant under Alternative 1 in “approximately the same and/or in the same exact manner as the proposed project.” (DEIR, p. 6-28.) However, it is puzzling how 30 percent decreases in emissions and traffic under Alternative 1 would be “the same” as no reduction at all under the proposed Project. If anything, the logical conclusion of this reasoning is that the City must consider an even smaller reduced scale alternative.

Thus, the DEIR fails to provide substantial evidence to support the dismissal of the environmentally superior alternative because it does not meet the project objectives “to the same degree as the proposed project.” (DEIR, Table 6.M.) Such logic is insufficient to support a conclusion that Alternative 1 is infeasible. Additional analysis is required to consider this environmentally superior alternative before the Board may reject it. (Pub. Res. Code, §21002; *Sierra Club v. Gilroy City Council* (1990) 220 Cal.App.3d 30, 31.)

C. THE DEIR ERRONEOUSLY CONCLUDES THAT THERE ARE NO FEASIBLE ALTERNATIVE SITES NEAR THE PROJECT AREA.

Additionally, the DEIR summarily concludes that all of the alternative sites near the project area are infeasible. However, the DEIR’s conclusion of infeasibility is based on extremely narrow project objectives, which the DEIR sums up as including “a contiguous 2,635-acre site for 41 million square feet of high-cube logistics warehouse uses.” (DEIR, pp. 6-2, 6-38.) These narrow objectives effectually eliminated from consideration all potential “feasible” sites which could have served the Project’s broader purpose of providing warehouses, though not in the same scale as the Project.

The DEIR’s application of extremely narrow project objectives of securing an alternative site similar in scale as the Proposed Project renders the Alternative Sites Analysis inadequate. For example, the DEIR ignored all potential sites within the City by focusing only on the large scale and concluding that “there are no sites available within the City that have nearly that amount of vacant land planned [as the Project site] or designated for industrial-related uses.” (DEIR, Table 6.R.) Therefore, the DEIR did

67

68

Comment Letter on World Logistics Center Draft EIR
State Clearinghouse No. 2012921945
April 5, 2013
Page 69 of 69

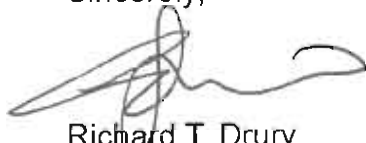

not consider any smaller sites within the City which could have been less environmentally damaging than the Project and perhaps some distance away from active farmland and/or from sensitive receptors like the San Jacinto Wildlife Area. (See id.)

In sum, the DEIR's improper dismissal of the "environmentally superior" Alternative 1 and its erroneous conclusion that no feasible alternative sites exist near the project area violates the mandates of CEQA. The revised DEIR must select the environmentally superior alternative, Alternative 1, and adequately analyze potential alternative sites in the Project's vicinity without focusing solely on fulfilling the Project's narrow objective of constructing a logistics warehouse similar in scale to the proposed Project.

VIII. CONCLUSION

For the foregoing reasons, LIUNA Local Union No. 1184 and its members living in the City of Moreno Valley and the surrounding areas, urge the City to continue the matter for future consideration pending completion of a supplemental EIR addressing the Project's significant impacts and mitigation measures. Thank you for your attention to these comments. Please include this letter and all attachments hereto in the record of proceedings for this project.

Sincerely,

Richard T. Drury
Cathy D. Lee
Lozeau Drury LLP
Attorneys for LIUNA Local Union No. 1184

RESPONSES TO LETTER F-7A

Lozeau Drury LLP

Response to Comment F-7A-1. The separate comments/commenters indicated by the commenter of this letter are addressed as Letters F-7B and F-7C following this letter. The City does not consider the Draft Environmental Impact Report (DEIR) to be inadequate or inaccurate, however, a number of corrections and additions have been made to the DEIR text to make it more accurate, to expand on concepts discussed in the DEIR, or to address comments made on the DEIR.

Response to Comment F-7A-2. According to Section 15125 of the CEQA Guidelines,

"An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. The baseline for the evaluation of biological resources is based on a current, thorough site visit. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives."

The Notice of Preparation for the World Logistics Center (WLC) was published February 21, 2012, and was used to establish the environmental setting, or baseline for the WLC.

In support of the DEIR, project biologists conducted biological resource field surveys for the WLCSP and additional areas to characterize the biological resources present at the site and identify sensitive resources and communities that may be impacted by the proposed project. Biological surveys were conducted between 2005 and 2012 to provide base-line information within the WLC Specific Plan (SP) for the Notice of Preparation (NOP) that was submitted on February 21, 2012. Surveys were conducted in 2013 to provide additional information and to confirm information related to the 2012 baseline. The main focus was on sensitive habitats and any areas with the potential to support sensitive flora or fauna species. In addition, project biologists conducted focused surveys for burrowing owl, Los Angeles pocket mouse (LAPM), and a comprehensive sensitive plant survey. A delineation of jurisdictional waters and wetlands was also conducted. Table F-7A.A below summarizes the survey dates, the type of survey, and FCS-MBA lead staff. Information on where the surveys were performed as the project evolved through time are presented in Exhibit 5 of the *Draft Habitat Assessment and MSHCP Consistency Analysis* (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1 and E-4) (hereafter MSHCP Consistency Analysis). In addition, project biologists contacted Riverside Conservation Authority (RCA) staff to obtain recorded occurrence data for sensitive plant and wildlife species observed within and adjacent to the San Jacinto Wildlife Area (SJWA).

Response to Comment F-7A-3. The commenter has suggested the project mitigate the loss of farmland by a conservation easement. In fact, a new Mitigation Measure (MM) 4.2.6.1A has been added to the Final Environmental Impact Report (FEIR) Volume 2 requiring the acquisition of a conservation easement be recorded over land of comparable productive value to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland. It should be noted the revised Parsons Brinckerhoff report and the *California (California) Land Evaluation and Site Assessments (LESA) Model* report (FEIR Volume 2, Appendix C-1 through C-4) have determined that conversion of the Farmland of Local Importance does not represent a significant impact based on the results of the revised LESA model assessment (see also Response F-7A-39 to Letter F-7A for more information on agricultural impacts).

Response to Comment F-7A-4. The commenter claims that the DEIR fails to adequately mitigate significant construction and operational air quality impact and indirect source pollution.

The DEIR addresses all potential impacts and applies feasible mitigation to reduce impacts, but not to below a level of significance. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project's mitigation measures. Refer to the response to comments which follow.

Response to Comment F-7A-5. The revised DEIR as well as Section 6.9 of the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013 – FEIR Volume 2, Appendix E-1) were specifically updated to adequately analyze all potential project-related impacts at a programmatic level and developed mitigation measures that will reduce potentially significant impacts to less than significant levels.

Response to Comment F-7A-5. The DEIR describes potentially significant impacts associated with Plummer's mariposa lily, burrowing owl, nitrogen deposition, riverine/riparian areas, drainage features under United States Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB) and California Department of Fish Wildlife (CDFW) jurisdiction, MSHCP, Migratory Bird Treaty Act (MBTA), Raptor foraging habitat, City of Moreno Valley Municipal Code related to

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

biological resources, Urban/Wildlands Interface (including toxics, lighting, noise invasive species, barriers, access, grading/land development, and fuels management), and Stephens' kangaroo rat (SKR). The revised DEIR as well as Section 6.9 of the MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1) specifically addresses required mitigation measures that will reduce impacts to less than significant levels.

Response to Comment F-7A-6. The commenter claims that the DEIR fails to adequately analyze and mitigate the project's construction and operational greenhouse gas (GHG) emissions.

The DEIR addresses all potential impacts and applies feasible mitigation to reduce impacts, but not to below a level of significance. Refer to the response to comments which follow.

Response to Comment F-7A-7. A comment was made about the DEIR's failure to adequately analyze hazards and hazardous materials and establishes an erroneous baseline. The comment references the Department of Toxic Substance Control Interim Guidance for Sampling Agricultural Properties (Third Revision), dated August 7, 2008 as the standard that should have been used for pesticide sampling conducted during the several Phase I Environmental Site Assessment (ESA) reports for various parcels that comprise the site.

The referenced (California) Department of Toxic Substance Control (DTSC) document is:

"specific to agricultural properties where pesticides and/or fertilizers were presumably applied uniformly, for agricultural purposes consistent with normal application practices. It is applicable to agricultural properties that are currently under cultivation with row, fiber or food crops, orchards, or pasture. It is also applicable to fallow and former agricultural properties that are no longer in production and have not been disturbed beyond normal disking and plowing practices. Each field of the same crop is assumed to have been watered, fertilized and treated with agricultural chemicals to the same degree across the field. Because of this homogeneous application, contaminant levels are expected to be similar at any given location within the field. This is the underlying premise of the guidance..."

Properties not requiring agricultural sampling under the referenced guidance include property used exclusively as grazing lands or pasture. The guidance also states that dry-land farming, which is the practice of growing a crop without irrigation, are not treated with pesticides or infrequently treated, since the lack of water does not provide a desirable habitat for most agricultural pests. Properties that clearly qualify as dry-land farming do not need further investigation for pesticides or metals. *"For properties where there is uncertainty regarding dry-land farming, limited sampling may be conducted at a rate of four discrete samples per site, with one sample collected in each quadrant."*

The DTSC 2003 Interim Guidance for Sampling Agricultural Properties, which they referenced as to why additional samples for organo-chloro-phosphate (OCPs) were necessary, was taken out of context. The 2008 Interim Guidance for Sampling Agricultural Properties speaks to how an environmental assessor for the DTSC should conduct an evaluation of an agricultural property to be converted into another use. The guidance is envisioned as being most relevant to sites on which schools will be constructed or for residential use. However, it does apply to any project with DTSC oversight. Properties not subject to this guidance include former agricultural property that has been graded for construction or other purposes, land used exclusively for grazing or pasture, most dry-land farming fields, and sites that were agricultural properties prior to 1950. The subject site would be an exempted site as it was dry farmed land.

DEIR Section 4.8.1.1 states that the number of soil samples taken at the subject site during the many Phase I ESAs has demonstrated that pesticide use was infrequent and limited over the site, and are at levels that are below regulatory requirements for residential property. These are the baseline conditions with respect to pesticide use at the site. The herbicide commonly called 2, 4-D or 2,4-

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Dichlorophenoxyacetic acid is the 3rd most common herbicide used in the United States. It can be purchased at retailers like Home Depot. It has a half-life of about 2 weeks. So in 6 months there is less than 0.5 percent of the original product in the soil, therefore, this is not a significant soil contamination issue.

In terms of sample frequency, the sampling pattern should be sufficient to characterize the site. The guidance, done for school and residential properties, apparently interprets this as a range for properties from one acre to fifty acres (with the number of each of the following categories increasing every few acres), of between 4 and 60 borings, 4 and 15 composite organo-chloro-phosphate (OCP) samples. For acreages greater than 50, consultation with the DTSC is required. However, mitigation of frequency is available to sites based on documentation of consistent ownership, operator, and use. It should be noted that none of our samples were composites but all were discrete samples, so they are more representative of what is actually on the properties. The DTSC's document is a guidance document for school sites and residential properties not those that are to be commercial/industrial. The intent is to avoid having children (schools, residential) from coming in contact with soils with high levels of OCPs.

The bottom line is there are no significant OCPs present on the site. The trace amounts detected in our sampling probably represent the presence of an irrigated crop, such as watermelons, or potatoes at one time, on portions of the property. None to trace amounts of OCPs, orders of magnitude below any regulatory level for residential property, were detected in all of our 50 plus samples over the site.

Response to Comment F-7A-8. Responses are provided for specific comments regarding storm water impacts on water quality. Refer to Responses to Comments F-1-38, F-1-78, F-5-10, F-5-12, F-5-13, F-5-15, F-5-16, F-5-22, F-5-23, and F-7B-5.

Response to Comment F-7A-9. The commenter believes the EIR has not adequately evaluated the project's cumulative impacts or recommended mitigation for loss of agriculture, biological resources, or air quality. The commenter is encouraged to review the revised and new agricultural reports (FEIR Volume 2 Appendices C-2 and C-4, respectively), the revised biological reports (FEIR Volume 2 Appendices E-1 through E-4), and the revised air quality report (FEIR Volume 2 Appendix D) for a more thorough evaluation of the programmatic and cumulative impacts of the project on these environmental issues. The FEIR explains that additional mitigation (MM 4.2.6.1A – see Response to Comment F-7A-39) was added in response to comments for agriculture (i.e., acquisition of an offsite conservation easement for loss of farmland), and revised mitigation measures for biological resources and air quality (FEIR Volume 2, Sections 4.4 and 4.3, respectively). Each of those sections of the DEIR did examine potential cumulative impacts of the WLC project on those environmental issues, which was based on growth projections in the City's General Plan and regional Southern California Association of Governments (SCAG) documents. There has been no evidence provided that would indicate why the cumulative analysis was inaccurate or inappropriate, and the rationale for the design of the cumulative analysis was clearly outlined in Section 2.10 of the DEIR. The analysis of cumulative impacts in the DEIR is adequate under California Environmental Quality Act (CEQA) for this project.

Based on the revised DEIR and the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1), the cumulative impacts are based on updated and accurate data collected during the 2013 survey season. CEQA requires the discussion of the cumulative impacts of proposed projects. The WLCSP was assessed based on closely related past, present, and future projects that may be developed in the foreseeable future. These guidelines allow for either a List Method or a Regional Growth Projection Method. Since the WLCSP is a program-level document, the Regional Growth Project Method is an appropriate methodology to evaluate cumulative impacts. The significant impacts

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

associated with the WLCSP were assessed based on the contribution to cumulative impacts on a regional basis.

Adoption of the City of Moreno Valley General Plan EIR did not result in significant direct impacts to existing biological resources; however, adoption of the General Plan would lead to future indirect impacts through approval of development projects within the City of Moreno Valley.

Project-related impacts resulting in quantifiable direct impacts to biological resources would be addressed subsequently through analysis at a lower tier, project-specific level of environmental review. MMs 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I, as listed in the DEIR, will reduce the project related impacts to a level less than significant. As a result, the contribution of impacts associated with projects within the WLCSP are fully mitigated and will reduce the cumulative impacts of the WLCSP to a less than significant level.

The WLCSP is located within the Central Planning Area of the City of Moreno Valley General Plan. The CDFW Conservation Buffer Area is located within the San Jacinto Wildlife Area - Mystic Lake Planning Area. Under the General Plan, further environmental review at the project-specific level will be required to minimize the risk of unmitigated impacts being authorized through adoption of the WLCSP.

