The Project operational emissions are so significant, they constitute significant majority of the entire City of Moreno Valley's GHG emissions estimates for the year 2020. The DEIR states that the City of Moreno Valley's mitigated GHG emissions in 2020 will be 798,000 mt CO₂e/year (DEIR, p.4.7-9). In 2020, Project's emissions, after mitigation, are estimated to be 612,000 mt CO₂e/year (DEIR, p. 4.7-35), or 77% of the entire business as usual estimate for the City of Moreno Valley.

³⁰ http://www.ci.berkeley.ca.us/uploadedFiles/Planning_and_Development/Level_3_-_Redevelopment_Agency/West%20Berkeley%20MMP.pdf, p. 3

Because emissions vastly exceed thresholds, additional mitigation, in the form of offsets, should be included in a revised DEIR. The Project applicant should obtain emission reduction credits, or carbon offsets, to reduce the Project's emissions to a less than significant level. Offsets should be chosen in a revised DEIR to show that offsets are verifiable and efficient. The DEIR should not be certified until the Applicant discloses that the Project's GHG emissions are significant during the construction period and mitigates emissions through the purchase of carbon offsets.

8

Construction emissions

Construction GHG emissions from 2013 to 2021 are estimated to total 434,126 mt CO₂e. The DEIR uses an amortization technique for a 30 year period to estimate emissions of 14,000 mt CO₂e (p. 4.7-30). The emissions are significant in that they exceed the threshold of South Coast AQMD threshold of 10,000 mt CO₂e.³¹

9

The DEIR does not identify any mitigation measures for construction GHGs in excess of thresholds. Many mitigation measures for construction GHGs are commonly recommended by the South Coast AQMD in their review of DEIRs.³² A revised DEIR should be prepared to include all mitigation measures that would be feasible in reducing GHG emissions. If these measures are not sufficient, carbon offsets should be purchased to reduce emissions to below the threshold.

Sincerely,

Matt Hagemann, P.G., C.Hg., QSD, QSP

RESPONSES TO LETTER F-7B

Lozeau Drury LLP

Response to Comment F-7B-1. The commenter refers to project information that has now changed, the revised project will develop 40.6 million square feet of logistics warehousing rather than 41.6 million, and the developable area of the World Logistics Center (WLC) Specific Plan is now 2,610 acres rather than 2,710 acres. The commenter also indicated that the analysis of impacts related to hazardous materials, hydrology, water quality, and air quality were inadequate and the EIR should be revised. The analysis in the original Draft Environmental Impact Report (DEIR), plus the additional and revised analyses of these issues in the Final Environmental Impact Report (FEIR), provide sufficient information upon which to make an informed decision, and that the additional information and mitigation, provided mainly in response to the many comments on the DEIR, do not rise to the level of significant new information, and do not identify any new or substantially increased environmental impacts of the project.

Response to Comment F-7B-2. The commenter says the DEIR does not adequately assess soil conditions on the project site. The many Phase 1 assessments do demonstrate that the WLC site does not contain significant soil contamination from agricultural chemicals, as explained in the Responses to Comments F-7A-18 and F-7A-21. However, to err on the side of caution, Mitigation Measure (MM) 4.8.6.1A has been modified to include soil sampling for agricultural chemicals when the 7 rural residences are developed.

Response to Comment F-7B-3. The commenter suggests the site has inadequate soil sampling and refers to a California Department of Toxic Substance Control (DTSC) publication for guidance (suggests organo-chloro-phosphate (OCPs) like dichlorodiphenyltrichloroethane (DDT) or dichlorodiphenyldichloroethylene (DDE) may be present). As outlined in Response to Comment F-7A-18, there is no reason to believe or evidence to demonstrate that the site is actually contaminated by OCPs such as DDT or DDE. The references cited by the commenter are general for those chemicals and are not specific to the WLC project site, and do not demonstrate that these chemicals were specifically used on the WLC site. The many Phase 1 assessments do demonstrate that the WLC site does not contain significant soil contamination from agricultural chemicals, as explained in the previous Response F-7A-18.

Response to Comment F-7B-4. The commenter expresses concern about soil contamination in the southwest portion of the project site. First, it should be noted that 100 acres in the southwest portion of the project were eliminated from the project, which covers most of the specific area referred to by the commenter. Again, the DEIR does adequately characterize baseline conditions on the WLC site in terms of soil contamination from agricultural activities. These issues are addressed in detail in Responses to Comments F-7A-18 and F-7A-21.

Response to Comment F-7B-5. Sediment toxicity was added to the 2010 303(d) list of impaired water bodies for Lake Elsinore and Table 4.9.A in the DEIR has been updated (FEIR Volume 2 Section 4.9 Table 4.9D). As required by MM 4.9.6.2B, a project-specific SWPPP will be prepared during the final design phase of the project. *“The Storm Water Pollution Prevention Plan (SWPPP) shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. In addition, the SWPPP shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and nonvisible discharges from the site.”* (Page 4.9-31). The SWPPP will be prepared meeting all requirements of the 2009-0009-DWQ Construction General Permit effective July 1, 2010 (California Environmental Protection Agency, State Water Resources Control Board). Table 4.9.H lists possible construction site Best Management Practices (BMPs) for runoff control, sediment control, erosion control, and housekeeping that may be used during the construction phases of the proposed WLC

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

project. The implementation of an approved SWPPP with appropriate construction site BMPs will control erosion and sediment transport such that contaminated sediment and runoff will not significantly affect the water quality at all downstream water bodies, including Mystic Lake, Lake Elsinore, and San Jacinto River.

There are no anticipated legacy pollutants as a result of past uses. A Phase I Environmental Site Assessment (ESA) for the World Logistics Center Specific Plan has revealed no evidence of recognized environmental conditions (RECs) indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject site. However, construction-related impacts from any pollutants that may be present based on current and historical uses of the project site, including organo-chloro-phosphate (OCPs) and other pesticides, or trace metals, will be mitigated by implementing appropriate construction BMPs to control erosion and sediment transport. Controlling erosion and sediment transport will also eliminate the transport of pollutants that attach to the sediments.

The SWPPP will identify specific construction site BMPs that will be required for the project. During construction, a registered Qualified SWPPP Practitioner (QSP) will be required to verify that a SWPPP is on site and check that construction BMPs are being implemented properly. Preparation of a SWPPP at the Specific Plan phase is not appropriate because no specific details of construction or grading are available at the specific plan level. The SWPPP will be prepared prior to issuance of any grading permit for development in the WLCSP area.

Changes to DEIR

Consistent with the comments provided by Letter F-7B (Lozeau Drury LLP), the text in DEIR Table 4.9.A, Page 4.9-5 is amended to include sediment toxicity for Lake Elsinore on the 303(d) list. The change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The revisions to the text of the DEIR are as follows:

Table 4.9.D: Receiving Waters from the Project Site

Receiving Water	303(d) List Impairments	Designated Beneficial Use	Proximity to RARE Use* Designation
San Jacinto River Reach 3 (Hydrologic Units 802.11, 802.14 and 802.21)	None	Intermittent: MUN, AGR, GWR, REC1, REC2, WARM, WILD	Approximately 2 miles to RARE designated San Jacinto Wildlife Area
Canyon Lake (Railroad Canyon Reservoir), San Jacinto River Reach 2 (Hydrologic Unit 802.11)	Nutrients, Pathogens	MUN, AGR, GWR, REC1, REC2, WARM, WILD	Not Rare
San Jacinto River Reach 1 (Hydrologic Units 802.32 and 802.31)	None	Intermittent: MUN, AGR, GWR, REC1, REC2, WARM, WILD	Not Rare
Lake Elsinore (Hydrologic Unit 802.31)	Nutrients, Organic Enrichment/Dissolved Oxygen, PCBs (polychlorinated biphenyls), Sediment Toxicity, Unknown Toxicity	MUN, REC1, REC2, WARM, WILD	Not Rare

* Rare, Threatened or Endangered Species (RARE) waters support habitats necessary for the survival and successful maintenance of plant or animal species designated under State or Federal law as rare, threatened, or endangered.

Letter F-7C: Lozeau Drury LLP (April 5, 2013) and Appendices 1-11 (on Flash Drive)

April 4, 2013

Ms. Cathy D. Lee
Lozeau-Drury, LLP
410 12th Street, Suite 250
Oakland, CA 94607

**Subject: Comments on the Draft Environmental Impact Report prepared for the
World Logistics Center Project**

Dear Ms. Lee:

This letter contains my comments on the Draft Environmental Impact Report (“DEIR”) prepared for the World Logistics Center Project (“Project”). Highland Fairview Operating Company (“Applicant”) is proposing the World Logistics Center Specific Plan for 3,918 acres in the Rancho Belago area of the City of Moreno Valley. The Project entails a General Plan Amendment, which would redesignate approximately 71 percent of the area (2,710 acres) for logistics warehousing and the remaining 29 percent (1,104 acres) for permanent open space and public facilities.

I am an environmental biologist with 20 years of professional experience in wildlife ecology, forestry, and natural resource management. I have served as a biological resources expert for over 50 development projects. My experience in this regard includes testifying before the California Energy Commission and California Public Utilities Commission, and assisting various clients with evaluations of biological resource issues. My educational background includes a B.S. in Resource Management from the University of California at Berkeley, and a M.S. in Wildlife and Fisheries Science from the Pennsylvania State University.

I am on Riverside County’s list of Authorized Biological Consultants. I have gained particular knowledge of the biological resource issues associated with the Project through studies I have conducted in Riverside County, and through my work on other projects in the Project region. The subsequent comments are based on my review of the environmental documents prepared for the Project, a review of scientific literature pertaining to biological resources known to occur in the Project area, consultations with biological resource experts, and the knowledge and experience I have acquired during more than 20 years of working in the field of natural resources management.

1

THE DEIR'S FAILURE TO ESTABLISH EXISTING CONDITIONS PRECLUDES A THOROUGH ASSESSMENT OF PROJECT IMPACTS TO SENSITIVE BIOLOGICAL RESOURCES

The DEIR Fails to Accurately Disclose the Value of the Project Site to Raptors

The DEIR identifies the Project site as providing “marginal foraging habitat for some raptors species.”¹ This statement is not substantiated by survey data. Indeed, two different studies that were conducted in the Project area demonstrate (or strongly suggest) that the Project site provides very important habitat for raptors.

McCrary et al. (1985) conducted a 2-year fall and winter study of raptors in the San Jacinto Valley to provide baseline data on populations in southern California and to quantify the importance of the valley as a wintering area for raptors.² The study area was predominately agricultural lands (alfalfa and grain crops) and dairy farms, and it included the southern half of the Project site.³ The investigators detected 14 raptor species during their study, and raptor densities were 5 to 17 times higher than those reported for other regions. This led the authors to conclude that “*the San Jacinto Valley and similar surrounding areas are of major importance to wintering birds of prey.*”⁴

Beckman et al. (2011) replicated the raptor surveys between 2005 and 2009 and derived a comparable conclusion regarding the importance of the region to raptor species.⁵ Furthermore, both studies indicate the San Jacinto Valley provides important wintering grounds for the white-tailed kite, northern harrier, ferruginous hawk, golden eagle, and prairie falcon—all of which are special-status species. The State of California indicates 22 overwintering raptor species are known to utilize the San Jacinto Valley, and that the San Jacinto Valley consistently ranks in the top one to two percent in species diversity for the North American Christmas Bird Counts.⁶

Burrowing Owl Surveys Were Incomplete and Did Not Adhere to Survey Protocols

The Western Riverside County Multiple Species Habitat Conservation Plan (“MSHCP”) identifies the Project site as being within an area requiring focused surveys for burrowing owls. The Applicant did not conduct surveys throughout all portions of the Project site that provide suitable habitat for burrowing owls, nor did it conduct surveys according to

the protocol established by the MSHCP.⁷

Burrowing owls occur in open habitat types (e.g., grassland, shrub steppe, desert, agriculture, and ruderal, among others) if the vegetation structure is suitable and there are useable burrows and foraging habitat in proximity.⁸ As the DEIR acknowledges, almost all of the Project site and surrounding buffer area provide potentially suitable habitat for burrowing owls.⁹ The DEIR suggests protocol surveys for the burrowing owl were conducted throughout the entire Project site, and that much of the Project site has been subject to several years of protocol-level surveys. To the contrary, the survey reports that accompany the DEIR suggest the burrowing owl surveys were cursory, and that some portions of the Project site providing suitable burrowing owl habitat were never surveyed.

2005 Surveys

In 2005, the Applicant's consultants used aerial photographs to categorize the potential (i.e., low, moderate, and high potential) for burrowing owls to occur in various portions of the 1,778-acre Bel Lago Property (a subset of the Project site). The consultants then conducted four surveys "on foot and by vehicle within suitable habitat on the Project site and within a 100-foot buffer around the suitable habitat."¹⁰ In my opinion, those surveys were insufficient for documenting habitat suitability; and the presence, abundance, and distribution of burrowing owls in the survey area.

First, the presence and abundance of suitable burrows is an essential element of burrowing owl habitat, and thus, the suitability of the habitat as a whole. It would have been impossible for the Applicant's consultants to use aerial photographs to map the presence of burrows. This issue is confounded because the conclusions in the survey report pertaining to habitat suitability are internally inconsistent and/or are not supported by scientific literature. For example, the report first states habitat within the "low potential" area had little to no vegetation, but it subsequently states "low potential" habitat typically contained 100% vegetation coverage that provided poor habitat for burrowing owls due to limited visibility of ground dwelling species.¹¹

Second, the surveys did not adhere to the methods described in the California Department of Fish and Wildlife's ("CDFW") Staff Report on Burrowing Owl Mitigation, as required by the MSHCP. CDFW's 2005 Staff Report states: "[s]urveys should be conducted by *walking* suitable habitat on the entire project site and (where possible) in areas within 150 meters (approx. 500 ft.) of the project impact zone."¹² Indeed, administrators of the

¹¹ *Ibid*, pp. 6 and 10.

¹² California Department of Fish and Game. 1995. Staff Report on Burrowing Owl Mitigation. [emphasis added].

MSHCP have established that burrowing owl surveys that are conducted while driving are unacceptable.¹³ Although the surveyors detected a breeding pair of burrowing owls on the Project site they did not conduct additional surveys to identify the location of the nest site.¹⁴

3

2007 Surveys

The Applicant's consultant conducted additional surveys for burrowing owls in 2007. However, the surveys were limited to the site for the 158.4-acre Highland Fairview Corporate Park and the surrounding 500-foot buffer zone.¹⁵ The surveys did not encompass the location where burrowing owls were detected in 2005, and thus they were incapable of determining continued use of the site by the breeding pair.¹⁶

4

2010 Surveys

In 2010, the Applicant's consultant conducted surveys within the 4,321-acres Highlands Specific Plan area. According to the survey report, a single biologist conducted the burrow survey (Part A of the protocol) and first focused burrowing owl survey (Part B of the protocol) between 0630 and 0730 hours on June 9, 2010.¹⁷ Only areas identified in the initial survey as having potential burrows and adjacent foraging habitat for owls were surveyed during the remaining three surveys.¹⁸ As a result, the survey effort was limited to four drainages within the entire Project site and surrounding buffer zone.¹⁹ Such an effort would have been insufficient for documenting the presence, abundance, and distribution of burrowing owls within the Project site.

5

First, it would have been impossible for a single biologist to identify the presence of potentially suitable burrows across several thousand acres of potentially suitable habitat within one hour. Furthermore, the "Sensitive Plant Focused Survey" report indicates the biologist was conducting sensitive plant surveys within four drainages at the exact same time and date. Consequently, he could not have been conducting the burrow and burrowing owl survey across the entire Project site and buffer—as the report indicates.

Second, each of the remaining three focused surveys was limited to two biologists conducting surveys for one hour per day.²⁰ At the same time, one of the two biologists

¹⁷ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Burrowing Owl Focused Survey: Highlands Specific Plan, p. 18.

¹⁸ *Ibid*, p. 13.

¹⁹ *Ibid*, Exhibit 4.

²⁰ *Ibid*, Table 2.

was reported to have been conducting surveys for sensitive plant species.²¹ It would have been impossible for the biologists to reliably survey the four drainages for burrowing owls and sensitive plants during such a short period of time, especially given that there were numerous burrows throughout the survey area.²²

The survey report indicates: “[t]here is no additional suitable habitat within 500 feet surrounding the project site. Therefore, although evaluated, protocol burrowing owl surveys were not conducted within the 500-foot buffer area.”²³ This statement is misleading and undermines the information presented in the DEIR. First, it is clear the Applicant’s consultant did not walk through (evaluate) the entire Project site and 500-foot buffer zone to determine the presence of potentially suitable burrows for burrowing owls. Second, the survey area appears to have been dictated by habitat suitability for sensitive plant species, which does not necessarily coincide with that for burrowing owls.²⁴ Third, the consultant’s statement conflicts with information presented in its 2005 survey report, which identifies most of the Project site as having “moderate potential habitat” for burrowing owls.²⁵ Fourth, the consultant’s statement conflicts with: (a) its map of vegetation communities; (b) imagery available through Google Earth (Figures 1 and 2); and (c) information provided in the DEIR.²⁶ These sources suggest there is considerably more suitable habitat for burrowing owls than suggested in the consultant’s 2010 survey report.

5

2007 and 2012 Surveys

The DEIR indicates focused burrow and burrowing owls surveys also were conducted in 2006 (750 acres) and 2012 (3,300 acres).²⁷ However, the DEIR does not provide survey reports or any other information that describes and documents the survey efforts. As a result, I am unable to evaluate the value of those survey efforts in providing information pertaining to the burrowing owl.

A single burrowing owl was observed within the temporary detention basin located south of the Highland Fairview Corporate Park during a March 2012 site visit associated with the Jurisdictional Delineation.²⁸ Although this observation was important given the scarcity of owls in the MSHCP plan area, the Applicant’s consultant apparently made no attempt to determine the breeding status of the owl.

²¹ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, Table 3.

²² *Ibid.* Michael Brandman Associates. 2010 Dec 13. Burrowing Owl Focused Survey: Highlands Specific Plan, p. 18.

²³ *Ibid.*

²⁴ *Ibid.*, Exhibit 4. *See also* DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 10 and Exhibit 5.

²⁵ DEIR, Appendix E. Michael Brandman Associates. 2005 Sep 12. DRAFT Focused Burrowing Owl Survey Report for the 1,778-acre Bel Lago Property, Exhibit 4.

²⁶ *Ibid.*, p. 4.4-29.

²⁷ *Ibid.*

²⁸ *Ibid.*, Appendix E, p. 46.

The Applicant's consultant has concluded the burrowing owl "is not considered a permanent resident within the entire study area."²⁹ The consultant has no basis for its conclusion because it did not conduct any surveys to evaluate winter residency. Moreover, it appears that at least one burrowing owl was detected south of the Highland Fairview Corporate Park (Skecher's Logistic Center) each time the area was surveyed.³⁰ This information, and the knowledge that burrowing owls have high site fidelity, strongly suggests that the burrowing owl is a breeding season resident on the Project site.

Figure 1. Potentially suitable burrowing owl habitat at proposed debris basin site east of Gilman Springs Road.

²⁹ *Ibid.*

³⁰ *Ibid.*

Figure 2. Potentially suitable burrowing owl habitat at proposed debris basin site east of Gilman Springs Road.

The DEIR Fails to Establish Existing Conditions Pertaining to Special-Status Plant Species That May Be Impacted by the Project

Protocol-Level Plant Surveys Were Not Conducted

Failure to survey the entire Project area and buffer-

The Applicant's consultant conducted rare plant surveys in June 2010. These surveys, however, were based on the footprint for the Highlands Specific Plan, and they were limited to four drainages within the Project site.³¹ The Applicant's consultant did not survey any other portions of the Project area, including the Riversidean Sage Scrub communities, which the DEIR identifies as having the potential to support rare plant species that are not covered by the MSHCP.³²

CDFW survey guidelines indicate focused botanical surveys should be conducted *whenever natural or naturalized vegetation occurs on a project site* and the project has

³¹ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 2. and Exhibit 5.

³² *Ibid*, pp. 4.4-26 and -27.

the potential for direct or indirect effects on vegetation.³³ Natural and naturalized vegetation occur on and adjacent to the Project site, and the Project will have direct and indirect impacts on that vegetation.³⁴ Therefore, to establish existing conditions and comply with CDFW guidelines, the Applicant needs to conduct appropriately timed botanical surveys throughout all portions of the Project area and buffer zone containing natural or naturalized vegetation. Data from those surveys are required to fully assess existing conditions, analyze Project impacts, and formulate appropriate mitigation for impacts to sensitive botanical resources.

Inappropriate methodology-

The methods used to survey special-status plants on the Project site had numerous flaws that have resulted in unreliable information on baseline conditions and Project impacts.

The Applicant's consultant concluded that three sensitive plant species have a "moderate" potential to occur on the Project site. The sensitive plant surveys were limited to a search for those three species.³⁵ The "list approach" implemented by the Applicant's consultant is not an accepted technique for disclosing and analyzing the impacts of a project. Indeed, the CDFW specifically advises against the "list approach" for botanical inventories. Its survey guidance states:

This list [of special-status plants with potential to occur within a particular region] can serve as a tool for the investigators and facilitate the use of reference sites; however, special status plants on site might not be limited to those on the list. Field surveys and subsequent reporting should be comprehensive and floristic in nature and *not restricted to or focused only on this list...* "Focused surveys" that are limited to habitats known to support special status species or are restricted to lists of likely potential species are not considered floristic in nature and **are not adequate** to identify all plant taxa on site to the level necessary to determine rarity and listing status.³⁶

As the survey report acknowledges, "[t]he focused plant survey...is not considered a comprehensive botanical survey to record all observed species within the survey areas."³⁷

According to the survey report, the 2010 surveys were conducted within the known flowering period of the special-status species potentially occurring within the Project footprint.³⁸ However, the phenology of plants can vary considerably within the known

http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html#Plants. [emphasis added].

³⁷ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, p. 9.

³⁸ *Ibid*.

flowering period depending on environmental conditions. Contrary to guidance issued by the CDFW, the Applicant's biologist did not visit reference sites to determine the phenology of the target species and to confirm they were identifiable at the time of the surveys.³⁹

The sensitive plant surveys were limited to seven man-hours, during which time the biologist was also searching for burrowing owls.⁴⁰ In my opinion, it would have been impossible for the biologist to reliably survey the four drainages for burrowing owls and sensitive plants during such a short period of time.

Due to the issues described above, the DEIR lacks reliable information on existing conditions, and it is not possible for the City of Moreno Valley ("City") to conclude special-status plant species are absent from the Project site.

The DEIR Fails to Establish Existing Conditions Pertaining to the Los Angeles Pocket Mouse

The Los Angeles pocket mouse is a state listed Species of Special Concern and a MSHCP Group 3 species. The Los Angeles pocket mouse is associated with fine, sandy soils in intermittent drainages, non-native grassland, Riversidean sage scrub, Riversidean alluvial fan sage scrub, chaparral and redshank chaparral habitats.⁴¹ The DEIR relays the opinion of the Applicant's consultant that the species is absent from the Project area.⁴² That conclusion is unjustified for two reasons.

First, focused surveys for the Los Angeles pocket mouse were not conducted throughout all potentially suitable habitats. In 2005, trapping surveys were limited to nine acres of suitable habitat within "Drainage Feature 9."⁴³ In 2010, surveys were limited to trapping along approximately 1,000 feet of Drainage Feature 9, and within two ephemeral drainages (each also approximately 1,000 feet) dominated by mule fat but within an agricultural field.⁴⁴ Trapping surveys were never conducted in other portions of the Project area that contain potentially suitable habitat for the Los Angeles pocket mouse. These include: (a) the northern portion of "Drainage Feature 7" where it is associated with native vegetation; (b) the drainages and native vegetation communities east of Gilman Springs Road and north of Highway 60; (c) the grassland community within the Project area; and (d) the remaining scrub communities in the Project area.

³⁹ CDFG. 2009. Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities. Available at:

http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html#Plants.

⁴⁰ DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Sensitive Plant Focused Survey: Highlands Specific Plan, Table 3. *See also* DEIR, Appendix E. Michael Brandman Associates. 2010 Dec 13. Burrowing Owl Focused Survey: Highlands Specific Plan, Table 2.

⁴¹ MSHCP, Vol II-B, Species Accounts: Mammals. Available at: <http://www.wrc-rca.org/library.asp>

⁴² DEIR, p. 4.4-30.

⁴³ *Ibid*, Appendix E. Michael Brandman Associates. 2005 Sep 26. DRAFT Focused Los Angeles Pocket Mouse Survey Report for the 1,778-Acre Bel Lago Property, p. 7.

⁴⁴ *Ibid*, p. 10.

Second, it is well established in the field of wildlife science that it is nearly impossible to prove absence. This is especially true for the Los Angeles pocket mouse, which appears to occur at low densities and is difficult to trap.⁴⁵

Potentially significant Project impacts to the Los Angeles pocket mouse cannot be properly disclosed, analyzed, and mitigated until trapping surveys have been completed throughout all potentially suitable habitats in the Project area and buffer zone.

7

The DEIR Fails to Disclose Impacts to All Special-Status Species

Northwestern San Diego Pocket Mouse

The Northwestern San Diego pocket mouse is a state listed Species of Special Concern. According to the DEIR, the Northwestern San Diego pocket mouse has a low potential of occurring in the Project area.⁴⁶ This conclusion is incorrect. The Applicant's consultant captured seven Northwestern San Diego pocket mice during its 2010 trapping surveys on the Project site.⁴⁷ Development of the Project will have an adverse effect on the Northwestern San Diego pocket mouse. The City must disclose, analyze, and provide mitigation for this potentially significant impact.

8

San Diego Desert Woodrat

The San Diego Desert woodrat is a state listed Species of Special Concern. The Applicant's consultant captured eight San Diego desert woodrats during its trapping surveys on the Project site.⁴⁸ The DEIR does not disclose the presence of San Diego desert woodrats on the Project site, nor does it analyze potentially significant impacts to the (sub)species.

9

American Badger

The American badger is a state listed Species of Special Concern that is not covered under the MSHCP. The DEIR incorrectly states that the Project area does not contain habitat for the American badger.⁴⁹ The American badger occurs in herbaceous, shrub, and open stages of most habitats with dry, friable soils.⁵⁰ American badgers have the potential to occur on the Project site, especially in the patches of habitat that have not been subject to periodic discing. As a result, the City must disclose, analyze, and provide mitigation for potentially significant Project impacts to the American badger.

Western Yellow Bat

The western yellow bat is a state listed Species of Special Concern that is not covered under the MSHCP. The DEIR states there is no suitable habitat for the species in the Project area even though (a) no bat surveys were conducted for the Project; and (b) the species has been documented occurring in the Project region.⁵¹

The western yellow bat is a “tree-roosting” species commonly found roosting in the skirt of dead fronds in both native and non-native palm trees.⁵² It is believed to form small maternity groups in trees and palms, including in ornamental plantings in residential areas and orchards.⁵³ One of the primary threats to the species in the U.S. is the cosmetic trimming of palm fronds.⁵⁴ Palms occur in the Project area and presumably may be impacted by the Project.⁵⁵

Bats are very vulnerable to disturbance.⁵⁶ Construction activities associated with the Project have the potential to cause bats to abandon roosts and maternity colonies. The DEIR does not disclose, assess, or provide mitigation for this potentially significant impact.

11

Bell’s Sage Sparrow

The Bell’s sage sparrow is a U.S. Fish and Wildlife Service (“USFWS”) Bird of Conservation Concern, a CDFW Watch List species, and a MSHCP Group 2 species. The DEIR states there is no suitable habitat for the Bell’s sage sparrow within the Project area.⁵⁷ The DEIR fails to acknowledge that the subspecies was detected during small mammal trapping surveys on the Project site.⁵⁸ As a result, the City must disclose and analyze potentially significant Project impacts to the Bell’s sage sparrow.

Grasshopper Sparrow

The grasshopper sparrow is a state listed Species of Special Concern. The species is not covered by the MSHCP because the species-specific conservation objectives defined in the MSHCP have not yet been met.⁵⁹ The grasshopper sparrow was detected on the Project site.⁶⁰ However, the DEIR does not disclose, analyze, or provide mitigation for potentially significant Project impacts to the species.

13

White-tailed Kite

The DEIR concludes “[n]o suitable nesting habitat for white-tailed kite or American peregrine falcon occurs within the area due to historic agricultural activities, regular disking of the site, and dominance of sparse, non-native low-quality vegetation.”⁶¹ This conclusion conflicts with scientific information. White-tailed kites are known to nest in a variety of different tree species.⁶² Furthermore, agricultural habitat, especially dryland field crops (e.g., wheat and barley), may play an important role as foraging habitat for nesting white-tailed kites because the fields are known to provide prey for foraging raptors. The City must disclose and analyze potentially significant Project impacts to the white-tailed kite.

14

Ferruginous Hawk and Merlin

The ferruginous hawk is a USFWS Bird of Conservation Concern and a CDFW Watch List species. The merlin is a CDFW Watch List species. The DEIR states the Project site provides suitable foraging habitat for these two species, but no suitable nesting habitat.⁶³ Both the ferruginous hawk and merlin are known to occur in the Project region.⁶⁴

15

It is well established that ferruginous hawks and merlins do not nest in California, and that the special-status designations for these two species apply to birds on their *wintering* grounds. Therefore, the lack of nesting habitat on the Project site is irrelevant to the potential for Project impacts under CEQA. As a result, the City must disclose and analyze Project impacts to the ferruginous hawk and merlin, and it must identify how potentially significant impacts to the two species would be mitigated.

The DEIR Provides Incorrect Information on the Jurisdictional Status of Drainages in the Project Area.

The DEIR states the drainage features in the Project area are not subject to the jurisdiction of the CDFW.⁶⁵ This statement is inconsistent with information provided in the Jurisdictional Delineation report, which identifies portions of Drainages 7 and 9 as being jurisdictional under 1600 of the Fish and Game Code.⁶⁶

The DEIR states that the Project site does not contain any features under the jurisdiction of the Regional Water Quality Control Board (“RWQCB”).⁶⁷ This statement appears to be based on the false impression that features not under the jurisdiction of the U.S. Army Corps of Engineers are also not under the jurisdiction of the RWQCB.⁶⁸

The jurisdictional reach of Porter-Cologne Water Quality Control Act (i.e., RWQCB) extends to all “waters of the state.”⁶⁹ That term is defined as “any surface water or groundwater, including saline waters, within the boundaries of the state.”⁷⁰ Because Porter-Cologne applies to any water and the federal Clean Water Act only applies to certain waters, California’s jurisdictional reach is broader and more comprehensive than the federal government’s.⁷¹

16

PROJECT IMPACTS

The Extent of Project Impacts to Sensitive Biological Resources Cannot Be Assessed Due to the Lack of Survey Data

For reasons previously discussed, project impacts to the burrowing owl, Los Angeles pocket mouse, and special-status plants cannot be sufficiently assessed due to the lack of comprehensive survey data. The lack of comprehensive survey data on burrowing owls is especially problematic because it is a MSHCP “Group 3” species (with additional survey needs and procedures), and because the species is known to occur on the Project site.

⁷¹ *Ibid*.

Burrowing Owl

Burrowing owls have been documented occurring on the Project site.⁷² As a result, the Project is likely to have significant direct and indirect impacts on burrowing owl resources (including burrows, foraging habitat, and individual owls). However, the extent and magnitude (e.g., number of afflicted owls) cannot be fully evaluated and mitigated until surveys that comply with CDFW's 2012 survey requirements have been conducted. Moreover, it is not possible to rule out the potential for the Project to significantly impact burrowing owls until surveys that adhere to the protocol have been conducted.

— 18

The DEIR Fails to Provide Scientific Analysis of Project Impacts to Raptor Habitat

The City's analysis of Project impacts to raptor foraging habitat is limited to the following statements:

The WLCSP [World Logistics Center Specific Plan] and off-site facilities contain flat, open areas with sparse vegetation, which could be considered foraging habitat for some raptor species. Due to the regular, heavy disturbance associated with the various agricultural activities in the WLCSP and off-site facilities resulting in a rather limited prey base, and the limited size of the site in relation to the expansive foraging habitat in the near vicinity including both the CDFW Conservation Buffer Area and the SJWA [San Jacinto Wildlife Area], LSSRA [Lake Perris State Recreation Area] and the extensive Badlands to the east, the foraging habitat on site is considered marginally suitable and an adverse but not significant impact to raptor foraging habitat is anticipated.⁷³

— 19

These statements are not supported by actual analysis.

First, neither the Applicant nor the City conducted any studies to quantify the prey base for raptors. Whereas agricultural activities can reduce the prey base, certain activities (e.g., harvesting, discing, mowing, flood irrigation, and burning) increase hunting efficiency by reducing cover or otherwise increasing the exposure of prey to foraging raptors. Indeed, some raptor species (e.g., Swainson's hawk) have learned to exploit the abundance of prey made available by agricultural activities. For example, Estep (1989) reported that Swainson's hawks in the Central Valley spent 52.8% of their foraging time hunting in apparent response to harvesting, discing, mowing, or irrigation.⁷⁴

Second, the Project site cannot be characterized as being of "limited size" in relation to the expansive foraging habitat in the vicinity. Indeed, the Applicant's consultant identified the study area as containing "extensive raptor foraging habitat."⁷⁵ The consultant also concluded that impacts to the large amount of raptor foraging habitat on

⁷² DEIR, Appendix E, p. 46.

⁷³ *Ibid*, p. 4.4-75.

⁷⁴ Estep JA. 1989. Biology, movements, and habitat relationships of the Swainson's Hawk in the Central Valley of California, 1986-87. Calif. Dept. Fish and Game, Nongame Bird and Mammal Sec. Rep., 52 pp. Available at: <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentVersionID=70479>

⁷⁵ DEIR, Appendix E, p. 3.

the site may be a significant impact under CEQA.⁷⁶

Whereas I do not contest that there is a considerable amount of foraging habitat in the Project vicinity, it is overly simplistic for the City to conclude that the loss of over 2,700 acres of foraging habitat would not have a significant impact on raptors. Some raptor species are intolerant of even small amounts of urban development.⁷⁷ For example, Berry et al. (1998) concluded that even small amounts of urbanization usually rendered *whole landscapes* unacceptable to bald eagles, ferruginous hawks, rough-legged hawks, and prairie falcons.⁷⁸ In addition, raptors that are displaced from the Project site to suboptimal habitats would likely experience reduced survivorship. Thus, the City's analysis of Project impacts to raptors must consider (a) the size and configuration of remnant foraging habitat in relation to urbanization; and (b) the quality and carrying capacity of the habitat remaining in the region.

19

The DEIR Fails to Disclose, Analyze, or Provide Mitigation for Adverse Effects Associated with the Relocation of Wildlife

The DEIR indicates burrowing owls, Los Angeles pocket mice, and perhaps other sensitive species may be “relocated” to the 250-foot setback zone along the southern boundary of the Project site. Relocating sensitive wildlife to the setback zone defeats its intent, which is to provide a buffer between the Project and sensitive biological resources. Moreover, relocating wildlife outside of the construction area does not ensure impacts are mitigated.

In a comprehensive review of translocation projects involving birds and mammals, Griffith et al. (1989) concluded overall success rates were apparently dependent on a variety of ecological factors, including the quality of the habitat where animals were released.⁷⁹ When an animal is moved to an unfamiliar location, it has no knowledge of the habitat resources essential for its survival (e.g., food, water, and cover). The lack of cover in an unfamiliar setting makes a prey species (e.g., Los Angeles pocket mouse) an easy target for predators. In addition, many animals exhibit an intrinsic homing response that is energetically taxing, and that may preclude procurement of food and cover resources. Elevated stress hormone levels an organism generates when it is handled and moved may synergistically interact with increased energetic demands to further reduce possibility of survival. Even if the translocated animal is placed in an area with readily available resources, aggressive competitors may prevent the displaced animal from accessing the resources, and from mating.

⁷⁸ *Ibid.*

⁷⁹ Griffith B, JM Scott, JW Carpenter, C Reed. 1989. Translocation as a species conservation tool: status and strategy. Science 245:477-480. (Attachment D).

Burrowing owl-

Consistent with CDFW guidelines, passive relocation is a potentially significant impact under CEQA that must be analyzed.⁸⁰ Specifically, the temporary or permanent closure of burrows may result in: (a) significant loss of burrows and habitat for reproduction and other life history requirements; (b) increased stress on burrowing owls and reduced reproductive rates; (c) increased depredation; (d) increased energetic costs; and (e) risks posed by having to find and compete for available burrows.⁸¹ The City must thoroughly analyze the effects of passive relocation if it may be implemented at the Project site.

The need for full analysis of potential impacts from passive relocation is further supported by research that indicates most translocation projects have resulted in fewer breeding pairs of burrowing owls at the mitigation site than at the original site, and that translocation projects generally have failed to produce self-sustaining populations.⁸² Investigators attribute the limited success of translocation to: (a) strong site tenacity exhibited by burrowing owls, and (b) potential risks associated with forcing owls to move into unfamiliar and perhaps less preferable habitats.⁸³

Each of these issues exemplifies the need for the Applicant to prepare a detailed translocation plan that is approved by the resource agencies before translocation occurs. At a minimum, the plan should contain:

1. an assessment of potential release sites, with special attention dedicated to estimating the size of the receiving population.
2. an assessment of threats at the release site (e.g., predators, pesticide use, land management activities), and a discussion of how these threats have been (or will be) mitigated.
3. a detailed description of the monitoring and adaptive management measures that will be implemented after animals are released.

The DEIR Fails to Assess Cumulative Impacts

The DEIR provides virtually no analysis of the Project's contribution to cumulative impacts to sensitive biological resources. It simply concludes: "the regional (cumulative) implications of the project can be addressed through the fee payment program of the MSHCP because it provides a regional and comprehensive approach to conservation planning," and that "no significant cumulative effect on biological resources would result from the development of the proposed uses with implementation of the identified program mitigation measures."⁸⁴

⁸⁰ CDFG. 2012. Staff Report on Burrowing Owl Mitigation, p. 10.

⁸¹ *Ibid.*

⁸² Smith BW, JR Belthoff. 2001. Burrowing owls and development: short-distance nest burrow relocation to minimize construction impacts. J. Raptor Research 35:385-391. (Attachment E).

⁸³ *Ibid.*

⁸⁴ DEIR, p. 4.4-81.

The City's justification fails to consider the Project's contribution to potentially significant impacts to species not covered by the MSHCP. Indeed, the Final EIR/EIS for the MSHCP states: "implementation of the MSHCP will result in cumulatively significant impacts on the Non-Covered Species because the issuance of incidental take permits will remove an impediment to development outside of the MSHCP Conservation Area. Non-Covered Species would receive little or no protection outside the reserves under existing ordinances and regulations."⁸⁵ In my opinion, the Project may contribute to cumulatively considerable impacts to Non-Covered Species, and those impacts would not be mitigated by the measures proposed by the City.

Many assumptions were incorporated into the MSHCP. The assumptions pertain to biological conditions (and relationships), development within the plan area, and actual implementation of the MSHCP. Some of the assumptions that were incorporated into the MSHCP have proven to be incorrect. For example, the MSHCP has been unsuccessful in the conservation of burrowing owls within the plan area.⁸⁶ This example highlights the flaws with the City's conclusion that the MSHCP will eliminate any potential for cumulative impacts.

Ultimately, the Project's contribution to cumulative impacts cannot be analyzed because the City has not identified the other projects within the cumulative effects analysis area. At a minimum, the City must identify the other projects may contribute to cumulatively considerable impacts to raptors, jurisdictional waters, the Northwestern San Diego pocket mouse, and other sensitive biological resources in the Project region.

MITIGATION MEASURES

The DEIR Fails to Establish Adequate Buffers to Mitigate Potentially Significant Impacts of Air Pollution on Wildlife

According to the DEIR, "[t]he most significant potential environmental impact on local wildlife (i.e., within the SJWA and Badlands) may be exposure to vehicular exhaust and especially diesel particulates and toxic air contaminants from truck exhaust as the WLCSP project builds out. New development will produce *significant amounts* of diesel-related air pollutants that will be released into the atmosphere, including gases and particles of various sizes."⁸⁷ Nevertheless, the City has concluded "[t]he 250-foot setback identified in Mitigation Measure 4.4.6.1A, and the presence of the CDFW Conservation Buffer Area, will effectively mitigate potential indirect impacts of air pollutants, including diesel particulate matter, on wildlife within the SJWA."⁸⁸

The DEIR fails to establish a monitoring and reporting program to ensure the proposed

⁸⁵ MSHCP, p. 5.1-7. [emphasis added].

⁸⁶ *Ibid*, Burrowing Owl Survey Report 2011. Available at: <http://www.wrc-rca.org/library.asp> See also Wilkerson RL and RB Siegel. 2010. Assessing changes in the distribution and abundance of burrowing owls in California, 1993-2007. Bird Populations 10: 1-36. (Attachment F).

⁸⁷ DEIR, Appendix E, p. 128. [emphasis added].

⁸⁸ *Ibid*, p. 4.4-72.

buffer mitigates the effects of air pollution on wildlife, vegetation, and aquatic resources. Moreover, information provided in the DEIR does not support the City's conclusion that a 400-foot buffer is sufficient to mitigate Project impacts to a less-than-significant level. Specifically, the DEIR cites research by the California Air Resources Board ("CARB") that indicates 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of the emission source.⁸⁹ Analyses by both the CARB and the South Coast Air Quality Management District indicate that providing a buffer of 1,000 feet would substantially reduce diesel PM concentrations and public exposure downwind of a distribution center.⁹⁰ Because wildlife may be more susceptible to air pollutant impacts than humans, one can infer that a buffer of at least 1,000 feet is needed to protect wildlife from air pollutants.⁹¹

22

The DEIR Lacks Adequate Mitigation for Project Impacts to Special-Status Plant Species

Mitigation proposed by the City for Project impacts to special-status plant species includes:

Prior to the approval of any Plot Plans for development within the project area, the applicant shall submit a biological assessment of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, or thread-leaved brodiaea) are present on the proposed development site. If plants are found in the proposed development area, they may be relocated to the 250-foot clear setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, an appropriate impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species on the WLC project site.⁹²

23

The proposed measures do not ensure Project impacts to special-status plant species are mitigated to a less-than-significant level.

First, Coulter's goldfields, smooth tarplant, and thread-leaved brodiaea are MSHCP Group 3 species. As a result, if any of these species occur within a proposed development area, the City must require the project proponent to conform to the procedures listed in Section 6.3.2 in the MSHCP. Section 6.3.2 states: "[f]or locations with positive survey results, 90% of those portions of the property that provide for long-term conservation value for the identified species shall be avoided until it is demonstrated that conservation goals for the particular species are met."⁹³

Second, the special-status plant species with the potential to occur in the Project area are

⁸⁹ *Ibid*, p. 4.4-70.

⁹⁰ California Air Resources Board (CARB) and California Environmental Protection Agency (CEPA). 2005. Air Quality and Land Use Handbook: A Community Health Perspective. Available at: <http://www.arb.ca.gov/ch/landuse.htm>

⁹¹ DEIR, Appendix E, p. 129.

⁹² *Ibid*, pp. 4.4-74 and -75.

⁹³ MSHCP, Vol I, Section 6.3.2. Available at: <http://www.wrc-rca.org/library.asp>

not limited to the three species identified in the mitigation measure.⁹⁴ In accordance with CDFW guidelines, the City must require surveys that are floristic in nature, meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status.⁹⁵

Third, the DEIR suggests mitigation may be limited to relocating plants to the buffer area. Although salvage and relocation have some merits as a last resort, it is generally not an effective means of mitigating impacts. Fiedler (1991) conducted a thorough review of mitigation-related transplantation, relocation and reintroduction attempts involving special-status plants in California.⁹⁶ The author reported only 8 of the 53 (15%) attempts reviewed in her study should be considered fully successful.⁹⁷ Although Fiedler reported several causes for the failed attempts, the common result was that the plants died. Unless the City can provide evidence that potentially impacted plants can be transplanted and/or propagated successfully, it must require fee payment to the Regional Conservation Authority.

Fourth, the City must identify the specific mitigation measure (or suite of potential measures) that will be required if a sensitive plant or animal species that is not covered under the MSHCP is detected within a proposed development area.

The DEIR Lacks Adequate Mitigation for Project Impacts to the Burrowing Owl

The conservation goals established in the MSHCP have not yet been met for the burrowing owl, and thus sites with burrowing owls appear to be subject to the provisions listed in Section 6.3.2 in the MSHCP.⁹⁸ Because the burrowing owl was recently (2012) detected on the Project site, the City needs to clarify whether the Project is subject to the provisions of MSHCP Section 6.3.2. If the Project is subject to those provisions, the City must identify how the Project will be capable of avoiding 90% of those portions of the site that provide for the long-term conservation value for the burrowing owl.

Burrowing owls have the potential to occupy the Project site prior to development.⁹⁹ The DEIR indicates “[t]his is a potentially significant impact requiring mitigation.”¹⁰⁰ However, it fails to define the impact(s) or provide any mitigation to offset the impact(s). Instead, it simply requires a pre-construction survey, establishment of buffer zones around active burrows, and the exclusion of owls from their burrows during the non-breeding season (which in itself is a potentially significant impact).

⁹⁴ *Ibid*, Table 4.4.D.

⁹⁹ DEIR, p. 4.4-77.

¹⁰⁰ *Ibid*.

23

24

Pre-construction Survey

The DEIR requires a pre-construction survey for burrowing owls no more than 30 days prior to initiation of ground-disturbing activities.¹⁰¹ This condition is not consistent with CDFW guidelines, which recommend an initial preconstruction survey within the 14 days prior to ground disturbance, followed by a subsequent survey within 24 hours prior to ground disturbance.¹⁰² As the CDFW's 2012 Staff Report acknowledges, "burrowing owls may re-colonize a site after only a few days."¹⁰³ As a result, a single pre-construction survey up to 30 days in advance of construction is insufficient to avoid and minimize take of burrowing owls.

The City must clarify that "take avoidance" (i.e., pre-construction) surveys for the burrowing owl are not a substitute for the four surveys required to assess Project impacts and formulate appropriate mitigation. The City must require the Applicant to conduct the protocol surveys described by CDFW, and the results of those surveys need to be released in a revised DEIR.¹⁰⁴

Buffers

The DEIR provides inconsistent information on the buffer distance required around active burrows (i.e., 250 feet or 500 feet).¹⁰⁵ Furthermore, the CDFW no longer uses the default standard of 250-foot buffers during the breeding season and 160-foot buffers during the non-breeding season. Instead, CDFW indicates that indirect impacts and appropriate mitigation should be determined through site-specific analyses that incorporate the wide variation in natal area, home range, foraging area, and other factors influencing burrowing owls and burrowing owl population persistence in a particular area.¹⁰⁶ CDFW guidelines indicate buffers may need to be up to 500 meters, depending on the level of disturbance.¹⁰⁷

Burrow Exclusion

In accordance with CDFW guidelines, burrowing owls should not be excluded from burrows unless or until the Applicant:

1. develops a Burrowing Owl Exclusion Plan that is approved by the CDFW;
2. secures off-site compensation habitat and constructs artificial burrows in close proximity (< 100 m) to the eviction sites;

¹⁰¹ *Ibid.*

RESPONSES TO LETTER F-7C

Lozeau Drury LLP

Response to Comment F-7C-1. The commenter refers to project information that has now changed, the revised project will develop 40.6 million square feet of logistics warehousing rather than 41.6 million, the developable area of the World Logistics Center (WLC) Specific Plan (SP) is now 2,610 acres rather than 2,710 acres, and the total area of the project is now 3,818 acres rather than 3,918 acres. The commenter also provided information on his qualifications to submit comments on the Environmental Impact Report (EIR) regarding biological resources. The commenter should note that the biological studies for the WLC project have been revised in part in response to the many comments on the Draft Environmental Impact Report (DEIR) (specifically Responses to Comments in Letter A-6, B-3, F-1, F-4, F-5, F-7A, F-8, F-9B, F-10, F-11 and F-13). The revised biological reports are located in Appendix E Volume 2 of the Final Environmental Impact Report (FEIR).

Response to Comment F-7C-2. In response to comments regarding raptor foraging habitat refer to Response to Comment F-7A-52.

Response to Comment F-7C-3. In response to comments on the Draft Environmental Impact Report (DEIR) an updated (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013 - FEIR Volume 2, Appendix E-1), was prepared including an updated 2013 burrowing owl survey (FEIR Volume 2, Appendix E-5). The previous burrowing owls surveys (2005, 2007, 2010, and 2012), were included in the DEIR as additional information to provide background information regarding burrowing owl. The 2013 burrowing owl protocol survey followed the approved protocol established by the MSHCP and began with a complete survey of the entire WLCSP area, including off-site improvement areas. All surveys were conducted on foot and no portion of the WLCSP was surveyed by vehicle. All potential burrow sites were identified and mapped. All suitable habitat areas, which included these burrow locations, were surveyed on four separate occasions, approximately one week apart during the appropriate time of year. For additional information, refer to Response to Comment F-7A-26.

Response to Comment F-7C-4. The 2007 burrowing owl survey report was included in the DEIR as additional information to provide background information regarding burrowing owl. This survey was never considered applicable for the entire WLCSP. Surveys were limited to a specific development footprint, and did not incorporate the entire WLCSP. The updated 2013 protocol survey was consistent with the MSHCP survey requirements and was conducted on the entire WLCSP as well as off-site facilities. For additional information regarding this response, please see Response to Comment F-7C-3 above.

Response to Comment F-7C-5. The 2010 burrowing owl surveys started with a burrow survey in areas that were previously determined to have suitable burrows. The entire 4,321-acres, which include the WLCSP, California Department of Fish and Wildlife (CDFW) Conservation Buffer Area, and additional off-site areas, were not completely surveyed on foot. The areas that were surveyed were relatively undisturbed areas that contained appropriate burrows. These survey areas are linear in shape and surveys consisted of walking up one side of the suitable habitat and down the other. While surveying for burrowing owls, one of the biologists was also surveying and making notations regarding sensitive plants. It is not unreasonable that both burrowing owl and sensitive plant surveys were conducted at the same time. Both types of surveys contain search patterns that occur along the ground. Surveys for burrowing owl and sensitive plants were both conducted in areas that were not actively disked as part of the on-going agricultural activities.

The 2010 surveys were not conducted based on the MSHCP requirements, but were limited to areas that were previously determined to be suitable habitat based on the 2005 and 2007 surveys.

The burrowing owl observed in 2012 within the temporary detention basin located south of the Skechers facility was determined to be an isolated individual, most likely a male looking for a breeding territory. This was an incidental observation and was not observed during a burrowing owl survey. The detention basin was revisited during the burrowing owl surveys and the owl was no longer using the detention basin. This individual was not observed breeding within the detention facility and appeared to have left the area at the time of the focused burrowing owl surveys that began in June 2012.

During the 2013 protocol survey, all portions of the WLCSP and off-site facility areas were surveyed. A team of six biologists covered the entire WLCSP in 3 days as part of the initial burrow survey. All areas containing suitable habitat and suitable burrows were surveyed on four separate occasions at least a week apart. The 2013 protocol survey met the MSHCP requirements (MSHCP Appendix E) and was sufficient for documenting the presence, abundance, and distribution of burrowing owls within the project site.

Response to Comment F-7C-6. The sensitive plant survey conducted in 2010 was not limited to the three species that the project biologist determined had a moderate potential to occur within the project site. While the focus of the survey was on those three species, all sensitive plant species that were determined to have some potential to occur within the project site were included in the protocol survey. All areas that contain suitable habitat were inventoried to determine if any sensitive plant species occur within the WLCSP.

The use of a list of potentially occurring species, although not recommended by CDFW, allows the biologists to limit their search to those species that would likely occur within the project site. Many of the plant species that occur on the California Natural Diversity Database (CNDD) list of sensitive plant species that were recorded to occur within the vicinity of the project site are associated with aquatic habitats such as wetlands, vernal pools, or lake margins. The project site does not contain any of these types of habitats, so it would not be unreasonable to remove these species from a list of potentially occurring species, since the constituent habitat elements necessary for these species to occur within the WLCSP do not occur.

The 2010 focused plant survey acknowledges that the plant survey is not a comprehensive botanical survey to record all observed plant species within the survey area. The intent of the focused plant survey was to identify sensitive plant species that occur within the WLCSP. It is not necessary to identify every ornamental landscape species or weedy non-native species within the WLCSP to verify that those species are not sensitive plants. The Michael Brandman and Associates (MBA) 2012 sensitive plant surveys meet the requirements as a complete protocol survey. However, additional focused plant surveys will be required on a project-by-project basis as each project is proposed.

It should be noted that the focused plant surveys were conducted in areas that were determined to be the only suitable habitat for sensitive plants within the WLCSP based on 5 years of surveys that were conducted within the WLCSP between 2005 and 2010. The biologists conducting the surveys were extremely familiar with the project site and the plants that occur within the project. If this was a project site that was surveyed for the first time, then survey days and duration of surveys would have been extended for project sites that are unfamiliar in an attempt to understand the project and associated habitat. However, the biologists conducting the plant surveys were familiar with the suitable habitat within the WLCSP and the blooming periods of sensitive plant species that commonly bloom in June.

Due to the disturbed nature of the WLCSP, the likelihood of sensitive plant species to occur is extremely low. However, the potential for sensitive plants to occur within the project site cannot be completely ruled out. Focused surveys were not feasible during the 2012 and 2013 survey season due to a lack of sufficient rainfall. Since the proposed project build-out will be over 15 years, updated sensitive plant surveys will be required during the same year the project-level California

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Environmental Quality Act (CEQA) document is prepared as described in Mitigation Measure (MM) 4.4.6.1B.

Project related impacts to sensitive plants, if observed within the WLCSP may be considered an adverse impact. The type of mitigation requirements depend on the sensitive plants that may occur within the project site. For instance, impacts associated with thread-leaved brodiaea, smooth tarplant, Coulter's goldfields, Parry's spineflower, and slender-horned spine flower are covered under the MSHCP. Payment of the MSHCP fee will fully mitigate project related impacts to these species. Project related impacts to Plummer's mariposa lily, Robinson's peppergrass, and San Bernardino aster will require a separate analysis under CEQA guidelines. These species do not have any legal federal or state protection under the Endangered Species Act.

Response to Comment F-7C-7. Protocol surveys were conducted within all suitable habitat areas within the WLCSP, including off-site improvement areas during the 2013 survey season. Protocol surveys were also conducted in 2010 and 2012. Suitable habitat areas were refined based on previous surveys and known suitable habitat for this species. No LAPM were observed during any of the surveys. Based on Resource Conservation Authority (RCA) data, no recorded occurrences of LAPM occur within the vicinity of the WLCSP. This species is considered absent from the WLCSP. For additional information, refer to Response to Comment F-7A-27.

Response to Comment F-7C-8. Seven Northwestern San Diego pocket mouse were captured during the 2010 surveys and seventeen Northwestern San Diego Pocket mouse were captured in 2013. Development of selected portions of the WLCSP will have an adverse effect on Northwestern San Diego pocket mouse. The only place within the WLCSP that contains suitable habitat and is considered occupied for Northwestern San Diego pocket mouse is within Drainage 9 south of Alessandro Boulevard and north of the existing gas pipeline. Northwestern San Diego pocket mouse is a covered species under the MSHCP, therefore mitigation for adverse effects on Northwestern San Diego pocket mouse will be satisfied by payment of the MSHCP fee. It should also be noted that Drainage 9 will remain as an open drainage feature with several erosion control modifications, such as drop structures or other similar device, and will be regraded along the northern portion of the drainage to provide a more gradual transition at the Alessandro Boulevard crossing. For additional information, refer to Response to Comment F-7A-29.

Response to Comment F-7C-9. Eight San Diego desert woodrat were captured during the 2010 surveys and a single San Diego desert woodrat was caught during the 2013 surveys. Development of selected portions of the WLCSP will have an adverse effect on San Diego desert woodrat. The only place within the WLCSP that contains suitable habitat and is considered occupied for San Diego desert woodrat is within Drainage 9 south of Alessandro Boulevard and north of the existing gas pipeline and within the northern portion of Drainage 8, just north of Gilman Springs Road. San Diego desert woodrat is a covered species under the MSHCP, therefore mitigation for adverse effects on San Diego desert woodrat will be satisfied by payment of the MSHCP fee. It should also be noted that Drainage 9 will remain as an open drainage feature with several erosion control modifications, such as drop structures or other similar device, and will be regraded along the northern portion of the drainage to provide a more gradual transition at the Alessandro Boulevard crossing as a project design feature.

Response to Comment F-7C-10. In response to comments regarding American badger refer to Response to Comment F-7A-31.

Response to Comment F-7C-11. In response to comments regarding western yellow bat refer to Response to Comment F-7A-32.

Response to Comment F-7C-12. In response to comments regarding Bell's sage sparrow refer to Response to Comment F-7A-33.

Response to Comment F-7C-13. In response to comments regarding grasshopper sparrow refer to Response to Comment F-7A-34.

Response to Comment F-7C-14. In response to comments regarding white-tailed kite refer to Response to Comment F-7A-35.

Response to Comment F-7C-15. In response to comments regarding ferruginous hawk and merlin refer to Response to Comment F-7A-36.

Response to Comment F-7C-16. The DEIR states that none of the drainage features are subject to CDFW Jurisdiction. An updated wetland delineation report was prepared to address concerns regarding regulatory agency jurisdiction over the drainage features within the WLCSP. The previous jurisdictional delineation assumed CDFW jurisdiction over a select portion of drainage features 7 and 9. It also assumed that since the drainage features were all isolated and not likely under United States Army Corps of Engineers (USACE) jurisdiction that the drainage features were also not under (Regional Water Quality Control Board (RWQCB) jurisdiction.

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the DEIR and the draft wetland delineation (FCS-MBA 2013 - FEIR Volume 2, Appendix E-13). Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the 1987 Regional Supplement to the USACE Wetland Delineation manual: Arid West Region and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the RWQCB and CDFW.

The applicant shall secure a jurisdictional determination with the USACE and confirm with the RWQCB and CDFW if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Jurisdictional features will be avoided and unavoidable impacts will be mitigated through the construction of compensatory wetland construction. Compensatory wetland mitigation will be provided at a minimum of 1:1 replacement ratio to ensure no net loss of wetlands or aquatic resources. Wetland mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the USACE/United States Environmental Protection Agency (USEPA)'s "Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios."

The updated jurisdictional delineation report assumes CDFW jurisdiction over the entire length of Drainages 7, 8, 9, 12, and 15. In addition these areas are also under the jurisdiction of the RWQCB. It is estimated that no more than 5.0 acres of streambed are under CDFW and RWQCB jurisdiction. It should also be noted that Drainages 12 and 15 are both hydrologically connected to downstream waters of the United States and are therefore under the USACE jurisdiction as well. Exact mitigation requirements will be negotiated at the time of permit acquisition.

Response to Comment F-7C-17. In support of the DEIR, FCS-MBA biologists conducted biological resource field surveys for the WLCSP and additional areas to provide information on potential indirect impacts. Biological surveys were conducted between 2005 and 2013, which is more than sufficient to provide base-line information within the WLCSP. The main focus was on sensitive habitats and any areas with the potential to support sensitive flora or fauna species. In addition, FCS-MBA biologists conducted focused surveys for burrowing owl, Los Angeles pocket mouse (LAPM), and a comprehensive sensitive plant survey. A delineation of jurisdictional waters and wetlands was also conducted. Table F-7C.A below summarizes the survey dates, the type of survey, and FCS-MBA lead

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

staff. Information on where the surveys were performed as the project evolved through time is presented in Exhibit 5 of the MSHCP Consistency Analysis (FCS 2013, FEIR Volume 2, Appendix E-1). In addition, FCS-MBA contacted Resource Conservation Authority (RCA) staff to obtain recorded occurrence data for sensitive plant and wildlife species observed within and adjacent to the San Jacinto Wildlife Area (SJWA).

Response to Comment F-7C-18. In response to comments, new protocol surveys for burrowing owl were conducted in 2013. A single breeding pair of burrowing owls was observed during the survey. Since a breeding pair of burrowing owl is known to occur within a non-criteria cell area of the MSHCP, conservation of this pair is not required under MSHCP requirements. To minimize impacts to this species, passive relocation will be required if owls are observed on-site during a 30-day preconstruction survey. Project related impacts could cause an adverse impact. MM 4.4.6.4B may be required if owls are determined to be present within a project specific area 30-days prior to project construction.

Passive relocation will be consistent with the CDFW guidelines. One-way trap doors will be installed at the burrow entrance and left in place for several days. Once the burrows are unoccupied, they can be collapsed to reduce the number of available burrows owls may use for relocation. Since no evidence of burrowing owl was observed within the northern portion of the SJWA, relocation of owls to the southern portion of the WLCSP will not cause an overcrowding of this species. Artificial burrows will be created in the 250-foot buffer area to provide suitable nesting burrows.

There is more than enough area to relocate a single pair of burrowing owl within the 250-foot buffer area. Based on CDFW background information, threats to burrowing owl will include large raptors from the SJWA, feral dogs, coyote, and active disking for the agricultural fields. Many of these threats

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

such as feral dogs and active diskings will be eliminated following project build-out, thus reducing the potential threats to this species.

Response to Comment F-7C-19. The DEIR generally discusses raptor foraging habitat, but does not provide a detailed discussion of the raptor foraging habitat and does not provide a sufficient analysis to assess whether the loss of raptor foraging habitat within the WLCSP is considered significant. Although a raptor foraging study was not conducted within the WLCSP area, it should be noted that general biological resource usage of the WLCSP area is based on the 8 years of surveys within the WLCSP area. See Response to Comment F-7C-2 for additional information regarding this response.

Response to Comment F-7C-20. In response to comments regarding focused protocol surveys for sensitive plants, LAPM, and burrowing owl refer to Response to Comment F-7A-53.

Response to Comment F-7C-21. In response to comments regarding focused cumulative impacts refer to Response to Comment F-7A-64.

Response to Comment F-7C-22. The commenter believes a 1,000-foot wide buffer of non-industrial land uses is needed for the west side of the project, and then it is consistent with Policy 2.5.2. The City's Municipal Code Section -9.05.040B (9) requires only a 250-foot setback between residential and industrial uses. Therefore, there is no need for a 1,000-foot wide buffer of non-industrial land uses to be consistent with Policy 2.5.2. In addition, a buffer analysis indicates that a 1,000-foot buffer does not substantially reduce the impact (please refer to Master Response 4).

Response to Comment F-7C-23. The mitigation proposed for the WLCSP does not ensure that special-status plant species are mitigated to a less than significant level. Based on the MSHCP requirements, no portions of the WLCSP require sensitive plant surveys based on the required survey areas for both Narrow-Endemic Plants Species as well as Cell Criteria Species. Therefore, focused plant surveys are only required within suitable habitat for those sensitive plant species that are not covered under or are conditionally covered under the MSHCP. Any future plant surveys will not limit the search to four plants listed below, but will be in accordance to CDFW guidelines as described in MM 4.4.6.1B.

Project related impacts to thread-leaved brodiaea, smooth tarplant, Coulter's goldfields, and slender-horned spine flower are covered under the MSHCP under Group d, which indicates that surveys may be required for these species within Criteria Areas as described in Section 6.3.2 of the MSHCP. Payment of the MSHCP fee will fully mitigate project related impacts to these species.

Under MSHCP guidelines impacts to Plummer's mariposa lily and Parry's spineflower, are conditionally covered and require 90 percent conservation of suitable habitat, if observed within the project site, until the conservation goal for these species is met. Based on previous surveys, these plants are not present within the project site. Since the development of the WLCSP will be spread out over 15 years, updated focused surveys for sensitive plants will be required on a project-by-project basis and is included as MM 4.4.6.1B.

Protocol level sensitive plant surveys will not be limited to Coulter's goldfields, smooth tarplant, and thread-leaved brodiaea, but will include all sensitive species with a moderate to high potential to occur within the project site, which also includes slender-horned spine flower, Plummer's mariposa lily, Parry's spineflower, Robinson's peppergrass, and San Bernardino aster.

Due to the disturbed nature of the project site, impacts to Robinson's peppergrass and San Bernardino aster will not be considered a significant impact unless the WLCSP will impact a large enough population of either of these plants that the loss would reduce the regional population to a less than self-sustaining level. Project-related impacts to a few sensitive plant individuals is an adverse, but less than significant level. Relocation of a few plant species, although not a

recommended means of mitigation, will be used as a last resort to salvage and relocate Robinson's peppergrass and San Bernardino aster to the 250-foot buffer area, if present within the WLCSP. No other mitigation measures are necessary because there are no sensitive plant species within the WLCSP that would result in a significant impact.

Response to Comment F-7C-24. In response to comments regarding burrowing owl, refer to Response to Comment F-7A-56.

Response to Comment Appendix 1. The appendix was directly referenced in the comment letter. It is assumed that the appendix is intended to provide personal qualifications and references for Scott Cashen, the commenter. Based on a review of the resume, Mr. Cashen is an experienced biologist in northern California with a focus on renewable energy projects. He also provides litigation and expert witness support to his clients. Mr. Cashen does not have experience with the Western Riverside County MSHCP. The information was considered in preparing the response to comments.

Response to Comment Appendix 2. This appendix was directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information with regard to raptor usage in the area. The raptor study was conducted by vehicle over several months. The project biologist does not refute the information that is contained within the document and it provides some general information with regard to the number of raptors that are known to occur in the area. It does not account for multiple observations of the same bird over a period of time. This information is useful for species diversity, but does not go into detail with regard to the total number of individuals that utilize the area. The information was considered in preparing the response to comments.

Response to Appendix 3 (Roadside Raptor Surveys of SAR Watershed). This appendix was directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information with regard to raptor usage in the region. The raptor study was conducted by vehicle over several years within a portion of the Santa Ana River Watershed in both Riverside and San Bernardino Counties. It appears to be an executive summary and does not contain a detailed description of methods or survey locations. Similar to the information mentioned above, the document provides general information with regard to the number of raptors that are known to occur in the Santa Ana River Watershed. It does not account for multiple observations of the same bird over a period of time. This information is useful for species diversity, but does not go into detail with regard to the total number of individuals that utilize the area. The information was considered in preparing the response to comments.

Response to Appendix 4 (The Biodiversity of Open Space Grasslands at a Suburban/Agricultural Interface by Mark E. Beny, Carl E. Bock, and Sandra L). This appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Urban/Wildlands Interface. The information was considered in preparing the response to comments.

Response to Appendix 5 (The Translocation as a species Conservation Tool: Status and Strategy by Brad Griffith, Michael Scott, James Carpenter and Christine Reed). This appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to relocating sensitive species as a conservation tool. The information was considered in preparing the response to comments.

Response to Appendix 6 (The Burrowing Owls and Development: Short-Distance Nest Burrow Relocation to Minimize Construction Impacts). This appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to relocation of burrowing owls. The information was considered in preparing the response to comments.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 7 (Assessing Changes in the Distribution and Abundance of Burrowing Owls in California, 1993-2007). This appendix was directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the changes in burrowing owl populations and recommend conservation measures to improve burrowing owl populations. This letter does not take into consideration conservation that has been implemented through the MSHCP. This information was considered in preparing the response to comments.

Response to Appendix 8 (Review of the Agricultural Elements of the World Logistics Center Project). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to potential agricultural resource impacts from the WLC.

Response to Appendix 9 (Qualifications of Gregory A. House). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide the qualifications and references of Gregory A. House, agricultural consultant.

Response to Appendix 10 (Moreno Valley Economic Development Summary). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the economic development summary for Moreno Valley from March 2013.

Response to Appendix 11. The commenter provided “Addressing Climate Change at the Project Level, California Attorney General’s Office.” See Response to Comment F-1-66 which identifies the feasibility for each of the suggested greenhouse gas measures listed by the Attorney General.

Re: World Logistics Center Project Draft Environmental Impact Report
(SCH #2012021045)

Dear Mr. Terell:

This firm represents the Friends of the Northern San Jacinto Valley with respect to the proposed World Logistics Center Project ("WLC" or "Project"). We respectfully submit this letter to present comments on the Draft Environmental Impact Report ("DEIR") circulated by the City of Moreno Valley for the proposed Project pursuant to the California Environmental Quality Act ("CEQA"), Public Resources Code § 21000 *et seq.*

The Project as proposed and described in the DEIR is enormous. Highland Fairview, the applicant, proposes to build more than 41 million square feet of warehouse and associated uses on over 2,700 acres of land. The new users of the site would overwhelm the area's roadways, in violation of the City's General Plan, and the Project itself would require extensive on- and off-site infrastructure and utilities. Through this approval, Highland Fairview seeks specific vested rights to build this particular project at this specific density.

Yet, due to the City's decision to prepare a programmatic EIR for the Project, critical details of the Project and its related infrastructure remain entirely

undefined. In many instances, the DEIR improperly defers both analysis and mitigation of the Project's impacts to some future, post-approval date. For example, the DEIR fails to provide crucial information relating to the extensive network of storm water infrastructure that would be needed to adequately handle increased storm water flows. This deferral is particularly problematic given the nature of the Project site, which has a history of poor drainage and localized flooding. The DEIR also asserts that the Project can be designed to avoid impacts to scenic viewsheds from State Route 60, but defers determining how the 41 million square feet of high-cube buildings can actually be arranged to accommodate these views.

2

3

The overly simplified nature of this programmatic EIR and its deficient impact analyses and mitigation measures undermine the very purpose of CEQA. As the Supreme Court has explained, the EIR is "the heart of CEQA." *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 392 ("*Laurel Heights I*") (citations omitted).

[It] is an environmental "alarm bell" whose purpose is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return. The EIR is also intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action." Because the EIR must be certified or rejected by public officials, it is a document of accountability.

4

Id. (citations omitted).

Where the environmental document fails to fully inform decision makers and the public of the environmental consequences of the proposed actions, it does not satisfy the basic goals of CEQA. "The purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project." Pub. Res. Code § 21061. The DEIR here fails to fulfill this purpose.

5

For all the reasons set forth below, it is our opinion that the DEIR does not comply with the requirements of CEQA. The City must revise and recirculate the DEIR to provide the public an accurate assessment of the environmental issues at stake, and a mitigation strategy—developed *before* project approval—that fully addresses the

6

Project's significant impacts. The City must also take a serious look at alternatives that can avoid or lessen the Project's significant impacts, rather than designing straw-man alternatives to make this particular Project seem like the only possible choice.

6

Finally, the Project demonstrates a disturbing disregard for the City of Moreno Valley General Plan's provisions developed to protect the environment and human health and well-being. Although the applicant proposes to amend to the General Plan, these amendments would likely only serve to undermine the integrity of the City's planning efforts. Thus, because the Project conflicts with fundamental General Plan provisions so as to result in significant environmental impacts, and because the City has failed to adequately identify these conflicts in the EIR, approval of the Project would violate not just CEQA, but also the California Planning and Zoning Law, Gov't Code § 65000 *et seq.*, and the Subdivision Map Act, Gov't Code §§ 66473.5, 66474.

7

I. THE PROJECT VIOLATES THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.

A. The City's Reliance on a Programmatic EIR Is Unlawful Because the Project Includes Vested Rights to Develop.

From the outset, the DEIR establishes that it will offer a "programmatic" review of the WLC. DEIR at 1-1 ("It is important to note that, even though this project has a Specific Plan, it does not have a site plan showing actual building locations, so the EIR will be programmatic rather than project level."); DEIR at 2-3. For that reason, the DEIR repeatedly defers analysis of environmental impacts and the development of mitigation and alternatives to a later time. The City avers this analysis will occur once the development plans are more specific. This approach violates the core tenant of CEQA: environmental impacts of a project are to be studied and disclosed at the earliest possible time.

8

"The most common type of EIR" is the "project EIR," which "examines the environmental impacts of a specific development project." CEQA Guidelines § 15161.¹ By contrast, programmatic EIRs are "designed for analyzing program-wide effects, broad policy alternatives and mitigation measures, cumulative impacts and basic policy considerations, as opposed to specific projects within the program." *Friends of*

9

¹ The CEQA Guidelines, Cal. Code Regs., tit. 14 § 15000 *et seq.*, are referred to herein as "CEQA Guidelines." The courts generally accord the Guidelines "great weight." *Laurel Heights I*, 47 Cal.3d at 391, fn. 2.

Mammoth v. Town of Mammoth Lakes Redevelopment Agency (2000) 82 Cal.App.4th 511, 533-34; CEQA Guidelines § 15168(c). Programmatic EIRs frequently serve as “first-tier” documents, whereby review for future specific projects relies in part on the analysis contained in the programmatic EIR. The City asserts that it will use the programmatic EIR as a first-tier EIR in this instance. DEIR at 3-27 (“This programmatic EIR provides a streamlined environmental review process for future development projects in the WLC Specific Plan area, including site-specific subdivisions and development entitlements that are consistent with the overall plan.”); *id.* at 3-75.

CEQA, however, permits the use of programmatic environmental review documents only in certain limited circumstances. In particular, programmatic EIRs—and later tiering—are permitted only when a lead agency considers a wide-ranging set of policies or an over-arching land use plan. *See, e.g., Al Larson Boat Shop, Inc. v. Board of Harbor Comrs.* (1993) 18 Cal.App.4th 729, 740 (noting the appropriateness of using a first-tier EIR for the adoption of a general plan “which is by its nature tentative and subject to change”); Pub. Res. Code § 21068.5 (tiering is available from a first-level document that reviews a “policy, plan, program or ordinance”); CEQA Guidelines §§ 15152(c), 15168. Programmatic EIRs have been upheld for such programs as a statewide water management plan (*In re Bay Delta Programmatic Environmental Impact Report Consolidated Proceedings* (2008) 43 Cal.4th 1143) and a major port expansion project (*Al Larson Boat Shop*, 18 Cal.App.4th at 740). This use of a programmatic EIR makes practical sense: it allows a lead agency to weigh the pros and cons of a general policy choice before proceeding to make site-specific decisions.

The CEQA Guidelines, however, caution that “[t]iering does not excuse the lead agency from adequately analyzing reasonably foreseeable significant environmental effects of the project and does not justify deferring such analysis to a later tier EIR or negative declaration.” CEQA Guidelines § 15152(b). Consequently, when an agency commits to a course of action by issuing binding approvals for a specific project, the use of a programmatic EIR and its generalized and deferred analysis are unlawful. *Id.* § 15152(c) (prohibiting the use of tiering to “prevent adequate identification of significant effects of the planning approval at hand”); *In re Bay Delta Programmatic Environmental Impact Report Consolidated Proceedings*, 43 Cal.4th at 1171 (distinguishing a statewide water management program, an appropriate subject of a programmatic EIR, from projects involving “proposed commercial land developments . . . on identified sites”).

In *Stanislaus Natural Heritage Project v. County of Stanislaus* (1996) 48 Cal.App.4th 182, the California Court of Appeal struck down the use of a first-tier EIR for a project analogous to the one under review by the City. In that case, Stanislaus County approved a private developer’s proposal to build a “destination resort and

residential community” that featured golf courses, sports facilities, and 5,000 residential units. *Id.* at 186. For its approval, the county prepared a “first-tier EIR” that, like this DEIR, explicitly deferred important aspects of environmental review to a later document. *Id.* at 197-98.

The Court of Appeal firmly rejected this approach: “[T]iering is not a device for deferring the identification of significant environmental impacts that the adoption of a specific plan can be expected to cause.” *Id.* at 199. Instead, because the county “adopted a specific plan calling for construction of [specific] facilities and of other particularly described facets of the [proposed resort]” (*id.* at 203), it had to prepare a project-level EIR. The court took particular issue with the project’s commitment to (1) “the specific sites for future development,” (2) “the timing of construction” and (3) “what structures the future development will consist of.” *Id.* at 204.

All three factors counsel in favor of a project EIR in this instance. The City is proposing to approve not only General Plan amendments, which alone might warrant a programmatic EIR, but also a Specific Plan, a Tentative Parcel Map, and a Development Agreement. DEIR at 3-25; 3-65, 3-74. The public has yet to be informed regarding the contents of the Development Agreement or the location or size of the parcels to be subdivided, but these activities will vest certain specific rights and entitlements with the developer, should the City approve the Project as proposed. Given the importance of these documents, the City must release this information to the public and provide additional time for review and comment. Pub. Res. Code § 21092(b)(1).

Regardless of the specifics, once a development agreement is approved, a public agency “shall not prevent development of the land for the uses and to the density or intensity of development set forth in the agreement,” even if the project requires further discretionary approvals. Gov. Code § 65865.2; *see also Citizens for Responsible Government v. City of Albany* (1997) 56 Cal.App.4th 1199, 1214-15 (development agreement creates vested rights in the form of an “entitlement for use”); DEIR at 3-74 (noting that the development agreement will “provide certainty for the future development of the project for those parcels owned by Highland Fairview”). If the agency breaches a development agreement, it may be subject to damages. *See Mammoth Lakes Land Acquisition, LLC v. Town of Mammoth Lakes* (2010) 191 Cal.App.4th 435, 443-47, 476 (developer awarded \$30 million for town’s anticipatory breach of development agreement).

Moreover, a city cannot later impose new standards or conditions on an approved vesting tentative map that were not in place at the time the application was deemed complete. *Bright Development Co. v. City of Tracy* (1993) 20 Cal.App.4th 783,

788. The DEIR's efforts to characterize the tentative parcel map as a mere technicality are ill-founded. DEIR at 3-25 ("A Tentative Parcel Map is being processed to subdivide 1,539 acres of the project for financing purposes only. . . . Approval of the map will confer no development rights to the property."). The Subdivision Map Act provides no mechanism for dividing land for a limited purpose such as financing. Instead, all resulting parcels can be sold, financed, or developed separately. A subdivision map is, by definition, a land use entitlement, not a financing mechanism. *See* Gov't Code § 66424 (defining "subdivision" as "the division, by any subdivider, of any unit or units of improved or unimproved land, or any portion thereof . . ."). We have located no law suggesting that a subdivision, even if created for the purpose of financing, is not a land use entitlement that could lead to development. The revised DEIR must clarify the legal import of this subdivision map.

14

Given these specific land use entitlements, the City's use of a programmatic EIR for the Project is entirely inappropriate. The City must instead employ a project EIR in order to meet CEQA's core mandate: to conduct a full environmental analysis at the time of a project's earliest approval. *See, e.g., Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 134.

15

The City's programmatic approach creates errors throughout the document. Some examples include:

- The DEIR's failure to produce visual renderings of the Project. DEIR at 1-9 (Mitigation Measure 4.1.6.1B).
- The DEIR's failure to conduct a glare analysis for solar panels, despite the Specific Plan's requirement for a "maximize[d] [] use" of roof-mounted solar systems. DEIR at 1-9 (Mitigation Measure 4.1.6.4B); *id.*, App. H at 10.
- The DEIR's failure to conduct surveys or analysis for sensitive plant species, the L.A. Pocket Mouse, and other biological resources. *E.g.*, DEIR at 1-14 (Mitigation Measure 4.4.6.2A), *id.* at 1-15 (Mitigation Measure 4.4.6.4E).
- The DEIR's failure to conduct a jurisdictional delineation of wetlands. DEIR at 1-14 (Mitigation Measure 4.4.6.3A).
- The DEIR's failure to conduct a geotechnical fault study. DEIR at 1-19 (Mitigation Measure 4.6.6.1A, B).
- The DEIR's failure to conduct grading and drainage studies. DEIR at 1-38 (Mitigation Measure 4.16.1.6.2A).

16

17

18

19

20

21

- The DEIR's failure to develop air pollution control measures. DEIR at 1-11 to 12 (Mitigation Measure 4.3.6.2A).

21

These errors are only compounded by others detailed elsewhere in this letter.

The very real problem created by the use of a programmatic EIR in this instance will become evident only after this phase of the development is approved. Highland Fairview is seeking specific vested rights through the Development Agreement and Tentative Parcel Map. Once these approvals are granted, it is impossible to undo them. *See, e.g., Citizens for Responsible Government*, 56 Cal.App.4th at 1223 (“[T]he purpose of a development agreement is to provide developers with assurance that they can complete the project. After entering into the development agreement . . . the City is not free to consider the wisdom of the project in light of environmental effects.”). Yet the DEIR is proposing to defer analysis of significant environmental effects and the development of necessary mitigation measures off into the future. Granting these approvals for a specific project at a guaranteed density now, before adequate CEQA analysis has been completed, contravenes CEQA's primary goal: to study the environmental impacts of an action *before* making a binding decision. *Laurel Heights I*, 47 Cal.3d at 392.

22

The DEIR must be revised as a project EIR, a document that will thoroughly analyze the impacts of the entitlements granted the developer, and identify appropriate mitigation measures and alternatives. Without a properly detailed level of analysis, the City cannot include the Specific Plan, Development Agreement, or Tentative Parcel Map as part of its approvals.

23

B. The DEIR's Project Description is Inadequate.

Even though the City proposes to grant specific vested rights to the applicant via this approval, the DEIR's project description fails to provide a complete picture of the entire Project. In order for an EIR to adequately evaluate the environmental ramifications of a project, it must first provide a comprehensive description of the project itself. “An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR.” *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730 (quoting *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193). As a result, courts have found that even if an EIR is adequate in all other respects, the use of a “truncated project concept” violates CEQA and mandates the conclusion that the lead agency did not proceed in the manner required by law. *San Joaquin Raptor/Wildlife Rescue Center*, 27 Cal.App.4th at 729-30. Further, “[a]n accurate project description is necessary for an

24

intelligent evaluation of the potential environmental effects of a proposed activity.” *Id.* at 730 (citation omitted). Thus, an inaccurate or incomplete project description renders the analysis of significant environmental impacts inherently unreliable. Here, the DEIR for the WLC Project does not come close to meeting this established legal standard.

24

In practical terms, the WLC is a plan to erect more than 41 million square feet of warehouses and warehousing-related uses in the middle of what are now mostly agricultural lands in the City of Moreno Valley. Because of the scale and the timing of the Project—it is slated to be developed over a period of 10 years—the DEIR has a lot of ground to cover. There may be further discretionary approvals down the road, but this EIR and the approvals it informs are the only opportunity for decision makers and the public to understand and weigh in on the “big-picture” questions that will determine what kind of Project will be created in their midst, or whether this massive Project should be created at all.