The following mitigation measures were adopted for the General Plan to provide assurances that potential significant biological impacts associated with the implementation of the proposed General Plan Update would be mitigated. Subsequent project-level environmental review could identify more detailed site-specific mitigation measures. Impacts to Stephens' kangaroo rat, sensitive plant and wildlife species, and Riverine/Riparian Habitat associated with drainage features, could be considered a cumulative impact without mitigation. The following mitigation measures are required under the General Plan and the WLCSP EIR proposes MM 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, 4.4.6.4A-I to reduce project-related impacts to a level less than significant:

1. Private development projects within the City shall comply with the Long-term Habitat Conservation Plan (HCP) for the Stephens' Kangaroo Rat.
2. Private development projects shall comply with the Western Riverside County Multi-Species Habitat Conservation Plan and the associated state and federal permits.
3. Where feasible, projects shall be designed to minimize impacts on sensitive habitat.
4. Prior to physical disturbance of any natural drainage course or wetland determined to contain riparian vegetation or otherwise qualify as a "jurisdictional" wetland or Non-wetland Water of the U.S., the applicant shall obtain a Streambed Alteration Agreement and/or permit, or written waiver of the requirement for such an agreement or permit, from all resource agencies with jurisdiction over such areas (CDFW and USACE).

The long-term HCP for the Stephens' Kangaroo Rat (SKR) was designed to compensate for the loss of SKR individuals and SKR habitat on a regional basis. A total of 48 acres of suitable habitat for SKR occurs within the WLCSP area. Future projects that impact suitable habitat would significantly impact SKR. Projects that are consistent with the requirement of the long-term HCP for SKR would not result in significant project-level impacts, and therefore would also not result in cumulative impacts to SKR on a regional basis. A mitigation fee is required on a project-level basis and is based on the overall size of the project site. Payment of the mitigation fee will reduce the level of impacts to a less than significant impact. The mitigation fees are used to purchase land within the core conservation areas for SKR.

Portions of the WLCSP contains non-native grasslands and Riversidean sage scrub. The past habitat loss along with potential; future development is a potentially significant impact with regard to raptor

foraging habitat, especially for those raptor species that are over-wintering in the Moreno Valley area. The MSHCP has been designed to compensate for the loss of biological resources throughout western Riverside County, and cumulative impacts to existing biological resources resulting through increased future development have been addressed in the MSHCP FEIR/EIS dated June 17, 2003. The MSHCP was designed to set aside large areas of native habitat necessary for the long-term conservation of sensitive plant and wildlife species, while at the same time providing a streamlined process for future development.

Therefore, future development projects within the planning area that conform to the MSHCP would not result in cumulatively considerable impacts for those biological resources adequately covered by the MSHCP. The MSHCP project fee will be used to purchase off-site mitigation lands that will partially compensate for significant impacts associated with raptor foraging habitat. Implementation of MMs 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I will reduce the project related impacts to a level less than significant. Subsequent CEQA review will be required on a project-by-project basis to ensure conformance with the MSHCP and future implementing plans/ordinances at the project-specific level.

The commenter also questions the analysis of cumulative biological impacts from the project. However, as with agricultural impacts described above, the WLC project would be the single largest project in the surrounding area to potentially affect biological resources because much of the remaining open land is owned by the state and already set aside for habitat and species conservation (e.g., Lake Perris, Mystic Lake, SJWA). In response to many comments about cumulative raptor foraging habitat, the MSHCP consistency report and DEIR Section 4.4 were revised to include an analysis of the effect the loss of the WLC property would have on regional raptor foraging habitat. The revised DEIR section concluded these impacts were potentially significant, but that payment of the established MSHCP mitigation fee, which would eventually result in the preservation of thousands of acres of open space habitat and conservation land, represents appropriate mitigation and impacts would be less than significant with payment of that mitigation fee.

For resources not covered adequately by the MSHCP, additional mitigation may be necessary. Any impacts to wetlands or non-wetland waters of the US or waters of the state are cumulatively considerable. Compliance with federal and state regulations (implementation of mitigation measures identified in the Biological Resources Section 4.4 in the DEIR) is expected to reduce these impacts to a level below significance or less than cumulatively considerable. Impacts to non-covered sensitive species or resources resulting from the Land Use Alternatives are not expected to be cumulatively considerable.

The commenter claims that the DEIR's entire cumulative impacts analyses are based on outdated and inaccurate summary of projections. The DEIR also fails to adequately analyze and mitigate the Project's cumulative impacts for agricultural resources and air quality.

The DEIR addresses all potential impacts, is based on the best available data, and applies all feasible mitigation to reduce impacts. However, regarding air quality, mitigation does not reduce cumulative impacts to below a level of significance. Refer to the response to comments which follow. The commenter does not indicate how the summary of projections is either outdated or inaccurate. The air quality analysis provides the most relevant air quality data with regard to cumulative impacts drawing on both regional air quality trends, analysis of the assumptions contained in South Coast Air Quality Management District's (SCAQMD's) Air Quality Management Plan, and analyses conducted by the SCAQMD as part of the Multiple Air Toxics Exposure Study (MATES)-III study. Together, this detailed information provides the basis for cumulative analysis and determination.

The analysis of cumulative agricultural impacts is actually less dependent on growth projections because the WLC project would be the single largest project in the surrounding area to convert

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

agricultural land to development, as much of the remaining open land is owned by the state and set aside for conservation (e.g., Lake Perris, Mystic Lake, SJWA). In response to many comments about direct and cumulative agricultural impacts, the applicant has agreed to provide a conservation easement on offsite agricultural land to mitigate for the loss of unique farmland. It should be noted that the revised agricultural assessments determined the loss of farmland of local importance was in fact not significant under CEQA based on the results of the revised LESA model (see FEIR Section 1.6 for more information).

Response to Comment F-7A-10. The alternatives analysis did identify several alternatives to the project that would lessen some of the significant environmental impacts of the WLC project. However, it must be remembered that any development project of this size would create significant environmental impacts, including air quality, traffic, noise, etc. For example, under the current SCAQMD thresholds, only an alternative that was substantially smaller (i.e., less than 2.5 percent or 1 million square feet) of warehousing would have less than significant air quality impacts. This drawback of the project size was discussed in the introduction to the alternatives section. As shown in DEIR Table 6.S, Alternative 1 (Less Intense Development) reduces air quality, greenhouse gas, and noise impacts of the proposed project, but not to less than significant levels mainly due to the size of the alternative land use plan. Any substantial development project on the WLC property that produces a large amount of new employment (e.g., office, commercial, light industrial) would result in a number of significant impacts such as traffic, air quality, noise, etc., many of which would be similar to those of the proposed WLC project, including truck exhaust pollution issues which would also be generated by light industrial and commercial uses. Therefore, the DEIR correctly rejected Alternative 1 in favor of the proposed project because Alternative 1 would not reduce one or more significant impacts of the proposed project and did not meet the goals of the project as well as the proposed project.

Response to Comment F-7A-11. A large number of comments on the DEIR have been received and responded to. They are included in Volume 1 of the FEIR. The DEIR has been revised to incorporate the information in the responses and has been presented in both redlined (FEIR Volume 2) and clean versions (FEIR Volume 3) so that the changes can be easily identified. The FEIR, including the DEIR as revised, adequately describes and analyzes the project and its impacts and, where appropriate, sets forth appropriate mitigation measures.

While some of the responses contain new information, the new information does not show the existence of new significant environmental impacts nor does it show any substantial increase in the severity of environmental impacts previously identified. Further, the FEIR, which includes the responses to the comments, will be made available for public review prior to the City Council's determination whether to certify the EIR as having been prepared in compliance with CEQA.

Response to Comment F-7A-12. The commenter has accurately summarized the project characteristics that were evaluated in the DEIR, however, several minor changes have been made to the project description since the time the DEIR was circulated, so the commenter should review Section 1.3 of FEIR Volume 1 for additional information in this regard.

Response to Comment F-7A-13. There is no way of verifying the claims of the commenter regarding where its members live, or that hundreds of its members will be impacted by development of the WLC project. However, the City acknowledges the WLC project may result in air pollutant-related health impacts to many residents in the City and surrounding communities, especially those along the SR-60 and other freeways that would serve WLC project traffic. Refer to Master Response-2 in Letter C-3 addressing air quality and health risk.

Response to Comment F-7A-14. The commenter claims that construction workers will be exposed from air pollution emissions from poorly maintained or controlled construction equipment. This potential impact is mitigated by MM 4.3.6.2A, which among other things requires the following: construction equipment shall have Tier 4 engines (which are the cleanest on the market), construction

equipment shall be properly maintained according to manufacturer specifications, construction equipment and vehicles shall be turned off when not in use, onsite idling is limited to three minutes in any one hour, etc. Therefore, the construction equipment will be properly maintained and the emissions are controlled.

In addition, the commenter again mentions the possible risks related to hazardous materials on the project site. The commenter is referred to Response to Comment F-7A-7.

Response to Comment F-7A-15. The City acknowledges the commenter's summary of CEQA requirements regarding goals, alternatives, and abuse of discretion is relatively accurate. The EIR complies with the intent and legal requirements of CEQA in these regards.

Response to Comment F-7A-16. Please see the Response to Comment F-7A-11.

Response to Comment F-7A-17. The DEIR has provided an accurate assessment of baseline conditions on the project site, including those related to hazardous materials, as is discussed later in these comments and responses (refer to Responses to Comments F-7A-18 through F-7A-24). The information provided in this section by the commenter consists mainly of excerpts from CEQA and court cases that dealt with baseline issues.

Response to Comment F-7A-18. The commenter believes the Phase 1 documents for the project site do not provide an accurate assessment of current soil conditions. The City disagrees and contends the many Phase 1 reports done on many parcels throughout the WLC property and over a long period of time constitutes an extensive random sampling of the onsite soils, and demonstrate the site does not contain widespread soil contamination from pesticides. Dry farming does not use a variety of agricultural chemicals because it relies on ambient rainfall and other conditions to support the limited crops grown on the site. Many of the organo-chloro-phosphate (OCP) based chemicals used for more intensive irrigated crops are not used in dry farming due to their cost and lack of irrigation to distribute the chemicals. In addition, the chemicals used in dry farming typically break down quickly in the soil and are not broadcast but rather applied by hand sprayers, so any applications would be necessarily limited. There is no practical reason why intense crop herbicides or pesticides like dichlorodiphenyltrichloroethane (DDT) would be used in conjunction with dry farming in general, and there is no evidence such chemicals were used on the WLC site in the past. In fact, onsite soil sampling conducted for the Phase 1 reports found no evidence of significant OCP contamination on the WLC site. The chicken ranch and related facilities that were on the site for a time are in the process of being removed, including any surficial materials with waste products. There has been no empirical evidence presented that would demonstrate there is actual contamination by agricultural chemicals or wastes on the WLC site.

Response to Comment F-7A-19. The commenter suggests the site has inadequate soil sampling and refers to a DTSC publication for guidance (suggests dichlorodiphenyltrichloroethane (DDT) or dichlorodiphenyldichloroethylene (DDE) may be present). As outlined in the previous Response to Comment F-7A-18, there is no reason to believe or evidence to demonstrate that the site is actually contaminated by OCPs such as DDT or DDE. The references cited by the commenter are general for those chemicals and are not specific to the WLC project site, and do not demonstrate that these chemicals were specifically used on the WLC site. However, the commenter does cite more recent data from the DTSC in later comments that indicates which pesticides and other agricultural chemicals have actually been used on the project site (see Responses to Comments F-7A-21 and 22 below for details).

Response to Comment F-7A-20. The commenter suggests construction workers may be exposed to hazardous chemicals from past agricultural activities during project grading. There has been no evidence presented that actually demonstrate the WLC site has significant pesticide or other

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

contamination related to past or ongoing agricultural activities (see Responses to Comments F-7A-19, -21, and -22 below for details). Therefore, there is no reason to believe that construction workers will be exposed to significant levels of hazardous materials during grading.

Response to Comment F-7A-21. Comments were made about the Phase I ESAs completed for the project. The commenter believes the assessment is outdated and inadequate. The project site is currently used for wheat cultivation but no samples were collected in association with the 2013 Phase I ESA. The commenter believes because the project site is still used for agricultural purposes, relying on sampling results from eight years ago will not reflect pesticide residuals that may exist in site soils from agricultural use of the site from 2005 to present-day. The commenter also believes additional pesticide sampling, to include 2, 4-D, 2-ethylhexyl ester, and any other pesticides that may have been used for wheat farming, should be conducted.

According to records from the DTSC provided by the commenter, dry farmed agricultural properties of the WLC project site have had pesticides like 2,4-Dichlorophenoxyacetic acid, commonly called 2, 4, D applied in the past. 2, 4 D is the 3rd most common herbicide used in the US and can be purchased at retailers like Home Depot and Lowes. 2,4 D has a half-life of a few days to two weeks, depending on site conditions (available water, sun etc.). Within a few months after application, the residual amount of pesticide is less than 1 percent. Dry farming operations, and any pesticide application, will have ceased well before the actual grading of the site, and any current pesticide application, will have biodegraded to less than significant levels. 2,4 D was the most common pesticide applied to the site, often combined with Agri-Dex (as indicated in the DTSC records) which is used as a wetting agent to increase absorption of the 2, 4 D. The DTSC records indicate these chemicals were applied to grapes on the site, but there are no areas of cultivated grapes at present on the WLC site. It is possible some of these materials were used on the rural residences on the site, however the 2, 4 D and Agri-Dex were by far the most common chemical used on the site by weight in 2010, which accounted for almost a thousand pounds of chemical applied. Other chemicals applied to properties within the WLC site during that time include pyrethrins, spinosad, beta-cyfluthrin, sulfur, "Roundup" (glyphosate), "scythe, and rimsulfuron mainly as herbicides and fungicides, but less than one pound of each of these materials was typically applied at a given time, so the overall potential exposure is considered to be relatively minor at present. Therefore, there is no evidence there will be adverse environmental impacts on adjacent property owners or WLC site workers from past pesticide applications at the site, including 2, 4 D. However, to err on the side of caution, MM 4.8.6.1A has been modified to include soil sampling for agricultural chemicals prior to grading of the 7 rural residential lots where it is possible more chemical materials were applied in more concentrated locations than broadcast on large wheat fields.

Response to Comment F-7A-22. The commenter expresses concern about pesticide exposure for the 7 onsite rural residences especially to 2,4-Dichlorophenoxyacetic acid. As outlined in Responses to Comments F-7A-18 and F-7A-21, the City does not believe the site contains significant soil contamination that would affect onsite workers or residents of the 7 rural residences. In addition, the main pesticide of concern cited by the commenter has a short life (half-life of a few days to two weeks) and breaks down quickly in the soil when present. However, MM 4.8.6.1A will be modified to include soil sampling for agricultural chemicals prior to grading of the 7 rural residential lots.

Response to Comment F-7A-23. Comments were made that the DEIR's baseline regarding hazardous materials or conditions was not accurate because it did not include the entire project area.

The Phase I ESA (January, 2013) has been amended to include these parcels. The parcels are and have been historically the same as the adjacent parcels, that is vacant, and/or dry farmed land. The inclusion of these parcels into the Phase I ESA does not change the conclusions and recommendations presented in that report, (see attached Addendum Letter dated October 22, 2013 located in FEIR Volume 2, Appendix I).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-7A-24. Based on the updated DEIR and the MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E), the cumulative impacts are based on updated and accurate data collected during the 2013 survey season. An updated cumulative impact section fully analyzes all WLCSP cumulative impacts and determined that there would be no significant impacts with implementation of the project mitigation identified FEIR Volume 2 Section 4.4.

Response to Comment F-7A-25. The DEIR did not identify the loss of raptor foraging habitat as a potentially significant impact due to the lack of significant prey base and poor quality foraging habitat. Based on the revised DEIR and the MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1), the loss of low-quality foraging habitat remains unchanged and is still not considered a significant impact.

Although the findings the McCrary, et al. and the Beckman, et al. reports are not discounted, the WLCSP is dominated by routinely disked agricultural fields that are dry-land farmed and rely on natural rainfall for irrigation. The McCrary, et al. and the Beckman, et al. reports are based on survey areas with much different foraging habitats than foraging habitat associated with the WLCSP. The vegetation communities within the WLCSP do not provide moderate to high quality foraging habitat for sensitive raptor species. The majority of the suitable foraging habitat in the vicinity of the WLCSP area includes artificially irrigated alfalfa fields, grain crops, and dairy farms.

Due to the relatively close proximity of the SJWA, which contains moderate to high quality raptor foraging habitat, there is a potential for the loss of low-quality foraging habitat for California fully protected species such as golden eagle and white-tailed kite. Any impact to California fully protected species is considered a potentially significant impact requires mitigation. These species are considered covered under the MSHCP and payment of the MSHCP Development Fee may be used to purchase off-site habitat within core conservation areas that will provide long-term conservation of moderate to high quality foraging habitat. However, the WLCSP does not have more than moderately suitable foraging habitat for the loss of 2,610 acres of foraging habitat in a region with thousands of acres of foraging habitat would not be considered significant with the implementation of the following new MM 4.4.6.4C has been added to FEIR Volume 2 Section 4.4.6.3:

4.4.6.4C The loss of foraging habitat for golden eagle and white-tailed kite will be mitigated by payment of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) fee and the creation of a landscaped buffer area adjacent to the San Jacinto Wildlife Area property (SJWA). First, the payment of the Western Riverside County Multiple species Habitat Conservation Plan fee will be required on a project-by-project basis. Second, a 250-foot setback as described in Mitigation Measure 4.4.6.1A will be established within the World Logistics Center Specific Plan area. This area will reduce impacts to raptor species foraging in the adjacent San Jacinto Wildlife Area open space areas.

Response to Comment F-7A-26. In response to comments on the DEIR, the MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1) included an updated 2013 burrowing owl survey. The 2013 burrowing owl survey complied with all applicable MSHCP guidelines for conducting burrowing owl surveys. The previous burrowing owls surveys (2005, 2007, and 2010), were included in the DEIR as additional information to provide background information regarding burrowing owl. The 2013 surveys began with a complete survey of the entire WLCSP area, including off-site improvement areas. All surveys were conducted on foot and no portion of the WLCSP was surveyed by vehicle. A total of five biologists conducted surveys over a three day period to cover the entire WLCSP area. All potential burrow sites were identified and mapped. All suitable habitat areas, which included these burrow locations, were surveyed on four separate occasions, approximately one week apart.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

A single burrowing owl pair was observed onsite during the 2013 survey season. The pair is considered a nesting pair and at least one of the fledglings was killed shortly after fledging the nest. The owl was most likely killed by a feral dog, which are known to occur within the project site, but was not confirmed. Because of the different kind of surveys that have been conducted on the project site and the number of surveys over the last 8 years, burrowing owl populations have been monitored over the years.

The first burrowing owl observation was made on May 10, 2005. The first burrowing owl was observed just south of Dracaea Avenue at the western end of a windrow. The actual burrow was not observed because it was located beneath a stack of trash and debris that was stack on the side of a dirt berm. In an attempt to minimize impacts to potentially nesting burrowing owls, there was no attempt to remove the debris to find the burrow. However, this area was resurveyed during the 2007, 2010, and 2013 focused surveys and no burrowing owls were observed.

During a wetland delineation survey, a burrowing owl individual was observed within the detention basin located at the north end of the WLCSP, south of the Skechers facility. This individual burrowing owl was not observed in any nesting or courtship behavior. Following the wetland delineation fieldwork, the project site was visited on a number of subsequent site visits to check on the status of the burrowing owl. This information was not included in the burrowing owl survey, because it was not part of a burrowing owl protocol survey. The detention basin was visited in June and July 2012 and no burrowing owl were observed.

Based on the number of surveys conducted within the project site and the recorded occurrences of burrowing owl, nesting activities has only been recorded to occur in 2005 and 2013. Burrowing owl has only been recorded in 2005, 2012, and 2013. Although infrequent, it appears that at least one pair of burrowing owl is a breeding season resident within the project site. However, there has been no observation of burrowing owl within a Criteria Cell. Any impact to a single breeding pair of burrowing owl located outside of a Criteria Cell does not require conservation under MSHCP guidelines. If more than three pairs of burrowing owl are observed within the WLCSP, conservation of 90% of the suitable habitat will be required until the conservation goals for burrowing owl as described in the MSHCP are met.

MM 4.4.6.4A, B, and D requires a pre-construction clearance survey for burrowing owl be conducted by a qualified biologist no more than thirty (30) days prior to any grading or ground disturbing activities for all projects with the WLCSP.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the proposed ground-disturbing activity during the 30-day pre-construction survey, construction activity shall maintain a 500-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the CDFW shall take place and an appropriate avoidance distance established. No disturbance to active burrows shall occur without appropriate permitting through the Migratory Bird Treaty Act and/or CDFW.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, passive relocation may be conducted following consultation with the CDFW. A relocation plan may be required by CDFW if passive relocation is necessary. Artificial burrows locations will be identified in a Burrowing Owl Relocation Plan, which will be approved by CDFW prior to burrowing owl relocation. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor.

Response to Comment F-7A-27. Protocol surveys for Los Angeles pocket mouse (LAPM) were conducted within all suitable habitat areas within the WLCSP, including off-site improvement areas during the 2013 survey season. Since there is no formally written protocol for LAPM, the survey protocol for Pacific pocket mouse (a federally endangered species) was utilized. The Pacific pocket mouse is a subspecies related to the LAPM. Protocol surveys were also conducted in 2010 and 2012. No LAPM were observed during any of the surveys. Based on Riverside Conservation Authority (RCA) data, no recorded occurrences of LAPM occur within the vicinity of the WLCSP. This species is considered absent from the WLCSP and there will be no project related impacts to LAPM. Therefore, no mitigation measures are required.

Response to Comment F-7A-28. Under the MSHCP, protocol level plant surveys are required within areas designated as Narrow Endemic Plant Survey Areas as well as Cell Criteria Plant Survey Areas (MSHCP Section 6.3.2). There are no portions of the WLCSP that fall within a designated Narrow Endemic Plant Survey Areas and/or Cell Criteria Plant Survey Area (FCS-MBA 2013 - FEIR Volume 2, Appendix E-6). Therefore, protocol surveys are not required for those species that are considered covered under the MSHCP. Focused plant surveys were conducted in 2010 to identify sensitive plant species that were not covered by the MSHCP or are conditionally covered by the MSHCP. The entire WLCSP was assessed to determine the suitable habitat areas that require surveys. It was determined that the suitable habitat areas did not include the entire WLCSP are, but was limited to the undisturbed portions of the WLCSP, which typically includes the drainage features.

The 2010 focused plant survey was conducted within the four drainages of the WLCSP that contain suitable habitat for sensitive plant species within the appropriate flowering period for the sensitive plant species that potentially occur within the project site. The surveys were conducted based on CDFW approved sensitive plant survey protocol. The Riversidean Sage Scrub communities within the survey area are not within the proposed development footprint and will not be impacted by project development. At this point, impacts to sensitive plant species are not expected to occur within the WLCSP.

However, recent surveys were not conducted within the WLCSP because of the extended drought conditions, which has resulted in less than average rainfall since the 2010 surveys were conducted. Since the development of the WLCSP may take up to 15 years, updated focused plant surveys may be required as part of the project specific assessment required for the CEQA process, but will not be required for any Narrow-Endemic or Criteria Cell Plant species. The WLCSP is not located within the survey area for any Narrow-Endemic or Criteria Cell Plant species.

Response to Comment F-7A-29. In response to comments on the DEIR, an updated MSHCP Consistency Analysis (FCS-MBA 2013, FEIR Volume 2, Appendix E) was prepared including an updated list of special-status wildlife species, as designated by the USFWS and CDFW. The list of species includes Northwestern San Diego Pocket Mouse, San Diego Desert Woodrat, Bell's Sage Sparrow, White-tailed Kite, and Ferruginous Hawk and Merlin. All of these species are covered under the Western Riverside County MSHCP. American Badger and Western Yellow Bat are not covered under the MSHCP and grasshopper sparrow is a conditionally covered species under the MSHCP, but these species are not likely to occur within the project site.

Seven Northwestern San Diego pocket mouse were captured during the 2010 surveys and seventeen Northwestern San Diego pocket mouse were captured in 2013. Development of selected portions of the WLCSP will have an adverse effect on Northwestern San Diego pocket mouse. The only place within the WLCSP that contains suitable habitat and is considered occupied for Northwestern San Diego pocket mouse is within Drainage 9 south of Alessandro Boulevard and north of the existing gas pipeline. Northwestern San Diego pocket mouse is a covered species under the MSHCP; therefore, mitigation for adverse effects on Northwestern San Diego pocket mouse will require payment of the MSHCP fee. It should also be noted that Drainage 9 will remain as an open drainage feature with

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

several erosion control modifications, such as drop structures or other similar device, and will be regraded along the northern portion of the drainage to provide a more gradual transition at the Alessandro Boulevard crossing.

Response to Comment F-7A-30. Eight San Diego desert woodrat were captured during the 2010 surveys and a single San Diego desert woodrat was caught during the 2013 surveys. Development of selected portions of the WLCSP will have an adverse effect on San Diego desert woodrat. The only place within the WLCSP that contains suitable habitat and is considered occupied for San Diego desert woodrat is within Drainage 9 south of Alessandro Boulevard and north of the existing gas pipeline and within the northern portion of Drainage 8, just north of Gilman Springs Road, in a potential off-site detention basin location. San Diego desert woodrat is a covered species under the MSHCP, therefore mitigation for adverse effects on San Diego desert woodrat will require payment of the MSHCP fee. It should also be noted that Drainage 9 will remain as an open drainage feature with several erosion control modifications and will be regraded along the northern portion of the drainage to provide a more gradual transition at the Alessandro Boulevard crossing. Drainage improvements may occur within the active channel of Drainage 8, just north of Gilman Springs Road. If this location is selected for a detention basin, the basin will be incorporated with the existing channel to minimize impacts to this species as a project design feature.

Response to Comment F-7A-31. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E), all American badger recorded occurrences within the vicinity of the project site have been limited to the Badlands area north and east of the WLCSP. No evidence or observations of American badger have occurred during the 8 years of surveys within the WLCSP. American badger is known to occur within the rolling foothills adjacent to valley areas. This species is typically not found within areas of cultivated soils. Therefore, it is unlikely that this species occurs within the WLCSP. It was given a low-potential to occur within the project site, due to the close proximity of suitable habitat, which is associated with the Badlands area north of Gilman Springs Road. It is highly unlikely that the American badger would utilize any portion of the WLCSP and therefore no adverse effect will occur and no mitigation will be required.

Response to Comment F-7A-32. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E), the western yellow bat occurs in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. It has also been observed within native and non-native palm trees in more urbanized areas, but is commonly found near water features such as stock tanks, ponds, streams, and rivers. There are no such water features within the WLCSP. Although a few palm trees are still standing within the WLCSP, they have been unmaintained for years and are in poor health. Most of the palms have lost their skirt of dead fronds and therefore, no longer provide suitable roosting habitat. This species is unlikely to occur within the WLCSP and no further mitigation is required.

Response to Comment F-7A-33. A single incidental observation of Bell's sage sparrow was observed during a burrowing owl survey in 2005. This is the only recorded observation of this species within the WLCSP during the last eight years of surveys. This species is considered present within the project site, although its presence is limited (FCS-MBA 2013 - FEIR Volume 2, Appendix E). Bell's sage sparrow is a covered species under the MSHCP; therefore, mitigation for adverse effects on Bell's sage sparrow will be satisfied by payment of the MSHCP Development Fee.

Response to Comment F-7A-34. The reference to grasshopper sparrow as present within the WLCSP was incorrect and has been corrected. The DEIR references the presence of grasshopper sparrow from a previous burrowing owl protocol survey, but the DEIR does not reference the date of the survey. Based on a review of the 2005, 2008, 2010, 2012, and 2013 burrowing owl survey reports, this species was not observed.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Also, based on the revised MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E), grasshopper sparrow is not likely to occur within the project site. This species is commonly found in grasslands, but may also be found in prairies, old fields, some agricultural fields, and open savannas. This species is an uncommon and very local summer resident on grassy slopes and mesas west of the deserts. Since grasshopper sparrow is not likely to occur within the WLCSP, no additional mitigation measures are required.

Response to Comment F-7A-35. White-tailed kites are considered present within the project site (FCS 2013). This species is listed as California fully protected species. The CDFW does not provide incidental take authority for any state fully protected species, unless specifically covered under a MSHCP. Impacts to white-tailed kites are considered a potentially adverse impact. White-tailed kites are covered under the MSHCP (Section 2.1.4) and therefore payment of the MSHCP fee will fully mitigate for adverse impacts to white-tailed kites.