25

1. Construction Phasing and Infrastructure Improvements Are Undefined.

Despite proposing to provide Highland Fairview with certain vested rights, the DEIR fails to contain fundamental information relating to the phasing and timing of the Project’s development and infrastructure. The document states that the Project will be built over the next ten years, absorbing approximately four million square feet of development each year, depending on market conditions. DEIR at 3-65. The DEIR does not, however, provide any evidence that this phasing timeline is realistic. Other than estimating that construction is estimated to take ten years, the DEIR lacks any substantive description of how or when this massive Project would actually be implemented. Details of construction are critical to understanding the impacts of the Project and to designing appropriate mitigation, yet the DEIR lacks the necessary description of this critical Project component. The revised DEIR must describe the overall plan for construction of this Project.

26

Fundamental details pertaining to the infrastructure and public services necessary to serve the Project are also deferred until later, remaining unplanned and therefore unresolved. In a development of this size and duration, public and private improvements must be developed in a logical and viable sequence; infrastructure needs to be in place prior to demand for new development. Because the DEIR contains no documentation, let alone evidence, that development would be efficiently linked to necessary infrastructure, it violates CEQA. Courts have made it abundantly clear that infrastructure improvements that are integral to a project must be analyzed in an EIR.

San Joaquin Raptor/Wildlife Rescue Center, 27 Cal.App.4th 713; *Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 830.

What little detail exists in the DEIR regarding infrastructure components such as water and wastewater service, flood control, and drainage and electrical service is given such cursory treatment that the public and decision-makers are left in the dark as to how the development would actually function. Although the DEIR contains diagrams of the water, wastewater, and drainage systems (Figures 3.13, 3.14, 3.15), these graphics simply depict the location and tentative size of utility lines. The description of the storm water drainage system, for example, amounts to nothing more than self-evident ruminations that a drainage system will be constructed. *See* DEIR at 1-54 (stating “[p]rior to issuance of any development permit within the Specific Plan area, the developer shall place detention basin(s) and spreading area(s) as appropriate within each proposed watershed).

In addition, as the report from Tom Brohard & Associates explains, the Project would result in a substantial increase in traffic congestion, yet the DEIR provides no assurance that the many needed improvements to local and regional roadways would keep pace with development.² In fact, the DEIR concedes that area roadways will operate under gridlock conditions during every phase of development and upon buildout. *Id.* at 1-32 to 1-35 (finding traffic impacts to be significant and unavoidable).

The Project would also require construction of a number of off-site infrastructure improvements, including debris basins and water reservoirs, covering more than 100 acres of land adjacent to the Project site. *Id.* at 3-19. Yet, the DEIR omits critical details associated with these improvements, such as their specific location or design. For example, while the DEIR states the Project will require the construction of three new off-site reservoirs (*id.* at 3-45, 61, 4.16-14), the details pertaining to these reservoirs are never identified. Nor is there any indication that the DEIR has analyzed the environmental effects associated with the construction of these facilities.

As described above, given that the City intends to use this EIR to support subdivision maps and a Development Agreement, the DEIR cannot put off analysis of necessary infrastructure planning. The public and decision makers must know now whether it is possible to develop infrastructure that is able to accommodate the density

² This report is submitted under separate cover.

that the City intends to guarantee to the applicant. The revised EIR must contain a description and analysis of these integral aspects of the Project.

30

2. The DEIR Does Not Identify General Plan Amendments Needed to Implement the Proposed Project.

The vagueness of the DEIR's description of the Project creates all sorts of analytical problems, including making it impossible to determine the Project's consistency with the City of Moreno Valley General Plan or to analyze the Project's land use impacts. The Project requires amendments to the General Plan's Goals and Objectives, as well as to several General Plan elements, including to the Community Development; Circulation; Parks, Recreation and Open Space; Safety; and Conservation elements. *Id.* at 3-25, 4.10-1. Amazingly, however, the DEIR fails to identify the *content* of these amendments or explain how they would relate to the existing General Plan. The scant explanation that is provided is entirely vague (e.g., "revise land use map," and "revise discussion on flood hazards" (*id.* at 3-71 and 3-72)). With respect to the transportation and circulation improvements, for example, the DEIR asserts that a revised General Plan Circulation Element will provide for the movement of vehicles in and around the WLC area. *Id.* at 3-33. Yet, the DEIR does not include the text of this "revised Circulation Element" or even bother to describe it in general terms.

31

As discussed below, the Project would be inconsistent with numerous provisions of the General Plan. Yet, because the DEIR does not identify the specific amendments to the General Plan, the public and decision makers have no idea whether it is even possible to rectify all of the General Plan inconsistencies, while ensuring the integrity of the Plan. Some of the amendments may result in environmental impacts, while other amendments may result in internal inconsistencies within Plan. The environmental impacts and planning inconsistencies arising from these amendments are indirect impacts of the Project. Under CEQA, they must be identified, analyzed, and mitigated now; they cannot wait until after approval of the Project.

32

C. The DEIR's Analysis of and Mitigation for the Impacts of the Proposed Project Are Inadequate.

The discussion of a proposed project's environmental impacts is at the core of an EIR. *See* CEQA Guidelines § 15126.2(a) ("[a]n EIR shall identify and focus on the significant environmental effects of the proposed project"). An EIR must effectuate the fundamental purpose of CEQA: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." *Laurel Heights Improvement Assn. v. Regents of the University of California* (1993) 6 Cal.4th 1112, 1123

33

(“*Laurel Heights II*”). To do so, an EIR must contain facts and analysis, not just an agency’s bare conclusions. *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 568.

33

An EIR must also identify feasible mitigation measures to minimize significant environmental impacts. CEQA Guidelines § 15126.4. Under CEQA, “public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects . . .” Pub. Res. Code § 21002. California courts have made clear that an EIR is inadequate if it fails to suggest feasible mitigation measures, or if the proposed mitigation measures are so undefined that it is impossible to evaluate their effectiveness. *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1984) 151 Cal.App.3d 61, 79.

34

As explained below, the EIR’s environmental impacts analysis is deficient under CEQA because it fails to provide the necessary facts and analysis to allow the City and the public to make informed decisions about the WLC Project and its environmental impacts. The DEIR also impermissibly defers analysis and the development of mitigation until after Project approval—clear violations of CEQA. Finally, the conclusions drawn in the DEIR regarding the significance of Project impacts and the adequacy and efficacy of mitigation are not supported by evidence. For all of these reasons, the DEIR is inadequate under CEQA.

35

1. The DEIR Fails to Adequately Analyze and Mitigate the Project’s Hydrological Impacts.

Insufficient drainage on and around the Project site currently causes localized flooding. The proposed Project would result in a substantial increase in the amount of impervious surfaces. Consequently, the post-development flow volumes that will be generated on site are anticipated to be substantially higher than the pre-development flows. DEIR at 4.9-28, 29. At the same time, the Project would substantially alter the existing drainage pattern of the site and area. This additional runoff volume and velocity, reduced infiltration, and increased flow frequency and duration have the potential to exceed the capacity of existing or planned storm water drainage systems. Notwithstanding these facts, the DEIR fails to accurately describe the existing drainage and flooding problems, fails to adequately analyze the Project’s potential to exacerbate these problems, and fails to identify enforceable mitigation for these impacts.

36

(a) The DEIR Fails to Describe the Project's Hydrological Setting.

CEQA requires that an initial study contain “an identification of the environmental setting.” CEQA Guidelines § 15063(d)(2). “Without accurate and complete information pertaining to the setting of the project and surrounding uses, it cannot be found that [a CEQA document] adequately investigated and discussed the environmental impacts” of the Project. *San Joaquin Raptor/Wildlife Rescue Center*, 27 Cal.App.4th at 729.

37

The DEIR generally concedes that the Project site and vicinity suffer from poor drainage and localized flooding. Members of the public have also expressed concerns regarding the Project's effects on local drainage, especially in locations that currently experience historic localized flooding. DEIR at 4.9-8. Drainage from east of Gilman Springs Road has been an on-going problem as it flows southwest and south out of the Badlands and under Gilman Springs Road through corrugated steel pipe culverts. These culverts are relatively small, and during times of high flow, runoff often causes repeated localized flooding along the roadway. *Id.* at 3-51. Despite recognizing this problem, the DEIR fails to describe these flooding incidents. Where does this flooding occur, and how often? How extensive is the flooding? What properties, if any, have been affected? What measures, if any, have been taken to control the drainage and flooding?

38

Nor does the DEIR include fundamental information regarding the site's hydrologic characteristics. It does not disclose, for example, the amount of existing impervious surfaces on the site, or the site's existing storm flow velocities or volumes. Without this information, it is not possible to determine if post-development velocities or volumes would exceed pre-development conditions, as the DEIR claims. *Id.* at 4.9-30.

39

In addition, the DEIR's hydrological chapter never discloses that the site contains numerous natural drainage channels and blue-line (waters of the state of California) streams. It is not until the biological resources chapter that the reader learns there are a total of 14 primary drainages and a number of sub-drainages or tributaries on the Project site. *Id.* at 4.4-59. Yet, the biological resources chapter discusses these drainages only in the context of riparian and wetland resources. Consequently, there is no discussion of the hydrological value of these creeks. Moreover, because the DEIR's hydrological analysis does not disclose the location—or even the existence—of these natural drainage features, it does not analyze whether the Project would result in a substantial alteration of the existing drainage pattern of the site consistent with the DEIR's thresholds of significance. *See id.* at 4.9-17 (“[A] project would have a

40

significant impact on surface hydrology if it would result in a substantial alteration of the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river.”).

40

As discussed below, the DEIR’s analysis focuses exclusively on whether post-development storm water flows would be greater than pre-development storm water flows. While this is an issue that requires analysis, the DEIR cannot simply omit evaluation of the Project’s impact on natural storm drainages. In particular, the DEIR must actually analyze the hydrological effect to downstream resources (e.g., San Jacinto Wildlife Area, Mystic Lake, and San Jacinto River). The EIR must be revised to include this analysis.

41

(b) The DEIR Fails to Adequately Analyze the Project’s Hydrological Impacts.

There are numerous deficiencies in the DEIR’s analysis of drainage and flooding impacts. First, as discussed above, the DEIR fails entirely to analyze the Project’s impacts to natural drainages and streams. The only mention of a potential impact to a natural drainage feature occurs in the context of biological resources. Here, the DEIR admits that the proposed Project may impact Drainage Feature 12, located on the San Jacinto Wildlife Area (“SJWA”), but then defers any analysis. Instead, the DEIR asserts that if any impacts are to occur, regulatory permitting may be required. *Id.* at 4.4-59. As California courts make clear, merely requiring compliance with agency regulations does not conclusively indicate that a proposed project will have no significant impacts. In *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 716, for example, the court found that the fact that the EPA and the local air pollution control district had issued air emission permits for a coal-fired cogeneration plant did not nullify CEQA’s requirement that the lead agency analyze the significant air quality impacts of the entire project. The revised EIR must analyze the Project’s potential impacts to all natural drainage features. If these impacts are significant, the EIR must identify mitigation and/or alternatives capable of minimizing or eliminating altogether these impacts.

42

Second, the DEIR fails to use the correct baseline for analyzing the Project’s storm water impacts under CEQA because it assumes the implementation of storm water infrastructure improvements. In analyzing the Project’s effects, the DEIR must evaluate the Project’s impacts against a baseline of existing conditions, not a hypothetical future environment where planned infrastructure will be built. In *Sunnyvale West Neighborhood Assn. v. City of Sunnyvale*, the City of Sunnyvale certified an EIR that measured the project’s impacts against a baseline of traffic conditions in the year

43

2020; these conditions assumed a future scenario where: (1) development had occurred according to the city's general plan, and (2) "numerous roadway improvements in the project area [were] in place by the year 2020" (2010) 190 Cal.App.4th 1351, 1361. In a lengthy analysis, the court held that this approach violated CEQA as a matter of law:

The statute requires the impact of any proposed project to be evaluated against a baseline of existing environmental conditions (*see* §§ 21060.5, 21100, subd. (d); *see also* CEQA Guidelines § 15125, subd. (a)), which is the only way to identify the environmental effects specific to the project alone.

Id. at 1380.

Here, the DEIR authors make the exact same error. The analysis simply assumes that storm water runoff will be stored in on-site basins or somehow infiltrated in the ground. DEIR at 4.9-29, Table 4.9.G, Footnote 1. Yet, as discussed below, there is no indication that this storm drain infrastructure will be constructed. Because the DEIR assumes the implementation of this as-of-yet unplanned storm water infrastructure, it concludes that post-development storm water flows would not exceed pre-development storm water flows. *Id.* at 4.9-29. An adequate environmental analysis would include the following four steps:

- (1) identify existing hydrologic conditions;
- (2) identify the Project's impact (assessment of the increase in storm flows attributable to proposed Project and the site's ability to accommodate these flows);
- (3) identify proposed storm water control features; and,
- (4) evaluate whether the storm water features are sufficient to ensure that post-development flows do not exceed pre-development flows.

The DEIR skips steps 1 through 3 and simply concludes, absent factual analysis, that post-development flows will exceed pre-development flows. DEIR at 4.9-29.

(c) The DEIR Proposes Insufficient Mitigation for the Project's Hydrological Impacts.

Notwithstanding this flawed impact analysis, the DEIR concludes that the Project would result in a significant hydrological impact. *Id.* at 4.9-29. The DEIR's approach to mitigation is insufficient, however, because it lacks the evidentiary support to

43

44

conclude the impacts would be reduced to insignificant levels. When a lead agency relies on mitigation measures to find that project impacts will be reduced to a level of insignificance, there must be substantial evidence in the record demonstrating that the measures are feasible and will be effective. *Sacramento Old City Assn. v. City Council of Sacramento* (1991) 229 Cal.App.3d 1011, 1027; *Kings County Farm Bureau*, 221 Cal.App.3d 692, 726-29. To this end, the DEIR must set forth either specific mitigation measures or specific performance standards guaranteeing that mitigation will be successful. See CEQA Guidelines § 15126.4; see also *Sacramento Old City Ass'n*, 229 Cal.App.3d at 1034. Here, the DEIR lacks the evidence necessary to show that the Project will not contribute to on-going drainage and flooding problems.

44

The DEIR identifies exactly one mitigation measure for the Project's significant drainage and flooding impacts. This measure (4.9.6.1A) would route the on-site storm water flows through a series of detention and infiltration basins, so that storm water flows are reduced to equal or below pre-development conditions. DEIR at 4.9-30. Specifically, the DEIR calls for the developer to place detention basin(s) and spreading area(s) *as appropriate* within each proposed watershed, to "mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development conditions." *Id.* (emphasis added). Unfortunately, there are numerous flaws with this proposed measure.

45

First, by using phrases such as "as appropriate," the DEIR provides no assurance or commitment that the storm water facilities will ever be implemented. *San Franciscans for Reasonable Growth*, 151 Cal.App.3d at 79. The CEQA Guidelines state that "mitigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments." CEQA Guidelines § 15126.4(a)(2).

46

Second, although the DEIR asserts the "project hydrology plan" provides the details regarding the storm water facilities relating to peak flow rate, velocity, flow volume and the timing of releasing flows (at 3-46), the hydrology plan contained in Appendix J to the DEIR does no such thing. The hydrological appendix explicitly *excludes* the necessary details relating both to the design for controlling increased peak flow rate, velocity, and flow volume and to the methodology that would be used to release the outflow at a rate that does not exceed the pre-development conditions. Instead, the appendix improperly asserts that the approximate sizes of the basins will be determined in the final design stage. DEIR, App. J at 9.

47

Moreover, even if these important details were included in the DEIR's hydrological appendix, the DEIR's approach is unlawful. CEQA requires that the

48

analysis be presented in the EIR. *See Santa Clarita Organization for Planning the Environment v. County of L.A.* (2003) 106 Cal.App.4th 715, 722 (agency's analysis must be contained in the EIR, not "scattered here and there in EIR appendices").

"Decisionmakers and the general public should not be forced to sift through obscure minutiae or appendices in order to ferret out the fundamental assumptions that are being used for purposes of the environmental analysis." *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 659; *see also Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442 ("The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project.").

48

Third, although the Project will be constructed in phases, neither the DEIR nor the hydrological appendix provides any explanation as to whether or how the drainage improvements would keep pace with anticipated development. The DEIR does not set forth specific, measurable performance standards for the Project's drainage system that could justify later formulation of mitigation methods targeted to meet those standards. The closest the hydrology appendix comes is the vague statement that "proposed drainage systems which are connecting to the existing downstream facilities shall be designed so the proposed discharge does not exceed the existing discharge to the downstream facilities." DEIR, App. J at 7. The Specific Plan also lacks any performance standards for the drainage improvements. Instead, it simply states that "at each stage of development, the peak flows at downstream discharge points at the southerly project boundary will not exceed the peak flows for the existing conditions." DEIR, App. H at 42. Because the DEIR lacks any specific performance standards, this vague statement of intent is meaningless.

49

Fourth, the DEIR promises that post-development flows will not exceed the pre-development condition. DEIR at 4.9-30. Yet, as discussed above, the Project site and surrounding area currently experience flooding. By the DEIR's own admission, the post-development flow volumes that will be generated on-site are anticipated to be substantially higher than the pre-development flows. *Id.* at 4.9-29. Simply designing drainage facilities to meet pre-development drainage conditions provides no assurance that flooding will not continue to occur on and adjacent to the Project site. In fact, as the DEIR recognizes, flood control systems are not always constructed to the ultimate condition envisioned. *See id.* at 4.9-26. Moreover, without appropriate monitoring and maintenance, over time storm drainage systems may no longer provide sufficient capacity for storm water flows.

50

Indeed, the DEIR provides no mechanism for on-going maintenance of drainage facilities. As the hydrology appendix makes clear, proper maintenance is necessary to adequately convey flows. DEIR, App. J at 18. Sediment, for example, can be transported downstream, filling the downstream channel, leading to a decrease in channel capacity and an increase in flooding and overbank deposition. *Id.* at 16. In fact, the DEIR identifies sediment as the principal component in most storm water by volume. DEIR at 4.9-31. Rather than ensure regular monitoring and maintenance as Project mitigation, the DEIR specifically states that sediment basins will *not* be constructed as part of the Project. *Id.* Instead, it calls for operations, maintenance and funding details to be included in a Project specific water quality management plan ("WQMP"), to be prepared at a later date. *Id.* at 4.9-35. Such deferral of mitigation violates CEQA.

51

Fifth, the DEIR explains that projects that are identified as "Priority Development Projects" are required to prepare a Project-Specific WQMP. DEIR at 4.9-12. The City's Municipal Separate Storm Sewer System ("MS4") Permit System mandates a Low Impact Development ("LID") approach to storm water treatment and management of runoff discharges. *Id.* at 3-59. According to the DEIR, the Project site should be designed to minimize imperviousness, detain runoff, and infiltrate, reuse, or evapotranspire runoff where feasible. DEIR at 4.9-13. The DEIR goes on to explain that LID Best Management Practices ("BMPs") should be used to infiltrate, evapotranspire, harvest and use, or treat runoff from impervious surfaces, in accordance with the Design Handbook for Low Impact Development Practices. *Id.* We can find no indication that the Project or the mitigation measures include any design features to minimize imperviousness or reuse or evapotranspire runoff.

52

2. The DEIR's Analysis and Conclusions Regarding Aesthetic Impacts to State Route 60, a City-Designated Scenic Road, Are Unsupported.

The Project site is directly adjacent to State Route 60, designated a local scenic road under the City's General Plan. Existing agricultural fields currently allow expansive views across the site. Consequently, motorists driving along State Route 60 in the vicinity of the Project site, particularly those driving east, have excellent views of Mystic Lake and the San Jacinto Valley.

53

The DEIR's analysis of impacts to these views errs in two crucial ways. First, the DEIR's primary methodology for understanding Project impacts on scenic vistas and viewsheds fails to provide necessary information about the Project's impacts to views from State Route 60. The DEIR purports to identify specific key vantage points. DEIR at 4.1-17. Photographs of existing conditions at these key vantage points are

54

provided (*id.* at 4.1-11, 13); next, digital models of the Project are projected onto each key vantage point to approximate the Project's impacts (*id.* at 4.11-43 to 59). The flaw is that while the DEIR recognizes that impacts to the motoring public along State Route 60 have the potential to be significant (*id.* at 4.1-7), the DEIR offers only *one* vantage point from this location. *Id.* at 4.1-9. Moreover, the direction and scope of the photograph work to *cut off* the significant views from this scenic road. *Id.* at 4.1-13 (Photograph 12). The DEIR must be revised to disclose the true extent of these visual impacts.

54

Second, the DEIR erroneously concludes that the Project's visual changes "while substantial, are generally consistent" with the City's General Plan. *Id.* at 4.1-65, 69. The City's General Plan "require[s] development along scenic roadways [including State Route 60] . . . to allow for scenic views of the surrounding mountains and Mystic Lake." Moreno Valley General Plan Policy 7.7.5. The DEIR's simulation of views from State Route 60, however, indicates that the Project will completely block all views from the road out toward the San Jacinto Wildlife Area and Mystic Lake. DEIR at 4.1-55, 57.

55

To the extent the City relies on the "programmatic" nature of the EIR to justify its failure to simulate important views from State Route 60 (DEIR at 4.1-62 to 63), the tactic must fail. The DEIR's statement provides another example of the improper deferral encouraged by the City's inappropriate use of a programmatic EIR. *See* Part I(A).

The DEIR offers a number of excuses for this apparent contradiction. While the General Plan focuses on impacts to views of both the surrounding mountains and Mystic Lake, the DEIR focuses only on impacts to views of the "scenic uplands." DEIR at 4.1-7. Because the tips of the mountains may be visible over structures reaching 60 feet or higher, the City implies that the Project can still comply with the General Plan. This argument strains credulity. The General Plan refers to "scenic views" of the surrounding mountains and Mystic Lake. Because the Project will largely block these natural features, the views will not be "scenic." In addition, the DEIR must be clarified that the Specific Plan allows this 60 foot height limitation to be raised under certain circumstances. *E.g.*, DEIR at 4.1-61 (stating that "the project will allow a maximum of 60-foot tall warehouse buildings along the west, north, and south perimeters of the site"); DEIR, App. H at 113 (Specific Plan allows height exceptions up to an additional ten feet).

56

The DEIR also relies on an erroneous baseline: the Moreno Highlands Specific Plan. The DEIR states that the Project's change in views "while substantial, is anticipated in the City's General Plan, which allows development within the Project area," and therefore concludes that the Project is compliant with the General Plan. *Id.* at

57

4-1.65. It is black letter CEQA law, however, that a lead agency must consider a project's impact on the existing environment, not on the underlying land use designations. *Environmental Planning & Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354 (CEQA is not concerned with a project's impacts on a plan, but "with the impacts of the project on the environment, defined as the existing physical conditions in the affected area."). Relying on the Moreno Highland Specific Plan in this instance is particularly inappropriate, as the development agreement for that project has since expired and the City acknowledged in an update to its Housing Element in 2011 that that project will not be built. DEIR at 4.13-5.

57

In addition, the DEIR's conclusion regarding compliance with the General Plan's protections for scenic roads is based on a faulty assumption regarding the City's ability to mitigate for Project impacts. The DEIR states that the Project "can preserve significant visual features, significant views, and vistas if the size and location of building developed under the [specific plan] can be controlled so as not to substantially block views of Mount Russell, the Badlands, and Mystic Lake." DEIR at 4.1-65; *accord id.* at 4.1-69. Yet the DEIR includes no requirement to actually control the size and location of buildings; the only mitigation measures outlined in the DEIR relate to setbacks and visual screening. *Id.* at 4.1-65. While the DEIR states that the Specific Plan includes such restrictions (*id.* at 4.1-69), the DEIR is wrong. In fact, the Specific Plan's only provisions for protecting views and vistas call for localized screening and setbacks, which would have no impact on long-range views. *See, e.g.,* DEIR, App. H at 104, 106-07. The Specific Plan fails even to mention the important viewsheds toward Mystic Lake and San Jacinto Valley.

58

In any event, given the sheer size of the Project, it is unlikely that such mitigation is feasible at all. *See* Pub. Res. Code § 21081.6 (mitigation under CEQA must be both feasible and enforceable); *Lincoln Place Tenants Ass'n*, 155 Cal.App.4th at 445 (same). Over 950 acres of the of the 2710-acre Project site will be covered in buildings, and much of the remainder will be used for parking facilities and other improvements. DEIR at 3-19.

59

The City's unsupported conclusion regarding the Project's compliance with the General Plan leads to two legal outcomes. First, the City cannot approve a project that fails to comply with a General Plan policy, where, like Policy 7.7.5, the requirement is "fundamental, mandatory, and clear." *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 782. Second, inconsistency with a General Plan is a potentially significant impact under CEQA, which must be analyzed just like any other potentially significant impact. *Pocket Protectors v. City Of Sacramento* (2004) 124 Cal.App.4th 903, 930-34. Here, given the Project's clear inconsistency with a

60

fundamental General Plan policy intended to protect the environmental setting, the impact is significant. The DEIR must be revised to address the Project's inconsistency with a fundamental General Plan policy and to address the inconsistency as a significant impact under CEQA.

60

3. The DEIR Does Not Properly Analyze the Project's Land Use Impacts.

The DEIR also suffers from other land use related errors. CEQA requires that environmental impact reports analyze the consistency of a project with applicable local plans, including general plans. *See Napa Citizens for Honest Govt. v. Napa County Board of Supervisors* (2001 91 Cal.App.4th 342, 386-87; CEQA Guidelines, App. G, § IX (b)). Inconsistencies with a general plan or other local plan goals and policies that were enacted in order to protect the environment are significant impacts in themselves and can also be evidence of other significant impacts. *See id.*; *Pocket Protectors*, 124 Cal.App.4th at 929.

61

The DEIR's analysis of the Project's consistency with the City's General Plan is seriously flawed. First, because the proposed general plan amendments are not provided, it is not even possible to determine the Project's consistency with the General Plan. Second, what information that is provided in the DEIR makes clear that the Project would conflict with numerous General Plan provisions.

(a) Deficiencies in the Project Description Make It Impossible to Determine the Project's Consistency With the General Plan.

As discussed above, the DEIR fails to adequately describe key components of the Project. The DEIR does not include, for example, fundamental information pertaining to the utilities, infrastructure and public services that will be needed to serve the Project. The General Plan, however, contains provisions about the importance of ensuring that utilities, infrastructure and public services keep pace with development. Because the DEIR does not provide that assurance—for example, there is no assurance that storm drainage infrastructure will be constructed in advance of each phase of development—it is simply not possible to determine whether the Project is consistent with the General Plan.

62

Nor does the DEIR disclose the content of the proposed general plan amendments. Consequently, the public and decision makers are left in the dark as to whether the amendments would be consistent with the remaining elements of the General Plan or whether they would result in a General Plan that is internally inconsistent. Perhaps the most troubling omission pertains to the DEIR's treatment of the Project's

63

transportation circulation system. Here, the DEIR states that “the revised General Plan Circulation Element (as amended by the proposed project) and the Specific Plan’s Circulation Plan (Specific Plan Section 3.1) provides for the movement of vehicles in and around the World Logistics Center area.” DEIR at 3-33. Yet, we can find no indication that this “revised General Plan Circulation Element” has even been prepared. If this Circulation Element is a part of the proposed Project, as the DEIR implies, it must be described in the DEIR.

63

The implications of this omission are very important. The circulation element of a general plan serves as an “infrastructure” plan and must “correlate” with the other elements of the plan, including planned land uses called for in the land use element. *Concerned Citizens of Calaveras County v. Calaveras County* (1985) 166 Cal.App.3d 90, 99-104. The City must ensure that its discretionary land use projects do not result in a general plan land use element that is inconsistent with its circulation element. Here, the WLC Project calls for an enormous level of development that will result in significant and unavoidable traffic impacts. DEIR at 1-32 through 1-35. The DEIR does not analyze the Project’s consistency with the General Plan Circulation Element, or whether approval of the Project would result in an internally inconsistent General Plan.

64

(b) The Project Is Inconsistent With Numerous General Plan Objectives, Goals and Policies.

The General Plan embodies values and principles that recognize the importance of protecting the safety, healthy, and desirability of the City. *See* General Plan at 1-1, 9-1. These goals and policies are inextricably linked to preserving the environment through protection of visual resources, avoidance of noise-intensive uses and air emissions near sensitive receptors, and minimizing traffic impacts.

65

Notwithstanding the massive nature of the Project and the General Plan’s emphasis on environmental protection, the DEIR concludes that the Project is consistent with the Plan’s goals, policies, and objectives. To reach this contrived conclusion, the EIR carefully cherry-picks a sampling of isolated Plan policies. DEIR Table 4.10.E. Because the EIR ignores a myriad of other relevant policies—with which the Project flatly conflicts—the document misinforms decision makers and the public about the Project’s consistency with the General Plan.

66

Set forth below are examples of the Project’s General Plan inconsistencies. The DEIR provides either inaccurate analysis, or no analysis, of these conflicts.

67

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project
Policy 2.5.2	Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses. General Plan at 9-7.	<i>Inconsistent:</i> As the DEIR explains, the Project would result in increased noise, lighting, air pollutant, and health risk impacts. There is no effective mitigation available to protect or separate existing residences in the area from the Project's warehousing buildings and operations. The DEIR concludes this impact is significant and unavoidable. DEIR at 4.10-34.
Policy 2.5.3	Screen manufacturing and industrial uses where necessary to reduce glare, noise, dust, vibrations and unsightly views. General Plan at 9-7.	<i>Inconsistent:</i> As the DEIR explains, the Project would result in increased noise, lighting, air pollutant, and health risk impacts. There is no effective mitigation available to protect or separate existing residences in the area from the Project's warehousing buildings and operations. The DEIR concludes this impact is significant and unavoidable. DEIR at 4.10-34.

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project
Policy 2.10.11	Screen and buffer nonresidential projects from adjacent residential property and other sensitive land uses when necessary to mitigate noise, glare and other adverse effects on adjacent uses. General Plan at 9-9.	<i>Inconsistent:</i> As the DEIR explains, the Project would result in increased noise, lighting, air pollutant and health risk impacts. There is no effective mitigation available to protect or separate existing residences in the area from the Project's warehousing buildings and operations. The DEIR concludes this impact is significant and unavoidable. DEIR at 4.10-34.
Objective 2.13	Coordinate development activity with the provision of public infrastructure and services to eliminate possible gaps in service provision. General Plan at 9-10.	<i>Inconsistent:</i> During each phase of development, and at build out, the Project will generate significant amounts of traffic onto roadways, intersections, and freeways. The DEIR identifies these impacts as significant and unavoidable. DEIR at 1-32 to 35. The DEIR provides no evidence that storm drain infrastructure will be installed concurrent with development.

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project
Objective 5.3	Maintain Level of Service (LOS) “C” on roadway links, wherever possible, and LOS “D” in the vicinity of SR 60 and high employment centers. Figure 9-2 depicts the LOS standards that are applicable to all segments of the General Plan Circulation Element Map. General Plan at 9-18, 19.	<i>Inconsistent:</i> During each phase of development, and at build out, the Project will generate significant amounts of traffic onto roadways, intersections and freeways. The DEIR identifies these impacts as significant and unavoidable. DEIR at 1-32 to 35.
Policy 5.3.6	Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements. General Plan at 9-19.	<i>Inconsistent:</i> During each phase of development, and at build out, the Project will generate significant amounts of traffic onto roadways, intersections and freeways. The DEIR identifies these impacts as significant and unavoidable. DEIR at 1-32 to 35.

Mr. John Terrell
 April 8, 2013
 Page 25

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project
Policy 5-6	<p>Conduct studies of specified arterial segments to determine if any additional improvements will be needed to maintain an acceptable LOS at General Plan build-out. Generally, these segments will be studied as new developments are proposed in their vicinity. Measures will be identified that are consistent with the Circulation Element designation of these roadway segments, such as additional turn lanes at intersections, signal optimization by coordination and enhanced phasing, and travel demand management measures. The study of specified arterial segments will be required to identify measures to maintain an acceptable LOS at General Plan build-out for at least one of the reasons discussed below:</p> <ul style="list-style-type: none"> (a) Segments will need improvement, but their ultimate volumes slightly exceed design capabilities. (b) Segments will need improvements but require inter-jurisdictional coordination. (c) Segments would require significant encroachment on existing adjacent development if built-out to their Circulation Element designations. General Plan at 9-23, 24. 	<p><i>Potentially inconsistent:</i> The Project includes a “Revised Circulation Element” yet it is not included in the DEIR. The DEIR concludes that roadway segments would exceed applicable level of service thresholds and that these impacts are significant and unavoidable. DEIR at 1-32 to 35.</p>

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project	
Policy 6.2.3	Maximize pervious areas in order to reduce increases in downstream runoff resulting from new development. General Plan at 9-30.	<i>Inconsistent:</i> Although the DEIR does not identify the increase in impervious surfaces, the 41 million square foot development would result in an enormous increase in impervious surfaces in a location that already experiences drainage deficiencies and flooding. The DEIR provides no indication as to whether the applicant has taken any action to maximize pervious areas.	70
Policy 6.2.4	Design, construct and maintain street and storm drain flood control systems to accommodate 10-year and 100-year storm flows respectively. General Plan at 9-30.	<i>Potentially Inconsistent:</i> As discussed above, the DEIR provides no evidence that sufficient storm drain flood control systems will be implemented.	71
Policy 6.3.1	The following uses shall require mitigation to reduce noise exposure where current or future exterior noise levels exceed 20 CNEL above the desired interior noise level: Single and multiple family residential buildings shall achieve an interior noise level of 45 CNEL or less. Such buildings shall include sound-insulating windows, walls, roofs and ventilation systems. Sound barriers shall also be installed (e.g. masonry walls or walls with berms) between single-family residences and major roadways. General Plan at 9-31.	<i>Inconsistent:</i> The Project will result in significant and unavoidable construction- and operational- noise impacts. DEIR at 1-27, 28.	72

Objective, Goal and Policy	Definition	Consistency of Proposed WLC Project	
Objective 6.5	Minimize noise impacts from significant noise generators such as, but not limited to, motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities. General Plan at 9-31.	<i>Inconsistent:</i> The Project will result in significant and unavoidable construction- and operational- noise impacts. DEIR at 1-27, 28.	73
Policy 7.7.5	Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake. General Plan at 9-38.	<i>Inconsistent:</i> The Project will significantly impact viewsheds in the area, including views of the Mt. Russell Range, the Badlands, and Mystic Lake. DEIR at 1-9; <i>see also</i> Part I(C)(2) of this letter.	74
The revised EIR must examine each of the General Plan policies for which the Project may be inconsistent. If inconsistencies exist, the revised EIR must identify these as significant impacts and identify feasible mitigation or Project alternatives capable of minimizing or eliminating these impacts.			75
4. The DEIR's Analysis of Hazards and Hazardous Materials Is Inadequate.			
(a) The DEIR Fails to Provide Sufficient Information for Accurate Analysis and Decision-Making.			
The hazards and hazardous materials section of the DEIR lacks sufficient information to enable the public and decision-makers to make an informed judgment regarding the potentially significant impacts of the Project. In particular, the section relies on conclusory statements and unstated assumptions that are specifically prohibited under CEQA. <i>See Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.</i> (2001) 91 Cal.App.4th 1344, 1371 (striking down an EIR "for failing to support its many conclusory statements by scientific or objective data"); <i>San Joaquin Raptor Rescue Center</i> , 149 Cal.App.4th at 659 ("[D]ecision makers and general public should not be forced to . . . ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis.").			76

As an example, the DEIR states that “18 separate Phase I Environmental Site Assessments (ESAs) have been conducted covering a large majority of the property.” DEIR at 4.8-2. However, the DEIR fails to inform the public which areas have not been subject to Phase I ESAs and if any of these areas will be part of the 42 million cubic yards of cut and fill necessary to grade the Project site. *Id.* at 3.6-1. Without this information, the public and the relevant decision-makers cannot ascertain whether the DEIR accurately concludes that the Project will result in a less than significant impact with respect to hazardous materials. *Id.* at 4.8-17.

77

The Moreno Valley Local Hazard Mitigation Plan and the Moreno Valley General Plan also indicates the presence of hazardous materials sites on the Project site. Local Hazard Mitigation Plant at 89; Moreno Valley General Plan Final EIR, Figure 5.5-1. These sites are not disclosed or otherwise described in the Project EIR. Information about these hazardous materials sites, and the impacts of the Project on the sites, must be included in a revised draft EIR and recirculated for additional public comment.

78

Similarly, the DEIR states that certain setbacks “appear [to be] sufficient” to guard against potential risks from an existing regional natural gas compressor station located within the Project site. *Id.* at 4.8-15. The DEIR, however, contains no analysis or substantial evidence to support its conclusion that the specified setbacks are “sufficient.” This type of conclusory statement does not comport with CEQA’s informational purpose.

79

(b) The DEIR Fails to Adequately Mitigate for Potentially Significant Impacts.

In addition to its information disclosure requirements, CEQA mandates that lead agencies adopt all feasible mitigation measures that substantially lessen the significant environmental effects of a project. Pub. Res. Code § 21001. If a lead agency concludes that an impact is less than significant based on the presence of conditions or mitigation measures that lessen the potential impact, these conditions or mitigation measures must be adopted and enforceable. Pub. Res. Code § 21081(a) (A lead agency may not approve a project unless “changes or alterations have been *required in, or incorporated into*, the project which mitigate or avoid the significant effects on the environment.” (emphasis added)). In contravention of these requirements, the hazards and hazardous materials section of the EIR frequently relies on conditions or mitigation measure that the City appears *not* to intend to adopt or enforce.

80

For example, Phase I ESAs for the Project site indicate the presence of trash and debris, including some potentially hazardous material. *E.g.*, DEIR at 4.8-2 to 4 (noting several containers of paint, waste, and hydrocarbons and dozens of tires and other

81

debris). These materials present a potentially significant impact, in that they could create a significant hazard to the public or the environment through a reasonably foreseeable upset and release. *Id.* at 4.8-11. While the DEIR indicates that “all containers of hazardous materials and waste will need to be lawfully transported off site for disposal or recycling by a licensed hazardous waste transporter” (*id.* at 4.8-4), this requirement is not listed as a condition or mitigation measure for the Project. As mitigation measures must be enforceable, the DEIR must be revised accordingly. Pub. Res. Code § 21081.6.

81

Similarly, the DEIR indicates that manufacturing or chemical processing on the Project site could result in a significant hazard to the public. DEIR at 4.8-13. The DEIR therefore states that such uses “will not be permitted under the provisions of the Specific Plan.” *Id.* However, the Specific Plan contains no express prohibition on this type of activity, and thus the DEIR erroneously concludes that there is no risk associated with this type of use. The DEIR must be revised to indicate that this prohibition must be incorporated into the Specific Plan.

82

The DEIR also concludes that potential hazards from the Moreno natural gas Compressor Plant will be reduced to a “less than significant level,” in part because of “sufficient setback[s] from the plant to the future warehouse uses (e.g., 1,000 feet to [sic] east and 1,500 feet to west).” *Id.* at 4.8-15. This setback, however, is not included as a requirement in the Specific Plan or as an enforceable mitigation measure in the DEIR. Given that the location of the buildings will not be established as part of the proposed Project, the DEIR or Specific Plan must include a specific condition regarding these proposed setbacks to ensure that the potential hazard from the natural gas compressor plant can be reduced to a less-than-significant level.

83

(c) The DEIR Repeatedly Defers Analysis and Mitigation Related to Potential Hazards.

In response to the City’s Notice of Preparation, a number of members of the public raised concerns regarding the pressurized natural gas lines that currently criss-cross the Project site and the potential for construction to result in a catastrophic accident. *Id.* at 4.8-6. In response to these concerns, the DEIR states that “as development occurs in areas with buried natural gas lines, the project proponent will be required to negotiate with the involved utility provider as to whether these pipelines can be relocated or need to be protected in place.” *Id.* at 4.8-16. The DEIR ultimately concludes, however, that any potential impact can be reduced to a less-than-significant level. *Id.* This response represents a deferral of analysis that is strictly prohibited under CEQA. *Communities for a Better Environment*, 184 Cal.App.4th at 92 (setting aside an EIR for deficient consideration of greenhouse gas emissions where the document “improper[ly] deferr[ed]

84

[] environmental assessment.”). As explained in Part I(A), the programmatic nature of the EIR provides no excuse for this deferral.

84

In addition, the Project includes the construction of a liquefied natural gas/compressed natural gas fueling station. DEIR at 4.8-18. This construction raises similar concerns related to a fire or catastrophic explosion. *Id.* Instead of addressing these concerns in the DEIR, however, the City defers the development of mitigation measures to a later time: after the approval, the applicant must “provide a risk assessment or safety study” that demonstrates that the location and construction of “the facility will not create any significant public health or safety impacts or risk.” *Id.* at 4.8-19. But this is the exact type of deferred mitigation that is prohibited under CEQA. An EIR is inadequate if

“[t]he success or failure of mitigation efforts . . . may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR.” *San Joaquin Raptor Rescue Center*, 149 Cal.App.4th at 670. “A study conducted after approval of a project will inevitably have a diminished influence on decisionmaking. Even if the study is subject to administrative approval, it is analogous to the sort of *post hoc* rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA.” *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 307.

85

Communities for a Better Environment, 184 Cal.App.4th at 92. Without the specific information that will be disclosed through a risk assessment or safety study, the public cannot be assured that mitigation related to the risk of fire or catastrophic explosion can be adequately mitigated at the Project site.

5. The DEIR Fails to Adequately Analyze and Mitigate Impacts Relating to Geology and Soils.

The DEIR’s analysis of impacts relating to geology and soils is riddled with flaws. First, the document fails to adequately analyze or mitigate impacts resulting from the Project site’s location within an area susceptible to fault rupture. State law prohibits the construction and placement of habitable structures over the trace of an active fault within an Alquist-Priolo Zone. DEIR at 4.6-17. Before a project can be permitted within an identified Earthquake Fault Zone, a lead agency must require a geologic investigation to demonstrate that proposed buildings will not be constructed across active faults. The primary method to avoid this hazard is to either set structures and facilities away from active faults, or avoid their construction in close proximity to an active fault. *Id.* 4. 6-16.

86

The DEIR asserts that a detailed fault investigation was performed for the site's projected faults. Trenching conducted across the Claremont Segment of the San Jacinto Fault in the eastern area of the Project site identified the location of a portion of the fault. However, the DEIR admits that the entire length of the fault through the site was not trenched. DEIR at 4.6-17. Notwithstanding this incomplete investigation, the DEIR correctly concludes that future development permitted by the Project would locate development in an area susceptible to fault rupture and finds this impact to be potentially significant. *Id.* at 4.6-16. The DEIR proposes to mitigate this impact by requiring a study that "will likely" involve future trenching to adequately identify the location of the Claremont segment of the San Jacinto Fault Zone. *See* Mitigation Measure 4.6.61B at 4.6-17. We can find no logical explanation as to why the initial "detailed" fault investigation did not include trenching of the section of entire length of the Claremont Segment of the San Jacinto Fault through the Project site. Moreover, the DEIR's mitigation measure does not even commit to conduct future trenching. Without a thorough investigation, the DEIR has no basis to conclude that proposed buildings will not be constructed across active faults. Therefore, the document's conclusion that the Project's impacts relating to susceptibility to fault rupture would be mitigated to less than significant levels cannot be sustained.

87

Second, the DEIR fails to adequately analyze or mitigate impacts relating to ground shaking. The DEIR states that the level of potential ground motion is considered moderate to high in the City of Moreno Valley and concludes that this impact is potentially significant. DEIR at 4.6-18. The DEIR proposes to mitigate for this impact by complying with applicable standards and codes (e.g., Title 24 (California Building Standards Code), City Building Code and/or professional engineering standards). The DEIR never, however, identifies the specific grading, soils and construction techniques that could justify later formulation of mitigation methods targeted to meet the applicable standards. In the absence of this information, the DEIR lacks the evidence necessary to conclude that the Project's impacts related to ground shaking would be reduced to less than significant levels.

88

Third, the DEIR concludes that the potential exists to locate development on moderately expansive and compressible soils and deems these impacts to be significant. DEIR at 4.6-19. Here too, the DEIR defers the necessary analysis of impacts until after project approval. Mitigation Measure 4.6.6.3A calls for geotechnical investigations that "shall identify any site-specific impacts...", while Measure 4.6.6.3D calls for studies to "address if or to what degree compressible and/or expansive alluvium on or underlying individual pads is present." *Id.* at 4.6-19,20. It is wholly inappropriate

89

to deem these measures “mitigation” and allow them to be delayed until after project approval. *Gentry v. City of Murrieta* (1995) 36 Cal. App. 4th 1359, 1396 (rejecting mitigation measures allowing project applicant to comply with report and measures regarding the Stephens’ kangaroo rat developed after project approval). An analysis of the Project’s potential to locate development on expansive and compressible soils must necessarily begin with a detailed investigation of the presence of such soils on the Project site. This information must be must be included in the revised DEIR.

89

Finally, the Project includes an array of off-site improvements such as reservoirs and highway projects. DEIR at 4. 6-10. The DEIR fails to analyze the extent to which these off-site improvements would be subject to potential geotechnical constraints. Instead, the DEIR simply concludes that none of the off-site improvement areas would have substantial seismic or seismically related constraints. *Id.* Contrary to this conclusion, the DEIR’s geotechnical appendix shows clearly significant potential geotechnical impacts. For example, several landslides have been mapped and observed during the field review of off-site reservoir Area A. *See* Appendix G at 6, 7. The appendix goes so far as to state, “Due to the existing nearby landslides, the gross stability of the area must be determined during future studies.” *Id.* Nor does the DEIR disclose that that the planned reservoir access road will traverse through a mapped landslide as well as potential unstable San Timoteo formation bedrock and that the site has potential for ground fissuring/rupture. *Id.*

90

The DEIR also fails to disclose that water reservoir and access area B also have landslides and that the access road would cut through potentially unstable bedrock. Appendix G at 8 and 9. The appendix also explains that although no faulting was observed during the review, “mass wasting and weathering of the formational materials may be masking any onsite features indicative of active faulting.” *Id.* at 8.

91

We can find no plausible explanation for the DEIR’s omission of this important information. As the appendix makes very clear, the potential exists for these off-site improvements to result in significant geotechnical impacts. The EIR must be revised to include a comprehensive analysis of these site constraints and identify appropriate mitigation measures.

92

///

///

///

6. The DEIR Fails to Properly Analyze Impacts Relating to Population, Housing and Employment.

The DEIR lacks evidentiary support to conclude that the Project would not induce substantial population growth. According to Highland Fairview, the proposed Project will more than double the number of jobs within the City. While there were approximately 25,000 jobs in the City in 2011, the DEIR states the Project will generate about 29,500 new direct and induced jobs. DEIR at 4.13-3, 9; 5-5.

93

The DEIR asserts that the jobs generated by the proposed Project are anticipated to be filled by workers who, for the most part, already reside in the Project area; therefore, construction of the proposed WLC Project would not cause a permanent increase in population. DEIR at 4.13-8. The DEIR fails, however, to provide any factual support for this assertion. Indeed, because the DEIR omits fundamental information about the skills and/or the educational characteristics of the local labor force, it is not possible to determine whether City residents could fill the new positions. The DEIR also entirely ignores the fact that the creation of 28,000 potential jobs could cause people to move to Moreno Valley, which could generate additional housing demand in the region.

94

Finally, the DEIR lacks factual support for the conclusion that the Project would improve the jobs/housing imbalance. The DEIR asserts that since the City is already “housing rich,” the Project’s increase in jobs will help to improve the region’s job/housing imbalance. DEIR at 4.13-13. But it is impossible to verify the accuracy of this conclusion because the DEIR provides incomplete information pertaining to existing employment. For example, the DEIR does not account for regional in- or out-commuting due to job/labor mismatches or housing affordability. Even if a community has a numerical balance between jobs and housing/employed residents, sizeable levels of in- and out-commuting are possible and even likely, especially where employment opportunities do not match the skills and/or the educational characteristics of the local labor force. An actual jobs-to-housing match occurs only when the types of jobs provided in a community “match” the skills and income needs of the employed workers within the community. The revised DEIR must describe the types of jobs that would be created by the Project and match them to local worker’ skills and education.

95

7. The DEIR Fails to Adequately Analyze the Project’s Cumulative Impacts.

Under the CEQA Guidelines, “a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR

96

together with other projects causing related impacts.” CEQA Guidelines § 15130(a)(1). Because “[c]umulative impacts can result from individually minor but collectively significant projects” (CEQA Guidelines § 15355(b)), an impact that appears less than significant (or mitigable to such a level) when only the project is scrutinized may turn out to contribute to a significant cumulative impact. Accordingly, the EIR must determine whether the project’s contribution is “cumulatively considerable,” that is, whether its “incremental effects . . . are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” CEQA Guidelines § 15065(a)(3); *see also Kings County Farm Bureau*, 221 Cal.App.3d at 729. This mandate assumes even greater importance for a program-level EIR such as this one. *See* CEQA Guidelines § 15168(b)(4) (programmatic EIR allows agency to “consider broad policy alternatives and program-wide mitigation measures” at an early stage when the agency has greater flexibility to deal with cumulative impacts).

96

To analyze the Project’s potential cumulative impacts, the DEIR purports to use the growth projections set forth in the City’s General Plan. DEIR at 2-22. However, the DEIR identifies only the growth that is expected to occur in the City and the County, which simply lists the amount of population, housing, employment and jobs/housing ratio (*see* Table 2.E at p. 2-23). There is no indication that the General Plan documents “described or evaluated regional conditions contributing to the cumulative impact,” as required by the CEQA Guidelines section 15130(b). Indeed, after purporting to rely on the City’s General Plan, the DEIR goes on to discuss the Project’s cumulative impacts without once referring back to the General Plan. DEIR at 4.9-42, 43.

97

The DEIR errs further because, rather than analyzing the Project’s cumulative impacts, it simply repackages, in abbreviated form, the project-specific impact analysis. In doing so, the DEIR misses the point of cumulative impacts analysis entirely. For example, the DEIR concludes that the Project would not contribute considerably to cumulative storm water impacts because the Project’s drainage system will be designed to control post-development runoff—and all other development in the vicinity of the Project site will have the same requirement. *Id.* at 4.9-43. However, the DEIR’s project-specific analysis did not analyze whether the buildout allowed under the City General Plan, together with development in the City, would cause significant storm water and flooding impacts. The document never identifies how the growth anticipated by the General Plan would affect the various watersheds in the area.

98

Moreover, the very purpose of cumulative impact analysis is to determine whether impacts that appear insignificant in isolation add up to significant damage when taken together with other projects’ impacts. Thus, the fact that individual projects may

99

have only less than significant impacts is no answer to the question whether, taken together, they may have a cumulative impact. *See Kings County Farm Bureau*, 221 Cal.App.3d at 720.

99

The DEIR must take a hard look at the impacts of the proposed Project together with the impacts of development with the various watersheds, and after undertaking that analysis, must determine whether the Project's contribution to such impacts are cumulatively considerable. In determining the significance of the Project's incremental contribution, the question is *not* the relative amount of the Project's contribution to the existing cumulative problem (i.e., whether this Project contributes the same, less, or more than other projects), but rather whether the addition of the Project's impact is significant in light of the serious existing or soon-to-be existing problem (i.e., whether the project's contribution to the environmental problem is cumulatively considerable). As the courts have explained, the greater the existing environmental problem is, the lower the threshold of significance is for considering a project's contribution to the cumulative impact. *Communities for a Better Environment v. California Resources Agency* (2002) 103 Cal.App.4th 98, 120.

100

The DEIR's analysis of cumulative impacts relating to wastewater treatment demand is similarly deficient. The document does not identify the cumulative wastewater demand in the area or evaluate whether the Project's increase in wastewater demand, combined with the wastewater demand from cumulative development, will impact wastewater treatment facilities. Instead, the DEIR merely observes that (1) cumulative population increases and development within the area serviced by the Moreno Valley Regional Water Reclamation Facility will increase the overall regional demand for wastewater treatment service, and (2) the reclamation facility *is expected to* have adequate capacity to service the City's wastewater needs through 2030. DEIR at 4.16-28. These vague and uninformative statements are not sufficient. CEQA requires that an EIR's conclusions be supported by substantial evidence. *Laurel Heights I*, 47 Cal.3d at 409. Substantial evidence consists of "facts, a reasonable presumption predicated on fact, or expert opinion supported by fact," not "argument, speculation, unsubstantiated opinion or narrative." Pub. Res. Code § 21080(e)(1)-(2).

101

The DEIR also concludes, absent factual analysis, that the proposed Project would not have a cumulatively significant impact on wastewater infrastructure because the Project itself would not require the expansion of existing infrastructure. DEIR at 4.16-28. As explained above, this misses the point of a cumulative impact analysis. Even where a project might cause an "individually limited" or "individually minor" incremental impact that, by itself, is not significant, the project may nevertheless contribute to a cumulative impact if the contribution is "cumulatively considerable" when

102

viewed together with environmental changes anticipated from past, present, and probable future projects. CEQA Guidelines §§ 15064(h)(1), 15355(b).

102

The DEIR must be revised to conduct its cumulative impact analyses in accordance with CEQA. If any Project impact is determined to be cumulatively considerable, the DEIR must identify mitigation measures or alternatives capable of minimizing or eliminating these impacts.

103

8. The DEIR Fails to Analyze the Project's Growth-Inducing Effects.

CEQA requires an EIR to include a "detailed statement" setting forth the growth-inducing impacts of a proposed project. Pub. Res. Code § 21100(b)(5); *City of Antioch v. City Council of Pittsburg* (1986) 187 Cal.App.3d 1325, 1337. The statement must "[d]iscuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." CEQA Guidelines § 15126.2(d). It must also discuss how projects "may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively." *Id.* The CEQA Guidelines expressly recognize that growth-inducing impacts can occur through extension of infrastructure. CEQA Guidelines, App. G, § XIII(a). The EIR here does not begin to meet these requirements.

104

The DEIR concedes that the Project has the potential to induce growth by creating new employment opportunities and increasing the demand for goods and services. DEIR at 5-5. Despite this pronouncement, however, we find no indication that the EIR has, in fact identified this resultant growth or evaluated its environmental consequences. None of the EIR's environmental impact analyses (save population, employment, and housing section) even mention induced or indirect growth. For its part, the population, employment and housing section merely notes that the specific location of the induced jobs cannot be specifically determined; the analysis then goes on to assume that a "large percentage" of these jobs may be located in the proposed WLC project vicinity, i.e. the City. *Id.* at 4.13-13. The DEIR provides no factual support for this assertion.

The DEIR errs further when it boldly asserts that "it is expected that any such [induced housing] development would occur consistent with planned growth identified in the General Plan or applicable specific plans." *Id.* 4.13-8. Here too, the DEIR provides no support that the City's General Plan anticipated the WLC project or its associated indirect growth. Nor could it: the Project as proposed requires numerous amendments to the City's General Plan.

105

Finally, the DEIR asserts that the streets, water, and sewer utilities that would be extended to serve the Project could potentially induce development because they would remove an impediment to growth. *Id.* at 5-6. Yet, the document immediately contradicts itself by stating that the Project will not necessitate extension of major infrastructure. *Id.* This statement is erroneous. Inasmuch as the Project site is currently undeveloped, it will certainly require the extension of utilities and services. Yet, because the DEIR fails to describe the necessary public utilities and services, the public is left in the dark as to whether this infrastructure would be sized only to accommodate the needs of the WLC. The revised DEIR must assess whether the extension of infrastructure to serve the Project will induce further growth and analyze the environmental consequences of this growth.

106

D. The DEIR Analyzes an Inadequate Range of Alternatives and Fails to Develop Alternatives that Reduce Impacts.

A core substantive requirement of CEQA is that “public agencies should not approve projects as proposed if there are feasible alternatives . . . which would substantially lessen the significant environmental effects of such projects.” Pub. Res. Code § 21002; *see also* CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d); *Citizens for Quality Growth v. City of Mount Shasta* (1988) 198 Cal.App.3d 433, 443-45. Accordingly, a major function of the EIR “is to ensure that all reasonable alternatives to proposed projects are thoroughly assessed by the responsible official.” *Laurel Heights I*, 47 Cal.3d at 400 (quoting *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 197). To fulfill this function, an EIR must consider a “reasonable range” of alternatives “that will foster informed decisionmaking and public participation.” CEQA Guidelines § 15126.6(a). “An EIR which does not produce adequate information regarding alternatives cannot achieve the dual purpose served by the EIR” *Kings County Farm Bureau*, 221 Cal.App.3d at 733.

107

By artificially constraining the Project’s objectives and failing to consider alternatives that would lessen the Project’s significant impacts, the DEIR for the Project fails to present a reasonable range of alternatives and thus violates CEQA.

1. The DEIR’s Narrow Project Objectives Prevent Consideration of Reasonable Alternatives.

The first step in conducting an alternatives analysis under CEQA is to define the project’s objectives. This step is crucial because project objectives “will help the Lead Agency develop a reasonable range of alternatives to evaluate in the EIR.” CEQA Guidelines § 15124(b). The lead agency may not define project objectives so

108

narrowly as to make the proposed development a foregone conclusion. *Kings County Farm Bureau*, 221 Cal.App.3d at 736.

Here, the DEIR's project objectives include the following very specific directives:

- "[E]stablish the 2,710-acre WLC Specific Plan land use designations and development standards that will direct the development of a world-class corporate park specifically designated to support the logistics warehouse and operational needs of large companies and corporate users"
- "[D]esignate 1,084 acres of vacant land owned by the CDFW as Open Space"
- "Create a high-quality regional logistics center"
- "Create a major logistics center in Rancho Belago"
- "Establish a master plan for the entire project area to ensure that the project is efficient and business-friendly to accommodate the next-generation of logistics buildings"

108

DEIR at 6.2. The Alternatives analysis also states that "[t]he purpose of the proposed project is to establish the 2,710-acre WLC Specific Plan that will result in the development of 41.6 million square feet of high-cube logistics warehouse uses." *Id.* at 6-3.

Because these objectives specify the precise location and size of the Project site, as well as the specific use and footprint of buildings, they constrain the DEIR's alternatives analysis in violation of CEQA. In fact, they preclude *all* alternatives except building a massive logistics facility at the applicant's proposed location in Moreno Valley. As the DEIR explains, the only feasible alternative sites are ones that "could realistically support the proposed project (i.e., a contiguous 2,635-acre site for 41 million square feet of high-cube logistics warehouse uses as envisioned by the WLC Specific Plan)." *Id.* at 6-38. The document then proceeds to reject all potential alternatives sites, even those as large as 1,700 acres. *Id.* at 6-41 to 43.

109

In addition, though the DEIR frames "alternatives sites" as a considered alternative, the DEIR ultimately rejects all possible sites and fails to consider whether any alternative site would lessen environmental impacts. DEIR at 6-38 to 43. This alternative, unless more fully developed as required under CEQA, should be classified as an alternative considered but not carried forward. *Id.* at 6-3 to 4.

110

By designing the project objectives to make the selection of the applicant's site a foregone conclusion, the City failed to proceed according to law. Under CEQA, an agency cannot "avoid an objective consideration of an alternative simply because, prior to commencing CEQA review, an applicant made substantial investments in the hope of gaining approval for a particular alternative." *Kings County Farm Bureau*, 221 Cal.App.3d at 736. Rather, the agency must analyze a range of alternatives "even if these alternatives would impede to some degree the attainment of the project objectives." CEQA Guidelines § 15126.6(b). Here, the DEIR should have posited project objectives in a way that includes the public purposes of the project—as opposed to focusing narrowly on the developer's private objectives. Such an approach would allow an adequate discussion of off-site alternatives and consideration of how to meet these purposes with "minimal environmental expense." *Citizens of Goleta Valley*, 197 Cal.App.3d at 1179.

111

In sum, because the DEIR's narrow objectives for the Project prevent decision makers from evaluating a reasonable range of alternatives, including off-site options, the City violated CEQA. CEQA Guidelines § 15126.6(a); see *National Parks & Conservation Assn. v. Bureau of Land Management* (9th Cir. 2010) 606 F.3d 1058, 1072 (striking down a narrowly drawn statement of project objectives where it "necessarily and unreasonably constrain[ed] the possible range of alternatives" and "foreordain[ed] approval of the proposed project"). Because CEQA was patterned on the National Environmental Policy Act ("NEPA"), NEPA case law is treated as "persuasive authority" in interpreting CEQA. *Citizens of Goleta Valley*, 52 Cal.3d at 565, fn. 4.

112

2. The DEIR Fails to Identify Alternatives that Would Avoid or Substantially Lessen the Project's Significant Impacts.

In order to achieve the goals of CEQA, the discussion of alternatives must focus on alternatives to the project or its location that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. CEQA Guidelines § 15126.6(b). In this case, the DEIR authors have crafted a handful of environmentally inferior alternatives that, unsurprisingly, the document dismisses as creating more significant impacts or as infeasible. This approach is untenable, as the point of the alternatives analysis is to develop alternatives that *lessen* significant environmental impacts. *Laurel Heights I*, 47 Cal.3d at 403.

113

For example, the DEIR sets up Alternative 2 as a mix of logistics warehousing, light manufacturing, retail commercial, and office space on the same footprint as the proposed Project. DEIR at 6-5. The DEIR states that Alternative 2 is

114

intended to avoid or reduce impacts to traffic, air quality, and noise impacts. *Id.* at 6-29. However, because of the changes in use, “the volume of operational air pollution would be increased when compared to the proposed project.” *Id.* at 6-30. Similarly, “this alternative would *almost triple total traffic trips*” as compared to the proposed Project, with concomitant effects on operational noise. *Id.* at 6-30 to 31 (emphasis added); *see also id.* at 6-33 (“[T]he Mixed Use Alternative A would increase employment opportunities but would substantially increase traffic, noise, and air quality impacts.”). The City’s good intentions mean nothing when the crafted alternative substantially worsens the very impacts it was intended to address. In fact, the only possible reason for including this mixed-use option is to set up a straw man that can be knocked down.

114

The DEIR fails to explain the significant impacts that Alternative 3 is intended to address, noting only that “this alternative would develop the project site similar to the land use plan of the Moreno Highlands Specific Plan (MSHP) but with logistics warehousing on the 603 acres proposed for business, retail, institutional and other uses under the MHSP.” *Id.* at 6-34. However, the DEIR concludes that the alternative would increase traffic by 13 percent; it would also increase almost all air quality impacts and potentially expose new residents to health risks associated with diesel-related air pollution. *Id.* at 6-36 to 37. While the DEIR concludes that the alternative “would reduce a significant impact of the project (aesthetic—views) by substantially reducing the amount of warehousing on the site and replacing it with residential uses” (*id.* at 6-37), the DEIR offers no analysis to support this conclusion. As the project site would still be developed, albeit at a lower height, the impact to views from State Route 60, a designated scenic road, would still be significant. Consequently, this alternative also fails to address any of the significant impacts created by the Project.

115

The DEIR likewise sets up the reduced density alternative for failure. Under this alternative, the Project would permit only 29 million square feet of logistics warehousing (a 28 percent reduction in size), but allow the development to be spread across the same 2,635 acre footprint. DEIR at 6-6, 6-22. Because the footprint is identical, the alternative’s impacts related to construction pollution and noise, storm water runoff and hydrology, agricultural land, and scenic vistas and local scenic roads, among others, remain *exactly the same* as under the proposed Project. *Id.* at 6-27. To reduce impacts, it would have been far more logical to reduce the footprint of the Project, as described further below. Such an alternative would produce far fewer significant impacts, yet offer similar employment and other public benefits. For that reason, a reduced footprint alternative, as opposed to the reduced density alternative developed in the DEIR, would meet CEQA’s mandate to develop and analyze alternatives that lessen a project’s significant impacts. *Laurel Heights I*, 47 Cal.3d at 403.

116

To remedy the DEIR's faulty alternatives analysis, the City must broaden the objectives both to clarify the public purpose of the proposed Project and to permit the selection of options other than the applicant's proposal. At the same time, the City must develop alternatives that actually lessen the Project's significant impacts, particularly in the areas of air quality, noise, traffic, aesthetics, agriculture, climate change, hydrology, and biological resources. One possible alternative to address many of these concerns is to build a smaller logistics warehousing project on a reduced footprint. Such a configuration would require the development of less impervious surfaces and allow for an increased buffer between the Project and the San Jacinto Wildlife Area. This option would not only reduce the Project's impacts from storm water runoff and other edge effects,³ but also lessen its impact to agricultural land, as portions of the site could be retained in productive agriculture. A reduced footprint alternative must also remove the San Jacinto Wildlife Area/MSHCP lands from the scope of the Project. The San Jacinto Wildlife Area is not part of this Project. A reduced footprint alternative could also be sited to avoid the Project's severe impacts to scenic vistas and designated scenic roads. Finally, the reduced footprint alternative would have the same benefits related to air quality impacts, traffic, and noise as a reduced density alternative.

117

In particular, a reduced footprint alternative should be sited to leave significant amounts of land in agriculture to provide for local agriculture, thereby also reducing greenhouse gas emissions. Finally, given the severe impacts of the Project on air quality, traffic and noise, the DEIR must also include an alternative that would reduce truck traffic. In particular, the DEIR should identify alternative sites that could be served by existing or proposed rail corridors.

118

In sum, the DEIR must be revised to consider logical, environmentally superior alternatives. Its exclusive reliance on environmentally inferior or infeasible alternatives does not meet CEQA's mandate to provide decision makers with a reasonable range of options. *Citizens for Quality Growth*, 198 Cal.App.3d at 443-45.

119

E. The DEIR Must Be Recirculated.

Under California law, the present EIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines describe the circumstances which require recirculation of a draft EIR. Such circumstances include: (1) the addition of significant new information to the EIR after public notice is given of the availability of the DEIR but before certification, or (2) the draft EIR is so "fundamentally and basically inadequate

120

and conclusory in nature that meaningful public review and comment were precluded.” CEQA Guidelines § 15088.5.

Here, both circumstances apply. Decision makers and the public cannot possibly assess the Project’s impacts, or even its feasibility, through the present DEIR, which is riddled with errors. Among other fundamental deficiencies, the DEIR repeatedly understates the Project’s significant environmental impacts and assumes that unformulated or clearly useless mitigation measures will effectively reduce these impacts. In order to resolve these issues, the City must prepare a revised EIR that would necessarily include substantial new information.

120

II. APPROVAL OF THE PROJECT WOULD VIOLATE THE STATE PLANNING AND ZONING LAW AND THE SUBDIVISION MAP ACT.

The State Planning and Zoning Law (Gov’t Code § 65000 *et seq.*) requires that development decisions be consistent with the jurisdiction’s general plan. As reiterated by the courts, “[u]nder state law, the propriety of virtually any local decision affecting land use and development depends upon consistency with the applicable general plan and its elements.” *Resource Defense Fund v. County of Santa Cruz* (1982) 133 Cal.App.3d 800, 806. Accordingly, “[t]he consistency doctrine [is] the linchpin of California’s land use and development laws; it is the principle which infuses the concept of planned growth with the force of law.” *Families Unafraid to Uphold Rural El Dorado County v. Board of Supervisors* (1998) 62 Cal.App.4th 1332, 1336.

General plans establish long-term goals and policies to guide future land use decisions, thus acting as a “constitution” for future development. *Leshner Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal.3d 531, 540. Specific plans and zoning then ensure implementation of the general plan. Gov’t Code § 65450; *see* Gov’t Code §§ 65850, 65860. The Subdivision Map Act likewise requires that subdivision maps be consistent with the general plan. Gov’t Code § 66473.5, 66474.

121

To promote coordinated land use policies and practices, state law requires local governments not just to formulate theoretical general plans, but also to conform their development and land use projects and approvals to those duly certified plans. *Citizens of Goleta Valley*, 52 Cal.3d at 570; *see also* Gov’t Code §§ 65860 (requiring consistency of zoning to general plan), 65454 (requiring consistency of specific plan to general plan), 66473.5 & 66474 (requiring consistency of subdivision maps to general plan), and 65867.5 (requiring consistency of development agreements to general plan). It is an abuse of discretion to approve a project that “frustrates[s] the General Plan’s goals and policies.” *Napa Citizens for Honest Gov’t*, 91 Cal.App.4th at 379. The project need

not present an "outright conflict" with a general plan provision to be considered inconsistent; the determining question is instead whether the project "is compatible with and will not frustrate the General Plan's goals and policies." *Id.* at 379.

121

For the reasons described in Parts I(C)(2) and I(D) above, the Project is inconsistent with the General Plan. Because of these inconsistencies, approval of this Project would violate State Planning and Zoning Law and the Subdivision Map Act.

In addition, the General Plan is legally inadequate because it contains a statement that the provisions of specific plans take precedence over provisions of the General Plan to the extent that the two documents are inconsistent. General Plan at 9-8. This General Plan provision fails to recognize that in the hierarchy of land use law, a specific plan is inferior to a general plan and therefore cannot take precedence over a general plan. Gov't Code § 65454. Specific plans must be consistent with the general plan, not the other way around. *Id.* Because this General Plan inadequacy implicates this Project, the Project cannot be lawfully approved. *Neighborhood Action Group v. County of Calaveras* (1984) 156 Cal.App.3d 1176, 1187-88.

122

III. CONCLUSION

As set forth above, the WLC DEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DEIR necessitate extensive revision of the document and recirculation for public comment. Moreover, as currently designed, the Project conflicts with the General Plan, and therefore cannot be legally approved. Accordingly, we respectfully request that the City reevaluate this Project in light of its inconsistencies with the General Plan, and take no further action on it until a legally adequate EIR is prepared and circulated.

RESPONSES TO LETTER F-8

Shute, Mihaly & Weinberger LLP

Page 1-2. Introduction to the commenter and project. It should be noted the Specific Plan (SP) area has been reduced from 2,710 acres to 2,610 acres (3.7 percent reduction) due to the removal of 100 acres in the southwest corner of the Specific Plan. This results in a reduction of 1 million square feet of logistics warehousing which is now 40.6 million square feet down 2.4 percent from the original 41.6 million square feet.

Response to Comment F-8-1. The commenter is generally correct regarding the characteristics of the project, and the Draft Environmental Impact Report (DEIR) has analyzed the traffic impacts of the project on local and regional roadways, and has recommended mitigation to the extent feasible to reduce these impacts. However, even with all the mitigation proposed, impacts at a number of intersections will remain significant, including many that must be mitigated through other agencies (which results in significant impacts because the measure would not be under the control of the lead agency).

Response to Comment F-8-2. The lead agency correctly chose to prepare a programmatic EIR for the World Logistics Center (WLC) project because specific development information (i.e., exact size and locations of buildings) is not known at this time, but the EIR clearly indicates there will be subsequent California Environmental Quality Act (CEQA) documentation tiered off the programmatic EIR, as outlined in Section 15168(c) of the State CEQA Guidelines. The project's overall hydrological impacts were evaluated in detail in Section 4.9, Hydrology and Water Quality, and that section concluded the WLC project would not have significant impacts on water resources, groundwater, flooding, etc. if the project was built on the design guidelines in the World Logistics Center Specific Plan (WLCSP) and implementation of the recommended mitigation measures.

Additional information has been added to DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 3.2, Proposed Drainage Systems* to provide more specific information for the drainage systems. In addition, Figure 1, *Proposed Storm Drains and Basins* and Figure 4, *Hydrology Map for Proposed Condition* were revised and Figure 8, *Typical Detention Basin* and Figure 9, *Typical Detention Basin with Drainage Spreading Structure* were added to provide additional information. Key elements of Section 3.2 *Proposed Drainage Systems* are summarized in Responses to Comments B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Wildlife (CDFW).

Response to Comment F-8-3. Actually, Section 4.1, Aesthetics, of the DEIR concluded that aesthetic impacts of the project, including views from SR-60, would be significant. However, Mitigation Measures (MM) 4.1.6.3A has been modified as follows to help better locate buildings to reduce the blockage of views. While these changes will reduce potential impacts, they will not to less than significant levels.

4.1.6.3A ~~Prior to the issuance of any discretionary permit for development under the WLCSP, the developer shall provide a site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that demonstrate changes in views of Mount Russell, the Badlands, and/or Mystic Lake for travelers along SR-60 or Gilman Springs Road, as appropriate. The renderings shall be sufficient to demonstrate typical views based on proposed site and landscaping plans, but the location and number of view presentations shall be at the discretion of the City Planning Division. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.

Response to Comment F-8-4. CEQA actually encourages the assessment of potential environmental impacts of a project at the earliest possible time. Although there is not detailed information yet on the size and location of specific buildings, the EIR has been prepared to evaluate the programmatic overall impacts of the WLC project, as encouraged in Section 15168 of the State CEQA Guidelines. When specific buildings are proposed at specific locations in the future, additional analysis, consistent with tiering under CEQA, will be conducted to determine if the specific development will have new or more extensive impacts than those outlined in the WLCSP DEIR. This process is consistent with the goals and requirements of CEQA relative to programmatic and subsequently tiered project-level CEQA documents.

Response to Comment F-8-5. The WLCSP EIR does provide sufficient information for decision makers to make informed decisions on this project. As previously stated, this is a programmatic EIR and more detailed CEQA documentation will be prepared when more specific project information is available (i.e., the size and locations of specific buildings), as allowed under the tiering guidelines of CEQA.

Response to Comment F-8-6. The City evaluated the many comments received on the DEIR, including those of the commenter. This Final (F)EIR provides additional information, mainly in the form of responding to the many questions and comments received on the DEIR. However, this additional information does not rise to the level of significant new information, nor does it identify any new or substantially different significant environmental impacts from those identified in the DEIR. Therefore, the DEIR will not be recirculated. The analysis of alternatives is sufficient and meets the legal requirements of CEQA (for additional information refer to Responses to Comments F-1-87, F-3-29, F-6-1, F-8-107, -110, -112, -113, & 119, F-7A-10 & -66, F-9A-44 & -46, and F-15-101, -102, & -103. However, the City Council will consider all comments on the EIR before making a decision on the project.

Response to Comment F-8-7. the City's General Plan allows for revision and updating as needed, and the DEIR provides an analysis of General Plan consistency in each environmental topic (DEIR Sections 4.1 through 4.16). The WLC project does represent a fundamental change in the planned land uses for this area, however, the review and approval process for a Specific Plan, such as the WLCSP, always requires a review of existing General Plan policies to make sure the proposed action is consistent with the General Plan, or if a General Plan Amendment is required. Such was the case with the proposed WLC project.

Response to Comment F-8-8. The commenter is correct that the EIR is a programmatic CEQA document, but it is not correct that it defers analysis to a later date without sufficient analysis at this point. The project's potential overall impacts for each of the seventeen environmental issues identified in the EIR were examined based on the level of project information available at this time (e.g., street network, total amount of buildings, location of existing rural residences, etc.). The EIR clearly identifies the overall impacts, and also clearly indicates that more specific information and analysis will be provided at the appropriate time in the future (i.e., when specific building sizes and locations are proposed). The mitigation measures in the DEIR contain performance standards to mitigate impacts for future development which is appropriate in a programmatic EIR.

Response to Comment F-8-9. The commenter is likely correct that the most common EIR is a project-level document, which is appropriate when there is specific development information available on that project (i.e., sizes and locations of buildings). However, the commenter even acknowledges that “programmatic EIRs – and later tiering – are permitted only when a lead agency considers a wide-ranging set of policies or an over-arching land use plan.” That is precisely what the WLCSP is for the Rancho Belago area, an over-arching land use plan. Therefore, a programmatic EIR is the most appropriate CEQA compliance document for the WLC project.

Response to Comment F-8-10. Most of the comment quotes the CEQA Guidelines and several court cases regarding tiering and deferral of mitigation. In this case, the WLC project did not have enough information to prepare a project-level EIR (i.e., specific sizes and locations of buildings). Therefore, a programmatic EIR was the most appropriate CEQA document for the WLC project. The EIR did not defer substantial environmental analysis, all potential issues of overall development were analyzed in the DEIR. However, the EIR did clearly indicate that future development would need additional review to determine if there were any impacts that were new or substantially different than those identified in the DEIR, as encouraged under CEQA Guidelines Section 15168(c).

Response to Comment F-8-11. The commenter cites a court case that deals with tiering and the use of a programmatic vs. a project-level EIR. In this case, the WLC project did not have enough information to prepare a project-level EIR (i.e., specific sizes and locations of buildings). Therefore, a programmatic EIR was the most appropriate CEQA document for the WLC project, one which analyzed the WLCSP's environmental impacts to the extent that a non-speculative analysis is possible (see also Response to Comment F-8-10 above).

Response to Comment F-8-12. The commenter is correct that the project pending before the City consists of a General Plan amendment, a change of zone, a specific plan, the annexation of property into the City, a development agreement and a tentative parcel map for financing purposes only. The heart of the project approvals being sought is the WLCSP which, if approved, will set forth the rules, regulations, plans and other criteria which will govern the physical development of WLC site which is one of the situations where a program EIR may profitably be used (CEQA Guidelines § 15168(a)(3). If approved, the General Plan amendment, the change of zone and the annexation of land currently in an unincorporated portion of the County will allow the adoption of the Specific Plan. If approved, the development agreement will ensure that the terms of the Specific Plan will continue to govern the physical development of the project for the term of the development agreement. If approved, the tentative parcel map will create large lots which will be available for financing purposes. None of the approvals will allow any physical development.

Further, as required by the case law interpreting CEQA, the program EIR has, to the greatest extent possible, analyzed the impacts on the environment which can be expected from the physical development of the project based on the information currently known. However, the details of the facilities to be constructed as part of the project – the number, size and location of individual buildings is currently unknown. However, because the details of physical development are not currently known, performance standards and criteria for the projects impacts on the environment have been specified where appropriate. As pointed out above, none of the actions currently pending before the City will allow any physical development; separate approvals and permits will be required before that can occur and, to the extent that those approvals and permits are discretionary, and virtually all of them will be, additional CEQA review will be required. The use of the program EIR allows the City to utilize the requirements set forth in CEQA Guidelines Section 15168(b) through the procedures set out in Sections 15168(c) and (d).

The City will determine if the proper CEQA document is being provided and the City Council will certify that the approach and all aspects of CEQA are carried out to meet the letter of the law. All

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

comments on the EIR and the project will be considered by the City Council as part of that determination.

Response to Comment F-8-13. The commenter is correct that a development agreement provides vested rights. However, those rights are limited to those “policies, rules and regulations” in effect at the time that the development agreement is approved (Government Code § 65866). The EIR prepared for the project has, to the greatest extent possible, analyzed the environmental impacts which are likely to result from development of the project to the extent that those impacts can be identified at the planning stage, leaving only those impacts which are specific to the development of particular parts of the project for later environmental review when the details of the development become known.

Response to Comment F-8-14. The commenter is correct that the approval of subdivision map is a form of land use approval. However, the approval of a subdivision map which allows no development cannot lead to any environmental impacts which have not already been considered in connection with the plans for the project itself. See CEQA Guidelines Section 15378(c) which states that the term “project” refers to the entirety of the action being approved and not to individual approvals of component parts.

Response to Comment F-8-15. The primary project approvals currently being sought consist of a general plan amendment, a rezoning, a specific plan, and a development agreement. There are no current or future approvals which will allow any physical development of the WLC site without the submittal of discretionary applications to be first reviewed and approved by the City. The DEIR deals with a specific geographic area, the first in a chain of required approvals, rules, regulations and plans which will govern the development of the WLC site for the life of the development agreement and a project which will be carried out under the same regulatory enactments. Thus, all of the criteria set forth in CEQA Guidelines § 15168(a) for the use of a program EIR are satisfied.

Response to Comment F-8-16. The DEIR Section 4.0 Aesthetics and specifically Figures 4.1.5A-F provide the visual renderings along the existing project boundary with Redlands Blvd., Merwin St. and Bay Ave. While the programmatic DEIR does not have building locations, these renderings depict a conceptual building envelope located at the minimum building setback, the maximum building height and white building color. This results in a worst case scenario for the view impacts as it places the potential building(s) as close to the project boundary, and as high as allowed in the project Specific Plan.

MM 4.1.6.1B requires that future plot plans provide landscape plans and visual renderings along these same project boundaries to demonstrate the same or lesser visual impacts as analyzed in the programmatic DEIR. This mitigation measure allows the City an opportunity to demonstrate consistency with the impacts evaluated in the programmatic DEIR.

Response to Comment F-8-17. A glare analysis requires knowledge of the building locations, building orientation, and the configuration of the solar system needed to support the demand. These are all factors unknown at the programmatic level, but can and will be evaluated at a future project level (plot plan) review (per MM 4.1.6.4B).

Response to Comment F-8-18. In response to comments regarding American badger. Refer to Response to Comment F-7A-55. Project biologists conducted focused surveys in 2013 for burrowing owl and Los Angeles pocket mouse (LAPM). The WLCSP contained a single pair of burrowing owl. No LAPM were identified during the 2013 survey and are therefore considered absent from the WLCSP.

Response to Comment F-8-19. All identifiable and potentially jurisdictional drainages on the site were mapped and included in the revised DEIR Section 4.4.6.3 and the draft wetland delineation

(FCS-MBA 2013 – FEIR Volume 2, Appendix E-13). Currently regulatory jurisdiction of the features is based on the existing regulatory guidance including the Regional Supplement to the United States Army Corps of Engineers (USACE) Wetland Delineation manual: Arid West Region (2008) and Rapanos guidance. Prior to any future development, specific project proposals will have to undergo separate environmental review under CEQA and will be required to secure a formal jurisdictional determination from the USACE as well as jurisdictional determinations from the Regional Water Quality Control Board (RWQCB) and CDFW. The applicant shall secure a jurisdictional determination with the USACE and confirm with the RWQCB and CDFW if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction.

Any impact to drainage features that are under regulatory agency jurisdiction or are considered riparian/riverine areas under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) are considered potentially significant and will require compensatory mitigation at a minimum of a 1:1 mitigation ratio through onsite creation, off-site creation, or purchase of available mitigation credits through an approved mitigation bank. Compensatory mitigation will be negotiated during the permit acquisition process.

A Compensatory Mitigation Plan may be required for all unavoidable impacts and will be consistent with the USACE/ United States Environmental Protection Agency's (USEPA) Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios.

Response to Comment F-8-20. DEIR 4.6 Geology and Soils and technical studies have adequately identified and address the potential geologic/geotechnical and fault constraints associated with this project. The soils report (Leighton, 2013, FEIR Volume 2, Appendix G) clearly indicates that the site is considered suitable for the proposed development provided all identified potential constraints are mitigated or address per the recommendations included therein. It is rather typical of such EIR level studies and in the absence of design level site development plans, including building loads and locations, that additional supplemental studies/reports will be prepared to further define the extent of corrective measures needed. These measures may include determining the depth of remedial grading and structural setbacks from existing faults, as in the case of this project. However, the overall geologic/geotechnical constraints associated with the project were extensively evaluated and defined. Future design level investigations (MMs 4.6.6.1A and 4.6.6.1B) will be performed to further confirm and refine the selected mitigation measures based on actual building loads and locations.