In addition, nesting activities of white-tailed kites are also protected under the Federal Migratory Bird Treaty Act. MMs 4.4.6.4A and 4.4.6.4B outlined in the DEIR will be required on a project-by-project basis to reduce impacts to nesting birds and burrowing owls to less than significant levels.

Response to Comment F-7A-36. Both ferruginous hawk and merlin have a low potential to occur within the project site due to a lack of suitable foraging habitat. Ferruginous hawk typically occur in open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of pinyon-juniper habitats. It has also been observed in irrigated croplands in southern California during the winter. Merlin commonly occur within seacoast, tidal estuaries, open woodlands, savannas, edges of grasslands and deserts, farms and ranches. Clumps of trees or windbreaks are required for roosting in open country.

Although it is unlikely that ferruginous hawk and merlin occur within the WLCSP, it cannot be completely ruled out. Therefore, the loss of foraging habitat for ferruginous hawk and merlin may be considered an adverse impact but less than significant, based on the poor quality of habitat.

The loss of low-quality foraging habitat is not a potentially significant impact and will not require mitigation (FCS-MBA 2013 - FEIR Volume 2, Appendix E). The WLCSP is dominated by routinely disked agricultural fields that are dry-land farmed and rely on natural rainfall for irrigation. This type of habitat does not provide moderate to high quality foraging habitat for sensitive raptor species. However, raptor species, such as golden eagle and white-tailed kite, may utilize the project site for foraging. Impacts to these California fully protected species is considered a potentially significant impact that require mitigation. Due to the close proximity of the SJWA, which contains moderate to high quality raptor foraging habitat, impacts to the WLCSP will require mitigation to off-set potentially significant impacts. The MSHCP Development Fee, may generate as much as \$14 million in fees, which may be used to purchase land to contribute to the core conservation areas established under the MSHCP. This land will be used to compensate for the loss of low-quality raptor foraging habitat. However, payment of the MSHCP fee will reduce the project related impacts to low-quality raptor foraging habitat to a less than significant level by the long-term acquisition of land that supports raptor foraging, as outlined in the MSHCP (FEIR Volume 2 Appendix E-1).

Response to Comment F-7A-37. An updated wetland delineation report (2013 - FEIR Volume 2, Appendix E-13) was prepared to address concerns regarding regulatory agency jurisdiction over the drainage features within the WLCSP. The previous jurisdictional delineation assumed CDFW jurisdiction over a select portion of Drainages 7 and 9. It also assumed that since the drainage features were all isolated and not likely under USACE jurisdiction that the drainage features were also not under RWQCB jurisdiction.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the draft Program EIR and the draft wetland delineation. Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the 1987 Regional Supplement to the USACE Wetland Delineation manual: Arid West Region and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the RWQCB and CDFW.

MM 4.4.6.3A requires that the applicant shall secure a jurisdictional determination with the USACE and confirm with the RWQCB and CDFW to determine if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction.

The updated jurisdictional delineation report assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. In addition these areas are also under the jurisdiction of the RWQCB. A maximum of 5.0 acres may be under CDFW and RWQCB jurisdiction. It should also be noted that Drainages 12 and 15 are hydrologically connected to downstream waters of the US and are also under the USACE jurisdiction. Mitigation for impacts to no more than 5.0 acres of waters of the State will be mitigated by the creation of a minimum of 5.0 acres of habitat creation or purchase of credits at an approved mitigation bank. Revised MM 4.4.6.3A addresses potentially significant impacts to waters of the State (refer to Response to Comment A-1-1, F-1-10, F-1-15, F-7C-16, and F-8-19).

Any impact to drainage features that are under regulatory agency jurisdiction or are considered riparian/riverine areas under the MSHCP are considered potentially significant and will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank. Compensatory mitigation will be negotiated during the permit acquisition process.

A Compensatory Mitigation Plan may be required for all unavoidable impacts and will be consistent with the USACE/USEPA's *Compensatory Mitigation for Losses of Aquatic Resources; Final Rule* and the USACE's *Standard Operating Procedure for Determination of Mitigation Ratios*.

In response to the general discussion regarding the adequacy of the investigation of the existence of all sensitive biological resource at the project site, it should be noted that a complete assessment of the biological resources within the WLCSP was updated during the 2013 field season. A review of the resource agencies comments regarding the Notice of Preparation provided the necessary information to adequately assess and analyses project related impacts to sensitive biological resources. Updated surveys were conducted for burrowing owl, LAPM, vegetation mapping, jurisdictional delineation, and possible off-site facilities. This update can be found in the MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1) and Determination of Biologically Equivalent or Superior Preservation (DBESP) Report (FCS-MBA 2013 - FEIR Volume 2, Appendix E-7).

Response to Comment F-7A-38. This comment is mainly excerpts from CEQA and the CEQA Guidelines, as well as several court cases related to significant impacts and the requirement to apply all feasible mitigation. The DEIR as amended does provide all feasible mitigation, yet due to the size of the project, some significant impacts will remain. Therefore a Statement of Overriding Considerations is required to be adopted by the City Council which demonstrates what overriding economic or other benefits the WLC project may have that outweigh the significant impacts.

Response to Comment F-7A-39. The commenter's statements about agricultural mitigation, as well as recent court cases on that topic, have led to the reconsideration of the issue of what is feasible mitigation for loss of agricultural land. Accordingly, the following mitigation measure is included in the FEIR Volume 2:

4.2.6.1BA Prior to the issuance of any grading permit affecting land designated as “Unique Farmland” (Figure 4.2.2 in the World Logistics Center EIR), an Agricultural Conservation Easement shall be recorded over land of equivalent or better agricultural economic productivity of the offsite easement property compared to the WLC property. The calculation of comparable agricultural productivity shall take into account soil conditions, drainage, irrigation limitations, and reasonable estimates of crop types and average yields for both sites. The form and content of this easement, as well as the estimates of agricultural productivity, shall be reviewed and approved in advance by the Planning Official.

This measure was added to address the loss of Unique Farmland which was identified in the revised Draft EIR as a significant impact of the WLCSP project. The EIR analysis was modified to incorporate data from a revised study and a new study of agricultural impacts based on the State LESA Model (see FEIR Volume 2 Appendix C-2).

Response to Comment F-7A-40. The region’s benign climate and good soils have not been adequate to sustain the Inland Empire’s agriculture industry. The region’s purported transportation advantages have not been adequate to sustain the region’s agriculture industry. Changes in the market economy have not been adequate to sustain the Inland Valley’s agriculture market. Despite trends and different government programs, agriculture production and employment has generally continued to shrink in the Inland Empire. In fact, the Inland Empire region was dead last in agriculture production growth and agriculture employment growth between 2004 and 2010. Agriculture production shrank by 28% and agriculture employment shrank by 27% in that time period. This has occurred despite the fact that the production in the Inland Empire as a whole and agriculture production for the state as a whole modestly grew during that time period. Moreover, agriculture has become a diminishing segment of Inland Empire economy. In 2004, it accounted for 5.7% of the economy and by 2010, it accounted for 4.1%, representing a 28.1% decline in relative size. Sales to local markets have not been adequate to sustain the Inland Valley’s agriculture market.

Response to Comment F-7A-41. The commenter acknowledges the DEIR concludes that loss of the “locally significant” agricultural land on the WLC project site is a significant impact. A new mitigation measure which would largely mitigate this impact, is outlined in Response to Comment F-7A-39 and is included in the FEIR Volume 2.

Response to Comment F-7A-42. The agricultural assessment for the WLC project (DEIR Appendix C) clearly outlines why “active” (irrigated, cultivated) agriculture is no longer viable in this portion of western Riverside County (DEIR Appendix C-1). The commenter states most of the WLC site is currently farmed, but fails to note it is dry farmed meaning minimal tillage and no there is no active irrigation (only natural precipitation). Dry farming is usually only marginally productive economically, and is only pursued when more active farming and more lucrative crops can be grown. As indicated in the Chang report (DEIR Appendix C), the most influential reasons for the economic decline of farming in this area are rising land prices as urban growth expands into rural areas, and rising water costs. The commenter argues against declining agriculture in this area, and cites data from the Riverside County Farm Bureau to support the argument. However, the commenter fails to note that as agriculture has declined in the western portion of the County, it has slowly moved out to more rural areas in the far southwest and eastern portions of the County (e.g., San Jacinto, Coachella Valley). This trend is the reason for the increased agricultural production numbers county-wide. In any event, the commenter should refer to Response to Comment F-7A-39 which outlines a new mitigation measure (MM 4.2.6.1A) that will protect agricultural land into the future. In addition, Response to Comment F-7A-45 explains why local groundwater cannot be used to irrigate onsite crops.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-7A-43. The DEIR has been revised to require the project applicant obtain conservation easements over agricultural land so as to provide for the preservation of agricultural land of equal quality to that which will be converted to non-agricultural uses as a result of the development of the area subject to the WLCSP. See MM 4.2.6.1A in Response to Comment F-7A-39.

Response to Comment F-7A-44. The project does not propose the “loss of over 3,400 acres of active farmland” as stated in this comment. As stated in the DEIR (DEIR, page 4.2-16), the project will impact 25 acres of “Unique Farmland,” and 2,610 acres of “Farmland of Local Importance.” The additional LESA Model studies and the revised Draft EIR (FEIR Volume 2) determined that the only significant agricultural impact of the WLCSP project was the loss of the Unique Farmland, and the revised DEIR proposed a revised mitigation measure (MM 4.2.6.1A, offsite agricultural easement) to address this impact. See Response to Comment B-6-10 regarding the heritage farm mitigation (MM 4.2.6.1A) which has been eliminated in favor of the new mitigation measure language.

In response to comments received regarding the issue of the loss of agricultural resources, additional analysis was conducted on the subject by the Agribusiness, Natural Resources & Energy Practice Group of Cushman & Wakefield Western, Inc. Part of their analysis included the preparation of a LESA Model report to validate assumptions made in the DEIR. The Cushman & Wakefield analysis (FEIR Volume 2 Appendix C-4) determined that, contrary to the information in the DEIR, the project will impact 25 acres of unique farmland and 2,201 acres of farmland of local importance, but that only the loss of the Unique Farmland is considered a significant impact. Based on the corrected numbers and application of the LESA Model, as documented in the revised ag study and the new Cushman Wakefield study, the project’s only impact on agricultural resources is the loss of Unique Farmland. Based on this revised information, it was determined that MM 4.2.6.1A (the 5-acre heritage farm) as no longer the most appropriate mitigation, but instead proposes revised mitigation language (offsite agricultural easement) as the most appropriate mitigation for project impacts to agriculture.

The reader should refer to Responses to Comments B-6-10 and F-7A-39 for information on an additional mitigation measure for loss of agricultural land, consistent with the commenter’s recommendations.

Response to Comment F-7A-45. The commenter provides extensive information about potential crops that could be grown in the Moreno Valley area if economical reclaimed water was available. It should also be noted the recent study cited and prepared by the commenter was for a small parcel of land to raise organic vegetables, which have a much higher sales price than most typical row crops or other crops typically grown in this area.

At this time, reclaimed water is not economically available to the WLC project site, and would require an extensive network of irrigation pipelines to be installed to support raising irrigated crops on the site. When the cost of infrastructure improvements necessary to actually supply reclaimed water to the site are factored in, irrigated crops are not financially feasible over the long-term for the WLC property. In addition, local groundwater, which could be available via several onsite agricultural wells, cannot be used to irrigate crops due to its high nitrate and salinity. In the California LESA Model Report prepared by Cushman & Wakefield Western, Inc. December 2013 (FEIR Volume 2 Appendix C-4), it was noted “...the ground water quality is poor and would not be able to support production of high value crops needed to produce enough income to cover water costs. A water study provided from a 2012 well test revealed the ground water to be inadequate for most landscaping plants. In fact, the water’s Total Dissolved Solids (TDS) level of 980 milligrams per liter (mg/L) exceeds the maximum level that the Eastern Municipal Water District (EMWD) has set for sewer water discharge (800 mg/L).”

EMWD monitors the West San Jacinto Ground Water Basin and has expressed concern with well water use on the project. These concerns revolve around overdraft of the groundwater basin and the shift in the migration of poor water quality into areas with good water quality. In addition, extensive

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

water use with crop production has the potential to leach more salts from the ground into the groundwater. In the Metropolitan Water District September 2007 “Groundwater Basin Reports - West San Jacinto Basins” they cited the consideration for the West San Jacinto Basins include: “*The primary constraint on groundwater extraction is poor water quality, which limits use of groundwater as a potable water source. Another related limiting factor involves controlling the migration of poor quality water into areas of pumped good quality groundwater.*” The Department of Water Resources - California Groundwater Bulletin 118 draws a similar conclusion on the impairment of the groundwater noting “*Pumping is causing groundwater of high TDS content to move from the western part of the basin into groundwater of lower TDS content in the central part of the basin* (TechLink 202; EMWD 2003).”

According to Highland Fairview, there are numerous wells located in the project area. Currently, the wells are either sealed or no longer have an electrical power source for pump operation. Well operation typically results in a rough cost of \$300 to \$350 per acre-foot of water to lift it out of the ground (pumping costs do not include well maintenance and reserves for repairs). However, the ground water quality is poor and would not be able to support production of high value crops needed to produce enough income to cover water costs. A water study provided from a 2012 well test revealed the ground water to be inadequate for irrigating most landscaping plants. In fact, the water’s Total Dissolved Solids (TDS) level of 980 mg/L exceeds the maximum level that the EMWD has set for sewer water discharge (800 mg/L). Additionally, capital expenditures would be needed to bring the irrigation system back to functional operation. Therefore, this would not a feasible source of irrigation water based upon ground water quality and irrigation costs (personal communication P. Revere, December 30, 2013).

Response to Comment F-7A-46. As outlined in Response to Comment F-7A-39, a new mitigation measure (MM 4.2.6.1A) that requires the acquisition of an agricultural conservation easement to preserve land of comparable productivity for agricultural use, as recommended by the commenter.

Response to Comment F-7A-47. The commenter claims that the DEIR fails to mitigate particulate matter emissions from project construction. The commenter then identifies additional mitigation for particulate matter, which are already included in SCAQMD Rule 403. The project is already required to comply with SCAQMD Rule 403 because it is an existing regulation; therefore, the fugitive dust measures are not required as mitigation (which is over and above compliance with established laws and regulations).

Suggested Mitigation Measure	Response
<ul style="list-style-type: none"> - All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions; - The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day; - Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meter (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicular Code Section 23114; and - The contractor shall ensure that traffic speeds on unpaved roads and project site areas are 15 miles per hour or less to reduce fugitive dust haul road emissions. 	<p>Already Included in SCAQMD Rule 403. As discussed in the DEIR, fugitive dust reduction measures are already included in SCAQMD Rule 403 and therefore are not required to be mitigation measures. The project will comply with all applicable requirements in SCAQMD Rule 403.</p>
<ul style="list-style-type: none"> - Limiting fugitive dust emissions from any active operation, open storage pile, or disturbed surface area if the dust emission exceeds 20 percent opacity; 	

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
<ul style="list-style-type: none"> - Prohibiting track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift; and - Not disturbing an area of five or more acres, or with a daily import or export of 100 cubic yards or more of material, without utilizing at least one of the following measures at each vehicle driveway from the site to a paved public road: installation of gravel pads; pave any surface extending at least 100 feet and at least 20 feet wide; utilize a wheel shaker and wheel washer to remove dirt and mud from tires and vehicles before they exit the site. 	

Response to Comment F-7A-48. The commenter identifies some additional mitigation measures to integrate into the project. These measures are discussed below.

Suggested Mitigation Measure	Response
Installation of air filtration systems in home of adjacent residents.	Not Incorporated. Please refer to Master Response-5.
Air quality monitoring in surrounding area.	Not Incorporated. Air quality monitoring would not reduce emissions or impacts; the commenter did not identify any potential benefit for air quality monitoring. In addition, there is an air quality monitoring station in Riverside, which provides a background sufficient for purposes of determining whether the project area is in attainment.
100 kW capacity solar photovoltaic system.	Incorporated. MM 4.16.4.6.1C requires onsite solar.
LEED Silver certified project buildings.	Partially Incorporated. MM 4.16.4.6.1C requires LEED certification for all buildings; LEED silver is not applied as discussed in Response to Comment A-4-4.
Electric vehicle charging stations.	Already Included. This measure is included in MM 4.3.6.4A.
Tier 4 off-road equipment (construction).	Partially Included. MM 4.3.6.2A has been refined and requires that off-road diesel powered construction equipment greater than 50 horsepower meet Tier 4 standards.

Response to Comment F-7A-49. The commenter believes the DEIR should be revised. The DEIR and technical studies have been revised to amplify and clarify information (see Response to Comment F-7A-11). The commenter indicates that a revised DEIR should be prepared to implement all applicable and feasible mitigation measures. As discussed in Response to Comments F-7A-48, several of the feasible mitigation measures as suggested by the commenter are implemented.

Response to Comment F-7A-50. The commenter indicates that CEQA requires analysis of both direct and indirect environmental impacts.

This was accomplished in the DEIR and in the revised analysis. The air quality and greenhouse gas analysis quantifies direct emissions (architectural coatings, consumer products, natural gas, onsite equipment, and emergency generators) and indirect emissions (offsite mobile vehicles, electricity, and waste). Emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} are above the SCAQMD's operational significance thresholds. Estimation of emissions from onsite equipment was added to the revised air quality analysis (FCS/MBA 2015). The greenhouse gas analysis quantifies direct emissions (onsite equipment, emergency generator, refrigerants, and natural gas) and indirect emissions (mobile vehicles/trucks, electricity, waste, and water use). Both the air quality and greenhouse gas analysis estimate construction related emissions as well (DEIR, Impact 4.3.6.2 (pages 4.3-53 – 58), Table 4.7.E - page 4.7-29; revised analysis (FCS/MBA 2015).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The commenter also indicates that the project would be a major source of indirect pollution since it will attract diesel trucks to the area. The air pollution generated by these diesel trucks was quantified in the DEIR (see Impact 4.3.6.4 for a quantification of the regional emissions; Impact 4.3.6.3 for the localized impact; Impact 4.3.6. for the health risk impact) and in the revised analysis (FCS/MBA 2015).

The commenter requests that the EIR should analyze a requirement that the project implement a mitigation measure similar to San Joaquin Valley Air Pollution Control District (SJVAPCD) Rule 9510, the Indirect Source Rule. The project cannot implement a rule similar to Rule 9510 for the following reasons.

1. The rule is only applicable to the San Joaquin Valley Air Pollution Control District and not to the SCAQMD.
2. The commenter states that this measure could “reduce pollution by almost 50%.” Rule 9510 does not require that all pollution of the project be reduced by 50 percent. For operational emissions, it requires that applicants do the following:
 - Reduce 33.3 percent of the project’s operational baseline NO_x emissions over a period of ten years as quantified in an approved Air Impact Assessment (AIA) and
 - Reduce 50 percent of the project’s operational baseline PM₁₀ emissions over a period of ten years as quantified in an approved AIA.

The AIA required by Rule 9510 is prepared using different methodology and assumptions than in CEQA analyses. The SJVAPCD AIA allows the developer to propose project specific information like vehicle fleet, trip length (such as the default CalEEMod trip lengths), and to use a phasing plan to spread out the development; it does not need to match the EIR. The AIA also uses the CalEEMod mitigation component for operational mitigation measures; therefore, the project would be able to deduct a greater percentage for things like pedestrian features and bicycle lanes.

3. The project applicant and the City do not have the resources and the same potential emission reduction sources that the SJVAPCD has available. Rule 9510 works in the San Joaquin Valley because the SJVAPCD manages it. The SJVAPCD also finds offsite emission reduction projects, such as replacing old agricultural engines with newer and cleaner equipment. The project applicant and the City do not have those resources available.

Response to Comment F-7A-51. See Response to Comment B-3-4.

Response to Comment F-7A-52. The DEIR, Section 4.4.1.13 generally discussed raptor foraging habitat, but did not provide a detailed discussion of the subject and did not provide a sufficient analysis to assess whether the loss of raptor foraging habitat within the WLCSP is considered significant. Although a raptor foraging study was not conducted within the WLCSP area, information regarding wildlife usage of the WLCSP area was gathered over an 8 years period.

The WLCSP provides low-quality raptor foraging habit for a variety of raptors such as burrowing owl, barn owl, red-tailed hawk, white-tailed kite, and American kestrel (see Response to Comment F-7A-25). The prey base is rather limited due to on-going agricultural practices that eliminate burrows for small rodents. Based on the most current burrowing owl survey (FCS-MBA 2013 - FEIR Volume 2, Appendix E-5), 270 suitable burrows were documented within the WLCSP. The burrows are generally located along the margins of the roads and drainage features, which usually contains the least amount of disturbance. No more than 20 burrows were observed in the middle of the disked agricultural fields. That amounts to 1 burrow for every 10 acres of habitat, which is sufficient to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

support a few raptors, but does not provide a sufficient amount of prey to be used as wintering foraging habitat by large numbers of raptor species.

The portion of the WLCSP that contains the least amount of burrows is the area east of Theodore Street and south of Alessandro Boulevard, which is the area immediately adjacent to the SJWA. With the exception of the burrows located within Drainage 9, approximately 20 burrows were observed within an area of approximately 740 acres. That amounts to 1 burrow for every 36 acres of habitat.

Another limited factor in determining the amount of available prey, is the availability of moisture. The extensive agricultural areas are dry-land farmed and do not receive any supplemental watering. This lack of irrigation water greatly reduces the amount of vegetation and the diversity of vegetation required to support a large population of prey for local raptors. The WLCSP also contains a population of feral dogs, which would reduce the population of available prey. These animals have been abandoned by their owners and forage on prey items within the undisturbed portions of the WLCSP, which is generally limited to the drainage features. All of these factors combined indicate that the prey-base is limited compared to the amount of habitat that is available for foraging.

The CDFW Conservation Buffer Area, similarly also has on going agricultural. The loss of low-quality foraging habitat associated with the development of the WLCSP would be gradual due to phased construction. The abundance of surrounding open lands associated with Core Area H and Proposed Core 3 provides ample foraging lands for the existing raptor population that over-winter around Mystic Lake. The loss of foraging habitat within the WLCSP consists of low-quality habitat with a limited prey base (2,610 acres).

When compared to the remaining higher quality open-space areas still available for foraging, such as the adjacent badlands area (16,000 acres) and the SJWA (20,000 acres), the loss of the WLCSP as a foraging area is less than 10 percent of the available foraging habitat in the surrounding area. However, with the development of the WLCSP, much of the existing foraging habitat within the eastern portion of the City of Moreno Valley will be removed. The WLCSP is not located within a Core Conservation Area or a Proposed Core area. The majority of the WLCSP is outside of any Criteria Cells and therefore is not required for long-term conservation of raptor foraging habitat. This would cause a potentially significant affect with regard to impacts to locally sensitive raptor species such as white-tailed kite (a CDFW fully protected species) and mitigation is required.

The loss of raptor foraging habitat associated with potentially significant impacts to white-tailed kite will be mitigated in a number of ways including payment of the MSHCP Development Fee and the creation of a buffer area along the southern boundary of the WLCSP. The MSHCP Development Fee will be used to purchase off-site lands that will be used to conserve high-quality foraging habitat within the Core Conservation Land or proposed conservation lands. Second, a 250-foot setback as described in MM 4.4.6.1A of the DEIR will be established between the WLCSP and the CDFW Conservation Buffer Area. This area will reduce impacts to raptor species foraging in the adjacent open space areas. These measures will reduce raptor foraging impacts to a less than significant level.

Response to Comment F-7A-53. Based on the revised MSHCP Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1) and the most current protocol survey results, no LAPM occur within the WLCSP and therefore relocation of this species will not be required. Based on the 2010 focused plant survey, no sensitive plant species occur within the WLCSP and therefore relocation of sensitive plants will not be required.

A single breeding pair of burrowing owl is known to occur within a non-criteria cell area of the MSHCP. Conservation of a single pair of burrowing owl outside of a criteria cell or proposed conservation area will not provide long-term conservation of this species and is not required under MSHCP guidelines. Conservation measures are only required outside of criteria cells if more than

three pairs of burrowing owl are observed. If more than three pairs of burrowing owl are identified within the WLCSP, conservation of 90% of the suitable habitat will be conserved until the conservation goal for conserving occupied burrowing owls habitat has been met.

In an attempt to minimize impacts to a single breeding pair of this species, passive relocation, as described in MM 4.4.6.4B, may be required if burrowing owls are observed on-site during a 30-day preconstruction survey. Passive relocation is an acceptable means of minimizing project related impacts to burrowing owl.

Passive relocation will be consistent with the CDFW guidelines. One-way trap doors will be installed at the burrow entrance and left in place for several days. Once the burrows are unoccupied, they can be collapsed to reduce the number of available burrows owls may use for relocation. Since no evidence of burrowing owl was observed within the northern portion of the SJWA, relocation of owls to the area immediately south of the WLCSP will not cause an overcrowding of this species. Artificial burrows will be created in the 250-foot buffer area to provide suitable nesting burrows within an area that is being set aside as a buffer between the proposed development and the adjacent open space.

There is more than enough area to relocate a single pair of burrowing owl within the 250-foot buffer area. Threats to burrowing owl will include large raptors from the SJWA, feral dogs, coyote, and active disking for the agricultural fields. Many of these threats such as feral dogs, and active disking will be eliminated following project build-out, which will improve overall habitat suitability for burrowing owls.

Response to Comment F-7A-54. See Response to Comment F-11-25.

Response to Comment F-7A-55. A focused plant survey was conducted in all areas of the WLCSP and CDFW Conservation Buffer Area with suitable habitat in 2010 and no special-status plant species were found (MBA 2013, FEIR Volume 2, Appendix E-6). The WLCSP and CDFW Conservation Buffer Area have limited suitable habitat for sensitive plant species to occur on site. It should be noted that the WLCSP and CDFW Conservation Buffer Area are currently under routine agricultural use for the dry-land farming of wheat and is disked regularly, which limits value and potential for rare/protected plants. Based on the most current information, three sensitive plant species were identified as having a moderate potential to occur within the project site, thread-leafed brodiaea (*Brodiaea filifolia*), smooth tarplant (*Centromadia pungens* ssp. *laevis*), and Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*). The 2010 sensitive plant survey was not limited to finding just these three species, but surveys were conducted for all sensitive plant species that were identified as potentially occurring within the project site.

Following the sensitive plant surveys and a better understanding of the function and value of the vegetation communities within the project site, the potential for occurrence of sensitive plant species was reevaluated based on current site conditions. Based on the constituent habitat elements within the WLCSP, the three sensitive plant species previously identified as potentially occurring within the WLCSP were determined by the project biologist as not likely to occur within the project site. The thread-leafed brodiaea is usually associated with annual grasslands and vernal pools in clay soils. Smooth tarplant often occurs in alkali meadow and alkali scrub. Coulter's goldfield is usually found on alkali soils in playans, sinks, and grasslands. Suitable habitat associated with these species is not found within the project site and therefore these species are not likely to occur within the project site.

Based on the revised Draft Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013, FEIR Volume 2, Appendix E-1) (hereafter MSHCP Consistency Analysis), four species were determined to have a low to moderate potential to occur within the WLCSP. These include Plummer's mariposa lily (*Calochortus plummerae*), Parry's spineflower (*Chorizanthe parryi* var. *parryi*), slender-horned spineflower (*Dodecahema leptoceras*), and Robinson's peppergrass (*Lepidium virginicum* var.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

robinsonii). The WLCSP contains marginal quality habitat for these four species and/or there is a close-recorded occurrence of these species within the vicinity of the WLCSP. These are the criteria used to determine the potential for occurrence.

None of these four species were observed during the 2010 focused plant survey. Based on the current site conditions and the necessary constituent habitat elements required for the sensitive plant species to potentially occur within the project site, it is unlikely that any of the seven sensitive plant species mentioned above occur within the WLCSP.

Due to drought conditions over those past three years, sensitive plant surveys have not been repeated on the WLCSP. However, the site has been visited on several occasions by qualified biologists during the known flowering period for these species, and no sensitive plants have been observed (See Table B-3.A in Response to Comment B-3.4 in Letter B-3 CDFW: Summary of Survey Types, Dates, Locations, and Staff).