Response to Comment F-8-21. The revised DEIR (FEIR Volume 2) contains an updated drainage study conducted by CH2M Hill that documents the existing on-site drainages and how they will be contained within the WLCSP. The DEIR contains a conceptual grading plan in Section 3.4.12, Figure 3.18. It should be remembered that the EIR is a programmatic document because the level of information about the project is programmatic as well, so there is no detailed grading or development information available at this time.

Response to Comment F-8-22. Please see Responses to Comments F-8-13 through F-8-15.

Response to Comment F-8-23. The EIR does not need to be rewritten to a project EIR because there is still not enough information available to complete a project EIR (see Response to Comment F-8-10 for details). The project approvals are not entitlements they consists only of planning designations and zoning which will allow a later determination of whether specific improvements will be allowed.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-8-24. The WLC EIR does have a complete project description (78 total pages with 18 figures and 4 tables) including a detailed description of what the Specific Plan will allow (DEIR Section 3.0). The Project Description also included information on water conservation, energy conservation, examples of architectural styles that are acceptable and those that are not acceptable, landscaping and lighting guidelines for onsite and offsite improvements, enhanced buffer treatments adjacent to residential areas (e.g., walls, berms, landscaping, etc.), proposed entitlements, existing land uses, alternative fueling, the proposed fire station, the proposed circulation plan with street cross sections and planned improvements, non-vehicular circulation, offsite improvements, wet and dry utility improvements, sustainability including solar panels, phasing, implementation, etc. However, even with all this information about the project, there is still not a sufficient degree of information about specific buildings or locations to allow the use of a project EIR, again, a programmatic EIR is the most appropriate CEQA document for this project at this time. For additional information, see the Response to Comment F-8-10.

Response to Comment F-8-25. The commenter is correct, this EIR is an opportunity to evaluate the large issues of the WLC project which is why a programmatic EIR is the most appropriate CEQA compliance document for this project. The commenter is also correct that subsequent development proposals, for which there will be more specific information (i.e., building sizes and locations), will have subsequent project-level CEQA analysis tiered off of this programmatic EIR.

Response to Comment F-8-26. The DEIR evaluated the project assuming it was built out over a period of 10 years (build out in 2022). Market conditions will determine the actual development timeline, but it is unlikely that it will be built out any sooner. The updated DEIR has modified the project construction period from 10 years to 15 years. This change is the result of nearly 2 years having already passed since the issuance of the Notice of Preparation in the baseline year of 2012, placing an optimistic construction start in 2014; leaving only 8 years for project build out. Given the project delays reasonable project construction start is likely 2015 and a 15 year construction period would place the project build out in 2030. The updated DEIR evaluated two project time periods for phasing; Phase 1 at the mid-point of anticipated project construction (2022); and Phase 2 at project buildout (2030).

Phase 1 is assumed to occur on the western half of the project and Phase 2 on the eastern half. Most of the existing utilities and infrastructure are on the west side of the project, so a progression from west to east is logical. The DEIR evaluated the project impacts based upon this phasing assumption.

The programmatic DEIR has identified the backbone utility and infrastructure improvements and evaluated their environmental impacts integral for project buildout; therefore the full environmental impacts have been evaluated. Subsequent project level (plot plan) submittals will provide project level environmental review and provide subsequent mitigation measures and conditions of approval, identifying the utilities and infrastructure required to support each plot plan. This subsequent review will ensure the project level impacts are consistent with those evaluated in the programmatic DEIR and will dictate a logical and viable sequence of infrastructure improvements.

The burden is on the developer to ensure the infrastructure is either in place prior to or concurrent with the project development. The mitigation measures and project level conditions of approval will dictate the improvements needed to support the pace of development and in most cases these measures require installation by the developer.

The programmatic EIR establishes the parameters and framework that subsequent project level submittals will adhere to in the design of each individual building and planning area. For example the DEIR establishes the use of detention basins to mitigate runoff to levels equal or below those of the existing conditions to mitigate the increase in impervious area and runoff. Subsequent project level submittals, with precise building size and location, will dictate the size, design and location of the drainage improvements to mitigate to the criteria established in the DEIR.

Response to Comment F-8-27. For information about the phasing of infrastructure by phase, refer to Response to Comment F-8-26 above. As noted in the comment the location and sizes of utility lines for the water, wastewater, flood control, drainage, and electrical have been shown. This is consistent with what should be included in a programmatic EIR. Detailed construction plans will be prepared as each parcel is developed. The design will be consistent with the concepts shown in the Specific Plan and EIR. As noted in the Response to Comment F-5-23 additional detail on the storm drain sizes of the detention and infiltration basins has been added. In addition, MM 4.9.6.1A has been revised to provide more detail and performance requirements and MM 4.9.6.1B has been added to provide additional detail and requirements for maintenance. These mitigation measures are described in detail in Response B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Wildlife related to their comments on flooding and water quality.

Response to Comment F-8-28. The commenter questions why the DEIR identifies significant impacts, while providing no assurance that the many needed improvements to local and regional roadways would keep pace with development.

MM 4.15.7.4A in the FEIR (and MM Trans-1 in the Traffic Impact Analysis (TIA)) sets forth a requirement for the preparation of subsequent traffic studies for each plot plan application for the purposes of determining what traffic improvements identified in the EIR (and TIA) are required to be completed prior to the issuance of a certificate of occupancy for each building. The scope and depth of the subsequent traffic studies described in MM 4.15.7.4A (and MM Trans-1 in the TIA) will be as specified in the City of Moreno Valley *Traffic Analysis Guidelines*. These studies will be required as part of the project approval process. Both of these elements are part of MM 4.15.7.4A (and MM Trans-1 in the TIA) which has been re-written as follows (added text shown in double underline; deleted text shown in strikeout) to clarify this:

~~**4.15.7.4A** When processing future individual development permits under the World Logistics Center Specific Plan, as part of the City's discretionary approval process, the City shall require each project to perform a project specific traffic impact study to ensure that the assumptions set forth in the TIA prepared for the programmatic level entitlement remain valid. These traffic impact analyses shall conform to the traffic impact analysis guidelines prepared by the City of Moreno Valley and the California Department of Transportation and shall be used to impose project-specific mitigation on the individually proposed projects. These traffic analyses shall be completed prior to the issuance of grading permits for the requested development. It should be noted that the City will require that the applicant to fully fund or to pay a fair share of some of the improvements identified in Tables 4.15.AX through 4.15.BC. These improvements will be required by the City as a Condition of Approval.~~

4.15.7.4A A traffic impact analysis ("TIA") conforming to the guidelines for traffic impact analysis adopted by the City shall be submitted in conjunction with each Plot Plan application within the World Logistics Center Specific Plan. Prior to the approval of the Plot Plan, the City shall review the traffic impact analysis to determine if any of the traffic improvements listed in Final EIR Volume 2 Tables 4.15.AV through 4.15.BA (TIA Tables 74 through 79) of the traffic impact analysis prepared for the Program Environmental Impact Report are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

within the City shall be subject to credit/reimbursement agreement for those DIF and/or TUMF eligible costs. If the City determines that any of the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in Mitigation Measure 4.15.7.4G prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the Program Environmental Impact Report, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.

Response to Comment F-8-29. The commenter points out the DEIR does not analyze the impacts of various offsite improvements, mainly 3 reservoirs. First, it must be remembered the DEIR is a programmatic document and specific details of development, including specific details of the reservoirs and other offsite improvements, cannot be provided at this time since they have not yet been designed. However, several sections of the DEIR do indicate there may be impacts from the various offsite improvements and recommend specific mitigation measures to address design of such facilities in the future.

The following sections and mitigation measures in the DEIR address offsite improvements:

- | | | |
|--------|----------------------|--|
| • 4.4 | Biological Resources | MM 4.4.6.3B, C, and D (offsite bio surveys) |
| • 4.5 | Cultural Resources | MM 4.5.6.1B (offsite surveys) |
| • 4.6 | Geology & Soils | MM 4.6.6.1C (offsite surveys) |
| • 4.12 | Noise | MMs 4.12.6.1I and 4.12.6.2A - 4.12.6.2D
(offsite noise assessments) |
| • 4.15 | Transportation | MMs 4.15.7.4A and 4.15.7.4E (offsite impacts) |

Implementation of these measures (as modified in the FEIR) as future development is proposed will help protect environmental resources and minimize potential environmental impacts of constructing the various offsite improvements.

Response to Comment F-8-30. The DEIR does identify the infrastructure needed to support overall development of the site, so that subsequent more specific development proposals will fit within the overall identified improvement networks. The project description does describe the general improvement levels needed to support the WLC project (DEIR, Section 3.4.6.3, Utilities and Improvements).

Response to Comment F-8-31. The commenter states the DEIR does not provide enough information about the proposed General Plan Amendment. With a Specific Plan, the anticipated changes to the General Plan are easier to see as the Specific Plan itself provides much detail relative to the various General Plan Elements. For example, the General Plan Land Use Element (i.e., City land use plan) would be amended to include the land uses outlined in the Specific Plan. Similarly, the Circulation Element would be amended to reflect the Circulation Plan outlined in the Specific Plan. The City's Park and Open Space Plan would be amended, per the land use plan of the Specific Plan, to include the new 74.3 acres of open space in the southwest corner of the WLCSP property, and the CDFW Conservation Area just south of the WLCSP would be redesignated as open space rather than as currently shown as mixed residential development under the Moreno Highlands Specific Plan. These changes in open space would also be reflected in the General Plan Land Use Element.

Response to Comment F-8-32. The DEIR does address the potential changes to the General Plan under appropriate specific environmental issues discussed in Sections 4.1 through 4.16 of the DEIR. For example, land use impacts, including changes to the Land Use Element, are addressed in detail in DEIR Section 4.10, Land Use and Planning – Table 4.10.E which compares the project to various General Plan land use policies. The WLC project is compared to appropriate General Plan policies in the other sections of the DEIR by environmental topic (e.g., noise, cultural, etc.).

Response to Comment F-8-33. The comment references sections of the CEQA Statute and Guidelines and a court case that deal with mitigating significant impacts. However, the EIR does provide extensive mitigation for identified impacts for many of the environmental issues addressed in the EIR. These measures are tailored to a programmatic document and subsequent development proposals will be tiered off this programmatic document. See the Response to Comment F-8-10 above for more details in this regard.

Response to Comment F-8-34. See Responses to Comments F-8-10 and F-8-33 above for more information about mitigation measures.

Response to Comment F-8-35. The EIR mitigation measures are programmatic due to the entire EIR being programmatic, but they are sufficient to address the impacts identified in the EIR. Future development proposals will have subsequent CEQA analysis tiered off this EIR as appropriate, once more specific development information is available, as allowed under Section 15168(c) of the CEQA Guidelines.

Response to Comment F-8-36. DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report* has been updated to provide additional information on the existing drainage and local flooding, and additional information on the runoff and infiltration volumes pre and post project. In addition changes to the mitigation measures were made. Please see Response to Comment F-5-23 for changes to the mitigation measures. In addition, the planned changes to the hydrology study and Section 4.9, Hydrology and Water Quality, of the DEIR are also discussed in Responses B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Wildlife.

Key findings of the existing conditions and runoff and infiltration volumes are summarized below.

Existing Drainage Conditions

The storm water runoff from the project generally flows in a southerly direction to the San Jacinto River. A topographic divide located west of Theodore Street separates storm water flows to the San Jacinto River in two directions. Runoff east of the divide flows through the San Jacinto Valley at a gradient ranging from 1 to 2 percent to the San Jacinto Wildlife Area and ultimately drains toward the Gilman Hot Springs hydro-subarea. Runoff west of the divide flows to the Perris Valley Storm Drain at a gradient ranging from 1 to 2 percent and ultimately drains toward the Perris Valley hydro-subarea. Both hydro-subareas eventually flow to the San Jacinto River, approximately 10 miles south of the project site.

Offsite flows tributary to the project site originate from the upstream Badlands and open space, specifically from north of SR-60 and Gilman Springs Road. For the hydrologic analysis and modeling purposes, the project onsite area along with the offsite tributary areas are divided into six (6) sub watersheds, named Watershed “A”, Watershed “B”, Watershed “C”, Watershed “D”, Watershed “E”, and Watershed “F”, shown on Figure 3.

Watershed “A”

Watershed “A” is located within Riverside County Flood Control and Water Conservation District (RCFCWCD) Moreno Master Drainage Plan (MMDP) area. RCFCWCD is currently preparing a revised MMDP. The MMDP indicates that storm flows north of SR-60 will be routed to the proposed Sinclair Basin and Redlands Basin. Flows released from the proposed basins will pass under SR-60

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

and be conveyed to MMDP Line “F” as shown on Figure 2. Because it is unknown when these basins will be constructed, this study is prepared with the assumption that the basins are not in place prior to this project, and the offsite flows will be conveyed to MMDP Line “F” directly.

Downstream of SR-60 MMDP Line “F” is a 12-foot wide by 8-foot high reinforced concrete box (RCB) that conveys runoff from the existing culverts under SR-60: one triple 4-foot × 2-foot RCB, two double 48-inch corrugated metal pipe (CMP), one double 72-inch CMP, and one 42-inch RCP (with a 36-inch Riser), as shown on Figure 6. The capacity of the existing culverts are summarized in Table 2.1. Runoff north of SR-60, in excess of the capacities of the existing culverts, ponds north of SR-60 and flows towards the intersection of SR-60 and Redlands Blvd. An existing 42-inch RCP conveys the runoff into the existing ditch along Redlands Blvd. Since the 42-inch RCP does not have enough capacity to convey all of the offsite flows, the flows then sheet flow to the south. As a result, the interchange of SR-60 and Redlands Blvd may be flooded in a significant storm event. Ultimately the flows upstream of SR-60 will be less once RCFC&WCD constructs the master plan detention basins located north of SR-60.

Table 2.1 SR-60 Culverts

Culvert	Size/Material	Node	Culvert Capacity* (cfs)	Tributary 100-year Flow (cfs)	Adequate to Convey 100-year flow
1	Triple 4' by 2' RCB	91	265	213	Yes
2	Double 48" CMP	76	250	715	No
3	Double 48" CMP	81	300	285	Yes
4	Double 72" CMP	81	805	557	Yes
5	42" RCP (36" Riser)		177	**	
Total			1797	1770	Yes

* Hydrology calculations based on a 100-year Water Surface Elevation of 1768.7 for all 5 culverts.

** Excess flows from Culvert 2 will pond at culvert 2.

The outflow from Line “F” south of Eucalyptus Avenue sheet flows via a spreading area into the agricultural land downstream. Flows then sheet flow across the agricultural land to the southwest corner of the project at Alessandro Boulevard and Merwin Street. The agricultural fields have been configured to direct runoff away from homes to the southwest. Flows leave the project boundary via a culvert under Alessandro Boulevard which outlets to an existing ditch, as shown on Figure 3.

The capacity of the existing ditch south of Alessandro Blvd was evaluated and varies from 75 cubic feet per second (cfs) to 390 cfs. Just south of the culvert at Alessandro Blvd, the existing ditch is trapezoidal with a depth of approximately 4 feet and capacity of 390 cfs. The capacity of the ditch is 75 cfs about 70 feet south of the Alessandro culvert where the ditch is 2 feet deep. The ditch capacity remains at 75 cfs with a depth of 2 feet until after it crosses Cactus Avenue. About 160 feet downstream of the culvert, the ditch transitions to a v-ditch 3 feet deep with a capacity of 165 cfs. The v-ditch extends southwest for approximately 100 feet and cross the Redland Blvd. Flows unable to be contained in the ditch will overtop the ditch into the agricultural area on the east and along Merwin Street on the west. Water in Merwin Street will turn west and flow into the residential streets and could cause flooding in a significant storm event. Further downstream, the runoff flows to the Greenbelt Channel located south of Cactus Avenue. The Greenbelt channel ultimately drains to the Perris Valley Storm Drain.

Watershed “B”

Watershed “B” drains a total of 1,361 acres, of which 92 acres is offsite flow from north of State Route (SR) 60 and 104 acres is offsite flow at the southerly end of the project. The total onsite area is 1,165

acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two sub areas by Theodore Street. Flows to the west of Theodore Street, consisting of 398 acres of onsite area and 104 acres of offsite area, drain to the ditch on the west side of Theodore Street. The 92 acres of offsite area flows to the ditch along the east side of Theodore Street. Onsite flows on the east side of Theodore Street sheet flow in a southerly direction through the project area. The ditches are vegetated with bottom widths varying from 1 to 2 feet and depths varying from 1 to 3 feet. The existing capacity of the ditch at the project boundary is 55 cfs. Flows greater than 55 cfs will sheet flow through the project area and leave the project boundary in a sheet flow condition.

Watershed “C”

Watershed “C” drains a total of 1,061 acres, of which 658 acres is offsite flow from north of State Route (SR) 60. The total onsite area is 403 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two watershed areas. The majority of the watershed, 944 acres, drains to a watercourse which exits the project area. A small portion of onsite flow, 117 acres, sheet flows offsite. The natural drainage course in Watershed “C” is vegetated, with an average bottom width of approximately 3 feet and a depth of approximately 2 feet. The existing capacity of the drainage course is 165 cfs. Flows greater than 165 cfs will sheet flow across the area. The drainage course drains southerly through the project boundary.

Watershed “D”

Watershed “D” drains a total of 965 acres, of which 627 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 338 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into two sub watersheds. The majority of the watershed, 754 acres, drains to a watercourse which exits the project area at Node 53. A portion of onsite flow, 211 acres, sheet flows offsite at Node 61. The natural drainage course in Watershed “D” is also vegetated. Its bottom width varies from approximately 1 to 3 feet, and its depth varies from approximately 1 to 2 feet. The existing capacity of the drainage course is 65 cfs. Flows greater than 65 cfs will sheet flow across the area. The drainage course ends east of the existing gas facility. It is estimated that when significant storm events occur, the runoff ponds locally and eventually drains southwest.

Watershed “E”

Watershed “E” drains a total of 2,510 acres, of which 2,430 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 80 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The natural drainage course in Watershed “E” has a bottom width varying from approximately 20 to 30 feet and depths varying from approximately 10 to 15 feet. The majority of this channel is vegetated, with a few locations of erosion. Approximately 1,500 feet north of the southerly project boundary, another natural drainage course confluent with the earthen channel forming a “V” shape junction. The junction is moderately eroded.

Watershed “F”

Watershed “F” drains a total of 445 acres, of which 288 acres is offsite flow from north of Gilman Springs Road. The total onsite area is 157 acres, of which approximately 90 percent is pervious and 10 percent is impervious. The drainage area is divided into four sub areas. The first sub area, 99 acres consists entirely of onsite flow which sheet flows off site. The second sub area drains 121 acres, of which 72 acres is offsite area. The third subarea drains 151 acres, including 146 acres of offsite area. The last sub area drains 74 acres, of which 70 is offsite area. The flow from these sub areas will ultimately drain to San Jacinto Wildlife Area. The main natural drainage course in Watershed “F” is located approximately 500 feet west of Gilman Springs Rd. The drainage course is vegetated, with bottom widths varying from approximately 5 to 10 feet, and depths varying from

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

approximately 1 to 3 feet. The capacity of the existing water course is 70 cfs. The remaining flow sheet flows offsite.

These natural drainage courses in Watersheds “B” through “F” drain into the San Jacinto Wildlife Area downstream. The majority of the project site sheet flows through the project’s southerly boundary.

Existing Culverts along Gilman Springs Road

Within the project vicinity, there are ten (10) existing cross culverts located in Gilman Springs Road, as shown on Figure 7. Field visits by CH2M HILL staff found that most of the existing culverts were partially or completely blocked by sediment and debris allowing little flow from the culverts to enter the project site.

In order to confirm if the existing culverts are sized appropriately to convey the offsite flow, the existing culvert capacities were analyzed using the inlet control capacity analysis chart. The results of the analysis are included in Appendix D, and summarized in Table 2.4. The analysis indicated that many of these culverts are undersized to convey the tributary 100-year flows even with proper maintenance, exclusive of culverts No. 2 and No. 7. Storm water unable to be conveyed by the culverts currently flows to the existing ditches along the road, overtop the road and flow into the downstream natural drainage courses. The detailed flow patterns at these culverts were analyzed and summarized in Table 2.5 and shown on Figure 7.

At Culvert No. 1, there is no existing ditch on either side of road. A total of 60 cfs offsite flow is tributary to the culvert, 20 cfs of the flow is conveyed through the 24-inch CMP, and 40 cfs overtops the road and flows to the natural drainage channel downstream. The impact to the downstream ditch is negligible due to the small amount of flow.

At culvert No. 3, a total of 370 cfs flow is generated from offsite, 40 cfs is conveyed through the 36-inch CMP, and 330 cfs is conveyed along the existing ditch on the north side of road, eventually flowing to Culvert No. 4. At Culvert No. 4, a total of 170 cfs of flow comes from the offsite tributary area. One hundred (100) cfs is conveyed through the 48-inch CMP. The remaining 70 cfs combines with the 330 cfs of flow from Culvert No. 3 and overtops the road, draining to the natural channel downstream. The natural channel has a capacity of 365 cfs; therefore the flow will be spread beyond the top of bank.

At Culvert No. 5, a total of 1,370 cfs is generated from offsite, 370 cfs is conveyed through the 7-foot × 6-foot RCB, 95 cfs flow along the existing ditch towards Culvert No. 6, and 900 cfs overtop the road draining to the natural channel downstream. The natural channel has a capacity of 330 cfs, the additional flow will overtop the channel and Alessandro Blvd, and then sheet flow to the south. At Culvert No. 6, with a total of 650 cfs offsite flow, 130 cfs is conveyed through the 4-foot x 4-foot RCB, 24 cfs is conveyed along the existing ditch along the road, and 540 cfs overtop the road flowing to the downstream channel. Due to the large amount of offsite flow and small capacity of the existing channel, the flow will overtop the existing Alessandro Blvd.

At Culvert No. 8, with a total of 55 cfs offsite flow, 45 cfs is conveyed through the 24-inch CMP, and 10 cfs overtop the road draining to the downstream natural channel. The downstream channel has a capacity of 75 cfs; therefore the excess flow will be contained within the natural channel. At Culvert No. 9, with a total of 140 cfs offsite flow, 20 cfs flow is conveyed through the 24-inch CMP, 112 cfs is conveyed along the existing ditch north side of street, and 8 cfs overtop the road and drain to the existing natural channel downstream. The channel has a capacity of 1,600 cfs; therefore the impact of 8 cfs is considered negligible. At Culvert No. 10, with a total of 70 cfs offsite flow, 20 cfs are conveyed through the 24-inch CMP, the remaining 50 cfs combine with 112 cfs flow from the upstream ditch overtop the road, 6 cfs drains to the existing ditch south side of the road, and the remaining flows to the natural drainage channel downstream, which has a capacity of 1,000 cfs.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

When larger storm events, such as a 5- or 10-year storm, occur; Gilman Springs Road may be flooded. Even with proper maintenance to remove the existing sediment and debris to operate at full capacities, there will be excessive offsite flow overtopping the road and entering the project site in a 100-year storm.

Table 2.4 Gilman Springs Road Culvert Capacity Analysis

Culvert	Size/Material	Node	Tributary 100-yr Flow (cfs)	Culvert Capacity * (cfs)	Adequate to Convey 100-year flow
1	24" CMP	341	60	20	No
2	36" CMP	351	15	50	Yes

** Assuming culverts cleared of sediment and debris.*

Runoff and infiltration Volumes Comparisons

An analysis of the runoff and infiltration volumes for the pre and post project conditions was performed as outlined in Appendix H of the Master Plan of Drainage Report and discussed in Response to Comment F-8-2.

The Main differences between Pre and Post Project conditions, presented in Figures 3 and 4 of the World Logistics Center Specific Plan Infiltration Analysis document (CH2M HILL, 2013), are the shift between runoff and direct infiltration, and the reduction in evapotranspiration. Under Pre Project

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

conditions, approximately 82 percent of the precipitation, which was on average 2010 acre-feet per year (af/yr) for the 1990 through 2012 period, becomes infiltration. The Post Project Conditions will reduce the direct infiltration to approximately 13 percent of the precipitation. The reduction in direct infiltration will be compensated by reduction in evapotranspiration and the implementation of Bioretention areas and Detention Basins.

The reduction in evapotranspiration to approximately 2 percent of the total precipitation from the original 15 percent will be the result of the project and drought-tolerant landscaping implementation. With less water consumed by vegetation, more will be available for infiltration. The implementation of bioretention and detention basin areas will together make it possible that 92 percent to 97 percent of the precipitation will be infiltrated, a range that is consistent with the historical infiltration at the site. The remaining direct infiltration, reduction of evapotranspiration, and implementation of bioretention and detention basins can potentially not only offset the direct loss in infiltration when compared to baseline, but also increase the infiltration at the proposed project site.

Response to Comment F-8-37. It is not clear why the commenter is referring to the Initial Study, however Section 4.8, *Hydrology and Water Quality*, of the revised DEIR (FEIR Volume 2) adequately describe the hydrological regime of the project area.

Response to Comment F-8-38. Additional information on potential flooding at Gilman Springs Road and Merwin Street and Alessandro Boulevard was added to the report. See Response to Comment F-8-36 and also FEIR Volume 2, Appendix J-1.

Response to Comment F-8-39. Additional information on the amount of existing impervious surfaces was added to DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 2.2*. See Response to Comment F-8-36 that describes information from this section of the report including the information on existing impervious surfaces. The runoff and infiltration analysis was added to discuss the storm flow volumes. See Response to Comment F-8-36 for this information. A section on flow velocities at the project boundary was added to Section 4 of the Report (FEIR Volume 2, Appendix J-1) See response to Comment F-8-2 for this information. Post development velocities do not exceed pre development velocities as shown in Table 4.4 *Comparison of Existing and Proposed Flow Velocities at Project Boundary*. See Response to Comment F-8-2 for Table 4-4.

Response to Comment F-8-40. Additional information was added to DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 2, Existing Conditions* (FEIR Volume 2, Appendix J-1) discuss the existing natural drainage courses. See Response to Comment F-8-36 for the description of these natural drainage courses. The creeks provide minimal hydrologic value in terms of ground water recharge relative to the water cycle. In general, the creeks are relatively small and convey flows from routine storms. Because the slope of the land is one to two percent the flows do not pond. Line “E” is the only drainage system large enough to provide hydrological value relative to recharge. However, this drainage course is also steep and does not provide for ponding of the flows. The drainage at the project boundary is designed to mimic pre-project conditions. See Response to Comment F-8-2 for this information.

Response to Comment F-8-41. The mitigation of impacts of the facilities are discussed in the DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 4, Mitigation of Impacts of Proposed Development*. The runoff leaving the project site will mimic existing conditions and will, thus, have no effect on downstream resources. See Response to Comment F-5-23 for this information.

Response to Comment F-8-42. The commenter is correct that much of the analysis of potential impacts to onsite drainages was found in the section on biological resources (DEIR Section 4.4.6.3, pages 4.4-59 – 4.4-60) due to the widespread concern of conservation organizations regarding potential biological resources of the drainages. However, Section 4.9, *Hydrology and Water Quality*, of the EIR clearly indicated most of the onsite drainages have little or no hydrological or biological habitat value, and all onsite runoff can be accommodated onsite with the planned series of detention basins. The EIR also evaluated development along Drainage 12, however, the WLCSP shows

development will be set back from that drainage. In addition, the revised biological studies (FEIR Volume 2, Appendix E) and the revised DEIR (FEIR Volume 2, Section 4.4) indicate Drainage 12 will be preserved to allow for wildlife movement between the Badlands and the SJWA and Mystic Lake.

Response to Comment F-8-43. The baseline used for hydrological impacts was existing conditions at the time the Notice of Preparation was issued. The baseline condition is the existing condition. Mitigation of impacts is proposed by the construction of drainage facilities including storm drains, bioretention areas, detention/infiltration basins and spreading areas. Storm water runoff will be stored in onsite basins as required by MMs 4.9.6.1A and 4.9.6.1B which state that basins must be constructed and maintained to mitigate impacts. See Response to Comment F-5-23 for a description of these mitigation measures.

The Master Plan of Drainage analysis followed the steps outlined below:

1. Identify existing hydrologic Conditions (*Section 2 Existing Condition of the Master Plan of Drainage Report*)
2. Identify the Project's Impact (*Section 3 Proposed Condition of the Master Plan of Drainage Report*)
3. Identification of Proposed Storm Water Facilities (*Section 3 Proposed Condition of the Master Plan of Drainage Report*)
4. Evaluation of Proposed Storm Water Facilities to ensure that post development flows do not exceed pre-development flows (*Section 4 Mitigation of Impacts of Proposed Development of the Master Plan of Drainage Report*)

The DEIR did not skip steps 1 through 3. Hydrologic and hydraulic analysis was performed to identify the existing conditions, proposed conditions and mitigation of impacts. Additional details have been added to the report. See Response to Comment F-8-2 for this information.

Response to Comment F-8-44. MM 4.9.6.1A has been revised to provide more detail and specific performance requirements and MM 4.9.6.1B has been added to provide additional detail and requirements for maintenance as discussed in Response to Comment F-5-23.

Response to Comment F-8-45. Please refer to response to Comment F-8-2 for additional information added to DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report*. MM 4.9.6.1A was revised and MM 4.9.6.1B was added. See Response to Comment F-5-23 for a description of these measures.

Response to Comment F-8-46. Please refer to Response to Comment F-5-23 for the revised MM 4.9.6.1A and the new MM 4.9.6.1B. The words "as appropriate" were deleted. The mitigation is fully enforceable as the first statement of MM 4.9.6.1A says "Prior to issuance of any development permit within the Specific Plan area..." The development permit cannot be implemented until the mitigation is approved to the satisfaction of the City Engineer.

Response to Comment F-8-47. Please refer to Response to Comment F-5-23 for additional information added to DEIR Appendix J *Hydrology and Water Quality Master Plan of Drainage Report*.

Response to Comment F-8-48. Sections 4.9.1.1 *Drainage* and 4.9.6.1 *Drainage Pattern and Capacity Related Impacts* of the DEIR have been updated to include additional information on the existing and proposed conditions and mitigation of impacts. See Response to Comment F-5-23 and F-8-36 for details of this information.

Response to Comment F-8-49. Performance standards have been added to MM 4.9.6.1A and 4.9.6.1B. See Response to Comment F-5-23 for a description of the measures.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-8-50. Additional information has been provided on runoff volume and infiltration for the existing and post project conditions. Flooding at Gilman Springs Road upstream of the project area will continue to occur as the project has no impact on upstream conditions. Flows leaving the project project's southerly boundary at the San Jacinto Wildlife Area will continue to sheet flow across the boundary. Flows at Alessandro and Merwin Street will be contained in drainage facilities designed to handle the 100-year storm. See Response to Comment F-8-23 for this information. The detention basins have been revised to include infiltration. MM 4.9.6.1B was added to provide requirements on maintenance and monitoring. See Response to Comment F-5-23 for a description of the measure.

Response to Comment F-8-51. MM 4.9.6.1B was added to provide requirements on maintenance and monitoring. See Response to Comment F-5-23 for a description of the measure.

Response to Comment F-8-52. MM 4.9.6.3A states "*Prior to issuance of any grading or building permits a site-specific Water Quality Management Plan (WQMP) shall be submitted to the City Land Development Division for review and approval.*" *The WQMP shall specifically identify site design, source control, and treatment control BMPs that shall be used on site to control pollutant runoff and to reduce impacts to water quality to the maximum extent practicable. The WQMP shall be consistent with the Water Quality Management Plan approved for the overall WLCSP project. At a minimum, the site developer shall implement the following site design, source control, and treatment control BMPs as appropriate:*

Site Design BMPs

- i. Minimize urban runoff.
- ii. Maximize the permeable area.
- iii. Incorporate landscaped buffer areas between sidewalks and streets.
- iv. Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
- v. Use natural drainage systems.
- vi. Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.
- vii. Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.
- viii. Minimize impervious footprint.
- ix. Maximize the permeable area.
- x. Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.
- xi. Reduce widths of street where off-street parking is available.
- xii. Minimize the use of impervious surfaces such as decorative concrete, in the landscape design.
- xiii. Conserve natural areas.
- xiv. Maximize canopy interception and water conservation by planting native or drought tolerant trees and large shrubs.
- xv. Use natural drainage systems.
- xvi. Minimize Directly Connected Impervious Areas (DCIAs).
- xvii. Runoff from impervious areas will sheet flow or be directed to treatment control BMPs.
- xviii. Streets, sidewalks, and parking lots will sheet flow to landscaping/ bioretention areas."

The preliminary Project Specific Water Quality Management Plan (WQMP) (DEIR Appendix J) states that flows from the project will be treated by low impact development (LID) BMPs that promote infiltration and evapotranspiration will be incorporated in specific projects throughout the project site. Infiltration BMPs will be preferred, but may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. In situations where infiltration BMPs are not appropriate, bioretention and/or biotreatment BMPs that provide opportunity for evapotranspiration and incidental

infiltration will be implemented. The locations of these facilities will be shown in each final project-specific WQMP.

Response to Comment F-8-53. The commenter is correct, drivers along SR-60 have excellent views of the Mt. Russell hills and existing agricultural fields on the WLC site although the existing Sketcher's building does block views south for both eastbound and westbound travelers on SR-60.

Response to Comment F-8-54. It is not clear what point the commenter is trying to make, the DEIR does identify impacts to views along SR-60 as significant, and the DEIR describes these impacts in detail (DEIR Sections 4.1.6.1 and 4.1.6.2), even though only one visual vantage point was shown in the renderings. The goal of the renderings was to illustrate representative views from different locations around the WLC site. With a site the size of the proposed project, many different locations could have been chosen to show views, but the views selected, while not exhaustive, are representative of general views in the project area, including along SR-60. The renderings in the DEIR will be corrected in FEIR Volume 2 Section 4.1. Refer to Responses to Comments F-8-55 and 56 for clarification and amendment of MM 4.1.6.3A.

Response to Comment F-8-55. It is not possible to definitively conclude visual impacts from the SR-60 will be significant without knowing the exact sizes and locations of buildings along the south side of the SR-60 and even some further on the interior of the project site, depending on the combination of views from particular locations along the freeway. This is a natural result of the programmatic nature of the EIR, which is the most appropriate CEQA document at this time given the level of information about project development (e.g., total square footage, allowable Floor Area Ratio (FAR), street/lot locations, etc.). The DEIR clearly indicates the final determination of a particular view impact along the SR-60 will necessarily depend on more specific project info in the future, but the EIR does conclude that view impacts along SR-60 will be significant, given the nature of the proposed project, which is still the correct conclusion in this regard, and does not represent inappropriate deferral of impact assessment. MM 4.1.6.3A has been amended as follows to provide clarification on the blocking of views of Mt Russell from SR-60.

4.1.6.3A ~~Prior to the issuance of any discretionary permit for development under the WLCSP, the developer shall provide a site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that demonstrate changes in views of Mount Russell, the Badlands, and/or Mystic Lake for travelers along SR-60 or Gilman Springs Road, as appropriate. The renderings shall be sufficient to demonstrate typical views based on proposed site and landscaping plans, but the location and number of view presentations shall be at the discretion of the City Planning Division. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource.~~

4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.

Response to Comment F-8-56. The commenter indicates that use of a programmatic EIR was inappropriate given the analysis of views from SR-60 which emphasized Mt. Russell and ignored Mystic Lake. Original page 4.1-7 of the DEIR clearly states “...Mount Russell, the Badlands, the SJWA, and Mystic Lake represent significant visual resources, and SR-60 and Gilman Springs Road

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

are considered scenic routes because they have relatively unobstructed views of these resources” so it is unclear what statement the commenter is referring to in the EIR that seems to focus only on Mt. Russell. In addition, Section 4.1.6.1 begins with the following statement. “The proposed project could have a substantial adverse effect on one or more scenic vistas, notably views of the Badlands, Mount Russell and the Mount Russell Range, and Mystic Lake/San Jacinto Wildlife Area.” The same section describes visual impacts from SR-60 as follows...

***“Views from SR-60.** The existing Skechers building can be used as a visual reference relative to future views involving the WLCSP. The average floor elevation of the Skechers facility is 1,740 feet amsl. Assuming an average building height of 55 feet, the Skechers building is at an elevation of 1,795 feet amsl compared to the elevation of SR-60 at 1,760 feet amsl adjacent to the Skechers building. This means a person driving on SR-60 cannot see much of the WLCSP property, or Mystic Lake while adjacent to the Skechers building, although the top of Mount Russell is visible from most locations.*

Travelers in both directions on SR-60 will have views of the project site until the northernmost portion of the site is developed. As the site develops, the buildings would replace existing flat agricultural fields with industrial buildings, which may block foreground and midground views of travelers in both directions, depending on their locations. There are no site plans at present to show exact building locations or heights, so the determination of impacts must be based on the characteristics of buildings allowed under the Specific Plan. Buildings adjacent to the freeway would be approximately 60 feet in height, while buildings away from the northern perimeter (i.e., the south side of SR-60) could be up to 80 feet tall. If all of the future buildings along the south side of SR-60 block views to the same degree as the Skechers building, this would be a significant visual impact as it would reduce views of Mount Russell, and the Badlands south of SR-60 along Gilman Springs Road.

The height and location of buildings along this portion of the project will have to be designed to allow background views between and over them (i.e., so the mountains and Mystic Lake are not fully or largely obscured by buildings in the future). The conceptual landscape plans for the proposed project show trees will be planted along the south side of SR-60 to soften views of future buildings, but these will not fully obscure views of the buildings or parking areas, as the buildings may be taller than the trees will grow, and the buildings will extend farther into the midground and background views for many travelers. Even with the landscaping proposed by the WLC Specific Plan, development of this area will eventually replace the existing flat agricultural fields with tall industrial warehouse buildings that may completely or partially block views of the lower slopes of Mount Russell and the Badlands and Mystic Lake. If future buildings were to block views of these major scenic resources substantially (per GP Figure 7-2), the WLC project would result in significant visual impacts along SR-60. The simulated view from SR-60 is shown in Figure 4.1.5J and K (Views 8 and 9).

Therefore, it is unclear in what way the commenter believes the EIR does not address views to Mystic Lake. Regarding building heights, the Specific Plan indicates that corners or entryways of the project buildings may be slightly raised for architectural purposes, but that the overall average or roof heights of the buildings along the north, west, and south perimeter must be 60 feet but can be up to 80 feet in the interior of the project and along the eastern perimeter (WLC Specific Plan, Section 5.3.3 page 5-21).

In conclusion, Section 4.1 of the DEIR clearly concludes that all aesthetic impacts of the WLC project will be significant, and that when more details of specific development is known in the future, additional visual analysis will be provided (MM 4.1.6.3A as amended in Response to Comment F-8-55).

Response to Comment F-8-57. The commenter states the EIR uses the Moreno Highlands Specific Plan (MHSP) as a baseline for aesthetics– that is incorrect. The DEIR uses existing conditions as the baseline, as required by CEQA. However, the current General Plan and zoning classifications for the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

WLC property are based on the approved MHSP so that land use plan is provided for comparison only, and not as a baseline against which to determine the significance of impacts. As previously stated, Section 4.1 of the DEIR clearly concludes that all aesthetic impacts of the WLC project will be significant. Also, refer to Responses to Comments F-8-54 through F-8-56.

Response to Comment F-8-58. The commenter states the Specific Plan does not mention views of Mt. Russell or Mystic Lake, and does not limit the size and locations of buildings - this is correct. However, the EIR does address viewshed impacts in the future. MM 4.1.6.3A requires renderings be provided of specific future buildings so that viewsheds of Mount Russell for travelers along SR-60 can be protected per the General Plan. Also review to Response to Comment F-8-56.

Response to Comment F-8-59. The commenter states that considering the size of the proposed project it is unlikely that mitigation to reduce impacts to visual impacts would be feasible at all. Actually, the Specific Plan allows for only a maximum Floor Area Ratio or FAR of 0.5 which is 50% site. Therefore, the recommended mitigation is indeed feasible.

Response to Comment F-8-60 & 61. The commenter contends the project is not consistent/compliant with the City's General Plan and this is a significant impact under CEQA and must be analyzed. As outlined in Responses to Comments F-8-56 through F-8-59 above, the WLC project will not be inconsistent with the General Plan since specific development in the future will be evaluated against the indicated General Plan policy using visual renderings that will be prepared once the specifics of the future development are known (e.g., building size, location, height, etc.) which is entirely appropriate when using a programmatic EIR such as with the WLCSP.

The evaluation of potential land use impacts of the WLC project were appropriately analyzed in Section 4.10 of the DEIR. The specifics of the General Plan Amendment and zone change are the WLCSP as outlined in Section 3 of the DEIR, Project Description. Page 3-25 of the DEIR lists the elements of the General Plan which will be amended.

“General Plan Amendment: ...*The General Plan Amendment (GPA) will replace the current Moreno Highland Specific Plan/General Plan Designations with the following land use designations: (a) ~~2,606~~ 2,383.8 acres for high cube logistics development; (b) 1,084 acres of Open Space; and (c) 20 acres for Public Facilities.*

Zone Change: *The project includes a Zone Change covering ~~3,814~~ 3,714 acres, which will designate 1,084 acres of land for Open Space (CDFW and San Diego Gas and Electric (SDG&E) properties), 20 acres for Public Facilities (SDG&E and Southern California Gas Company (SCGC) properties), and ~~2,710~~ 2,610 acres for the World Logistics Center Specific Plan.”*

In addition, Section 3.4.6 of the DEIR states...

“The proposed project includes a Specific Plan to implement the new General Plan Amendment and to set forth comprehensive land use regulations governing the proposed project. The Specific Plan is a master plan for the future development of up to ~~41.6~~ 40.6 million square feet of building area on ~~2,710~~ 2,610 acres, providing for mainly high-cube logistics and distribution facilities. This programmatic EIR be provides a streamlined environmental review process for future development projects in the WLC Specific Plan area, including site-specific subdivisions and development entitlements that are consistent with the overall plan. Subsequent projects that the City determines to be within the scope of the EIR may be approved pursuant to the procedures set forth in CEQA Guidelines Sections 15162 and 15177.”

The following uses are proposed within the WLC Specific Plan (Table 3.C in this document) and are directly related to the WLC project general plan and zoning entitlements:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

• Logistics Development (LD)	2,383.8 acres	40.4 million square feet
• Light Logistics (LL)	37.1 acres	200,000 square feet
• Open Space (OS)	74.3 acres	
• Right-of-Way (ROW)	115.8 acres	
	2,610.0 acres (WLCSP)	
• State and Utility Land	1,104.0 acres (rezone to open space and utilities)	
• Offsite Improvement Areas	104.0 acres (to support WLCSP development)	
	1,208.0 acres (non-Specific Plan areas)	

Response to Comment F-8-62. The commenter expresses concern that the project description does not describe key components of the project such as fundamental information pertaining to utilities, infrastructure and public services that will be required to serve the project. The project description (DEIR Section 3.0) contains a description of the project as well as the WLCSP (Section 3.0, *Infrastructure Plan*). DEIR Sections 3.4.6.3 and 3.4.6.4 describe aspects of the proposed project relative to utilities, infrastructure, and public services.

The WLCSP does not include specific information on backbone infrastructure phasing but does identify a number of alternative funding mechanisms that future developers can take advantage of to pay for certain improvements (WLCSP Section 10.0, *Financing of Improvements*). It must be remembered this is a programmatic document and so it only evaluates the level of information about the project provided at the time of project application. Future development applications will require backbone infrastructure that will be identified in their particular traffic and utility studies, and will be responsible for installing or paying a fair share towards the installation of necessary infrastructure. The City's development review process will assure that infrastructure needed by a particular development is in place or will be in place prior to occupancy of that development.

The commenter expresses concern that storm drainage improvements will not be made as development occurs in the future. To address this concern, MM 4.9.6.1A has been revised to specifically include "storm drain pipes and other conveyances" as shown below (added text underlined).

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) ~~as appropriate~~ within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term "construct" shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to

reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

However, it should be noted that the WLCSP EIR is a programmatic document, and there will be subsequent CEQA analysis of overall utility impacts of the WLC project when specific development is proposed (i.e., consistent with the WLCSP) in the future. The City's development review process would determine if future development proposals are consistent with the overall development parameters outlined in the WLCSP EIR. The hydrology study for the WLC project (DEIR Appendix J-1) demonstrates that the WLCSP area can be developed such that future runoff does not exceed current levels, and therefore offsite and downstream properties would not be significantly impacted by development of the WLC property.

Response to Comment F-8-63. The commenter says the Circulation Element portion of the General Plan Amendment is not described in the EIR. A proposed Circulation Element amendment has been submitted to the City, and the revised Circulation Element map would include the Circulation Plan presented in the WLCSP (Exhibit 3-1) and shown in the Project Description of the DEIR (Figures 3-10 through 3-12). In fact, Section 3.4.6.2, Circulation Element, in the DEIR Project Description says...

"The revised General Plan Circulation Element (as amended by the proposed project) and the Specific Plan's Circulation Plan (Specific Plan Section 3.1) provides for the movement of vehicles in and around the World Logistics Center area. It provides the details of the road/street designations, right-of-way design, and road improvement thresholds. This section addresses the interface of the planning area with existing roadways as defined in the City General Plan."

Response to Comment F-8-64. The FEIR Volume 2 Section 4.15 concludes that the WLC project is consistent with the City's General Plan policies regarding traffic, however, the reason the DEIR concludes many of the traffic impacts of the WLC project are significant is that many of the mitigation measures that could reduce potential impacts cannot be made physically (e.g., restricted right-of-way, existing buildings, etc.) or the improvements are within another jurisdiction and are not under the control of the lead agency (i.e., implementation cannot be guaranteed). The DEIR and project TIA clearly demonstrate that onsite impacts of traffic from the WLC project can be accommodated within the WLC site and within City level of service (LOS) standard, based on the proposed circulation plan outlined in the WLCSP (refer to FEIR Volume 2 Appendix L-1).

Response to Comment F-8-65. The commenter states the EIR should examine the WLC project's consistency with all applicable General Plan policies including protection of visual resources, avoidance of noise intensive uses and air emissions near sensitive receptors and minimizing traffic impacts. The commenter is correct, and the potential impacts of the project relative to these various policies are examined in the appropriate sections of the DEIR (4.1 through 4.16) for each environmental topic area (see Response to Comment F-8-67).

Response to Comment F-8-66. The commenter states Section 4.10 of the EIR should examine the WLC project's consistency with all applicable General Plan policies. Section 4.10 of the DEIR does examine the WLC project's consistency or inconsistency with applicable land use General Plan policies, as outlined in the specific CEQA threshold used in this analysis, which states..." *Conflict with any applicable land use plan, policy, or regulation...*" The commenter has neglected to acknowledge the other analysis sections of the DEIR (4.1 through 4.16) examine the potential impacts of the WLC project against the General Plan policies, objectives, etc. that are particular to that environmental

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

issue (e.g., noise, traffic, etc.). Table 4.10.E of the EIR only examines the WLC project's impact on land use policies, while the commenter refers to many other non-land use policies in this comment. For example, Objective 5.3 and Policies 5.3.6 and 5-6 are related to traffic, so they are evaluated in Section 4.15, *Traffic and Circulation*, of the DEIR, Policies 6.2.3 and 6.2.4 are addressed in Section 4.10, *Hydrology and Water Quality*, of the DEIR, and so on (see Response to Comment F-8-67).

Response to Comment F-8-67. The commenter states the DEIR does not evaluate the WLC project relative to several specific General Plan policies and objectives. Response to Comment F-5-66 above explains that Table 4.10.E does not address every General Plan policy applicable to the WLC project, only the land use policies, because Section 4.10 of the DEIR addresses land use impacts. The other DEIR impact analysis sections (4.1 through 4.16) address other environmental topics/issues (e.g., noise, traffic), and the General Plan policies applicable to that issue are addressed in that section.

City General Plan policies, objectives, etc. are addressed in the following sections according to the particular environmental issue they address:

• 4.1	Aesthetics	DEIR Section 4.1.2.1
• 4.2	Agriculture	DEIR Section 4.2.5
• 4.3	Air Quality	DEIR Section 4.3.2.4
• 4.4	Biological Resources	DEIR Section 4.4.2.4 and Table 4.4.E
• 4.5	Cultural Resources	DEIR Section 4.5.2.3
• 4.6	Geology & Soils	DEIR Section 4.6.2.2
• 4.7	Greenhouse Gases	DEIR Section 4.7.2.5
• 4.8	Hazards	DEIR Section 4.8.2.4
• 4.9	Hydrology & Water Quality	DEIR Section 4.9.2.4
• 4.10	Land Use	DEIR Section 4.10.2 and Table 4.10.E
• 4.11	Minerals	DEIR Section 4.11.2.2 (none)
• 4.12	Noise	DEIR Section 4.12.2.2
• 4.13	Pop & Housing	DEIR Section 4.13.2.3
• 4.14	Public Services	DEIR Section Table 4.14.A
• 4.15	Transportation	DEIR Section 4.15.2
• 4.16	Utilities	DEIR Section 4.16.1.2

Response to Comment F-8-68. The commenter claims the project is inconsistent with General Plan in that some impacts are identified as significant and unavoidable and so the target LOS cannot be maintained.

The mitigation measures identified in the TIA would enable the City to achieve the target LOS. To the extent these measures are feasible and within the authority of the City of Moreno Valley, the City will see to it that the measures are implemented. However, the City is not in a position to guarantee the implementation of measures that are either infeasible or outside of its control. See Chapter 11, Sections E and F of the TIA (FEIR Volume 2, Appendix L-1).

Response to Comment F-8-69. The commenter states the project includes a Revised Circulation Element but that it was not included in the DEIR. The commenter repeats his earlier claim the project is inconsistent with General Plan in that some mitigation measures are identified as significant and unavoidable and so the target LOS cannot be maintained.

The TIA, which comprised part of the DEIR, included Figure 21 (now Figure 24 in the FEIR Volume 2, Appendix L-1) showing the revised circulation plan. Please also see the Response to Comment F-8-68.

Response to Comment F-8-70. As stated in DEIR Appendix J-1 *Hydrology and Water Quality* Appendix J-1 *Preliminary Project Specific Water Quality Management Plan*, page 12 a “significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood detention. The use of impervious surfaces for decorative purposes will be minimized where possible. Street, sidewalk, and parking design will incorporate or keep minimum street widths that still meet City requirements and emergency access requirements.”

Response to Comment F-8-71. MM 4.9.6.1A has been revised and MM 4.9.6.1B has been added to ensure that sufficient storm drain flood controls systems will be implemented to accommodate the 10 and 100 year storm flows. See Response to Comment F-5-23 for a description of the measures.

Response to Comment F-8-72. Policy 6.3.1 of the General Plan is being misinterpreted by the commentator. The policy is intended to insure that new residential construction meet certain noise standards. Specifically if a new residence is constructed it will be required to meet a 45 CNEL noise standard. Additionally, soundwalls would be required between single-family residences and major roadways. It is not intended to limit impacts generated by projects. The significance criteria that addresses transportation noise impacts on residential uses is detailed on page 26 of the technical noise appendix (DEIR Appendix K Noise). A 65 CNEL threshold is a key part of the significance criteria.

Response to Comment F-8-73. The proposed project is consistent with Objective 6.5. Traffic noise is being mitigated when a significant impact is identified and it is feasible. Operational noise from the logistics facilities will meet the City’s noise ordinance standards, and construction noise is being mitigated to the extent feasible. Therefore, the project is seeking to “*minimize noise impacts from significant noise generators...*”

Response to Comment F-8-74. The commenter believes the WLC project is not consistent with General Plan Policy 7.7.4. Policy 7.7.4 states... “*Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake.*” The visual analysis in the DEIR does indicate future development under the Specific Plan will be visually attractive relative to industrial warehouse buildings. The programmatic EIR determined that future development would have significant visual impacts, but the maintenance of views to Mt. Russell must wait for an evaluation of specific development in the future, as outlined in the EIR (refer to Response to Comment F-8-56. Future development will be evaluated under CEQA (i.e., tiered off the WLCSP EIR) for compliance with this policy when more specifics about building size and location are known, consistent with the tiering requirements of CEQA. In addition MM 4.1.6.3A has been modified and addresses this comment (see Response to Comment G-95-18).

Response to Comment F-8-75. The commenter restates the position the DEIR does not evaluate General Plan policies applicable to the WLC project. The DEIR examines the WLC project’s potential impact on relevant General Plan policies in the appropriate sections of the DEIR (4.1 through 4.16) depending on the specific environmental topic (e.g., noise, traffic, etc.). Those sections identify inconsistencies and indicate if mitigation is necessary, as required by CEQA.

Response to Comment F-8-76. The commenter says the DEIR does not contain sufficient baseline information on hazards or hazardous materials. Section 4.11, *Hazards and Hazardous Materials*, does provide extensive detailed information about the existing baseline conditions and impact assumptions of the site relative to these topics, including the results of 22 Phase 1 hazmat studies, one of which was completed in January 10, 2013 for the entire site (DEIR Appendix I). These issues are addressed in detail in Responses to Comments F-7A-18 through F-7A-21 and F-7B-2 and F-7B-3 and demonstrate why the EIR does provide an adequate description of baseline conditions relative to the onsite hazmat studies.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-8-77. Comments in general were made about the DEIR's analysis of hazards and hazardous materials inadequacy. Comments were also made about the DEIR failure to provide sufficient information for accurate analysis and decision-making. An example is the 18 previous Phase I ESA reports conducted for portions the site (DEIR Section 4.8) as not providing the information as to what areas were included and what areas were omitted. DEIR Section 4.8 explains that the Phase I ESA, dated January, 2013, covered the project area. The previous 18 Phase I ESAs, which were conducted on portions of the project area over several years, were used as references in that comprehensive Phase I ESA report for the project area. The Moreno Valley Local Hazard Mitigation Plan and the Moreno Valley General Plan also indicates the presence of hazardous materials sites on the project site. Local Hazard Mitigation Plan at 89; Moreno Valley General Plan FEIR, Figure 5.5-1. These sites are not disclosed or otherwise described in the project EIR.

Response to Comment F-8-78. The Phase I ESA conducted for the project area, dated January 2013, adequately addresses these two sites and all other hazardous waste sites on or around the project area, within a one mile radius. The Phase I ESA concluded they would not adversely impact the project development. Also refer to Response of Comment F-8-79.

Response to Comment F-8-79. According to DEIR, Section 4.8.5.3, the Moreno Gas Compressor Plant currently occupies a 19-acre site, surrounded by 174 acres of SDG&E-owned open space. There is additional open space around the plant, consisting of land owned by the CDFW as part of the SJWA. There are no plans to expand or otherwise modify the plant and/or its open space zone, which is considered adequate at this time to protect public health and safety, including users of the SJWA and new employees and users of the new warehouses associated with the WLCSP. The WLCSP Land Use Plan shows new warehouse uses east and west of the plant will have setbacks of 1,000 feet to the east and 1,500 feet to the west, those to the north will have an additional 104 foot additional setback, from the construction of Street G. While these setbacks appear to be sufficient, the following measure will be added to the EIR to assure setbacks are in fact sufficient to protect the safety of future workers within Planning Areas 9 through 12 (i.e., those around the compressor plant):

4.8.6.1C Prior to grading for any discretionary permits for development in Planning Areas 9-12 adjacent to the natural gas compressor plant, the applicant shall prepare a risk assessment report analyzing safety conditions relative to the existing compressor plant and planned development. The report must be based on appropriate industry standards and identify the potential hazards from the compressor plant (e.g., fire, explosion) and determine that the distance from the plant to the closest planned buildings in Planning Areas 9-12 is sufficient to protect the safety of workers from accidents that could occur (see Final EIR Volume 2 Figure 4.1.6B) at the compressor plant. This measure shall be implemented to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.

Response to Comment F-8-80. The commenter expresses concern the hazmat mitigation will not be implemented. The DEIR contains two hazmat-related mitigation measures (MMs 4.8.6.1A) addresses lead-based paint or asbestos-containing materials in the rural residences, and safety related to the alternative fueling facility). There is no reason to believe these measures will not or cannot be successfully implemented by the City during subsequent discretionary approvals and the City's development review process.

Response to Comment F-8-81. The commenter wants mitigation added to address the cleanup of waste materials on the site. In response to this comment, the following measure will be added to Section 4.8.6.1 of the revised DEIR:

4.8.6.1D Prior to the issuance of any grading permit, the developer shall inform the City of any existing solid waste materials within the development area. In conjunction with grading activities, all solid waste matter within the development area shall be

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

removed by a licensed contractor and disposed of in an approved landfill. A record of the removal and disposal of any waste materials, in compliance with applicable laws and regulations, shall be submitted to the City prior to the issuance of any building permits.

Response to Comment F-8-82. The commenter states the Specific Plan does not preclude manufacturing or chemical uses. Manufacturing and chemical processing are not permitted uses within the WLCSP. The Specific Plan allows only logistics and logistics-related uses within the WLC project, which allow only limited assembly and do not allow manufacturing or chemical processes by their very definition, in much the same way heavy industrial uses would not be allowed in areas designated for light industrial uses. Future discretionary review by the City will restrict future uses within the WLC to those uses outlined in the Specific Plan (see WLCSP Section 2.2.2, Permitted Uses).

Response to Comment F-8-83. The commenter expresses concern that the setbacks identified in the DEIR for the natural gas compressor station are not codified in the Specific Plan. The “setback” is visible by an inspection of the project conceptual land use plan and existing aerial photographs in that the existing compressor station buildings are at least 1,000 feet from any warehouse building that could be built in Planning Area 12 to the east and approximately 1,500 feet from any buildings that could be built in Planning Area 10 to the west due to proposed road placement and developable areas. In response to this concern, MM 4.8.6.1C (see below) was added to protect future worker safety, as outlined in Response to Comment F-8-82 above.

4.8.6.1C Prior to grading for any discretionary permits for development in Planning Areas 9-12 adjacent to the natural gas compressor plant, the applicant shall prepare a risk assessment report analyzing safety conditions relative to the existing compressor plant and planned development. The report must be based on appropriate industry standards and identify the potential hazards from the compressor plant (e.g., fire, explosion) and determine that the distance from the plant to the closest planned buildings in Planning Areas 9-12 is sufficient to protect the safety of workers from accidents that could occur (see Final EIR Volume 2 Figure 4.1.6B) at the compressor plant. This measure shall be implemented to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.

In addition, Section 4.12.6.4 Long-Term Utility Noise Impacts in the DEIR addressed the issue of the noise impacts of the natural gas compressor plant and imposed MM 4.12.6.4A requiring prior to issuance of building permits, projects within 500 feet of the SCGC and SDG&E facilities will have sound attenuation devices providing at least 40 dB reduction, be in place for planned blow-down events. The Specific Plan contains a setback requirement from the natural gas compressor in response to the concerns regarding potential noise impacts to future users of the WLC.

Response to Comment F-8-84. The commenter expresses concern that identification of safety impacts from relocation of gas pipelines has been deferred contrary to the requirements of CEQA. The programmatic DEIR has correctly identified a potential significant impact, but has further concluded this impact can be reduced to less than significant levels as part of discretionary approvals in the future when the size and location of future buildings is known in more details. The relocation of existing natural gas lines requires coordination with local utility companies, the City, and developer, and can only be done effectively when specific development information is known. At that time, existing lines can be relocated with appropriate safety setbacks from planned buildings. This process is consistent with the tiering requirements of CEQA and is not a deferral of impact identification or development of appropriate mitigation. The commenter has failed to acknowledge the additional CEQA review that future development will have, as outlined in DEIR Section 3.4.6 as follows...

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

“The proposed project includes a Specific Plan to implement the new General Plan Amendment and to set forth comprehensive land use regulations governing the proposed project. The Specific Plan is a master plan for the future development of up to 41.6 million square feet of building area on 2,710 acres, providing for mainly high-cube logistics and distribution facilities. This programmatic EIR provides a streamlined environmental review process for future development projects in the WLC Specific Plan area, including site-specific subdivisions and development entitlements that are consistent with the overall plan. Subsequent projects that the City determines to be within the scope of the EIR may be approved pursuant to the procedures set forth in CEQA Guidelines Sections 15162 and 15177.”

Response to Comment F-8-85. The commenter states the EIR defers analysis and mitigation for potential impacts of the proposed alternative fueling station. Again, the commenter has misinterpreted the CEQA requirements for a programmatic EIR vs. a project level EIR, where sufficient information is not yet known about certain physical aspects of the project. In this case, the size, location, and other physical attributes of the fueling station are unknown, so the DEIR correctly concludes there could be a significant impact, and recommends a safety study be conducted to determine specific safety setbacks for the station from surrounding development once those physical factors are known. Since the station is planned to be built relatively soon in Phase 1, it will not be long before this information is known. Setbacks to the neighboring industrial warehouse uses would need to be established once the specific physical characteristics of the fueling station are known. Construction of this station will require subsequent discretionary review, including CEQA compliance, through the City. Refer to MM 4.8.6.1B as follows:

4.8.6.1B Prior to the issuance of any discretionary permits associated with the ~~natural gas proposed~~ fueling facility (“~~Logistic Ssupport~~” site in the LD zone), ~~the applicant shall provide~~ a risk assessment or safety study that identifies the potential public health and safety risks from accidents at the facility (e.g., fire, tank rupture, boiling liquid, or expanding vapor explosion) ~~shall be submitted to the City for review and approval~~. This study shall be prepared to industry standards and demonstrate that the facility will not create any significant public health or safety impacts or risks, to the satisfaction of the City ~~Community Development Director and the City Building Official Building and Safety Division and the Fire Prevention Bureau.~~

Response to Comment F-8-86 & 87. DEIR Section 4.6.6.1, based on published geologic maps and subsurface fault evaluation completed for this project (Leighton, 2013, DEIR Appendix G), the Claremont Segment of the San Jacinto Fault Zone has been identified and located within the eastern portions of the project (within mapped Alquist Priolo (AP) Zone). At the time of Leighton’s fault trenching, legal access to all parts of the property was neither possible nor required for this initial level of fault investigation. As such, a central portion of the Fault Zone was not specifically explored. However, the fault strands are expected to continue through that un-explored portion within the AP Zone and future trenching would be required to confirm the trend (connect the dots) of the mapped fault and provide setback requirements for any proposed habitable buildings in this area. As such, no structures for human occupancy will be located over active faults or within the State AP Zone unless structural setbacks are established based on sufficient fault trenching in accordance with State and County guidelines. Therefore, the DEIR’s conclusion that the project’s impacts relating to susceptibility to fault rupture would be mitigated to less than significant is valid.

Response to Comment F-8-88. As states in DEIR Section 4.6.6.3A, the site, like the rest of Southern California, is located within a seismically active region. The principal source of seismic activity is movement along the northwest-trending regional fault systems such as the San Andreas, San Jacinto, and Elsinore Fault Zones. Mitigation measures for such seismic shaking were adequately addressed in the Soils Report (DEIR Appendix G) that included recommendations for structural design and ground improvements. These mitigation measures

generally follow standard of care in this area and considered adequate to mitigate impacts relating to ground shaking. All buildings constructed on this site will be structurally designed to the pertinent sections of the current or future adopted California Building Code and seismic design coefficients provided by the project Geotechnical Engineer. General remedial grading requirements (ground improvement mitigation) included in the Soils Report are also expected to further reduce the effects of ground shaking on proposed structures. The actual extent of remedial grading is expected to vary based on building location and foundation loads and will be verified based on development of final site plans. However, the general parameters for the prescribed corrective measures included in the Soils Report remain the same.

Response to Comment F-8-89. The project Soils Report (DEIR Appendix G) is a detailed investigation that provides an extensive evaluation of the expansive and compressible soils potential on this site. The report presents over one-hundred test pits and test borings including extensive laboratory testing to qualify and quantify the extent of such geologic hazard. Even if dozens of additional borings are performed for this approximately 4,000-acre site, the recommendations of the DEIR will generally remain the same as to the need for future verification and evaluation of compressible and expansive soils in specific areas of the site. The interbedded and highly variable nature of alluvial deposits on this site require that when final development plans are developed the remedial earthwork removal depth or potential presence of expansive soils are verified and mitigated based on those plans. This is typical of EIR level investigation for such large projects and mitigation measures are rather straightforward and easily implemented during later phases of development by means of ground improvements (remedial earthwork grading) or structural design (i.e. stiffened slab design) based on specific building foundation plans and location.

Response to Comment F-8-90. The commenter is concerned the DEIR has not identified geotechnical impacts to offsite improvements. DEIR Section 4.6, *Geology and Soils*, examines potential geotechnical and soils impacts of the various offsite improvements in general, given the programmatic nature of the EIR, which also means there is no specific information at this time on the size, exact location, etc. for the various offsite improvements, although Figure 3-7 in the DEIR does show the general location of the improvements. MM 4.6.6.1C addresses how future offsite improvement sites will be evaluated for geotechnical and soils constraints, and requires all improvements to be designed to withstand expected geological and soils conditions, as shown below...

“Prior to the approval of project grading permits, or permits for construction of off-site improvements, whichever comes first, the City shall review and approve plans confirming that the project has been designed to withstand anticipated ground shaking and other geotechnical and soil constraints (e.g., settlement). The project proponent shall submit improvement plans to the City or County as appropriate for review and approval prior to construction of any offsite improvements related to the project. This measure shall be implemented to the satisfaction of the City Engineer.”

Response to Comment F-8-90 & 91. The commenter expresses concern about geotechnical constraints on the proposed water reservoir site. Offsite improvements can be subject to a variety of geologic/geotechnical constraints such as faults, landslides, unstable soils, etc. However, these constraints are typical of this area and specific mitigation methods will be determined during later phases of planning or once improvement plans become available. Mitigation methods may include previously prescribed measures such as remedial earthwork ground improvements or avoidance of difficult areas (i.e. mass wasting, landslides and faults). However, all off-site improvements are considered feasible from a geotechnical viewpoint and the appropriate site specific mitigation must be determined during later stages of planning to derive the most cost-effective mitigation methods.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

As outlined in Response to Comment F-8-90 above, additional geotechnical testing will be done when a specific site and a specific reservoir is proposed, and the facilities will have to be constructed to withstand expected constraints/conditions, as outlined in MM 4.6.6.1C outlined above, or they will have to be located on some other site.

Response to Comment F-8-92. The commenter states more detailed information on geotechnical constraints on offsite improvement sites must be included in the DEIR. The location of offsite improvements is not fully known at this time, and has only been estimated for the purposes of a programmatic CEQA-level analysis. It is possible that improvements would actually have to be placed at other locations than those estimated for the project at this time. Therefore, it is inappropriate to conduct more detailed assessments at this time. More detailed assessments will be prepared when specific offsite improvements are identified, as outlined in MM 4.6.6.1C.

Response to Comment F-8-93. The commenter asserts that the WLC project would induce substantial population growth in the City by adding so many jobs. First, the City currently has a high unemployment rate, so it is likely that many of the first jobs produced by the WLC project would go to unemployed City residents as well as unemployed workers in other nearby communities (e.g., Redlands, Riverside, Perris, etc.). Second, the City's Housing Element indicates future (anticipated) growth of 6,169 houses over the next 8 years, which would absorb many of the new jobs generated by the WLC project. For example, the WLC project would be developed in lieu of the approved Moreno Highlands Specific Plan (MHSP), which could have introduced 7,736 dwelling units and 17,019 new residents into the City over the next 20 years or so. Development of the WLCSP would supplant that planned growth, so it is not likely the WLC project would induce substantial new residential growth over that anticipated by the MHSP. Finally, it is possible the project would generate some need for additional housing at some point in the future, but it is overly speculative to estimate specifically how much because of the many variables involved in future residential development (e.g., actual phasing of WLC development and local housing development, the availability of vacant land for housing, future development costs, etc.). Therefore, the DEIR concluded that population and housing impacts of the WLC project would be less than significant (in fact would substantially help the City's jobs/housing ratio), and Section 5 of the DEIR concluded the project would not induce substantial new growth of population or housing into the City.

Response to Comment F-8-94 and 95. The commenter states that the DEIR claims that WLC jobs will be filled by "workers, who, for the most part, already reside in the project area," and that WLC workers will not cause an increase in the City's population. The DEIR has been modified regarding this claim. While it is likely that some of the jobs may be filled by City residents who possess the skills and/or education required, it is expected that many project employees will be commuting to the Project from other locations in the Inland Empire and may eventually move to the City to live closer to work, thereby increasing the population and ultimately the demand for homes within the City over a period of time.

While it is true that some WLC workers will commute to the project from other parts of the Inland Empire, the impact of the Project on the jobs/housing balance in both the City and throughout the Inland Empire will be improved by the potential 20,000 jobs to be generated by the WLC. Both the City and the Inland Empire have a surplus of homes versus jobs, which causes residents to drive to LA and Orange County for work, leading to traffic congestion, less family time and an overall lower quality of life. As noted in Section 4(III) of the DEIR, the City's Jobs-Housing Balance is currently 0.47, which is one of the lowest of any City in the Inland Empire. Riverside County as a whole only has a Jobs-Housing Balance of 0.74. As the norm throughout Southern California ranges between 1.0 and 1.29 jobs per household according to Southern California Association of Governments (SCAG's) landmark 2001 study "The New Economy and the Jobs/Housing Balance in Southern California," both the City and the County are badly in need of jobs. According to this SCAG study, the average commute distance for a Riverside County resident of 21.6 miles was higher than any other County in Southern California.

Response to Comment F-8-96. The commenter stated the DEIR needs to examine cumulative impacts of the project. Each DEIR environmental analysis sections (4.1 through 4.16) examined potential cumulative impacts of the WLC project. DEIR Section 5.1 summarized that the project would make a significant contribution to cumulatively considerable impacts in the areas of aesthetics, agriculture, air quality, noise, and transportation. It is unclear how the commenter concludes the DEIR did not examine these potential impacts when it is clear the DEIR concluded the project would have a number of cumulative impacts. Section 1.6 of the DEIR explains why the “summary of growth projections” methodology was used for the assessment of most cumulative impacts, although the project’s traffic impact assessment was able to develop a comprehensive list of development projects for the general project area to identify roadway and intersection impacts for each of the two phases of project development. It is permissible to use different cumulative baselines or areas of influence as long as the EIR explains why it is reasonable to do so for a particular environmental issue. For most issues, the EIR used the growth projections of the City General Plan and the Regional Transportation Plan (RTP) of the SCAG as these represent the best long-term estimates of population, housing, and employment conditions for the Southern California region that could be affected by development of the WLC project.

Response to Comment F-8-97. The commenter states the General Plan projections are not mentioned in the cumulative analysis sections of the EIR and uses hydrology as an example. Section 4.9.7, *Hydrology and Water Quality – Cumulative Impacts*, says that *“Increased impervious surfaces are likely to alter existing hydrology and increase potential pollutant loads. However, all future development in the City and throughout the Santa Ana RWQCB will be required to comply with the requirements of the National Pollutant Discharge Elimination System (NPDES) permit program. Continued growth is anticipated to occur in the City and surrounding areas and all new development and significant redevelopment will be required to minimize its individual impacts to water quality and pollutant transport through implementation of BMPs.”* The term “in the City” refers to projected growth in the City as it occurs in the future, the commenter apparently wants any reference to growth within the City to refer to the General Plan projections. That is not necessary or clarifies the cumulative analysis to any great degree, and appears merely to be argumentative on the wording of the section rather than the analysis or conclusions reached. The WLC site is relatively isolated hydrologically due to the presence of SR-60 and Gilman Springs Road immediately upstream of the site. Therefore no regional development will substantially affect drainage onto the WLC site in the future. In addition the project hydrology report demonstrates the WLC project will not have significant drainage impacts on downstream properties in the future.

Response to Comment F-8-98. The commenter states the EIR cumulative analysis for hydrology restates the project impact analysis. It must first be remembered this is a programmatic document, and future specific development will have its own project-level CEQA analysis. However, it is instructive to note the “project-level” analysis referred to by the commenter, and outlined in Section 4.9 of the EIR, concludes the WLC project may have significant impacts but provides mitigation, based on accepted regulatory programs and best management practices, to eliminate those impacts. The EIR then assumes that other (cumulative) development projects will be required to mitigate their own project-level impacts to less than significant levels by similar methods. Looking at development across the entire region, it is also reasonable to assume if each future development must mitigate its own impacts to less than significant, and this is monitored by federal and state regulatory agencies, the cumulative impacts to hydrology and water quality will similarly be less than significant. Therefore there is no need for additional cumulative analysis on a project that will not contribute to any cumulative impacts.

Response to Comment F-8-99. The commenter explains that a project’s individual impacts do not affect its cumulative impacts. The DEIR did examine potential regional impacts of development of the WLC site in light of planned or future development in the surrounding region. The commenter

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

provides no empirical evidence that the project will actually have a cumulatively considerable impact on area hydrology or water quality.

Response to Comment F-8-100. The commenter explains how cumulative impacts should be determined. Section 4.9.7 of the EIR did evaluate potential cumulative impacts of the WLC project, and Responses to Comments F-8-96 through F-8-99 above attempt to clarify this analysis and the DEIR conclusions.

Response to Comment F-8-101. The commenter expresses concern about the EIR's analysis of cumulative wastewater impacts similar to Responses to Comments F-8-96 through F-8-99 regarding water resources. The commenter also asks whether the City's projections for the Moreno Valley Regional Water Reclamation Facility will have sufficient wastewater treatment capacity for future development. The City has reviewed the land uses proposed in the WLC project and the potential wastewater generation will be considerably less than anticipated under existing land use and zoning designations (i.e. Moreno Highlands Specific Plan) which were included in the City's plans for long-range wastewater service within its service boundaries so the lower wastewater generation rates of logistics and warehousing uses under the WLCSP can easily be accommodated with anticipated increases in wastewater treatment planned by the City. The City's capital improvement program typically includes these types of specific improvements only 5 years in the future and additional improvements are scheduled as needed for at least 5 years in the future.

Response to Comment F-8-102. The commenter warns the WLC project alone may not trigger wastewater expansion or significant impacts regarding wastewater treatment, but the WLC project, in conjunction with other development, could have cumulative impacts. As pointed out in Response to Comment F-8-101, the City has anticipated growth within its service area and has planned improvements to its treatment facilities to accommodate planned growth. Since the WLC project would generate substantially less wastewater than uses under the current General Plan (i.e., Moreno Highlands Specific Plan), which formed the basis for determining needed wastewater treatment facilities the WLC project would not make a significant contribution to cumulatively considerable impacts to regional wastewater services.

Response to Comment F-8-103. The DEIR does evaluate the cumulative impacts of the proposed project in Sections 4.1-4.16 for each environmental topic that was analyzed. Refer to Responses to Comments F-8-96 through F-8-98, F-8-101, and F-8-102.

Response to Comment F-8-104. The commenter states the EIR has not identified any specific growth-inducing impacts of the project. In fact, Section 5.3 describes the growth-inducing effects of the WLC project, while Section 4.13, *Population, Housing, and Employment*, provide project-specific projections as to the fiscal and employment benefits of the project, while indicating why housing or population impacts of the project would be less than significant. Since the DEIR demonstrates there are no significant adverse population or housing impacts from the WLC project, it would be overly speculative to try to evaluate potential indirect and incremental environmental impacts of this potential growth on the City or surrounding communities.

Response to Comment F-8-105. The commenter contests the EIR's assertion that any additional housing needed to support the WLC project would be consistent with planned growth. In one way the commenter is correct, the proposed WLC project would not be consistent with current housing or population growth predictions because it would substitute industrial warehousing for planned residential and mixed use development, and would substantially reduce the amount of land available for future housing within the City. DEIR Section 4.13, *Population, Housing, and Employment*, indicates why this change would be beneficial to the City (i.e., large shift in the jobs/housing ratio of the City). There may be some indirect induced growth over a long period of time as the WLC project builds out, however, it would be overly speculative to try to estimate that growth.

First, the City currently has a high unemployment rate, so it is likely that many of the first jobs produced by the WLC project would go to unemployed City residents as well as unemployed workers in other nearby communities (e.g., Redlands, Riverside, Perris, etc.). Second, the City's General Plan indicates future (anticipated) growth of 6,169 houses over the next 8 years, which would absorb many of the new jobs generated by the WLC project. For example, the WLC project would be developed in lieu of the approved Moreno Highlands Specific Plan (MHSP), which could have introduced 7,736 dwelling units and 17,019 new residents into the City over the next 20 years or so. Development of the WLCSP would supplant that planned growth, so it is not likely the WLC project would induce substantial new residential growth over that anticipated by the MHSP. Finally, it is possible the project would generate some need for additional housing at some point in the future, but it is overly speculative to estimate specifically how much because of the many variables involved in future residential development (e.g., actual phasing of WLC development and local housing development, the availability of vacant land for housing, future development costs, etc.). Therefore, the DEIR concluded that population and housing impacts of the WLC project would be less than significant (in fact would substantially help the City's jobs/housing ratio), and Section 5 concluded the project would not induce substantial new growth of population or housing into the City.

Response to Comment F-8-106. The commenter says the EIR contradicts itself by saying the project does not require major extensions of existing infrastructure, but would result in the installation of considerable infrastructure. The commenter has interpreted the statements incorrectly. The DEIR correctly indicates that there is considerable existing infrastructure available adjacent to the WLC site, mainly due to the presence of existing development west of Redlands Boulevard and northeast of Eucalyptus and Redlands (i.e., Skechers). Due to the size of the project site, an extensive network of roads, pipelines, electrical lines, etc. must be constructed onsite to serve the new uses. However, in most cases, adequate infrastructure is available adjacent to the site to provide service capability (i.e., water supply, wastewater conveyance and treatment, electrical lines, etc.). So both statements are correct, but it will take careful coordination between future development, the City, and the various utility and service providers to make sure adequate services can continue to be provided as the area east of Redlands Boulevard is developed. The commenter must remember that this is a programmatic document, and cannot by its nature detail how specific utility connections and service provisions will be made until specific development proposals are brought forward in the future, with subsequent CEQA analysis tiered off this programmatic EIR.

Response to Comment F-8-107. The commenter believes the alternatives studied in the EIR are not a reasonable range and the objectives are drawn too tightly to comply with CEQA. The alternatives analysis in the EIR does in fact represent a reasonable range of alternatives, including several with reduced impacts. However, those alternatives must be evaluated in light of project objectives, which in this case are to create a regional logistics campus, improving the City's jobs/housing balance and providing financial benefits to the City. A plan of this scope and scale must by its very nature have broad and large objectives, some of which could not be met by much smaller or very different projects. Indeed, it would be very difficult for just about any project of this size (i.e., 2,600 acres) to substantially reduce the significant impacts identified for the proposed project except possibly for air quality (i.e., health risks from diesel particulate matter and toxic air contaminants from diesel exhaust). All of the other project alternatives propose land uses that would not produce as many truck-related air emissions (e.g., No project - Moreno Highlands Specific Plan, Less Intense Alternative, and Mixed Use Alternatives A and B) would also not fulfill the City's objectives. However, some would produce substantially more vehicular traffic and would not introduce nearly as much employment as the proposed project which helps improve the City's jobs/housing balance.

In addition, satisfying the market demand for warehousing, maximizing employment opportunities, and improving the jobs/housing imbalance, all in the context of supporting the City's Economic Development Action Plan, are important, indeed fundamental objectives. See FEIR Volume 1 Response to Comments Section 1.5.1 for 2011 and 2013 Economic Development Action Plan

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

objectives related to the WLC. The comparison of the environmentally superior alternative, the reduced density alternative, as shown in Table 6.T of the DEIR demonstrates the objectives are not as fully met by the reduced density alternative. However it will be up to the City Council to determine if the benefits of the proposed project outweigh its detriments.

Response to Comment F-8-108. The commenter has quoted only a portion of the project's objectives and has omitted those which set forth the City's desired economic objectives, particularly those which seek to increase the number of jobs within the City and to improve the City's jobs/housing balance. See the full set of objectives at DEIR page 3-73 and the discussion of the City's housing and employment situation in DEIR Section 4.13.1. Also see Responses to Comments F-7A-68., F-8-107, and F-8-111.

Response to Comment F-8-109. Any site location not in the City would not allow the City to derive project benefits as outlined in the project objectives. See Responses to Comments F-8-108 and F-8-111.

Response to Comment F-8-110. The commenter suggested alternative sites be studied in more detail or be classified as alternatives considered but rejected. The various alternative sites were evaluated to the degree necessary to determine if any would reduce or eliminate one or more significant impacts of the proposed project, which are their purpose. Whether they remained within the body of the alternatives analysis or were moved to the section mentioned by the commenter, the conclusion would still be the same, there are no feasible alternative sites in the general project area that could support the WLC project as proposed, or that would substantially reduce or eliminate one or more significant impacts of the proposed project due to a different location. As discussed previously, this is due mainly to the size and nature of the proposed project with its need for freeway access. See Responses to Comments F-8-108 and F-8-68.

Response to Comment F-8-111. The commenter believes the project objectives are only those of the developer. In fact, the twelve objectives are a combination of private and public interests, as follows:

- "Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities" (Objective #1);
- "Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan" (Objective #2);
- "Establish design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project" (Objective #4);
- "Create a project that will provide a balanced approach to the City's responsibilities of fiscal viability, economic expansion, and environmental integrity" (Objective #7); and
- "Significantly improve the City's jobs/housing balance and help reduce unemployment within the City" (Objective #10).

These clearly show the objectives embody both public and private goals for the WLC project. See FEIR Volume 1 Response to Comments Section 1.5.1 for all 2011 and 2013 Economic Development Action Plan objectives related to the WLC. The EIR used the ability of an alternative site to accommodate the proposed project, and the significant impacts of the proposed project, as the two main factors to evaluate alternative sites.

Response to Comment F-8-112. Response F-8-111 above has demonstrated the project objectives are not narrowly drawn but include a wide range of both public and private goals for the project. The

EIR has provided an evaluation of alternatives and alternative sites consistent with the intent and requirements of CEQA.

Response to Comment F-8-113. The alternatives analysis did identify several alternatives to the project that would lessen some of the significant environmental impacts of the WLC project. However, it must be remembered that any development project of this size would create significant environmental impacts, including air quality, traffic, noise, etc. For example, under the current South Coast Air Quality Management District thresholds, only an alternative that was substantially smaller (i.e., less than 2.5 percent or 1 million square feet) of warehousing would have less than significant air quality impacts. This drawback of the project size was discussed in the introduction to the alternatives section. As shown in Table 6.S, Alternative 1 (Less Intense Development) and Alternative 3 (Mixed Use B) both reduce air quality, greenhouse gas, and noise impacts of the proposed project, but not to less than significant levels mainly due to the size of the alternative land use plans. Any substantial development project on the WLC property that produces a large amount of new employment (e.g., office, commercial, light industrial) would result in a number of significant impacts such as traffic, air quality, noise, etc., many of which would be similar to those of the proposed WLC project, including truck exhaust pollution issues which would also be generated by light industrial and commercial uses.