Under CEQA guidelines, focused surveys for sensitive plant species should be conducted at the time of the CEQA document is submitted for public review. Based on the most current information available, no sensitive plant species occur within the WLCSP. However, the build-out for the specific plan may take up to 15 years to complete. Therefore, additional focused sensitive plant surveys will be required on a project-by-project basis during the project-level CEQA process and are described in MM 4.4.6.1B.

If any sensitive plant species are observed within the project site during focused surveys for sensitive plant species, project-related impacts may be considered significant and require mitigation measures.

Thread-leaved brodiaea, smooth tarplant, Coulter's goldfields, and slender-horned spineflower are all covered species under the MSHCP and if found within the project site during focused plant surveys, payment of the MSHCP fee will fully mitigate impacts to these species.

Plummer's mariposa lily (California Native Plant Society (CNPS) 4.2) and Parry's spineflower (CNPS 1B.1) are conditionally covered species under the MSHCP. These species will become fully covered under the MSHCP once they meet a specific conservation goal. Since the WLCSP has an extended build-out period, these two species may become covered prior to construction of individual projects, and payment of the MSHCP fee will fully mitigate impacts to these species. Until then, if these species are observed within the WLCSP during focused surveys before the conservation goals are met, then 90% of the occupied habitat must be avoided until the conservation goal is met. If the 90% cannot be avoided, then a DBESP for impacts to Plummer's mariposa lily and Parry's spineflower will be required.

Robinson's pepper grass (CNPS 4.3) and San Bernardino aster (CNPS 1B.2) are not covered under the MSHCP and have no legal protection under the federal or state Endangered Species Acts. If these species are identified within a project site during project-specific focused plant surveys, then an assessment must be conducted to determine the significance of the population that is found as described in MM 4.4.6.1B. The loss of a few individual plants would not be considered a significant impact, since it would not reduce the population of this plant to a level that is no longer self-sustaining. However, if a large population of these plants is observed within a project site, and the removal of those plants will likely cause the population to fall below a self-sustaining level, then avoidance, minimization, and mitigation measures will be required. The preferred method of mitigation is to redesign the proposed project and avoid the plant population. If avoidance is not an option, then off-site purchase of land that contains occupied habitat may be required. Alternatively, an appropriate impact fee may be paid to the RCA or other appropriate conservation organizations to offset for the loss of these species on the WLC project site. A third option is to relocate these plants to the proposed buffer area and placed into conservation. A plant relocation plan will be required prior to relocation. The CDFW does not recommend this option, since it is extremely hard to relocate

sensitive plant species and maintain a viable population, but it is included as an option as a worst case scenario. MM 4.4.6.1B will reduce impacts to a less than significant level.

Response to Comment F-7A-56. The WLCSP is within a required survey area for burrowing owl, since the required conservation goals established for burrowing owl under the MSHCP have not been met. Under MSHCP guidelines, the conservation of 90 percent of suitable habitat that provides for long-term conservation value for burrowing owl is only required if the project site contains more than one pair of burrowing owl within project sites that are within Criteria Cells and more than three pairs for projects that are outside of Criteria Cells. Only a single pair of burrowing owls has been recorded to occur within the WLCSP. However, if more than one pair of burrowing owl is observed within the portion of the WLCSP that contains Criteria Cells or more than three pairs for those areas outside of Criteria Cells, conservation of 90% of suitable habitat that provides for long-term conservation value for burrowing owl will be required until the conservation goal is met.

Based on the DEIR MM 4.4.6.4D, a pre-construction clearance survey for burrowing owl shall be conducted by a qualified biologist no more than thirty (30) days prior to any grading or ground disturbing activities within the WLCSP to identify if any burrowing owl occur within the WLCSP. The CDFW's 2012 Staff Report, recommends pre-construction clearance surveys occur 14 days prior to ground disturbance, followed by a subsequent survey within 24 hours of any ground disturbance. However, the MSHCP guidelines have incorporated the following protocol with regard to burrowing owl surveys, which must be followed to be consistent with the MSHCP. Based on the number of owls that have been identified within the WLCSP over the last 8 years, it can be assumed that the WLCSP is considered occupied and additional focused surveys for burrowing owl may be required on a project-by-project basis at the discretion of the City of Moreno Valley planning staff.

Based on the "Burrowing Owl Survey Instructions" for the Western Riverside Multiple Species Habitat Conservation Plan Area, all project sites containing burrows or suitable habitat (based on Step I/Habitat Assessment) whether owls were found or not, require pre-construction surveys that shall be conducted within 30 days prior to ground disturbance to avoid direct take of burrowing owls (MSHCP Species-Specific Objective 6).

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the proposed ground-disturbing activity during the 30-day pre-construction survey, construction activity shall maintain a 500-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the CDFW shall take place and an appropriate avoidance distance established at a minimum of 250-feet. No disturbance to active burrows shall occur without appropriate permitting through the Migratory Bird Treaty Act and/or CDFW.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, passive relocation may be conducted following consultation with the CDFW. A relocation plan may be required by CDFW if passive relocation is necessary. Artificial burrows should be constructed within the 250-foot buffer area along the southern boundary of the WLCSP. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor. This will satisfy mitigation as described under MM 4.4.6.4D of the DEIR and will reduce impacts to burrowing owl to a less than significant level.

Response to Comment F-7A-57. The commenter claims that GHG emissions are under-estimated because the analysis used an average distance of 50 miles for trucks while the distance to the Los Angeles ports is 80 miles.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The 50 mile figure for average truck distance is a default value suggested by the SCAQMD for use when modeling data is not available. An additional section (Chapter 12, Section F) has been included in the Traffic Impact Analysis (TIA) (FEIR Volume 2, Appendix L-1) that describes in detail how trips to the ports were estimated. The analysis found that only a small percentage of WLC truck traffic would be to and from the ports. Tests with the Riverside County Traffic Analysis Model (RivTAM) model suggest the actual average truck trip length for the WLC would be 30 to 40 miles, so the 50-mile figure, which was used in the DEIR, is a conservative estimate since it over-states rather than under-states project impacts. The air quality analysis has been updated in the FEIR (refer to FEIR Volume 2, Appendix D-1) to use the trip distribution pattern from the RivTAM model since it more realistic and better reflects the anticipated change in travel patterns over time.

The commenter claims that the DEIR underestimates the project's operational greenhouse gas emissions and fails to mitigate. The greenhouse gas emissions as estimated in the DEIR have been revised to account for more detailed construction and operational assumption information as discussed in Master Response-1.

The commenter indicates that the long haul truck trip distance was underestimated. The commenter claims that no basis for making the estimate of 50 miles per truck trip was provided in the DEIR. However, this is incorrect, as Appendix D of the DEIR (pages 119-120) described the reasoning for the 50 miles per truck trip. Nevertheless, the revised TIA provides substantial evidence for the use of roadway and freeway specific traffic volumes, which are used in the revised analysis and result in decreased emissions estimates.

The commenter indicates that the project's greenhouse gas emissions constitute a majority of the City of Moreno Valley's greenhouse gas emissions. Please refer to Response to Comment F-1-45.

The commenter indicates that greenhouse gas offsets should be applied to reduce emissions. However, offsets are not feasible as discussed in Response to Comment F-1-66.

The commenter indicates that all of the greenhouse gas measures as set forth by the California Attorney General should be applied. Refer to Response to Comment F-1-66, which assesses the feasibility of the Attorney General measures individually.

Response to Comment F-7A-58. The commenter indicates that construction greenhouse gas emissions should be mitigated. The commenter then references a comment letter prepared by the SCAQMD. Review of that comment letter reveals that there are no construction mitigation measures to reduce greenhouse gas emissions that the project is not already implementing.

The commenter indicates that carbon offsets should be purchased to reduce construction emissions to below the threshold. The SCAQMD threshold of 10,000 metric tons carbon dioxide equivalent per year (MTCO₂e/year) is for a combination of the construction emissions (averaged over 30 years) and operational emissions. Refer to Response to Comment F-1-66 for a discussion of why carbon offsets are not feasible or required.

Response to Comment F-7A-59. Sediment toxicity was added to the 2010 303(d) list of impaired water bodies for Lake Elsinore and Table 4.9.A in the DEIR is updated (FEIR Volume 2 Section 4.9 Table 4.9D). As required by MM 4.9.6.2B, a project-specific Storm Water Pollution Prevention Plan (SWPPP) will be prepared during the final design phase of the project. "The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. In addition, the SWPPP shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and nonvisible discharges from the site." (page 4.9-31). The SWPPP will be prepared meeting all requirements of the Construction General Permit. Table 4.9.H lists possible construction site BMPs for runoff control, sediment control, erosion control, and housekeeping that may be used during the

construction phases of the proposed WLC project. The implementation of an approved SWPPP with appropriate construction site BMPs will control erosion and sediment transport such that contaminated sediment and runoff will not significantly affect the water quality at all downstream water bodies, including Mystic Lake, Lake Elsinore, and San Jacinto River.

Response to Comment F-7A-60. There are no anticipated legacy pollutants as a result of past uses. A Phase I Environmental Site Assessment for the WLCSP (FEIR Volume 2, Appendix I-22) revealed no evidence of recognized environmental conditions (RECs) indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject site. However, construction-related impacts from any pollutants that may be present based on current and historical uses of the project site, including organo-chloro-phosphate (OCPs) and other pesticides, or trace metals, will be mitigated by implementing appropriate construction BMPs to control erosion and sediment transport. Controlling erosion and sediment transport will also eliminate the transport of pollutants that attach to the sediments.

The SWPPP will identify specific construction site BMPs that will be required for the project. During construction, a registered Qualified SWPPP Practitioner (QSP) will be required to verify that a SWPPP is on site and check that construction BMPs are being implemented properly. Preparation of a SWPPP at the Specific Plan phase is not appropriate because no specific details of construction or grading are available at the specific plan level. The SWPPP will be prepared prior to issuance of any grading permit for development in the WLCSP area.

Response to Comment F-7A-61. Most of the comment are excerpts from the CEQA Statute and Guidelines, and court cases that relate to cumulative impacts. The DEIR did contain an analysis of cumulative impacts for each environmental topic (DEIR Sections 4.1-4.16). DEIR Section 2.10, *Cumulative Impacts*, explains that CEQA (Guidelines Section 15130) allows two different types of cumulative analyses to be conducted, and the lead agency is responsible to choose the most appropriate method based on the project and other local conditions. In this case, the City chose to use the “summary of projections” method (CEQA Guidelines Section 15130b.1.B) rather than the “list” method due to the size, location, and development phasing or horizon of the project. For the WLC project, the DEIR used the City’s General Plan buildout projections as a basis to characterize cumulative impacts. The programmatic EIR for this project examined general project-type impacts of the WLC project as an incremental part of regional impacts that will eventually occur as the general area develops with more suburban-level development.

Response to Comment F-7A-62. The commenter must remember the WLCSP EIR is a programmatic document that outlines general development on the WLC site for a period of at least 15 years. The cumulative analysis in the TIA (FEIR Volume 2 Appendix L-1) does include appropriate projects from the commenters list except for the “recently approved projects” (1-3) which have already been constructed and are part of the environmental baseline. The traffic study used a specific set of cumulative projects to estimate traffic levels on area streets at interim years, the cumulative analysis for other environmental issues used the growth projections of the City, Western Riverside Council of Governments (WRCOG), and Southern California Association of Governments (SCAG) to estimate future conditions under which WLC project impacts should be characterized. Given the type and size of this project, the summary of projections method is the most appropriate way to estimate cumulative impacts.

The TIA for the WLC project developed its own list of projects that would contribute traffic on the short- and long-term to the City and surrounding areas, which was necessary to anticipate traffic at the 136 intersections that the TIA examined. However, the other impacts of the WLC project were more regional in nature, and it was determined their characterization did not depend on the timing of specific development projects but rather on overall growth in the region consistent with that identified in the City’s General Plan buildout and SCAG’s Regional Comprehensive Plan (RCP), and SCAG’s

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Regional Transportation Plan (RTP). None of information presented on cumulative impacts have indicated why the list method would be more accurate or appropriate for estimating cumulative impacts of the WLCSP, they merely make the claim. The City continues to believe the growth projections method is the most appropriate method of estimating cumulative impacts of the WLCSP given its size, location, timing, and uses proposed.

Response to Comment F-7A-63. The commenter states the assessment of cumulative agricultural impacts is inadequate and recommends no mitigation. The Response to Comment F-7A-39 outlines the changes made to the agricultural resources assessment for the project (FEIR Volume 2 Appendix C-2). In addition, a new MM 4.2.6.1A has been added to the FEIR Volume 2 requiring the acquisition of a conservation easement be recorded over land of comparable productive value to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland (refer to Response to Comment F-7A-39). It should be noted that the revised agricultural assessments determined the loss of farmland of local importance was in fact not significant under CEQA based on the results of the revised LESA model (see FEIR Volume 2 Appendix C-4 for more information).

Response to Comment F-7A-64. Section 4.4.7 of the DEIR discusses cumulative impacts with regard to the MSHCP, which is a regional planning document that provides for long-term conservation goals for the western Riverside County area. The DEIR does not discuss cumulative impacts with regard to sensitive habitats or species that are not covered under the MSHCP. The CEQA requires the discussion of the cumulative impacts of proposed projects. The WLCSP was assessed based on closely related past, present and future projects that may be developed in the foreseeable future. Cumulative impacts are typically analyzed using either a List Method or a Regional Growth Projection Method. Since the WLCSP is a program-level document, the Regional Growth Project Method is an appropriate methodology to re-evaluate cumulative impacts. The project related impacts associated with the WLCSP were assessed based on the contribution to cumulative impacts on a regional basis.

Adoption of the City of Moreno Valley General Plan EIR did not result in significant direct impacts to existing biological resources. All future development projects anticipated in the General Plan can feasibly be mitigated to less than significant levels and therefore, would not contribute to a cumulative impact on a regional basis. However, adoption of the General Plan would lead to future indirect impacts through approval of development projects within the City of Moreno Valley.

Project-related impacts resulting in quantifiable direct impacts to biological resources not currently covered under the MSHCP would be addressed subsequently through analysis at a lower tier, project-specific level of environmental review. However, conservation of lands purchased with MSHCP Development Fees for the long-term conservation of sensitive species covered under the MSHCP, will also provide similar conservation for plant and wildlife species not covered under the MSHCP. For instance, lands purchased in a Core Conservation Area that contains coastal sage scrub and/or chaparral will provide suitable habitat for Parry's spineflower, which is a covered species under the MSHCP. It will also provide habitat for Robinson's pepper grass, which is not covered under the MSHCP. MM 4.4.6.1B, as listed in the DEIR, will reduce the project related impacts to a level less than significant. As a result, the contribution of impacts associated with project within the WLCSP, are fully mitigated and will not contribute to cumulative impacts within the region.