Response to Comment F-8-114. The commenter states that Alternative 2 (Mixed Use A) is a “straw man” alternative that was developed just to be rejected as having more impacts. In fact, it is difficult to craft a reasonable alternative for such a large project site that generates large amounts of employment without generating many significant impacts as well. For example, the result of trying to reduce truck-related impacts (i.e., health risks from diesel air pollutants) is that other types of non-residential land uses generate employment but also generate large amounts of vehicular traffic, especially during peak hours (e.g., commercial, office, light industrial). From any kind of development on a site of this size, there would be potentially significant impacts associated with hydrology and water quality, utilities, public services, traffic, air quality, noise, etc. Even allowing all low intensity residential uses on the site would create significant traffic and air quality impacts, as indicated in Section 6.2.1, *Alternatives Considered But Not Carried Forward For Detailed Analysis - All Residential Uses*.

Response to Comment F-8-115. The commenter objects to Alternative 3, which is similar to the Moreno Highlands Specific Plan (MHSP) but replaces 603 acres of commercial uses with logistics warehousing. This alternative was an attempt to develop an alternative that substantially reduced the amount of logistics warehousing (603 acres instead of 2,610 acres or less than a quarter of the WLC project) to generate employment while trying to reduce truck-related impacts of traffic and air quality (health risks). However, the residential uses of the MHSP end up generating a large amount of vehicular (car) traffic, so the significant impacts are not eliminated except for truck-related emissions. As explained in Response to Comment F-8-114 above, it is difficult for any development alternative on a site the size of the WLC property not to generate a number of significant impacts. However, it is reasonable to assume that an alternative with mainly residential uses (1- and 2-story houses) with over 75 percent less warehouses would have substantially less visual impacts than the proposed WLC project. Lower and fewer buildings would very likely reduce potential visual impacts along SR-60 to less than significant levels, but obviously that would depend on the location of the warehouse buildings.

Response to Comment F-8-116. The commenter states the Reduced Density Alternative 1 must be on a smaller footprint of land to reduce significant impacts. A reduced density alternative, unless it was reduced less than 2.5 percent the size of the proposed WLC project, would not reduce the significant air quality impacts, although it would reduce most of the other impacts of the project to less than significant levels. A project that small would only occupy 65 acres or less, so the question would still remain what development would occur on the remaining 2,545 acres, and what impacts that development would have. Certainly a reduced footprint would help reduce some of the indirect

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

impacts identified in the EIR related to the San Jacinto Wildlife Area (SJWA), but those were not determined to be significant impacts, so they are not addressed in the development of alternatives. The EIR has also determined that continued agriculture is not a viable long-term land use for the project site, so creating a large buffer of agricultural land around the site, or even just on the southern end, would still result in development of some type of land use on the buffer land unless the state or some other entity were to purchase the vacant “buffer” land to add to the SJWA.

Response to Comment F-8-117. The commenter has misunderstood the project’s application to the San Jacinto Wildlife Area. The only project actions which affect the CDFW Conservation Buffer Area, the northern most portion of the San Jacinto Wildlife Area, are the General Plan Amendment and rezoning which change the designation of the CDFW Conservation Buffer Area from residential to open space. Also, please see the Responses to Comments F-7A-67 and F-8-108.

Response to Comment F-8-118. The commenter summarizes several issues about the alternatives. A reduced footprint alternative would reduce greenhouse gas emissions, but the drawbacks of a reduced footprint alternative also discussed in Response to Comment F-8-116.

The DEIR Section 6.0 Alternatives does evaluate a Reduced Density Alternative, *Section 6.3.6 Alternative 1: Reduced Density*. This alternative assumes a 28 percent reduction in building square footage, 41.6 million square feet vs 29 million square feet. The analysis concludes with this reduction many of the impacts remain significant and unavoidable. Further reduction in density would not achieve the fundamental project objectives of maximizing employment opportunities, improving the jobs/housing imbalance, and supporting the City’s Economic Development Action Plan. See FEIR Volume 1 Response to Comments Section 1.5.1 for 2011 and 2013 Economic Development Action Plan objectives related to the WLC. Agriculture is not a viable land use because of housing affordability in the region, rising cost of land, competition from other regions, and volatile water allocations. The agricultural quality of the WLC site is quite low. It has been planned and zoned for development for over 20 years. See the discussion in the DEIR at pages 4.2-13 and -19. Section 5.F of the revised TIA (FEIR Volume 2, Appendix L-1) discusses the possibility of having rail service serve the project and concludes that it is infeasible. Also, please see the Responses to Comments F-7A-67 and F-7A-68.

The DEIR did include several alternatives that substantially reduced truck traffic to and from the project site (Mixed Use A and B = Alternatives 2 and 3), and Responses to Comments F-8-114 and F-8-115 in this letter address drawbacks of Alternatives 2 and 3.

The revised DEIR and TIA (FEIR Volume 2, Appendix L-1) includes a study on the use of rail to reduce truck traffic. The conclusion is rail is not a viable option for several reasons, primarily due to physical constraints of rail access to the project (grade, impacts to existing developed areas) and rail is not economically viable until transports exceed 500 miles. The majority of the demand for goods and products occur within the southern California region, well under the 500 mile threshold. In addition, Response to Comment F-3-5 from Letter F-3 explains why rail service is infeasible to the WLC project site, and would result in additional environmental impacts were it to be extended to the site.

Response to Comment F-8-119. The commenter states the EIR must develop an environmentally superior alternatives. The EIR did identify the Reduced Density Alternative as environmentally superior to the proposed project. However, it was rejected as it did not meet the project objectives to nearly the degree as the proposed project. The discussion in Responses to Comments F-8-107 through F-8-119 above in this letter explain why it is difficult to develop an alternative on a site the size of the WLC property that generates substantial employment but does not generate many significant environmental impacts as well.

Response to Comment F-8-120. The commenter states the EIR must be recirculated. The commenter's CEQA citations are correct, but the conclusion drawn is incorrect. While a lot of additional information has been generated subsequent to circulation of the DEIR, mainly in response to the many comments on the EIR, none of the additional analysis or responses has indicated the project will have any substantially different or new significant impacts than those identified in the DEIR. Therefore, a FEIR has been prepared with extensive response to comments, and the public and City Council will be provided adequate time to review the responses before a decision is made on the project. Also, please see the Response to Comment F-7A-11.

Response to Comment F-8-121. The commenter states that State Planning and Zoning Law requires that development decisions be consistent with the jurisdiction's general plan and goes on to cite court cases to that effect. Because to the reasons stated by the commenter her opinion is the project is not consistent with the City's current General Plan and approval of the project would violate State law. The analysis in the EIR actually indicates the project is generally consistent with the General Plan current goals, policies and objectives, but the proposed project includes a General Plan Amendment that will assure the WLC project and General Plan are consistent with each other. DEIR Section 3.5, *General Plan Amendment*, in the project Description outlines changes to various elements of the General Plan. If the project is to be approved, the General Plan Amendment will also need to be approved so the two plans are consistent with each other.

Response to Comment F-8-122. The commenter states the City's General Plan is legally inadequate because it contains a statement that the provisions of specific plans take precedence over provisions of the General Plan to the extent the two documents are inconsistent. Because of this general Plan inadequacy implicates this project cannot be lawfully approved. However, the City Council, which is responsible for approving the City's General Plan, can determine that the Specific Plan is generally consistent with the General Plan in that it complies with the overall intent of the General Plan, yet contains details or aspects that are not fully consistent with the current General Plan and must therefore process a General Plan Amendment to make the two planning documents consistent with each other. If this is done, the Specific Plan would be consistent with the state planning laws cited by the commenter. It will be the purview to the City Council to approve or deny the proposed project and they will have to make findings as to the proposed project consistency with the City's General Plan.

Response to Comment F-8-123. It is the commenter's opinion the EIR is deficient, does not comply with the General Plan, and must be recirculated. The EIR is consistent with the goals and requirements of CEQA, has provided the decision-makers with sufficient objective information upon which to make an informed decision, and the WLCSP will be consistent with the City's General Plan if the proposed General Plan Amendment is approved as part of the project entitlements. After careful review of all the additional information provided in response to comments on the DEIR, none of the additional analysis or responses has indicated the project will have any substantially different or new significant impacts than those identified in the DEIR. Therefore, a FEIR has been prepared with extensive response to comments, and the public and City Council will be provided adequate time to review the responses before a decision is made on the project.

Letter F-9A: Sierra Club, Sierra Club, Center for Community Action and Environmental Justice, and Natural Resources Defense Council (April 8, 2013) and Appendix 1 (on Flash Drive)

April 8, 2013

Mark Gross
Senior Planner

planning@moval.org

Re: World Logistics Center Project Draft Environmental Impact Report (SCH #2012021045)

Dear Mr. Gross:

On behalf of the Sierra Club, Center for Community Action & Environmental Justice, and the Natural Resources Defense Council, we provide comments on the World Logistics Center Project Draft Environmental Impact Report ("EIR"). We appreciate the opportunity to provide comments on the EIR for the World Logistics Center Project ("WLC" or "Project"). Given the inevitable regional and acute local impacts of the proposed Project, it is especially important that the EIR contain the necessary analysis to enable both the decision makers and the public to understand the significant environmental repercussions of this Project. Additionally, it is also critical that the EIR compare the proposed Project to other possible alternatives. Instead, the EIR effectively disguises the true impacts of the Project by omitting crucial information, underestimating many environmental impacts and ignoring others altogether.

1

Overall, this project, which is planned to be the largest master planned warehousing development in the world, will exact a large toll on the environment and public health even under the favorable assumptions used in the EIR. For example, the EIR concedes the Project will interfere with the Air Quality Management Plan, which is the region's roadmap for clean air. As we fight to meet air quality standards, these types of projects, which emit thousands upon thousands of pounds of pollution a day must not be approved, until and unless they comply with clean air plans and adopt **ALL** feasible mitigation measures. And, as articulated below, the full extent of the impacts is not even articulated in the EIR. By way of example, the EIR dramatically underestimates by 50% to 100% the number of trucks that will serve this Project. Since the number of trucks serves as the lynchpin to several analyses in the EIR (i.e. air quality, traffic, noise, etc), this flaw demands that the analysis be revised. Underestimating the level of truck traffic expected for this Project does a disservice to the public and decision-makers.

2

3

It effectively masks the extent and challenges this Project will exact on the region and local communities. .

3

As a result of the EIR's inadequacies, there can be no meaningful public review of the Project. CEQA accordingly requires the City to prepare and circulate a revised EIR to permit a complete understanding of the environmental issues at stake, if its wishes to pursue this project.

4

I. The Proposed Project will have an Indelible Impact on Adjacent Communities and the Region in General.

The health impacts and regional air quality impacts from freight activities are well documented. Of all listed Toxic Air Contaminants identified by the California Air Resources Board ("CARB"), diesel particulate matter ("DPM") is known to present the greatest health risks to Californians.¹ Dozens of studies have shown adverse impacts from DPM and Oxides of Nitrogen ("NO_x") including respiratory disease, cardiovascular mortality, cancer, and reproductive effects as well as an increase in regional smog and water contamination. CARB has determined that diesel exhaust is responsible for over 70% of the risk from breathing our air statewide and in the South Coast Air Basin ("SCAB").² Further, the South Coast Air Quality Management District ("SCAQMD") in the Multiple Air Toxics Exposure Study III ("MATES III") "indicate[ed] that diesel exhaust is the major contributor to air toxics risk, accounting on average for about 84% of the total" risk from breathing air toxics."³

5

Residents in Inland Empire communities will undoubtedly face additional impacts due to the increased pollution from this Project. For sensitive populations, such as children and the elderly, and for those who live and work in close proximity to these major sources of diesel exhaust, the risk will be even higher.

In recent years, environmental health researchers have firmly established the linkage between air pollution exposure and a range of negative health outcomes, including slowed lung growth rates in children (Gauderman et al Cohort C, Cohort D papers), exacerbation of existing respiratory disease (McConnell et al EHP bronchitis/asthmatic paper), increased absences from school due to respiratory illness (Gilliland et al CHS absences paper), and increased mortality. The following charts display the troubling findings of the impacts of air pollution on

¹ CARB, *Emissions Reduction Plan for Ports and Goods Movement in California*, 7 (2006)(hereinafter "ERP").

² ERP, at 7.

South Coast Air Quality Management District, “Multiple Air Toxics Exposure Study in the South Coast Air Basin” (MATES II Study), March 2000.

In addition to the large impacts on residents and workers closest to the sources of emissions, distribution center operations pose a particularly acute threat to regional air quality. The area where the proposed project is located, consistently ranks near the top of the list for the nation's most polluted air.⁴ Freight transport, including the operations culminating in the Inland Empire, greatly contributes to the persistent failure of the South Coast Air Basin ("SCAB") to meet federal and state clean air standards established by the Environmental Protection Agency. Without all feasible mitigation, the SCAB could fail to achieve the federal annual PM2.5 standard by 2014, the 8-hour ozone standard by 2024, and other air quality standards. This project proposes to add additional pollution that would not have occurred if the project was not built. Against this backdrop, there are several deficiencies in the EIR that must be addressed.

6

II. The EIR Provides Inadequate Analysis of and Mitigation For the Project's Traffic Impacts.

There are a number of important flaws in the transportation and traffic section of the EIR. As such, further study must be undertaken to properly identify, analyze, and mitigate the traffic impacts of the proposed Project.

7

CEQA requires that all adverse and significant traffic impacts be properly disclosed, analyzed and, where feasible, mitigated. Until these various issues and concerns are addressed, there is substantial evidence that the proposed Project may have adverse traffic impacts, and these impacts have not been properly disclosed, analyzed, or mitigated. According, the Draft EIR for the WLC must be revised and recirculated.

Most of these concerns are discussed at length in the Review of the EIR for the World Logistics Center prepared by Mr. Tom Brohard for NRDC ("Brohard Letter"). Mr. Brohard is a Professional Civil Engineer in both California and Hawaii and a Professional Traffic Engineer in California. He has over 40 years of engineering experience. His report is attached to this Letter as Exhibit A and incorporated herein by reference. The EIR and its technical studies should be revised to address the flaws identified by Mr. Brohard. Below are some particularly salient points from the Brohard Letter.

8

⁴ See AMERICAN LUNG ASSOCIATION, STATE OF THE AIR 2012 12-17 (2012), available at <http://www.stateoftheair.org/2012/assets/state-of-the-air2012.pdf>. San Bernardino and Riverside Counties rank first and second, respectively, as the most ozone-polluted counties nationwide. *Id.* at 17. San Bernardino and Riverside are also among the most polluted counties by year-round particle pollution (annual PM2.5), ranking ninth and fourth respectively nationwide. *Id.* at 16.

a. The EIR Uses an Improper Baseline.

As outlined in Exhibit A, the traffic analysis uses a faulty baseline. In particular, the EIR and its TIA analysis contain three critical flaws in this regard. First, the EIR fails to adjust upward for 2011 traffic counts.⁵ Second, the EIR and TIA fail to adjust for seasonal fluctuations.⁶ Finally, the EIR does not indicate if there were adjustments made to convert trucks to passenger car equivalents.⁷

9

b. Direct and Cumulative Impacts are Incorrectly Identified.

The Brohard Letter identifies more than three pages of examples where direct traffic impacts are not disclosed in the EIR.⁸ With more than 50 additional direct project traffic impacts not revealed in the EIR, this precludes a proper analysis of the major traffic impacts from this Project. Also, by failing to disclose these impacts properly, the EIR forecloses analysis of proper mitigation for these intersections where traffic will be degraded.

10

c. The EIR Dramatically Underestimates Truck Traffic.

As articulated in the Brohard Letter, truck trips are underestimated for this Project.⁹ Of particular importance, even using the favorable assumptions from the NAIOP study, this estimate of daily passenger car equivalents is underestimated by 14,281.¹⁰ Thus, the EIR fails to disclose the true extent to the major traffic impacts imposed by this Project.

11

d. The EIR Ignores Several Feasible Measures That Would Mitigate the Project's Traffic Impacts.

There are many problems with the mitigation measures for this Project. The Brohard letter has identified several mitigation measures that should be implemented to reduce the impacts of this Project.¹¹ Also, the EIR proposes no mitigation measures for 2017 or 2022.¹² Since there are significant project impacts in this timeframe, CEQA requires the adoption of all feasible mitigation measures to reduce significant impacts like traffic impacts or if there is substantial evidence

¹² Brohard Letter, at 11.

as to why the mitigation measures are infeasible.¹³ And even the mitigation offered is flawed. For example, the Brohard Letter identifies flaws with the mitigation measures on pages 13-14. Most importantly, the Brohard Letter identifies that many of the mitigation measures will not be implemented in a timely fashion.

12

III. The DEIR Provides Inadequate Analysis of and Mitigation For the Air Quality Impacts.

The air quality analysis suffers many flaws that render it incapable of informing public decisions on the merits of this Project. In particular, the EIR underestimates emissions from this Project. Three assumptions create this underestimation, including a) underestimating trip generation numbers, b) underestimating the percentage of trucks associated with the Project, and c) underestimating trip lengths for both autos and trucks.

13

a. The EIR Uses Faulty Trip Generation Numbers.

Trip generation assumptions are of paramount importance in accurately disclosing the environmental impacts of a project. The trip generation numbers are artificially deflated for this Project, which underestimates the air quality impacts from this project. In particular, the EIR's Air Quality Analysis uses a trip generation number based not on ITE Trip Generation Manual, but rather discounted based on the NAIOP study.¹⁴ The EIR also relies on guidance from SCAQMD, which is reproduced in Exhibit B to this comment letter.¹⁵ The guidance relied upon in pertinent part, states –

14

In order to avoid underestimating the number of trips associated with large warehouse / distribution center operations without rail service, AQMD staff recommends that lead agencies utilize a rate of 2.59 trips per TSF for large warehouse air quality analyses on a project specific basis. The value of 2.59 from the nationwide dataset is preferable instead of the SCAB rate of 3.68 due to the greater reliability of data based on the larger sample size. For warehouses with rail service, a rate of 1.63 trips per TSF may be used. These values provide reasonable worst case default rates for individual new warehouses in the absence of more project-specific data.

15

In the case that air quality is evaluated for multiple warehouses (>10), such as in an analysis for a general plan, the average rate of 1.44 trips per TSF from the ITE 8th Edition Trip Generation manual is acceptable. This lower value may be more appropriate as on

¹³ Pub. Res. Code § 21081(a)(3).

¹⁴ EIR, at 4.15-30.

¹⁵ EIR, Appendix D, at 110.

average, a small portion of warehouses can be expected to operate at varying levels of service, including some warehouses experiencing temporary partial or complete vacancy.¹⁶

15

The basis for using a lower trip generation than the rate of 2.59 recommended in SCAQMD's guidance is laid out in the case where 1) there is rail access or 2) "a small portion of warehouses can be expected to operate at varying levels of service, including some warehouses experiencing temporary partial or complete vacancy." Here, since there is no rail access, the project proponents presumably rely on the latter assumption related to more than 10 warehouses. However, the EIR does not contain sufficient analysis to demonstrate this trip generation number is appropriate. For example, the EIR and its studies fail to articulate the amount of temporary partial or complete vacancy that is expected at this complex. In fact, in Appendix O, which articulates the economic benefits of the operation of this facility, there does not anticipate "temporary partial or complete vacancy." To the extent the EIR anticipates that portions of this warehouse complex are presumed to lay vacant, these assumptions should be articulated in all relevant sections of the EIR (e.g. purpose and need section, economic analysis). Absent this justification, the Project should assume the higher trip generation from the ITE Trip Generation Manual for individual warehouse developments.

16

b. The EIR uses Faulty Assumptions About Truck Trips as a Percentage of Total Trips.

Even if the trip generation numbers are based in reality, the EIR dramatically underestimates the percentage of trips that are by trucks.¹⁷ As outlined in the Brohard Letter, the assumption that only 20% based on a 2003 Fontana Study of warehouse trips attributed to trucks is not supported by the record. In particular, three sources cut against use of this artificially low threshold.

17

First, the SCAQMD recommends using a much higher truck assumption. In pertinent part, SCAQMD recommends –

[i]n order to avoid underestimating the number of trucks visiting warehouse facilities, AQMD staff recommends that lead agencies conservatively assume that an average of 40% of total trips are truck trips $[(0.48*10 + 0.2*4)/(10+4)=0.4]$. Without more project-specific data (such as detailed trip rates based on a known tenant schedule), this average rate of 40%

¹⁶ South Coast Air Quality Management District, CalEEMod, Appendix E, Technical Source Documentation, *available at* <https://www.aqmd.gov/caleemod/doc/AppendixE.pdf> (Exhibit B), at 15.

¹⁷ EIR, at 4.15-32 (Table 4.15M).

provides a reasonably conservative value based on currently available data.¹⁸

The 40% recommendation is 100% higher than the 20% estimate used for this EIR. Despite claims by the EIR that the air quality analysis is conservative, this assumption renders the analysis completely indefensible because it undercuts the extent of emissions from this project.

Second, Appendix S to the TIA includes the December 20, 2011 NAIOP Truck Trip Generation Study of 31 high-cube warehouses larger than 500,000 square feet in size in the Inland Empire prepared by Kunzman Associates (“NAIOP Study”).¹⁹ This study indicates that 69.70 percent of the high-cube warehouse trips were made by cars and 30.21 percent of the high cube warehouse trips were made by trucks.²⁰ Even this study, which was relied upon in the EIR to provide justification for a much lower trip generation number than that in the ITE Trip Generation Manual, demonstrates that 20% of trips are attributed to trucks is an inappropriate estimate for high cube warehouses. If the EIR wishes to deviate from using this analysis, it must explain why it deviates from “[t]he 2011 NAIOP [study, which] provides the more accurate trip generation for the proposed project as the NAIOP study is the most comprehensive trip study performed for high-cube logistics warehouses.”²¹

Third, the Peer Review of the NAIOP Study in Appendix T to the TIA Report states that “[b]ased on the study’s small overall sample size and the fact that only one warehouse over 500,000 square feet was included in the analysis, the 2003 Fontana Study is not an appropriate source for vehicle/truck trip generation rates for modern high-cube warehouses uses larger than 500,000 square feet.”²² Thus, the record also includes evidence that the study in which the 20% truck share number is established is deeply flawed.

The dramatic underestimation of trucks is important because as the EIR concedes, “heavy-duty trucks have greater NOX, PM10, and PM2.5 emissions compared with automobiles.”²³ This means that under a conservative assumption endorsed by the SCAQMD, the trucks are underestimated by 100% in the EIR. Even using the less conservative assumptions of the NAOIP study, trips from trucks in the EIR are underestimated by 50%. A particular flaw is the underrepresentation of heavy-heavy duty trucks, which under the 2003 are presumed to be only 12 percent of total trips, but the NAIOP study indicates heavy-heavy duty truck trips

¹⁸ Exhibit B, at 16.

²² Brohard Letter, at 5; *see also* Appendix L, Appendix T, at 5-6.

²³ EIR, at 4.3-50.

should be much greater than what this outdated study articulates. This underestimation renders the EIR incapable of informed decision-making because it underestimates the number of trucks by thousands. As a result of this analysis, the total emissions from the project are incorrect, in addition to the health risk assessment, which underreported health risk due to the failure to include

20

c. The Proposed Trip Lengths are Not Support in the EIR.

Also, of great concern, the EIR underestimates trip length for trucks using the proposed warehousing facilities. NRDC retained Dr. Alex Karner to look at the trip length assumptions in the EIR and associated technical studies. This memo summarizing his findings is located at Exhibit C to the attached comments. We incorporate this analysis by reference and ask that the EIR address the comments contained therein. As noted by Dr. Karner, small changes in assumptions can dramatically impact emissions. For example, a 55 average trip length, would increase the emissions compared to the current 50 mile trip length assumed in the EIR.

21

Dr. Karner's analysis indicates that the EIR fails include sufficient data to justify the 50 mile assumed trip length.²⁴ In particular, using the EIR assumptions, only 881 of the 14,683 truck trips associated with this project in 2022 would be from the Ports. This is less than 10% of the total number of port-related trips projected for the San Bernardino Valley in 2022, which is likely to be approximately 9,100.²⁵ This low level of port-related trips is curious, given the stated goal of this warehousing project to accommodate traffic to and from the Ports of Los Angeles and Long Beach. Given this likely underestimation of trip lengths, the emissions from the project will be understated as well.

22

d. The Construction Mitigation Measures Must be Improved.

The mitigation measures for construction are vague. We recommend that the construction mitigation comply with the following requirements:

23

The mitigation measures provided for construction activity are inadequate because they fail to fully address the diesel engines used by construction equipment, which are the largest construction related emission source. Construction related emissions from this project are estimated to exceed several important health and air quality thresholds including SCAQMD regional thresholds of significance for VOC, NO_x, CO, PM₁₀ and PM_{2.5}; local thresholds for NO₂, PM₁₀ and PM_{2.5}; and cancer risk.

²⁴ EIR, Appendix D, at 120.

²⁵ Exhibit C, at 4.

While the plan calls for construction equipment to meet EPA Tier 4 emission standards in 2017 and thereafter, it continues to allow for interim tier 4 equipment that meets a particulate standard ten times less protective,²⁶ and allows for more polluting tier 3 equipment if the cleaner equipment is not easily available through a rental company.²⁷ This opens the door to widespread use of more polluting construction equipment despite the fact that tier 4 compliant construction equipment is already available and will be widely available beginning in 2014, the final U.S. EPA deadline for which it is required across the board.²⁸

24

Of most concern is that prior to 2017, construction equipment is only required to meet U.S. EPA Tier 3 standards, which are similar to 1994 vintage truck standards and at least ten times more polluting than modern standards for both NOx and PM.²⁹ The WLC should adhere to the clean construction policies adopted by the Port of Los Angeles and by the Los Angeles County Metropolitan Transportation Authority (“LA METRO”).³⁰ Both of these policies require construction equipment to meet Tier 4 standards no later than 2015 and require use of diesel particulate filters on all construction equipment that does not meet Tier 4 standards starting in 2011. Further, the policies also require all on-road trucks associated with construction to meet U.S. EPA 2007 emission standards by January 2014, all trucks carrying material such as debris or fill be fully covered; and that in any case where grid power is inaccessible and generators are utilized, they must meet 0.01 gram per brake-horsepower hour standard for PM or be equipped with best available control technology for PM, such as diesel particulate filters. All three of these important elements must be applied to this project.

25

We recommend a strict no idling policy on the construction site, applied to all vehicles – on- and off-road when they are not actively engaged in work on the

26

²⁶ See diesel standards explained by dieselnet:

<http://www.dieselnet.com/standards/us/nonroad.php>

²⁷ “Written verification of the Tier IV equipment search of three or more rental companies shall be provided by the project applicant to the City verifying the results of the search.”

²⁸ Again, see dieselnet for more information on the phase in of interim and tier IV standards. Note that tier IV equipment phases in through 2015 only for the very largest engines, exceeding 750 horsepower and more typically used for mining, not construction. See Cummins for another helpful description of tier IV equipment and note a modest fuel savings in addition to major emission reductions associated with final tier IV equipment: <http://cumminsengines.com/tier-4-final>

²⁹ Compare standards at dieselnet.com.

³⁰ Port of Los Angeles Green Construction program, see page 160, http://www.portoflosangeles.org/CAAP/_2010_CAAP_UPDATE_FINAL.pdf
LA Metro Green Construction Policy, http://www.metro.net/projects_studies/sustainability/images/Green_Construction_Policy.pdf

site. Additionally we recommend the use of electric and alternative fueled equipment where feasible. We support the remaining construction mitigation measures and best practices, including most notably that on site electrical hook ups for equipment will be provided, where feasible. We note that establishing access to grid power is an essential priority.

26

Finally, it is important for all nearby residents and sensitive sites such as schools, daycares and senior centers to be actively notified in advance of and during construction activities.

27

e. The Operational Mitigation Must Be Strengthened.

Mitigation for diesel trucks in the plan is grossly inadequate, especially considering that these trucks are by far the greatest source of pollution from the project with or without the mitigation package.³¹ In fact emissions from diesel trucks in the mitigated scenario appear to be much less than the “worst case scenario” because credit is taken for a “project design feature” calling for 2010 and later model year trucks to serve the facility.³² However, this specification is not included as mitigation nor is it made clear how it will be enforced or upheld. Diesel truck emissions remain high even when the 2010 and later truck design feature is accounted for, comprising almost 3,000 pounds per day of NOx emissions or more than 90 percent of the project total; and over 120 pounds per day of PM2.5 emissions or 80 percent of the project total.³³ Not only should 2010 and newer diesel trucks be required as a minimum specific mitigation measure, the plan must go further to address this major source of pollution by adding the following mitigation measures:

28

- Require at least half of the trucks serving the facilities to be alternative fuel including, but not limited to electric and hydrogen fuel cell or hybrid vehicles.
- Require at least one quarter of trucks serving the facility to be zero-tailpipe emission vehicles; or that one quarter of goods delivered to the facility be conveyed by zero-tailpipe emission technology; and that the proportion of zero-tailpipe emission conveyance increase to fifty percent by 2020.

29

30

Although the plan fails to adequately address pollution from the largest source, diesel trucks, there are many other mitigation measures that we support. Several mitigations are helpful, pertaining to providing ample signage to keep

31

³¹ See for example, tables 52 and 57 of Air Quality, Greenhouse Gas and Health Risk Assessment Report.

³² See discussion on page 180, of Air Quality, Greenhouse Gas and Health Risk Assessment Report

³³ According to table 57 of the Air Quality, Greenhouse Gas and Health Risk Assessment Report.

trucks on truck routes and off residential streets and curtailing unnecessary idling (MM AQ-6, a, b, and c). Similarly, MM AQ-6 i providing trucking services is helpful. Other measures in MM AQ-6 seem of little consequence as they encourage compliance with existing laws. For example, it is not clear what MM AQ-6 f and g encouraging SmartWay certified trucks add to the existing California regulations requiring SmartWay type efficiency measures for trucks. We support the commitment in MM AQ-6 h to provide onsite alternative fueling infrastructure in accordance with the Regional Transportation Plan zero/near-zero emissions truck corridor along State Route 60. However, this commitment does not go far enough, as the project itself should require utilization of zero and near-zero emission trucks, discussed above.

31

Many mitigation measures are focused on reducing passenger vehicle emissions, including bikeways, bike lockers and showers, pedestrian access and others; these are helpful measures, yet they do not provide significant reductions in pollution from the project (MM AQ-7). The last element of MM AQ-7 covering buffer zones addresses near project exposures, however, is of paramount importance. We strongly support the inclusion of buffer zones, but the measure as stated must be strengthened. The South Coast Air Quality Management District noted in its May 1, 2012 letter commenting on the Draft Specific Plan for the Project, that the setbacks described in the plan are inadequate to protect public health. We share the Air District's concern that certain areas with heavy duty diesel trucking activity (e.g. roadways and loading docks) may not have adequate setback distances from residential areas and seem to focus mainly on the buildings instead of the high traffic roadways and loading areas. The Air District also notes California Air Resources Board (CARB) guidance calling for a 1,000 foot setback between sensitive sites including housing and distribution centers receiving more than 100 truck trips per day or 40 trucks with refrigeration units. According to Exhibit 21, showing the project's incremental cancer risk with mitigation accounted for, an additional cancer risk of 10 per million appears to impact the residential area far beyond 1,000 feet of the project perimeter. Thus, a minimum setback of 1,000 feet as CARB recommends is essential.

32

Mitigation of pollution from transport refrigeration units (TRUs) and yard equipment such as hostlers and forklifts is entirely missing from the Plan. This type of equipment is universally associated with warehousing and therefore must be accounted for here and mitigated. We recommend the following additional mitigations:

33

- Forklifts, yard tractors, and other equipment at warehouses run steadily and never leave the site, which means their emissions accumulate nearby. All equipment should use electric battery or fuel cell engines. Where this is not possible, any remaining diesel equipment must employ the best available control technology to reduce emissions of PM and NOx, such as diesel particulate filters, cleaner fuels, and more efficient engines.

- Warehouse operators have the ability to minimize truckers' use of transport refrigeration units that rely on secondary diesel engines. WLC must provide electric hookups for refrigeration at each loading dock, minimizing the use of any diesel refrigeration units and ensuring that those that do remain in use meet the cleanest emissions standards (U.S. EPA Tier 4). Further, indoor warehouse space must provide ample storage for refrigerated goods passing through the facility to ensure that no refrigerated goods are stored in trailers or externally, requiring use of TRUs.

34

The **mitigation for greenhouse gas (GHG) emissions from this project** is also grossly inadequate. It seems that it is entirely focused on solid waste and recycling (MM AQ-8), despite the many other opportunities for GHG reduction measures.

35

We strongly support the addition of a mitigation measure requiring rooftop solar generation, as the Air District suggests in their above mentioned comment letter (5/1/12). However, this mitigation measure must be enforceable and clearly articulated in the EIR. The high cube warehouses will have ample roof space for photovoltaic panels or any other type of solar power generation, not only to meet the electrical needs of the facility itself but also to provide additional renewable power to California to help mitigate the transportation GHG impacts of the project. The Plan erroneously states that the project is not part of California's power generation grid and thus cannot contribute to the 33 percent Renewable Portfolio Standard. This is false because the project will utilize power from the California grid and could instead become a power generator contributing to the state's efforts to increase renewables and mitigating the project impacts.

36

All warehousing buildings on the site should be built to meet the standards of the Leadership in Energy and Environmental Design (LEED) Green Building Rating System.TM They should include energy efficient lighting, heating, and cooling measures as well as stormwater management, vegetative cover, and the use of locally sourced materials where possible.³⁴ Simply stating that the project will comply with California energy codes and other existing requirements does not constitute a mitigation measure. WLC can go far beyond what is required by law, significantly cutting GHG emissions by meeting LEED platinum standards for all the structures that are built.

37

f. The Project Proponent Should Provide Funding to Provide Clinics and Other Sensitive Site Mitigation to Reduce the Impacts from Warehouse Pollution.

38

³⁴ For information on LEED standards, see the U.S. Green Building Council: <http://www.usgbc.org/DisplayPage.aspx?CategoryID=19>.

To avoid injury to public health, the project must mitigate its impacts through the reduction of emissions to as near zero as possible, and this comment letter offers numerous measures that should be used in pursuing that goal. Given that increases in pollution are likely even after these measures are implemented and given the lasting effects of pollution from the WLC, further mitigation is needed to address the extraordinary impact of this project on the respiratory health of communities near the proposed project and along the goods movement corridors that go to the proposed project. A mitigation fund controlled by the neighboring community should also be made available to help address some of the unmitigated impacts of this project, supporting the implementation of such measures as vegetation and other barriers, filtration devices and window upgrades for nearby buildings, and on-site air quality monitoring. The fund should be of ample size so as to cover indoor air filtration expenses for all nearby residents who request such filtration, buffer vegetation and landscaping, and a community air monitor if so desired, as well as sufficient funds to administer these programs.

38

Many residents of goods movement communities and workers at the ports have already suffered irreparable long term damage to their lungs – as noted earlier, diminished lung function in children generates lifelong health effects. The project proponent should fund the establishment of one or several medical facilities close to the project and along the route to the project dedicated to the respiratory and general health of the people most affected by these emissions.

39

Many of the goods movement adjacent neighborhoods in this region are heavily populated with low and moderate income families unable to afford health insurance. Similarly, while some workers in the warehousing industry earn relatively high wages with good benefits, thousands of others earn low wages with few or no benefits.

40

Thus, funding for clinics should be sufficient not only to construct appropriate facilities, but also include adequate support for operations so that two classes of patients – residents of the identified goods movement adjacent communities and warehouse workers can access the facility without out of pocket cost regardless of insurance status.

41

Finally, the project proponent needs to explore installation of air filtration system to protect residents from harmful levels of air pollution. The Port of Los Angeles agreed through the TraPac MOU to fund filtration systems in school in the vicinity of that project, and this Project should also include this type of mitigation. In addition, the Port of Long Beach through the Middle Harbor Redevelopment Project agreed to fund air filtration systems for schools and other sensitive sites. This mitigation must be part of the WLC project.

42

IV. The Analysis of Agricultural Impacts is Deeply Flawed.

The proposed project will have a large impact on loss of agricultural lands. In particular, the EIR provides absolutely no mitigation for the impacts of loss of agricultural land. In examining the potential of a fee to help offset the loss of agricultural land, the EIR summarily dismisses this potential because the fee was rejected during larger general plan discussions. Thus, the EIR does not engage in a project specific analysis of the feasibility of this type of measure. In particular, given the economic promises being made by the Project proponents in Appendix O, it is unclear why such a fee is infeasible.

43

V. The DEIR/S Does Not Adequately Discuss Alternatives to the Proposed Project.

The analysis of alternatives to the proposed project lies at “[t]he core of an EIR.”³⁵ In this analysis, the EIR must consider a reasonable range of alternatives that would avoid or substantially lessen this impact while feasibly attaining most of the Project’s basic objectives.³⁶ If the EIR refuses to consider a reasonable range of alternatives or fails to support its analysis with substantial evidence, the purposes of CEQA are subverted and the EIR is legally inadequate.³⁷ If a feasible alternative exists that will meet the project’s objectives while reducing or avoiding its significant environmental impacts, the project may not be approved.³⁸

44

The analysis of the alternatives throughout the document fails in this respect. In particular, the EIR has failed to examine an alternative with better access to rail and closer to the Ports.³⁹ As the SCAQMD has articulated, “[r]ail lines are expected to lower the truck trip rate by diverting the transportation of goods from trucks to trains that directly service the facility.”⁴⁰ The EIR summarily notes that there are no alternative sites in surrounding areas.⁴¹ By determining that the only feasible alternative site would include “a contiguous 2,635-acre site for 41 million square feet,”⁴² the EIR fails to examine existing warehouse space and future land zoned industrial. For example, a recent SCAG report entitled *Industrial Space in Southern California* attached as Exhibit D demonstrates that there are other

⁴² EIR, at 6-38.

potential sites that could have been explored. For example, the report identifies 143 million ft² of available warehouse space.⁴³ In addition, it also identifies 186 million ft² of warehouse development potential in the region.⁴⁴ Surely, the cursory, unlawful analysis in the EIR would have benefited from a reasonable analysis of locations with better rail service and closer to regional centers to reduce truck trip length. The failure to consider a reasonable range of alternatives renders the EIR invalid.

46

VI. A Revised Draft EIR Must Be Prepared and Recirculated.

Because of the inadequacies discussed above, the draft EIR cannot form the basis of a final EIR. CEQA requires preparation and recirculation of a supplemental draft “[w]hen significant new information is added to an environmental impact report” after public review and comment on the earlier draft EIR.⁴⁵ The opportunity for meaningful public review of significant new information is essential “to test, assess, and evaluate the data and make an informed judgment as to the validity of the conclusions to be drawn therefrom.”⁴⁶ An agency cannot simply release a draft report “that hedges on important environmental issues while deferring a more detailed analysis to the final [EIR] that is insulated from public review.”⁴⁷

47

In order to cure the panoply of EIR defects identified in this letter, the City must obtain substantial new information to adequately assess the proposed Project’s environmental impacts, and to identify effective mitigation and alternatives capable of alleviating the Project’s significant impacts. This new information will clearly necessitate recirculation. CEQA requires that the public have a meaningful opportunity to review and comment upon this significant new information in the form of a recirculated draft supplemental EIR.

WLC EIR Comments

April 8, 2013

Page 18

We appreciate your consideration of our comments. While these comments solely focus on air quality, traffic and loss of agricultural space, we remain concerned about many other impacts articulated in comments from other organizations. Please feel free to contact us if you have any questions.

48

Sincerely,

Adriano L. Martinez
Staff Attorney
Natural Resources Defense Council
(310) 434-2300
amartinez@nrdc.org

RESPONSES TO LETTER F-9A

Sierra Club, Center for Community Action and Environmental Justice, and Natural Resources Defense Council

Response to Comment F-9A-1. The commenter believes the Draft Environmental Impact Report (DEIR) does not contain sufficient information. The City disagrees and the DEIR does present accurate and adequate in the analysis in the original DEIR, plus the additional and revised analyses of these issues in the Final Environmental Impact Report (FEIR), and thus provides sufficient information upon which to make an informed decision.

Response to Comment F-9A-2. The commenter believes the EIR does not recommend all feasible mitigation for air quality and health risk impacts. The commenter is encouraged to review the project air quality study, which was extensively revised mainly in responding to the many comments on the DEIR (FEIR Volume 2, Appendix D). Section 1.6 of this FEIR (Volume 1) outlines the many changes that were made to the air study to provide more detailed information on health risks both on and off the World Logistics Center (WLC) property. The air study also contains revised mitigation measures to help further address these impacts.

Response to Comment F-9A-3. The commenter's statement is incorrect. Please see Responses to Comments F-9A-3, F-9A-17, 18, 19 and 20 and in Responses to Comments F-9B-13, 14, 15, 16, and 17. Please see the responses to those comments for a detailed discussion of why Comment F-9A-3 is incorrect.

Response to Comment F-9A-4. The commenter believes the EIR is inadequate, however, the EIR does present accurate and adequate analysis of the proposed project, plus the additional and revised analyses of these issues in the FEIR and revised technical studies as a result of responses to comments on the DEIR. Refer to Response to Comment F-7A-11 for a discussion on recirculation of the DEIR.

Response to Comment F-9A-5. The commenter discusses the potential health impacts related to exposures to diesel PM, including references to the University of Southern California (USC) Children's Health Study.

The health impacts from exposures to diesel particulate matter (PM) are discussed in the Master Response-2: Health Effects of Diesel Particulate Matter and in both the DEIR and the revised analysis and in Response to Comment E-3-7 on childhood risk

Response to Comment F-9A-6. The commenter indicates that regional air quality is poor in the Basin, freight transport contributes to the failure of the Basin to meet clean air standards, without mitigation, the Basin could fail to achieve the federal annual PM_{2.5} standard by 2014, the 8-hour ozone standard by 2024, and other air quality standards.

As discussed in Master Response - 1, Changes to Air Quality, Greenhouse Gas, and Health Risk Assessment, and Response to Comments G-40-2 and G-49-3, air pollution levels in the South Coast Air Basin, and in particular the Inland Empire, have decreased in the past decade. One of the reasons for this decrease is principally the regulation of motor vehicle emissions. As shown in Master Response-3, heavy duty diesel NOx and PM emission standards have decreased over the past decade. Mitigation Measure (MM) 4.3.6.3B requires model year 2010 and later diesel trucks, which as shown in the figure below, would substantially reduce emissions of NOx and PM. The project is implementing feasible mitigation to reduce impacts including the use of Tier 4 off-road construction equipment, the cleanest diesel equipment required under current regulations. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project's mitigation measures.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-9A-7. The comment makes reference to "various issues" that must be resolved before the project can be approved. The revised Traffic Impact Analysis (TIA) (FEIR Volume 2, Appendix L-1) does not show any new or increased impacts, therefore recirculation is not needed. See Response to Comment F-7A-11.

Response to Comment F-9A-8. The commenter wants their comments and those of Mr. Brohard's addressed. All of the comments submitted by the commenter, plus those of Mr. Brohard, have been addressed in this FEIR document.

Response to Comment F-9A-9. The commenter claims the TIA's baseline was improper in that it failed to adjust upward for 2011 traffic counts, failed to adjust for seasonal fluctuations, and that the EIR does not indicate if adjustments were made to convert trucks to passenger car equivalents.

Traffic counts were taken within a year of the Notice of Preparation and so no adjustment was necessary. Most of the counts were done in late 2011 while the Notice of Preparation came out in February 2012.

The TIA followed standard engineering practice which is to base the analysis on a "typical workday" which is defined as a Tuesday, Wednesday, or Thursday in a week when schools are open and no special weather or event affects normal traffic patterns.

An analysis was performed to determine if seasonality of traffic flows may be a significant factor that needs to be accounted for in the analysis. The monthly fluctuations in traffic flow on SR-60 in Moreno Valley were reviewed to determine if this was the case. The average daily traffic on SR-60 from 2011 was collected from Caltrans at the SR-60 Perris, Heacock, and Day interchanges and summarized by month (see in the TIA, FEIR, Volume 2, Appendix L-1). The average daily traffic for each individual month was calculated and compared to the annual average. The data showed that the monthly fluctuations in traffic were not consistent between interchanges; in months where the traffic volumes at one interchange were above the annual average while the adjacent interchange count location was below the annual average. For example, the lowest month of the year for the Perris interchange, January, was the highest month for the two nearby interchanges. In 10 out of 12 months the two count sites closest to the project (Perris Blvd. and Heacock Ave.) deviated in opposite directions from the annual average.

If this area were subject to seasonal peaking then the three interchange count locations would show similar peaking characteristics during any given month. The count data showed no such consistency; therefore, seasonal peaking of ambient traffic is not considered a significant factor for traffic analysis for the WLC (as illustrated in Table F-9A.A below).

A further analysis was performed to determine whether there may be significant seasonal peaking of truck traffic from the WLC that needs to be factored into the analysis. There are several reasons to believe that this will not occur:

- When it is fully operational the WLC is expected to have 15-to-25 different tenants from a variety of economic sectors; for example the National Association of Industrial and Office Properties (NAIOP) survey found tenants in the consumer goods, pharmaceuticals, automotive products, tools, office supply, home furnishings, and building materials sectors (study available online at: <http://www.naiop.org/~media/Research/Research/Research%20Reports/Logistics%20Trends%20and%20Specific%20Industries/LogisticsTrendsandIndustries.ashx>). To the extent that these sectors have season peaks they occur at different times of the year and would tend to offset each other (i.e. a high period for one tenant may be a low period for the tenant next door). This is one reason why traffic on SR-60 itself does not display seasonal peaking.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- Furthermore, the commenter's belief that seasonal variation in truck traffic may pose significant impacts was premised on the commenter's erroneous over-estimate of the amount of truck traffic that will be generated by the WLC. To the extent that truck volumes will be smaller, the impact of any variations in truck traffic will also be smaller.

For these reasons, there is no basis for a presumption that seasonal peaking of truck traffic will create any significant impacts that have not already been identified using the trip generation rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual.

Chapter 2, Section A the TIA includes a sub-section entitled Passenger Car Equivalents (PCEs) that explains in detail how PCEs were used in this study.

Table F-9A.A: Average Day Traffic at Three Interchanges Near the WLC

PeMS Detector	Location	Month												Annual Average
		Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

The lowest month of the year for the Perris IC was the highest month for the two nearest interchanges.

In 10 out of 12 months the two count sites deviated in opposite directions from the annual average; i.e. one was higher than the annual average and the other lower.

Response to Comment F-9A-10. The commenter appears to refer to the 52 impacts listed in Comment F-9B-20. Forty-seven, or 90%, of the 52 instances cited by the commenter occur in future-year scenarios where the addition of traffic from other development projects contributes to the level of congestion on the facility. Project impacts under these conditions were properly identified as “cumulative.”

Of the remaining five, two (Intersections 123 and 132) were identified as direct project impacts in Table 77 of the TIA (renumbered as Table 73 in the revised TIA) entitled “Direct Impacts on Intersections and Mitigations Measures.” The remaining three instances, freeway mainline section F-6 and weaving sections 25 east bound (EB) and 25 west bound (WB), were identified as a direct impacts in Table 78 of the TIA (renumbered as Table 74 in the revised TIA) entitled “Direct Impacts on Freeways and Mitigations.”

Response to Comment F-9A-11. The commenter cites the attachment to their letter to advance a claim that trip generation rate used is too low and results in underreporting the air quality impact and health risk impacts. Please see the Responses to Comments F-9A-13 and F-9A-17.

Response to Comment F-9A-12. The commenter claims no mitigation measures were identified for 2017 or 2022, and refers to the attachment for details of other problems, such as the issue of timeliness of mitigation measures.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The claim that mitigation measures were not identified for 2017 and 2022 is not correct. The TIA (DEIR Appendix L) included:

- Table 39 describing the mitigation measures for the 2017 Plus project scenario for project road segments. The revised TIA (FEIR Volume 2, Appendix L-1) addresses Phase 1 in Year 2022, so all year 2017 analyses have been removed from the revised TIA.
- Table 41 describing the mitigation measures for the 2017 Plus project scenario for project intersections. The revised TIA (FEIR Volume 2, Appendix L-1) addresses Phase 1 in Year 2022, so all year 2017 analyses have been removed from the revised TIA.
- Table 43 describing the mitigation measures for the 2017 Plus project scenario for project freeway mainline segments. The revised TIA (FEIR Volume 2, Appendix L-1) addresses Phase 1 in Year 2022, so all year 2017 analyses have been removed from the revised TIA.
- Table 45 describing the mitigation measures for the 2017 Plus project scenario for project freeway weaving sections. The revised TIA (FEIR Volume 2, Appendix L-1) addresses Phase 1 in Year 2022, so all year 2017 analyses have been removed from the revised TIA.
- Table 47 describing the mitigation measures for the 2017 Plus project scenario for project freeway ramps. The revised TIA (FEIR Volume 2, Appendix L-1) addresses Phase 1 in Year 2022, so all year 2017 analyses have been removed from the revised TIA.
- Table 53 describing the mitigation measures for the 2022 Plus project scenario for project road segments. This table is now number 49 in the revised TIA (FEIR Volume 2, Appendix L-1).
- Table 55 describing the mitigation measures for the 2022 Plus project scenario for project intersections. This table is now number 51 in the revised TIA (FEIR Volume 2, Appendix L-1).
- Table 57 describing the mitigation measures for the 2022 Plus project scenario for project freeway mainline segments. This table is now number 53 in the revised TIA (FEIR Volume 2, Appendix L-1).
- Table 59 describing the mitigation measures for the 2022 Plus project scenario for project freeway weaving sections. This table is now number 55 in the revised TIA (FEIR Volume 2, Appendix L-1).
- Table 61 describing the mitigation measures for the 2022 Plus project scenario for project freeway ramps. This table is now number 57 in the revised TIA (FEIR Volume 2, Appendix L-1).

The fact that the attachment to the commenter's letter cites some of these tables shows that the information was made available for public review.

The commenter's references to issues raised in the attachment to the comment letter are responded to for those specific comments. Please see the Response to Comment F-9B-2 for the issue of timeliness of mitigation measures.

Response to Comment F-9A-13. The commenter claims three assumptions in the EIR would lead to an underestimate of emissions, namely: 1) underestimating trip generation numbers, 2) underestimating the percentage of trucks associated with the project, and 3) underestimating the trip lengths for auto and trucks. The commenter claims the air quality analysis used a trip generation rate from the NAIOP study rather than from ITE. The commenter also cites a passage from South Coast Air Quality Management District (SCAQMD) guidance, claiming that it shows that the trip generation rate used in the analysis is too low.

The commenter cites the SCAQMD guidance interpreting the guidance as recommending that a rate of 2.59 vehicular trips per thousand square feet per day (VT/KSF/day) should be used. The commenter quotes the guidance at length, including this passage,

“In the case that air quality is evaluated for multiple warehouses (>10), such as for a general plan, the average rate of 1.44 trips per thousand square feet from the ITE 8th Edition Trip Generation manual is acceptable. This lower value may be more appropriate as on average, a small portion of warehouses can be expected to operate at varying levels of service, including some warehouses experiencing temporary partial or complete vacancy.”

As stated in Section 2.1 of the Specific Plan, it is anticipated that the WLC will have 15-to-30 logistics warehouses. The TIA complies with this SCAQMD guidance for multiple warehouses projects. In fact, the TIA more than complies with the guidance since the trip generation rate used in the TIA, 1.68 vehicle trips per KSF per day, is higher than the 1.44 rate in the SCAQMD guidance (the WLC used the 9th edition of the Trip Generation Manual, which has a higher rate than the 8th edition). In addition, the SCAQMD is currently in the process of revising its recommended trip generation rate for warehouse buildings (www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/high-cube-warehouse).

The portion of the air quality analysis covering mobile sources used data from the traffic analysis and so it incorporates the ITE trip generation rates used in the TIA, not the NAIOP rate.

The 50 mile figure for average truck distance is a default value suggested by the SCAQMD for use when modeling data is not available for large warehouses. An additional section (Chapter 12, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that describes in detail how trips to the Los Angeles ports (ports) were estimated. The analysis found that only a small percentage of WLC truck traffic would be to and from the ports. Tests with the Riverside County Traffic Analysis Model (RivTAM) model suggest that the actual average truck trip length for the WLC would be 30 to 40 miles, so the 50-mile figure, which was used in the DEIR, is a conservative estimate since it over-states rather than under-states project impacts. The air quality analysis has been updated in the FEIR (Volume 2, Appendix D) to use the trip distribution pattern from the RivTAM model since it more realistic and better reflects the anticipated change in travel patterns over time.

Response to Comment F-9A-14. See Response to Comment F-9A-13 above.

Response to Comment F-9A-15. See Response to Comment F-9A-13 above.

Response to Comment F-9A-16. See Response to Comment F-9A-13 above.

Response to Comment F-9A-17. The commenter claims that the percentage of truck traffic used in the analysis was too low and resulting in under-estimation of air quality impacts.

The Fontana study, which is mandated by the City of Moreno Valley *Traffic Impact Analysis Preparation Guide* as the source for vehicle mix percentages (City of Moreno Valley, “Traffic Impact Analysis Preparation Guide”, page 10), found 12.3% of trips entering or leaving high-cube warehouses to be heavy trucks, while some other sources have a higher percentage of heavy trucks (the NAIOP study, for example, had 20.8% heavy trucks; City of Moreno Valley 2013 survey data²⁹ yields 13.4% trucks calculated on a weighted average. The commenter uses a figure of 30.21 percent trucks for the NAIOP study, but that figure includes light and medium trucks. The comment seems to indicate the interpretation that this meant that the WLC was forecasting fewer trucks than the best field data indicated was appropriate. In fact, because the WLC analysis assumes a very high overall

²⁹ Vehicle Mix Assumption for High-Cube Warehouse, Memo from Michael Lloyd to Eric Lewis, September 27, 2013.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

trip generation rate, the 0.207 number of truck trips per day per 1,000 square feet of floor assumed was slightly higher than the 0.206 in the NAIOP survey, slightly less than the 0.218 in the Moreno Valley survey, and more than double the Skechers 0.086 data indicates is appropriate (see below). The numbers used in this TIA analysis can therefore be considered a reasonable estimate of truck traffic and a very high estimate of car traffic compared to conditions actually found at the most comparable sites.

Table F-9A.B: Comparison of Trip Generation Rates from WLC TIA and Other Sources

Source	Total Vehicle Trips/KSF/Day	% Trucks	Heavy Duty Truck Trips/KSF/Day	Other Vehicle Trips/KSF/Day
WLC	1.68	12.3	0.207	1.473
NAIOP	0.99	20.8	0.206	0.784
Skechers	0.57	15.2	0.086	0.481
Moreno Valley 2013 ¹	1.624	13.4 ²	0.218	1.406

¹ Vehicle Mix Assumption for High-Cube Warehouse, Memo from Michael Lloyd to Eric Lewis, September 27, 2013.

² Although the un-weighted average reported in the Memo is 17.6%, when calculated based on a weighted average, the rate drops to 13.4%.

Exhibit F-9A-1: Comparison of Truck Trip Generation from southern California Sources

The commenter has suggested that this analysis should use a combination of a very high overall trip generation rate with a high heavy truck percentage to estimate the number of project truck trips. The problem with this approach is that the City has used it before in previous analyses and found that it produced results that were unreasonable when compared to actual field conditions. For example, this approach was used in EIR for the Skechers high-cube warehouse building and resulted in forecasts that were three times the actual operational trip generation for car trips and nearly eight times the

actual trip generation for trucks³⁰. This approach provides misleading information to decision makers and the public creates an undue burden on development, and could ultimately create doubt about the City's project review process in the eyes of the public and potential developers. For these reasons the formula in the City's Traffic Impact Guidelines was used instead in the analysis. Also, as discussed before, the SCAQMD approved the use of the ITE trip generation rate for this TIA study prior to the analysis being performed.

Response to Comment F-9A-18. See Response to Comment F-9A-17 above.

Response to Comment F-9A-19. See Response to Comment F-9A-17 above.

Response to Comment F-9A-20. See Response to Comment F-9A-17 above.

Response to Comment F-9A-21. The commenter notes that the truck trip lengths are underestimated, leading to an underestimation of project emissions.

The truck trip length used in the DEIR was assumed to be 50 miles, based on SCAQMD CEQA comment letters published by the SCAQMD on various warehouse type projects. The SCAQMD has in the past recommended an average truck trip length of 40 miles for warehouse-type projects that do not have identified occupants. Information developed by Parsons Brinkerhoff in its analysis of project traffic impacts concluded that a reasonable average truck trip length for trips throughout the South Coast Air Basin was 36 miles. The Parsons Brinkerhoff conclusion was derived from the actual results of the RivTAM model that was used in the TIA. That model is based on information on trip destinations internal to Riverside County, external to Riverside County and port-related intermodal trip information from the Southern California Association of Governments (SCAG) in its 2012 Regional Transportation Plan. This information was discussed on Table 20 of the Air Quality, Greenhouse Gas, Health Risk Assessment report contained as Appendix D of the DEIR. To provide a conservative estimate of the project's mobile source emissions, an average truck trip length of 50 miles was assumed in the DEIR, which was greater than either the recommended truck trip length from the SCAQMD or as estimated from the traffic impact analysis.

Note that in the revised analysis, the issue of truck and local trip lengths is moot because in the revised analysis, the estimates of the project's regional emissions were based directly on the traffic volume information developed as part of the regional transportation modeling performed in the TIA. The regional transportation modeling provided daily and peak-hour traffic volumes for nearly 500 individual roadway segments by vehicle class from which the daily and peak-hour vehicle miles travels were determined (by multiplying the vehicle volumes for each roadway segment by the length of the roadway segment). The emissions along each roadway segment were then determined by multiplying the vehicle miles traveled for each vehicle class and roadway segment by an emission factor for each vehicle class derived from the Air Resources Board (ARB) Emissions Factor model 2014 (EMFAC2014) mobile source emission model. This information is provided in Section 4.5.1 Motor Vehicle Emissions, of the revised Air Quality, Greenhouse Gas, and Health Risk Assessment.

Response to Comment F-9A-22. The commenter claims the EIR underestimates the trip length for trucks using the proposed warehouses. It quotes a figure of 50 miles as the EIR's estimate for average trip length. It also describes the low figure for forecasted truck trips to the port as "curious."

The 50 mile figure for average truck distance is a default value suggested by the SCAQMD for use when modeling data is not available. Tests with the RivTAM model suggest that the actual average

³⁰ These figures are based on traffic counts taken at the Skechers building after it had been fully operational for over a year. See Technical Memorandum *Traffic Generated by the Skechers Warehouse*, Parsons Brinkerhoff to the City of Moreno Valley, November 14, 2012.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

truck trip length for the WLC would be 30-to-40 miles, so the 50-mile figure is conservative because it over-states rather than under-states project impacts. Additionally, the 50-mile default value is no longer being used with the analysis in the FEIR based entirely on the results of the traffic modeling, not default trip lengths.

An additional section (Chapter 12, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes project impacts on freeways to the ports. The analysis, which is based on and supported by research done by SCAG and by the Port of Long Beach, found that only a small percentage of WLC truck traffic would be to and from the ports. See Table 86 in the revised TIA (FEIR Volume 2 Appendix L-1), repeated below.

Table 86: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

Response to Comment F-9A-22. See Response to Comment F-9A-23.

Response to Comment F-9A-23 and F-9A-24. The commenter claims the mitigation measures for construction are vague. However, the commenter does not indicate why the measures are vague; however, the measures are specific and require meeting future performance standards.

The commenter indicates that the construction mitigation measures are inadequate because they fail to address the diesel engines used by construction equipment. This is not the case. MM 4.3.6.2A has been refined and requires that off-road diesel powered construction equipment greater than 50 horsepower meet Tier 4 standards, the most stringent standard for off-road equipment.

Response to Comment F-9A-25. The commenter incorrectly states that Tier 3 standards are similar to the 1994 vintage truck standards and at least ten times more polluting than modern NOx and PM standards. This statement is not in the reference provided by the commenter. Instead, the reference indicates the following, “Tier 3 standards for NOx+HC are similar in stringency to the 2004 standards for highway engines; however Tier 3 standards for PM were never adopted.”³¹ This is shown in the figure below.³² The figure shows that although Tier 2 and Tier 3 have the same particulates (PM) standard, Tier 3 engines have lower NOx emissions than both Tier 1 and Tier 2 engines.

³¹ <http://www.dieselnet.com/standards/us/nonroad.php#tier3>

³² Diesel Technology: Tier 4 & More. From *Clean Diesel Technology for Off-Road Engines and Equipment: Tier 4 and More*. Website: <http://gb.baumpub.com/news/1415/diesel-technology-tier-4-amp-more>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The commenter also suggests additional mitigation measures, as follows:

Suggested Mitigation Measure	Response
Require construction equipment to meet Tier 4 standards no later than 2015 and require use of diesel particulate filters on all construction equipment that does not meet Tier 4 standards starting in 2011.	Included. See Response to Comment F-9A-24.
All on-road trucks associated with construction shall meet U.S. EPA 2007 emission standards by January 2014.	Incorporated. This measure is incorporated into MM 4.3.6.2A.
All trucks carrying material such as debris or fill be fully covered.	Already Included as part of SCAQMD Rule 403. The project is considered a large operation under the rule; therefore, it is required to comply with Control Measure (1E or 2E), "cover all haul vehicles or comply with the vehicle freeboard requirements of Section 23114 of the California Vehicle Code for both public and private roads."
In any case where grid power is inaccessible and generators are utilized, they must meet 0.01 gram per brake-horsepower hour standard for PM or be equipped with best available control technology for PM, such as diesel particulate filters.	Partially Included. As shown in the above graphic, Tier 4 equipment have PM emissions standards at 0.015 g/kw-hr, the most stringent regulation currently adopted. MM 4.3.6.2A requires Tier 4 equipment.

Response to Comment F-9A-26. The commenter requests additional construction mitigation, as follows:

Mitigation Measure	Response
A strict no idling policy on the construction site, applied to all vehicles on- and off-road when they are not actively engaged in work on the site.	Incorporated. MM 4.3.6.2A requires that all diesel powered construction equipment, vehicles, and delivery trucks be turned off when not in use or limit onsite idling to 3 minutes or less in any one hour. This is consistent with ARB's regulation

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Mitigation Measure	Response
	for In-Use Off-Road Diesel Vehicles (www.arb.ca.gov/msprog/ordiesel/guidance/idling.pdf).
Use of electric and alternative fueled equipment where feasible.	Incorporated. MM 4.3.6.2A requires that where feasible electric tools are required.

Response to Comment F-9A-27. See Response to Comment F-7A-65.

Response to Comment F-9A-28. The commenter is not clear how project design features will be enforced or upheld. The project design features are included in the WLCSP. Since this is Programmatic EIR, any future projects would need to undergo subsequent review, including plot plan review. The City would ensure that during that review, any subsequent project met the requirements of the WLCSP and complied with the mitigation measures contained in this EIR.

Regardless, what was a project design feature in the DEIR requiring model year 2010 trucks and later to the project site is now included as part of MM 4.3.6.3B. The air quality analysis has been refined and the air pollutant emissions from construction and operation are now lower than estimated in the DEIR (see Master Response-1).

Response to Comment F-9A-29 and F-9A-30. The commenter suggests additional mitigation measures, as follows:

Mitigation Measure	Response
Require at least half of the trucks serving the facilities to be alternative fuel including, but not limited to electric and hydrogen fuel cell or hybrid vehicles.	Not Included. As discussed in Master Response - 3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, this is not feasible. In addition, the use of alternative fueled vehicles must be market driven and based on the availability of such vehicles and convenient fueling locations, while CARB already has detailed implementation schedules for various tiers of truck engines to reduce pollution over time, and the project would be consistent with those requirements.
Require at least one quarter of trucks serving the facility to be zero-tailpipe emission vehicles; or that one quarter of goods delivered to the facility be conveyed by zero-tailpipe emission technology; and that the proportion of zero-tailpipe emission conveyance increase to fifty percent by 2020.	Not Included. As discussed in Master Response - 3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, this is not feasible.

Response to Comment F-9A-31. The commenter is not clear whether MM 4.3.6.3B encouraging SmartWay trucks add to the existing California regulations requiring SmartWay type efficiency measures.

ARB's Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation³³ would apply to the trucks accessing the project site. Background information regarding this regulation has been added to the revised analysis (FCS/MBA 2015). However, the mitigation measures are retained because they do not conflict with the regulation.

³³ California Air Resources Board. Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation. Website: www.arb.ca.gov/cc/hdghg/documents_hdghg.htm

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The commenter indicates that the project should require utilization of zero and near-zero emission trucks. Refer to Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, for why this is not feasible for the WLC project.

Response to Comment F-9A-32. The commenter indicates that MM 4.3.6.4A(k) regarding buffer zones be strengthened. Note that this mitigation measure was a duplicate of MM 4.1.6.1A (aesthetics), therefore, the air quality mitigation measure has been removed for clarity. The specific setback is still used in the air quality analysis, and the commenter incorrectly claims that the SCAQMD said that the setbacks described in the project's Specific Plan are inadequate. The SCAQMD in its comment letter states the following:

“According to the California Air Resources Board guidance, without more project-specific information, sensitive land uses such as homes should maintain a buffer zone of up to 1,000 feet from distribution centers with more than 100 trucks per day or 40 trucks per day with operating diesel transportation refrigeration units. AQMD staff recommends that an air quality Health Risk Assessment (HRA) be prepared that analyzes the cumulative impact of all approved and proposed warehouses in the vicinity before determining the appropriate buffer zone distances. Further, setback distances should be specified between areas of diesel trucking activity and sensitive land uses.”

The project has prepared a Health Risk Assessment that analyzes the cumulative impact of all the warehouses within the project. The assessment was refined for the FEIR, which incorporates more detailed construction and operational assumptions. As discussed in Master Response-2, new technology diesel exhaust does not contribute to cancer and so no buffer is required. Nonetheless, an analysis of the buffer using methodologies for traditional diesel exhaust. The analysis found no impact outside the project boundaries, so no buffer would be needed. Please also refer to Master Response-1, Changes to Air Quality, Greenhouse Gas, and Health Risk Assessment. Please refer to Master Response-4 regarding buffer zones.

Response to Comment F-9A-33. The commenter recommends the following mitigation:

Suggested Mitigation Measure	Response
Forklifts, yard tractors, and other equipment at warehouses run steadily and never leave the site, which means their emissions accumulate nearby. All equipment should use electric battery or fuel cell engines. Where this is not possible, any remaining diesel equipment must employ the best available control technology to reduce emissions of PM and NOx, such as diesel particulate filters, cleaner fuels, and more efficient engines.	Partially Incorporated. The Specific Plan (Section 12.3) and the DEIR (page 3-33) indicates that the forklifts, yard tractors, and other onsite equipment used during operation would be powered by non-diesel fuel. However, the mitigation measure does not specify the type of fuel (electric battery or fuel cell) that the equipment should use to allow for flexibility for the project tenants.

Response to Comment F-9A-34. The commenter recommends the following mitigation:

Suggested Mitigation Measure	Response
Warehouse operators have the ability to minimize truckers' use of transport refrigeration units that rely on secondary diesel engines. WLC must provide electric hookups for refrigeration at each loading dock, minimizing the use of any diesel refrigeration units and ensuring that those that do remain in use meet the cleanest emissions standards (U.S. EPA	Partially Incorporated. MM 4.3.6.3E states: <u>“Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan application</u>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
Tier 4). Further, indoor warehouse space must provide ample storage for refrigerated goods passing through the facility to ensure that no refrigerated goods are stored in trailers or externally, requiring use of TRUs.	<u>proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).</u> Therefore, refrigeration hookups and amenities for refrigerated warehouses are required by MM 4.3.6.3E.

Response to Comment F-9A-35. The commenter claims that the mitigation for greenhouse gas emissions is inadequate and focuses on waste and recycling. Although only one waste-related mitigation is required to reduce greenhouse gas emissions to less than significant, many other mitigation measures and project design features would reduce greenhouse gas emissions, as shown in the DEIR (Table 4.7.H in the DEIR and pages 4.7-31 – 4.7-34) and in the revised analysis (FCS/MBA 2015, FEIR Volume 2 Appendix D).

Response to Comment F-9A-36. The commenter recommends rooftop solar. This has been incorporated into MM 4.16.4.6.1C.

Response to Comment F-9A-37. The commenter recommends that the project be built to meet LEED standards. This has been incorporated into MM 4.16.4.6.1C.

Response to Comment F-9A-38. See Responses to Comments F-9A-40 and F-9A-41 below.

Response to Comment F-9A-39. The commenter is asking as a mitigation measure the project proponent should fund the establishment of one or several medical facilities close to the project and along the route of the project dedicated to respiratory and general health of the people most affected by air emissions from the project. The proposed mitigation by the commenter is not feasible. In order for a mitigation to be feasible, it must be reasonably capable of being accomplished in a successful manner. Because there are multiple sources of air pollution, it is impossible to determine what population should be served through such a program. Additionally, even if a target population could be identified it is not possible to determine whether that population would make use of such services or whether such services would be effective in reducing the impact of the proposed project.

Nonetheless, in an effort to reduce impacts of the proposed project, all feasible mitigation has been incorporated. As an example, the WLC has committed to using the cleanest available technology to reduce impacts. In a first for a project of this scale, the WLC will require that all trucks serving the proposed project meet United States Environmental Protection Agency (USEPA) 2010 emissions standards. These standards are the most stringent emissions standards ever promulgated by USEPA, reducing emissions of nitrogen oxides and particulate matter by over 90% from the previous generation of diesel trucks. Additionally, the proposed project has committed to using the cleanest construction equipment and project design elements such as preventing truck trips on Cactus and Alessandro and green building design will further reduce project impacts.

Response to Comment F-9A-40 and 41. The commenter includes a discussion suggesting that WLC should provide medical clinics for low and moderate income families working at their project, with no out-of-pocket expense to those families regardless of their insurance status. As is the case with all legitimate businesses operating within the City of Moreno Valley, WLC employers will be required to fully comply with all existing state and federal regulations as they relate to employer responsibilities to provide for the health and welfare of employees. A more detailed response to this question is included under the Response to Comment F-11-21. Also, please reference the Master Response-3 in Letter C-3. The City Council will consider the comment prior to deciding whether to approve the project.

The commenter has also recommended the establishment of various types of mitigation funding to provide off-site improvements related to air quality, such as air filters or landscaping. However, such mitigation does not mitigate specific, project-related impacts. While the concepts proposed for funding are recognized to provide benefits such as improving indoor air quality, the benefits are not tied to reducing impacts from the proposed project. There is no nexus between the generalized benefits of a proposed existing community benefits fund and specific project impacts. As a result, such a fund cannot be reasonably expected to avoid or minimize air quality impacts of the project as is required for mitigation. Please also refer to Master Response-5.

Response to Comment F-9A-42. The commenter encouraged the project proponent to explore installation of air filtration system to protect residents from harmful levels of air pollution. The Port of Los Angeles agreed through the TraPac MOU to fund filtration systems in schools in the vicinity of that project, and this project should also include this type of mitigation. In addition, the Port of Long Beach through the Middle Harbor Redevelopment project agreed to fund air filtration systems for schools and other sensitive sites. This mitigation must be part of the WLC project.

Though new technology diesel exhaust does not contribute to cancer as described in Master Response-2, a Health Risk Assessment (HRA) was prepared for the project (see FEIR Volume 2 Section 4.3.6.5). A standard 9-year exposure analysis was conducted for the school sites, including modifications recommended by the Moreno Valley School District (see also Response to Comment E-3-9). No significant impacts were found (the incremental cancer risk was less than 10 in a million), therefore, no additional mitigation is necessary at those locations.

The HRA also assessed impacts to the sensitive receptors within and around the project site. The recently adopted “Current OEHHA Guidance” methodology which includes a 30-year exposure duration, age sensitivity factors, and a higher breathing rate was used to estimate risk, assuming that new technology diesel exhaust causes cancer, contrary to the HEI study results. The results indicate that after mitigation there would be a significant cancer risk (risk greater than 10 in a million) at three (3) residences within the WLC project area under the Current OEHHA Guidance. However, as discussed in Master Response-2, new technology diesel exhaust does not contribute to cancer and traditional diesel engines are prohibited from the project. Air filtration systems are discussed in Master Response-5.

Response to Comment F-9A-43. The commenter states the EIR needs to include mitigation for loss of agricultural land. A new MM 4.2.6.1A has been added to the FEIR Volume 2 requiring the acquisition of a conservation easement be recorded over land of comparable productive value to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland. The commenter is encouraged to review the revised and new agricultural assessments (FEIR Volume 2 Appendices C-2 and C-4, respectively). It should be noted that the revised agricultural assessments determined the loss of farmland of local importance was in fact not significant under CEQA based on the results of the revised (California) Land Evaluation and Site Assessments (LESA) model (see FEIR Volume Sections 1.5 and 1.6 and Response to Comment F-7A-39 for more information).

Response to Comment F-9A-44. The commenter states the EIR did not examine a reasonable range of alternatives. The EIR does evaluate a reasonable range of alternatives, based on the potential significant environmental impacts of the project identified in the DEIR and the project objectives. The EIR examined several mixed use alternatives, a lesser intensity alternative, and the existing General Plan designations for the site. The commenter has failed to state why the alternatives selected for analysis in the DEIR are not reasonable.

Response to Comment F-9A-45. The commenter states the EIR fails to address project alternatives such as rail and other potential project locations that would be closer to the ports. The commenter cites a Southern California Association of Governments (SCAG) report entitled *Industrial Space in*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Southern California to support its claim that there are other sites that could have been developed instead.

An additional section (Chapter 4, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to this site was not viable due to a variety of factors, including high fixed costs, secondary impacts on the community, terrain, and capacity constraints in the rail system. See Responses to Comments G-53-4 and G-70-5.

The report cited by the commenter, *Industrial Space in Southern California*, reached the opposite conclusion from that presented by the commenter. Its Executive Summary at page ES-1 states that:

- *“According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet.*
- *During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available.”*

In other words there is an easily foreseeable shortage of sites suitable for warehouse development even if one assumes, as the SCAG study does, that all vacant land currently zoned for industrial use were to be developed into warehouse space. The study demonstrates the need to zone additional land for warehouse space, which is what the WLC proposes to do. In addition, an alternative closer to the port would be in a jurisdiction other than the City of Moreno Valley, so the City would not derive any benefits from the project as outlined in the project objectives.

Response to Comment F-9A-46. The commenter states the alternative sites analysis in the alternatives section is inadequate. Section 6.3.9 of the DEIR that provides a detailed analysis of 16 potential alternative sites in 11 different jurisdictions up to 22 miles from the WLC project site. The DEIR concluded that there were no adequate sites available for various reasons, including size, freeway accessibility, etc. CEQA requires an evaluation of alternative sites that could house the proposed project which in this case is the 2,610-acre WLCSP property proposed for development. In addition, locating the WLCSP outside the City would mean the City could not obtain the substantial project benefits such as increased jobs. There is no requirement to look at separate or smaller sites to accommodate a smaller project; so many sites were rejected because they could not support the WLC project as proposed, consistent with the CEQA Guidelines.

Response to Comment F-9A-47. The commenter believes the EIR must be recirculated. The City evaluated the many comments received on the Draft EIR, including those of this commenter. The revised technical studies and DEIR provide additional information, mainly in the form of responding to the many questions and comments received on the DEIR. In that regard, several of the project technical studies were revised both to address comments on the DEIR and changes to the WLC project (e.g., loss of 100 acres and 1 million square feet of building area) and this resulted in a number of existing mitigation measures being modified. However, this additional information and the revised studies do not rise to the level of significant new information, nor does this information identify any new or substantially different significant environmental impacts from those identified in the DEIR. Therefore, the DEIR will not be recirculated.

Response to Comment F-9A-48. The commenter expresses concern over the impacts of the project. All of the comments provided by the commenter, plus many similar comments provided by others, have been responded to in this FEIR document (Volume 1). All of the comments and responses will be reviewed by the City Council prior to making a decision on this project.

**Letter F-9B: Tom Brohard & Associates (March 29, 2013) and Appendices 1-3
(on Flash Drive)**

Tom Brohard and Associates

March 29, 2013

Mr. Adriano Martinez, Staff Attorney
Natural Resources Defense Council
1314 Second St.
Santa Monica, CA 90401

SUBJECT: World Logistics Center Project Draft Environmental Impact Report – Traffic and Transportation – Findings and Comments

Dear Mr. Martinez:

At the request of the Sierra Club, I have reviewed the traffic and transportation portions of the February 4, 2013 World Logistics Center Project Draft Environmental Impact Report (Draft EIR) prepared by LSA for the City of Moreno Valley. In preparing these findings and comments, the following sections and appendices related to traffic and transportation in the Draft EIR for the World Logistics Center Project have been reviewed:

- Chapter 1.0 – Executive Summary
- Chapter 2.0 – Introduction and Purpose
- Chapter 3.0 – Project Description
- Chapter 4.15 – Traffic and Circulation
- Draft EIR Appendix L – January 2013 Traffic Impact Analysis Report (TIA Report) prepared by Parsons Brinckerhoff
- TIA Report Appendices A through T prepared by Parsons Brinckerhoff (TIA Appendices)

In my review of these documents, I have concluded that the Draft EIR and the TIA Report for the proposed World Logistics Center Project are seriously flawed as an adequate assessment of Project traffic impacts on freeways, roadways and intersections has not been provided. Further study of the findings and comments identified in this letter is required as part of a Recirculated Draft EIR for the World Logistics Center Project.

As explained in detail throughout this letter, the Draft EIR and the TIA Report fail to establish a proper baseline for analysis. Direct Project traffic impacts are repeatedly confused with cumulative Project traffic impacts, leading to defective mitigation measures. Mitigation measures are not developed for Project conditions forecast in either Year 2017 or in Year 2022, and funding is not shown to be available to construct mitigation measures in a timely manner as the significant Project traffic impacts occur in Years 2012, 2017, 2022, and 2035. The documents also omit important information and contain numerous errors, making it difficult at best for the public to review and understand.

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 40 years of professional engineering experience. I am licensed as a Professional Civil Engineer both in California and Hawaii, and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and now serve as the City Traffic Engineer for the City of Indio and as Consulting Transportation Engineer for the Cities of Big Bear Lake, San Fernando, and Tustin. I have extensive experience in traffic engineering and transportation planning. During my career in both the public and private sectors, I have reviewed many environmental documents and traffic studies, with only a few of these shown on the enclosed resume.

3

Traffic and Transportation Issues/Concerns – Findings and Comments

Based on the information provided in the February 4, 2013 Draft EIR and the January 2013 TIA Report for the World Logistics Center Project, my review disclosed numerous issues and concerns relating to traffic and transportation. Each of the following findings and comments must be addressed through further study and necessary modifications to the Draft EIR, together with recirculation for public review and comment:

4

- 1) Traffic Counts Were Not Adjusted to Create a Proper Baseline – Traffic counts at study intersections were made over 20 months between March 2011 and October 2012. All counts were assumed to have been made in 2012 but Appendix A to the TIA Report shows that traffic counts at 78 of the intersections were actually conducted in Year 2011. No adjustments were made to account for annual ambient traffic growth to bring the Year 2011 counts forward to Year 2012 whereas a two percent per year increase was assumed to grow the Year 2012 counts to Year 2017. Furthermore, no adjustments were made to remove potentially significant seasonal traffic volume fluctuations among the months of February, March, October, November, and December when the counts were taken.

5

According to Page 46 of the TIA Report, 24-hour traffic counts were collected on the study road segments. Copies of these traffic counts were not provided in Appendix A. Similar deficiencies in establishing a proper baseline for the 24-hour counts including annual ambient growth and seasonal adjustments may also exist. In addition, no evidence is presented to indicate how or if adjustments were made to convert trucks to passenger car equivalents.

Additionally, traffic volume counts on the freeway mainline and weaving segments may have been taken from annual Caltrans Traffic Volume publications but the TIA Report does not identify the source of this data. The most recent data available from Caltrans reflects freeway traffic volumes

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

counted in Year 2011 or earlier. Similar deficiencies in establishing a proper baseline for these counts including annual ambient growth may also exist.

Traffic counts made during Year 2011 or before should be brought forward at two percent per year to reflect proper baseline traffic volumes in Year 2012. By failing to do this, the Draft EIR is internally inconsistent as the TIA Report did expand traffic volumes by two percent per year to establish baseline conditions in Year 2017. Furthermore, traffic volume fluctuations during different seasons should have been adjusted to a common seasonal baseline to properly reflect the higher volumes recorded during the peak month. If the counts are not adjusted, then the TIA Report and the Draft EIR must present evidence through validation and comparison of traffic counts that annual and seasonal adjustments are not required.

5

- 2) Traffic Volumes for Approved Projects Are Not Supported by Evidence - Figure 3 on Page 6 of the TIA Report followed by Table 1 beginning on Page 7 provide a map and a list of approved development projects that have been assumed to be complete by Year 2017. The TIA Report fails to include the trip generation and trip distribution for each of these projects as well as a summary of peak hour trips from these projects that are forecast to travel through study intersections as well as on roadway and freeway segments. In addition, no evidence is presented to indicate how or if adjustments were made to adjust truck volumes to passenger car equivalents generated by these projects. Without this data and information, the baseline traffic volumes used in the Year 2017 analyses cannot be supported.

6

In addition, the Year 2017 traffic volume baseline does not appear to include trips to and from various nearby development projects on the enclosed listing provided by Riverside County. General Plan Amendments are associated with each of these projects and some of these projects have already been entitled. As a result, each of these projects must be considered to be reasonably foreseeable and trips to and from each of them must be added to the Year 2017 baseline for a proper traffic analysis of the World Logistics Center.

- 3) Year 2035 Baseline Traffic Volumes Are Lower than Earlier Years – Several freeway segment volumes in the Year 2035 scenario are less than the same freeway segment volumes in the scenarios of earlier years. The Draft EIR and TIA Report indicate that the Project will reverse the significant existing jobs to housing imbalance with 25,000 new jobs for City of Moreno Valley residents. It is unreasonable to conclude that the 25,000 new jobs will solely be taken by City residents and that the current directional peak hour congestion will be eliminated, especially with World Logistics Center Project trucks replacing a number of the commuter worker trips in the current peak direction.

7

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

In the traffic analysis, associated segment volumes in the current peak directions are forecast to drop. In turn, the Level of Service (LOS) for freeway segments in the current peak direction is then forecast to improve from LOS "F" to LOS "D" with the negative Project trips are added (subtracted). The conclusion that building 41,600,000 square feet of high cube warehouses will lower traffic volumes on the freeway system and then improve peak hour operating conditions is not reasonable or logical.

7

- 4) World Logistics Center Project Traffic Volumes Not Adequately Disclosed – Table 24 on Page 78 of the TIA Report as well as Table 4.15M on Page 4.15-32 of the Draft EIR provide peak hour and daily trip forecast volumes for truck and auto traffic forecast for the World Logistics Center Project. It appears that the "Phase 2" subheading in both of these tables represent the total number of trips that will be generated at completion of the entire World Logistics Center Project, not merely by completion of Phase 2 of the Project. This requires clarification.

8

Page 80 of the TIA Report provides graphic representations of the forecast changes in freeway "car" traffic volumes in the AM peak hour in Figure 26 and in the PM peak hour in Figure 27 by comparing 2012 without project volumes to with project traffic volumes. Volumes in the current primary travel direction (westbound in the AM peak hour and eastbound in the PM peak hour) show reductions of over 500 car trips and corresponding increases of over 500 car trips in the current secondary travel pattern. As indicated above, the reductions and additions are based upon the faulty assumption that the 25,000 new jobs will be taken by City of Moreno Valley residents.

9

Figures 26 and 27 are also misleading if they include only "car" trips. The World Logistics Center will generate a significant number of truck trips in the current secondary travel directions. When these are converted to passenger car equivalents to properly disclose the overall changes, the reductions will likely be lower and the additions will likely be higher than shown in Figures 26 and 27.

10

The Draft EIR and the TIA Report do not clearly identify the numbers of auto and truck trips associated with World Logistics Center on freeway segments, roadway segments, and at intersections. Instead, the documents provide figures of baseline and baseline plus project trips. The two different figures require comparison with each other to identify project traffic.

11

Traffic study guidelines such as the "Guide for the Preparation of Traffic Impact Studies" published by the California Department of Transportation in December 2002 require that figures be provided to clearly disclose project generated trips. By omitting these figures with actual numbers, the TIA Report and Draft EIR do not properly disclose the negative trip generation that is

12

Mr. Adriano Martinez
World Logistics Center Draft EIR – Traffic and Transportation Comments
March 29, 2013

forecast to occur. By omitting these figures for project generated trips only, it is not clear if the analyses properly included passenger car equivalents for the trucks or just traffic volumes for the World Logistics Center Project without the necessary passenger car equivalent adjustments.

12

- 5) World Logistics Center Project Daily Truck Trips Are Underestimated – Table 4.15.M on Page 4.15-32 of the Draft EIR and Table 24 on Page 78 of the TIA Report provide forecasts for the number of autos, light trucks, medium trucks, and heavy trucks that are forecast to be generated by the World Logistics Center Project. Footnotes to these tables indicate the numbers of auto and truck trips shown are based on the Truck Trip Generation Study (Fontana Study) prepared in August 2003 for the City of Fontana. Using the Fontana Study, the text immediately below each table indicates that 80 percent of the vehicles forecast for the World Logistics Center are autos and the remaining 20 percent of the vehicles are trucks.

13

Appendix S to the TIA Report provides the December 20, 2011 NAIOP Truck Trip Generation Study of 31 high-cube warehouses larger than 500,000 square feet in size in the Inland Empire area prepared by Kunzman Associates (NAIOP Study) and Appendix T to the TIA Report provides the February 1, 2012 Peer Review conducted by Urban Crossroads of the NAIOP Study. Data contained in Appendix D to the NAIOP Study indicates that 69.79 percent of the high-cube warehouse trips were made by cars and 30.21 percent of the high-cube warehouse trips were made by trucks, not 80 percent cars and 20 percent trucks from the 2003 Fontana Study. Other entities suggest using an even greater truck trip percentage for this type of warehouse development (i.e., SCAQMD's recommendation to use a 40 percent truck assumption for a conservative analysis). Based on this, the Draft EIR and TIA Report must revise the percentage of trucks up from 20 percent to at least 30 percent.

14

Regarding the 2003 Fontana Study, Page 7 of the Peer Review in Appendix T to the TIA Report states "Based on the study's small overall sample size and the fact that only one warehouse over 500,000 square feet was included in the analysis, the 2003 Fontana Study is not an appropriate source for vehicle/truck trip generation rates for modern high-cube warehouse uses larger than 500,000 square feet. In addition, the 2003 Fontana Study surveyed buildings that were likely constructed prior to the shift to larger, highly automated buildings that many global retailers and logistics companies are utilizing in the modern economy."

15

Both Appendix S and Appendix T to the TIA Report clearly demonstrate that the 2003 Fontana Study should not be used to forecast truck trip generation for the World Logistics Center Project. By doing this, the Draft EIR and TIA

16

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

Report have significantly underestimated the number of truck trips that the World Logistics Center will generate.

16

For example, application of the data shown in the NAIOP Study to the 71,085 daily trips forecast for the completion of the entire World Logistics Center Project (currently identified as Phase 2 in the tables) changes the number of passenger car equivalents that must be used to properly identify, disclose, analyze, and mitigate the additional number of significant environmental impacts that will be created by the World Logistics Center Project. Using data from the outdated 2003 Fontana Study, the Draft EIR and TIA Report indicate 93,414 daily passenger car equivalent trips will be generated. Using the current data contained in Appendix D to the NAIOP Study including 70 percent autos, three percent 2-axle trucks, four percent 3-axle trucks, and 23 percent 4+-axle trucks indicates 107,695 daily passenger car equivalent trips will be generated. Therefore, the Draft EIR has underestimated 14,281 daily passenger car equivalent trips in its analyses of environmental impacts.

17

- 6) Direct and Cumulative Impacts Are Incorrectly Identified – Page 4.15-85 of the Draft EIR properly defines direct and cumulative traffic impacts as follows:

➤ Direct Traffic Impacts – “A significant project-specific impact would occur if the project would cause a decrease from satisfactory LOS (based on local agency adopted standards) to an unsatisfactory LOS on a study area intersection, roadway segment, freeway mainline lane, freeway weaving segment or freeway ramp.”

18

➤ Cumulative Traffic Impacts – “A significant cumulative traffic impact would occur if the project contributes toward those facilities operating at unsatisfactory LOS in the pre-project condition.”

19

The Draft EIR and the TIA Report incorrectly identify many cumulative traffic impacts when they are in fact direct traffic impacts from the definitions above. Further, other direct impacts are not disclosed in the text even though the direct impacts are clearly shown in the various tables when the LOS degrades from an acceptable to an unacceptable level with the addition of only Project traffic. Additional direct traffic impacts which have not been identified in the Draft EIR include the following:

20

Existing (2012) plus Project – Intersections – (PM Peak Table 4.15.AD-2)

- #123 – Gilman Springs/Bridge Street – Degrades from LOS C with 20.8 seconds of delay to LOS D with 26.1 seconds of delay with Project traffic added.
- #132 – San Timoteo/Alessandro - Degrades from LOS C with 23.9 seconds of delay to LOS F with 103.4 seconds of delay with Project traffic.

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

Existing (2012) plus Project – Mainline – (AM Peak Hour Table 4.15.AF)

- F-6 – EB SR-60 – Euclid/Grove – Degrades from LOS D with density of 34.7 to LOS E with density of 38.5 with Project traffic added.

Existing (2012) plus Project – Weaving – (PM Peak Hour Table 4.15.AG)

- W-25 – EB SR-60 – Central/Fair Isle – Degrades from LOS D with density of 32.4 to LOS E with density of 35.5 with Project traffic added.
- W-25 – WB SR-60 – Central/Fair Isle – Degrades from LOS D with density of 29.3 to LOS E with density of 35.3 with Project traffic added.

Year 2017 plus Project – Intersections – (AM Peak Table 4.15.AI-1)

- #74 – Elsworth/Cactus – Degrades from LOS D with 54.4 seconds of delay to LOS E with 56.1 seconds of delay with Project traffic added.

Year 2017 plus Project – Mainline – (AM Peak Hour Table 4.15.AK-1)

- F-7 – EB SR-60 – Grove/Vineyard – Degrades from LOS D with density of 34.9 to LOS E with density of 37.2 with Project traffic added.
- F-8 – EB SR-60 – Vineyard/Archibald – Degrades from LOS D with density of 34.1 to LOS E with density of 36.1 with Project traffic added.
- F-19 – EB SR-60 – Market/Main – Degrades from LOS D with density of 31.8 to LOS E with density of 35.3 with Project traffic added.
- F-49 – EB SR-91 – Central/14th – Degrades from LOS D with density of 34.6 to LOS E with density of 35.1 with Project traffic added.

Year 2017 plus Project – Mainline – (PM Peak Hour Table 4.15.AK-2)

- F-17 – WB SR-60 – Valley/Rubidoux – Degrades from LOS D with density of 34.1 to LOS E with density of 36.5 with Project traffic added.
- F-24 – WB SR-60 – MLK/Central – Degrades from LOS D with density of 33.9 to LOS E with density of 40.3 with Project traffic added.
- F-29 – WB SR-60 – Pigeon Pass/Heacock – Degrades from LOS D with density of 32.7 to LOS E with density of 39.3 with Project traffic added.

Year 2017 plus Project – Weaving – (PM Peak Hour Table 4.15.AL-2)

- W-28 – WB SR-60 – Day/Pigeon Pass – Degrades from LOS D with density of 32.5 to LOS E with density of 35.6 with Project traffic added.

Year 2017 plus Project – Ramps – (PM Peak Hour Table 4.15.AM)

- R-19 – WB SR-60 – MLK Off/MLK Off – Degrades from LOS C with density of 23.0 to LOS E with density of 36.0 with Project traffic added.

Year 2022 plus Project – Intersections – (AM Peak Table 4.15.AN)

- #27 – Redlands/Cactus – Degrades from LOS B with 13.4 seconds of delay to LOS F with >50 seconds of delay with Project traffic added.
- #38 – Perris/JFK – Degrades from LOS D with 50.8 seconds of delay to LOS E with 58.3 seconds of delay with Project traffic added.

– 20

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

- #39 – Iris/Perris – Degrades from LOS D with 54.0 seconds of delay to LOS E with 57.8 seconds of delay with Project traffic added.
- #46 – Kitching/Krameria – Degrades from LOS C with 29.2 seconds of delay to LOS E with 61.4 seconds of delay with Project traffic added.
- #123 – Gilman Springs/Bridge – Degrades from LOS C with 22.3 seconds of delay to LOS E with 38.3 seconds of delay with Project traffic added.
- #135 – Crescent/Alessandro – Degrades from LOS D with 27.7 seconds of delay to LOS E with 47.8 seconds of delay with Project traffic added.

Year 2022 plus Project – Intersections – (PM Peak Table 4.15.AN)

- #12 – Theodore/Ironwood – Degrades from LOS C with 17.8 seconds of delay to LOS F with 50.5 seconds of delay with Project traffic added.
- #27 – Redlands/Cactus – Degrades from LOS A with 9.5 seconds of delay to LOS F with >50 seconds of delay with Project traffic added.
- #28 – Moreno Beach/JFK – Degrades from LOS B with 18.9 seconds of delay to LOS E with 57.8 seconds of delay with Project traffic added.
- #36 – Moreno Beach/Ironwood – Degrades from LOS D with 51.0 seconds of delay to LOS E with 56.7 seconds of delay with Project traffic added.
- #38 – Perris/JFK – Degrades from LOS D with 53.5 seconds of delay to LOS E with 56.7 seconds of delay with Project traffic added.
- #40 – Kitching/Iris – Degrades from LOS C with 23.9 seconds of delay to LOS E with 71.5 seconds of delay with Project traffic added.
- #46 – Kitching/Krameria – Degrades from LOS D with 40.0 seconds of delay to LOS E with 55.7 seconds of delay with Project traffic added.
- #58 – Heacock/Alessandro – Degrades from LOS D with 48.9 seconds of delay to LOS E with 65.3 seconds of delay with Project traffic added.
- #70 – Day/Alessandro – Degrades from LOS D with 43.0 seconds of delay to LOS F with 98.5 seconds of delay with Project traffic added.

Year 2022 plus Project – Mainline – (AM Peak Hour Table 4.15.AP-1)

- F-4 – EB SR-60 – Central/Mountain – Degrades from LOS D with density of 33.0 to LOS E with density of 35.5 with Project traffic added.
- F-5 – EB SR-60 – Mountain/Euclid – Degrades from LOS D with density of 32.5 to LOS E with density of 35.1 with Project traffic added.
- F-9 – EB SR-60 – Archibald/Haven – Degrades from LOS D with density of 32.8 to LOS E with density of 36.0 with Project traffic added.
- F-29 – EB SR-60 – Pigeon Pass/Heacock – Degrades from LOS D with density of 29.2 to LOS E with density of 39.6 with Project traffic added.
- F-30 – EB SR-60 – Heacock/Perris – Degrades from LOS C with density of 25.0 to LOS E with density of 39.2 with Project traffic added.
- F-49 – EB SR-91 – Central/14th – Degrades from LOS D with density of 34.9 to LOS E with density of 35.5 with Project traffic added.

20

Mr. Adriano Martinez

**World Logistics Center Draft EIR – Traffic and Transportation Comments
March 29, 2013**

Year 2022 plus Project – Mainline – (PM Peak Hour Table 4.15.AP-2)

- F-18 – WB SR-60 – Rubidoux/Market – Degrades from LOS D with density of 32.5 to LOS E with density of 37.1 with Project traffic added.
- F-29 – WB SR-60 – Pigeon Pass/Heacock – Degrades from LOS D with density of 34.0 to LOS F with density of 46.9 with Project traffic added.
- F-30 – WB SR-60 – Heacock/Perris – Degrades from LOS D with density of 27.5 to LOS E with density of 39.1 with Project traffic added.

Year 2022 plus Project – Weaving – (AM Peak Hour Table 4.15.AQ)

- W-23 – EB SR-60 – University/MLK – Degrades from LOS D with density of 30.5 to LOS E with density of 35.3 with Project traffic added.
- W-25 – EB SR-60 – Central/Fair Isle – Degrades from LOS C with density of 27.4 to LOS E with density of 35.3 with Project traffic added.

Year 2022 plus Project – Ramps – (AM Peak Hour Table 4.15.AR)

- R-2 – EB SR-60 – On from Central – Degrades from LOS D with density of 28.8 to LOS F with density of 33.2 with Project traffic added.

Year 2035 plus Project – Intersections – (AM Peak Table 4.15.AS-1)

- #11 – Theodore/Ironwood – Degrades from LOS C with 22.9 seconds of delay to LOS E with 44.3 seconds of delay with Project traffic added.
- #86 – Central/Chicago – Degrades from LOS D with 49.5 seconds of delay to LOS E with 61.3 seconds of delay with Project traffic added.
- #98 – Alessandro/Canyon Crest – Degrades from LOS D with 54.4 seconds of delay to LOS E with 55.9 seconds of delay with Project traffic added.
- #131 – Reche Canyon/Reche Vista – Degrades from LOS C with 35.0 seconds of delay to LOS D with 40.4 seconds of delay with Project traffic.

Year 2035 plus Project – Intersections – (PM Peak Table 4.15.AS-2)

- #53 – Lasselle/Cactus – Degrades from LOS C with 34.8 seconds of delay to LOS D with 38.2 seconds of delay with Project traffic added.

Year 2035 plus Project – Mainline – (PM Peak Hour Table 4.15.AU-2)

- F-2 – WB SR-60 – Reservoir/Ramona – Degrades from LOS D with density of 34.6 to LOS E with density of 35.8 with Project traffic added.
- F-34 – WB SR-60 – Redlands/Theodore – Degrades from LOS D with density of 29.7 to LOS E with density of 35.0 with Project traffic added.

Year 2035 plus Project – Weaving – (AM Peak Hour Table 4.15.AV-1)

- W-20 – EB SR-60 – Main/SR91 – Degrades from LOS D with density of 34.2 to LOS E with density of 35.9 with Project traffic added.

– 20

Mr. Adriano Martinez

**World Logistics Center Draft EIR – Traffic and Transportation Comments
March 29, 2013**

Year 2035 plus Project – Weaving – (PM Peak Hour Table 4.15.AV-2)

- W-28 – WB SR-60 – Day/Pigeon Pass – Degrades from LOS D with density of 32.3 to LOS E with density of 36.1 with Project traffic added.

Year 2035 plus Project – Ramps – (AM Peak Hour Table 4.15.AW)

- R-8 – EB SR-60 – On from Theodore – Degrades to LOS F with density of 43.6 with Project traffic added. While this new ramp is to be constructed by the Project, LOS F conditions result when Project traffic is added. The Project must therefore build a ramp with more initial capacity rather than one that immediately fails to carry traffic generated by the Project.

As identified above, there are over 50 additional direct project traffic impacts beyond those identified in the Draft EIR where the World Logistics Center Project traffic causes an intersection or segment to fall below the acceptable LOS. In each of the various sections in the different analysis scenarios, the text in the Draft EIR conflicts with the entries in the various tables throughout the discussion of traffic impacts. Instead, these locations are either incorrectly shown as cumulative impacts or they are omitted altogether from the listings.

The Project must be required to fully mitigate its direct impacts created when the LOS falls from a satisfactory level to an unsatisfactory level when project traffic is added.

- 7) Other LOS Calculation Errors Must Be Corrected – Several locations are shown with better operations when Project traffic is added to baseline volumes but no physical improvements are installed. As one example, Page 4.15-116 identifies Redlands/Alessandro as being directly impacted although this intersection is shown to improve dramatically with the addition of Project traffic and without any improvements specified. It is not possible for intersection operations to improve unless additional traffic lanes are added or other improvements are made. The following are additional examples of calculations of improved LOS and reduced delay when project traffic is added that are clearly erroneous and must be corrected:

Existing (2012) plus Project – Intersections – (AM Peak Table 4.15.AD-1)

- #11 – Redlands/Ironwood – Improves from LOS D with 40.9 seconds of delay to LOS C with 34.4 seconds of delay with Project traffic added.
- #112 – Placentia/Perris - Improves from LOS C with 30.1 seconds of delay to LOS C with 29.6 seconds of delay with Project traffic added.

Existing (2012) plus Project – Intersections – (PM Peak Table 4.15.AD-2)

- #11 – Redlands/Ironwood – Improves from LOS D with 37.3 seconds of delay to LOS C with 34.8 seconds of delay with Project traffic added.
- #107 – Evans/Rider - Improves from LOS C with 28.3 seconds of delay to LOS C with 27.6 seconds of delay with Project traffic added.

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments
March 29, 2013

Year 2017 plus Project – Intersections – (AM Peak Table 4.15.AI-1)

- #23 – Redlands/Alessandro – Improves from LOS E with 39.2 seconds of delay to LOS C with 17.1 seconds of delay with Project traffic added.

Year 2017 plus Project – Intersections – (PM Peak Table 4.15.AI-2)

- #23 – Redlands/Alessandro – Improves from LOS C with 20.1 seconds of delay to LOS C with 16.2 seconds of delay with Project traffic added.

Numerous duplications in the listings in the Draft EIR must also be eliminated (i.e., see Page 4.15-106 which repeats the last two intersections of San Timoteo-Live Oak and Redlands-San Timoteo at the end of the list of intersections identified as being cumulatively impacted).

- 8) No Mitigation Measures Proposed for Year 2017 or Year 2022 Analyses – The Draft EIR and TIA Report provide mitigation measures based on the analyses of Existing as well as Year 2035 Buildout with Project traffic added. While many significant direct and cumulative impacts are identified in the TIA Report in the analysis of Year 2017 conditions with fifty percent of Project traffic added as well as in the analysis of Year 2022 conditions with all Project traffic added, no mitigation measures are proposed for the Year 2017 and for the Year 2022 significant impacts.

The Draft EIR must also identify the mitigation measures that are shown in the TIA Report and that are concurrently required in Year 2017 and in Year 2022. This is the major flaw in the Draft EIR since significant impacts must be mitigated in a timely manner and mitigation of these significant traffic impacts when they are forecast to occur has been omitted.

- 9) “Significant and Unavoidable” Impacts Require Further Evaluation – In regard to Alternative Transportation Policies, Plans, and Programs, Page 1-31 of the Draft EIR states “The Proposed Project will create a complete roadway circulation network, install a loop trail system, have Class II bikeways and sidewalks on all internal streets, and streets can accommodate bus turnouts when needed by the local transit agency.” As mitigation, Page 1-31 of the Draft EIR states “Carpooling is required under Air Quality Mitigation Measure 4.3.6.4A. No additional mitigation is required.”

Mitigation Measure 4.3.6.4A on Page 1-12 of the Draft EIR states “Future development in the WLCSP will implement a number of activities to help reduce long-term air pollutant emissions, including participation in the County’s Rideshare Program, on-site bicycle lanes, sidewalks and pedestrian paths, etc.” The traffic analysis then proceeds to identify numerous significant traffic impacts and classifies many of them including all those on the freeway system as “significant and unavoidable.”

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

While the Draft EIR identifies a number of “significant and unavoidable” traffic impacts, it does not evaluate or propose all feasible Transportation Demand Management (TDM) measures that would address these impacts. TDM measures reduce traffic impacts by lowering the number of vehicle trips by encouraging, requiring, and/or subsidizing alternative transportation. Impacts are also reduced by measures that avoid travel during congested peak hours.

27

From their website, the Riverside County Transportation Commission’s Core Rideshare Program offers ride matching for carpools and vanpools, free incentives for employees to try ridesharing, and a guaranteed ride home program for employers with more than 250 employees. In addition to participation in the County’s Rideshare Program, the all reasonable TDM measures must be considered including:

28

Shuttles to Connect to Existing Transit Service – At this time, transit service is not provided in the World Logistics Center Project area. Until this occurs, shuttle service connecting with existing transit would encourage use of alternative transportation by many employees.

29

Construction of Bus Turnouts - Construction of bus turnouts throughout the Project, initially to be used by shuttles, must be required as street improvements are constructed rather than being deferred until needed by the local transit agency.

30

Flex Time, Staggered Work Hours, and Compressed Work Hours - A number of the Project’s peak hour trips would likely be generated by employee commuting. Use of flex time, staggered work hours, and/or compressed work hours to avoid peak commute hours is an effective method to reduce travel at these congested periods.

31

Differential Parking Treatments - Preferential parking for those employees that commute together is a simple measure that can encourage alternative transportation.

32

On-Site Child Care - Provision of child care facilities on-site can encourage use of alternative transportation because employees will not need the flexibility of passenger vehicles to arrange drop-offs and pick-ups and because they will be able to respond to emergencies without leaving the site.

33

Other TDM Measures – The following TDM measures would further reduce the number of employee commute trips to and from the Project:

- Designated Contact – Administers all aspects of TDM Program; provides employee orientation packets identifying transportation options; periodic special promotions as well as trip planning with routes and maps.

34

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

➤ Secured Bicycle Parking; Motorcycle Parking; Showers/Clothes Lockers

34

To achieve and maintain employee trip reduction goals, the individual TDM plans for employers in the World Logistics Center must be developed and then monitored on a regular basis. Further, these plans must also contain penalties for non-compliance. The Draft EIR must include the preparation and monitoring of TDM plans as an enforceable condition of approval for each project in the World Logistics Center.

35

10) Proposed Mitigation Measures Are Defective – Several of the Mitigation Measures that are identified in the Draft EIR and in the TIA Report are defective as follows:

a) Trans 1 requires that each development within the World Logistics Center must conduct a traffic study. The depth and scope of these required traffic studies must be defined in the Draft EIR in addition to including this requirement as an enforceable condition of approval for each and every project within the World Logistics Center.

36

b) Trans 5 requires a study with Caltrans and the other cities to determine how the many required improvements will be funded and implemented. Such an effort has not begun and it will take many years to complete. By then, a number of developments in the World Logistics Center will likely have paid their DIF and TUMF fees. Payment of the additional fee determined by the multi-jurisdictional study must be included as an enforceable condition of approval for each and every project within the World Logistics Center. Additionally, since the measure only identifies Caltrans and the cities, it appears the County has been omitted from this study effort and they must be added.

37

c) Trans 6 suggests aligning the TUMF Program so that improvements needed to mitigate traffic impacts created by the World Logistics Center are funded earlier. Many improvements are needed throughout the County and there is no guarantee that the realignment of project priorities to benefit the World Logistics Center will occur in a timely manner.

38

d) In the mitigation of impacts, the use of TUMF or DIF fees are proposed to implement the necessary improvements, even though the World Logistics Center Project creates a direct impact. The World Logistics Center Project must be required to mitigate all of the direct traffic impacts that it creates.

39

e) The Draft EIR and the TIA Report do not identify which, if any, of the improvements required by the Mitigation Measures are covered by fees now being collected under the TUMF and DIF Programs. The Draft EIR

40

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments

March 29, 2013

must provide supporting evidence as to which TUMF and DIF improvements are currently programmed, and which are not.

40

f) In several cases, particularly in the 2035 analysis, potential mitigation measures are quickly dismissed because of cost (such as adding a mixed flow lane to a freeway segment). It is my understanding that high cost cannot be used to conclude that the particular mitigation is not feasible. For other freeway sections such as SR-91 south of SR-60, Caltrans is currently widening the mainline whereas the Draft EIR indicates adding lanes to this portion of the freeway is not feasible because of the need for retaining walls which are currently being built.

41

g) There are a number of errors that were cut and pasted from the TIA Report directly into the Draft EIR. Many of these appear in the 2035 analysis for the freeway segments (see Page 379 of the TIA Report and following) where the words in the second line “period this intersection” appear again and again. This gets worse (see Page 386 of the TIA Report and following) where the freeway segments involve I-10 but the references are to SR91. These errors must be eliminated to properly define the mitigation measures and the responsibility for their implementation.

42

11) Proposed Mitigation Measures Are Not Shown To Be Timely – Payments of either traffic impact fees or fair shares toward improvements do not ensure that the improvements will be constructed in a timely manner. CEQA requires that mitigation measures be effective, enforceable, and timely. Merely requiring the applicant to make fair share payments does not ensure the significant improvements will be constructed in a timely manner. Therefore, the mitigation measures included in the Draft EIR are not feasible as they cannot be constructed without adequate funding. As discussed further below, the Draft EIR must be modified to require that significant additional mitigation measures be funded and constructed by the World Logistics Center Project.

43

To provide timely implementation of improvements required for cumulative impact mitigation, execution of a reimbursement agreement with the City must be considered. Under this agreement, the Project constructs all improvements necessary to mitigate cumulative impacts, and is subsequently reimbursed by the City for costs in excess of the Project’s fair share as other development occurs. To avoid gridlock LOS F conditions in the Project area, the City of Moreno Valley should utilize this tool to accelerate the required improvements so they are available in a timely manner, and should make this mitigation arrangement an enforceable condition prior to approving this Project.

12) Traffic Queuing Has Not Been Studied, Evaluated, or Mitigated - Traffic study guidelines such as the “Guide for the Preparation of Traffic Impact Studies” published by the California Department of Transportation in December 2002

44

Mr. Adriano Martinez

World Logistics Center Draft EIR – Traffic and Transportation Comments
March 29, 2013

require that facility geometry including the storage lengths be evaluated for baseline and for baseline with Project traffic added. The TIA Report did not evaluate queuing or determine if adequate storage capacity exists before turning lanes overflow or if through traffic backs up through adjacent closely spaced intersections. Facility geometry together with queuing must be analyzed, evaluated, disclosed, and mitigated.

44

- 13) Draft EIR Fails to Analyze Rail Service for the World Logistics Center – The traffic analysis discloses that the World Logistics Center Project will create numerous significant environmental impacts, many of which are the direct result of the high volumes of truck traffic required to serve the site. The Draft EIR must review transportation access to the site using rail service as a mitigation measure rather than just rely on trucks to provide access.

45

- 14) Mitigation Monitoring Program Is Required – The Draft EIR does not indicate that a Mitigation Monitoring and Reporting Program will be prepared as a part of the Final Draft EIR. The Mitigation Monitoring and Reporting Program should have been made a part of the Draft EIR so it would be available for public review and comment at this time, along with the rest of the documents.

46

In sum, the Draft EIR must address the significant issues and concerns outlined in this letter. The evidence in the Draft EIR makes clear that the significant traffic impacts created by the World Logistics Center Project cannot or will not be addressed in a timely manner, especially in light of the fact that critical mitigation measures are not funded. After correction of the faulty methodology in the Draft EIR, the World Logistics Center Project will also be found to create additional significant traffic impacts in Years 2012, 2017, 2022, and 2035 that must be properly evaluated and mitigated in a Recirculated Draft EIR.

47

Respectfully submitted,

Tom Brohard and Associates

Tom Brohard, PE
Principal

Enclosures

RESPONSES TO LETTER F-9B

Sierra Club, Center for Community Action and Environmental Justice, and Natural Resources Defense Council

Response to Comment F-9B-1. The commenter states that he, Tom Brohard and Associates, was hired by the Natural Resources Defense Council to review the World Logistics Center (WLC) Draft Environmental Impact Report (DEIR) Traffic and Transportation sections and the Traffic Impact Analysis (TIA) Report prepared by Parsons Brinkerhoff. He, Mr. Brohard, finds the DEIR and TIA seriously flawed and requests the finding and comments in his letter be addressed in a Recirculated DEIR. His comments have been addressed in this response to comment letter by the City and because there are no new significant impacts not previously discussed in the DEIR a Recirculated DEIR is not required. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment F-9B-2. The commenter states the DEIR and TIA confuse direct and cumulative impacts, do not show mitigation measures for 2017 or 2022, or demonstrate that funding is available to construct mitigation measures in a timely manner.

The commenter confuses direct and indirect impacts. The comment is addressed below in Responses to Comments F-9B-18 through F-9B-21. The claim that mitigation measures were not identified for 2017 and 2022 is incorrect. Please see Response to Comment F-9A-12, which lists where mitigation measures for 2017 and 2022 are presented in the TIA.

Funding for the identified improvements is expected to come from a variety of sources:

- The Development Impact Fee (DIF) program, which is designed to provide funds for improvements needed to mitigate the impacts of development in the City of Moreno Valley. See Mitigation Measure (MM)-Trans-3 in the TIA.
- DIF-like fee programs in other jurisdictions designed to provide funds for improvements needed to mitigate the impacts of developments with their respective jurisdictions.
- The Transportation Uniform Mitigation Fee (TUMF) program, which is designed to provide funds for improvements needed to mitigate development throughout western Riverside County. See MM-Trans-4 in the TIA.
- State and Federal sources as described in Southern California Association of Governments' (SCAG's) 2012 Regional Transportation Plan (RTP).
- Fair-share contributions from the WLC, identified in the TIA, for improvements under the jurisdiction of the City of Moreno Valley. See MM-Trans-2 in the TIA.
- Fair-share contributions from the WLC identified in the TIA, for improvements outside the jurisdiction of the City of Moreno Valley under programs to be established with neighboring jurisdictions to provide for the collection of fees from developments with impacts outside the approving jurisdiction and not already covered in the TUMF program. See MM-Trans-5 in the TIA.

The WLC's fair-share contributions to DIF, TUMF, and improvements covered by new inter-agency agreements would be conditions of approval of each of the project's individual building permits and thus, the funds would be available in a timely manner as the need for improvements emerges over time of the project's buildout (see TIA MM-Trans 1, 2, 3, 4, and 5). The City does not have direct control over the expenditure of TUMF funds but has pledged to work with WRCOG to shift funding priorities to align with the improvements identified in the TIA (see MM-Trans-6 in Chapter 11, Section G DEIR Appendix L). The City does not control the state and federal funds identified in the RTP.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The TIA correctly points out the City is unable to ensure the implementation or timeliness of improvements to facilities not under its control (TIA Chapter 11, Sections E and F, DEIR Appendix L). Moreover, under state law the project cannot be held responsible for existing deficiencies or for more than its fair share of the cost of improvements needed to accommodate growth. Through the mitigation measures identified in the TIA the City has exercised its authority to the maximum extent towards ensuring that the mitigation measures are implemented in a timely manner. The TIA also recognizes that improvements not under the control of the City may not be built in a timely fashion so that the impacts have been characterized as significant and unavoidable. Refer to TIA in Chapter 11, Sections E and F. DEIR Appendix L.

Response to Comment F-9B-3. The City acknowledges the commenters education and experience on traffic and transportation. This information along with the commenter's resume will be provided to the City's decision makers for consideration before acting on the proposed project and the EIR.

Response to Comment F-9B-4. The commenter again states he has reviewed the DEIR and TIA (Parsons Brinkerhoff, January 2013) and has comments that must be addressed and further studied. He also implies the comments would require revision and recirculation of the DEIR and recirculation should occur. The commenter's comments along with other comments letters addressing traffic (refer to Response to Comments B-2-9, C-3-17, E-2A-5, E-2A-12, E-2B-21, E-2B-22, E-3-5, E-5-2, E-5-3, F-1-43, F-9A-9, F-9A-13, F-9C-2, F-11-22, F-13-9, F-13-12, F-13-92, F-13-94, F-13-97, F-13-98, and G-57-5) have been responded to by the City and the TIA has been revised, where appropriate, and is included as Appendix L to the FEIR Volume 2. Responses to specific comments are provided below in Responses to Comments F-9B-5 through F-9B-47 below.

Response to Comment F-9B-5. The commenter states that traffic counts taken in 2011 should have been adjusted upwards by 2% for 2012 analysis, the analysis did not account for seasonal fluctuations in traffic, and that no evidence was presented to indicate how or if adjustments were made to convert trucks into passenger car equivalents.

Traffic counts were taken within a year of the Notice of Preparation (dated February 2012). Counts taken with a year of the analysis date are generally accepted as valid, therefore no adjustment was necessary. The 2% value cited by the commenter is a default value used by the City of Moreno Valley for certain simplified forecasts of future traffic and is not intended for the use in adjusting traffic counts.

Response to Comment F-9A-9 provides a detailed analysis for seasonal traffic fluctuations and why they are not an issue in this analysis.

Detailed information on the use of passenger car equivalents is provided in Chapter 2, Section A of the TIA (DEIR Appendix L-1), in the sub-section entitled "Passenger Car Equivalents."

Response to Comment F-9B-6. The commenter states the TIA fails to provide the trip generation and distribution for each of the other development projects cited in the report, and does not show peak hour traffic for them through study intersections, roadway, and freeway segments. It also claims the 2017 scenario does not appear to include trips to and from various projects in Riverside County.

The traffic analysis included an exceptionally strong effort to incorporate a comprehensive list of other known projects, with over one hundred projects included on the list. As stated in the TIA (Chapter 2, Section B, DEIR Appendix L-1), these projects were input into the Riverside County Traffic Analysis Model (RivTAM) model, which computed the trips generated by these projects and distributed them to logical paths as is done for all land uses. The traffic impact of these projects is therefore fully accounted for in the TIA analysis.

Manually computing and assigning the traffic from each of these projects, which is what the commenter seems to be suggesting, represents an obsolete methodology from the days prior to the use of travel demand models in traffic analyses. Among other problems, such a procedure would not represent that ways that the individually-examined projects interact with each other. For example, it would not show how trips originating in one project might have another new project as a destination, or how the traffic from one project might cause the traffic from another project to divert to a different route. The City approved the use of RivTAM because it performs the trip generation and distribution functions much better than the procedure suggested by the commenter. RivTAM is a version of the SCAG's latest six-county model with additional detail (traffic analysis zones and local roads) added within Riverside County. It was developed for TIAs in Riverside County as a replacement for several older models that covered different portions of the county. RivTAM has both the geographic scope needed to capture all likely impacts and conformity with regional planning assumptions. There is a memorandum of understanding³⁴ among the jurisdictions of Riverside County that encourages the use of the RivTAM model for TIAs. The MOU reads, in part (from page 4 of the MOU),

"RivTAM was designed to address most city and county level modeling needs in Riverside County. The model inputs and zone system were designed with sufficient detail to support most city/county planning applications. The modeling methodology can support evaluation of a range of highway, HOV, and transit scenarios. The Agencies encourage the use of RivTAM by Cities, other governmental jurisdictions, and private entities for their own transportation planning purposes. Universal use of RivTAM by the Agencies, Cities, other governmental jurisdictions, and private entities, and their consultants will ensure that planning decisions in Riverside County are made on accurate and consistent travel forecasts."

By using RivTAM for trip generation and assignment the TIA follows the approved methodology for traffic impact studies in Riverside County.

Response to Comment F-9B-7. The commenter states that several freeway segments volumes in 2035 are lower than in earlier years. He says that it is unreasonable to assume that the 25,000 new jobs will solely be taken by city residents. He further states that it is illogical for the level of service (LOS) to improve when the 41.6 million square feet of warehouse is constructed.

The commenter does not identify either the study segments or the study years so it is very difficult to provide a specific and detailed response to the comment. Overall, there are a number of reasons why freeway volumes may be lower in future years than in earlier years or why LOS may improve as follows:

- Improvements on alternate routes could divert traffic away from some segments, especially if the segments are congested. For example, when the WLC extends Eucalyptus Avenue from Redlands Blvd. to Gilman Springs Road will create an alternate route for some trips currently using Alessandro Blvd., SR-60, and Ironwood Avenue.
- Improvements to the road may result in a better LOS. An example would be the widening of Gilman Springs Rd. that is planned as part of the WLC.
- The commenter may have been comparing the 2012 Plus project scenario with the 2017 Plus project scenario and found that volumes are lower in some places in the latter scenario. This is due to the fact that the 2012 scenario includes full build-out of the WLC while the 2017 assumed only partial build-out. Please refer to Response to Comment B-2-8.

³⁴ *MOU for RIVTAM Model Maintenance, Update, and Usage.* Not dated, but signed by various parties between June and September, 2010. The signatories were Riverside County Transportation Department, Riverside County Transportation Commission, Western Riverside Council of Governments, Coachella Valley Association of Governments, Southern California Association of Governments, and Caltrans.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- The long-term effect of SCAG's 2012 RTP/ Sustainable Communities Strategy (SCS) is to improve the jobs/housing balance and reduce the amount of long-distance commuting. This would reduce future traffic demand and could produce lower volumes in absolute terms at some locations.
- Upstream congestion may limit the amount of traffic reaching some segments, thus creating spot reductions in traffic volumes even though overall demand increases.

Any of these reasons could account for the occurrence cited by the commenter.

The TIA makes no claim that all WLC jobs would be taken by city residents.

Response to Comment F-9B-8. The commenter states Table 24 of the TIA provides inadequate detail on the trip generation of Phases I and II. TIA Table 24 (FEIR Volume 2 Appendix L-1) has been revised to clarify the trip generation by phase as requested.

Response to Comment F-9B-10. The commenter states Figure 26 and 27 in the TIA are misleading if they show only car traffic. They should also show truck traffic.

The TIA distinguishes between car traffic and truck traffic when it discusses trip generation and distribution. This is appropriate given that the two types of traffic use different routes (trucks are restricted to truck routes), have different air quality impacts, different time-of-day characteristics, etc. Figure 26 and 27 in the TIA (now numbered Figures 32 and 33 in the FEIR Volume 2, Appendix L-1), reproduced below, describe two key characteristics of WLC car traffic, namely:

- *Workers coming from Orange or Los Angeles County would, in most cases, be travelling on freeways in the off-peak direction; i.e. commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of freeways, since the freeways were sized for flows in the peak direction.*
- *Assuming, as RivTAM does, that WLC employees would work elsewhere if the WLC project were not implemented, then the availability of jobs at the east end of Moreno Valley would reduce the number of workers driving long commutes to distant jobsites to the west and southwest. Exhibit F-9B-1: (Exhibit F-9B-1 below) of the TIA shows that although the project would increase freeway auto traffic eastbound in the morning, it would also decrease the traffic in the more congested westbound direction. In the evening the pattern would reverse, with the project relieving traffic in the congested eastbound direction (see Exhibit F-9B-2 in the TIA or Exhibit F-9B-2 below). Therefore, the WLC project would have a net beneficial impact on the regional freeway auto traffic. This is the desired effect sought in the policies of SCAG, WRCOG, and other regional governments and agencies that encourage better jobs/housing balances as a way to reduce peak directional flows on the regional freeway system.*

Since these are characteristics of car traffic only, not trucks, it is appropriate that the figures be based on car traffic only. Please note that there is a separate figure (Figure 36 in the revised TIA, FEIR Volume 2 Appendix L) showing the distribution of truck traffic.

Exhibit F-9B-2: Effect of WLC on Freeway Car Traffic, PM Peak Hour 2012

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Response to Comment F-9B-11. The commenter claims the TIA does not clearly identify project trips on freeway segments, roadway segments, and intersections. Instead, with- and without-project figures are given which require comparison.

As the commenter notes, the TIA provides a comparison of with- and without-project conditions. The commenter failed to mention that these volumes are provided side-by-side in the same tables to facilitate the comparison. For example, Table 38 in the revised TIA (Table 28 in the TIA contained in the DEIR) shows the with- and without-project traffic volumes on the freeways in the same row of a single table.

The project's traffic is reported separately in situations where this is appropriate, for example in the air quality analysis where the introduction of clean-fuel trucks servicing the project is being tracked over time. The traffic analysis is different in that the level of service is crucially dependent on the combined effects of project and non-project traffic for the purposes of assessing LOS. LOS cannot be assessed by separating project traffic and other traffic. The TIA therefore properly followed established practice in showing the total volume of traffic using a facility and comparing the with- and without-project LOS.

Response to Comment F-9B-12. The commenter claims the TIA does not follow Caltrans' *Guide for the Preparation of Traffic Impact Studies* in that it does not clearly disclose project generated trips. The commenter also repeats its earlier claim that the use of passenger car equivalents is not clear.

Caltrans' *Guide for the Preparation of Traffic Impact Studies* requirements in this regard are found in Appendix A, Section IV. Points C and D which read (regarding items to be included in a TIA report),

"C. project trip generation including references (table)

D. Project generated trip distribution and assignment (figure)"

The requirement to disclose project trip generation is fulfilled by TIA Chapter 2, Section A, sub-sections entitled Trip Generation Assumptions for High-Cube Warehouses, and Trip Generation Assumptions for Other WLC Land Uses, along with TIA Chapter 4, Section C (project Trip Generation), DEIR Appendix L. Please note that in Comment F-9B-8 the commenter cites the trip generation information in the TIA (DEIR Appendix L), the very information that this comment claims was not provided.

The requirement to provide a figure showing project trip distribution was fulfilled in TIA Figure 25 (DEIR Appendix L) (now numbered 28 FEIR Volume 2, Appendix L-1) showing the distribution of project car traffic and by Figure 29 (DEIR Appendix L) (now renumbered 33, FEIR Volume 2, Appendix L-1) showing the distribution of project truck traffic.

Also note that Caltrans reviewed and commented on the TIA and did not find any deficiency regarding the presentation of trip generation and distribution information. See Response Letter B-2.

Detailed information on the use of passenger car equivalents is provided in Chapter 2, Section A of the TIA, in the sub-section entitled "Passenger Car Equivalents (PCEs)" (DEIR Appendix L).

Response to Comment F-9B-13, 14, 15, 16, 17. The commenter claims that the percentage of truck traffic used in the analysis was too low and results in under-estimation of air quality impacts. The commenter states the percentage of trucks from the NAIOP study should have been used.

Please see Responses to Comments F-9A-17 through F-9A-20. The commenter's suggests the truck percentages from the NAIOP study should be used would be appropriate if the overall trip generation rate from the NAIOP study was also used. Instead, the commenter suggests cherry-picking where the high truck percentage from one source (NAIOP) is selected and then combined

with the high overall trip generation rate selected from a different source Institute of Transportation Engineers (ITE) to produce a very high estimate of project truck traffic. The problem with this approach is the City has used it before in previous analyses and found that it produced results that were unreasonable when compared to actual field conditions. For example, this approach was used in EIR for the Skechers high-cube warehouse building and resulted in forecasts that were three times the actual operational trip generation for car trips and nearly eight times the actual trip generation for trucks³⁵. This approach is misleading to decision makers, creates an undue burden on development, and could ultimately discredit the City's project review process in the eyes of potential developers and members of the public. For these reasons it was not used in the current analysis and the formula in the City's Traffic Impact Guidelines was used instead. A comparison of the trip generation rates used in the WLC TIA and from the NAIOP, Moreno Valley 2013, and Skechers studies is shown in Exhibits F-9B-3 and F-9B-4 below.

Exhibit F-9B-3: Comparison of Trip Generation from Southern California Sources

³⁵ These figures are based on traffic counts taken at the Skechers building after it had been fully operational for over a year. See Technical Memorandum *Traffic Generated by the Skechers Warehouse*, Parsons Brinckerhoff to the City of Moreno Valley, November 14, 2012.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Exhibit F-9B-4: Comparison of Trip Generation from WLC TIA and City (2013) Warehouse Survey

Response to Comment F-9B-18, 19, 20, 21 The commenter claims the TIA incorrectly identifies many impacts as being cumulative when they are in fact direct impacts. The comment provides a list of 52 instances to support this contention.

Forty-seven, or 90%, of the 52 instances cited by the commenter occur in future-year scenarios where the addition of traffic from other development projects contributes to the level of congestion on the facility. Project impacts under these conditions were properly identified as “cumulative.”

Of the remaining five, two (Intersections 123 and 132) were identified as direct project impacts in Table 77 of the TIA (Table 73 in the revised TIA, FEIR Volume 2 Appendix L) entitled “Direct Impacts on Intersections and Mitigations Measures” (DEIR Appendix L). The remaining three instances, freeway mainline section F-6 and weaving sections 25 EB and 25 WB, were identified as a direct impacts in Table 78 of the TIA (Table 73 in the revised TIA, FEIR Volume 2 Appendix L) entitled “Direct Impacts on Freeways and Mitigations” (DEIR Appendix L).

Response to Comment F-9B-23. The commenter states there are several locations where the Plus-Project LOS is better than the No-Project LOS even though no physical improvements are installed. The commenter cites the Redlands/Alessandro intersection as a case where average traffic delay improves dramatically without any improvements specified. The commenter claims, “*it is not possible for intersection operations to improve unless additional traffic lanes are added or other improvements are made.*” The commenter also cites the Redlands/Ironwood, Placentia/Perris, and Evans/Rider intersections as places where this occurs.

Contrary to these claims, it is possible for traffic conditions to improve at a certain location even without physical improvements there. Specifically:

- The LOS of the Redlands Blvd./Alessandro Blvd intersection would improve with the WLC because the project would sever Alessandro Blvd east of Merwin Street, thus cutting off the main flow of traffic to the Redlands/Alessandro intersection (see Figure 16 in the TIA, copied below as Exhibit F-9B 5). The City is doing this to prevent project traffic from routing through an existing Old Moreno neighborhood along Alessandro Blvd. This would certainly have the effect of reducing congestion and traffic delay at Redlands/Alessandro.
- The project would extend Eucalyptus Avenue from Redlands Blvd. to Gilman Springs Road. This would divert some traffic away from Redlands Blvd. and reduce traffic delay at the Redlands Ave./Ironwood intersection.
- The reductions in delay at the two other locations cited in the comment are half-a-second or less. Minor changes like this can be accounted for by the general re-distribution of traffic that is to be expected with all major developments.

Exhibit F-9B 5: Proposed Roadways and Phasing

Response to Comment F-9B-24. The commenter claims that no mitigation measures were identified for 2017 or 2022. The claim that no mitigation measures were identified for 2017 and 2022 is incorrect. Response to Comment F-9A-12 includes a list of tables where mitigations for each year were provided in the TIA.

Response to Comment F-9B-25 through 35. The commenter contends that the DEIR does not evaluate or propose all feasible Transportation Demand Management (TDM) measures that would address project impacts. However, the proposed project includes a number of mitigation measures to reduce project-related traffic impacts, including nearly all those recommended by the commenter. A requirement already contained within the DEIR is MM 4.3.6.4A mandates that tenants participate in

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Riverside County's rideshare program, which has an established program to distribute information and coordinate carpooling and public transportation. Consistent with those goals, all tenants will also need to comply with the requirements of SCAQMD Rule 2202, which accomplishes the same goals as requested by the commenter. All of the methods identified above are means to comply with SCAQMD Rule 2202. In addition, Section 3.4.6.2 of the DEIR describes the various ways that the project would incorporate strategies to reduce congestion. Specifically, the DEIR states "*The Specific Plan states that project site development will support alternative transportation options for employees through implementation of onsite bicycle storage, preferred parking for low-emitting and fuel-efficient cars, carpool high-occupancy vehicles, and access to public transit.*" These requirements would be fully enforceable elements of the Specific Plan and the Mitigation Monitoring and Reporting Plan.

As stated in the WLCSP and Section 12.D of the TIA (DEIR Appendix L), the WLC would be designed to accommodate bus access on all project streets. Bus turn-outs and shelters would be provided at all active bus stops. However, there is no purpose in constructing bus turnouts prior to their need by the local transit agency. Bus stops/turnouts serve no purpose without the local transit agency utilizing them.

Due to the programmatic nature of this project, it is unknown at this time the nature of tenants that may choose to operate at the WLC. As a result, it is not known whether strategies like flex time would be compatible with a company's operations. A number of factors go into determination of work schedules, including operational needs, employee acceptance, labor negotiations and established work rules, coordination with offsite customers/vendors, coordination with other shifts to identify a few. As a result, it would be speculative as to whether such an effort would be feasible or successful.

The proposed project site is an industrial site. As such, it is not recommended that child care centers be located within the boundaries of the WLC. In addition, there are no suitable locations for offsite child care facilities within walking distance for several reasons. First, the WLC project is itself very large, covering approximately four square miles, and any location that would be walkable from a specific portion of the WLC project site would not be walkable from other portions of the site. More importantly, the project site is bounded on the north by State Route 60, on the east by the Badlands, on the south by San Jacinto Wildlife Area Conservation Buffer, and on the west by a residential buffer beyond which there are single family homes. As a result, no suitable location for a day care facility within walking distance of the WLC project site could be identified. However, there are a number of child care facilities nearby within the residential and commercial areas of Moreno Valley that could effectively serve employees working at the WLC.

Response to Comment F-9B-36. The commenter states that the mitigation measures in the TIA are defective in that the depth and scope of the traffic studies required under MM Trans-1 must be defined in the EIR in addition to including this requirement as a condition of approval for every project in the WLC.

MM Trans-1 contained in the TIA (and identified as MM 4.15.7.4A in the EIR) sets forth a requirement for the preparation of subsequent traffic studies for each plot plan application for the purposes of determining what traffic improvements identified in the TIA (and EIR) are required to be completed prior to the issuance of a certificate of occupancy for each building. The scope and depth of the traffic studies described in MM-Trans-1 will be as specified in the City of Moreno Valley *Traffic Analysis Guidelines*. These studies will be required as part of the project approval process. Both of these elements are part of MM Trans-1 (and MM 4.15.7.4A in the EIR). MM Trans-1 (and MM 4.15.7.4A in the EIR) has been re-written as follows (added text shown in double underline; deleted text shown in strikeout) to clarify this:

~~**4.15.7.4A** When processing future individual development permits under the World Logistics Center Specific Plan, as part of the City's discretionary approval process, the City shall require each project to perform a project specific traffic impact study to ensure~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

~~that the assumptions set forth in the TIA prepared for the programmatic level entitlement remain valid. These traffic impact analyses shall conform to the traffic impact analysis guidelines prepared by the City of Moreno Valley and the California Department of Transportation and shall be used to impose project specific mitigation on the individually proposed projects. These traffic analyses shall be completed prior to the issuance of grading permits for the requested development. It should be noted that the City will require that the applicant to fully fund or to pay a fair share of some of the improvements identified in Tables 4.15.AX through 4.15.BC. These improvements will be required by the City as a Condition of Approval.~~

4.15.7.4A A traffic impact analysis ("TIA") conforming to the guidelines for traffic impact analysis adopted by the City shall be submitted in conjunction with each Plot Plan application within the World Logistics Center Specific Plan. Prior to the approval of the Plot Plan, the City shall review the traffic impact analysis to determine if any of the traffic improvements listed in Final EIR Volume 2 Tables 4.15.AV through 4.15.BA (TIA Tables 74 through 79) of the traffic impact analysis prepared for the Program Environmental Impact Report are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements within the City shall be subject to credit/reimbursement agreement for those DIF and/or TUMF eligible costs. If the City determines that any of the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in Mitigation Measure 4.15.7.4G prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the Program Environmental Impact Report, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.

Response to Comment F-9B-37. The commenter states the mitigation measures in the TIA are defective in that MM-Trans-5 requires a study that could take a long time. Payment into the fee must be an enforceable condition of approval. MM-Trans-5 should include the County, not just Caltrans and the cities.

Payment into the multi-jurisdictional program is already an enforceable condition of approval under MM-Trans-5. The time required to do the study depends on other agencies' actions and so is not under the control of the City of Moreno Valley. In response to the comment the County of Riverside has been included as one of the agencies that the City will endeavor to work with to establish the inter-jurisdictional funding mechanism.

Response to Comment F-9B-38. The commenter states the mitigation measures in the TIA are defective in that MM-Trans-6 states that the City will try to align TUMF priorities with the project but there is no guarantee that this will happen given that many improvements are needed throughout the county.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

MM-Trans-6 correctly states that the City will request the change in priority and work with Western Riverside Council of Governments (WRCOG) regularly on this issue. However, the City does not have direct control over TUMF priorities and therefore any change requires working cooperatively with all other partner agencies. Because there is no guarantee that TUMF funded improvements will be in place when needed, impacts mitigated by TUMF funded improvements are characterized as significant and unavoidable. See TIA in Chapter 11, Sections E and F, FEIR Appendix L.

Response to Comment F-9B-39 and 40. The commenter states the DEIR and TIA propose to use payment of TUMF and DIF as mitigation for direct project impacts. The commenter also states that the DEIR and TIA must provide supporting evidence of which TUMF projects are programmed and which are not.

The FEIR and TIA (FEIR, Appendix L) has been clarified to state that fair share payments for direct project impacts will be made in addition to TUMF and DIF payments. The rationale behind this mitigation approach is that most of the direct impacts (see FEIR Tables 4.15.AT through 4.15.AV or TIA Tables 72, 73, and 74) are to facilities that already have existing deficiencies. Under these circumstances, the project should only pay its fair share of the cost of the improvements needed to achieve the adopted LOS target in accordance with key federal court rulings (i.e., *Dolan v. City of Tigard* 1994) and California law.

Furthermore, the FEIR and TIA contain a mitigation measure (FEIR MM 4.15.7.4A and TIA MM Trans-1) requiring preparation of subsequent TIAs in conjunction with each Plot Plan application within the WLCSP for the purposes of determining which of the traffic improvements listed in FEIR Tables 4.15.AT through 4.15.AY (or Tables 72 through 77 of the TIA prepared for the Program EIR) are required to be completed prior to the issuance of a certificate of occupancy for each building. In this manner, each increment of development will be required to install/construct certain transportation improvements identified in FEIR Tables 4.15.AT through 4.15.AY as dictated by the subsequent TIAs.

The comment regarding TUMF programming puts the cart before the horse in terms of how prioritization, programming, and allocation of funds work in the TUMF program. The premise of the comment is that the list of programmed projects is fixed and so the list of programmed projects accurately reflects which projects will be funded in the future. In fact the list is not fixed; it is updated as situations change. Some of the projects that would support the WLC are not on the list because the WLC has not yet been approved; if the City approves the WLC then the project list will be adjusted to reflect this major economic development. It is already the policy of Riverside County Transportation Commission (RCTC) to prioritize improvements that support economic development projects such as WLC. To quote from RCTC's *Commission Policy Goals and Objectives* statement:

“Encourage Economic Development

Transportation decisions will consider the economic benefits derived from any improvement, and, where feasible and practical, will pursue transportation alternatives that enhance or complement economic development.

- Commit to seek opportunities related to transportation projects that will create jobs and improve the economic base in the County.*
- Support local agencies in the design and construction of interchanges that are in proximity to regional economic centers and developments.*
- Support local projects, consistent with countywide transportation goals, which enhance business development, local employment, and area tourism.”*

Response to Comment F-9B-41. The commenter states that in several cases the TIA dismisses potential mitigation measures due to high cost, which is not allowed.

The TIA noted, as information for the use of policy makers, the cost of some improvements would be high. While the CEQA definition specifically takes into account economic factors, this was not a criterion used to determine feasibility for these traffic-related impacts. In the TIA, improvements were deemed to be infeasible if they would (1) require the acquisition of existing homes or businesses; (2) result in excessive air, noise, or vibration impacts on existing homes, businesses, or sensitive natural environments, or (3) create safety impacts that could be considered less acceptable than an improved traffic LOS. In cases where feasibility is uncertain the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities so the project's responsibilities would not be under-estimated. Discussions of the cost of improvements have been removed from the TIA to avoid confusion (FEIR, Volume 2, Appendix L-1).

Response to Comment F-9B-42. The commenter states that there are numerous cases of cut-and-paste errors in the text. The TIA has been reviewed and such errors have been eliminated as they were found (FEIR, Volume 2, Appendix L-1).

Response to Comment F-9B-43. The commenter states the mitigation measures are not shown to be timely. The commenter recommends that the City require the project to construct all mitigation measures needed for cumulative impacts and be later reimbursed for the excess portion beyond the project's fair share.

As stated in the Response to Comment F-9B-2, the City's ability to determine the schedule for implementing mitigation measures is limited. The City has committed to use the reimbursement approach in cases where the project can be shown to have a major impact and where improvements are needed in the short term; for example for Gilman Springs Road. However, neither the developer nor the City has the authority to upgrade facilities in other jurisdictions as suggested by the commenter. Moreover, requiring the project to pay in advance the full the cost of improvements for which it has only a small share of responsibility, which is the case of most of the mitigations identified in the report that are outside of the City, would be contrary to the "rough proportionality" requirement of the Mitigation Fee Act. MM 4.15.7.4F requires the establishment of fair share contribution mechanisms in the affected jurisdictions, which gives all jurisdictions affected by WLC traffic the ability to establish a mechanism to obtain fair share funds from the WLC project as development occurs in the future.

In addition, the approach suggested by the commenter would usurp other agencies' discretion over the orderly development of their facilities. For example, the WLC is responsible for less than 1 percent (0.8%) of the cumulative need to widen I-215 between SR-74 and Ellis Avenue (see TIA Table 77). This widening would have no benefit, in fact could cause traffic operations problems, unless it is done in conjunction with the construction of the proposed new interchange at Ellis Avenue, which is scheduled for completion in 2030 and which has no relationship with the WLC (see RTP project # 3M0731).

Response to Comment F-9B-44. The commenter states their opinion that traffic queuing should have been analyzed in the TIA.

The City does not require queue length analysis for studies intended to provide planning-level assessments of potential improvements that may be needed decades into the future. The City will require queue length analysis where appropriate for plot-level traffic studies as portions of the project build out and more design details are developed, including about building footprints, driveway locations, etc.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-9B-45. The commenter states the TIA should address using rail as a mitigation measure.

An additional section (Chapter 4, Section F) has been included in the TIA (FEIR Volume 2, Appendix L-1) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to this site was not viable due to a variety of factors, including high fixed costs, secondary impacts on the community, and capacity constraints in the rail system.

Response to Comment F-9B-46. A Mitigation Monitoring and Reporting Program (MMRP) is provided in the FEIR, Volume I. It contains all the mitigation measures in the DEIR and FEIR. CEQA Guidelines Section 15097(a) states *“when a public agency has made the findings required under paragraph (1) of subdivision (a) of Section 15091 relative to an EIR or adopted a mitigated negative declaration in conjunction with approving a project. In order to ensure that the mitigation measures and project revisions identified in the EIR or negative declaration are implemented, the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects.”*

Response to Comment F-9B-47. The commenter is summarizing his previous comments related to the adequacy of the WLC to implement measures to reduce traffic impacts for measures that are not funded and that the project after additional corrections to the “faulty methodology” in relation to traffic is corrected, the project will be found to have additional significant impacts in Years 2012, 2017, 2022, and 2035 which must be fully evaluated and mitigated in a Recirculated DEIR. Revisions to the TIA were conducted and are provided in FEIR Volume 2 Appendix L-1 of this FEIR. The revised TIA did not find additional significant traffic impacts of the proposed project.

Response to Appendix 1 (Résumé for Tom Brohard). The referenced appendix was cited in the comment letter in the section under Education and Experience. We have reviewed the resume in the appendix and although we appreciate the inclusion of professional resumes as parts of comments, we review and consider all technical comments equally.

Response to Appendix 2 (General Plan Amendments Summary for Riverside County). The appendix was cited in the comment letter in reference to the comment that the “Year 2017 traffic volume baseline does not appear to include trips to and from various nearby development projects...” The appendix was reviewed and is included in the analysis in the revised TIA and Section 4.15 of the FEIR Volume 2.

Response to Appendix 3 (California Emissions Estimator Model – Appendix E Technical Source Documentation). The appendix is intended to provide additional information related to the truck trip generation estimations. The appendix was reviewed and is included in the analysis in the revised TIA and Section 4.15 of the FEIR Volume 2.

From: Alex Karner, PhD
Subject: World Logistics Center Truck Distance Estimates

I was retained by the Natural Resources Defense Council to assess the truck trip distance estimates contained in the Draft Environmental Impact Report for the proposed World Logistics Center (WLC). My curriculum vitae is attached to this memorandum.

The WLC is a proposed warehouse distribution and logistics center that would create a maximum of 41.4 million square feet of warehousing space over an area of approximately 4,000 acres in the San Bernardino Valley in the city of Moreno Valley, California [1, p. 3-19]. This memo assesses the derivation of an important variable used in the Draft Environmental Impact Report for the WLC (DEIR) – the average distance that trucks travel to access the site. This distance is used throughout the DEIR to determine the air quality, greenhouse gas, and traffic impacts of the project (see, e.g., DEIR Appendix D, pp. 119-121). Small variations in this value are likely to affect the magnitude of calculated environmental impacts because they will affect all truck trips. Problematically, the DEIR's estimated distance for all future years is based on 2008 *regional* truck movements with an arbitrary adjustment upward to account for the types of trips expected to be generated by the WLC. However, the expected distribution of truck trips coming to/from the WLC is not specified and is not likely to reflect future increases in truck traffic associated with the San Pedro Bay Ports, as illustrated further below.

In reviewing the derivation of this value, I consult the air quality, greenhouse gas, and health risk assessment appendix to the DEIR (Appendix D) and the traffic impact report appendix to the DEIR (Appendix L).¹

DEIR Approach to estimating truck trip distance

Assumptions about truck trip distance – the average length trucks travel to and from the WLC – critically affect the magnitude of the WLC's estimated environmental impacts. Deriving an appropriate trip length is complicated by the variation in truck origins and destinations. To address this challenge, Appendix D follows an approach based in part on a recommendation made by the South Coast Air Quality Management District (SCAQMD) in their comments on the Bandini Industrial Center Project.²

In brief, the method used in Appendix D proceeds as follows. Consider truck traffic originating from or destined for six mutually exclusive geographies: internal to the SCAG region, external to the SCAG region in four possible directions, and the San Pedro Bay Ports. This disaggregation follows from the approach taken in the Southern California Association of Governments (SCAG) 2012 regional transportation plan goods movement appendix [2, pp. 13-14]. That appendix classifies all regional truck trips for 2008 into five categories (percentages of total regional truck trips are shown in parentheses): internal to SCAG (87.3%), external to SCAG (7%), and three San Pedro Bay Port-related categories (5.7%). The total number of truck vehicle

¹ Note that this is a partial review of all documents associated with the project. Review of additional documents may reveal factors that were not considered as part of this review that would change the conclusions it contains.

² MacMillan, I. April 27, 2012. Email to Nancy Fong Re: Draft Mitigated Negative Declaration (Draft MND) for the Proposed Bandini Industrial Center. <http://www.aqmd.gov/CEQA/igr/2012/April/MNDbandini.pdf>

miles traveled (VMT) is then taken from elsewhere in the RTP and associated with each category of travel [3, p. 52]. Dividing truck VMT by the total number of truck trips results in an average per trip length for each trip category. Using the RTP values, the DEIR takes the share of trips in each category multiplied by its average distance and sums over all categories to arrive at a representative trip length. Results are shown for both the SCAG region as a whole and Riverside County alone because they have somewhat different distributions of trip categories. Both result in the same average trip distance of 36 miles.

This figure is subsequently adjusted upwards:

[B]ased on various comments from the SCAQMD regarding trip lengths for trucks going to warehouse and distribution center projects as contained in their published CEQA review correspondence, the trip length used for this analysis is increased to 50 miles to provide a worst case scenario. (Appendix D, p. 120).

The “published CEQA review correspondence” cited in the quotation above was not available, so the extent to which the trip distribution was adjusted to achieve that result is unclear. We return to the issue of the disparity between the 36 and 50 mile average trip distance estimates below.

Flawed DEIR approach

The categorization of truck trips used in the RTP is justified in Appendix L which states “truck traffic associated with the WLC and other logistics centers is expected to follow this general pattern” (Appendix L, p. 61). However, the transfer of the regional and county-specific distribution of truck trips is not likely to reflect the distribution of actual truck trips at the WLC for several reasons. Most importantly the WLC is being constructed precisely to accommodate expected growth in port-related truck traffic. An article from the Press-Enterprise on the WLC describes SCAG Executive Director Hasan Ikhrata as stating that the “growing volume of cargo from the ports creates a demand for warehouse space on the scale sought by Benzeevi [the WLC’s developer].”³ Additionally, SCAG’s 2012 RTP states that while current port-related truck traffic stays largely in the vicinity of the San Pedro Bay Ports, that pattern is expected to change “in the future with an increase in the number of daily trucks traveling to warehouses in the San Gabriel Valley and the Inland Empire” [2, p. 14]. Specifically, the RTP states that by 2035, 8.8% and 7% of all port-related truck trips will be associated with eastern and western San Bernardino Valley, respectively (ibid.).⁴ In other words, 15.8% of all truck traffic related to the San Pedro Bay Ports will have an origin or destination within the San Bernardino Valley, where the WLC is located. This amounts to a total of $120,000 * 0.158 = 18,960$ port-related truck trips per day entering or exiting the Valley in 2035.⁵ As a result, SR-60, the main facility serving the WLC, is projected to see the highest growth among all east-west corridors in the region (ibid.). Future distributions of truck traffic expected in the vicinity of the WLC are therefore likely to shift to port-related trip purposes.

³ Danelski, D. March 12, 2012. “Moreno Valley: Huge Warehouse Development Sought.” *The Press-Enterprise*. <http://www.pe.com/local-news/riverside-county/moreno-valley/moreno-valley-headlines-index/20120310-moreno-valley-huge-warehouse-development-sought.ece>

⁴ These percentages represent an increase from 0.5% and 2.3% for the eastern and western San Bernardino Valley in 2008, respectively.

⁵ According to SCAG’s 2012 RTP, port-related truck trips numbered 1,400 in 2008.

Sensitivity of the estimated distance to input assumptions

The DEIR analysis for the WLC errs because it assumes that the distribution of truck traffic that serves the facility will remain unchanged in the future and will reflect the 2008 *regional* or county-wide distribution of all truck trips as stated in the 2012 SCAG RTP. In other words, the truck trip distribution is not adjusted to reflect the types of trips expected to enter or exit the WLC site; instead the truck distribution entering and leaving the WLC for all analysis years is assumed to mimic the region's truck trip distribution in 2008.

The 2008 distribution of trips based on the 2012 SCAG RTP is asserted in the DEIR even though the trip distance is adjusted upwards from 36 to 50 miles. However, this increase actually depends upon a shift to longer trip types, based on a recognition that the warehouse facility will generate trips differently than the region-wide 2008 average would suggest. External-north, external-south, and port-related trips are all 50 miles in length or greater, so in order to increase from 36 to 50 miles, greater shares of these trips would have to be realized. Table 1 illustrates one possible truck trip distribution that would generate an average trip distance of 50 miles and compares that to the distribution for Riverside County cited in the DEIR (Appendix D, p. 120; Appendix L, p. 61). The adjusted distribution was generated by growing the percentage of all trips 50 miles or greater at an equivalent rate, and shrinking the percentage of all trips less than 50 miles at an equivalent rate. Each of the percentage values for trips 50 miles or greater was multiplied by 3.35 and each of the percentage values for trips less than 50 miles was multiplied by 0.773. These values were determined by trial-and-error.

Table 1. Truck trip distributions for the DEIR and a hypothetical adjusted example. Trip lengths represent average one-way travel between an origin or a destination and the WLC. The DEIR Riverside County share of truck trips is based on 2008 values in the region and is used in the DEIR to estimate the distribution of WLC trips for all analysis years. The adjusted Riverside County share of truck trips is a hypothetical example showing one possibility for realizing the adjusted 50 mile average trip length used in the DEIR.

Trip type	Direction	Trip length (mi)	DEIR Riverside County share of truck trips (%)	Adjusted Riverside County Share of truck trips
Internal		30	87.9	67.9
External	North	140	4.0	13.4
	Northeast/ Southeast	47	2.2	1.7
	East	23	1.1	0.85
	South	50	3.0	10.1
Port-related		79	1.8	6.0
Weighted average trip length (mi)			36	49.9

The hypothetical adjusted distribution shown in Table 1 illustrates that the internal proportion of truck trips must drop substantially to result in an average distance of 50 miles.⁶ Proportions of long external and port-related trips increase accordingly. These percentages can be converted into numbers of total truck trips per day using values presented in the DEIR. Appendix D shows

⁶ This will be the case in any scenario with an average trip length of 50 miles. Even if all trip types with distances less than 50 miles had a 0% share and external-north (the longest trip type) increased accordingly, average trip distance would only be 40 miles.

total daily trips at full project buildout in 2022 (Appendix D, Table 17, p. 112). The total number of estimated truck trips per day accessing the WLC in 2022 is 14,683. This total, and the share shown in Table 1 of 6%, implies that the total number of port-related truck trips entering and leaving the WLC under the hypothetical adjusted distribution would be $0.06 * 14,683 = 881$ at project buildout in 2022. The total number of port-related trips associated with the San Bernardino Valley in 2022 is likely to be approximately 9,100.⁷ In 2035, at the end of the project's planning horizon, port-related truck trips entering and leaving the San Bernardino Valley will number 18,960 trips per day. According to a SCAG-sponsored study, the total regional share of warehousing space devoted to port-related uses will grow from 19% in 2022 to 25% in 2035 [4, Table 3.2]. Other data from that study show the proportion of warehousing space in Western Riverside County (where the WLC will be located) devoted to port-related uses increasing from 7.1% in 2008 to 14.4% in 2022 and 2035 [4, Table 5.9]. In light of these figures, the proportion of port-related truck trips attributed to the WLC in the DEIR appears unreasonably low.

Values for the total number of port-related trips drawn to the San Bernardino Valley in 2022 and 2035 shown above are both much higher than the number of port-related trips expected to be drawn to the WLC according to the DEIR analysis, yet the facility will be the largest warehouse constructed in the United States when it begins operation.⁸ Additionally, the WLC's proposed 41.2 million square feet of warehousing space exceeds total available in Riverside County as of 2009 [4, Table 2.3]. The size of the WLC, combined with the stated logic of its construction – to serve growth in port-related cargo volumes – indicate that the proportion of port-related trips expected to be traveling to and from the WLC deserves closer scrutiny. The DEIR should explicitly state the new distribution of truck trips it uses to get from 36 to 50 miles and compare the project's expected share of port-related trips to the total expected in the San Bernardino Valley in 2022 and 2035 to ensure that the calculated values are within reason. If the DEIR finds that the projected share of port-related traffic is too low in future years, it is likely that the average trip distance will need to be increased to reflect the true environmental impacts of the WLC.

RESPONSES TO LETTER F-9C

Sierra Club, Center for Community Action and Environmental Justice, and Natural Resources Defense Council

Response to Comment F-9C-1. The commenter states Sustainable Systems Research, LLC was hired by the Natural Resources Defense Council to review the World Logistics Center (WLC) Draft Environmental Impact Report (DEIR) Traffic and Transportation sections and the Traffic Impact Analysis (TIA) Report (January 2013) prepared by Parsons Brinkerhoff. The commenter's, Alex Karner, PhD, professional resume is attached to the comment letter. The commenter's letter and his resume will be provided to the City decision makers for their review prior to action on the proposed project and EIR.

Response to Comment F-9C-2. The commenter claims that the average truck trip distance of 50 miles was used to determine the air quality, greenhouse gas, and traffic impacts of the project. He believes that the number is incorrect and specifically states that the distribution of trips to the port should have increased over time.

The 50 mile figure for average truck distance is a default value suggested by the South Coast Air Quality Management District (SCAQMD) for use when modeling data is not available. The traffic analysis did not use this figure but instead used the Riverside County Traffic Analysis Model (RivTAM) model to determine the distribution of origins and destinations for project-related trips. This is in accordance with City guidance and with best industry practice. The air quality analysis originally used the 50 mile figure but the analysis has been revised since to using the trip distribution pattern from the RivTAM model since it more realistic and better reflects the anticipated change in travel patterns over time (Final Environmental Impact Report (FEIR) Volume 2, Appendix L-1).

In response to this and other similar comments, an additional section (Section F) was included in Chapter 12 of the TIA (FEIR Volume 2, Appendix L) to provide more details regarding the forecasts of truck trips to the port. The analysis was also revised to include a share of port-related truck traffic that increases over time. This is shown in a Table F-9C.A (see below, showing the expected increase in project trips to the ports over time.

Table F-9C.A: WLC Truck Trips to and from the Port by Analysis Period³⁶

Scenario	AM Peak Hour		PM Peak Hour		Daily	
	In	Out	In	Out	In	Out
2012 Plus Build-out	18	10	14	17	121	121
2022 Plus Phase 1	19	11	15	18	127	127
2035 Plus Build-out	57	33	46	53	393	393

This forecast of trips to the port is supported by survey data and demand forecasts from Southern California Association of Governments (SCAG) and the Port of Long Beach, as cited in the TIA.

Response to Comment F-9C-3. The commenter indicates what documents were used to develop the Comment F-9C-2.

Response to Comments F-9C-4, -5, -6 and -7. The commenter provides calculations that attempt to reconcile the trip distribution in the TIA with the 50 mile average distance; states that a higher share

³⁶ The 2022 Plus Phase 1 scenario has only half as much warehouse space as the 2012 Plus Full Build-Out scenario but, because a the percent of space devoted to port uses nearly doubles in the 2012-to-2022 period, the truck trips to the port (once rounded to whole numbers) are nearly the same.

of trips to the port would be needed for the average trip length to be 50 miles; and request that the TIA explicitly state the estimated number of truck trips to the port and show that those are within reason. The revised TIA does provide an expanded discussion on trip generation and trip length to address this and other similar comments.

The commenter's calculation is based on the incorrect premise that the 50-mile figure was the result of the trip length distribution used in the analysis. In fact, the 50 mile average truck trip distance was a conservative default value suggested by SCAQMD. This default value is unrelated to the truck trip length distribution modeled by RivTAM and which is likely to occur when the project is built. The RivTAM's trip length distribution is used in the TIA analyses. The commenter is referred to the low percentage of trips going to and from the port in the SCAG projections, and should also see Table E-2A.A in Response to Comment E-2A-7 for additional information in this regard.

As stated in Response to Comment F-9C-2, the TIA analysis includes an assumption that truck trips to the ports will increase over time. An additional section (Section F) was included in Chapter 12 of the TIA to provide more details regarding the forecasts of truck trips to the port. The analysis was also revised to include a share of port-related truck traffic that increases over time. This is shown in a Table 87 (see Response to Comments F-9C-4, -5, -6 and -7, showing the expected increase in project trips to the ports over time. This forecast of trips to the port is supported by survey data and demand forecasts from SCAG and the Port of Long Beach, as cited in the TIA (FEIR Volume 2, Appendix L-1).

Response to Comment F-9C-5. The commenter elaborates on his earlier statement that the distribution of trips to the port should have increased over time. The TIA analysis includes an assumption that truck trips to the ports will increase over time. Please see Response to Comment F-9C-2.

Response to Comment F-9C-6. The commenter elaborates on his earlier calculation that attempts to reconcile the trip distribution in the TIA with the 50 mile average distance, and reaches a conclusion that a higher share of trips to the port would be needed for the average trip length to be 50 miles. The commenter suggests adjusting the number of trips to the port accordingly.

As stated in our Response to Comment F-9C-2, the 50 mile average truck trip distance was a conservative default value suggested by SCAQMD and is unrelated to the truck trip length distribution that is found in RivTAM and is likely to occur when the project is built. The TIA's forecast of trips to the port is supported by survey data and does not need adjustment.

Response to Comment F-9C-7. The commenter elaborates on his calculation cited in the previous comment to conclude that the TIA may have under-estimated truck trips to the port. He requests that the TIA explicitly state the estimated number of truck trips to the port and show that they are within reason.

The commenter's conclusion is based on his misunderstanding of the 50-mile average truck length figure, its derivation, and the function it served in the traffic analysis (none). A detailed analysis has been added to the TIA to clarify the assumptions regarding trips to the port and to demonstrate that they are supported by field evidence. See TIA Chapter 12, Section F (FEIR Volume 2, Appendix L-1).

Response to Appendix 1 (Resume for Alex Karner). The referenced appendix was cited in the comment letter. We have reviewed the resume in the appendix and although we appreciate the inclusion of professional resumes as parts of comments, we review and consider all technical comments equally.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 2 (SCAG, Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities (Task 5 Report) (Jul. 2010)). The referenced appendix was cited in the comment letter in reference to the approach used to estimate truck trip distance. The appendix was reviewed and is included in the analysis in the revised TIA and Section 4.15 of the FEIR Volume 2.

Letter F-10: Tri-County Conservation League (April 8, 2013)

Re: DEIR for the proposed World Logistics Center, State Clearinghouse No. 2012021045

Please accept the following comments pertaining to the project referenced above on behalf of the Tri-County Conservation League (TCCL). TCCL is a public interest organization primarily concerned with the Santa Ana River and its watershed. The proposed project lies wholly within the Santa Ana River Watershed and, by virtue of its size and nature, has great potential for adversely affecting the river, its tributaries, and their associated natural communities both directly and indirectly. Please include these comments in the public records pertaining to CEQA review of the above referenced project.

1

The proposed World Logistics Center project (hereafter WLC Project) must be viewed in the context of pre-existing conditions, the overall needs and welfare of residents, and likely prospects that it would enhance the community. Although growth boosters abound (sometimes verging on irrational exuberance), real opportunities for the city to achieve fiscal security while enhancing, or at least not sacrificing its residential "Quality of Life" are limited. One must question whether the proposed benefits of the WLC project to the community are realistic and whether they would outweigh likely detriments.

2

The nature of the problem

The City of Moreno Valley aspires to be a place "where dreams soar", yet its aspirations for economic growth and community vitality are ultimately constrained by physical and economic realities. Most of the urban landscape is devoted to residential use, which (partly due to Prop 13 tax constraints) lacks the tax base to support and improve urban services in the long-term. This is a persistent structural problem.

3

One might ascribe Moreno Valley's fiscal problems to poor urban planning, which has followed a path of growth divergent from traditional communities. While population centers traditionally arise around sources of economic opportunity, based on proximity and/or convenient access to basic industrial resources and transportation corridors, the City of Moreno Valley has reversed the process by first establishing itself as a bedroom community to distant job centers. Secondly, the City seeks to lure job-producing industries which might increase its tax base and employ its residents. This reverse sequence has been enabled by an automobile-dependent culture fueled by relatively cheap fuel, a factor now changing rapidly. When the City of Moreno Valley incorporated, the price of gasoline was about one quarter of the current price. Cheap fuel was an incentive for long-distance commuting, as was the

4

relatively cheap housing in Moreno Valley (compared to housing near coastal job centers). The population of Moreno Valley grew rapidly, accompanied by imbalance in the tax base and associated sociological problems, such as proliferation of latch-key kids, juvenile delinquency, drug use, street crime, etc.

The jobs/housing imbalance in Moreno Valley is destined to continue as long as the coastal communities continue to offer higher wage jobs and higher cost housing. For every Moreno Valley commuter who chooses to give up a long commute for a local job, another worker is likely to take his/her place in the commuter queue.

Because most of the land in Moreno Valley is devoted to residential homes and retail businesses, options for locating major new job-producing industries are largely constrained to the city's undeveloped eastern outskirts. Although this land was long devoted to agricultural and pastoral activities, it was more recently zoned for residential housing, but the WLC proposal would convert much of it to industrial warehouses, thereby foreclosing other opportunities for housing and/or other industrial uses. This area lies farthest from access to the only major north-south transportation corridor (I-215) serving Moreno Valley. The only major east-west corridor (SR-60), although nearer the proposed WLC project site, is already at or near capacity and traffic is regularly backed up where the SR-60 and I-215 merge near the west end of Moreno Valley. Considering that the WLC project is projected to add several thousand daily truck trips to local traffic corridors, getting into or out of Moreno Valley and nearby communities could get much worse – a commuter's nightmare. Even without the WLC project, the traffic burden on these traffic routes is projected to increase. Whether truck traffic to/from the eastern portion of Moreno Valley moves on SR-60 or on surface streets, it must ultimately contribute to traffic congestion on one or both routes and to worsen the bottlenecks at the SR-60/I-215 and SR-60/SR-91 (in Riverside) interchanges. Trucks emanating from the WLC site and traveling east on SR-60 have a steep grade to surmount and will surely impede other vehicular traffic using that route. All-in-all, it seems illogical to place a major warehouse project in the area now proposed.

The WLC Project (if built out as planned) would be a major consumer of transportation capacity on most, if not all, roads leading into and out of Moreno Valley. The added traffic would compete directly with existing commercial and private commuter traffic, thereby substantially reducing the rate of traffic flow for current and future residents of Moreno Valley, as well as neighboring communities. The slower traffic will likely add measurably more pollutants to the already impaired air quality than would the same volume of traffic were the traffic flow rate to remain as it is currently. It is bad enough that the major portion of added traffic associated with the proposed WLC Project would consist of diesel trucks, a major source of health-debilitating exhaust components, but the amount of pollution they produce is greatly increased as they alternately brake and accelerate in stop-and-go traffic.