The following mitigation measures were developed to provide assurances that potential significant biological impacts associated with the implementation of the General Plan will be mitigated. The General Plan is a regional development plan and has included the WLCSP as a part of the development plan for the City of Moreno Valley. Subsequent project-level environmental review could identify more detailed site-specific mitigation measures. Impacts to Stephens' kangaroo rat, sensitive plant and wildlife species, and Riverine/Riparian Habitat associated with drainage features, could be considered a cumulative impact without mitigation. The following mitigation measures are required under the General Plan to reduce project-related impacts to a level less than significant:

1. Private development projects within the City shall comply with the Long-term Habitat Conservation Plan (HCP) for the Stephens' Kangaroo Rat (SKR).
2. Private development projects shall comply with the Western Riverside County Multi-Species Habitat Conservation Plan (MSHCP) and the associated state and federal permits.
3. Where feasible, projects shall be designed to minimize impacts on sensitive habitat.
4. Prior to physical disturbance of any natural drainage course or wetland determined to contain riparian vegetation or otherwise qualify as a "jurisdictional" wetland or Non-wetland Water of the U.S., the applicant shall obtain a Streambed Alteration Agreement and/or permit, or written waiver of the requirement for such an agreement or permit, from all resource agencies with jurisdiction over such areas (CDFW and USACE).

The long-term HCP for the Stephens' Kangaroo Rat was designed to compensate for the loss of SKR individuals and SKR habitat on a regional basis. A total of 48 acres of suitable habitat for SKR occurs within the WLCSP area. Future projects that impact suitable habitat would significantly impact SKR. Projects that are consistent with the requirement of the long-term HCP for SKR would not result in significant project-level impacts, and therefore would not result in cumulative impacts to SKR on a regional basis. A mitigation fee is required on a project-level basis and is based on the overall size of the project site. Payment of the mitigation fee will reduce the level of impacts to a less than significant impact. The mitigation fees are used to purchase land within the core conservation areas for SKR.

Portions of the WLCSP contains non-native grasslands and Riversidean sage scrub. The past habitat loss along with potent future development is a potentially significant impact with regard to Raptor foraging habitat, especially for those raptor species that are over-wintering in the Moreno Valley area. The MSHCP has been designed to compensate for the loss of biological resources throughout western Riverside County, and cumulative impacts to existing biological resources resulting through increased future development have been addressed in the MSHCP FEIR/EIS dated June 17, 2003. The MSHCP was designed to set aside large areas of native habitat necessary for the long-term conservation of sensitive plant and wildlife species, while at the same time providing a streamlined process for future development.

Therefore, future development projects within the planning area that conform to the MSHCP would not result in cumulatively considerable impacts for those biological resources adequately covered by the MSHCP. The MSHCP project fee will be used to purchase off-site mitigation lands that will fully compensate for significant impacts associated with raptor foraging habitat. Implementation of MMs 4.4.6.1A-B, 4.4.6.2A-B, 4.4.6.3A-C, and 4.4.6.4A-I will reduce the project related impacts to a level less than significant. Subsequent CEQA review will be required on a project-by-project basis to ensure conformance with the MSHCP and future implementing plans/ordinances at the project-specific level.

For resources not currently covered by the MSHCP, additional mitigation may be necessary. Any impacts to wetlands or non-wetland waters of the United States or waters of the state are cumulatively considerable. Compliance with federal and state regulations (implementation of mitigation measures identified in the Biological Resources Section 4.4 of the DEIR) is expected to reduce these impacts to a level below significance or less than cumulatively considerable. Impacts to non-covered sensitive species or resources resulting from the Land Use Alternatives are not expected to be cumulatively considerable. If proposed development within the regional would cause a sensitive species population to reduce to a less than self-sustaining level, it would have been included in the MSHCP as a covered species.

Response to Comment F-7A-65. The commenter indicates that the mitigation of cumulative project impacts is inadequate and that the DEIR offers no mitigation for diesel particulate matter (PM) emissions. This is incorrect. The project has adopted all feasible mitigation measures as summarized

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

in Response to Comment E-3-8. The commenter suggested mitigation measures, as discussed below.

Suggested Mitigation Measure	Response
1. Installation of Minimum Efficiency Reporting Value (MERV) filters rated at 13 or above at all residential units where incremental cancer risks exceed one in one hundred thousand	Not Incorporated. Refer to Master Response-5.
2. Plant tiered vegetation along the project site boundaries	Partially Included. The project would include extensive landscape treatments consistent with the Municipal Code including trees and berms. The effectiveness of vegetative barrier in reducing pollutant levels is dependent on a number of factors including vegetative variety, maturity, height, spacing, leaf density, and wind speed. Vegetative barriers may have some benefit; however, at present there are no established methodologies to quantify their effectiveness in reducing pollutant levels.
3. Notification to nearby residents	Not Incorporated. Notifications of substantial local impacts are required under SCAQMD Rule 1401 and the Air Resources Board (ARB) AB 2588 Air Toxics Hot Spots Act. However, neither of these regulatory programs applies to the project (with the exception of the emergency standby generators) since the vast majority of project impacts are derived from mobile sources and the Rule 1401 and AB 2588 programs are directed to permitted stationary sources. In addition, the CEQA and permitting process serves as notice of the environmental impacts to all residents throughout the City and beyond.

Response to Comment F-7A-66. This comment is mainly excerpts from CEQA and the CEQA Guidelines, as well as several court cases related to alternatives. The commenter explains the process of selecting a feasible alternative, however, the commenter fails to mention an additional part of the analysis of alternatives, that being the determination as to what degree a particular alternative meets the project objectives (refer to Response to Comment F-7A-67 for more information on Alternative 1).

Response to Comment F-7A-67. The commenter claims the DEIR improperly dismisses Alternative 1 which would develop approximately 29 million square feet of logistics warehousing or approximately 30% less than under the proposed project. First, it should be noted that the proposed project has been slightly modified and has 100 fewer acres and 1 million fewer square feet of logistics warehousing than under the project evaluated in the DEIR (see Section 6.3.6 of the DEIR for details). The commenter says this alternative is superior to the proposed project but is dismissed for inappropriate reasons. However, the City maintains this alternative was rejected because it did not reduce one or more of the significant impacts of the project to less than significant levels, and it did not achieve the project objectives to nearly the same degree as the proposed project. The reduced density alternative does reduce the impacts which can be expected from the construction and operation of the project but does not reduce them to insignificance, as shown in Table 6.L and the discussion beginning on DEIR page 6-27. However, as set forth in Table 6.M, the reduced density alternative would not attain the project objectives to as great a degree as the project and, in particular, would not provide the same number of jobs nor improve the City's job/housing ratio to the same extent. See the discussion in DEIR Section 4.13.1. The City Council will weigh the environmental benefits of the reduced density alternative against the economic benefits which the project will provide and decide which best serves the public welfare.

Response to Comment F-7A-68. The commenter is concerned that the DEIR dismisses all of the potential alternative sites for the proposed project. The purpose of the alternative sites analysis is to see if there is an appropriate site elsewhere within the lead agency's jurisdiction, or in another jurisdiction, upon which the proposed project could be located, and generate fewer environmental impacts just by placing it on a different site. The commenter suggests finding a smaller site, or several disconnected smaller sites, that could support a reduced version of the project. However, the proposed project (as revised) encompasses 2,610 acres with 40.6 million square feet of warehousing. Table 6.R in Section 6 of the DEIR demonstrates that there are no sites, either in Moreno Valley, or in any of the nearby cities, which are anywhere close to being large enough to support a 40,600,000 sq. ft. logistics project. The proposed project is a regional logistics warehousing center, and that primary project objective would not be achieved by breaking the project up into several smaller non-contiguous properties. There is no requirement under CEQA to substantially change or reduce the scope of the proposed project so it will "fit" onto one or more alternative sites. Due to its size and type of uses, most of the significant impacts of the proposed project would occur regardless of where the site was located. The only potential for a measureable reduction in project impacts would be if the site were adjacent to freeways that were less congested, or possibly if the project could be served by existing rail lines on some other site. However, the alternative sites analysis indicates there are no sites of suitable size and that have rail service already available to them. Further, even if a suitable alternative site could be located, the project applicant would not own the site and there is no way of knowing whether the applicant could acquire it. Accordingly, the DEIR properly concluded that there were no feasible alternative sites. Therefore, alternative sites were correctly rejected.

Please see the response to Comment F-7A-67 with respect to the assertion that the DEIR should have selected the reduced alternative density.

Response to Comment F-7A-69. Although the commenter is not a public agency, the City will send all commenters the Responses to Comments at least 10 days before action on the project to allow time to review the responses. The City Council will consider all comments on the WLC project before taking any action on the proposed project.

**Subject: Comments on the Draft Environmental Impact Report for the World Logistics Center,
Riverside County, California**

Dear Mr. Drury:

We have reviewed the February 2013 Draft Environmental Impact Report (DEIR) and associated documents for the World Logistics Center Project (Project). The Project proposes to build a 41.6 million square foot warehouse on 2,710 acres of a 3,198 acre parcel in the City of Moreno Valley in Riverside County. The site is currently used for wheat farming. Seven residences currently exist on Project site. San Diego Gas & Electric operates a natural gas compressor plant on 19 acres of the Project site and Southern California Gas Company operates a metering and pipe cleaning facility on 1.5 acres on the south central portion of the site.

We reviewed the DEIR for issues associated with hazards and hazardous materials, hydrology and water quality, and air quality. Project construction and operation may result in potentially significant impacts to workers, nearby residents, and surrounding hydrological features that are not adequately evaluated by the DEIR. A revised DEIR should be prepared to fully analyze and disclose impacts and provide appropriate mitigation to ensure that the Project will not result in significant impacts.

HAZARDS AND HAZARDOUS MATERIALS

Eighteen Phase I Environmental Site Assessments ("Phase I ESAs") were completed for the site from May 2003 to January 2013 and are included as Appendix I to the DEIR. The January 2013 Phase I ESA, which includes a summary of the findings of the previous Phase I ESAs, states that past uses of the site included a chicken ranch, three dairies, and agriculture (2013 Phase I ESA, p. 1).

The 2013 Phase I ESA states that there are no recognized environmental conditions (RECs)¹ associated with the Project site (2013 Phase I ESA, p. 35). Our review shows that the Phase I ESA and the DEIR do not thoroughly evaluate current soil conditions at the site. Failure to adequately disclose baseline conditions at the Project site that may result in significant impacts to construction workers and nearby residents.

2

Inadequate sampling of pesticides in Project site soils from past uses

Currently, the Project site is used for dry farming and wheat is typically grown on the Project site (DEIR, p. 4.2-2). The DEIR states that dry farming does not typically use pesticides (DEIR, p. 4.8-4) but our review of data for the Project site from the California Department of Pesticide Regulation (CDPR) shows that pesticides such as 2,4-D, 2-ethylhexyl ester were used on the site for wheat cultivation (see Attachment A).

The 2013 Phase I ESA, however, does not mention recent pesticide usage. The 2013 Phase I does include sampling results for organochlorine pesticides (OCPs). The ESA notes that OCP sampling results were below regulatory levels (2013 Phase I ESA, p. 2). However, only 52 samples were collected from the Project site in previous investigations.

The "Interim Guidance for Sampling Agricultural Properties" prepared by the Department of Toxic Substances Control (DTSC) recommends that, when testing for OCPs, samples for sites over 50 acres should be collected at over 60 locations.² The Project site, at 2,710 acres, is well over 50 acres. Therefore, the 52 samples collected over the last ten years³ are likely insufficient to provide an accurate assessment of the Project site's soil conditions and collecting such a limited number of samples may not reliably disclose current environmental concerns associated with Project site soils. In addition, because these samples were collected a minimum of eight years ago, sampling results are outdated and cannot be used to baseline conditions.

3

The Project site has been used for agricultural purposes since at least 1948 (2013 Phase I ESA, p. 15). OCPs such as DDT and DDE were used starting in 1940s.⁴ Although their use was banned in the 1970s, these compounds can persist in soil for hundreds of years.⁵

The limited number of samples collected on the Project site may not fully show the total extent of OCP concentrations throughout the Project site. The Applicant should disclose how many acres of the 2,710-acre site were historically and currently used for agricultural activities and

¹ A REC is defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. See <http://www.astm.org/Standards/E1527.htm>

² Department of Toxic Substances Control, Interim Guidance for Sampling Agricultural Properties (Third Revision). <http://www.dtsc.ca.gov/Schools/upload/Ag-Guidance-Rev-3-August-7-2008-2.pdf>, p. 8

³ 42 samples were collected in 2003, 9 samples were collected in 2004, and one sample was collected in 2005.

⁴ U.S. EPA, DDT – A Brief History and Status. <http://www.epa.gov/pesticides/factsheets/chemicals/ddt-brief-history-status.htm>

⁵ *Ibid.*, p. 3

should collect 60 soil samples per 50-acre portion. For example, if 100 acres of the Project site was used for agriculture, 60 samples on each 50-acre portion should be collected for a total of 120 samples.

The Project site is currently used for wheat cultivation but no samples were collected in association with the 2013 Phase I ESA. Because the Project site is still used for agricultural purposes, relying on sampling results from eight years ago will not reflect pesticide residuals that may exist in site soils from agricultural use of the site from 2005 to present-day. Additional pesticide sampling, to include 2, 4-D, 2-ethylhexyl ester and any other pesticides that may have been used for wheat farming, should be conducted.

Project construction will require grading, excavation, vegetation removal, and trenching. Construction workers can be exposed, via inhalation and dermal contact, to pesticides in soil that can become airborne during these ground-disturbing activities. Exposure to these pesticides can pose significant health risks. Oral exposure to 2, 4-D, 2-ethylhexyl ester can result in vomiting, diarrhea, headache, confusion, and bizarre behavior. Dermal exposure can result in irritation and inhalation exposure can lead to coughing and burning sensations in the upper respiratory tract and chest.⁶ Exposure to DDT can result in headaches, nausea, and convulsions⁷ as well as damage the liver, nervous, and reproductive system.⁸

There are seven residences located onsite (DEIR, p. 4.5-12) and residences are also located directly adjacent to the Project site along the western boundary of the Project site (DEIR, Figure 3.8). These residents may also be adversely affected from exposure to pesticide-containing soil during Project construction. Inhalation of pesticide-contaminated soil has been linked to asthma in recent research.⁹ A report prepared by the California Department of Health identifies pesticides as an asthma trigger.¹⁰

Limited soil sampling was conducted on the Project site eight years ago. Sampling did not target pesticides used for wheat cultivation, such as 2, 4-D, 2-ethylhexyl ester. Project soils should be tested for all pesticides that may have been used on the site. All sampling results should be compared to appropriate human health regulatory levels¹¹ as well as construction worker thresholds¹² to determine if the Project may pose significant health risks. A revised DEIR should

be prepared to disclose sampling results and any mitigation, if necessary, to ensure that the Project will not result in significant public health impacts.