The diminished "quality of life", due to increased air pollution, related health issues, and traffic congestion expected to accompany the WLC project, may never come to pass because the warehouse complex may never meet economic expectations. Such warehouses would have to compete with existing facilities in the Ontario – San Bernardino area, which are better situated with respect to access to rail and highway transportation corridors. These facilities currently are reported to have around a

4

5

6

7

20% vacancy rate, and competition for warehouse occupants will only become greater when the expanded Panama Canal is completed in the near future (2015 projected) and around 30% of the shipping volume currently off-loaded at West Coast ports is anticipated to sail on to East Coast ports. What then would be the use of over 40,000,000 sq-ft of under-utilized (maybe empty) warehouse space? If those facilities could not then be converted to viable economic uses, they will simply become a proverbial white elephant, although albatross might be a more appropriate metaphor.

7

If the WLC Project is approved, in spite of the numerous associated environmental impacts, it is hoped that effective mitigation measures will be incorporated to reduce or eliminate those impacts. Considering that regional air quality is already impaired, all feasible measures should be taken to ensure that air quality will not be further degraded as a result of the WLC project. Several measures could mitigate traffic-related impacts. For example: 1) mandate construction of additional road capacity (sufficient to accommodate all project-related vehicle traffic), perhaps in the form of new traffic lanes dedicated to trucks, be added to SR-60 and I-215, including the SR-60/215 and SR-60/91 interchanges; 2) mandate that diesel trucks use only low-sulfur fuel, as an interim measure, and be expeditiously replaced with zero-emission vehicles; 3) mandate that on-site warehouse vehicles be all-electric. To the extent that environmental impacts cannot be fully eliminated, the project should be required to purchase local carbon emission credits and/or adopt other measures to offset regional air quality impacts.

8

Other comments:

- 1) The WLC Project appears to claim over 1000 acres of public lands (owned in fee title by the State) at the northern limits of the San Jacinto Wildlife Area (SJWA) as a "conservation buffer". This is an egregious error, as the land in question belongs to the People of California and cannot be part of a private project. Nor can it be considered a "conservation buffer", as it is already conserved habitat, just the same as all other portions of the SJWA. Rather than serving as a buffer, this land is conserved habitat which needs to be buffered from incompatible adjoining land uses. And, to the extent that environmental values in the lands bordering the WLC project become degraded, appropriate mitigation(s) must be proposed. The concept of an open space buffer at the southern limits of the WLC Project is a good idea and would certainly help to reduce the impacts arising from proposed adjoining industrial uses; but such a buffer cannot be comprised of existing conserved habitat owned by the State of California. To claim the use of public lands as mitigation for an adjoining private project makes a farce of public acquisition of lands for parks, wildlife habitat, and other open space purposes; this would have state-wide repercussions and surely invite legal challenge.
- 2) The WLC Project needs to be redefined/designed to eliminate inclusion of public lands as any form of mitigation; the redefined project should include discussion of likely adverse impacts to the adjacent SJWA and specify appropriate mitigations. Additionally, the WLC project would displace much foraging habitat for raptors and other birds which inhabit and/or regularly overwinter in the Northern San Jacinto Valley. The EIR needs to identify these impacts and specify appropriate mitigation measures.

9

10

- 3) This project has serious socio-economic implications for the City of Moreno Valley and the entire region. It deserves detailed analysis of likely environmental degradation for the region in general and specifically for the adjacent SJWA. The ecological functions, habitat values, and constituent natural communities (including several sensitive plant and animal species) of the SJWA are major assets of Riverside County's Multi-Species Habitat Conservation Plan (MSHCP). Degradation of these assets could risk the loss of permits (under auspices of the MSHCP) which allow for "take" of federally protected species elsewhere in western Riverside County, including the WLC project site. Additionally, the EIR needs to present an independent (of project proponents) assessment of project-related economic, mobility, and health issues. In its current form the DEIR does not provide sufficient and accurate information for public consideration and assessment of all likely environmental impacts and proposed mitigations.

RESPONSES TO LETTER F-10

Tri-County Conservation League

Master Response (Economics). Skepticism included within the commenter's letter regarding the future need for logistics development in the Inland Empire, in particular due to the current expansion of the Panama Canal, does not have a factual basis. Existing industrial vacancy rates are only 4.9% in the Inland Empire (Exhibit L – Casden Forecast page 54) and the demand for more space appears to be increasing rapidly. Output in the Inland Empire logistics industry has risen from \$4.1 billion in 2001 to over \$5.5 billion in 2011, an increase of 34%, despite the advent of the Great Recession. The Inland Empire as a whole, with its competitive land pricing, sizeable vacant parcels, large workforce without post-secondary education and centralized location represents an ideal setting for logistics facilities.

While the current expansion of the Panama Canal will increase the Canal's ability to handle cargo, and in particular, larger ships, the increased level of demand for logistics facilities nationally should generate greater need for port facilities on both the East and the West Coasts. NAIOP projections indicate a need nationally for about 700 million square feet of warehouse and distribution space over the next decade, on top of 300 million square feet of normal replacement of existing facilities (Page 7 of Exhibit I). The Port of Long Beach's Master Plan calls for the acquisition of 450 acres of landfill to house additional cargo handling facilities due to increased demand (Page 16 of Exhibit J). Currently, the Panama Canal only receives 20% of Asian imports and exports because it takes three days longer to deliver goods to the east coast than it does by ship and train from the West Coast (Exhibit K). This more lengthy delivery time will also continue to impact the Panama Canal's ability to take over West Coast import export business, even after its expansion. Finally, the rapid growth of web-based sales with deliveries to consumers coming straight from the warehouse, rather than through traditional brick and mortar retail stores, will further increase the demand for warehouse space throughout the West, including in the Inland Empire.

Response to Comment F-10-1. The commenter would like their comments included in the record. The City acknowledges the role of the commenter in the California Environmental Quality Act (CEQA) process, and has responded to their comments in this Final Environmental Impact Report (FEIR) document. They will be kept informed as to the progress of the CEQA processing of this project. The commenter's comments will be included in the public record on the document and are contained in FEIR Volume 1.

Response to Comment F-10-2. The commenter wonders if the benefits of the project outweigh its environmental impacts. All of the comments provided by the commenter, plus many similar comments provided by others, have been responded to in this FEIR document (Volume 1). The revised fiscal assessment for the project (DTA 2014, FEIR Volume 2, Appendix O) also addresses the projected benefits of the project over time. The Draft Environmental Impact Report (DEIR) and FEIR provide extensive analysis regarding potential impacts of the project, some that remain significant even after implementation of recommended mitigation. All of the comments and responses will be reviewed by the City Council prior to making a decision on this project.

Response to Comment F-10-3. The commenter states the City's tax base is insufficient to support itself. The revised fiscal assessment for the project (DTA 2014, FEIR Volume 2, Appendix O-1) addresses the projected costs and benefits of the project over time, and its influence on the City in terms of additional revenues and employment and concludes the WLC project will generate 5.7 million in surplus revenues (i.e., revenues minus costs)(DTA 2014, FEIR Volume 2, Appendix O-1).

Response to Comment F-10-4. The commenter outlines a view of the City's history regarding housing, job growth, and commuting on freeways, but does not make any specific comments on the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

EIR or the WLC project. This comment sets the stage for later conclusions regarding housing and employment.

Response to Comment F-10-5. This comment states the project would convert land to industrial warehouses, thereby foreclosing other opportunities for housing and/or industrial uses. The commenter states the World Logistics Center (WLC) is far from Moreno Valley's only north-south corridor (I-215) and that the SR-60 is congested and will be worse with the project. The commenter opines that "*it seems illogical to place a major warehouse project in the area now proposed.*"

The previous paragraphs of the same comment letter (Responses to Comments F-10-3 and F-10-4) discuss the jobs/housing imbalance in Moreno Valley and the problems associated with long-distance commuting. Additional housing development would further exacerbate the jobs/housing imbalance in the City, but it is unclear what point the commenter is trying to make about one proposed industrial use eliminating opportunities for some other possible industrial use. In any case, the Moreno Highlands Specific Plan, which included housing and business park uses for the WLC site, was approved for development more than 20 years ago but no one built any houses or buildings based on that plan. This implies that other things, such as market viability, are what actually prevented development or other land use opportunities, not the WLC.

Regarding the project's access to the freeway system, the project is directly adjacent to SR-60 which is a major east-west corridor for freight movement. There is no need for a warehouse to be sited adjacent to more than one freeway so long as they have connections to other freeways (including I-215). The map of existing occupied warehouse, taken from SCAG's study entitled *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities*, shows that the vast majority of warehouses are located near a single freeway, if for no other reason than that there are not sufficient locations near two freeways to meet the demand, especially since such sites are desirable for retail uses.

Furthermore, Figures 30 and 31 of the project TIA show that the WLC project will encourage reverse commuting and so reduce peak-direction auto demand on SR-60. Congestion on SR-60 stems from the problem of long commutes caused by jobs being located in urban cores while housing spreads out to suburbs and exurbs. Moreno Valley, which has one of the lowest jobs-to-housing ratios in the six-county SCAG region, is an extreme example of this problem. A large majority (70%) of Moreno Valley workers commute to jobs outside the city, and many commute long distances far outside the city. According to the U.S. Census Bureau, 20.2% of Moreno Valley workers commute more than 50 miles one way to work, and another 22.2% drive 25 to 50 miles one way (U.S. Census Bureau. 2013. OnTheMap Application. Longitudinal-Employer Household Dynamics Program. <http://onthemap.ces.census.gov/>). It is reasonable to expect that if 20,000 jobs, closely matching the skill set of the Moreno Valley labor force, were to become available in Moreno Valley that many residents of the city would take up those jobs in lieu of working at more distant locations, thus reducing the amount of long-distance commuting.

The topic areas covered in the comment have been addressed in the TIA. The jobs/housing topic is further discussed in Chapter 4, Section D and Response to Comment F-3-12. The traffic impacts of the project are fully addressed in the TIA, including the study area thresholds used to determine the freeway segments requiring further evaluation.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

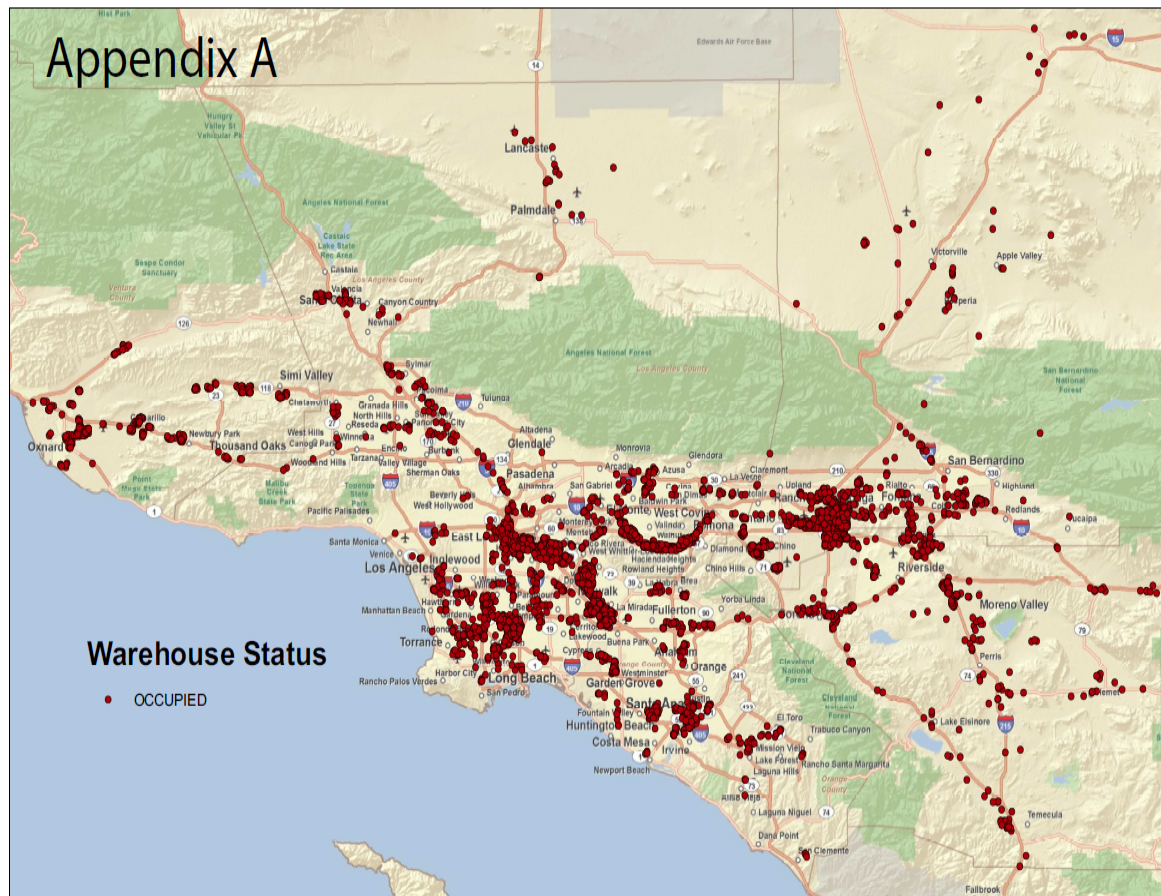

Exhibit F-10-1: Existing Occupied Warehouses in the SCAG Region

Response to Comment F-10-6. The commenter states the WLC project would cause congestion on all area roadways and produce substantial air pollutants including diesel exhaust. The project TIA identifies those area roadways which will be most affected by project traffic, however, it must be remembered truck traffic from the project must use established truck routes within the City, although passenger vehicles from project employees will utilize many City streets (which are outlined in the project TIA and DEIR Section 4.15, Traffic and Circulation. The project TIA and air quality studies were revised from those used to prepare the DEIR, mainly in response to the comments on the DEIR (refer to FEIR Volume 2, Appendices L (traffic) and Appendix D (air quality). The commenter is encouraged to read those revised reports and the revised traffic and air quality sections plus modified mitigation measures in FEIR Volume 2.

Response to Comment F-10-7. The commenter questioned whether there will be sufficient demand for the 41 million square feet of logistics facilities to be constructed in the proposed project. According to commenter:

"Such warehouses would have to compete with existing facilities in the Ontario – San Bernardino area, which are better situated with respect to access to rail and highway transportation corridors. These facilities currently are reported to have around a 20% vacancy rate, and competition for warehouse occupants will only become greater when the expanded Panama Canal is completed in the near future (2015 projected) and around 30% of the shipping volume currently off-loaded at West Coast ports is anticipated to sail on to East Coast ports. What then would be the use of over

40,600,000 square feet of under-utilized (maybe empty) warehouse space? If those facilities could not then be converted to viable economic uses, they will simply become a proverbial white elephant, although albatross might be a more appropriate metaphor."

While the future of the California economy is certain to have its peaks and valleys, with the 2008-2012 period representing an extreme example of the latter, both the short-term and long-term prognostications regarding logistics uses both throughout the United States and in the Inland Empire are very positive, as reflected below.

1. Commenter's claim that warehouse facilities in the Ontario-San Bernardino area are experiencing a 20% vacancy rate is factually incorrect.

While the commenter unfortunately does not provide any source documents within which their alleged 20% vacancy rate is stated, the latest Casden Industrial & Office Forecast Report, released by the University of Southern California at the end of 2012 (Exhibit L), directly contradicts this figure. The report, which analyses the vacancy rates for five sub-markets within the Inland Empire (Riverside, San Bernardino, Ontario Airport, West County, and South County), states that "for the third year in a row, the Inland Empire industrial market showed significant improvement in demand. From Quarter (Q)3 2011 to Q3 2012, the area logged 9.4 million square feet of positive net absorption, bringing the total net absorption since Q1 2009 to nearly 40 million square feet. The vacancy rate subsequently fell another 1.7 percentage points to 4.9 percent." With a clear demand for industrial space, the project will answer a growing need within the County. Higher demand has dovetailed into higher revenues. The report further states "area-wide average asking rents rose for the second year in a row, climbing 6.1 percent to \$0.35 per square foot. These rents are largely driven by changes in demand for warehouse space, which accounts for 86 percent of the industrial stock."

2. Commenter's claim that 30% of the shipping volume currently off-loaded at West Coast ports is anticipated to sail on to East Coast ports as a result of the expansion of the Panama Canal is purely conjecture at this point, and minimizes the impacts of the many other growing sources of demand for warehouse facilities in the Inland Empire.

First, with the overall need for logistics facilities in the United States expanding rapidly, it is more than likely that both East Coast and West Coast ports will find themselves impacted by increasing demand. According to a 2010 study prepared by National Association of Industrial and Office Properties (NAIOP) entitled "Logistics Trends and Specific Industries that Will Drive Warehouse and Distribution Growth and Demand for Space," the overall shipment of goods in the United States grew by 30% in value and 13% in tonnage between 1997 and 2007 (Exhibit B). NAIOP goes on to say that:

"Forecasts for employment in the logistics sector indicate a need for about 700 million square feet of warehouse and distribution space during the next decade on top of new construction for normal replacement, which averaged 300 million square feet per year from 1990-2003. If that trend continues, then a total of approximately 3.5 – 4 billion square feet of new construction will be needed during the next decade." (page 7, Exhibit B)

The Inland Empire as a whole, with its competitive land pricing, sizeable vacant parcels, large workforce without post-secondary education and centralized location, represents an ideal setting for logistics facilities. The attractiveness of the Inland Empire for these purposes can be confirmed by looking at the growth which it has experienced in recent years. Output in the Inland Empire logistics industry has risen from \$4.1 billion in 2001 to over \$5.5 billion in 2011, an increase of 34%, despite the advent of the Great Recession. Logistics has also accounted for an increasing share of the Inland Empire's economy. In 2001, transportation and warehousing was responsible for only 4.9% of the

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Inland Empire's total output. By 2011, the contribution of the industry grew to 6.1% of total output. New national truck-driver restrictions are expected to increase the rate of growth, as since July 1, 2013, all truck drivers throughout the United States have been restricted to 11 hours of driving per day and a total weekly limit of 60 or 70 hours rather than the previous limit of 82 hours. As a result, goods being shipped to California customers will need to be stored closer to these customers, with the Inland Empire serving as a prime location.

Second, the uses for logistics facilities are expanding rapidly with the advent of E-Commerce. The need for brick and mortar retail buildings is decreasing, as Internet retailers such as Amazon and mainstream retailers such as Nordstrom's and Macy's now ship goods directly from warehouses, completely bypassing the traditional stores and shopping centers which until recently dominated the retail markets. The advent of fulfillment centers throughout the Inland Empire and Central Valley in recent years is a perfect example of this trend. U.S. retail e-commerce sales grew by 700% between 2000 and 2011, and at its current growth rate will double its 2011 sales by 2016. A 2012 Study prepared by Deloitte Research projects that within five years, the current percentage of sales made at brick and mortar stores versus online and mail order shopping will drop from 91 percent to 76 percent, clearly adding to the need for more logistics facilities. While it is always difficult to pinpoint future trends, the current outlook for logistics development in the Inland Empire is as strong, if not stronger, than any other segment of the economy.

Third, should legislation currently being considered by Congress eventually become law, sales taxes will be charged on all future Internet sales. To the extent that the point of sale is considered to be the warehouse to which the orders flow and at which the inventory is located prior to delivery to the customer, the City of Moreno Valley could become the beneficiary of an annual windfall in sales taxes that are currently paid to the coastal communities in which brick and mortar stores are presently located.

Fourth, it must be recognized that the Panama Canal is currently operating at full capacity, limited by its system of artificial lakes, channels, and locks that were initially constructed in 1914. The Canal Expansion was proposed and fast-tracked because a sizeable portion of today's containerships are simply too large for the canal and because the fact that it's currently operating at capacity means that delays and bottlenecks occur frequently and are very costly. Some of the anticipated expansion will come from customers who currently don't use Southern California ports but will access the Panama Canal once its capacity has been increased.

Fifth, it is really uncertain how much business the Ports of Los Angeles and Long Beach will lose to the Panama Canal. The U.S. Army Corps of Engineers ("USACE") notes in its white paper entitled "The Implications of Panama Canal Expansion to U.S. Ports and Coastal Navigation Economic Analysis (December 2008) (Exhibit M)," that:

"Despite all the congestion, the Ports of Los Angeles/Long Beach (LA/LB) have always managed to accommodate ever more volumes of cargo through productivity improvements, optimizing terminal space, daytime surcharges, medallions, and acquiring new landfills. According to the Port of Long Beach's Master Plan, if year 2020 trade volumes reach the high end of their forecast, the Port of Long Beach will acquire 450 acres of landfills which will support additional cargo handling facilities. LA/LB processed a combined 15 million (twenty-foot equivalent unit TEUs) in 2007, accounting for 40% of all freight entering the US, including 80% of imports from Asia." (page 16, Exhibit M)

Finally, Asian importers and exporters utilizing the Panama Canal will find that it will take longer to get their goods to market. The United States Department of Agriculture (USDA), in its "Impact of Panama Canal Expansion on the U.S. Intermodal System" (January 2010) (Exhibit N), states that the fastest way to get cargo from China to the U.S. East Coast will still be a combination of ship and rail, both of

which will play a role in all of this. According to the USDA, it takes 12.3 days for a ship to go from China to the U.S. West Coast and 6 days for rail transport from the West Coast to the East Coast – a total of 18.3 days. For this reason, 75% of Asian imports go this way. Only 20% go through the Panama Canal because it takes nearly 20% longer, at 21.6 days. The rest goes through the Suez Canal directly to the U.S. East Coast, which takes 21 days.

Moreover, as further expanded upon in *The Implications of Panama Canal Expansion to U.S. Ports and Coastal Navigation Economic Analysis*, most US East ports will not have the capacity or the depths to accommodate the amount of [post-expansion] vessels (Exhibit M).

3. **Comments regarding the likelihood of 40,000,000 square feet of under-utilized (maybe empty) warehouse space constituting a "white elephant" or "albatross" within the City reflect a lack of understanding of the economics of warehouse development, particularly after the recent Great Recession.**

While economies ebb and flow, and the demand for logistics space can be anticipated to follow that same pattern, the proposed logistics buildings themselves will not be constructed until a point in time at which there is sufficient demand for their space. Warehouse buildings will not be built "on spec" and then sit vacant for years. They will either be built and owned by the ultimate users of the buildings, or built by investors in situations where the buildings themselves are either pre-leased or in a market where demand levels are high enough that the buildings are very likely to be leased upon completion. Investors and lenders have had sufficient experience over the past few years to not move forward with the construction of logistics buildings that will sit empty upon completion. The idea that 40.4 million square feet of logistics space will be constructed prior to the existence of sufficient demand is completely unrealistic.

Response to Comment F-10-8. See Response to Comment D-2-3.

Response to Comment F-10-9. The commenter completely misstates the DEIR's description of the 910 acres of the project at the southerly edge of the project. DEIR Section 3.4.1 "Project Description" clearly defines this area as owned by the State of California as part of the San Jacinto Wildlife Area (SJWA). The area is included in the project in order to amend the City's General Plan and zoning to correctly designate it for "open space" uses. The project does not propose to use the property for mitigation of any sort. It is defined in Section 3.1 of the DEIR as the "CDFW Conservation Buffer Area" for identification purposes.

The property remains within the boundary of the City of Moreno Valley and is included in its General Plan and zoning ordinance. The land is presently designated for mixed use development under the existing Moreno Highlands Specific Plan. This project proposes to change that designation to "open space," consistent with the current and proposed use of the property.

The State acquired this acreage in 2001. The minutes from the May 18, 2001 meeting of the Wildlife Conservation Board state in part, "*The acquisition of the subject properties are important to the wildlife area as they will serve as a buffer from development north of the WLA...*" At the time of the purchase, the development of the adjacent property for urban uses was permitted by the City's General Plan and zoning and was protected by a Development Agreement. The future development of the immediately adjacent property was understood at the time the State acquired the property and the acquisition was intended to, among other things, serve as a buffer to that future development.

Response to Comment F-10-10. The WLC Specific Plan (SP) does not include any public lands, including any portion of the SJWA, as a form of mitigation. The DEIR has analyzed the impact of the development that will take place as part of the WLC project in the California Department of Fish and Wildlife (CDFW) Conservation Buffer Area. The 910-acre portion of the project area owned by the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

State is being rezoned to “open space.” It is CDFW land acquired as a buffer (and for other reasons as well), between the high quality SJWA habitat and any proposed development to the north. Calling it the CDFW buffer is not inaccurate or misleading.

The General Plan Amendment provides for the designation of the CDFW and portions of the San Diego Gas and Electric (SDG&E) lands as permanent open space. Leaving the General Plan as currently stated would allow for development of residences across all of the WLCSP as well as the CDFW and SDG&E lands. This would have a greater potential impact on species of the region. The WLC project does not “take credit” for re-zoning this area as open space. The current zoning for the property is a mix of residential, public, and open space designations that need to be removed since those uses are no longer planned and will never be developed.

The CDFW land has been incorporated into the SJWA following a sale the subject lands to the State in 2001. The May 18, 2001 Wildlife Conservation Board Agenda (page 43) recommended that 5 separate parcels totaling approximately 1,000 acres (910 acres of which were part of the Moreno Highland Specific Plan) be purchased as expansions of the California Department of Fish and Game’s San Jacinto Wildlife Area. *“Acquisitions of the proposed expansions will allow for the protection of a portion of Mystic Lake and its associated upland habitat which is important to a number of sensitive plant and animal species.”* There will be no direct impacts to any portion of the SJWA as part of the WLCSP and no mitigation measures are required.

The loss of low-quality raptor foraging habitat is not considered a significant impact. The limited prey-based and disturbed nature of the habitat provides low-quality raptor foraging habitat for a few common raptor species such as red-tailed hawk, American kestrel, and white-tailed kite. Since white-tailed kite is a fully protected species, any impact to this species is considered a significant impact. This species is covered under the MSHCP and payment of the MSHCP development fee will be used to purchase off-site lands that would provide high-quality foraging habitat and provide for the long-term conservation of this species. The payment of the MSHCP development fee will reduce the impacts to white-tailed kite to a less than significant level.

The WLCSP is a significant development within the eastern portion of the City of Moreno Valley. Development was anticipated and is included in the General Plan and zoned as residential development. The loss of 2,610 acres of disked agricultural lands will not have a significant impact on any sensitive plant and/or wildlife species. The loss of or impacts to any portion of a MSHCP Core Conservation Areas is a potentially significant impact, which may affect the long-term conservation goals of the MSHCP. Based the proposed WLCSP October 2013, indirect impacts associated with light, noise, air quality, and water quality will require mitigation measures that are outlined in the appropriate sections of the DEIR. These measures will reduce the indirect impacts to less than significant levels.

Response to Comment F-10-11. The commenter states the EIR needs to present independent information on project mobility, economic, and health impacts. The DEIR, the revised technical studies, and the revised DEIR (FEIR Volume 2) provide sufficient objective and independent information on the potential impacts of the proposed WLC project. In addition the City hired an independent reviewer to review the EIR and technical studies and is of the opinion the EIR represents the independent judgment of the City as CEQA Lead Agency.

Letter F-11: Sierra Club, San Gorgonio Chapter (April 8, 2013) and Appendices 1-21 (On Flash Drive)

RECEIVED

APR 08 2013

CITY OF MORENO VALLEY
Planning Division

Letter F-11

SAN GORGONIO CHAPTER

Mark Gross
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

Dear Mr. Gross:

April 8, 2013

Re: Draft EIR for the World Logistic Center (WLC)

The Sierra Club appreciates this opportunity to comment on the World Logistic Center's (WLC) Draft EIR. We have several concerns and questions we want addressed in the Final Environmental Impact Report (FEIR) which we believe were not fully addresses in the Draft EIR. We were disappointed that we did not find the answers we were looking for in the DEIR and therefore are resubmitting much of our Notice Of Preparation (NOP) comments as part of these DEIR comments. These concerns can be read below and we expect this project to do everything possible to eliminate and mitigate these problems in our non-attainment area.

During attendance at the NOP meeting, the Sierra Club noticed that more needed to be done. The Skechers NOP meeting also had more than 30 in attendance, and this project is just as divisive. You had less than a dozen NOP handouts. When you were notified that significantly more were needed, they were not forthcoming. Therefore, at least 80% of those in attendance did not have what little information you provided during the meeting. Arriving early, I was able to obtain one of the few documents, and on the backside of the cover page, it reads "at this meeting, agencies, organizations, and members of the public will be provided a brief presentation on the project and will be able to review the proposed project ..." Most people were not able to review the project, and I would be surprised if all had access to a computer or even know the NOP document was available somewhere online.

Environmental justice requires informed "public participation." What is described above does not qualify. Moreno Valley's population is more than 54% persons of Latino/Hispanic origin, according to the 2010 census. How can you truly have public participation without all documents related to the World Logistic Center (WLC) available in both English and Spanish? The same is true for all meetings. There must be enough headsets and interpreters for everyone to know what is said at all meetings related to the WLC by everyone else. In the Kettleman City case, the California Superior Court ruled, "meaningful involvement in the CEQA process was effectively precluded by the absence of Spanish translations."

1st of 117 pages

The Sierra Club strongly recommends that you begin the NOP process anew because the City's failure to translate crucial documents and meetings has effectively excluded many residents from exercising their statutory right to participate in the decision-making process. The Sierra Club also expects all documents related to the WLC to avoid highly technical language and to make them comprehensible to the average Moreno Valley resident. The Draft EIR was also only in English and most people would have needed a computer to have a viable chance to read it after working all day. How could you have made it more accessible to our population? Since the Sierra Club believes the WLC's DEIR is inadequate and needs to be revised and reissued, maybe you will have a chance to do right by those who would like to comment, but have been excluded by past practices.

4

The DEIR mentions many road segments that will need noise mitigation as a result of the WLC. As mentioned later in this letter the need for six foot sound walls are recommended for some homes which are some distance away from the project site such as along Moreno Beach Drive north of Ironwood Ave. In some cases they have to tear down existing walls and replace them. All of these residents impacted by significant noise levels caused by the WLC needed to be mailed notices of the Draft EIR and told of the comment period. This points out another reason why the NOP and DEIR both need to be properly noticed and recirculated.

5

The Sierra Club also believes the NOP document provided to the public did not have enough information and was misleading. The information did not "provide sufficient information describing the project and the potential environmental effects to enable responsible agencies to make a meaningful response. At a minimum, the information shall include: (c) Probable environmental effects of the project" (CA Code of Regulation EIR Process Section 15082). The project description was also misleading and inadequate.

6

The NOP the City provided did not address potential environmental impacts or even easily understood location and number of homes that will be impacted. Your map of open space is misleading. The maps on Pages 5 and 6, as well as Page 7, give the impression that existing Department of Fish and Game (DFG) lands, as well as those of San Diego Gas & Electric, are part of the project and, therefore, the project description is not accurate for NOP commenters. Those DFG lands are part of the San Jacinto Wildlife Area (SJWA), which is a cornerstone of the Riverside County Multi-Species Plan, and the NOP failed to mention any potential environmental impacts to these significant lands for the NOP commenters. Potential impacts to our two-lane SR 60 should have been mentioned, similar to the concerns expressed by the executive director of the Southern California Association of Governments: " 'You are talking about a huge amount of warehousing, and you don't have the infrastructure to support that,' Ikhrrata said." (Press-Enterprise, 3-10-2012) The FEIR needs to address these comments by Mr Ikhrrata.

7

For all of the above reasons, the Sierra Club strongly believes that the WLC NOP process needs to be improved, then recirculated to all agencies and organizations, as well as to members of the public. We also believe that for such a large and regionally significant project that all interested parties need more than 30 days. Since you failed to do this, the entire process is now flawed. As stated earlier the Sierra Club believes the DEIR needs to be reissued, after resolving its

8

inadequacies, and therefore believes the project should begin from the beginning with a proper NOP.

8

The WLC is displacing – not replacing – 7,700 housing units that were part of the 20-year-old unbuilt Moreno Highlands project and are still shown on the Moreno Valley General Plan as part of our fair share of the region’s housing stock. The DEIR and any General Plan amendments for the project must show the alternative placement for these houses in Moreno Valley. The DEIR must include these displaced units in the air quality and traffic analysis as well as all other impacts analyzed, or the document will be inadequate. In the DEIR you indicate that this is not true because you have revised the housing plan several years ago. You indicate the concerns raised in this paragraph “was largely addressed in the updated (2011) Housing Element”. (p 4.13-5) The Final EIR must explain why it was only “largely” addressed and not “totally” addressed. That which was not addressed needs to be added to the impacts caused by the WLC as mentioned above. The fact that this revision was completed prior to the end of the Moreno Highland’s Development Agreement brings up the issue of predetermined outcome for the WLC. You cannot just say that you just did not think the Moreno Highlands project was going to be built. The Moreno Highland Project was not only for 7,700 homes, but also for 21,000 permanent jobs, which also included the right to build many millions of square feet of warehousing. The City bought into the vision of the WLC developer when he talked about the “Logistic Modified General Plan” well before the updated (2011) Housing Element and helped him by removing obstacles that could make it more difficult getting the development approved.

9

The DEIR must have a traffic analysis of Moreno Valley’s city streets and, probably at a minimum, those of neighboring cities where there is a blockage on SR 60 at any point between the Santa Ana River and the city of Banning. The traffic analysis needs to show what happens at each off-ramp/city streets between these two points where a semi-truck caused a freeway-closing accident, or the DEIR will be inadequate. Gilman Springs Road is a two-lane death trap. What improvements will be made to this road to make it safer? Will the improvements be made all the way to highway 79 or to Bridge Street? When will those improvements be made? Redlands Blvd and the San Timoteo Canyon roads are no better. Since these dangerous roadways are the alternative routes when SR 60 is closed in the badlands, what will be done to more safely allow the many thousands of trucks the WLC will attract to use these winding two lane roads that are popular with commuters. Figure 4.15.2 (Study Intersection Locations) has those intersections, limited to those which you studied, “at which the proposed project would add 50 or more peak hour trips.” Since it is only at least 50 one does not know if perhaps it is 500 or more peak hour trips. The FEIR will be inadequate if it does not explain how the roadways between all the intersections indicated with a bullet point in Figure 4.15.2 will be improved to handle the increased traffic generated by the WLC and the responsibility of the project towards those improvements. For example how will you mitigate the many intersection the WLC impacts in the City of Perris? The FEIR needs to name each of those intersections and what will be done with each and how will the WLC help with the ultimate improvements. What will be the LOS at those Perris indicated intersections before and after the improvements with the addition of the WLC as well as cumulative traffic? This needs to be done at all intersections and road segments between them indicated on Figure 4.15.2 for the FEIR to provide the level of information needed/required for both the decision makers and the public or the document will be inadequate. The Figure also indicates several intersections on the south side of the City of Redlands will be

10

impacted, but does not explain how the traffic is dispersed in the City or travels through the City to get to the indicated intersection. This must be done in the FEIR for not only the City of Redlands, but also for the Cities of Perris, Riverside, San Jacinto, Beaumont and of course the City of Moreno Valley. You cannot just say you pay your fair share of fees and be done with it.

10

Immediately below are two sections copied from the noise section of the WLC's DEIR that proves trucks are planning to use Moreno Beach to Reche Canyon Road and/or visa/versa. The section of Reche Canyon Road between Moreno Beach and Reche Vista Drive is mainly a narrow dirt road. Even the section of Reche Canyon Road between Reche Vista Drive and I-215 or I-10 is mainly several miles of narrow, winding two-lane road with many driveways and smaller roads intersecting it. The Sierra Club is concerned that the WLC is using this unimproved and inappropriate route to make it appear that SR-60 will not have to handle these trucks. While the Riverside County Transportation Commission would like to make this a major roadway as indicated on their maps, there is no proof that such will ever happen. I do not see guarantees for these improvements written anywhere. The WLC's FEIR must assume the Reche Canyon Road connection between Moreno Beach and Reche Vista Drive will never be made to handle any traffic and especially diesel trucks. Is the WLC going to make the necessary improvements to the Reche Canyon Road or just pay the normal developer transportation impact fees that can be used in many different places? The Traffic Impact Analysis in the FEIR must show the traffic projected for the Moreno Beach/Reche Canyon Road directed elsewhere or the document would be inadequate.

11

Locust Avenue between Moreno Beach Drive and Smiley Boulevard (54). Only the 2035 case results in a significant noise increase for this area. In 2035 the project will result in a 3.5 dB increase raising the noise level up to 68.9 CNEL. There are three single-family homes along this roadway and they front onto the roadway. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

12

Moreno Beach Drive between Locust Avenue and Ironwood Avenue (56). Only the 2035 case results in a significant noise increase for this area. In 2035 the project will result in a 3.3 dB increase raising the noise level up to 66.6 CNEL. There are 18 single-family homes along this roadway. Some homes front onto the roadway, but most backup to the roadway. Currently there are no soundwalls along these homes. The walls would need to be 6 feet tall with respect to the rear yard. Roughly 2,000 feet of six-foot tall barrier would need to be provided for mitigation for 15 of the 18 impacted homes (Exhibit 18). With the retrofit the noise levels would drop at least 5 dB, with the resultant noise levels around 62 CNEL in rear yard areas. Approximately 3 homes would remain unmitigated, because these homes front onto Moreno Beach.

13

Pages 34-70 of Appendix K on noise analysis list more than 35 road segments that will experience significant noise impacts as a result of the WLC warehouse project's mainly truck traffic. There is discussion of mitigating the noise with six foot sound walls as is done in the above two paragraphs. There is, however, no discussion of mitigating the toxic diesel pollution that will easily make its way over any six-foot sound walls and into the yards and homes and lungs of nearby residents. The Final EIR will be inadequate unless it produces data showing all

14

the ways—physical and mental—these residents health will be impacted by living on one of these road segments which will be carrying WLC truck traffic. The FEIR must show what will be done to mitigate this toxic diesel pollution along these road segments and produce the data to prove its effectiveness. Requiring 2010 trucks is not going to be good enough when you consider that Moreno Valley is approving so many warehouse projects that we are inviting almost 30,000 into our community. The most current and best technology must be required on all trucks used within the WLC Specific Plan.

14

The noise impacts to residents show traffic patterns and roadway usage. These roads will suffer significant damage from trucks and our City does very little to repair roads. Will the WLC Center do more than pay property taxes beyond their build out years to repair these roadways? If not then the damage done to resident's cars and repair costs need to be factored into the economic analysis.

15

The same is true for those homes that were put into the WLC's Specific Plan Area against their wishes and will suffer significant diesel, noise, vibration, light and possible drainage pollution as a result. The FEIR must show what physical and mental impact these residents will potentially suffer as a result of the build out and operation of the WLC. What will protect them from the dust, noise and vibration during the grading of the project site? The FEIR needs to fully explain how you can subject these people to significant health impacts—physical and mental—in order to allow a developer to make money. Some of these people have lived in their home for more than 30 years and have now retired with the hope of spending their remaining years in the home in which they raised their family. . The residents of the seven homes who were forced into the Specific Plan must be given more than the knowledge that nothing can or will be done to protect them from all the health impacts of the WLC. This also includes the aesthetics of having to live near 41,600,000 sq ft of warehousing. What protection will be provided to those who live near D Street? What health and noise impacts can those who live in the old section of town called Moreno expect from the traffic of the WLC? In the attachments to this letter are several articles on the health impact of diesel and some with the recommendation that sensitive receptors must be 500 meters or 1,600 feet away from a project like the WLC or roadways with significant diesel truck activity. The FEIR needs to explain everything being done to protect these families when you are not providing a 500-meter buffer. Will the developer and/or the City buy them out at the highest residential or industrial usage of their home? Which would be higher? Will their homes decrease in value as a residential home if the WLC is approved? If this happens, who is responsible for making up the loss value? Why has the new uses available to these seven residents for there lands been restricted by the city when compared to the same zoning elsewhere in our city? Does the City consider this a takings and if not why not?

16

17

What proof is in the environmental documents to prove that these sound walls are effective for people taller than six feet like myself? The Sierra Club expects to see data in the in the FEIR that shows the six-foot sound walls will significantly lower the decibels for people who are above 6 foot 3 inches the same as those who are 5 foot 9 inches. If this cannot be done, then more needs to be done to reduce sound levels and relying on future improvements is not satisfactory. Data needs to be given for the effectiveness of any improved noise reduction solutions that will be implemented. All of these noise impacted neighborhoods need to have

18

several noise monitoring equipments installed and kept in operating conditions for the life of the project. The results need to be part of the public record and read by the City. What will the WLC or their successors in interest do if it is shown that these noises and other health related impacts are damaging the lives of those inflicted? The WLC will be the largest contributor of these impacts that impair the health of our residents.

18

"Noise generated by SCG blow down events has the potential to cause permanent hearing loss in persons in the developed area of the project" (page 16 SDG&E and SCG Mestre Greve Associates in appendices). I did not see the analysis and numbers for single event noise caused by these blow-downs. The FEIR must include this analysis. These blow downs can happen any time and last for 90 minutes. This noise would impact almost half of the Specific Plan including the support facility. The referenced impact analysis was done "to ensure worker safety" and "all mitigations measures imposed in the analysis are the responsibility of future developers and not the Gas Company." (Page 1) Since infrastructure work will probably be put in place prior to the building of warehousing, the FEIR needs to show how these infrastructure workers hearing will be protected from these unpredictable blow downs if future warehousing is going to pay for all mitigation measures. The recommended silencer system for mitigation was only paper researched. The Industrial Acoustic Company literature "determined that a silencer system installed on the blow-down equipment could reduce noise levels by 40 dB." The word is "could" and not "will". The System must be required to be installed and tested several times before any work is done within the southern half of the WLC. Noise monitoring equipment needs to be installed at several locations to make sure the equipment continues to work as intended throughout the life of the project with the City reading the data. Figure 4.12.2 shows a need to have more monitoring locations to protect existing residents and ones that will remain in place well beyond build out of the WLC with the data available to the public. Since many warehouse workers, grounds maintenance, security and truckers work outside the walls of the warehouses, how will they be protected from these unpredictable blow-down events which could damage their hearing?

19

The FEIR must have a Health Impact Report to cover all aspects of this projects negative impact on residents and workers in and around Moreno Valley. This Health Impact Report must be one the project produces specifically about the WLC and not something borrowed from other sources. Many of the pages following my signature will have articles about the health impacts of diesel. The Sierra Club will expect those article printed in the Final EIR along with this letter. The decision makers and the public have a right to read them prior to any future public hearings.

20

"Is growth of the logistics industry worth the cost? We are not able to truly answer this question, because it is possible that the increased economic output could exceed the health costs associated with the expansion. We know, though, that major reasons logistic industry growth has been welcomed to bring jobs to the eastern Inland Empire. These jobs on average pay \$36,000 per year, but we find out that local health costs per year per job are likely to be at least half that value. Perhaps more to the point, it should be asked whether the logistics industry itself would be willing to pay full external costs of it actions. For example, would each facility be willing to pay a charge of \$5 to \$9 million per year to cover heath costs it is estimated to impose on the community? We are not in a position to say yea or nay, but economic efficiency dictates that mechanisms should be put in place so those enjoying the benefits of logistics industry growth

21

also pay the full costs – including external health costs – of their actions.” (Page 16 of this link and attached

http://www.pdx.edu/sites/www.pdx.edu.econ/files/bluff_warehouses_and_trucks.pdf

Warehouses, Trucks and PM2.5: Human Health and Logistics Industry Growth in the Eastern Inland Empire)

When you revise your economic analysis of the WLC you must address the health cost issues found in the above paragraph or it will not be valid. How will the warehouse projects within the WLC pay for their fair share of the area's health costs – especially of their workers?

Since the majority of warehouses have peak times during the year—such as getting ready for school opening and the holiday season—the traffic analysis as well as all others such Air Quality/ Greenhouse Gas must be done to show the worst case scenario possible. Your DEIR traffic analysis does not do justice to the peak times of most warehouses such as before the opening of school and the winter holidays. This problem must be rectified in the FEIR and also the updating of all the traffic information from that of 2011 to 2013 or it will be inadequate.

Moreno Valley's proposed 41,600,000 sq ft World Logistic Center (WLC) warehouse project will have significant impacts to not only our City but also throughout the Inland Empire. Two figures point out the increase in health risks and also some of the traffic patterns.

They are the "No Project Cancer Risk" and "With Project Cancer Risk". They can be found in the Draft EIR as Figures 4.3.9 and 4.3.10. They are also found below, but the numbers would be a little clearer if you read them from the documents themselves.

Please put the two below figures side by side and begin comparing.

For example in the first, the Moreno Valley area around Lake Perris is not impacted, but the second encompasses much of that area and the lake as well as much of the San Jacinto Wildlife Area. In the first, I-10 west of San Bernardino is not impacted but in the second it is as is highway 79. The second figure shows significant impacts caused by WLC truck pollution to areas north, south, east and west of the City of San Bernardino as well as north, south, east, and west of the City of Riverside. Increase impacts all along SR 91 to Corona can be seen and north through Riverside. Increase in cancer

pollution impacts and therefore truck increases on the I-215 from the south in Menifee to north of the I-210 can be seen as a result of the WLC build out. Impact to SR-60 shown on the second figure seem to be artificially cut off and would indicate that the impacts extend further both to the west and to the east. At the very least the impact would extend to Chino on SR-60 but should extend to at least Diamond bar if the cancer pollution analysis was not arbitrarily cut off. The impacts along SR-60/I-10 heading east to the Palm Springs area is again artificially cut off. The traffic impacts along this entire stretch of SR-60/I-10 need to be studied because the pollution from the trucks shows that the WLC is impacting all of these roadways. In fact highways 79, 111, and 62 are impacted by the WLC truck pollution and need to be added to the traffic analysis. Again the cancer pollution shading and contours are artificially cut off as you move west along the I-10 and the City of Pomona should be included which means the WLC traffic impact need to be studied along the I-10 route to the project site. The same is true for SR-91 beyond Corona. Since these cancer risk pollution figures show the far-reaching impacts of the traffic generated by the building of the WLC throughout and beyond the Inland Empire, it is imperative that the FEIR analyze these traffic impacts along all these highways that are shown to be impacted by the WLC or the FEIR will be inadequate.

23

I noticed that the following cities as well as others are now included in the second (With Project Cancer Risk) and/or have the blue area extended further into their borders as well as having the contour cancer numbers increase. This is because the highways near these cities have trucks going to or leaving the WLC. Without the WLC the residents in these cities would have a much healthier environment in which to live. What will be done during the more than 20-year build out of the WLC to protect the residents in and around these cities?

Banning

Beaumont
Loma Linda
Redlands
Moreno Valley
Riverside
Jurupa Valley
Grand Terrace
Chino
Ontario
Pomona
Montclair
Meniffee
Corona
Fontana
Rialto
San Bernardino
Perris

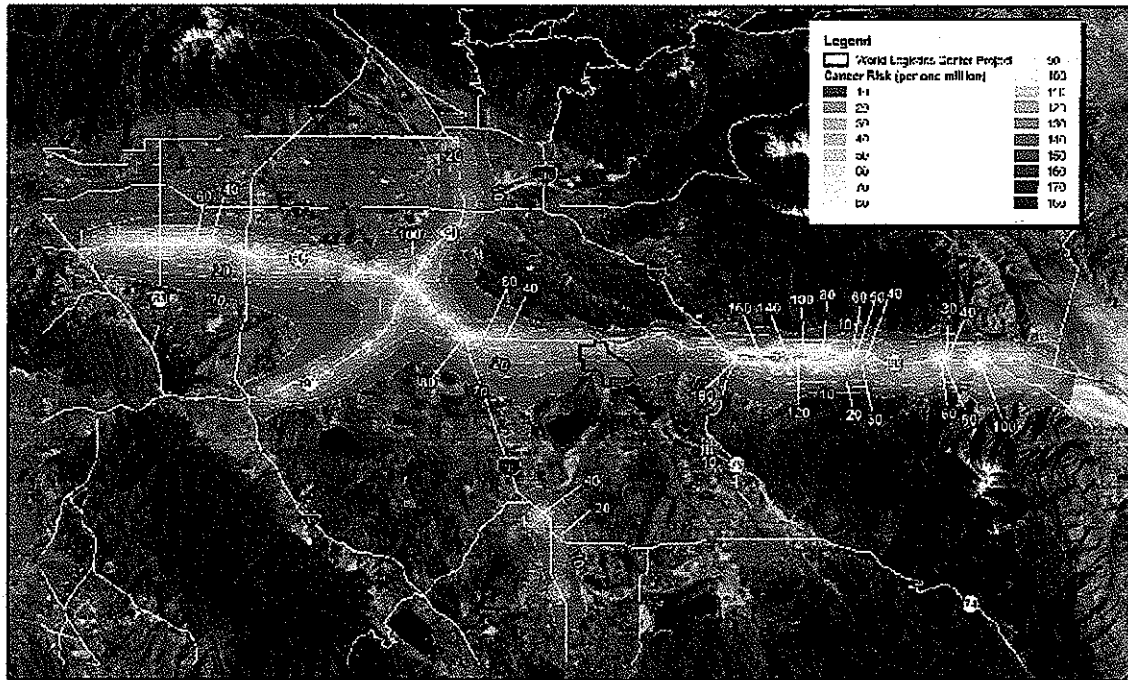

23

I am sure there are other cities that are impacted With the Project that I did not list or some like Sun City and Cucamonga which may just be on the edge one way or the other. All of these cities and their residents have the right to know that the World Logistic Center will impact their lives. *According to the California Air Resources Board Soot pollution causes almost 5,000 premature deaths in southern California each year and in the Inland Empire the main contributor to soot is diesel pollution.* There are many other health problems related to diesel pollution like asthma and heart problems as well as depression. While they do not have Figures for other health problems, it makes sense that if an area is in a cancer zone, then other health problems related to soot are also going to increase as a result of the WLC. While some WLC proponents may make fun of the low numbers of cancer victims, they will have difficulty

disputing the wide impact of the 41,600,000 sq ft World Logistic Center's pollution in our non-attainment area with its related health impacts. Since health impacts do not seem to concern some decision makers, maybe the prospect of *losing billions of dollars of highway funding* will when we can not meet EPA's new soot standards because of projects like the WLC and this will cause problems well beyond the borders on Moreno Valley. The FEIR must show how the WLC will help our area meet the new EPA soot standards. If the WLC is detrimental to the area meeting the new EPA standards for soot, then that needs to be shown and how bad it will impact the efforts to eventually meet the standards – in ten years and again in 20 years from the projects possible approval.

23

While the area needs jobs, please look at the cancer numbers of the two figures where the WLC will be built, and realize that maybe we should be going after healthy jobs. It is very evident from the two figures that warehouse workers breath in toxic diesel pollution throughout their workday.

World Logistics Center Project
 Environmental Impact Report
 With Project Cancer Risks

The DEIR must include those projects that will add to the cumulative impacts of the WLC. This must include not only the projects approved but not built, but also those that are in the pipeline but not yet approved. These projects cannot be limited to ones within Moreno Valley but must include all those in neighboring communities/lands that will impact the same roads systems and air quality that the WLC will impact, or the DEIR will be inadequate. Under my signature will be five pages of Riverside County General Plan Amendments (GPA) (October 2003 – February 2012). The area abbreviations are spelled out on the fifth page. You must include those GPA in your cumulative impacts for areas that are impacted by the WLC cancer causing pollution. Those GPA's with abbreviations that must be included in the cumulative impact analysis are MVAP, PAP, RCBAP, SCMAP, SJVAP and even TCAP because it appears you have arbitrarily cut of the cancer plume just as it reaches Corona. The Mott Lakeview Ranch project on the north side of the Ramona Expressway must be included as it is redoing its DEIR for the County. In speaking with Leon Swails of the Lewis Operating Corp. a few days ago they have a revised plan for the Villages of Lakeview that he wanted to share and which he said would be coming out later this year from the County. Both of these County projects must remain part of the cumulative impacts analysis.

The WLC will have significant impacts to the San Jacinto Wildlife Area (SJWA) and all of its wonderful resources. The DEIR must show what type of buffer the WLC will provide to protect the SJWA's resources. You cannot just say a setback of a certain number of feet for buildings.

The FEIR must show all planned uses within what you consider a buffer. Will there be streets or access roads or lights of any kind? What will be allowed in the detention basins and what uses as well as hardscape will be allowed. Will there be parking lots within the buffer? These and other uses must be described in the FEIR for all buffers next to the SJWA, open space and homes or the document will be inadequate. In fact the FEIR should have drawings depicting each buffer area and explain what is contained within each. The SJWA is a California Department of Fish and Wildlife managed area where several types of hunting are allowed as well as where protecting threatened/endangered species is very important. The rules of land use next to areas designated for hunting must be observed. How will you observe those restrictions without impacting the uses of the SJWA? There are several threatened/endangered species at the SJWA, as well as others that fall under the protection of Western Riverside County's Multi-Species Habitat Conservation Plan (MSHCP) – both plants and animals. The toxic diesel emissions will float above the SJWA and settle on the habitat, plants, animals and ponds. The FEIR will be inadequate if it does not explain the impacts of these toxic emissions on the habitat, plants, animals and water resources of the SJWA, private hunting clubs, and the Lake Perris SRA over the 20 year build out of the WLC and for at least ten years past that point. Because environmental stresses impact each species in a different way, the FEIR must explain how toxic diesel emissions and other environmental stressors such as light and noise impact each of the species covered by the MSHCP as well as the Stephens Kangaroo Rat on the SJWA, private hunting club lands, and the Lake Perris SRA over the life of the build out and at least a ten-year beyond. How will the toxic diesel emissions, run-off, lights and noise impact the public and private hunting resources? The Sierra Club needs proof to your responses to these concerns and questions.

25

The FEIR must show all county and city trails within five miles of the WLC and how the project will facilitate their interconnection as well as where it will cause a breakage in the trail system. The de Anza National Historic Trail need to be further explained and highlighted within the project. How will the WLC educate the public about the de Anza National Historic Trail? How will the project accommodate public transit and make sure the proper decision makers provide it for this area of the city? This is a major requirement to gain points under LEED certification and the WLC must make sure that the workers have easy access to this form of transportation. Bike trails also need to be totally integrated into the WLC's Specific Plan. They should be Class 1 bike paths to protect the riders from the 18-wheelers. They should also be integrated into any regional plans as well as a slowly improving City plan.

26

Since building near sensitive receptors is considered unacceptable because of the toxic diesel emissions, the FEIR must analyze the health impacts on the well-being of warehouse workers within the WLC Specific Plan – especially those working outside.

27

The FEIR needs to show how building all warehouses to each level of LEED certification (certified through Platinum) reduces both the short term and long term environmental impacts of the project. The FEIR also needs to give a definition of "modern high-cube logistics facilities" to be used throughout the Specific Plan. Since you will allow both high-cubed and regular warehousing how are you doing the analysis of the project---all areas--- when the project could have an unknown percentage of each type? When you explain or show the number of acres set aside for jobs on behalf of Moreno Valley residents you must include our fair share of the March

28

29

Inland Port acres or your data will not be valid. Any economic analysis must include the efforts, which "are underway to establish mega-warehouse complexes off Interstate 15 in the Adelanto and Barstow areas in San Bernardino County." (Press-Enterprise 3-10-12) The cost of improving the infrastructure to at least a Level of Service D needs to be factored into the same economic analysis. "A new railroad spur might have to be built, or Highway 60 could need a new lane in each direction on the 17-mile stretch between Interstate 215 in Riverside and the I-10 in Beaumont, Ikhrata said" (Press-Enterprise 3-10-12) The viability of the WLC being built needs to be analyzed in light of the Panama Canal being widened to allow the shipping of goods directly to the eastern portions of the United States. To combat this most West Coast ports have banded together with Western railroads to eliminate thousands of trucks from the local goods movement. The Jobs 1st Alliance fears that the ports of Los Angeles and Long Beach could lose as many as 100,000 jobs when the Panama Canal overhaul allows much larger ships to bypass California. "Worst case, there could be a 25% diversion from the Los Angeles-Long Beach," said Paul Bingham, the group's chief economist. "That's upwards of 3 million cargo containers. That's a lot of dockworkers who don't get work, truckers with less to haul and trains that don't run." (Los Angeles Times 12-28-2011) The economic analysis must address the above concerns and how they could easily impact the short term as well as long-term viability of this project. The Sierra Club will also expect to hear these real concerns addressed during presentations on the WLC.

29

What are your plans for the homes the WLC has decided to include within their Specific Plan. The Sierra Club believes better transitional uses than shown in the DEIR need to be near these and other nearby homes. If the your plan does not show these transitional uses, are we to assume that the City will use eminent domain to acquire lands from unwilling sellers? Will the City use eminent domain in connection with the WLC.

30

With 45-50 million square feet of warehousing in the immediate area, will there be a truck stop planned within the WLC Specific Plan? The social and environmental impacts of a potential truck stop must be analyzed in this FEIR and not later as some planned after thought. Calling it a Service Center with room to expand later to a truck stop still makes it a truck stop and needs to be analyzed as such.

31

The FEIR must show how toxic runoff from the project will be handled. The document must first identify what toxic runoff will be expected from 41,600,000 square feet of warehouses and quantify it. How will you protect the San Jacinto Wildlife Area (SJWA) and its resources from the toxic runoff? Are there presently waters entering the SJWA from the project site that the SJWA relies on for its mission? How will you maintain that water continuing to enter the SJWA? The project's lands divide the flow of water with some heading eastward and other lands within the Specific Plan heading westward. The FEIR needs to explain the problems presented by this as well as the solution. The project needs to show how it plans to deal with the significant flooding in the area and what will happen to those waters. There are places where the ground water is quite shallow and the FEIR needs to show how these large buildings will deal with this problem. The reliance of our area on ground water is becoming more and more evident. What will the project do to avoid decreasing the amount of ground water these acres within the Specific Plan area presently provide? The FEIR needs to explain the net decrease of ground water as a result of the WLC. The Sierra Club expects you to have proof that there will

32

be at least a 20-year supply of water—after build out—without impacting the San Jacinto Wildlife Area. More needs to be explained about the lift station in the FEIR.

32

Your NOP/DEIR should have mentioned that the consumption of electricity by all these warehouses “would generate air pollutant emissions.” During the “Forum” the word “green” was used again and again to describe the WLC. The Sierra Club expects all buildings WLC buildings to match or exceed the Gold LEED certification recently agreed to by the Alessandro Business Center warehouse in the City of Riverside and the Skechers in Moreno Valley. Through the installation of solar panels and other LEED ideas you could avoid generating air pollutants with the electricity you consume. Why are you limiting the coverage of the warehouse roofs with solar? Why isn’t the entire roof covered with solar – except the area needed for skylights? The FEIR must also explain what other aspects of the project will be “green” and if they are going to be required or just included to the “greatest extent possible,” which mean very little. Agreeing to require at least 90% of your off road construction equipment meet Tier III standards and by 2015 Tier IV would also significantly help our non-attainment city and county. Continuing to pave over Prime Agricultural lands as well as those of Local and State Importance must be mitigated. Having locally grown products also cuts down on the Climate Change problems mentioned above and below. The elimination of locally grown products needs to be factored into your Air Quality and GHG analysis. As you know, recently a developer donated \$100,000 to the Riverside Land Conservancy to help mitigate for the loss of Ag Lands. Please consider how your project will seriously mitigate its impacts to Agriculture and raptor foraging. This valley is world renowned for having more than 20 species of raptors. You should also make sure your parking provides ample reserved spaces for several form of cars using alternative fuels. Their parking lot also needs to be made of porous material to help with ground water recharge and to lessen run off.

33

34

35

Since some of Moreno Valley’s designated truck routes pass by schools and their playgrounds, the Sierra Club expects the FEIR to explain what requirements will be placed on the tenants to avoid this very toxic situation as well as the truckers who will deliver/pickup products for your warehouse. How will the WLC increase the toxic level of any school within 1,500 feet of designated truck routes within our City? Explain why trucks will be allowed to leave the I-215 and head towards the WLC and visa versa on City streets instead of using SR-60. You are to use all means of reducing the projects impacts on residents. Using Cactus Ave or Alessandro Blvd or JFK instead of SR-60 to head east or west shows you are not doing so. The signals and stop signs more than offsets the pollution you might save by going a little shorter distance. The projects distance from homes needs to be easily understood as well as all the paths trucks could take to the warehouse. Using east/west surface streets significantly increases the toxic diesel pollution as well as the noise pollution and vibrations people will have to suffer. The WLC’s traffic analysis needs to have the truck traffic using Moreno Valley surface streets using SR-60 to move east and west. Only then can the WLC state that it is doing more to reduce the diesel and noise pollution impacts on Moreno Valley residents. The FEIR must also show how much money the City will save on road improvements if the trucks are using SR-60 instead of the east/west surface streets. The WLC’s trucks must also be restricted from using all roads that pass schools such as those on Heacock Street. How will you protect the workers from breathing toxic diesel emissions throughout their workday? What equipment will you make sure is electric instead of diesel or gasoline in order to lessen pollution and better protect the workers--this

36

includes gardening equipment? The DEIR needs to explain how noise barriers used during construction and use of the warehouse could lessen impacts identified in the Initial Study. Impacts to our local streets as well as our very crowded freeways need to be explained so the average citizen will understand. The FEIR-not just appendices- needs to show the length of trips the diesel trucks will be taking when driving to and from the warehouse as well as their routes. We need to know the maximum number of trucks that will use these warehouses each workday and not just after the first year, but when the warehouse is being used to its maximum capacity at peak times of the year.

36

The FEIR must show all off site infrastructures on single map/figure to allow the public to easily understand. These include but are not limited to sewer, debris basins, and the Theodore Interchange improvements. This includes all such needed improvements on both sides of Gilman Springs Road. The public needs to know who owns these lands needed for these off site improvements and what it will cost to build them as well as who will pay those costs. It also must include any additional interchanges and widening over crossings as well as widening of SR-60 to meet the demands of the WLC. The recent decrease of Development Impact Fees for High-cubed warehousing makes many needed improvements underfunded. What will the WLC do to compensate for this? All of these off site improvements need to be part of the economic analysis. Your economic analysis must give proof of its viability for at least 20 years after build out. It is in this time period that Proposition 13 tax increase restriction will have significant impacts on the WLC's income to the City of Moreno Valley and will probably become a drain on the well being of the City.

37

The land should not be disked for at least six months prior to doing the Burrowing Owl survey. Otherwise many will believe you are just making it difficult on this special animal as well as making it more likely it will be listed as endangered. Figure 4.4.5 shows excellent Burrowing Owl habitat in the within the drainage areas of the WLC. What will happen to those animals during the life of the project and what else can be done to protect them? Will all drainage channels be soft bottom and if not why not? The Sierra Club believes the FEIR will be inadequate unless our concerns and issues found throughout this letter are thoroughly addressed within the DEIR document. The Sierra club does not accept your limited Open Space dedication as adequate and you should be ashamed of continuing to give the impression that the existing San Jacinto Wildlife (SJWA) area lands are being given as part of the WLC project. Figure 4.4.3 shows criteria cells along Gilman Springs Road. What is being proposed with those lands?

38

How will you modify power poles to protect raptors from being electrocuted as they land or spread their wings? The Sierra Club expects such modifications on all new and existing electrical poles within at least a half-mile of the WLC project. The placement of power poles near the San Jacinto Wildlife Area may prove dangerous when people are hunting. In addition they are ugly and should be placed as far away as possible from the open space of the SJWA. Make sure all existing as well as proposed underground pipelines are shown on maps/figures and what is transported within them. What proof do you have that your drainage plan will protect the SJWA and all its resources – especially threatened and endangered species?

39

40

41

The FEIR must explain the area proposed for annexation. When will the application for annexation be submitted and what happens when it is denied? Since this is part of the process

42

for the getting the project approved, the Sierra Club believes that everyone who requested all documents and notices of all meetings related to the WLC needs to be sent the annexation application and timely notices of those meetings.

42

Why wasn't the Development Agreement in the Draft EIR and will it be made available in the Final EIR? When future warehouses are proposed for development what must they do to get approval? Will they need to do their own EIR or will they be able to rely on the WLC's certified EIR? Will this be the case for the entire build out of the WLC? There will be many changes between now and 2035 and those changes should be dealt with in new environmental documents.

43

THE EIR MUST ADDRESS THE IMPACT GLOBAL WARMING WILL HAVE ON THE PROJECT

California's temperatures are expected to rise "dramatically" over the course of this century (Cayan 2007). These factors will impact the planned project, as well as exacerbate its own environmental impacts.

The rise in temperatures resulting from global warming will create a more conducive environment for air pollution formation (Cayan 2007). This will intensify the adverse effects the proposed project will already have on air quality in the project area and threaten residents' health (Cayan 2007).

Significantly for the state, as well as the project area, is global warming's impact on water supply. The IPCC specifically identified the American West as vulnerable, warning, "Projected warming in the western mountains by the mid-21st century is very likely to cause large decreases in snowpack, earlier snow melt, more winter rain events, increased peak winter flows and flooding, and reduced summer flows" (IPCC 2007b). Recently, researches found that an increase in atmospheric greenhouse gases has contributed to a "coming crisis in water supply for the western United States" (Barnett 2008). Using several climate models and comparing the results, the researches found that "warmer temperatures accompany" decreases in snow pack and precipitation and the timing of runoff, impacting river flow and water levels (Barnett 2008). These researchers concluded with high confidence that up to 60 percent of the "climate related trends of river flow, winter air temperature and snow pack between 1950-1999" are human-induced.

44

(Barnett 2008). This, the researchers wrote, is "not good news for those living in the western United States" (Barnett 2008).

The California Center on Climate Change has also recognized the problem global warming presents to the state's water supply and predicts that if greenhouse gas emissions continue under the business-as-usual scenario, this snowpack could decline up to 70-90 percent, affecting winter recreation, water supply and natural ecosystems (Cayan 2007). Global warming will affect snowpack and precipitation levels, and California will face significant impacts, as its ecosystems depend upon relatively constant precipitation levels and water resources are already under strain (Cayan 2007). The decrease in snowpack in the Sierra Nevada will lead to a decrease in California's already "over-stretched" water supplies (Cayan 2007). It could also potentially reduce hydropower and lead to the loss of winter recreation (Cayan 2007). All of this means "major changes" in water management and allocation will have to be made (Cayan 2007). Thus, global warming may directly affect the City's ability to supply clean, affordable water to the residents, or force the City to change how it will utilize water, and it may also impact other activities outside the project area, such as agriculture.

Scientists indicate that climate change will also exacerbate the problem of flooding by increasing the frequency and magnitude of large storms, which in turn will cause an increase in the size and frequency of flood events (NRDC 2007). The increasing cost of flood damages and potential loss of life will put more pressure on water managers to provide greater flood protection (NRDC 2007). At the same time, changing climate conditions (decreased snowpack, earlier runoff, larger peak events, etc.) will make predicting and maximizing water supply more difficult (NRDC 2007). These changes in hazard risk and water supply availability must be considered during environmental review.

Water quality, in addition to water quantity and timing, will also be impacted. Changes in precipitation, flow, and temperature associated with climate change will likely exacerbate water quality problems (NRDC 2007). Changes in precipitation affect water quantity, flow rates, and flow timing (Gleick 2000). Shifting weather patterns are also jeopardizing water quality and quantity in many countries, where groundwater systems are overdrawn (Epstein 2005). Decreased flows can exacerbate the effect of temperature increases, raise the concentration of pollutants, increase residence time of pollutants, and heighten salinity levels in arid regions (Schindler 1997).

These are only examples of how global warming will impact the proposed project and intensify the environmental impacts the project will already have. It is not an exhaustive list. Thus, when assessing the impact of the Project on air quality, water supply, flood hazards, and biological resources, the EIR must take into account global warming. To ignore the impact of global warming on the Project and the resources impacted by the Project would significantly understate Project impacts.

, a universally adopted methodology is *not* necessary to

THE EIR MUST ANALYZE AND ADOPT ALL FEASIBLE MITIGATION MEASURES TO REDUCE THE PROJECT'S GREENHOUSE GAS EMISSIONS

In addition to thoroughly evaluating project alternatives, because it is clear that the project's greenhouse gas emissions will cumulatively contribute to global warming, "the EIR must propose and describe mitigation measures that will minimize the significant environmental effects that the EIR has identified." *Napa Citizens for Honest Gov't v. Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 360 (2001). CEQA requires that agencies "mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so." Pub. Res. Code § 21002.1(b). Mitigation of a project's significant impacts is one of the "most important" functions of CEQA. *Sierra Club v. Gilroy City Council*, 222 Cal.App.3d 30, 41 (1990). Therefore, it is the "policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects." Pub. Res. Code § 21002. Importantly, mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will actually be implemented as a condition of development." *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles*, 83 Cal.App.4th 1252, 1261 (2000).

To the extent that the project moves forward as planned, there are many mitigation measures the City can consider, as described below. This is not an exhaustive list and the EIR should explore these and all other feasible mitigation measures that will reduce the project's greenhouse gas emissions (CAPCOA 2008; California Office of the Attorney General 2008).

ii. Land Use and Energy

Using green building techniques, however, can substantially reduce buildings' influence in increasing greenhouse gas emissions. Green buildings help reduce the amount of energy used to light, heat, cool and operate buildings and substitute carbon-based energy sources with alternatives that do not result in greenhouse gas emissions (Commission for Environmental Cooperation 2008). Currently green buildings can reduce energy by 30 percent or more and carbon emissions by 35 percent. (Commission for Environmental Cooperation 2008). The technologies available for green building are already in wide-use and include "passive solar design, high-efficiency lighting and appliances, highly efficient ventilation and cooling systems, solar water heaters, insulation materials and techniques, high-reflectivity building materials and multiple glazing (IPCC 2007c). Additionally, the U.S. Green Building Council (USGBC), a private, nonprofit corporation, has established a nationwide green building rating system, called Leadership in Energy and Environmental Design ("LEED"). The LEED standard supports and certifies successful green building design, construction and operations. It is one of the most widely used and recognized systems, and to obtain LEED certification from the USGBC, project architects must verify in writing that design elements meet established LEED goals.

Specific mitigation for the greenhouse gas emissions generated by the Project's energy consumption include, but are not limited to:

- Analyzing and incorporating the U.S. Green Building Council's LEED (Leadership in Energy and Environmental Design) or comparable standards for energy efficient building during pre-design, design, construction, operations and management. All buildings within the World Logistic Center must be required to obtain a least Gold LEED certification.
- Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.;
- Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.
- Reducing the use of pavement and impermeable surfaces;
- Requiring water re-use systems;
- Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting
- Limiting the hours of operation of outdoor lighting
- Maximizing water conservation measures in buildings and landscaping, using drought tolerant plants in lieu of turf, planting shade trees;
- Ensure that the Project is fully served by full recycling and composting services;
- Ensure that the Project's wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.
- Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible;
- Installing solar water heating systems to generate all of the Project's hot water requirements;
- Installing solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations to reduce emissions from vehicle trips.

iii. Mitigation Related to Project Construction

45

46

- Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials;
- Minimize, reuse, and recycle construction-related waste;
- Minimize grading, earth-moving, and other energy-intensive construction practices;
- Landscape to preserve natural vegetation and maintain watershed integrity;
- Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.

46

iv. Transportation Mitigation Measures

- Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles;
- Create a car sharing program within the planned community;
- Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system;
- Provide necessary facilities and infrastructure to encourage residents to use low or zero-emission vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations;
- Provide a shuttle service to public transit within and beyond the planned community;• Incorporate bicycle lanes and routes into the planned community's street systems.

47

THE EIR MUST CONSIDER A REASONABLE RANGE OF ALTERNATIVES

The EIR must consider a meaningful analysis of reasonable alternatives to the Project in order to lessen or avoid the Project's significant impacts. CEQA mandates that significant environmental damage be avoided or substantially lessened where feasible. Pub. Res. Code § 21002; Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d). A rigorous analysis of reasonable alternatives to the project must be provided to comply with this strict mandate. "Without meaningful analysis of alternatives in the EIR, neither courts nor the public can fulfill their proper roles in the CEQA process." *Laurel Heights Improvement Ass'n v. Regents of University of California*, 47 Cal.3d 376, 404 (1988). Moreover, "[a] potential alternative should not be excluded from consideration merely because it 'would impede to some degree the attainment of the project objectives, or would be more costly' even when that alternative includes Project development on an alternative site. *Save Round Valley Alliance v. County of Inyo*, 157 Cal. App. 4th 1437, 1456-57 (2007) (quotations omitted).

48

An analysis of alternatives should also quantify the estimated greenhouse gas emissions, quantified impacts to biological resources, water resources-including water quality and water availability, as well as traffic resulting from each proposed alternative. Selecting an alternative site closer to rail availability would be ideal and closer to I-10 or some other major freeway instead of our SR-60 which is only two lanes in from of the project. These places do exist.

CONCLUSION

Thank you for your attention to these comments. The Sierra Club expects all growth inducing as well as cumulative direct and indirect impact to be fully addressed in the FEIR. We look forward to working with the City to assure that the EIR conforms to the requirements of CEQA to assure that all significant impacts to the environment are fully analyzed, mitigated or avoided. The

49

Sierra Club wishes to be placed on the mailing list for all future notices and documents regarding this project. Please mail all notices to Sierra Club, San Gorgonio Chapter, Moreno Valley Group, 26711 Ironwood Ave, Moreno Valley, CA. 92555.

49

Thank you,

George Hague
Conservation Chair

RESPONSES TO LETTER F-11

Sierra Club, San Geronio Chapter

Response to Comment F-11-1. The commenter suggests the Environmental Impact Report (EIR) is inadequate and has submitted their Notice of Preparation (NOP) comments in addition to their comments on the Draft Environmental Impact Report (DEIR). The DEIR does present accurate and adequate analysis in the DEIR, plus the additional and revised analyses of these issues have been provided in the Final Environmental Impact Report (FEIR), which together provide sufficient information upon which to make an informed decision.

Response to Comment F-11-2. The commenter points out there was not enough information at the “Skechers” public scoping session. While there were more people attending the meeting than anticipated, City staff made additional copies and distributed them during the meeting. The materials were projected on a screen during the meeting, and the written materials were made available on the City’s website both before and after the scoping meeting. Despite these concerns, the public has had ample opportunity to review the project information, technical studies, and EIR documents via a 63-day public review period, plus the many months since the time the DEIR review period closed (April 8, 2013) during which the City has continued to receive emails and written correspondence on the DEIR and World Logistics Center (WLC) project. All of these comments have been included and responded to in this FEIR document regardless of when they were received by the City. In addition, public hearings at the Planning Commission and City Council will occur to review all of this material prior to any decision by the City.

Response to Comment F-11-3. The commenter asserts that there was inadequate public participation because California Environmental Quality Act (CEQA) materials were not provided in Spanish. The commenter should note that no EIR has ever been translated into Spanish for the purposes of CEQA review, including those in communities with much higher proportion of Hispanic residents. A large segment of the population of Moreno Valley is Hispanic or Latino, however, because a person is Hispanic or Latino does not automatically mean that they only speak Spanish. There is no legal requirement to translate the environmental documents or the notices into other languages. It is not the policy of the City to require project applicants to incur the added expense of having project environmental documents or public notices translated into Spanish. The City is also not required to incur the expense of providing a Spanish translator at public meetings. The commenter is free to provide a Spanish translator at its costs. In addition, neither the State CEQA Statutes nor the State CEQA Guidelines require or even suggest providing such notices in Spanish.

Response to Comment F-11-4. The commenter reiterates the issue regarding translating CEQA materials into Spanish. Response to Comment F-11-3 above outlines why the City does not provide CEQA documents and notices in Spanish. The EIR materials related to this project are adequate in terms of the level of analysis and issues addressed given the nature of the project and its location.

Response to Comment F-11-5. The commenter asserts the EIR process is inadequate because residents living along roads affected by project traffic and noise, including proposed mitigation with sound walls, were not individually noticed regarding the project. The City has made every reasonable effort to inform the public as to the potential impacts and proposed mitigation for this project, including a 63-day public review period on the DEIR which was posted in its entirety on the City’s website. In addition, approximately 1,337 residents/residences near the WLC project site were sent individual notices regarding the proposed action per state law and City legal procedures. A legal notice was also placed in the local newspaper regarding circulation of the EIR. It would be cost prohibitive and unnecessary to mail individual notices to any City resident affected in some way by this project due to its size and nature, and adequate notice has been provided in this regard for this project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-11-6. The commenter believes the NOP for the project was misleading. The City disagrees, the information included in the NOP, including extensive information about the nature of the project and the relationship to the gas company and California Department of Fish and Wildlife/San Jacinto Wildlife Area (SJWA) conservation lands. A detailed Initial Study was not included in the NOP per State CEQA Guidelines Section 15060(d) because the City knew from the very beginning that an EIR was needed for this project. The NOP correctly indicated that all potential environmental issues would be evaluated in the EIR, as reflected by the analysis in DEIR Sections 4.1 through 4.16. The project information and maps in the NOP were accurate. In addition, the DEIR contained even more detailed information on the project and its potential impacts, and all of the agencies that commented on the NOP had ample opportunity to review and comment on the various technical studies and analyses in the DEIR. In these ways the City has followed the intent and requirements of CEQA regarding the NOP and EIR. Also refer to Responses to Comments B-3-40 regarding why the California Department of Fish and Wildlife (CDFW) Conservation Buffer Area and the San Diego Gas and Electric (SDG&E) lands are included in the WLC Specific Plan(SP).

Response to Comment F-11-7. The commenter raises more specific items of concern with the NOP. The NOP was an accurate representation of the project and its potential impacts, as outlined in Response to Comment F-11-6 above. The NOP specifically mentions SJWA and the state conservation land south of the Specific Plan property.

Response to Comment F-11-8. The commenter believes the NOP needed more than 30 days review. The NOP provided sufficient information for resource agencies to indicate their major areas of concern regarding environmental impacts, and all these agencies had 63 days to review and comment on the DEIR and its various technical studies. The purpose of the NOP is to provide responsible and trustee agencies with sufficient information describing the project and the potential environmental effects to enable the responsible agencies to make a “reasonable” response (CEQA Guidelines Section 15082(1)). There is no evidence that any agencies or the public were denied adequate time under CEQA to evaluate the NOP and the EIR. In fact, no agencies asked for more time to comment on the NOP.

Response to Comment F-11-9. The City and the DEIR have clearly indicated the status of the Moreno Highlands Specific Plan (MHSP) in relation to the City’s Housing Element and future sites for affordable housing. Page 3-13 of the DEIR states...

“The City’s 2006 Housing Element identified the Moreno Highlands Specific Plan as a potential source of vacant land that could accommodate possible future residential growth in the City. In 2011, the City updated its Housing Element and anticipated possible land use changes from mixed use and residential to jobs producing warehouses in the eastern part of the City. The 2011 Housing Element concluded that redesignating the entire land area east of Redlands to the eastern City border for warehouse uses would not impede the City’s Housing Element Objectives. The State Department of Housing and Community Development certified the City’s Housing Element as being in compliance with State law on February 22, 2011. The proposed project is consistent with the City’s current Housing Element.”

This correctly explains the relationship of the MHSP project in relation to the Housing Element.

Response to Comment F-11-9. Environmental impacts were addressed in the No Project (Existing General Plan) Alternative, DEIR Section 6.3.5.

The commenter incorrectly states that the dwelling units currently planned under the existing zoning for the property (the Moreno Highlands Specific Plan for most of the project area) must be relocated within the City. The project proposes to replace existing residential land use designations with jobs-producing logistics land uses. There is no requirement to relocate planned residential units elsewhere in the City. Nor is there any requirement in CEQA to include these “displaced units” in the air quality or traffic analyses as the commenter claims. These units do not exist.

Per CEQA, the EIR for the proposed project is required to measure its impacts on existing conditions, not address planned, but not built dwelling units.

Response to Comment F-11-10. The commenter requests an analysis of city freeway ramps and local streets to determine what would happen in the event that a truck accident causes a freeway-closing accident on SR-60. He cites existing deficiencies on Gilman Springs Road, Redlands Blvd, and San Timoteo Canyon Road and asks what improvements will be made to make them safer. The commenter cites the 50-vehicle/peak-hour threshold for studying roads and says that he doesn't know if the project adds 50 or perhaps 500 trips. The commenter requests that all of the road segments between the study intersections be studied. Also, the commenter inquires about the level of service (LOS) at the intersections before and after the improvements and how improvements will be implemented over and above just paying impact fees.

In the event of an accident on SR-60, the California Highway Patrol may direct traffic onto an alternate route including local surface streets. Although the travel patterns of vehicles on SR-60 could change for the short period of time that the freeway would remain closed due to a hypothetical accident on SR-60, such conditions are temporary and not indicative of the weekday a.m. and p.m. peak hours which are customarily analyzed in a traffic impact study and which are used as the basis for determining the number of lanes needed at roadways and intersections. An analysis of freeway closure traffic impacts is not reasonable, is not included in the traffic study guidelines that guided the methodology of the traffic impact analysis included in the DEIR, and therefore is not included in the FEIR. Note that by extending Eucalyptus Avenue from Redlands Blvd. to Gilman Springs Road, the project would create a new detour route that could be used in the event of an accident on SR-60.

By state law, the project cannot be held responsible for rectifying existing deficiencies on Gilman Springs Road, Redlands Blvd, and San Timoteo Canyon Road. However, the traffic impact analysis included in the DEIR assesses the potential project direct and cumulative impact of these three roadways. Deficiencies on Gilman Springs Road are disclosed in the DEIR, improvements are identified, and mitigation measures are set forth. The City will require the project to pay Transportation Uniform Mitigation Fee (TUMF) and Development Impact Fees (DIF) and to fund its fair share of the cost of improvements for which there is a nexus to the project.

Response to Comment F-11-11. The commenter expresses concern that the TIA assumes that some project truck traffic will use Reche Canyon Road which is currently a winding 2-lane road. The commenter acknowledges that the Riverside County Transportation Commission (RCTC) has plans to widen the road but states that there is no proof that this will ever happen. The commenter requests that the TIA assume that the road will never be built.

Because of the scale of the proposed project and the time lapse that would occur between its first increment of development and buildout, this EIR is a program level EIR. For this reason, the TIA assesses project impacts against existing (i.e., baseline) and General Plan Year 2035 (cumulative) traffic conditions. The General Plan Year 2035 traffic scenario appropriately assumes certain non-project land uses will be developed and certain transportation improvements will be constructed between now and year 2035. The transportation improvements assumed to be in place for the General Plan Year 2035 traffic scenario include the transportation improvements contained in the following:

1. Federal Transportation Improvement Program (FTIP). The 2012 FTIP covers the first four years of SCAG's 2012-2035 Regional Transportation Plan (RTP). The FTIP includes transportation projects that are already funded and are either already under construction or are in an advanced stage of development.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

2. RTP Financially Constrained Project List. The RTP Financially Constrained Project List covers transportation projects that are next in line to be programmed and included in the four year FTIP. These projects would occur in the 2016-2035 time frame.
3. City of Moreno Valley General Plan road network. The General Plan network includes future planned improvements that are funded through the City's Development Impact Fee (DIF), Western Riverside Council of Governments' Transportation Uniform Mitigation Fee (TUMF), and improvements made directly by developers. The expectation that these improvements will be in place is appropriate for the long-term traffic analysis contained in this Program EIR because the General Plan Year 2035 traffic scenario also assumes buildout of the City's General Plan land uses. Most of future City transportation improvements will be funded through DIF and TUMF fees on collected from future developments projects. If future developments projects do not fully buildout per the General Plan then the LOS on the study streets and intersection would likely be better than shown in the TIA.

The 2012 Federal Transportation Improvement Program (FTIP) project list, which shows the projects for which funding is currently available, includes a Project Approval and Environmental Document (PA&ED) study of the widening Reche Canyon Road from 2 to 4 lanes, including realignment, signals, and medians (see FTIP Project RIV041043). This study is to occur in the FTIP four year time frame and is therefore assured of being in place prior to buildout of the General Plan Year 2035 assumed land uses and roadway network. The FTIP includes another project (see FTIP Project 200843) to fund widening of one section of Reche Canyon Rd. from 2 to 4 lanes, and another project (FTIP project 200064) to widen another section and modify the traffic signals in the FTIP four year time frame.

SCAG's financially-constrained project list, which identifies projects for which funding is expected to become available in the medium term in the 2016-2035 time frame, includes further widening of Reche Canyon Rd. one segment at a time (see Projects 3A07105, 3A04WT065, and 3A04WT184). So, contrary to the comment, there is ample evidence that this project will go forward as planned. If this roadway were left out of the TIA analysis then the possible impacts of project trucks using this route would have been missed.

Response to Comment F-11-12. Please see Response to Comment F-11-11.

Response to Comment F-11-13. Please see Response to Comment F-11-11.

Response to Comment F-11-14. The commenter claims there is no discussion of mitigating the diesel pollution that will traverse over six-foot sound walls into the residents' homes and yards. A detailed Health Risk Assessment (HRA) was prepared in the DEIR and was refined for the FEIR, which found no significant impact in residents adjacent to the WLCSP. Sound walls can provide some relief from roadway pollution. The South Coast Air Quality Management District (SCAQMD) indicates a range of pollutant reductions on the order of 15 to 50 percent for "near" locations on the downwind side of the wall.³⁷ The effectiveness of sound walls varies with distance from the roadway. Other site specific characteristics such as wind direction/roadway orientation, wall height, wind speed, and distance of the wall from the roadway may significantly affect the effectiveness of walls as pollutant mitigation. In the project air quality impact analyses, no credit was taken for any potential mitigation from sound walls.

The commenter indicates that there would be 30,000 trucks into Moreno Valley. However, as shown in the DEIR (Appendix D, Table 17) there was estimated to be approximately 13,000 diesel truck trips per day, which has been reduced in the revised analysis (with the reduction in square footage) to approximately 12,000 diesel trucks per day and 2,000 non-diesel trucks per day.

³⁷ SCAQMD 2012. 2012 Air Quality Management Plan. Chapter 9.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The commenter states that requiring 2010 trucks is not good enough. As discussed in Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, other truck technologies such as zero and near-zero emissions trucks are not currently viable or feasible technologies. In addition, the project's diesel trucks will need to be model year 2010 or greater (pursuant to Mitigation Measure (MM) 4.3.6.3B), which substantially reduces NOx and PM emissions. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project's mitigation measures.

Response to Comment F-11-15. The commenter does not raise any issue regarding the adequacy of the DEIR and no response is required. The City will consider all comments in connection with its consideration of the proposed project.

Appendix "O" to the DEIR, the "Fiscal and Economic Impact Study," includes projections for on-going maintenance costs for public facilities and improvements (including road improvements) at approximately \$1,900,000 annually. The overall WLC cost vs. revenue analysis concludes that the WLC project will generate a "Total Annual Recurring General Fund Surplus" of nearly \$7,000,000 per year (Exhibit A-9 of DEIR Appendix O). The City will have ample General Fund resources to do additional road maintenance if determined necessary by the City.

Response to Comment F-11-16 and 17. The commenter indicates that the EIR should show what physical and mental impact residents might experience as a result of the operation of the project. The commenter wonders what would protect the residents from the dust, noise, and vibration during grading. The FEIR and revised analysis (FEIR Volume 2, Section 4.3 and Appendix D) provide discussions of potential impacts on health that would occur with the project. Numerous mitigation measures are included that would minimize the potential impacts including the use of the cleanest fleet of heavy duty diesel trucks (Section 3.4.6.1), non-diesel support equipment the installation of air filtration systems (Section 4.3.6), noise mitigation (Section 4.12.5) and dust mitigation measures designed to meet the requirements of SCAQMD Rule 403 for Fugitive Dust (Section 4.3.6). The FEIR recognizes that the residents of the seven homes would be significantly and unavoidably impacted by the project's development (Section 4.3.6).

As part of the FEIR the circulation of the project has been revised to reroute Cactus Ave as Street "D" into the WLC based on the Transportation Engineering Division's recommendations. Incorporating this road alignment impacts the original land plan for the southwestern portion of the Specific Plan to the point where approximately 100 acres of land in this area can no longer function as an integral part of the WLC project. Section 3.1 of the WLCSP depicts the revised circulation system. The revised health risk assessment based on the revised land plan shows that there will be no significant health risks for those residences not within the project's boundaries (Section 4.3.5, FEIR Volume 2). It should also be noted that heavy trucks are prohibited from using city streets other than truck routes (Section 4.3.6, FEIR Volume 2), that noise mitigation measures have been imposed to mitigate the impacts on the surrounding residences (Section 4.12.6, FEIR Volume 2); therefore, there is no need to increase the separation between the project or truck routes from the existing residences.

The commenter wonders if the existing residential homes will decrease in value if the project is approved. The commenter wonders if the City considers this a taking. It is not possible to determine the impact of home values if the proposed project is approved and such economic issues are beyond the scope of CEQA. The City Council will consider all comments in connection with its consideration of the project before making a decision on the project.

The commenter indicates that the EIR should show what physical and mental impact residents might experience as a result of the operation of the project. The commenter wonders what would protect the residents from the dust, noise, and vibration during grading.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Impacts related to dust are discussed in DEIR Section 4.3, *Air Quality*, while noise and vibration impacts are addressed in DEIR Section 4.12, *Noise*. Mitigation Measures were recommended under both of these environmental issues, although air and noise impacts were determined to be significant even with implementation of feasible mitigation as recommended in the DEIR. See also Response to Comment F-9A-39 and the Master Responses in Letter C-3 for additional discussion on dust impacts, and Responses to Comments E-2A-13 to E-2A-15 and Responses to Comments F-8-72 and F-8-73 for additional discussion of noise and vibration impacts.

The DEIR and revised analysis provide discussions of potential impacts on health that would accrue with the project. Numerous mitigation measures are included that would minimize the potential impacts including but not limited to the following:

- Use of the cleanest fleet of diesel trucks during operation (MM 4.3.6.3B)
- Non-diesel support equipment (MM 4.3.6.3B)
- Dust measures designed to meet the requirements of SCAQMD Rule 403 for Fugitive Dust (MM 4.3.6.2A).
- Cleanest off-road construction equipment (MM 4.3.6.2A).

The commenter wonders if the existing residential homes will decrease in value if the project is approved. The commenter wonders if the City considers this a taking. It is not possible to determine the impact of home values if the proposed project is approved and economic issues such as those indicated by the commenter are beyond the scope of CEQA.

Response to Comment F-11-18. The Federal Highway Administration (FHWA) has established that the typical ear height is 5 feet (see for example “FHWA Highway Traffic Noise Prediction Model”, FHWA-RD-77-108, December 1978), and this has also been adopted by the California Department of Transportation (Caltrans), the Federal Transit Authority (FTA), and other agencies. The ear height is roughly 6 inches below the top of the head, and even a 6’3” person would have an ear height below 6 feet. The noise source height for automobiles is at the pavement level since most noise generated by automobiles is due to the interaction between the pavement and the tires. The primary noise source for medium trucks is the engine noise which the FHWA models at 3 feet above pavement. The primary source for heavy trucks is the exhaust stack which generally occurs at 10 feet above pavement, but tire and engine noise are also important. Much of the noise impact along arterial roadways for this project is not due trucks but rather to the increase in automobile traffic, since most of the truck traffic will go directly to the nearby freeway. With such a low source height, a 6-foot wall will be very effective in reducing the noise impact of the project.

Response to Comment F-11-19. Detailed numbers for single event noise caused by blow-downs is included in the appendix to the technical noise study (DEIR Appendix K, pages 24 and 25 which are identified as Exhibits 9 and 10). Southern California Gas Company (SCG) has indicated in meetings to Highland Fairview that a muffler will be put on the blow-down points if anybody is in the vicinity of the blow-down, and this should be adequate to protect infrastructure workers. SCG currently owns and uses these or similar silencers on their blow-down points and therefore, their effectiveness is proven. SCG has several blow-down points near residential areas and successfully have blown-downs without significantly impacting the residents. The responsibility for insuring that blown-down events have a reasonable noise level is SCG’s, not the project applicant.

Response to Comment F-11-20. The commenter requests the FEIR have a health risk assessment to cover all aspects of the project’s negative impact on residents and workers.

The DEIR and revised analysis (FEIR Volume 2, Appendix D) contain an extensive health risk assessment of the project’s health risk impacts on residents and workers. The revised analysis was expanded to address potential health risk impacts to school-age children and schoolchildren. These

estimates were made using regulatory-approved models and methods to derive both emission estimates and resulting cancer risks and non-cancer hazards specific to this project. The assessments were comprehensive and the results and conclusions were presented therein.

Response to Comment F-11-21. The commenter suggests, without offering documentation, that WLC will cause \$5 million to \$9 million in health costs to the community. While the City acknowledges that logistics development will have both positive and negative impacts in its sphere of influence, so will other potential development, as would a lack of employment-oriented development in Moreno Valley. Notably, this letter does not concern itself with the health costs associated with the level of unemployment that would exist if the project is not built, and the significant health opportunities available to those who will receive regular paychecks from their work at WLC. A recent study prepared by Economic & Politics, Inc. titled *Policy Choices and the Inland Empire's Public Health* found that the most important causes of public health issues were socio-economic, i.e. income, education, poverty, and employment (Exhibit P). In point of fact, some of the employers at WLC will directly provide health insurance to its workers, while employees at other firms will be able to access Affordable Health Care Act benefits by making the necessary copayments only because they would be employed at WLC. Furthermore, as is the case with all legitimate businesses operating within the City of Moreno Valley, WLC employers will be required to operate in full compliance with all existing state and federal regulations as they relate to employer responsibilities to provide for the health and welfare of employees.

Response to Comment F-11-22. The commenter asserts that the majority of warehouses have peak times during the year and that the traffic and air quality analyses must be done to show the worst case scenario possible. The commenter also requests all traffic counts from 2011 to be updated to 2013.

Response to Comment F-9A-9 explains why there is no need to study seasonal peaking for this particular project. The TIA followed standard engineering practice is to base the analysis on a “typical workday” which is defined as a Tuesday, Wednesday, or Thursday in a week when schools are open and no special weather or event affects normal traffic patterns.

An analysis was performed to determine if seasonality of traffic flows may be a significant factor that needs to be accounted for in the analysis. The monthly fluctuations in traffic flow on SR-60 in Moreno Valley were reviewed to determine if this was the case. The average daily traffic on SR-60 from 2011 was collected from Caltrans at the SR-60 interchanges with Perris Boulevard, Heacock Street, and Day Street and summarized by month (see refer to FEIR, Volume 2, Section 4.15 Traffic, Table 4.15.F: Existing (2012) Roadway Segment Levels of Service). The average daily traffic for each individual month was calculated and compared to the annual average. The data showed that the monthly fluctuations in traffic were not consistent between interchanges; in months where the traffic volumes at one interchange were above the annual average while the adjacent interchange count location was below the annual average. For example, the lowest month of the year for the Perris interchange, January, was the highest month for the two nearby interchanges. In 10 out of 12 months the two count sites closest to the project (Perris Boulevard and Heacock Avenue) deviated in opposite directions from the annual average.

If this area were subject to seasonal peaking then the three interchange count locations would show similar peaking characteristics during any given month. The count data showed no such consistency, therefore, seasonal peaking of ambient traffic is not considered a significant factor for traffic analysis for the WLC (as illustrated in Table F-11.A below).

A further analysis was performed to determine whether there may be significant seasonal peaking of truck traffic from the WLC that needs to be factored into the analysis. There are several reasons to believe that this will not occur:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- When it is fully operational the WLC is expected to have 15-to-25 different tenants from a variety of economic sectors; for example the National Association of Industrial and Office Properties (NAIOP) survey found tenants in the consumer goods, pharmaceuticals, automotive products, tools, office supply, home furnishings, and building materials sectors. To the extent that these sectors have season peaks they occur at different times of the year and would tend to offset each other (i.e. a high period for one tenant may be a low period for the tenant next door). This is one reason why traffic on SR-60 itself does not display seasonal peaking.
- Furthermore, the commenter's opinion that seasonal variation in truck traffic may pose significant impacts was premised on the commenter's erroneous over-estimate of the amount of truck traffic that will be generated by the WLC. To the extent that truck volumes will be smaller, the impact of any variations in truck traffic will also be smaller.

For these reasons, there is no basis for a presumption that seasonal peaking of truck traffic will create any significant impacts that have not already been identified using the trip generation rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual.

The traffic counts were taken within a year of the NOP (dated February 2012) and so no adjustment was necessary.

Table F-11.A: Average Day Traffic at Three Interchanges near the WLC

PeMS		Month												Annual
Detector	Location	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Average

The lowest month of the year for the Perris IC was the highest month for the two nearest interchanges.

In 10 out of 12 months the two count sites deviated in opposite directions from the annual average; i.e. one was higher than the annual average and the other lower.

Response to Comment F-11-23. The commenter lists multiple freeways that should be included in the traffic analysis because the air quality analysis shows that pollution from trucks is impacting the air quality on those roadways.

The commenter lists multiple freeways that should be included in the traffic analysis because the air quality analysis shows that pollution from trucks is impacting the air quality on those roadways. The TIA (DEIR Appendix L) used a City of Moreno Valley-approved threshold of 100 peak-hour trips to be used to determine whether or not a freeway segment needs to be further analyzed for potential traffic impacts. As a result, the impacts from the project's vehicle traffic encompassed the region from the junction of SRs-62/111 westward to the junction of SRs-60/71. In response to various public comments received on the DEIR, the geographical extent of the analysis of freeway impacts contained in the revised analysis was extended westward from the junction of State Routes 60/71 to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Interstate 710 and southward to the ports of Los Angeles and Long Beach. Additional freeway segments were also added to the assessment including the westward extension from the junction of SR-91/Interstate 15 to Interstate 710 and the Interstate 215 from the junction with the SR-60 to south of SR-79. The entire freeway segments analyzed in the revised TIA are shown in TIA Figures 2 and 3 (FEIR Volume 2, Appendix L). As a consequence, the project's impacts are now fully described over the area that would experience the emissions from the project's vehicle traffic.

The commenter should also note that MM 4.3.6.3B requires that all diesel trucks must meet model year 2010 truck engine standards, the cleanest diesel truck engines available today.

Response to Comment F-11-24. The commenter states the DEIR must include those projects that will add to the cumulative impacts of the WLC - include all projects, even those that are in the pipeline but not yet approved and including projects in neighboring jurisdictions. A complete listing of other past, present, and reasonably foreseeable projects in the study area included in the DEIR cumulative impact analysis is shown in Exhibit 16 and Appendix E of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report, Appendix D of the DEIR.

The traffic analysis incorporates a comprehensive list of other known projects, with over one hundred projects included on the list (see TIA Chapter 2, Section A, the sub-section entitled Land Use Assumptions, FEIR Volume 2, Appendix L-1). This list includes all projects in nearby jurisdictions for which data was available. In addition, the future-year scenarios also included other land developments incorporated into SCAG's 2012 Sustainable Communities Strategy (SCS), the region-wide land use plan.

Response to Comment F-11-25. Current land use of the northern portion of the SJWA (called the CDFW Conservation Buffer in the DEIR) is presently in dryland agriculture like the WLCSP lands. Numerous biological surveys since 2005 have identified only a limited number of plant and wildlife species due to repeated disking, planting and harvesting of dryland crops. The northern portion of the SJWA (approximately 830-acres) is highly disturbed and does not provide suitable habitat for any threatened or endangered species and is not used for hunting of any kind.

The WLCSP requires that there will be a setback of 250 feet from the boundary of the CDFW Conservation Buffer Area. The project incorporates special edge treatments designed to separate development areas from open space areas. These areas will serve to minimize unauthorized access, domestic animal predation, and illegal trespass and dumping. MSHCP guidelines recommend a setback or a buffer between urban and wildland areas. No specific research has been done on the WLCSP-SJWA interface, but scientific and academic research can provide guidance on the appropriate width of such a buffer under these types of conditions. Typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but 200 to 215 feet appears adequate for the most sensitive or valuable wetlands, based on recommendations from California Department of Fish and Wildlife (CDFW) and United States Fish and Wildlife Service (USFWS). The City of Moreno Valley has setbacks related to residential development in its General Plan of 250 feet. The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and adopted guidelines of the USFWS and CDFW include a setback of 300 to 500 from nesting birds during construction activities. For example, typical burrowing owl mitigation says, *"To adequately avoid active nests, no grading or heavy equipment activity shall take place within at least 250 feet of an active nest during the breeding season (February 1 through August 31) and 160 feet during the non-breeding season."*

According to available research, a 250-foot "clear" setback (i.e., no human activity or improvements) appears to be adequate for a WLCSP-SJWA buffer (McElfish 2008). This buffer shall be enhanced by an additional setback of buildings, and by the presence of the CDFW Conservation Buffer Area, which was originally purchased to provide a buffer between Mystic Lake and development in Moreno

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Valley. A minimum 250-foot setback is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and the distance established in nesting bird surveys for setbacks from human activity. An additional 150-foot building setback will help provide an additional buffer from building lighting and noise.

Planned uses within the 250-foot buffer will include several linear detention facilities with spreading features. These detention basins will receive storm flows and nuisance flows from existing debris basins within the WLCSP that will treat the first flush flows during storm events. This treated water will then enter the detention basins with spreading features, which will provide sufficient hydrology to support native riparian habitat. The riparian habitat may be created as part of the necessary mitigation requirements for regulatory permitting. This will provide a significant patch of native riparian habitat, which will reduce off-site impacts associated with light, noise, and air quality. Other activities than may occur within the 250-foot buffer area include barrier fencing and maintenance roads to access the detention basins. In addition, a 150-foot building setback will be extended from the edge of the detention basins to the nearest building footprint. This area will contain landscape vegetation, access roads, parking facilities, and other development not including structures.

A total setback of 400 feet within the WLCSP for any permanent buildings shall be enforced on the southern and eastern boundary of the WLCSP. This setback shall provide an additional buffer from building lighting, noise, and air quality concerns. The 400-foot distance to buildings from the boundaries of the Specific Plan will effectively mitigate potential direct and indirect impacts on the SJWA and Criteria Cells to indirect noise, light and air quality impacts associated with both the construction and operation of the facilities.

With regard to toxics, the Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013 – FEIR Volume 2, Appendix E-1) provides the following:

“Development plans for the WLCSP and offsite facilities shall be designed to include Water Quality Best Management Practices (BMPs) such as vegetated earthen channels, storm drain stenciling, street sweeping, and education. Detention basins shall be designed to filter potential toxics in the storm water. These BMPs shall be implemented as part of the storm water pollution prevention measures for the project, in accordance with all appropriate National Pollutant Discharge Elimination System (NPDES) requirements.

Development of the WLCSP and offsite facilities would most likely result in the additional use of hazardous materials in limited quantities associated with normal logistics use such as janitorial and cleaning products, solvents, herbicides, and insecticides. However, compliance with regulations, standards, and guidelines established by the Environmental Protection Agency (EPA), State, county, and local agencies relating to the storage, use, and disposal of hazardous waste shall reduce the potential risk of hazardous materials exposure to a level that is less than significant.

A Health Risk Assessment (HRA) (MBA 2013) was completed for the project to analyze human health risks associated with airborne hazards. A HRA is a guide that helps to determine if current or future exposure to a chemical or substance could affect the health of a human population.

Comparable data on these types of air quality exposures in wildlife is difficult to obtain, although there are a number of studies from Europe that infer that air quality emissions can cause both genetic changes and nutritional stress in birds and mice (Dudley and Stolton 1995; Gordon et al. 2012; Constantini 2006; Solomon et al. 1998). The results of these studies are not comparable to the exposures at the WLCSP and no scientifically proven statements can be made on the effects to wildlife. Therefore, because the impacts are speculative, no mitigation measures can be specified.

Impacts to Lake Perris SRA would be well beyond any proven spread of toxics. The Lake Perris area would be protected by prevailing winds that would remove any air driven toxics from that area. In addition, the Lake Perris area would not be impacted by any waterborne toxics as the majority of the drainages flow around this area has no direct connectivity with the Lake Perris watershed.

The distances to the hunting clubs are well over 5,000 feet from the WLC boundary and the land use within the WLCSP will not affect the hunting club or the land use within the SJWA. In addition, the potential for airborne toxics to spread that distance is unlikely as 300 to 1,000 feet of dispersion is a more recognized number. Waterborne toxics would be captured by the detention basins planned at the southern end of the WLCSP. These basins by design would provide for bio-treatment of the water and still allow existing flows to continue offsite. The treated flows through the basin system would provide for better water quality than that which is currently happening across the WLCSP and the CDFW Conservation Buffer Area with continuing agriculture.

Sections 2.5 and 4.2.4 of the Specific Plan explain in detail land uses that are prohibited and permitted within setbacks as well as the overall layout of said setbacks. MM 4.4.6.1A further outline permitted uses within the minimum 250-foot clear setback along the southern property line of the WLCSP, both east and west of the SDG&E natural gas compressor plant. Permitted uses within or adjacent to this setback area include landscaping, drainage and water quality facilities, fences and walls, maintenance access drives, and similar related uses.

MM 4.4.6.1A prohibits parking lots within the 250-foot clear setback along the southern property line of the WLC Specific Plan area and the SJWA area. That measure specifies there will be no warehouse buildings within 400 feet and no truck activity areas within 250 feet of the SJWA area. It must be remembered this is a programmatic EIR and the project information is at a programmatic level (i.e., no specific information on building sizes or locations), therefore, it would be overly speculative to try to depict the specific locations of improvements or uses within the buffer areas at this time.

The proposed project is not required by state regulations to setback any given distance from the SJWA. State law requires that it is unlawful for any person, other than the owner, person in possession of the premises, or a person having the express permission of the owner or person in possession of the premises, to hunt or to discharge while hunting, any firearm or other deadly weapon within 150 yards (450 feet) of any occupied dwelling house, residence, or other building or any barn or other outbuilding used in connection therewith. (California Fish and Game Code Section 3004.) Additionally, it is illegal to fire a weapon from or over a public road or way open to the public. (California Fish and Game Code Section 3004.) In addition, California Fish and Game Code Section 3000, limits hunting hours. These restrictions relate to the hunter's actions, not allowed land uses. Thus, no "buffer" is required by state law between areas in which hunting is permitted and adjacent areas.

Section 4.4.6.1 of the DEIR examined the potential direct and indirect impacts of air pollution, noise, and light pollution on plants and animals within the SJWA in detail, and determined that the project design and recommended mitigation measures would help assure that potential impacts to these resources would be less than significant. There has been no empirical evidence submitted by the commenter or others that would demonstrate otherwise.

Response to Comment F-11-26. The commenter requests that all County and City trails within five miles of the project site be shown. The WLC should also show how they will educate the public about the de Anza National Historic Trail. The commenter questions how the project will accommodate public transit and how it will bring transit to the area. In addition, the commenter requests bike trails (Class I facilities) be integrated into the WLCSP.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Chapter 4, Section B of the TIA discusses the proposed bikeways and multi-use trails in the vicinity of the project site. The commenter requests that trails within five miles of the project site be identified to determine if the project “will cause a breakage in the trail system.” A breakage in the existing trail system would be caused by disrupting an existing trail at the project site. The revised Figure 28 of the revised TIA, copied below as Exhibit F-11-1, shows existing trails within the project site and identifies proposed trails that will connect to the existing trail network. Note that the project would add to the trail system and not break any trails.

The De Anza National Historic Trail traverses the WLC site and much of the southwestern United States (see map below from the National Park Service). In some places there are commemorative trails or markers but in most there are not. The established recreational trail of the Juan Bautista de Anza National Historic Trail in Moreno Valley is not located within the project site (see Exhibits F-11-2A and F-11-2B) and the trail is not identified on the City of Moreno Valley Master Plan of Trails (see Exhibit F-11-3 below). The project will provide an east-west trail connection between Cactus Avenue and the SJWA that would provide a better approximation of the De Anza Trail than currently exists.

The project would include transit-supportive features (see Chapter 12, Section D of the TIA, FEIR Volume 2 Appendix L-1) and it is expected that transit service will be provided once the project reaches a transit-supportable level of operations.

Figure 27 of the TIA shows the proposed bike lanes (Class II) at the project site, which are consistent with the City’s General Plan Policy 5.10.2 to “...maintain Class II and III bikeways as part of the City’s street system.” The on-street facilities will link to bikeways to the west to provide paths between residential areas outside WLC and employment centers within the WLC site (consistent with General Plan Policy 5.10.1).

(source: <http://www.anzahistorictrail.org/visit/explorer>)

Exhibit F-11-3: City of Moreno Valley Master Plan of Trails

Response to Comment F-11-27. The commenter indicates that the FEIR must analyze the health impacts on the well-being of warehouse workers within the WLCSP, especially those working outside. The FEIR examined both onsite and offsite worker risk pursuant to the Current OEHHA Guidance and found no significant impact. See Section 4.3 of the FEIR for more information.

In addition, there are a variety of state and national programs that protect workers from safety hazards, including high air pollutant concentrations (California Division of Occupational Safety and Health; Centers for Disease Control and Prevention 2012).

Response to Comment F-11-28. MM 4.16.4.6.1C would require LEED certification for the project buildings. LEED buildings would reduce energy and water used by the project. The definition of high-cube logistics warehouse can be found in Section 3.4.6.1 of the DEIR.

Response to Comment F-11-29. As part of the Conditions of Approval assigned by the City to entitle the construction of WLC, the applicant will be required (at its own expense) to construct mandatory infrastructure improvements stipulated by the City to meet the infrastructure demands of the project. These Conditions of Approval will ensure that the Level of Service (“LOS”) available for all local infrastructure impacted by the project will cover a LOS of D for intersections adjacent to freeways or employment centers and a LOS of C for all other services during and after buildout of the project. Further details regarding transportation improvements are included in Section 4.F of the TIA, included in the DEIR.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Please see Response to Comment A-4-4 regarding LEED certification. High-Cube warehouses are defined in the WLCSP on page 13-2 and further defined in the *ITE Trip Generation Manual Land Use 152 (9th edition, 2012)*. The main advantage associated with building such a structure is that it is appropriate for a variety of logistics-related uses and can easily be converted from one industry to another, or from one commodity to another, and is also suitable for light manufacturing. These types of facilities are also appropriate for a single user or for multiple tenants. The commenter is concerned about the mix of modern high-cubed and more standard warehousing in the Project, but while it is impossible at this time to project the actual mix that will be constructed, it is intended that this mix will meet the specific future demands of the logistics marketplace during the buildout process. The intent of the DEIR is to reflect a mix of high-cube logistics facilities with other types of distribution facilities to generate employee per square foot and employee wage data that were provided by a variety of government sources and NAIOP publications as documented throughout the DEIR and in the attached responses to other commenters' questions (see Response to Comment G-49-22). To assume a specific percentage of each type of logistics development within the WLC that differs from these overall averages would be purely speculative.

Importantly, the Development Agreement addresses a Local Hiring Program (LHP) for new employment opportunities within the WLCSP.

Regarding March Inland Port, it is to the benefit of Moreno Valley residents with appropriate experience and skills (as well as similar residents throughout the Inland Empire) that they will have access to two large logistics-based projects within the City at which they may be able to find employment opportunities. As explained previously in responses to other commenters (see Response to Comment G-90-6) the need for additional jobs in the City and the overall Inland Empire is paramount, as the overabundance of residents versus the number of jobs has had a deleterious impact on the quality of life in these areas. The TIA prepared as part of the revised DEIR, addressed the infeasibility of rail (see FEIR Volume 2, Section 4.F of the traffic impact analysis) and the impacts of the WLC on the City's existing infrastructure. Additional information can be found there related to the mitigation of such impacts and the adequacy of the infrastructure once these mitigation measures have been put in place.

The City has addressed the commenter's concerns related to the impact that the Panama Canal expansion will bring to the Inland Empire's warehousing logistics industry in the Response to Comment F-10-7.

Response to Comment F-11-30. Development of the private property within the WLCSP would not occur without the express permission and approval of the property owners (i.e., no other entity could propose or process any development proposals on the owner property without owner's express consent). Please see Response to Comment F-13-9 for information on proposed mitigation measure related to onsite rural residential uses.

Response to Comment F-11-31. A truck stop is not part of the WLC project. The permitted uses for the Logistic Support land use is included outlined in Section 2.2.5 of the WLCSP, a truck stop is not a listed as a permitted use.

Response to Comment F-11-32. The *Water Quality Management Plan* prepared for the project identifies the potential pollutants of concern from the project and identifies bioretention low impact development (LID) BMPs to be constructed to mitigate the impacts of these pollutants. The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County*, which requires the use of LID BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These

basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area.

The *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012) discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted Total Maximum Daily Loads (TMDLs) in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

The *Master Plan of Drainage Report* discusses the existing hydrologic conditions of the site and how flows currently reach the SJWA. In the current condition the storm water runoff from the project generally flows in a southerly direction to the San Jacinto River. A topographic divide located west of Theodore Street separates storm water flows to the San Jacinto River in two directions. Runoff east of the divide flows through the San Jacinto Valley at a gradient ranging from 1 to 2 percent to the San Jacinto Wildlife Area and ultimately drains toward the Gilman Hot Springs hydro-subarea. Runoff west of the divide flows to the Perris Valley Storm Drain at a gradient ranging from 1 to 2 percent and ultimately drains toward the Perris Valley hydro-subarea. Both hydro-subareas eventually flow to the San Jacinto River, approximately 10 miles south of the project site. This topographic divide has been maintained in the project condition. As outlined in the report, Watershed “A” flows to the west to the Perris Valley Storm Drain. Watersheds “B” through “F” drain to the San Jacinto Valley Wildlife Area. The drainage basins and flows leaving the project site have been designed to mimic the pre project condition.

A series of detention/infiltration basins will be constructed to mitigate potential impacts from increased runoff. These basins will be designed to infiltrate increased runoff and release flows through a weir structure that mimics pre-project conditions and provides for flows to reach the SJWA similar to existing conditions.

As outlined in the DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report Section 4.5 Runoff and Infiltration Volumes*, a water balance model was developed based on historical rainfall data to determine the amount of water infiltrated into the ground under existing conditions. The infiltration portion of the detention basins are sized to infiltrate the increased flows similar in quantity to what the existing conditions infiltrate. There will be no net loss of groundwater recharge.

DEIR Appendix G *Geotechnical Preliminary Geotechnical Evaluation for the World Logistics Center Specific Plan* determined the depth to groundwater. As stated in Section 5.0 Conclusions *“Groundwater was not encountered up to the maximum explored depth of 81 feet during our site investigations. Shallow groundwater is not expected to be a factor during site grading.”* The building foundations will be designed based on recommendations from the Final Geotechnical report prepared prior to final design.

DEIR Section 4.16.1 *Water Supply* discusses the water supply available for the project through the year 2035. This section determined that there is adequate water supply to serve the project with mitigation. Pertinent details from this section are presented below:

The project’s water consumption represents substantially less than 1 percent of the consumption yearly capacity and because the Eastern Municipal Water District (EMWD) indicates that water to service the project’s proposed industrial uses is available, no

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

significant water supply impacts would occur with implementation of the industrial use, and no mitigation would be necessary.

Metropolitan is currently engaged in planning processes that will identify solutions that, when combined with the rest of its supply portfolio, will ensure a reliable long-term water supply for its member agencies, the EMWD has determined that it will be able to provide adequate water supply to meet the potable water demand for the project in addition to existing and future users. However, until these supplies are secured, potential impacts of the proposed project on regional water supplies may be significant, and mitigation is required.

Specific Plan Design Features. Section 6.0 of the Specific Plan requires the careful use of xeriscape or drought-tolerant vegetation with minimal mechanical irrigation to minimize water use for landscaping. Sections 4.2 and 5.3 require implementation of water-conserving landscaping and Section 5.1.3 provides architectural design guidelines that will help minimize the consumption of water for landscape irrigation.

Mitigation Measures. The following measures are recommended to help ensure that the proposed WLC project will have less than significant impacts on long-term regional water supplies.

4.16.1.6.1A ~~Prior to issuance and recordation of a Final Map approval of a precise grading permit for each plot plan for development within the World Logistics Center Specific Plan (WLCSP), the developer shall submit landscape plans that demonstrate compliance with the World Logistics Center Specific Plan, the State of California Model Water Efficient Landscape Ordinance (AB 1881), and Conservation in Landscaping Act (AB 325). Landscape plans shall be approved prior to issuance of building permits and This measure shall be implemented to the satisfaction of the Planning Division. Said landscape plans shall incorporate the following:~~

- Use of xeriscape, drought-tolerant, and water-conserving landscape plant materials wherever feasible and as outlined in Section 6.0 of the World Logistics Center Specific Plan;
- Use of vacuums, sweepers, and other “dry” cleaning equipment to reduce the use of water for wash down of exterior areas;
- Weather-based automatic irrigation controllers for outdoor irrigation (i.e., use moisture sensors);
- Use of irrigation systems primarily at night or early morning, when evaporation rates are lowest;
- Use of recirculation systems in any outdoor water features, fountains, etc.;
- Use of low-flow sprinkler heads in irrigation system;
- Provide information to the public in conspicuous places regarding outdoor water conservation; and
- Use of reclaimed water for irrigation if it becomes available.

4.16.1.6.1B ~~Prior to issuance of any building permit for development within the WLCSP, the developer All buildings shall submit building plans that demonstrate the project has include water-efficient design features outlined in Section 4.0 of the WLCSP including World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division/Public Works. These design features shall include, but not be limited to the following:~~

- Instantaneous (flash) or solar water heaters;
- Automatic on and off water facets;
- Water-efficient appliances;
- Low-flow fittings, fixtures and equipment;
- Use of high efficiency toilets (1.28 gallons per flush [gpf] or less);
- Use of waterless or very low water use urinals (0.0 gpf to 0.25 gpf);
- Use of self-closing valves for drinking fountains;
- Infrared sensors on drinking fountains, sinks, toilets and urinals;
- Low-flow showerheads;
- Water-efficient ice machines, dishwashers, clothes washers, and other water-using appliances;
- Cooling tower recirculating system where applicable;
- Provide information to the public in conspicuous places regarding indoor water conservation; and
- Use of reclaimed water for wash down if it becomes available.

4.16.1.6.1C ~~Prior to issuance of any approval of a precise grading permit for development within each plot plan, irrigation plans shall be submitted to and approved by the WLCSP, the developer shall submit irrigation plans that demonstrate City demonstrating that the development will have separate irrigation lines for recycled water. The irrigation plans shall be approved prior to issuance of a building permit.~~ All irrigation systems shall be designed so that they will function properly with recycled water if it becomes available. This measure shall be implemented to the satisfaction of the City Planning Division and Land Development Division/Public Works.

Level of Impact After Mitigation. *With implementation of the recommended mitigation measures, expected impacts to water supply over the long term will be reduced to less than significant levels.*

A sewer lift station is proposed as identified in DEIR Appendix N-4 *Utilities Technical Memorandum World Logistics Center Specific Plan Sanitary Sewer Analysis*, Exhibit 4. This lift station will service buildings located east of Street A. The pump station is rated at approximately 970 gallons per minute and 85 feet of total dynamic head. The force main is sized at 12 inches.

Response to Comment F-11-33. See Response to Comment F-11-28 addressing comments relative to LEED. See Response to Comment F-3-20 relative to placing additional solar panels on the entire roof top. The WLC project has committed to the use of Tier 4 construction equipment where reasonably available. This is reinforced by mitigation measure MM 4.3.6.2A.

The commenter indicates that the NOP should have mentioned that the consumption of electricity would generate air pollutant emissions. There is no requirement that the NOP contain this information. The DEIR quantifies the greenhouse gas emission contribution from electricity (DEIR Section 4.7, pages 4.7-30 through 4.7-35). This estimation has been slightly updated in the revised analysis due to the project reducing its electricity usage and updated emission factors.

The commenter recommends the following mitigation:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
Buildings should be LEED Gold.	Partially Incorporated. MM 4.16.4.6.1C requires that buildings be LEED certified. Gold certification is not needed as discussed in Response to Comment A-4-4.
The project should incorporate solar.	Incorporated. MM 4.16.4.6.1C requires solar.
Off-road construction equipment should meet Tier III standards and by 2015 meet Tier IV standards.	Incorporated. MM 4.3.6.2A requires Tier 4 equipment.

Response to Comment F-11-34. The commenter states the project should provide mitigation for loss of agriculture. It should be noted MM 4.2.6.1A has been added to the EIR which will require acquisition of such a conservation easement to preserve offsite farmland or equal or more agricultural productivity compared to the unique farmland (refer to Response to Comment F-7A-39 in Letter F-7A for further information). The commenter also states the air quality analysis should account for loss of the existing agriculture in terms of greenhouse gases (GHG) and air pollution. The GHG analysis does quantify the loss of existing agriculture in the category “land use change” shown in Section 4.7 of the FEIR. The air quality and GHG studies were done using worst case conditions which assume zero onsite air pollutant and GHG emissions so that the project emissions would not in any way be masked or reduced by any existing onsite emissions.

Response to Comment F-11-35. The commenter mentions several issues. Mitigation for loss of agriculture is addressed in Responses to Comments F-11-34 and F-7A-39. The loss of raptor foraging is addressed in Response to Comment F-1-33.

DEIR Appendix J *Hydrology and Water Quality* has been modified to include infiltration areas that will be constructed to provide for mitigation of increased runoff (refer to FEIR Volume 2, Appendix J). A water balance model was developed based on historical rainfall data to determine the amount of water infiltrated into the ground under existing conditions. The infiltration portion of the detention basins are sized to infiltrate the increased flows similar in quantity to what the existing conditions infiltrate. There will be no net loss of groundwater recharge with construction of this mitigation. See also response to Response to Comment F-11-41. Parking lot design will be addressed with future plot plan specific application.

Response to Comment F-11-36. The commenter expresses concern about project truck traffic near schools. The commenter asks why trucks will be allowed to leave the I-215 and head towards WLC on city streets (Alessandro Blvd. or Cactus Ave.) instead of SR-60. He states that the TIA needs to have project trucks going east-west on SR-60 instead of city streets. The FEIR, not just the appendices, needs to show truck routes. The commenter also inquires about the maximum number of trucks that will use the warehouses not just in the first year but when the warehouses are used to their maximum capacity.

As explained in the TIA (Chapter 4, Section B, FEIR Volume 2, Appendix L-1), Alessandro Blvd. will be severed at Merwin Street to prevent use by any project traffic, and the Cactus Avenue Extension will be closed to truck traffic. Trucks from the project going west towards I-215 will route along SR-60 as requested by the commenter. See Exhibit F-11-5 below.

Exhibit F-11-5: Proposed Roadways and Phasing

Also an additional figure (Figure 8) has been included showing the designated truck routes in and around Moreno Valley.

A figure (Figure 47) has been added to the TIA (see Exhibit F-11-6 below) to clarify the relationship between truck routes and school location. The figure is part of a new section (Chapter 12.B) added to clarify that the project will not have safety impacts to nearby schools. In addition, a new memorandum dated July 2014 has been added to show the potential impacts to the proposed high school #5 located north of the SR-60. The memorandum determined that with the previously identified mitigation measures in the WLC DEIR no significant impacts would occur if the proposed school was developed.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

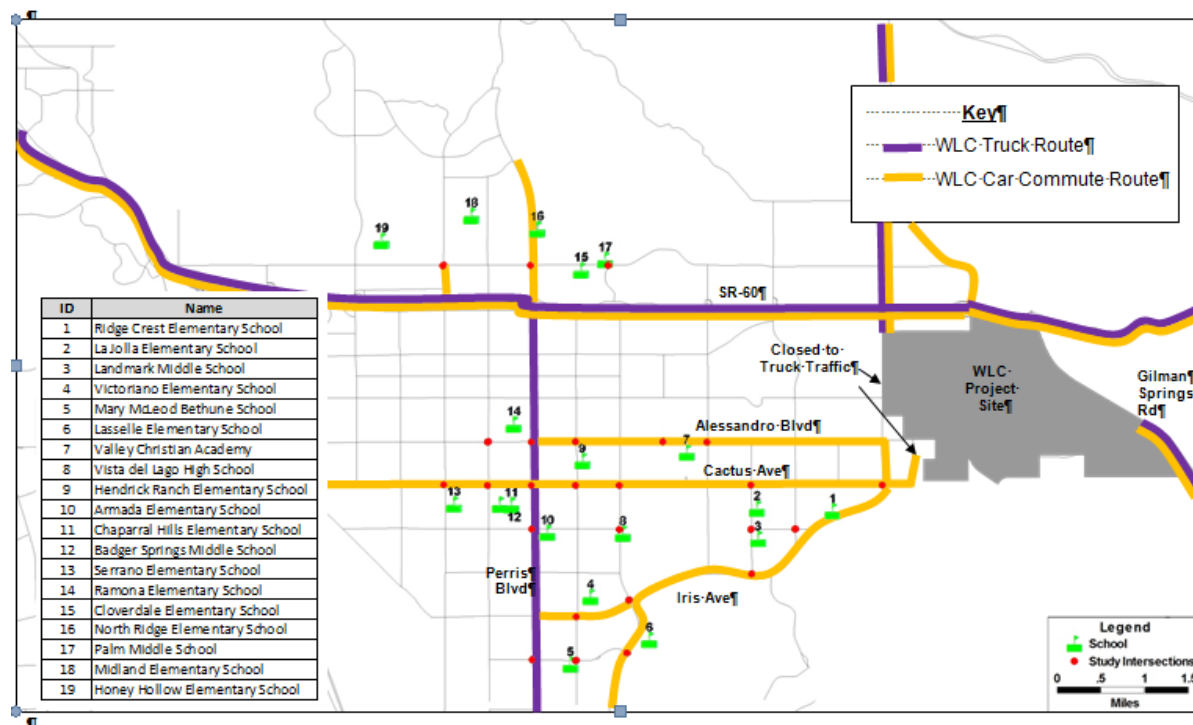

Exhibit F-11-6: Routes Taken by WLC Trips in Relation to Schools

The truck trip generation shown in the TIA (Chapter 4, Section C, FEIR Volume 2, Appendix L-1) is based on surveys of warehouses in full operation as requested by the commenter.

Response to Comment F-11-37. The commenter includes an additional discussion regarding off-site infrastructure needs and their associated costs, as well as requesting proof of the WLC's viability over a 20 year period. As previously stated, the Conditions of Approval mandated by the City in approving the project's entitlements requires the applicant (at its own expense) to construct the mandatory infrastructure improvements as stipulated by City staff. That being said, there is no way to document or guarantee that the project will definitely be viable over a 20-year period, due to the fact that the real estate market is cyclical in nature and changes are inevitable and difficult to predict. While it is inevitable that there will be a greater demand for the project's logistics facilities in some years than in other years, it is important to note that the applicant has sufficient confidence in the overall longevity and success of WLC that it has been and continues to be investing millions of dollars to entitle the project and build the necessary upfront infrastructure. The direct project infrastructure impacts and mitigation measures are identified in Section 11E of the project TIA (FEIR Volume 2, Appendix L-1) and the cumulative impacts and mitigation measures are identified in Section 11F of the project TIA (FEIR Volume 2, Appendix L-1).

Response to Comment F-11-38. Burrowing owl surveys were conducted on the WLCSP study area in 2005, 2006, 2007, 2010, 2012, and 2013. Owls were found during formal surveys only in 2005 and 2013. No more than a single pair has ever been recorded in a single year of surveys. The statement regarding leaving the land undisturbed for at least 6 months is not necessary as the land owner has the right to conduct business on the land for agricultural as that is the current land use. There is no requirement for leaving land fallow prior to surveys under any regulations or guidelines.

With regard to Figure 4.4.5 of the DEIR, the project biologist agrees that there are suitable burrows within the banks of Drainage features 4, 7, 8, and 9. However, burrowing owl has only been observed in Drainage feature 4 during the 2005 survey season. Owls have not been observed within any of the

Drainage features since the 2005 surveys. The owls found in 2013 were found in a road berm on the extreme southern end of the WLCSP (FCS-MBA 2013 – FEIR Volume 2, Appendix E-5). The drainages, with the exception of Drainage 9 (the easternmost drainage in Figure 4.4.5) would be removed. Habitat for burrowing owl may be present in the proposed detention basins, but due to the limited number of owls present, it is unlikely for owls to inhabit the area in sufficient numbers to be considered a significant impact under MSHCP guidelines (more than 3 pairs). If burrowing owls are found during any focused survey or during pre-construction surveys, MM 4.4.6.4D would be implemented and the breeding burrowing owls relocated to CDFW approved burrows created in the 250-foot buffer area along the southern edge of the WLCSP.

The comment regarding criteria cells along Gilman Springs Road is valid. There are portions of Criteria Cells 1204 and 1297 that would be within the WLCSP. While exact development strategies have not yet been proposed, the DEIR assumed that the cells would be impacted by construction. Section 5.1.1 of the MSHCP Consistency Analysis document addresses the issue of these criteria cells. The document states the following:

Cell Group X: Criteria Cells 1204 and 1297

Conservation within Cell Group X will contribute to assembly of Proposed Core 3. Conservation within this Cell Group will focus on chaparral, coastal sage scrub, and grassland habitat. Areas conserved within Cell Group X will be connected to habitat proposed for conservation in Cell Groups C to the east, V to the northeast, and to chaparral and grassland habitat proposed for conservation in Cell Group E to the south. Conservation within Cell Group X will range from 65 percent to 75 percent of the Cell Group focusing in the northeastern portion of the Cell Group.

Within the southwestern portion of Cell Group X, and specifically within Criteria Cells 1204 and 1297, the WLCSP development and one potential debris basin encroaches on 114.2 acres of the cells. Under the MSHCP, conservation for Cell Group X is proposed for the northeastern portions of the Cell Group. The WLCSP development is not within the targeted conservation areas and, therefore, will not adversely affect the City/County's ability to achieve the goals of the MSHCP.

All created drainage features will be created with soft-bottom channels. Drainage features that will remain in place include Drainage 9, 12, and 15. All other drainages will be impacted and riparian habitat will be created in the proposed detention basins with spreading features.

Response to Comment F-11-39. New power poles will be designed to eliminate electrocution risk of raptors that perch on power poles. The WLCSP would have no say over the types of power poles placed outside of the boundaries of the respective developments, especially if they are not part of the proposed project development. Replacement of poles, outside of the project footprint, will not be the responsibility of the developer but would fall under the guidelines of the local electric utility.

While we agree that power poles in general greatly reduce the natural component of open spaces areas, properly designed “raptor-safe” power poles can provide perching locations for raptors, increasing their chances for capturing prey.

Response to Comment F-11-40. Figure 4.9.3 Proposed Drainage System on page 4.9-27 of the DEIR has been updated and shows the sizes of pipes carrying storm water. DEIR Appendix M-2 *Water Resources World Logistics Center Specific Plan Water Systems Analysis* Figure 4 shows the recommended water system improvement underground pipelines and their proposed sizes and the *World Logistic Center Recycled Water Systems Analysis* Exhibit 6 shows the recommended recycled water system improvement underground pipelines and their proposed sizes. DEIR Appendix N

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Utilities *World Logistics Center Specific Plan Sanitary Sewer Analysis* Exhibit 2 shows the recommended sewer system improvement underground pipelines and their proposed sizes.

Response to Comment F-11-41. The DEIR Appendix J-1 *Hydrology and Water Quality Master Plan of Drainage Report* and *WQMP* provide for the construction of bioretention, detention and infiltration areas to mitigate the impacts from the quantity and quality of runoff as discussed in Responses to Comments B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Wildlife, including recommended changes to the wording of MMs 4.9.6.1A and 4.9.6.3C (refer to Response to Comment F-5-13) and a new MM 4.9.6.1B (refer to Response to Comment F-5-23) in response to several comments regarding water quality.

Response to Comment F-11-42. The EIR clearly illustrates the 85-acre property which is the subject of the proposed annexation (see Figure 3.6 in the DEIR Section 3.0). The property is located along the easterly side of Gilman Springs Road, northerly of existing Alessandro Road.

As fully explained in DEIR Section 3.4.5, the property to be annexed has been within the City's official Sphere of Influence for nearly 30 years as a result of a formal action by Riverside County's Local Agency Formation Commission (LAFCO) in 1985. That action by the LAFCO established the intent for this property to become part of the City of Moreno Valley. That eventuality has been a part of all planning activities for the Moreno Valley since 1985. The annexation process will complete that process.

The annexation of 85 acres of the WLC project will be processed through Riverside County's LAFCO separately from the planning entitlements which are being processed through the City of Moreno Valley. Part of the LAFCO process requires compliance with CEQA and therefore, the annexation is being addressed in the EIR for the overall WLC project. The current City process will establish zoning for this property, known as "pre-zoning," in advance of LAFCO's final annexation action. Both the CEQA review and the pre-zoning activities will occur before the formal processing with LAFCO.

Response to Comment F-11-43. A Development Agreement will be part of the FEIR and will be available for public review prior to consideration by the City Council. All persons requesting information regarding the WLC project will receive all notices regarding the annexation process.

As discussed in Section 11 of the Specific Plan, each building will require the City's review and approval of a discretionary Plot Plan application which will provide the details of architecture, layout, access, landscaping, elevations, etc. Prior to the approval of any of these Plot Plan applications, a separate CEQA compliance process will be conducted by the City to verify conformance with the overall WLC EIR and to address any site-specific impacts that may not have been addressed in the programmatic document.

Response to Comment F-11-44. The commenter suggests the EIR address the climate change impacts on the project and the projects overall effects on climate change. CEQA does not require that an EIR analyze the impacts of the environment on the project. The DEIR has adequately dealt with all the effects that can be expected from climate change nonetheless consistent with the recommendations to respond to the impacts of climate change outlined in the DEIR Water Supply Assessment (WSA) contained in Appendix M the project has reduced its water supply needs by implementing water use efficiencies throughout the project. These efficiencies include the use of low water use fixtures in the buildings, drought tolerant landscaping and recycled water where available. As outlined in the WSA Section 3.2 *Project Demand* the projected water demand for the project is made up of two components, building demand and irrigation demand. As stated in the WSA, "A majority of the estimated demand would be for landscape irrigation. The developers of this project are proposing very low water use landscaping which would reduce the projected project demand significantly."

Climate Change is discussed in Appendix A of the Water Supply Assessment, Section 7. *“EMWD has considered the impact of climate change on water supplies as part of our long term strategic planning. Climate change has the potential to affect not only local demand and supplies, but to reduce the amount of water available for import. Potential changes that may impact water supply include:*

- *Warmer temperatures leading to higher demand for water within EMWD’s service area and throughout California;*
- *Reduction in the Sierra Nevada snow pack;*
- *Increased intensity and frequency of extreme weather events; and*
- *Rising sea levels resulting in increased risk of damage from storms in the Delta, high tide event and the erosion of levees in the Delta.*

“To limit the impact of climate change, EMWD’s long term planning focuses on the development of reliable local recourses and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD’s service area.”

As discussed above, this project is consistent with these water use efficiencies and MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C will be implemented to mitigate the water supply impacts, including the impacts of climate change on the project, to less than significant.

DEIR Section 4.16.1.6.1 Adequate Water Supply

The City is amending the text in DEIR Section 4.16.1.6.1 to clarify the inclusion of impacts to the project from climate change. This change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the DEIR is as follows (refer to FEIR Volume 2):

The Water Supply Assessment considered the impact of climate change on water supplies. Climate change has the potential to affect not only local demand and supplies, but to reduce the amount of water available for import. Potential changes that may impact water supply include:

- Warmer temperatures leading to higher demand for water within EMWD’s service area and throughout California;
- Reduction in the Sierra Nevada snow pack;
- Increased intensity and frequency of extreme weather events; and
- Rising sea levels resulting in increased risk of damage from storms in the Delta, high tide event and the erosion of levees in the Delta.

One of the outcomes of climate change could be more frequent limitations on imported supplies. To limit the impact of climate change, EMWD’s long term planning focuses on the development of reliable local recourses and the implementation of water use efficiency. This includes the full utilization of recycled water and the recharge of local groundwater basins to increase supply reliability during periods of water shortage. EMWD is also focused on reducing demand for water supplies, especially outdoors. Increasing the use of local resource and reducing the need for imported water has the dual benefit of not only improving water quality reliability, but reducing the energy required to import water to EMWD’s service area. The project developer is committed to water use efficiency and minimizing the use of potable water for landscape irrigation by using low

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

water use fixtures, drought tolerant plants and recycled water where available as outlined in MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C

Climate change is taken into account as part of the rainfall characteristics and is accounted for in the hydrologic and hydraulic analysis of the drainage facilities. As stated in section 3.2 Design Guidelines of the DEIR Master Drainage Report “Drainage facilities shall be designed in accordance with the Riverside County Hydrology Manual and Design Manual Standard Drawings.” The Hydrology Manual includes the most up-to-date rainfall characteristics as required by the local, state, and federal regulations. The design of the drainage facilities include a factor of safety in the form of freeboard to account for uncertainties due to climate change, rainfall patterns, friction factors and other uncertainties. One foot of freeboard was included in the detention basins and drainage facilities to account for these uncertainties. At the time of final design the amount of freeboard to account for these uncertainties will be finalized. MM 4.9.6.1.A below requires the project to mitigate its impacts, including any impacts to the project as a result of climate change.

4.9.6.1A Prior to issuance of ~~any development~~ any building permit within the Specific Plan area, the developer shall ~~place~~ construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) ~~as appropriate~~ within each proposed watershed, as outlined in the project hydrology plan, to mitigate the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing ~~increased runoff for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition~~ and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term “construct” shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow ~~in such a way~~ that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment transported through the project boundary so that the existing sediment carrying capacity is maintained.

DEIR Section 4.9.6.1 Drainage Pattern and Capacity-Related Impacts Project or Specific Plan Design Features

The City is amending the text in DEIR Section 4.9.6.1 to clarify the inclusion of impacts to the project from climate change. This change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the DEIR is as follows (refer to FEIR Volume 2):

These facilities will be designed based on the most up-to-date hydrology based on the latest rainfall to runoff patterns in compliance with local, state, and federal regulations. The design of the drainage facilities include a factor of safety in the form of freeboard to account for uncertainties due to climate change, rainfall patterns, friction factors and other uncertainties. One foot of freeboard was included in the detention basins and drainage facilities to account for these uncertainties. At the time of final design the amount of freeboard to account for these uncertainties will be finalized. The facilities are being designed to provide both detention and infiltration to mitigate increases in runoff volume, velocity and peak discharge as outlined in the following mitigation measure.

The project will comply with the *Water Quality Management Plan for the Santa Ana Region of Riverside County* (approved by the Santa Ana Regional Water Quality Control Board October 22, 2012), which requires the use of Low Impact Development (LID) BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Flows from the project will be treated first by LID BMPs where the flow will be infiltrated, evapotranspired, or treated. As required by MM 4.9.6.1A, the treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through a series of on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. All runoff from the site will be treated by LID BMPs and then routed through the detention and infiltration basins before it leaves the project area and into Mystic Lake and the San Jacinto Wildlife Area. The effects of climate change on pollutant loadings and residence time will be addressed in accordance with the requirements at the time of final design. LID BMPs have been shown to maximize the benefit for improved water quality. This would include the design based on the appropriate pollutant loads for the project from all sources including climate change.

The Water Quality Management Plan Guidance Document for the Santa Ana Region of Riverside County discusses water quality impacts and the use of LID BMPs:

“LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above, and those subject to adopted TMDLs in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives.” (p. 19)

DEIR Section 4.9.6.3 Operational Related Water Quality Impacts Treatment Control BMPs

The City is amending the text in Draft EIR Section 4.9.6.3 to clarify the inclusion of impacts to the project from climate change. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR. The addition to the text of the Draft EIR is as follows (refer to FEIR Volume 2):

All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master WQMP's water quality requirements identified previously. This would include the design based on the appropriate pollutant loads for the project from all sources including climate change.

The commenter discusses background information on climate change. The DEIR contains background information on climate change (DEIR Section 4.7, pages 4.7-1 through 4.7-5).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The commenter also indicates that climate change should be taken into account when addressing the impact of the project on air quality, water supply, flood hazards, and biological resources.

Regarding air quality, please refer to Response to Comment F-1-74. Water supply and flooding issues are addressed in general in Responses to Comments G-4A-1 through G-4A-7 in Letter G-4A, Response to Comment D-1-1, and Response to Comment F-5-17.

Impacts to biological resources are addressed in general in the Responses to Comments to Letter B-3 (State Department of Fish and Wildlife) and Responses to Comments F-7A-25 through F-7A-36.

Response to Comment F-11-45. The commenter suggests mitigation measures to reduce greenhouse gases, as discussed below:

Suggested Mitigation Measure	Response
Project buildings meet LEED Gold certification.	Partially Incorporated. MM 4.16.4.6.1C requires LEED certification for the buildings. However, Gold certification is not needed as discussed in Response to Comment A-4-4.
Design buildings for passive heating and cooling, natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.	Already Included. Page 4.16-39 of the DEIR states, "The project will encourage passive heating and cooling opportunities into the design or modification of the high-cubed warehouse developments and ancillary land uses." MM 4.16.4.6.1B would place skylights where it does not affect placement of solar panels and has been edited to include this measure.
Design buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.	Incorporated. MM 4.16.4.6.1C requires LEED certification and exceeding Title 24 energy efficiency requirements by 10 percent. MM 4.16.4.6.1B requires energy efficient lighting, appliances, and equipment.
Reduce the use of pavement and impermeable surfaces.	Partially Incorporated. MM 4.16.4.6.1A requires cool pavement, porous materials, or permeable or porous pavement.
Require water re-use systems.	Incorporated. MM 4.16.1.6.1C will provide separate irrigation lines for recycled water.
Install light emitting diodes (LEDs) for traffic, street and other outdoor lighting.	Partially Incorporated. As stated in Section 4.3.2 of the WLCSP, street lighting would be high pressure sodium or LED. MM 4.16.4.6.1B requires energy efficient lighting.
Maximum water conservation measures in buildings and landscaping, using drought tolerant plants in lieu of turf, planting shade trees	Already Included. MM 4.16.1.6.1A, 4.16.1.6.1B, and project design features would reduce water use. MM 4.9.6.3A requires tree planting. As discussed on page 4.7-42 of the DEIR, "The Specific Plan indicates that vehicle parking areas are to be landscaped to provide a shade canopy (50 percent coverage at maturity).
Ensure that the project is fully served by full recycling and composting services.	Already Included. MM 4.7.6.1A would confirm that all tenants have recycling procedures set in place and that recycling is available. Composting services may be provided if there is a future need.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
Ensure that the project's wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.	Not Included. It is not feasible for the project to require certain standards for landfills or wastewater treatment plants. Those facilities will be required to comply with applicable regulations and rules.
Installing the maximum possible photovoltaic array.	Incorporated. MM 4.16.4.6.1C requires solar panels for office-related uses.
Utilize wind energy to the extent necessary and feasible.	Not Included. Wind energy is not necessary for the project because the project would have onsite solar.
Install solar water heating systems to generate all the project's hot water requirements.	Already Included. Instantaneous or solar water heaters are required as part of MM 4.16.1.6.1B.
Install solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations.	Incorporated. MM 4.16.4.6.1C requires solar panels. MM 4.3.6.4A requires electric vehicle charging stations. The electricity for the electric vehicle charging stations could be powered by onsite solar generation. Wind energy is not necessary for the project because the project is incorporating onsite solar.

Response to Comment F-11-46. The commenter recommends the following mitigation measures related to project construction:

Suggested Mitigation Measure	Response
Utilize recycled, low carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials.	Partially Incorporated. MM 4.16.4.6.1C requires LEED certification. In LEED BD+C: New Construction (version 4), points can be earned through building life-cycle impact reduction, building product optimization, building sourcing of raw materials. LEED version 2009 has points for recycled content of material, regional materials, and rapidly renewable materials.
Minimize, reuse, and recycle construction-related waste.	Already Included. The California Green Building Standards Code requires that a minimum of 50 percent of nonhazardous construction and demolition waste be recycled and/or salvaged (Code section 5.408.1).
Minimize grading, earth-moving, and other energy-intensive construction practices.	Partially included. As discussed in the Final EIR, changes to the project description result in reduced construction and grading intensity. While the same quantity of earth moving is expected, the duration over which grading and earth-moving would occur has been extended, thereby reducing daily emissions from equipment and fugitive dust.
Landscape to preserve natural vegetation and maintain watershed integrity.	Partially Included. The majority of the site is used for dry land farming and is disked yearly. There is very little natural vegetation. The WLCSP has committed to use native vegetation to the maximum extent practical (Sections 5.1.8.3, 5.1.8.6, 5.1.8.8, and 5.2.3 in the WLCSP).
Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.	Partially Incorporated. The best available technology is used for the construction equipment. MM 4.3.6.2A requires Tier 4 construction off-road equipment. Alternative fuels

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	such as natural gas are generally not available; therefore, it is not feasible to require that the equipment utilize alternative fuels.

Response to Comment F-11-47. The commenter recommends the following mitigation measures related to transportation:

Suggested Mitigation Measure	Response
Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles.	Already Included. MM 4.3.6.4A requires that the tenants participate in Riverside County's Rideshare Program. In addition, the measure also requires preferential parking for fuel efficient and carpool/vanpools. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
Create a car sharing program within the planned community.	Not Incorporated. The proposed project is not a planned community. In addition, this is not incorporated because Riverside County already has a car sharing program, which the project will participate in pursuant to MM 4.3.6.4A.
Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.	Not Incorporated. There is not expected to be any relationship between tenants at the WLC. As result, there is no need to for individuals to travel between buildings on a routine basis. As such, there is no need for a neighborhood electric vehicle system.
Provide necessary facilities and infrastructure to encourage residents to use low or zero-emission vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations.	Already Included. MM 4.3.6.4A requires electric vehicle charging stations. MM 4.3.6.3C requires an alternative fueling station.
Provide a shuttle service to public transit within and beyond the planned community.	Incorporated. Public transit would be incorporated into the design of the WLC. See Section 3.4.6.2 of the FEIR.
Incorporate bicycle lanes and routes into the planned community's street systems.	Already Included. MM 4.3.6.4A requires Class II bicycle lanes on all project streets.

Response to Comment F-11-48. Please see the Responses to Comments F-7A-67 and F-7A-68 and F-8-118.

Response to Comment F-11-49. The commenter encourages the FEIR to examine all project and cumulative impacts of the project. The DEIR, plus the revised technical studies and revised discussion in the DEIR (FEIR Volume 2), and this FEIR document (Volume 1) provide sufficient information to the decision makers regarding the direct, indirect, and cumulative impacts of the proposed WLC project.

Response to Appendix 1 (General Plan Amendments Summary for Riverside County). The appendix was cited in the comment letter in reference to the comment that the Riverside County General Plan Amendments be included in the cumulative impacts for the project. The appendix was reviewed but the cumulative analysis methodology outlined in Section 2.10, Cumulative Impacts, uses the growth projections method rather than the list of projects method and so the detailed list of development projects in the county provided by the commenter is appreciated but unnecessary.

Response to Appendix 2 (Center for Community Action and Environmental Justice - Truth and Consequences). This appendix provides a collection of information that discusses a range of health effects related to particulate matter and, specifically, diesel particulate matter (PM). The City acknowledges this information and have provided an extensive discussion in the DEIR, the revised analysis, and Master Response-2: Health Effects of Diesel Particulate Matter, which describes the health effects of diesel PM and the potential impacts from the project.

Response to Appendix 3 (Global Trade, Good Movement and the Resulting Health Crisis in the Inland Valleys). This appendix provides a collection of information that discusses a range of health effects related to particulate matter and specifically diesel PM as they relate to goods movement. We acknowledge this information and have provided an extensive discussion in the DEIR, the revised analysis, and Master Response-2: Health Effects of Diesel Particulate Matter, which describes the health effects of diesel PM and the potential impacts from the project.

Response to Appendix 4 (The Press-Enterprise Region: Inland air quality remains almost worst in nation). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality in the Inland Empire.

Response to Appendix 5 (L.A./ Long Beach and Riverside Most Polluted in USA Says Lung Association). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality in Southern California.

Response to Appendix 6 (Smog May Cause Lifelong Lung Deficits). This appendix provides a description and summary of a long-term health study conducted by the USC called the Children's Health Study.

Information from this study has been added to the revised analysis as discussed in the Master Response-2: Health Effects of Diesel Particulate Matter.

One figure of interest in this appendix is shown on Comment Letter F-11, Appendix 6, page 47, which relates annual lung function growth to ambient PM₁₀ measurements from the USC Children's Health Study. The correlation coefficient—which measures the strength and the direction of a linear relationship between two variables—shows a value of -0.57, which indicates a negative relationship between lung function growth and PM₁₀ concentrations. The square of the correlation coefficient, called the coefficient of determination, is useful because it gives the proportion of the variance (fluctuation) of one variable that is predictable from the other variable. It is a measure that allows us to determine how certain one can be in making predictions from a certain model/graph. For this exhibit, the correlation of determination is 0.32 (square of -0.57). Based on the linear relationship shown in this figure, this value means that only 32 percent of the total variability in the annual function growth can be explained by the linear relationship with PM₁₀ measurements. The remaining 68 percent of the total variation in annual lung function growth remains unexplained. While this figure is of great interest, the relationship between lung function growth and PM₁₀ is not a simple one as depicted in the figure. Factors such as the constituents of the PM₁₀, some of which are fugitive windblown dust, and socioeconomic factors combine to make the relationship much more complicated than the figure depicts.

Response to Appendix 7 (The Effect of Air Pollution on Lung Development from 10 to 18 years of Age). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution effects on youth.

Response to Appendix 8 (Ultrafine particles in air pollution may heighten allergic inflammation in asthma). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution correlation with asthma.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Appendix 9 (The Effect of Air Pollution on Lung Development from 10 to 18 years of Age). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution effects on youth.

Response to Appendix 10 (USC Study Finds Air Pollution Exposure at Schools Linked to Childhood Asthma Development). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution correlation with asthma.

Response to Appendix 11 (Untitled by ClickGreen staff. Published Sun 18 2011 10:47). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution.

Response to Appendix 12 (California Watch - Southern Californians at risk of death from air pollution, EPA says). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality in Southern California.

Response to Appendix 13 (Hearts and air pollution: Five deadly air pollutants on five continents). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution correlation with heart attacks.

Response to Appendix 14 (Big Air Pollution Impacts on Local Communities: Traffic Corridors Major Contributors to Illness from Childhood Asthma). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution correlation with asthma.

Response to Appendix 15 (Latino Communities Hardest Hit by Air Pollution). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality impacts on Latino communities.

Response to Appendix 16 (Pollution During Pregnancy Linked to Lower IQ). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality impacts on pregnant mothers.

Response to Appendix 17 (Pregnant mothers at risk from air pollution). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air quality impacts on pregnant mothers.

Response to Appendix 18 (Determination of Elemental Carbon and Organic Carbon Concentrations During the Southern California Children's Health Study, 1999-2001). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution effects on youth.

Response to Appendix 19 (Inland air hard to swallow for youth). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution effects on youth.

Response to Appendix 20 (Region's smog stunts young lungs). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to air pollution effects on youth.

Response to Appendix 21. This appendix examines the relationships between the growth in logistics industry in the Inland Empire and associated societal cost due to increased pollution-caused health effects.

While providing an interesting discussion of the relationships between the growth of the logistics industry and societal costs, the analysis does not take into account that emission controls on diesel trucks already mandated by the ARB, which have resulted in substantial decreases in emissions of PM_{2.5} in the past 5 years and will continue to do so in the next 10 years. This is shown clearly in Exhibit 16 of the revised analysis (Exhibit F-11-7 below), which shows the trends in large truck vehicle emission rates for diesel PM in the South Coast Air Basin.

Exhibit F-11-7: Average Diesel PM Emissions in the South Coast Air Basin

In addition, Exhibit 2 of the revised analysis (Exhibit F-11-8) below shows the historical trends from 2001 to 2012 for PM_{2.5} in the Inland Empire. PM_{2.5} is often used as a surrogate for diesel PM. The exhibit shows definite downward trends in PM_{2.5} at all locations despite the large increase of the logistics industry in the Inland Empire as identified in this appendix. This then calls into question some of the conclusions reached in this appendix regarding future PM_{2.5} levels and associated societal costs.

Letter F-12

<http://www.pe.com/local-news/riverside-county/moreno-valley/moreno-valley-headlines-index/20130407-moreno-valley-community-forum-addresses-draft-charter-process.ece>

Good evening Mr Gross,

An additional comment on the World Logistic Center's DEIR. The article on this page is about the City Council of Moreno Valley rushing to produce a Charter for the City. Will such a Charter allow the WLC to have the land proposed for the project zoned for warehousing or to allow for no zoning? How could such a City Charter help the WLC developer realize his dream of 41,600,000 sq ft of warehousing? Please keep me informed of all meeting notices and future documents related to the World Logistic Center (WLC). I assume you received my hard copy delivered to the City earlier today.

[Comments \(2\)](#)

Moreno Valley residents who attended a Sunday, April 7, community forum asked why the City Council appears to be rushing to put a proposed city charter on the November ballot.

About two dozen residents listened as Councilman Richard Stewart explained how a City Council subcommittee made up of him, Mayor Tom Owings and special advisor and attorney Michael Geller are drafting what could become Moreno Valley's constitution. The committee, which has met twice, wants to have a draft prepared by June, Owings said last week.

A charter would be similar to a city constitution. Charter cities have "home rule" over municipal affairs, which trumps state rules governing the same topics.

The subcommittee, which will meet at 1:30 p.m. Wednesday, April 10, at City Hall, has said that Moreno Valley's charter will be modeled after those of other cities, including Riverside.

"A charter by itself is not a threat to anyone," Stewart said. "It's what's in the charter."

Residents Craig Givens and Curtis Gardner, members of a group called Concerned Citizens of Moreno Valley, questioned why city officials want to push a document that could define roles, including those of the mayor, city council and city manager, set terms limits and regulate campaign financing. They urged residents to sign their petition asking voters whether Moreno Valley should become a charter city. If so, Givens and Gardner's group thinks voters should determine whether a 15-member residents' commission drafts a charter, instead of the City Council.

"They are rushing through this process," Givens said. "This method of trying to do this in two months, there's something fishy about that."

He said the subcommittee must complete the draft by June in order to hold two mandated public hearings in time for it to be submitted by an August deadline for the November ballot.

"That's why they're in a rush," Givens said. "The train has left the station. They are in a rush to ram this down our throats."

Residents agreed, describing the move as a power grab, and repeatedly asked Stewart for an explanation. They also said they believe a draft charter already exists.

Stewart denied that a draft charter already is complete. He also said he didn't know until last week that the draft charter was to be completed by June. Stewart said he believes Owings and the other council members are eager to move and don't want to waste time.

Stewart said he supports the City Council's subcommittee effort to draft a charter because large groups like the one Givens and Gardner are proposing can be difficult to manage. He said public participation also is hard to garner.

Givens disagreed.

"A charter could be great thing if done by residents," he said. "If a charter is done the right way, no developer can help a few people get elected and then run the city. The citizens would have the power to limit the administration and politicians from running your city."

Resident Scott Heveran said he thinks the city's charter should allow for residents to determine the city's vision.

"We have a city manager whose vision is for warehouses," he said. "It's like warehouses or nothing. We need a charter so we can vote for a person who has our vision for the city."

Heveran and other residents said they want similar charter forums to be held throughout the city. They also encouraged each other to read drafts that have been posted to the city's website and email Stewart and Owings.

RESPONSES TO LETTER F-12

George Hague

Response to Comment F-12-1. The commenter has provided an article he obtained from the *Press Enterprise* newspaper which provides an account of a Moreno Valley Community Forum held on April 7, 2013 addressing a proposed draft City Charter. The letter or the article does not mention the WLC project by name therefore, the comment does not apply to the WLC project.

The City will keep the commenter informed of any future meeting notices and future documents as they become available for public review. The hard copy of your comment letter F-11 was received by the City and responded to in this FEIR (refer to Volume 1).

RE: World Logistics Center Project, Comments on Draft EIR (SCH#2012021045)

Greetings:

On behalf of the Sierra Club, Moreno Valley Group, and Residents for a Livable Moreno Valley, I hereby submit these comments on the World Logistics Center Project Draft EIR opposing that Project.

GENERAL COMMENTS

The California Environmental Quality Act (CEQA) was adopted as a disclosure and transparency document. The theory is that by providing a document that adequately describes the environmental consequences of a project to decision makers and the public, the decision makers will make a rational decision based upon the true environmental consequences of the project and if they do not, the electorate can hold them accountable for their decisions. The core of this statutory structure is the adequacy of the document as an informational document.

Unfortunately, the Draft EIR for this Project fails as an informational document. The EIR misleads decision makers and the public as to the extent and severity of the Project's environmental impacts. On top of these inadequacies, the Draft EIR is almost constantly conclusory, and does not provide the analysis or examination required by CEQA to inform the public and decision makers of the analytical pathway taken from facts to conclusions. The findings are also not supported by substantial evidence in the record, but rather only by the

baseless conclusions cited in the EIR.

PROJECT DESCRIPTION AND SUMMARY

The proposed Project would result in the construction and operation of approximately 41.6 million square feet of distribution warehouse uses on 2,710 acres, plus an additional 1,104 acres for open space and public facilities, for a total Project footprint of 3,918 acres. It must be noted that 1,085 acres of the open space area are apparently owned by the California Department of Fish and Wildlife and SDG&E, and would be designated as Open Space anyways in the City's General Plan. The only real change to the 1,085 acres would be their change to "Specific Plan" designation. Hence the Project *really* proposes 2,710 acres of warehousing and 19 acres of *additional* open space *and/or* public facilities compared to what would exist without the Project.

2

USE OF PROGRAMMATIC EIR

The Draft EIR is prepared as a "programmatic EIR." A "program EIR" is one which may be prepared on a series of actions that can be characterized as one large project and are related in specified ways, such as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways. Cal. Code Regs., tit. 14, § 15168, subd. (a)(4). A program EIR is designed to (1) Provide an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action, (2) Ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis, (3) Avoid duplicative reconsideration of basic policy considerations, (4) Allow the lead agency to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts, and (5) Allow reduction in paperwork. Cal. Code Regs., tit. 14, § 15168, subd. (b). A prior EIR may then be relied upon where effects were examined at a sufficient level of detail in a prior EIR to allow effects to be mitigated or avoided by site specific revisions. (Pub. Res. C. § 21094(a))

3

The programmatic EIR in this instance fails to accomplish these goals. Instead, the programmatic EIR here appears to have been chosen to temporarily avoid specificity in the document and certain mitigation and then, later, rely on the lack of evaluation and mitigation to make subsequent CEQA approvals. If portion of the Project is later determined to be consistent with this EIR, then much of the future review set forth in the mitigation measures will not be required. For example, if a building approval is deemed not discretionary but instead a ministerial or design review issue, then MM 4.15.7.4A requiring a further traffic study could be avoided. This misuse of the environmental review process must not be condoned.

4

The use of a Program level EIR renders it impossible to fully comprehend the effects of this Project.

DEVELOPMENT AGREEMENT AND PROJECT DESCRIPTION

5

The EIR fails to disclose, discuss, or evaluate the Development Agreement or any Project plans. Without such disclosure and discussion, it is impossible to evaluate the Project's potential

effects. The EIR must be amended to incorporate and evaluate these documents and then re-circulated.

5

MITIGATION

The EIR fails to incorporate program-wide mitigation measures which commit the City to actually reduce the effects of this Project. CEQA requires that where feasible mitigation exists which can substantially lessen the environmental impacts of a project, **all feasible mitigation** must be adopted. In this way CEQA goes beyond its informational role to require that projects substantively lessen their negative effects on the environment. It is critical to proper drafting of an EIR that all feasible mitigation measures be required of a project. This has not been done with this Project. For example, the only mitigation adopted for the loss of 2,610 acres of significant agricultural land is a 5 acre dedication for “heritage farming.” Additional feasible mitigation is available even at this “programmatic” level, as set forth herein.

6

CEQA also requires that all mitigation measures in an EIR be fully enforceable, certain to occur, and not deferred. (Public Resources Code § 21081.6; Cal. Code of Regulations, Tit. 14 §§ 15074.1, 15097.) Deferral of mitigation is only permissible when mitigation is known to be feasible but, for practical reasons, it is not feasible to prescribe specific mitigation measures in the EIR. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 94) For those impacts not susceptible to precise mitigation measures at a more general planning stage, an agency may commit to making project advancement contingent on meeting *specific performance criteria set forth for future mitigation measures*. (*Id.*, *Rio Vista Farm Bureau Center v. County of Solano* (1992) 5 Cal.App.4th 351, 376-377.) This Project fails to ensure that all feasible mitigation will occur with this Project and instead provides vague, uncertain, and unenforceable mitigation measures. For example, mitigation measure 4.4.6.1B defers the preparation of biological assessments for non-covered MSHCP listed or sensitive species without reason, and without incorporating enforceable performance criteria.

7

Many mitigation measures set forth in the World Logistic Center EIR require nothing more than the preparation of a future study or rendering with *no specific performance criteria for future mitigation measures*. For example, Mitigation Measure 4.1.6.1B requires no actual mitigation, but only that visual renderings be provided. There is no requirement that these visual renderings demonstrate the application of specific design criteria or performance criteria, or in fact *reduce aesthetic impacts at all*. MM 4.1.6.3A, 4.1.6.4A, and 4.1.6.4B are similarly useless in *mitigating* aesthetic impacts versus merely *documenting* potential effects.

8

These are just a few examples of the lack of commitment to mitigate the impacts expected with to result from this Project.

PROPERTIES WITHIN THE PROJECT

The Project site would encompass seven existing residential properties and associated ranch/farm buildings.. The impacts to the holdings is seldom touched upon, let alone evaluated, in the EIR. For instance, noise, health risks, traffic, and other impacts to the residences are not considered and would be significantly greater than those impacts experiences at nearby residences.

9

CUMULATIVE EFFECTS

One of the biggest deficiencies in the EIR relates to cumulative effects of the Project for each and every impact considered. An effect is cumulatively considerable if the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and the effects of probable future projects. (Guidelines § 15064 (h)(1)) The EIR gives short shrift to the consideration of cumulative impacts. The EIR fails to discuss the Project's impacts in conjunction with other proposed, past, or current Projects. The EIR also often finds impacts not cumulatively considerable on the basis that such impacts were found not individually significant. This completely disregards the purpose of CEQA requiring that an EIR consider whether impacts may be cumulatively considerable, even if they are not individually significant. The EIR fails as an informational document by failing to sufficiently evaluate the cumulative impacts of this Project.

10

REGIONAL EFFECTS

The EIR does not adequately evaluate this Project's impact to the region. As commented by SCAQMD, this Project represents 25% of *all* planned warehouse space in the region. However, the EIR looks only limitedly to impacts such as traffic and air quality, failing to evaluate Project regional effect to highways such as SR-60, to the Port of Long Beach, and persons among the predicted routes this Project will use, among others. The EIR also understates the impact regionally to growth inducement. Given the scale of this Project, mitigation measures which may not be available to a smaller Project may be feasible for this Project. For example, this Project may employ alternative fuels by providing the infrastructure for so doing. Likewise, this Project would support the development of a reclaimed and recycled water line from EMWD, particularly where one exists near the Project. Connection to a recycled water supply must be required of this Project.

11

PROJECT CONSTRUCTION

Project construction is predicted to occur for ten years and may occur 24 hrs/ day, 7 days a week. Any evaluation of construction as a "temporary" impact does not give adequate consideration to this impact on sensitive receptors or biological resources. Moreover, any construction Phasing is *not* required, so that at any one time far greater construction effects could be felt. Furthermore, the estimated equipment amount is not the set maximum, and additional equipment may be used to construct faster. Actual impacts of construction should be considered permanent for 10 years and overlap of "phases" and equipment use must be considered in determining predicted effects. The EIR fails as an informational document by relying on, but not requiring, phasing.

12

For these reasons and the specific reasons outlined below, the EIR completely fails to provide the public and decision-makers with needed information about this Project's significant environmental effects. The EIR also fails to adopt certain mitigation all feasible mitigation to

13

reduce the Project's significant effects. To the extent these deficiencies may be remedied, the EIR must be substantially amended and recirculated.

13

Aesthetics

With regards to the figures provided in the Aesthetics portion of the EIR, it is difficult if not impossible to evaluate this Project's aesthetic impacts without additional and more detailed renderings and elevations. Given that the Project is one cohesive Project it is not clear why the EIR was prepared now rather than when such site plans are available (other than to misuse the program level EIR, as described above). Site plans should be included and aesthetic impacts thereon evaluated.

14

Vegetation at installation should be more visually appealing and mature, given the 15 years to plant maturity. The EIR does not cite any reason why it was decided that trees will only be planted to soften, but not block, views of future buildings. Taller trees may be required to fully obscure building views.

15

The EIR finds the Project consistent with General Plan policies and objectives despite the fact that development will obscure and decimate many visual features. The EIR also finds the Project consistent with General Plan policies without considering that two of those policies relate to scenic roadways, which will be significantly impacted. The finding of consistency with the General Plan policies is unsupported.

16

Furthermore, re: scenic vistas, while the City's General Plan allows development in the Project area, such development would be less than half the height of this development and would likely occur over a much longer period of time. The claim that this "change in views...is anticipated in the City's General Plan" (p. 4.1-65) is not supported.