Entire Project site has not been evaluated

Our review of the areas evaluated in the 18 Phase I ESAs shows that an approximately 50-acre portion of the Project site located south of Alessandro Blvd., east of Merwin St., and north of Brodiaea Ave has not been surveyed (see Attachment B). The land use map in the DEIR shows that this area will be used for logistics development (DEIR, Figure 3.8).

Project construction will occur in areas that have not been surveyed by the Phase I ESA. Therefore, conclusions in the DEIR about the absence of environmental concerns on the Project site are not completely substantiated. If environmental hazards exist on this portion of the site, Project construction may pose significant risks to workers and other site personnel.

A new Phase I ESA should be prepared to survey, identify and disclose baseline conditions of the entire Project site, to be included with a revised DEIR. If hazardous conditions are found, all appropriate mitigation measures should be identified to prevent the exposure of workers to conditions that would present health risks during construction and operation of the Project.

HYDROLOGY AND WATER QUALITY

Project construction will require extensive grading, vegetation removal, and excavation. Approximately 42 million cubic yards of cut-and-fill will be required to grade the entire site (DEIR, p. 3-61). Project construction may lead to erosion of site soils. The DEIR states that pollutants associated with the Project include sediments, nutrients, bacteria, toxic organic compounds, and pesticides (DEIR, p. 4.9-34). During periods of rainfall, water that washes over eroded soil can entrain these contaminants and discharge into adjacent waterways.

The DEIR states that Project runoff from the western portion flows into the Perris Valley storm drain while runoff from the eastern portion flows into Mystic Lake and the San Jacinto River (DEIR, p. 4.9-22) which is located ten miles south of the Project site. From the San Jacinto River, flow ultimately reaches Lake Elsinore (DEIR, p. 4.9-2). The DEIR identifies that Lake Elsinore is listed under the California Regional Water Quality Control Board's 303(d) List of Impaired Water Bodies for nutrients, low dissolved oxygen, and PCBs (DEIR, p. 4.9-5). The DEIR, however, does not disclose that Lake Elsinore is also impaired for sedimentation and sediment toxicity.¹³ If rainfall washes over disturbed soil stockpiled on site during Project construction, contaminated sediment and runoff can eventually drain to Lake Elsinore, further degrading water quality.

The DEIR states that during operational activities, stormwater runoff can carry trace metals such as zinc, copper, lead, cadmium, and iron and that treatment controls will be based on these pollutants (DEIR, pp. 4.9-33-4.9-34). However, the DEIR does not consider the possibility that ground-disturbing activities

¹³ Search for Elsinore, Lake at http://www.waterboards.ca.gov/water_issues/programs/tmdl/2010state_ir_reports/category5_report.shtml

during Project construction can also lead to erosion and transport of these contaminants deposition to adjacent waterways.

The DEIR states that a SWPPP will be prepared and identifies measures that will be implemented to reduce impacts from soil erosion (DEIR, p. 4.6-13). Mitigation measure 4.9.6.3A lists best management practices (BMPs) that will be implemented to reduce water quality impacts (DEIR, p. 4.9-37). However, no measures or BMPs are provided that specifically identify that OCPs and other pesticides, which may exist from previous uses of the site, can flow into the adjacent waterways. To ensure that Project construction will not result in significant impacts to hydrological resources, the SWPPP should be prepared prior to Project construction to include BMPs such as erosion control and treatment measures specifically designed to address OCPs and other pesticides.

5

AIR QUALITY

Additional mitigation for particulate matter should be incorporated

Particulate matter (PM10) emissions from Project construction will exceed the South Coast Air Quality Management District (SCAQMD) thresholds throughout the construction period (DEIR, p. 4.3-55). The DEIR discusses SCAQMD Rule 403, established to reduce fugitive dust emissions, and provides the following four measures from Rule 403 as mitigation for the Project's significant emissions of PM10:

- all clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions;
- the contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day;
- cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meter (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicular Code Section 23114; and
- the contractor shall ensure that traffic speeds on unpaved roads and project site areas are 15 miles per hour or less to reduce fugitive dust haul road emissions (DEIR, p. 4.3-55).

6

Mitigation measures 4.3.6.2A through 4.3.6.2D also address PM10 emissions. However, the Project's PM10 emissions will be significant even after mitigation (DEIR, 4.3-57). Additional mitigation measures to reduce fugitive dust emissions are identified in Rule 403 but not in the DEIR. These measures should be identified in a revised DEIR to ensure that all applicable and feasible measures will be implemented to reduce Project emissions, to include:

- limiting fugitive dust emissions from any active operation, open storage pile, or disturbed surface area if the dust emission exceeds 20 percent opacity;

- prohibiting track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift; and
- not disturbing an area of five or more acres, or with a daily import or export of 100 cubic yards or more of material, without utilizing at least one of the following measures at each vehicle driveway from the site to a paved public road:
 - installation of gravel pads;
 - pave any surface extending at least 100 feet and at least 20 feet wide;
 - utilize a wheel shaker and wheel washer to remove dirt and mud from tires and vehicles before they exit the site.¹⁴

Rule 403 also states that active operations cannot be conducted unless all applicable best available control measures included in Table 1 are included.¹⁵ Table 1 provides mitigation measures for trenching, cut-and-fill, truck loading, road maintenance, and earth-disturbing activities.¹⁶ Project construction will require these types of activities. Review of the DEIR shows that not all measures listed in Table 1 are included as mitigation. A revised DEIR should be prepared that includes all applicable measures in Table 1. The Project, defined as a large operation¹⁷ under Rule 403, should also follow all the applicable dust control measures listed in Table 2.¹⁸

Air dispersion modeling shows that localized concentrations of PM10 emissions also exceed SCAQMD thresholds (DEIR, p. 4.3-66). Significant localized PM10 emissions will pose adverse health risks to nearby residents and construction workers. The DEIR, however, only states that air quality impacts remain “significant and unavoidable” in the absence of feasible mitigation (DEIR, p. 4.3-66).

We have identified additional feasible mitigation measures that can further reduce PM10 emissions and mitigate these impacts to the extent feasible. For example, a recent ruling by the California Attorney General for construction of an industrial project in Jurupa Valley, a city located 17 miles west of the Project site, required the following measures:

- installation of air filtration systems in home of adjacent residents;
- air quality monitoring in surrounding area; and
- a “green” project site, including a 100kW capacity solar photovoltaic system, LEED Silver certified project buildings, and electric vehicle charging stations.¹⁹

¹⁹ State of California Department of Justice, Office of the Attorney General. Attorney General Kamala D. Harris Announces Settlement to Protect Public Health in Jurupa Valley. <http://oag.ca.gov/news/press-releases/attorney-general-kamala-d-harris-announces-settlement-protect-public-health>

The press release accompanying the settlement²⁰ notes that Riverside County is home to numerous warehouse projects whose associated truck trips are negatively impacting resident health. Because the above-referenced mitigation measures were required for a similar project in a nearby city, it seems reasonable that these measures are feasible and should be implemented by the Applicant to protect resident health and local air quality.

Other mitigation, such as use of newer technology, should also be implemented to ensure that all feasible mitigation measures are being used to reduce emissions. Tier 4 technology, which applies to diesel engines used for off-road equipment,²¹ uses new higher pressure fuel injection systems and electronic engine controls²² and can reduce PM10 emissions by 90% as compared to older technology.²³ The DEIR discusses this technology but states that it will not be required until 2013 (DEIR, p. 4.3-57) and allow for the use of older Tier 3 technology in mitigation measure 4.3.6.2A (DEIR, p. 4.3-56). However, review of 40 CFR Part 1039, which establishes regulation about emissions standards, shows that Tier 4 technology will be phased in starting in 2011.²⁴ The U.S. EPA has recommended the use of Tier 4 technology on other projects under CEQA review.²⁵ Because Project emissions are still significant even after mitigation, equipment used for the Project should meet Tier 4 standards to achieve maximum reduction in emissions.

The Project is located in the South Coast Air Basin, which is designated non-attainment for PM10. Because the air basin suffers from poor air quality from PM10, significant emissions of PM10 can worsen regional air quality. Because the Project will result in significant PM10 emissions, all feasible mitigation measures should be implemented to reduce emissions to the maximum extent feasible to ensure that Project construction will not contribute to a degradation of air quality. A revised DEIR should be prepared to implement all recommended mitigation measures, to include air filtration systems in residents' homes, equipment with Tier 4 technology, and all applicable Rule 403 measures.

Cumulative air impacts are inadequately mitigated

The DEIR predicts cumulative impacts to human health from the Project and other nearby projects to exceed risk thresholds set by the SCAQMD. The DEIR (p. 4.3-88) includes modeling results that estimate health impacts as follow:

Table 4.3.AC: Comparison of Cancer Risk Values

Receptor Location	Cancer Risk (risk per million)		
	Project Increment	Cumulative	MATES-III
Maximum affected receptor located outside of the boundaries of the WLC Specific Plan	45 ¹	193 ¹	1,029 ²
Maximum affected sensitive receptor located within of the boundaries of the WLC Specific Plan	76.8	121.1	496
Existing residences located across Redlands Boulevard	20.9	45.9	496

The table shows that the incremental impacts from the Project range from 20.9 to 76.8 cancer risks which greatly exceed the SCAQMD threshold of 10 additional cancer risks in a population of one million.²⁶ The table also shows that a sensitive receptor who already faces a risk level well in excess of the SCAQMD threshold (496 in a million) will have that risk increased by an increment of 121 in a population of a million (or 12 in a population of 100,000), a 24% increase, from cumulative project construction. Existing residences across Redlands Blvd. will see cumulative risk levels increase 9% (existing cancer risk of 45.9/MATES III risk of 496 = 9.3%).

Cancer risks that residents currently face in the area of the Project are primarily driven by diesel particulate matter (DEIR, 4.3-87). The California Air Resources Board has classified diesel particulate matter as a toxic air contaminant for both its cancer and non-cancer health effects.²⁷ In addition the California Office of Environmental Health Hazard Assessment found that exposure to diesel particulate resulted in an increased risk of cancer and an increase in chronic non-cancer health effects including a greater incidence of cough, labored breathing, chest tightness, wheezing, bronchitis, and asthma.²⁸

Emissions of diesel particulate matter from cumulative project emissions will increase, driven by an increase in truck traffic from the Project and from other cumulative projects in the area. The DEIR offers no mitigation for diesel particulate matter emissions. Because current cancer risks greatly exceed thresholds, and will get significantly worse from cumulative impacts, all feasible mitigation should be considered for nearby residents, especially sensitive receptors. The mitigation should target reductions in diesel particulates, the most significant contributor to health risks.

Other projects, where risks from diesel particulates are as high as those estimated in the DEIR, have instituted mitigation that is considered to be Best Available Control Technologies for Toxics and which are capable of reducing potential cancer and non-cancer risks to an acceptable level. These Best Available Control Technologies and other mitigation measures include:

- Installation of Minimum Efficiency Reporting Value (MERV) filters rated at 13 or better at all residential units where incremental cancer risk exceeds one in one hundred thousand²⁹;

²⁶ <http://www.aqmd.gov/ceqa/handbook/signthres.pdf>

²⁷ http://www.oehha.ca.gov/public_info/facts/dieselfacts.html

²⁸ Ibid.

²⁹ http://cityplanning.lacity.org/EIR/CornfieldArroyo/RDEIR/RP-DEIR_Volume%20I.pdf,
http://www.ci.berkeley.ca.us/uploadedFiles/Planning_and_Development/Level_3_-_Redevelopment_Agency/West%20Berkeley%20MMP.pdf

- Plant tiered vegetation along the project site boundaries -- laboratory studies show that cedar trees can remove some of the fine particulate matter emitted from traffic under low wind speeds³⁰;
- Providing notification to nearby residents in areas of estimated cumulative risk that exceeds one in one hundred thousand population that operation of the project may have detrimental health impacts as noted by California Air Resources Board and the South Coast Air Quality Management District.

A revised DEIR should be prepared to identify additional mitigation to reduce cancer risks from diesel particulates from cumulative project construction. The DEIR should include all feasible mitigation and should include modeling estimates to show risk reduction to levels less than the SCAQMD threshold of one in a million cancer risk.

GREENHOUSE GAS EMISSIONS REQUIRE ADDITIONAL MITIGATION

Operational emissions

The DEIR estimates project operational emissions to be 752,000 mt CO₂e/year, more than 75 times the SCAQMD's significance threshold of 10,000 mt CO₂e per year. The DEIR correctly concludes that emissions are significant (p. 4.7-30) and provides mitigation. Even after mitigation, operational GHG emissions are nearly 70 times greater than the thresholds (Table 4.7.I). As high as these emissions remain, even after mitigation, the estimate of post-mitigation GHG emissions is based on incorrect assumptions. If correct estimates of long-haul truck trips were used, estimates of GHG emissions would even be higher. Because emissions are so high, a revised DEIR should be prepared to identify additional mitigation measure to attempt to reduce GHG impacts.

Underestimating the GHG emissions in the DEIR stems largely from incorrectly estimating long haul truck trip distances which make up more than half of all Project operational emissions (DEIR, p. 4.7-30). The DEIR states that long-haul trucks travel an average of 50 miles per trip (p. 4.7-30). No basis for making this estimate of long-haul travel distances is provided in the DEIR.

The DEIR states the project would be haul cargo containers from the Port of Los Angeles or the Port of Long Beach (p. 4.7-43). Google maps shows routes to the Project average about 80 miles from the Ports of Los Angeles Long Beach, a distance 60% greater than the 50 mile distance estimated in the DEIR (Attachment C). Long-haul trips, even as underestimated in the DEIR, constitute the biggest component of operational emissions, by far, from Project operation (DEIR, p. 4.7-30).