17

The conclusion that the WLCSP is consistent with the Community Development Element of the General Plan (p. 4.1-71) is likewise unsupported. The Project does not "promote a mix of industrial uses which provide a sound and diversified economic base" but **one** use across 2,600 acres of land. Additionally, the EIR does not consider the seven homes within the Project in determining its consistency with locating manufacturing and industrial to avoid adverse effects.

18

The EIR does not adequately address or mitigate for impacts to sky glow and the Palomar Mountain observatory. Compliance with City standards *would not* reduce lighting impacts below a level of significance due to the scope of this project and existing lack of lighting.

19

Cumulative impacts: The EIR does not consider cumulative lighting effects from all Project in the vicinity which would impact night lighting. The cumulative impact evaluation is unclear as to what other projects are considered.

20

Mitigation Measures for aesthetic effects, including 4.1.6.1B, 4.1.6.3A, and 4.1.6.4A, are uncertain, vague, and will not ensure that aesthetic impacts are mitigated or reduced. Instead, these measures merely require the documentation of impacts or measures. These measures should be rewritten in a manner that not only discloses impacts but then requires that steps be

21

taken to reduce impacts. For example, after preparing renderings pursuant to 4.1.6.1B, the proposed project must be developed in compliance with the prepared renderings.

21

Agricultural Resources

The Project will convert 25 acres of Unique Farmland and 2,610 acres of Farmland of Local importance to urban uses. This farmland also has a LESA score of 63.51, indicating a significant impact. The only mitigation delineated to reduce this impact to 2,635 acres is the dedication of 5 acres for “heritage farming” (Mitigation Measure 4.2.6.1A.) This alleged “mitigation” obviously does not reduce project impacts. Moreover, the EIR states that mitigation measure “4.2.6.1B” will reduce these impacts to agricultural resources—this measure does not appear to exist. (See, *Executive Summary p. 1-10*) Agricultural mitigation is utterly deficient.

The EIR relies on the fact that the General Plan EIR found certain mitigation to be infeasible at that level of planning. The fact that the General Plan EIR found mitigation to be infeasible on a citywide scale does not mean that mitigation is infeasible at this programmatic specific plan scale or at a Project level scale. The conclusion that mitigation is infeasible here is unsupported.

22

The EIR downplays the effect of development and operation of industrial uses in increasing development pressure on adjacent agricultural properties. The EIR does not disclose the predicted impacts on properties adjacent to the project site or along the truck routes used to access the project site, as well as city wide impacts. Additionally, the area to be designated “open space” with this project includes area that is being actively farmed. The EIR does not adequately evaluate impacts to this farming activity from development of 41.6 million square feet of logistics building.

Mitigation measures identified by the CDC to reduce agricultural impacts include:

- The purchase of agricultural conservation easements;
- Transfer of development rights;
- Acquisition of farmland by the city or county;
- mitigation banking;
- the establishment of “urban limits,” greenbelts, and buffers;
- the payment of in-lieu fees sufficient to a purchase and maintain farmland conservation easements;
- and planning tools such as clustering development, use of density bonuses, and limiting “leapfrog” development.

23

While the measures regarding planning have been determined to be infeasible by the City, *the EIR does not provide evidence to support the finding of infeasibility with regard to the purchase or transfer of development rights, conservation easements, or donation of funds to assist in the preservation of agricultural lands.*

24

Air Quality

The Project’s air quality impact is incredible, yet understated in the EIR *repeatedly*. For

25

instance, despite accepted health risk assessment protocols, the EIR posits that such assessments overestimate the risk of cancer associated with PM exposure. The fact is that SCAQMD and CARB have required certain methodological protocols when studying the health risk imposed by diesel PM, and such protocols should be given substantial credence.

25

As another example, the EIR alleges that a trip generation rate of 1.44 trips should have been used because, as with a general plan EIR, “on average a small portion of warehouses can be expected to operate at varying levels of service.” (p. 4.3-38). The fact is that this is not a general plan EIR but *one >10 warehouse project*, and at least 1.68 trips per thousand square feet is correctly applied. It should be noted that the EIR does not disclose how many warehouses *are* proposed with this project.

26

The EIR provides graphs of the frequency of unhealthful ozone days from the 1970’s to 2000. Yet, in the explanation, it is noted that 2010 showed a “slight uptick” in the number of unhealthy air for ozone and particulate pollution. (EIR p. 4.3-17) This change in trend is troubling.

27

The project will result in significant and unavoidable impacts to air quality during construction and operation.

Construction is proposed to occur for 10 years, yet the EIR evaluates construction impacts as “short term.” This evaluation is not supported.

28

Construction air quality impacts evaluate the use of equipment for only 10 hours a day, despite the fact that construction may occur 24/7 with no limit on how much equipment is onsite. Impacts are understated given this 24/7 construction schedule.

The EIR fails to consider the overlap of construction phases. Construction impacts and emissions may be much higher if construction phases are permitted to overlap. A mitigation measure should be incorporated requiring longer construction phasing to reduce daily pollutant emissions, or at least to solidify Project phasing as set forth in the EIR.

At table 4.3.U (p.4.3-67), the EIR provides that at buildout the project will emit 14,863 lbs/day of NOX. This blows away the 55 lbs/ day significance threshold. Likewise, the 9,862 lbs/day of CO emissions is far and above the 550 lb threshold. These are just two examples.

29

The Project will dramatically and drastically surpass the significance thresholds for VOC, NOX, CO, PM10, and PM 2.5, not even including any dust emissions or accounting for overlap of construction phases, or construction phase plus partial Project operation. This Projects’ impact to regional and local air quality is simply unheard of and substantially unmitigated.

The EIR provides an apples to oranges comparison of operational emissions mitigated versus unmitigated. Table 4.3.U and Table 4.3.X look at different year worst case scenarios, yet seem to be the same to any observer. Table 4.3.X lacks operational emissions from 2013-2022 for yearly comparison to Table 4.3.V, yet comparing 2022 emissions shows similar operational effects despite mitigation. A comparison of Table 4.3.W and 4.3.Y likewise shows little impact from mitigation, though construction mitigation plays a greater role. (Note: Table 4.3.Y contains

30

a typographical error listing year 1,147)

30

There is no evaluation of operational emissions past 2022 when emissions will no longer include construction. Effects from growth will also presumably need to be taken into account in determining 2023 + emissions.

31

The EIR fails to disclose all Moreno Valley General Plan Policies relevant to air pollutant emissions. Such omitted policies and objectives include:

- Ultimate Goal VII: achieve a community which “Emphasizes public health and safety...”
- Goal 6.1: “To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property.”
- Objective 7.5 “Encourage efficient use of energy resources.”
- Policies 7.5.1; 7.5.2; 7.5.5 regarding energy efficiency.

32

The EIR wrongly fails to evaluate air pollutant emissions across the routes that will be used by Project trucks. The trucks will be accessing the Port of Long Beach, yet impacts along SR-60 to the port, impacts at the port, etc. are not evaluated in the EIR. Where the Project will create significant on-road emissions, impacts to these areas absolutely must be evaluated in the EIR.

33

Mitigation

Several of the construction air quality impact “mitigation measures” are required by law, and therefore do not qualify as “mitigation,” such as Mitigation Measure 4.3.6.2A

34

Mitigation measure 4.3.6.2A(c) is deceiving and deficient. While a piece of construction equipment may be limited to 10 hours of operation per day during construction, there is no limit to the hours of construction, which may apparently occur 24/7, or to the amount or type of construction equipment onsite at any time. It is feasible to require that all construction be limited to 10 hours per day.

At mitigation measure 4.3.6.2C (d), the language “whenever possible” must be removed to make the measure certain to occur and legally enforceable.

35

MM 4.3.6.3A is uncertain to reduce air quality impacts as the only requirement is that vehicles can access the buildings on paved roads, not that they *must* access the building using paved roads. Access via any unpaved roads must be barred and prevented.

36

MM 4.3.6.3B is insufficient. At subsections (f) and (g), it is feasible to require that tenants be required by contract to become a SmartWay Partner and to require that all trucks be SmartWay 1.0 or greater carriers.

37

MM 4.3.6.4A: storage lockers should be provided for a greater portion of full-time employees to encourage the use of alternative transportation and carpooling. Additional electric charging stations must be required, preferably across 10% of the vehicle parking spaces for autos and light-duty trucks. Bicycle storage should also be increased.

38

Additional mitigation must be incorporated into any Project of this scope. The Project's significant air quality and health impacts also well justify Project denial.

39

It is feasible to require the following, and such mitigation must be incorporated into the Project:

Mitigation to Reduce Construction Impacts

Additional mitigation measures are also feasible to further reduce construction air quality emissions including the following which must be applied to future development:

1. Gravel pads must be installed at all access points to prevent tracking of mud onto public roads.
2. Install and maintain trackout control devices in effective condition at all access points where paved and unpaved access or travel routes intersect (eg. Install wheel shakers, wheel washers, and limit site access.)
3. All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.
4. Pave all construction roads.
5. Pave all construction access roads at least 100 feet on to the site from the main road.
6. Limit fugitive dust sources to 20 percent opacity.
7. Require a dust control plan for earthmoving operations.
8. When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.
9. All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.
10. The contractor or builder shall designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite.
11. Post a publicly visible sign with the telephone number and person to contact regarding dust complaints. This person shall respond and take corrective action within 24 hours.
12. Extend grading period sufficiently to reduce air quality impacts below a level of significance.
13. The simultaneous disturbance of the site shall be limited to five acres per day.
14. Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.
15. Any on-site stockpiles of debris, dirt or other dusty material shall be covered or watered three times daily.
16. Any site access points within 30 minutes of any visible dirt deposition on any public roadway shall be swept or washed.
17. A high wind response plan shall be formulated for enhanced dust control if winds are forecast to exceed 25 mph in any upcoming 24-hour period.

40

18. Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.*
19. Develop a trip reduction plan to achieve a 1.5 AVR for construction employees
20. Require high pressure injectors on diesel construction equipment.*
21. Restrict truck operation to "clean" trucks, such as a 2007 or newer model year or 2010 compliant vehicles.*
22. Require the use of CARB certified particulate traps that meet level 3 requirements on all construction equipment.*
23. Utilize only CARB certified equipment for construction activities.*
24. The developer shall require all contractors to turn off all construction equipment and delivery vehicles when not in use and/or idling in excess of 3 minutes.*
25. Restrict engine size of construction equipment to the minimum practical size.*
26. Use electric construction equipment where technically feasible.*
27. Substitute gasoline-powered for diesel-powered construction equipment.*
28. Require use of alternatively fueled construction equipment, using, e.g., compressed natural gas, liquefied natural gas, propane, or biodiesel.*
29. Use methanol-fueled pile drivers.*
30. Install catalytic converters on gasoline-powered equipment.*
31. Require the use of Alternative Diesel Fuels on diesel equipment used. Alternative diesel fuels exist that achieve PM10 and NOx reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NOx and a 63% reduction in PM10 compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.
32. Electrical powered equipment shall be utilized in-lieu of gasoline-powered engines where technically feasible.*
33. All forklifts shall be electric or natural gas powered.*
34. Suspend use of all construction equipment operations during second stage smog alerts.*
35. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.*
36. Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site.*
37. Reroute construction trucks away from congested streets and sensitive receptor areas.*
38. Configure construction parking to minimize traffic interference.*
39. Prior to the issuance of a grading and building permit, the applicant shall submit verification that a ridesharing program for the construction crew has been encouraged and will be supported by the contractor via incentives or other inducements.*
40. Minimize construction worker trips by requiring carpooling and providing for lunch onsite. *

41. Provide shuttle service to food service establishments/commercial areas for the construction crew.*
42. Provide shuttle service to transit stations/multimodal centers for the construction crew.*

40

Mitigation to Reduce Operational Emissions

1. All trucks accessing the Project site must meet 2010 standards or better at opening, improving to advance to higher standards by 2022. Results, including backup data shall be reported to the Planning Department semi-annually.*
2. If the above mitigation is not feasible, the tenant shall phase-in trucks beginning with 30% 2010 standards or better at opening and continually improving, to introduce newer trucks faster than regulatory standards. (Alternatively, see 8-10 below)
3. The Project shall not only provide infrastructure for alternative fuels (for example, electric or natural gas) but require that its usage be phased in as soon as such technology is technologically feasible. Such infrastructure must be adequate to provide alternative fuels for the entire project or, if deemed infeasible, at least 25 million square feet of logistics warehousing and its associated truck trips.
4. The tenants shall implementing advanced technology demonstration and implementation programs
5. Tenants shall be required by contract to apply for funding to retrofit and replace older, dirtier trucks prior to purchase or lease of any portion of the site.
6. Incorporate another method of accelerated penetration of partial zero-emission and zero-emission vehicles and trucks through funding assistance.
7. Accelerate retirement of older light-, medium-, and heavy- duty vehicles, through funding incentives or contract specification.
8. The operator of any Project facilities shall become SmartWay Partner.*
9. All Project facilities shall meet SmartWay 1.25 ratings.*
10. All Project facilities shall use only freight companies that meet SmartWay 1.25 ratings.*
11. (ALTERNATIVELY from 2,3 above) The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*
12. The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve a 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidator trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*
13. All spaces utilizing refrigerated storage, including restaurants and food or beverage stores, shall provide an electrical hookup for refrigeration units on delivery trucks. Trucks incapable of utilizing the electrical hookup for powering refrigeration units shall be prohibited from accessing the site. All leasing documents shall include these requirements and provide that violation of those provisions will constitute a material

41

- breach of the lease that will result in the termination of the lease. Because of the fact that these terms of the lease are designed to benefit the public, the public shall be considered to be a third party beneficiary with standing to enforce the requirements of the lease.*
14. Install catalytic converters on gasoline-powered equipment.*
 15. Where diesel powered vehicles are necessary, require the use of alternative diesel fuels. Alternative diesel fuels exist that achieve PM10 and NOx reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NOx and a 63% reduction in PM10 compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.
 16. Electrical powered equipment should be utilized in-lieu of gasoline-powered engines where technically feasible.*
 17. Utilize only electrical equipment for landscape maintenance.*
 18. All forklifts shall be electric or natural gas powered.*
 19. Utilize only electric yard trucks.*
 20. Prohibit idling of trucks for periods exceeding three minutes.*
 21. Provide electrical vehicle ("EV") and compressed natural gas ("CNG") vehicles in vehicle fleets.*
 22. Charge reduced or no parking fee for EVs and CNG vehicles.*
 23. Install EV charging facilities for a minimum of 10% of all parking spaces.*
 24. Install a CNG fueling facility.*
 25. Provide preferential parking locations for EVs and CNG vehicles.*
 26. Implement parking fee for single-occupancy vehicle commuters.*
 27. Plant shade trees in parking lots to provide minimum 50% cover to reduce evaporative emissions from parked vehicles.*
 28. Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.*
 29. Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.*
 30. Orient 75 percent or more of buildings to face either north or south (within 30 degrees of N/S) and plant trees and shrubs that shed their leaves in winter nearer to these structures to maximize shade to the building during the summer and allow sunlight to strike the building during the winter months.*
 31. Provide grass paving, tree shading, or reflective surface for unshaded parking lot areas, driveways, or fire lanes that reduce standard black asphalt paving by 10% or more.*
 32. Electrical outlets shall be installed on the exterior walls of all residential and commercial buildings (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.*
 33. Prohibit gas powered landscape maintenance equipment within residential, commercial, and mixed-use developments. Require landscape maintenance companies to use battery powered or electric equipment **or** contract only with commercial landscapers who operate

- with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.*
34. Implement parking cash-out program for non-driving employees.*
 35. Require each user to establish a carpool/vanpool program.*
 36. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.*
 37. Provide preferential parking for carpool/vanpool vehicles.*
 38. Provide subsidies or incentives to employees who use public transit or carpooling, including preferential parking.*
 39. Provide direct, safe, attractive pedestrian access from project to transit stops and adjacent development.*
 40. Provide direct safe, direct bicycle access to adjacent bicycle routes.*
 41. Connect bicycle lanes/paths to city-wide network.*
 42. Design and locate buildings to facilitate transit access, e.g., locate building entrances near transit stops, eliminate building setbacks, etc.*
 43. Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc.*
 44. Provide a display case or kiosk displaying transportation information in a prominent area accessible to employees.
 45. Provide shuttle service to food service establishments/commercial areas.*
 46. Provide shuttle service to transit stations/multimodal centers.*
 47. Provide on-site child care or contribute to off-site child care within walking distance.*
 48. Implement a compressed workweek schedule.*
 49. Implement home-based telecommunicating program, alternate work schedules, and satellite work centers.*
 50. All buildings shall be constructed to LEED Platinum standards.*
 51. Design buildings for passive heating and cooling and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.*
 52. Construct photovoltaic solar or alternative renewable energy sources sufficient to provide 100% of all electrical usage for the entire Project.*
 53. Install an ozone destruction catalyst on all air conditioning systems.*
 54. Construct renewable energy sources sufficient to offset the equivalent of 100% of all greenhouse gas emissions from mobile sources (internal combustion engines) for the entire Project. *
 55. Purchase only green/ renewable power from the electric company.*
 56. Install solar water heating systems to generate all hot water requirements.*

(* Would reduce impacts to GHGs as well)

Health Risks

This Project is predicted to result in enormous health risk impacts, a Project caused increase of at least 100.7 cancers in one million, well above the 10 in one million threshold. While these impacts are likely understated, this health risk is unacceptable.

In addition to the risk of cancer, diesel PM is known to cause immune system effects; reproductive, developmental, and endocrine effects; nervous system effects; and lung health

41

42

problems, as recognized by the County in the General Plan. Immune system effects include increased allergic inflammatory responses and suppression of infection fighting ability. Diesel PM has also been associated with reproductive effects such as decreased sperm production, changes in fetal development, low birth weight and other impacts. Diesel PM exposure may also cause impairment to the central nervous system. (*The Health Effects of Air Pollution on Children*, Michael T. Kleinman, Ph.D, Fall 2000, <http://aqmd.gov/forstudents/health_effects_on_children.html#WhyChildren>; *See also, Diesel and Health in America: the Lingering Threat*, Clean Air Task Force, February 2005, <http://www.catf.us/resources/publications/files/Diesel_Health_in_America.pdf>)

SCAQMD has stated with regards to the health effects from diesel PM:

“Diesel particles consist mainly of elemental carbon and other carbon-containing compounds... Diesel particles are microscopic... Due to their minute size, diesel particles can penetrate deeply into the lung. There is evidence that once in the lung, diesel particles may stay there for a long time.

In addition to particles, diesel exhaust contains several gaseous compounds including carbon monoxide, nitrogen oxides, sulfur dioxide and organic vapors, for example formaldehyde and 1,3-butadiene. Formaldehyde and 1,3-butadiene have been classified as toxic and hazardous air pollutants. Both have been shown to cause tumors in animal studies and there is evidence that exposure to high levels of 1,3-butadiene can cause cancer in humans...

Diesel emissions may also be a problem for asthmatics. Some studies suggest that children with asthma who live near roadways with high amounts of diesel truck traffic have more asthma attacks and use more asthma medication.

Some human volunteers, exposed to diesel exhaust in carefully controlled laboratory studies, reported symptoms such as eye and throat irritation, coughing, phlegm production, difficulty breathing, headache, lightheadedness, nausea and perception of unpleasant odors. Another laboratory study, in which volunteers were exposed to relatively high levels of diesel particles for about an hour, showed that such exposures could cause lung inflammation.” (*The Health Effects of Air Pollution on Children, supra*; *See also, Mira Loma Commerce Center EIR No. 450, Air Quality, Section 4.*)

Furthermore, infants, children, and the elderly are more susceptible to diesel PM and its associated health impacts. Given this project’s close proximity to two schools, the Rancho Verde High school (1 mile east) and El Potrero Elementary School (1 mile northeast) this increased susceptibility is extremely relevant. With regards to infants and children, increased susceptibility to TACs and diesel PM exists for a variety of reasons. Children are generally more active than adults, have higher respiration rates, and inhale more pollutants deeper into the lung. Children also have more lung surface area in proportion to their body size and inhale more air pound for pound when compared to adults, taking in 20 to 50 percent more air and associated air pollutants than adults. When compared to adults, children spend more active time outdoors in polluted air environments and exert themselves harder than adults when playing outside.

Importantly, this exposure to high pollutant levels in children occurs while their lungs are still developing, and therefore has more severe impacts on this sensitive group. (*The Health Effects of Air Pollution on Children, supra.*)

This increased susceptibility to air pollutant emissions for children has resulted in the California EPA Office of Environmental Health Hazard Assessment (“OEHHA”) weighting cancer risk by a factor of 10 for exposures to carcinogens from birth to two years old, and by a factor of 3 for exposures from 2 years old to 15 years old. (*Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures*, California EPA OEHHA Air Toxicology and Epidemiology Branch, April 2009, p. 3. <http://www.oehha.ca.gov/air/hot_spots/pdf/TSDCPFApril_09.pdf>.) It is unclear that these increased risks were accounted for in the EIR. Additionally, recent studies conducted by SCAQMD’s Brain and Lung Tumor and Air Pollution Foundation have found a specific connection between exposure to diesel PM and brain cancer in children. (Annual Meeting of the Brain & Lung Tumor and Air Pollution Foundation, April 2, 2010, <<http://www.aqmd.gov/hb/2010/April/100425a.htm>>)

42

In addition to an increased risk of cancer, the effects of diesel PM on children include slowed lung function and growth, increased emergency room visits, increased incidences of asthma and bronchitis, crib death, asthma respiratory infections, allergic symptoms, and asthma hospitalizations. (*Diesel and Health in America: the Lingering Threat, supra.*)

This project will contribute to an already dire TAC situation in Riverside County. The Riverside County Planning Commission recently considered GPA 1096, an amendment to the General Plan to add a Healthy Communities Element which seeks to reduce hazardous air quality impacts to environmental and human health. The Healthy Communities Element of the General Plan was approved in view of the following significant health impacts resulting from already poor air quality in Riverside County:

- ***Asthma-Related Hospitalizations:*** In 2005, the greatest percentage of asthma-related hospitalizations were among those under age 18 (38%) followed by those over 65 (19%). Blacks experienced the greatest rate of hospitalizations in 2005 at 225.7 per 100,000 population, versus 99.5 and 81.2 for Hispanics and whites, respectively.
- ***Risk of Cancer from Diesel Soot and Other Toxic Air Pollutants:*** *Whereas the regional risk of cancer from diesel soot and other toxic air pollutants dropped by 8 percent between 1998 and 2005, the cancer risk in Riverside County increased by 2 percent.*
- Poor air quality costs Riverside and San Bernardino around ***\$6.3 billion annually*** in health care expenses.
- 19% of private schools, 11% of public schools, and 21% of licensed child care centers in Riverside County are located within a quarter (1/4) mile of a major highway.
- Around 350,000 Riverside County residents live within a half (1/2) mile of a major highway, including about 40,000 children under age 5.
- Five schools in Riverside County rank in the 10th percentile for air quality, meaning that 90 percent of the schools in the country had better air. Twenty-five schools ranked in the 50th percentile or below.

43

The EIR fails to consider health risks along the routes intended for travel by Project trucks. Health risks must be evaluated beyond the immediate proximity of the WLC as trucks will continue beyond this area, to the Ports and other destinations. The EIR fails as an informational document by not considering impacts in getting to and from these common destinations.

43

Cumulative Air Quality Impacts

The Cumulative Impact analysis for air quality effects is completely deficient. Regarding construction impacts, the EIR fails to detail the “number of individual projects” which “may be under construction simultaneously.” The EIR should list the Projects that are currently proposed, approved, or expected to be developed with the Project. Projected emissions should then be provided in the EIR. Without detailing these projected impacts, the EIR fails to provide needed information as to the extent and severity of the Project’s cumulative construction impacts. The same goes for any cumulative evaluation of hot spots.

Regarding operational impacts, the EIR considers construction and operational impacts of the Project *but no other projects in the area or that will be using the same routes*. This is utterly deficient. Moreover, as previously discussed operational effects are only considered through 2022 when construction ceases, not longer-term. The EIR fails as an informational document by not considering any other Projects in its alleged “cumulative impact” analysis of operational air quality.

44

On health risks, the cumulative projects considered in the cumulative impact analysis are not listed or disclosed. Nevertheless, the Project will contribute >120 cancers in the area of the Project site where existing risk is over 400 cancers per million. The EIR fails to consider or disclose risks caused by the Project and other cumulative projects in even higher risk areas of San Bernardino, Long Beach, etc. By failing to detail actual cumulative health risk impacts, the EIR again fails to provide needed information to the public and decisionmakers.

Biological Resources

The area to be designated “open space” includes area that is being actively farmed. The reliance in the EIR on this area as wildlife area may be misplaced. This must be clarified in the EIR.

45

The EIR fails to provide needed studies to determine whether significant impacts to biological resources will occur and whether such impacts may be mitigated below a level of significance. Instead, the EIR lists mitigation measures deferring needed studies which would disclose potential effects to the public and decision-makers. These studies must be prepared, incorporated in the EIR, and the EIR must be recirculated.

46

The EIR states that coastal sage both is and is not onsite. This must be clarified. (See, e.g. Table 4.4.B p. 4.4-22)

47

Species not covered by the MSHCP include Stephens’ Kangaroo Rat pursuant to p. 4.4-41, yet at

48

Table 4.4B this species is designated “covered.”

48

Additional surveys must be required of special status species not covered by the MSHCP.

49

The EIR finds no significant riparian or biologically sensitive habitat onsite despite the existence of such plants and 14 drainages. There is no support or explanation for this conclusion. (p. 4.4-60)

50

The change in ambient noise and lighting will likely significantly impact biological resources. To the extent the EIR concludes otherwise, such conclusion is unsupported by that document. Moreover, the finding that construction will not impact wild life, apparently because “noise-related impacts would be temporary in nature,” is unsupported. Construction is not required to occur in phases but is expected to last 10 years. Any reliance on either phasing or the “temporary” nature of construction is not supported. Also, vibration impacts to wildlife were also not considered in the EIR, rendering the impact analysis insufficient.

51

The conclusion that impacts to raptor foraging habitat will be less than significant is not supported by any reasoning or evidence in the EIR. Further evaluation must be made of this issue.

52

The Cumulative impact analysis of biological effects is greatly deficient. For example, the cumulative loss of raptor foraging land, impacts to the burrowing owl, impacts to species not adequately mitigated by MSHCP, noise impacts, etc. are not considered. Impacts along highways and roadways which will be used by this Project are not considered. Mere compliance with the MSHCP does not provide the detail necessary to *inform* the public and decision makers about this Project’s individual and/or cumulative effects, a purpose of CEQA. By failing to adequately address cumulative biological effects, the EIR again fails as an informational document.

53

The EIR repeatedly professes the benefits of the 250-foot setback area of MM 4.4.6.1A as a fix-all for the project. This setback area is insufficient in that it includes not only landscaping by water quality facilities, fences and walls, maintenance access drives, and similar uses. It is unlikely that mitigation for impacted plants or animal species can be accomplished by moving such species to this setback area. Mitigation for biological resources in this manner fails to demonstrate that impacts to biological resources would be adequately reduced below a level of significance.

54

MM 4.4.6.1B is likewise insufficient and wrongly deferred. This measure wrongly defers the needed study of impacts to non-covered MSHCP listed and sensitive species without reason and without detailing any alternatives or performance criteria to be achieved. A biological assessment of the impacts to these species must be undertaken presently and incorporated in a re-circulated EIR which discloses such potential impacts and discussed whether mitigation is

55

feasible and, if so, incorporates such mitigation.

MM 4.4.6.2A wrongly defers mitigation with only vague instructions as to the preparation of a needed study for impacts to sensitive plants. There is no explanation for why this study could not be undertaken and impacts disclosed in this EIR so that such mitigation is wrongly deferred. Moreover, it is unclear what sensitive plants must be assessed. Lastly, the EIR fails to show that relocation to the 250-ft setback area or fee payment will be adequate to reduce any impacts below a level of significance. Again, this assessment must be prepared and the EIR recirculated to disclose these impacts.

MM 4.4.6.2B wrongly defers mitigation where the HANS and JPR process could be completed at this time. JPR should be presently completed, potential biological effects disclosed, and the EIR recirculated with RCA review available for public comment.

MM 4.4.6.3A should be implemented not by the City Planning Division but by a qualified biologist. This mitigation is improperly vague and uncertain without the incorporation of alternatives or performance standards to ensure that the drainage remains in a “relatively natural condition.”

MM 4.4.6.4E defers, without reason, a protocol survey for the Los Angeles Pocket Mouse. Any mitigation is vague, requiring that, for instance, an “appropriate amount of land” be set aside to compensate for loss of habitat. Biologically equivalent or superior land should be required to be set aside at a 2:1 ratio.

MM 4.4.6.4F wrongly defers preparation of a Biological Resource Management Plan without performance standards or other assurances that adequate mitigation will occur.

Cultural Resources

The EIR finds at least 45 archaeological and historical resources sites in the project area, and thus has the likelihood to significantly impact cultural resources. Of these, nine prehistoric resources were Phase II tested. It is not clear why only nine were included in this testing. All of the known historic resources should be Phase II tested for significance in the EIR, and the EIR should be recirculated. Without further evaluation, the EIR fails to disclose impacts or show that they may be mitigated below a level of significance.

The EIR nevertheless finds that impacts to cultural resources would be less than significant with mitigation. Overall, the mitigation required for archaeological resources fails to reduce impacts below a level of significance through vagueness and inherent deficiencies.

MM 4.5.6.1A does not provide any option for avoidance of significant archaeological or cultural resources.

MM 4.5.6.1B should clarify that subsections (a) and (b), avoidance, are preferred to subsection

(c), excavation.

MM 4.5.6.1C is vague and uncertain to provide adequate mitigation. First, subsection 2 should amend 50% of the earth to ensure that monitoring not be terminated until at least half of the site to maximum depth is examined. Moreover, the portions of the site which are expected to contain cultural resources should be required to be monitored. As written, the entire site to a minimal depth could be examined uncovering no resources, or, alternatively, the portion of the site with the highest expectation for resources could be avoided. This is unacceptable. Subsection 5 should clarify that avoidance is preferred and data recovery or curation are not preferred. If curation is the only method available, then the artifacts will be curated in a museum that has agreed to take such resources.

MM 4.5.6.3B wrongly defers a needed paleontological assessment where such assessments could presently occur. The EIR should incorporate this paleontological assessment and map areas in which monitoring shall occur and which may require further assessment.

The EIR also finds cumulative impacts less than significant on the basis that individual Project effects will be reduced below a level of significance. This reasoning rejects the purpose of a cumulative impact analysis under CEQA, that an individually insignificant project may have cumulative effects when considered with other projects. Here, the EIR again fails to disclose what projects were considered in the cumulative impact analysis and what cumulative effects they may have. The cumulative impact analysis is inadequate.

Geology and Soils

MM 4.6.6.1A wrongly defers a needed fault study without explanation or reason. The City may presently determine whether a detailed fault study of the Casa Loma Fault Zone area is necessary or the EIR may undertake these investigations voluntarily to determine whether faulting issues exist and whether potential impacts may be mitigated. Likewise, MM 4.6.6.1B wrongly defers a San Jacinto Alquist-Priolo fault study without reason. Again, without this needed study the EIR fails to provide the public and decision-makers with essential information or demonstrate that impacts are mitigable. These studies must be prepared, incorporated in the EIR, and the EIR must be re-circulated.

MM4.6.6.3A wrongly defers the preparation of a geotechnical report. MM4.6.6.3A also does not ensure that geotechnical impacts will be eliminated or sufficiently mitigated, but only that a report be prepared. This measure must require that a report be prepared to address specific issues to specific performance standards, and that the Project then comply with all recommendations of the geotechnical report.

Similarly, MM 4.6.6.3C requires further soils and geotechnical investigations but fails to require that any recommendations of those investigations be implemented in Project development. Mere

↑ 63

64

65

66

67

68

↓ 69

preparation of a report is insufficient to mitigate for soils/geotechnical impacts.

↑
69

GHGs

This Project's Greenhouse Gas emissions are exorbitant. Where an industrial project may have significant GHG emissions if they exceed the screening level of 10,000 mtco2e/yr, this Project will exceed 700,000 mtco2e/yr!

70

Mitigation measures for greenhouse gas emissions are utterly insufficient and fail to show that, as required by CEQA, all feasible mitigation for this Project has been adopted. The only mitigation adopted to reduce GHGs is MM 4.7.6.1A implementing minimal requirements to reduce solid waste.

71

Additional mitigation is feasible, as detailed in the Air Quality section and delineated with an asterisk. Nevertheless, this Project's enormous GHG impact will likely remain immitigable.

Also, the EIR fails to evaluate the Project's consistency with the CARB Scoping Plan, generally evaluating only whether a scoping plan reduction measure is "applicable" or "inapplicable." (Table 4.7.K) The EIR must evaluate if the Project is consistent with any applicable measures. The EIR then finds that the Project would not conflict with any plan, etc. related to the reduction of GHGs. (p. 4.7-43) This conclusion is not supported by evidence in the EIR.

72

The EIR next raises the uncertainty re: climate change and impact from international shipping. CEQA, however, recognizes the impact of GHGs and requires an attempt at disclosing and reducing that effect. Again, the EIR's attempt to play down this Project's effects must be rejected.

73

Hazards and HazMat

The EIR should consider the Project's immense truck presence to be a routinely transported hazard and evaluate impacts accordingly. Likewise, cumulative hazard impacts should be evaluated for these risks.

74

Hydrology and Water Quality

MM 4.9.6.3C does not provide any alternatives or performance standards for ensuring that runoff not impact the SJWA, or remedying any water quality exceedences.

75

Land Use and Planning

The Project site currently provides for a diverse mix of residential, commercial business park, and open space land uses. The Project would amend such uses to 2,606 acres of high cube logistics, 1,084 acres of open space, and 20 acres for public facilities. Open space includes area that is being actively farmed. This alteration to proposed land uses is a *very significant impact*.

76
↓

A new General Plan should be prepared if this Project is to completely overhaul the existing planning and zoning.

76

Also, while this is one of the few areas of the EIR where the seven existing residences are considered, they are then completely ignored. Some mitigation for impacts to these residences must be considered.

Noise

Vibration impacts at the seven existing residences on the Project site are not, and must be, considered in the EIR. Such impacts may be significant because those residences are less than 50 feet from construction.

77

Construction may occur 24/7 anywhere on the Project site. This impact may be mitigated somewhat by limiting hours of construction to daytime. The EIR does not show that such a limitation is infeasible; hence it must be adopted.

78

Construction noise is expected to be up to 97 dBA at 50 ft, yet some residences are less than 50 ft from construction. The EIR fails to disclose the real worst case construction noise scenario.

79

Noise impacts are to be evaluated pursuant to whether they would exceed the threshold noise level, or whether they cause either substantial temporary or permanent increases in ambient noise. The EIR wrongly combines these thresholds regarding whether the Project will permanently increase ambient noise. (EIR p.4.12-47) The 5 db, 3 db, 1.5db increases applied for 60, 60-65, and 65 CNEL respectively are not the threshold of significance. In fact, a lesser increase is likely more significant at a lower level as more noticeable. Also, this threshold is only wrongly applied to only traffic noise, not stationary noise. The Project will likely permanently increase ambient noise in this undeveloped area.

80

On the other hand, whether the Project would cause exceedences of noise standards is only applied to stationary noise; mobile source/ traffic noise is not considered. The tables at 4.12-38 through 4.12-46 show countless exceedences of the City's noise standards. The finding that this impact is less than significant is not supported.

81

Cumulative noise impacts are not adequately considered. The cumulative analysis does not evaluate noise impacts from proposed or future planned projects. The Cumulative impact analysis must be re-prepared and the EIR recirculated to take into account projects which, when combined with this Project, may have a significant impact on noise.

82

MM4.12.6.1A wrongly defers the creation of a Noise Reduction Compliance Plan for construction noise and fails to provide any alternatives to be incorporated into such a plan or performance standards to ensure that noise is actually reduced. Instead, the only requirements of the plan is that it show where nighttime construction will occur in relation to dwellings. No

83

mitigation will occur from this measure.

MM4.12.6.1D has a typographical error, twice referencing weekends where, presumably, the first reference should be to weekdays.

MM4.12.6.1E permits construction at night anywhere with a temporary sound barrier. MM 4.12.6.1F would permit nighttime construction closer to residences if okayed by personnel.

Given the Project's expected construction noise impacts, MM4.12.6.1 E and F should not be able to be employed to permit construction any time.

It is feasible that, at all times, construction shall be prohibited at night within 2,800 feet of residences, and a 12-foot tall sound barrier shall be installed between all residences within 2,800 feet of active nighttime construction areas. Additionally, noise measurements shall be taken by qualified personnel and buffer distances may be enlarged based on their recommendation, but not decreased.

The following additional mitigation is feasible and must be required of the project:

1. Temporary noise barriers must be installed during project construction around the entire construction area.
2. Where technically feasible, utilize only electrical construction equipment
3. During construction, the developer shall require that all contractors turn off all construction equipment and delivery vehicles when not in use and prohibit idling in excess of 3 minutes.
4. Provide a "windows closed" condition requiring a means of mechanical ventilation (e.g. air conditioning) for all buildings within 250 feet of the Project. The Project must pay for such ventilation on all such buildings.
5. Provide upgraded windows with a minimum Sound Transmission Class (STC) rating of 34 for all buildings within 250 feet of the Project buildings, and on roadways on which the Project will contribute 100 or more trips/day, and/or require the installation of double-paned windows of those buildings.
6. Keep new transportation facilities away from vibration sensitive areas.
7. Obvious vibration causes, such as pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc., on existing transportation facilities and roadways which will be used by the Project during construction and/or operation must be eliminated by resurfacing prior to commencement of construction and again prior to Project operation of each phase.
8. Require the use of rubberized asphalt for construction of all roadways and parking areas.
9. Maintain quality pavement conditions that are free of bumps, pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc. during Project operation. Resolve any sub-par pavement conditions within one week of notification/awareness.
10. Require resurfacing of roads.
11. Ban heavy trucks near (i.e. within 250 feet) vibration sensitive uses.

12. Use alternate construction methods and tools to reduce construction vibrations including, as applicable, predrilling of pile holes, avoiding cracking and seating methods for resurfacing concrete pavements near vibration sensitive areas, using rubber tired as opposed to tracked vehicles, placing haul roads away from vibration sensitive areas.
13. Scheduling construction activities (particularly pile driving) for times when it does not interfere with vibration sensitive operations (e.g. night time).

88

Traffic

The WLC will generate significant direct and cumulative traffic impacts. The DEIR concludes that these impacts are significant and unavoidable. The conclusions of the DEIR are not based on substantial evidence and mitigation measures that are relied upon are uncertain, unenforceable and ineffective.

Firstly, the conclusions of the DEIR are not based on substantial evidence where, among other things, the DEIR relies heavily upon the 2003 Truck Trip Generation Study prepared for the City of Fontana. Reliance upon this study is flawed to the extent that truck traffic represents a much larger portion of the WLC's traffic than is assumed in that study. Additionally, the DEIR assumes that the WLC will employ local residents as the majority of its purportedly 25,000 employees. The DEIR thus creates the impression that vehicle trips will be shorter or fewer due to the fact that employees will have a short commute to work. The DEIR likewise assumes that nearly half of the worker trips will occur on arterial streets and not freeways. These assumptions regarding traffic influence other sections of the DEIR (*see* p. 4.15-33 "It should be noted that all technical studies based all or in part on traffic (i.e., air quality, greenhouse gases, and noise) have used these same assumptions..."). In relying upon these bare assumptions, the DEIR has understated the Project's traffic impacts, and in turn, other impacts as well.

89

For each study year (2012, 2017, 2022 and 2035) the WLC Project causes significant direct impacts to local intersections, roadway segments and freeway segments. The Project also contributes to significant cumulative conditions for each area of study. Despite causing significant direct impacts and contributing to significant cumulative impacts the Project does not mitigate its impacts as required by law.

90

The DEIR first improperly relies upon the preparation of future traffic studies for individual development projects within the WLC. This deferral of mitigation is not permitted under CEQA. Moreover, according to the mitigation plan, the future studies will only be conducted pursuant to the City's "discretionary approval process" in connection with future development applications. There is no assurance that the City considers any future applications related to the Project to be "discretionary" review processes such that there is no guarantee that any future traffic studies will be prepared.

91

Next, the mitigation plan relies heavily on the payment of TUMF and DIF fees; however, the plan fails to comply with CEQA because the reader cannot discern from the DEIR which improvements are subject to which funding programs. Additionally, there is a lack of evidence that the alleged payment of TUMF and DIF fees are tied to the actual implementation of mitigation measures. In other words, there is a lack of evidence that there are actual plans in

92

place for the construction of the necessary traffic improvements and/or evidence that sufficient funding has already been collected under the TUMF and DIF programs for the construction of the improvements. Thus it is not clear from the DEIR that the improvements are certain to occur in the foreseeable future. In the event that mitigation measures are not covered by TUMF or DIF programs, the DEIR calls for the payment by the individual development projects of “fair share” fees. While fair share fees can be appropriate mitigation under CEQA, there is no evidence that fair share programs exist for the remaining measures not covered by TUMF or DIF programs; there is no evidence that any funding has been collected under the alleged fair share programs; and there is no evidence as to when the necessary measures might be implemented under the programs. Together this reliance on fee-based mitigation is uncertain and ineffective.

93

The mitigation plan also calls for the City to “request” that TUMF funds be aligned with the improvements related to the Project’s significant impacts. Thus there is no guarantee that TUMF funds will be spent towards the implementation of the necessary improvements, or evidence of when such alignment would occur. With respect to improvements that are under the jurisdiction of Caltrans, the mitigation plan calls for the City to participate in a “multi-jurisdictional effort with Caltrans and adjacent cities to develop a study to identify fair-share construction funding sources ...” There is no evidence that this coordinated strategy will be pursued in the future. Furthermore, while the payment of fair share fees can be adequate mitigation for cumulative impacts, many of the impacts at issue are direct impacts of the WLC project. For this reason, the applicant must be responsible for the implementation any measures relative to direct project impacts.

Finally, the DEIR’s mitigation plan for freeway impacts is convoluted where the DEIR acknowledges significant impacts and the existence of feasible mitigation for some freeway sections but states these measures will not be pursued because the overall “policy” of the City is to improve surface streets “that could serve as alternate routes to freeways.” CEQA requires the implementation of all feasible mitigation measures for significant project impacts. In addition, some freeway mitigation measures are apparently discounted because of cost or technical concerns without substantial evidence in the record that the measures are infeasible within the meaning of CEQA. Again CEQA requires the adoption of all feasible mitigation measures. Where a measure is considered infeasible, the agency must support that finding with substantial evidence in the record.

94

MM 4.15.7.4A requires no mitigation of traffic impacts occur but only that a project-specific traffic impact study be prepared. This is insufficient as it fails to incorporate any solution or mitigation if the assumptions of the TIA are invalid.

95

MM4.15.7.4F is uncertain to occur and fails to commit the Project to mitigating impacts to state roads/highways. This measure requires only that the City contact Caltrans. Caltrans has not agreed to this participation and the City has no authority to require any action be taken by Caltrans. If Caltrans cooperates in a study, and if the study identifies funding sources necessary to mitigate impacts through fair-share contributions, and if the study is approved, and if the City imposes fair-share fees on the project, then the Project shall be required to pay prior to the

96

issuance of occupancy permits (presumably if those permits are requested after all the prior actions occur). This is the definition of uncertain and unenforceable mitigation.

96

Correspondingly, while most of the project's environmental effects will be a result of its use as a distribution center and corresponding traffic and air quality impacts, not the effects of the warehouse building itself, little if any mitigation is required to reduce these impacts. Regarding traffic effects, the EIR relies heavily on TUMF, DIF and fair share programs and concludes that significant effects will be either immediately or promptly reduced by these programs. To the contrary, a significant amount of the streets impacted are not currently planned or funded for improvements, and given the underfunding of these programs are unlikely to see any improvement in the near term. The EIR accordingly understates the traffic and air quality impacts of the project and fails to require all feasible mitigation.

97

In fact, the roadways reliant on TUMF funds are not presently scheduled for improvement nor are the improvements funded. (*See, e.g., 2011 Annual Report, Transportation Uniform Mitigation Fee Program*, Western Riverside Council of Governments, "Five Year Transportation Improvement Program," <http://www.wrcog.cog.ca.us/downloads/AnnualReport_for_web.pdf>, p.39, *See, also*, <<http://www.wrcog.cog.ca.us/downloads/2012CentralZoneTIP020612.pdf>> [detailing funded expenditures in the Central Zone]) Furthermore, TUMF improvements can take up to 9 years to become a reality from a local jurisdiction developing a project to completion of construction. (*2011 Annual Report, Transportation Uniform Mitigation Fee Program, supra*, p.7) Project prioritization, programming, and allocation of funds may also be a barrier to improvements on the roadways impacted by this project. (*2011 Annual Report, Transportation Uniform Mitigation Fee Program, supra*, p.10) The EIR's conclusion that project transportation impacts on local roadways and intersections is less than significant after mitigation is simply not supported by evidence and the realities of these fair share programs.

98

Utilities and Service Systems

Water supply impacts are not adequately assessed or mitigated. The project will use approximately 1,991.25 AFY, from .66-.93 percent of EMWD's water supply. The EIR finds that EMWD will be able to meet its agencies demand through 2035, but this prediction does not include the Project. While the Moreno Highlands Specific Plan would require more water than the Project, development may not occur prior to 2035 but over a greater span of time. Hence, the fact that EMWD previously stated its ability to meet demand does not show that EMWD has sufficient supplies to meet the demands of this Project.

99

As discussed above, it is feasible to require the use of recycled water for this Project. The EIR finds water supply impacts to be reduced to less than significant levels, but does not state predicted mitigated demand. By failing to show reductions, the EIR fails to provide needed information.

100

MM 4.16.1.6.2A defers the preparation of grading and drainage studies. Without such studies, it is impossible to conclude that flows will be maintained similar to the existing condition. The same is true for MM 4.16.1.6.2B regarding runoff velocity, and 4.16.1.6.2C regarding sediment carrying capacity and erosion. These studies must be prepared, incorporated in the EIR, and the EIR recirculated in a manner that discloses potential impacts and thereafter evaluates whether they are mitigable.

100

Alternatives

Where there is an environmentally superior alternative that significantly decreases the significant impacts of the Project then that alternative must be approved rather than the Project if that alternative is feasible, even if the alternative would impede to some degree the attainment of the project objectives, or would be more costly. [(PRC§ 21002; *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 597, State CEQA Guidelines § 15126.6(b)]

101

CEQA requires a meaningful discussion of project alternatives. Project alternatives must be designed to meet basic project objectives and be capable of lessening significant project impacts. A reasonable range of project alternatives must be explored. In addition, where a project alternative is determined to be infeasible the determination must be based on substantial evidence in the record. In this case the DEIR fails to comply with CEQA's mandates with respect to analysis of project alternatives.

102

The DEIR fails to contain a clear description of what Alternatives 1 -3 would entail in terms of a development scenario. Moreover the DEIR states that only the development of a very small portion of the project site could reduce impacts, thus meaning that no alternative could successfully reduce impacts and thus closing the door on the adoption of any reasonable alternative. This conclusion is not based on logic where the reduction of the project's overall footprint and the amount of development proposed must translate to fewer significant impacts.

103

Assuming that the Reduced Density alternative is environmentally superior, the alternative meets the "primary" objectives of the project (i.e., development of a specific plan and establishment of open space). However, the alternative has not been shown to be infeasible based on substantial evidence in the record. The DEIR merely states that the alternative does not meet certain project objectives to "the same degree" as the proposed project. This does not suffice as a finding of infeasibility. For instance, the fact that the Reduced Density alternative creates fewer jobs does not show the alternative to be infeasible. In fact, the creation of roughly 17,000 jobs meets the objective to "provide jobs" for residents. Also for instance the alternative satisfies the objective of creating a "major logistics center" in the City. The fact that the alternative involves a lesser amount of space for potential development does not render the alternative financially or otherwise infeasible within the meaning of CEQA.

RESPONSE TO LETTER F-13

Johnson & Sedlack on behalf of Sierra Club, Moreno Valley Group & Residents for a Livable Moreno Valley

Response to Comment F-13-1. The commenter states the Environmental Impact Report (EIR) fails as an informational document, is conclusory, and the conclusions are not based on substantial evidence in the record. The EIR does provide decision-makers with objective factual information about the potential impacts of the project, and draws conclusions about significant impacts based on evidence presented in the EIR and supporting technical studies. The following responses will demonstrate why this is to be the case for this EIR.

Response to Comment F-13-2. The commenter questions the project description and states “the project really proposes 2,710 acres of warehousing and 19 acres of additional open space and/or public facilities compared to what would exist without the project” and indicates the California Department of Fish and Game (CDFG) conservation land is in the Specific Plan. The CDFG (now California Department of Fish and Wildlife (CDFW)) conservation land is not in the World Logistics Center Specific Plan (WLCSP) but is in the requested General Plan Amendment and Zone Change to permanently change its land use designation from a variety of developed uses under the existing Moreno Highlands Specific Plan to Open Space, consistent with its present use. The revised project actually proposes less warehouse development (40.6 million square feet vs. 41.6 million under the original plan) with 74.3 acres of open space within the WLCSP (in addition to the 1,085 acres of open space in the CDFW Conservation Buffer Area which is not in the Specific Plan. Section 1.3 of this Final Environmental Impact Report (FEIR) Volume 2 clarifies the project characteristics of the original project analyzed in the Draft Environmental Impact Report (DEIR) and the current project that was revised to remove 100 acres of land and 1 million square feet of development.

Response to Comment F-13-3. The commenter outlines the main considerations for preparing a programmatic EIR versus a project-level EIR. However, the commenter fails to acknowledge the most basic and practical reasons for using a programmatic EIR, that being when a large project is proposed to be developed over a long period of time, but detailed information is not yet available about the development. In this case, the WLC project represents one of, if not the largest logistics project in the country at this time, but the size and location of individual buildings is not known, therefore, a programmatic EIR is the most appropriate California Environmental Quality Act (CEQA) compliance document at this time. CEQA encourages compliance at the earliest possible time information is known about a proposed development.

Response to Comment F-13-4. The commenter believes a programmatic EIR is not appropriate for this project. As outlined in Response to Comment F-13-3 above, a programmatic document is the most appropriate CEQA document that can be prepared at this time, given the size and phasing of the project and the lack of specific information known at this time about future development. The example the commenter uses is not applicable, all future development proposals within the WLCSP area will have subsequent CEQA analysis, ministerial approvals will not be given for new proposed warehouse buildings, regardless of location or size (WLCSP Section 11.3.2). All future development applications will have to tier off this programmatic EIR as part of subsequent CEQA compliance review.

Response to Comment F-13-5. The commenter states more specific information is needed on the Development Agreement (DA) and project development. As explained in DEIR Section 2.0, *Introduction*, the EIR is programmatic because no specific development information is available at this time (i.e., size and location of buildings) so by its nature the EIR cannot provide more detailed information in that regard. The Development Agreement deals with fee payments and non-

infrastructure commitments between the City and Highland Fairview. Information in the DA does not change the analysis of potential impacts or recommended mitigation in the DEIR.

Response to Comment F-13-6. The commenter states additional mitigation is required for loss of agriculture. In the DEIR, the CDFW Conservation Buffer Area just south of the WLCSP was included in the agricultural assessment because it was being dry farmed similar to the southern end of the WLCSP property. With that additional property, the agricultural assessment determined loss of agriculture was a significant impact using the Land Evaluation and Site Assessment (LESA) model developed by the State Department of Conservation. Based on comments on the DEIR regarding the LESA model analysis, the agricultural assessment in the DEIR (Appendix C-2) was revised to remove the CDFW Conservation Buffer Area (FEIR Volume 2, Appendix C-2). With that revision, the LESA model results indicate the loss of Farmland of Local Importance within the WLCSP is not significant (see FEIR Volume 2 Appendix C-1 through C-4) for details). However, to err on the side of caution, the FEIR concludes that cumulative loss of agricultural land is still significant. In responding to many comments about the loss of agriculture, will be required to provide offsite mitigation to offset the loss of onsite agriculture, with the mitigation ratio to be based on the current agricultural economic productivity of the WLC property compared to the economic productivity of the offsite mitigation property. Therefore, the following Mitigation Measure (MM) 4.2.6.1A has been added to the EIR in response to comments on agricultural impacts:

4.2.6.1A Prior to the issuance of any grading permit affecting land designated as “Unique Farmland” (Figure 4.2.2 in the World Logistics Center Environmental Impact Report), an Agricultural Conservation Easement shall be recorded over land of equivalent or better agricultural economic productivity of the offsite easement property compared to the World Logistics Center property. The analysis will include a comparison of the project’s “Unique Farmland” considering its relative economic potential as the best measure of productivity (i.e., net profitability per acre or potential net rental income per acre). It will include a consideration of various important physical factors including location and accessibility, soils and topography, micro and macro climatic conditions, water availability and quality, as well as local practices, good farm management and cultural (growing) costs. The form and content of this easement, as well as the estimates of agricultural productivity, shall be reviewed and approved in advance by the Planning Official.

This measure is intended to address concerns expressed by the commenter and others regarding loss of onsite agricultural land. However, even with this measure, the FEIR still concludes that loss of locally important agricultural soils is a significant impact of the WLC project.

Response to Comment F-13-7. The DEIR identifies potentially significant impacts associated with the WLCSP and provides appropriate mitigation measures to reduce the impacts to levels that are less than significant with regard to sensitive biological resources. An update Habitat Assessment and (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2103 – FEIR Volume 2, Appendix E-1) was prepared to update existing conditions within the WLCSP area. The development of the WLCSP will potentially impact sensitive plants, nesting birds, six sensitive wildlife species (including burrowing owl) and jurisdictional drainage features. All feasible mitigation measures discussed in Section 4.4.6 of the DEIR will reduce project related impacts to less than significant levels. The biological mitigation measures have the following performance standards:

~~**4.4.6.1A** All development projects on lots adjacent to the CDFW property shall provide a minimum 250 foot setback between the CDFW property line and any building or vehicular circulation area (excluding emergency access drives). Permitted uses within or adjacent to this setback area include landscaping, drainage and water~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

~~quality facilities, fences and walls, maintenance access drives, and similar related uses. Prior to issuance of any discretionary permit in the WLCSP for development adjacent to the CDFW Conservation Buffer Area, development plans shall establish a minimum 250-foot clear setback along the southern property line of the WLC Specific Plan, both east and west of the SDG&E natural gas compressor plant. For the purposes of this measure, the term “clear” shall refer to all existing or future roads, industrial buildings or related improvements, walls, truck travel areas, etc. The only allowed uses within the 250-foot setback area are landscaping per the WLCSP, drainage or water quality basins, or relocation of any impacted plant or animal species from development areas within the Specific Plan. In addition, development plans shall also establish a minimum 150-foot setback from the north edge of the clear zone to the closest logistics warehouse building. This will provide a total minimum building setback of 400 feet from the northern edge of the CDFW Conservation Buffer Area to new warehouse buildings within the Specific Plan.~~

~~Development adjacent to the 250-foot open space setback shall have a minimum six-foot tall chain link fence to help separate warehouse activity from the buffer area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas. In addition, all truck activity areas within 750 feet of the southern boundary of the site shall be enclosed by minimum 11-foot tall solid block walls to help reduce noise and lighting impacts on the CDFW Conservation Area to the south. This measure shall be implemented to the satisfaction of the City Planning Division.~~

~~A landscape plan for the 250-foot setback area shall be submitted with any development proposal for lots adjacent to the CDFW property. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the Specific Plan. No plant species listed in Section 6.1.4 of the MSHCP shall be installed within the setback area. In conjunction with development adjacent to the CDFW Conservation Buffer Area, cottonwood trees shall be planted along the southern boundary of the 250-foot “clear” setback zone, consistent with the WLCSP landscaping plan and plant palette. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the SJWA Manager.~~

4.4.6.1A All Plot Plan applications within Planning Areas 10 and 12 (i.e. adjacent to the San Jacinto Wildlife Area as shown in Final EIR Volume 2 Figure 4.1.6B) shall provide a 250-foot setback from the southerly property line. Permitted uses within this setback area include landscaping, drainage and water quality facilities, fences and walls, utilities and utility structures, maintenance access drives, and similar related uses. No logistics buildings or truck access/parking/maneuvering facilities are permitted in this setback area.

In addition, logistics buildings within Planning Areas 10 and 12 may not be located within 400 feet of the southerly property line. All development proposals in Planning Areas 10 and 12 shall include a minimum six-foot tall chain link fence or similar barrier to separate warehouse activity from the setback area. This fence/barrier shall have metal mesh installed below and above ground level to prevent animals from moving between the development area and the setback area.

Within Planning Areas 10 and 12, all truck activity areas adjacent to the 250-foot buffer area along the southern property line shall be enclosed by minimum 11-foot tall solid walls to reduce noise and lighting impacts on the adjacent property. This measure shall be implemented to the satisfaction of the Planning Official.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

A preliminary landscape plan for the 250-foot setback area shall be submitted with all Plot Plan applications for lots adjacent to the California Department of Fish and Wildlife property. Precise landscape plans shall be submitted with any grading permit for said lots and must be approved prior to the issuance of any building permit on said lots. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the World Logistics Center Specific Plan. No plant species listed in Section 6.1.4 of the Western Riverside County Multiple Species Habitat Conservation Plan shall be installed within the setback area. Cottonwood trees shall be planted within the setback area consistent with the World Logistics Center Specific Plan. This measure shall be implemented to the satisfaction of the Land Development Division Manager.

Response to Comment F-13-8. The commenter states MM 4.1.6.1B does not establish performance standards in terms of visual impacts. The commenter is correct, the following language (underlined text) will be added to the measure to shield views from existing residences:

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

In addition, Response to Comment F-8-3 describes changes to MM 4.1.6.3A that will be made to protect future views of Mt. Russell from SR-60, a locally designated scenic highway.

Response to Comment F-13-9. The commenter states the EIR does not examine noise, health risks, and traffic impacts to onsite rural residential uses. In fact, the appropriate sections of the DEIR do address impacts to onsite rural residential uses.

DEIR Section 4.3.1.6, *Sensitive Land Uses in the project Vicinity*, specifically identifies the seven rural residences as sensitive receptors to be used in the air quality and health risk assessments, as follows...*"There are currently seven occupied single-family homes and associated ranch/farm buildings in various locations on the proposed project site. These residences are existing on-site sensitive receptors."* (DEIR page 4.3-20).

DEIR Section 4.3.6.3 *Localized Construction and Operational Air Quality Impacts*, discusses air quality and health risk impacts to these residences, as follows...*"The estimated maximum localized air quality impacts from the construction of the project in 2013 are summarized in Table 4.3.O. These*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

maximum impacts were found at the locations of the existing residences within the boundaries of the Specific Plan... project construction would exceed the significance thresholds for NO_x, PM₁₀, and PM_{2.5} and thus represents a significant impact without mitigation.” (DEIR page 4.3-61). Due to their location within the property, feasible mitigation for air quality impacts to onsite rural residences is limited. In addition, the FEIR Volume 2 has been revised to more clearly indicate the conclusion that air quality impacts to onsite rural residences is significant (refer to FEIR Volume 2, Section 4.3).

DEIR Section 4.12.6 outlines the noise impacts on these residences and proposes mitigation (MM 4.12.6.1A, D, E, and G). DEIR Section 4.12.6.1, *Short-Term Construction Noise Impacts*, specifically identifies the seven rural residences as sensitive receptors, as follows...*“Sensitive receptors that would be potentially affected by on-site construction activities would include residences located within and adjacent to the WLCSP area...”* and further in the section states...*“the existing residences are considered to be noise-sensitive uses that would be affected by intense construction activities.* (DEIR page 4.12-32). This section goes on to conclude the following:

“Based on these projections, anticipated worst-case construction noise levels would regularly be exceeded during daytime and nighttime hours at residences within the Specific Plan area. Based on an Leq noise level of 90 dBA at 50 feet, an observer would need to be 1,580 feet from the construction to experience a noise level of 60 dBA (Leq), or 2,800 feet for a noise level of 55 dBA (Leq). Therefore, a residence within 1,580 feet during active construction during the daytime would be affected. Similarly, a residence within 2,800 feet during the nighttime would be affected by construction noise. As set forth in Section 3.4.14 and as stated by the project applicant, construction could occur 24 hours per day, 7 days per week for these construction activities. Therefore, noise levels at the nearest residences would exceed the City’s exterior noise standard of the 60 dBA 1 CNEL daytime standard and 55 dBA CNEL nighttime standard for residential uses. This is a significant impact requiring mitigation.” (DEIR page 4.12-34).

Therefore, MMs 4.12.6.1A, D, E, and G were proposed to help reduce potential noise impacts to onsite rural residences, as shown below:

~~**4.12.6.1A** Prior to issuance of any discretionary approvals for development in the WLCSP, the project applicant shall submit a Noise Reduction Compliance Plan (NRCP) to the City of Moreno Valley for review and approval. The NRCP shall show the limits of nighttime construction in relation to any then occupied residential dwellings. Conditions shall be added to any discretionary projects requiring that the limits of nighttime grading be shown on the NRCP and all grading plans submitted to the City. The limits of construction allowed at night shall be clearly staked on site, and contractors will be provided with a copy of the plan showing the limits of nighttime construction.~~

4.12.6.1A Prior to issuance of any discretionary project approvals, a Noise Reduction Compliance Plan (NRCP) shall be submitted to and approved by the City. The Noise Reduction Compliance Plan shall show the limits of nighttime construction in relation to any then-occupied residential dwellings and shall be in conformance with City standards. Conditions shall be added to any discretionary projects requiring that the limits of nighttime grading be shown on the Noise Reduction Compliance Plan and all grading plans submitted to the City (per Noise Study MM N-2, pg. 51).

~~**4.12.6.1D** All discretionary approvals for development in the WLCSP shall include conditions of approval stating that no nighttime grading shall occur within 2,800 feet of residences south of SR-60 (between 8 p.m. and 6 a.m. on weekends and 8 p.m. and 7 a.m. on weekends or holidays). These restrictions shall be included as part of the Noise Reduction Compliance Plan. As an alternative to this requirement, a temporary construction sound barrier may be used in lieu of the construction buffer, per Mitigation Measure 4.12.6.1E.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- 4.12.6.1D** No grading shall occur within 2,800 feet of residences south of State Route-60 between 8 p.m. and 6 a.m. on weekdays and between 8 p.m. and 7 a.m. on weekends. These restrictions shall be included as part of the Noise Reduction Compliance Plan per Mitigation Measure 4.12.6.1A (per Noise Study MM N-2, pg. 51).
- 4.12.6.1E** As an alternative to Mitigation Measure 4.12.6.1D, a 12-foot tall temporary construction sound barrier may be installed for residences within 1,580 feet of active nighttime construction areas. The temporary sound barrier shall be constructed of plywood with a total thickness of 1-~~to~~ 4.5 inches, or a sound blanket wall may be used. If sound blankets are used, ~~the curtains they~~ must have a Sound Transmission Class (STC) rating of 27 or greater. This shall be included as part of the Noise Reduction Compliance Plan required in Mitigation Measure 4.12.6.1A, which shall be reviewed and approved by the City prior to implementation (per Noise Study MM N-2 and N-3, pg. 51 and pg. 52).
- 4.12.6.1G** Any discretionary approvals for development that proposes grading within 1,580 feet of occupied residential units shall require that all grading equipment be equipped with residential grade mufflers (or better). All stationary construction equipment shall be placed so that emitted noise is directed away from noise-sensitive receptors nearest the site. Additionally, stationary construction equipment shall have all standard acoustic covers in place during operation (per Noise Study MM N-4, pg. 52).

DEIR Section 4.15 describes projected onsite traffic impacts that would affect the rural residences, although it does not specifically mention the residences. The proposed Specific Plan roadway system will maintain onsite traffic conditions within City Level of Service (LOS) standards, as outlined in DEIR Table 4.15.B, therefore, there is no need for traffic or circulation mitigation specifically related to the rural residences.

Response to Comment F-13-10. The commenter states the DEIR fails to discuss the project's impacts in conjunction with other proposed, past, or current projects.

The TIA analyzes traffic operations on roadways, freeways, and at intersections in future year conditions. The TIA included future roadway assumptions based on Southern California Association of Governments' (SCAG's) approved Regional Transportation Plan project lists, which include hundreds of projects, and which were included by reference. The future roadway improvements are described in Chapter 2, Section A, the sub-section entitled "Network Assumptions." The analysis also takes into account other land development projects described in Chapter 2, Section A, the sub-section entitled "Land Use Assumptions." The analysis in the report on future year scenarios therefore does discuss impacts in conjunction with other proposed, past, and current projects.

Response to Comment F-13-11. The commenter cites a South Coast Air Quality Management District (SCAQMD) comment that the project represents 25% of *all* planned warehouse space in the region. The commenter states that the DEIR fails to evaluate the project's regional impacts on SR-60 and the Port of Long Beach, and understates the growth inducement impact on a regional level.

The comment is incorrect regarding the WLC's share of regional warehouse growth. As can be seen in the table below taken from SCAG's study entitled *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities*, the demand for warehouse space in the region is expected to grow from 665 million square feet in 2013 to 1,250 million square feet by 2035 (see red boxes in table); at total growth of 585 million square feet. The WLC's 41 million square feet represents less than 7% of the foreseeable growth in demand.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Note that the port-related demand for warehouse space is expected to nearly triple by 2035 (see blue boxes) and non-port-related demand will grow by 69% (green boxes). This is due to a combination of factors including the growth of international trade, structural changes in how goods are distributed, and population and economic growth. These large increases in demand are inducing the growth in warehousing, not the other way around.

Exhibit 2.-Aggregate Port & Non-Port Demand For Warehousing Space						
Year	Port Demand	Change	Non-Port Demand	Change	Total Demand	Change
2008 actual	102,082,701		591,760,159		693,842,860	
2009 actual	84,132,118	(17,950,583)	578,615,853	(13,144,306)	662,747,971	(31,094,889)

2035	307,277,606	12,705,423	942,962,180	20,307,029	1,250,239,786	33,012,452

Exhibit F-13-1: Aggregate Demand for Port and Non-Port Warehousing Space

An additional section (Chapter 12, Section F) has been included in the Traffic Impact Analysis (TIA) (refer to FEIR Volume 2, Appendix L-1) that analyzes project impacts on freeways to the port. The analysis, which is based on and supported by research done by SCAG and by the Port of Long Beach, found that only a small percentage of WLC truck traffic would be to and from the ports. See Table 86 in the revised TIA (Table F-13.A below) (FEIR Volume 2 Appendix L-1), repeated below.

Table F-13.A: Percentage of WLC Trucks to or from the Port

Year	% of Warehouse Space Used for Port-Related Cargo	% of Truck Trips Going to and from the Ports
2012	5.00%	2.07%
2022	9.30%	3.86%
2035	16.30%	6.76%

Response to Comment F-13-12. The commenter states the EIR should require specific phasing to better identify impacts. The temporary or construction impacts estimated in the DEIR are based on “worst case” daily estimates based on the estimated project phasing, which is appropriate given the programmatic nature of the EIR. Phasing for this type of project is difficult to estimate let alone control. Regardless of what phasing is estimated for analysis in the DEIR, the actual phasing of development will depend on actual applications for development in the future which is totally driven by market conditions and cannot be controlled by a schedule constructed as part of an environmental analysis document. It should be also be noted that processing of development applications takes many months if not years for large industrial projects, so it is likely the City would be processing only one large industrial warehouse application at a time, so the estimate of construction phasing impacts is still considered to be accurate given the physical and planning constraints upon the WLC project.

In addition, the DEIR evaluated the project assuming it was built out over a period of 10 years (buildout in 2022). Market conditions will prove this out, but if you take the 41.6 million square feet of logistics warehouse this would be assuming a build-out of 2.5 million square feet a year can be built over 15 years. This assumes there is available construction equipment and workers to complete 2.5 million square feet per year. The updated EIR (FEIR Volume 2) has increased the project construction period from 10 years to 15 years. This increase is the result of nearly 2 years having already passed since the issuance of the Notice of Preparation in the baseline year of 2012, placing the most optimistic construction start in 2014 thereby leaving only 8 years for project buildout. A reasonable project construction start would be 2015 and a 15 year construction period. This would place the project buildout in 2030. The updated DEIR (FEIR Volume 2) evaluated two project time periods for phasing; Phase 1 at the mid-point of anticipated project construction (2022); and Phase 2 at project buildout (2030).

The majority of the construction activity is expected to occur during typical construction hours (7:00 am to 6:00 pm, Monday through Saturday). It is anticipated that concrete pours could occur during nighttime periods to utilize the cooler temperatures and facilitate the concrete curing process. Due to the likelihood of these nighttime concrete pours, the DEIR has evaluated a 24 hrs/day, 7 days a week construction impact. It is not reasonable or foreseeable that all construction activity would occur 24 hrs/day, 7 days a week, and it is not reasonable or foreseeable it would occur for the entire 15 year construction period. The DEIR assumed the probable availability of construction equipment and likely duration of operation to complete the project in the 15 year construction period.

Section 3.4.13 and 3.4.14 in the FEIR Volume 2 has been updated to reflect the numbers in the revised air quality report (refer to FEIR Volume 2, Appendix D).

Response to Comment F-13-13. The commenter believes the EIR needs to be recirculated to address its deficiencies. The EIR does not need to be recirculated as the EIR does provide decision-makers with objective factual information about the potential impacts of the project, and draws conclusions about significant impacts based on evidence presented in the EIR and supporting technical studies. The responses to the commenter’s comments in this letter demonstrate why this is the case for this EIR. The commenter is referred to various other responses in this letter regarding all

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

feasible mitigation but the commenter was not specific about which mitigation measures he was referring.

Response to Comment F-13-14. The DEIR Section 4.01 *Aesthetics* provides eight (8) Computerized Photographic Renderings from sensitive viewpoints around the project boundary. While the programmatic DEIR does not have building locations, these renderings depict a building envelope located at the minimum building setback, the maximum building height and white building color. This results in a worst case scenario for the view impacts as it places the potential building(s) as close to the project boundary, and as high as allowed in the project Specific Plan. This would represent a full environmental analysis for visual impacts along these boundaries. Subsequent project level (plot plans) submittals including site specific renderings and elevations will provide project level environmental review and provide subsequent mitigation measures and conditions of approval.

Response to Comment F-13-15. The project is proposing to utilize a native/drought tolerant plant pallet to support the commitment to sustainability and minimize irrigation and water demands. Studies have found that smaller container stock at initial installation will outperform larger container stock after approximately 3 years of growth. Trees and shrubs tend to be less root bound in smaller container sizes and will adapt and mature much quicker than those installed with larger container stock.

The DEIR view simulations have provided a reasonable and foreseeable simulation of the view at installation and the subsequent growth at 15 years. It's expected the plants and trees will continue to grow and mature beyond the 15 years depicted, but the views shown provide a very reasonable and conservative depiction.

It is not the goal or objective of the project to completely obscure the buildings. The landscape will evolve as it matures, leaving gaps where a portion of a plant may die or tree branches don't extend as far as hoped. There is no certainty of complete obscurity. Studies have found that plants do perform better where there is room to grow and there is not a lot of competition. This will be particularly true as supplemental water will be at a minimum and in some cases non-existent. The project proponent has installed a test planting area, adjacent to the WLC, using the proposed project plant pallet. The test area has received no supplemental irrigation for three years and is performing exceptional well, consistent with the plants used in the visual renderings.

Response to Comment F-13-16. The commenter purports the EIR does not evaluate the project correctly relative to two of the City's General Plan policies regarding aesthetics. However, the commenter does not specify what policies. Table 4.1.C in DEIR Section 4.1.6.3 evaluates the WLC project's potential impacts relative to the City's General Plan policies regarding visual resources, and determines those impacts are significant based on project characteristics available at this time. In response to comments from this commenter and others, MM 4.1.6.1B has been modified to include a performance standard in addition to the visual renderings of future development (see Response to Comment F-13-8 above). This change should address the commenter's concerns regarding visual impacts. It is unclear why the commenter believes this conclusion is unsubstantiated when it concludes visual impacts are significant.

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

Response to Comment F-13-17. The commenter states the conclusion of the "change in views" relative to future development is unsubstantiated. However, the currently approved General Plan land use and zoning designations for the WLC site are the Moreno Highlands Specific Plan (MHSP) which would allow a variety of residential and commercial uses to be developed on the site. The current condition of the site is largely vacant agricultural land, against which aesthetic impacts in the DEIR are measured, and they were determined to be significant. The DEIR also provided a comparison to the currently approved land uses, indicating that, under the MHSP, the site could be developed with a variety of residential and commercial uses which would cover essentially all of the site but with 1-2 story buildings (max. 35-40 feet) rather than the 60-80 foot tall warehousing buildings that would be built under the WLCSP.

Response to Comment F-13-18. The commenter quotes from the General Plan suggesting that the project is inconsistent with the general plan because it proposes "one use across 2,600 acres of land" instead of a mix of industrial uses. The commenter is misreading the General Plan by suggesting that it directs that each project provide this desired range of industrial uses. The range of industrial uses sought by the General Plan will occur city-wide, not within every project. The intent is to provide "a sound and diversified economic base" for the City as a whole, not on a project-by-project basis.

The commenters statement 'the EIR does not consider the seven homes within the Project area in determining its consistency...' is incorrect. Throughout the EIR document there is discussion regarding impacts to the existing residential uses within the Project. The Project includes a proposed amendment to the General Plan, including an amendment to the Land Use Plan, to change the designation of these properties to logistics land uses. If the General Plan Amendment and accompanying Zone Change are approved, the existing residential uses will become legal, non-conforming uses and be subject to Section 9.02.180 of the Municipal Code.

Response to Comment F-13-19. The commenter believes compliance with City standards would not reduce future lighting impacts under the WLC project to less than significant levels. However, the City recently adopted a lighting ordinance that was intended to deal specifically with skyglow and nightlighting in rural areas. Planning review of future development proposals within the WLC area will be required to comply with the City's lighting ordinance, as outlined under MM 6.1.6.4A in the DEIR. The commenter has not provided any empirical evidence that future development would create a significant nighttime lighting impact even if it was consistent with the City's lighting ordinance.

Response to Comment F-13-20. The commenter expresses concern that the EIR has not addressed nighttime lighting impacts from surrounding development. However, the commenter fails to acknowledge that the WLC project would result in development of much of the remaining vacant developable land in eastern Moreno Valley, and much of the land to the east (Badlands), south (Mystic Lake), and southwest (Lake Perris State Park) would not be developed and would not add additional nighttime lighting to the project area. Despite this, the proposed WLC represents the most significant source of future nighttime lighting for this area, regardless of whether it is compared to the projected General Plan growth or specific projects identified in the traffic impact assessment. With the recommended mitigation measures and compliance with the City's lighting ordinance, the project would still have cumulative lighting impacts, as already identified in Section 4.1.7 of the DEIR. The

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Executive Summary has been revised to be consistent with the cumulative analysis in DEIR Section 4.1.7.

Response to Comment F-13-21. MMs 4.1.6.1B, and 4.1.6.3A do have provisions that require each respective study to demonstrate they are consistent with the WLCSP. MM 4.1.6.4A requires the lighting studies to be consistent with the City Municipal Code. The comment expresses concern over the project being developed in compliance with the prepared renderings. A mitigation measure has been added to Section 4.01 as follows:

4.1.6.1C Prior to the issuance of a certificate of occupancy for buildings adjacent to the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing residences at the time of application) the screening required in Mitigation Measure 4.1.6.1A shall be installed in substantial conformance with the approved plans to the satisfaction of the Planning Official.

Response to Comment F-13-22. The commenter believes the mitigation recommended in the DEIR for agricultural impacts is not sufficient. In responding to many comments about the loss of agriculture, the developer will be required to provide offsite mitigation to offset the loss of onsite agriculture, with the mitigation ratio to be based on the current agricultural economic productivity of the WLC property compared to the economic productivity of the offsite mitigation property. Therefore, Response F-13-6 in this letter above outlines a new mitigation measure (MM 4.2.6.1A) the developer has proposed to address these comments and the impacts to locally important agricultural soils. However, even with this measure, the FEIR still concludes that loss of locally important agricultural soils is a significant impact of the WLC project.

Response to Comment F-13-23. See Response to Comment F-13-6 above.

Response to Comment F-13-24. See Response to Comment F-13-6 above.

Response to Comment F-13-25. The health risk methodology employed in the health risk assessments contained in the DEIR and FEIR are based on the basic health risk and non-cancer risk formulations and meteorological data as recommended by OEHHA and SCAQMD and/or the ARB as discussed in the DEIR Section 4.7 and FEIR Volume 2, Section 4.7. In particular, the exposure durations for the residential and worker health risk assessment are 30 years and 25 years, respectively, as recommended by OEHHA. More importantly, the latest research demonstrates that new technology diesel exhaust does not contribute to cancer and the proposed project would prohibit traditional diesel engines. Please refer to Master Response-1 and Master Response-2 in Response to Comment C-3 for more information.

Response to Comment F-13-26. The commenter notes the DEIR talks about using a trip generation rate of 1.44 because this is a general plan EIR. This is not a general plan EIR. It should have said that the average rate was used because more than ten warehouses are under study. The commenter states that the correct rate of 1.68 was correctly applied, but criticizes the DEIR for not stating exactly how many warehouses are being proposed in the project.

The text in the EIR has been revised to clarify the discussion about a trip generation rate (FEIR Volume 2, Section 4.15.3.2 Project Trip Generation, Distribution, and Assignment). As stated in Section 2.1 of the Specific Plan, it is anticipated that the WLC will have 15-to-30 logistics warehouses. The exact number of buildings has not yet been determined though the total floor area will not exceed the amount shown in the project description. As noted by the commenter, the correct trip generation rate was used in the traffic analysis which formed the basis for the air quality analysis.

Response to Comment F-13-27. The commenter indicates that the following statement from the DEIR (page 4.3-17) is troubling: “While the 2010 State of the Air Report shows a slight uptick in the number of days of unhealthy air for ozone and annual particle pollution since the 2009 report, it is

important to note that pollution levels measured in this latter report were affected by fluctuations in weather conditions in 2010 and the addition of several new particulate monitoring stations in areas in San Bernardino known to be particularly problematic for particulate matter given local conditions.”

This uptick is not a change in the trend. A trend does not refer to one year of events, but is measured over a period of many years. The DEIR Section 4.3 (page 4.3-17) further explains that the uptick is primarily due to the addition of other PM monitoring stations. In addition, the Executive Summary of the revised air quality analysis presents additional graphs and information regarding the decreasing trend in pollution in the Inland Empire (see Master Response-1 in Letter C-3).

Response to Comment F-13-28. The commenter indicates that the evaluation of short-term construction is not supported. In CEQA, construction impacts are commonly referred as "short-term" while operational impacts are referred as "long-term" - this is to distinguish between the two activities, as operation does not have an identified end date. Additionally, the revised analysis extends construction over 15 years instead of 10, thereby reducing the daily emissions of pollutants and the intensity of construction since construction is spread over a longer time interval.

The commenter also indicates that the air quality analysis evaluates the use of construction equipment for only 10 hours per day with no limit on how much equipment is onsite, so the commenter claims the impacts are understated. MM 4.3.6.2A restricts construction equipment from being in the on position for more than 10 hours per day. The equipment assumptions used in estimating the emissions are a worst-case scenario and assumed a high quantity of equipment to be operating each day. Construction activities would vary substantially from day to day depending on the specific activity being performed, i.e., grading, building construction, paving, utilities, etc. In addition, the California Emissions Estimator Model (CalEEMod) default of the number of hours per day the off-road construction equipment would be in use is 6 to 8 hours per day.³⁸ As a result, the project analysis is conservative. In addition, with the refinement of the construction schedule, there would be fewer equipment onsite on any one day, thereby reducing the construction related emissions.

The commenter claims that the EIR fails to consider the overlap of construction phases. However, this is not true, as both the analyses in the DEIR and the revised analysis provide an estimate of the overlap of the construction phases (i.e., building construction occurring at the same time as paving) as well as the overlap of operation and construction. For the regional analysis, in the DEIR, refer to Table 4.3.W and Table 4.3.Y. The localized analysis (DEIR Section 4.3, pages 4.3-58 - 66) and the Health Risk Assessment (HRA) (DEIR Section 4.3, pages 4.3-71 through 4.3-83) also include all sources of construction and operation as such activities would overlap.

The commenter indicates that a mitigation measure should be incorporated requiring longer construction phasing. Although this is not a mitigation measure, the project details and assumptions have been refined to extend the construction from 10 years to 15 years.

Response to Comment F-13-29. The commenter indicates that the NO_x (14,800 pounds/day) and CO values in Table 4.3.U of the DEIR are high.

These refer to the “worst-case scenario” emissions, which use emission factors from the year 2012, assuming that the project is completely build out in 2012 and that there have been no emission upgrades to cars or trucks in the subsequent years as would be expected from the emission standards already adopted by the California Air Resources Board. This “worst case scenario” is an unrealistic scenario but is included to provide consistency with the analyses contained in the project traffic impact study. The DEIR also provides a more realistic scenario in which the project’s emission

³⁸ CalEEMod Manual, Appendix E, Section 1, Construction Survey by SCAQMD. Website: www.aqmd.gov/caleemod/doc/AppendixE.pdf

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

impacts are assessed assuming the expected construction and occupancy schedule for the project (Table 4.3.V in the DEIR indicates approximately 3,000 pounds per day of NO_x at buildout using 2022 emission factors). In addition, the revised analysis uses updated methodology and emission factors, which reflect further emission upgrades to the vehicle and truck fleet. The methodology also considers a detailed analysis of the roadways in which the project's vehicles and trucks would traverse, which provides a more realistic emissions estimation. The NO_x emissions for operation at buildout in the revised analysis are estimated to be approximately 1,000 pounds per day (DEIR Section 4.3, after mitigation).

The commenter incorrectly claims that the emissions do not include dust. The regional and localized emissions in the DEIR and in the revised analysis both include dust in both operation and construction in the form of fugitive dust, brake and tire wear dust, and re-entrained road dust. In addition, the dust estimates are displayed separately from the exhaust estimates in the revised analysis (see DEIR Section 4.3, Tables 4.3.Y).

Response to Comment F-13-30. The commenter claims that the DEIR provides an “apples to oranges” comparison of operational regional emissions and claims that the mitigation shows little impact. The revised analysis in the FEIR (see Section 4.3 and the revised Air Quality, Greenhouse Gas, and Health Risk Assessment, 2015) attempts to present the regional emissions more clearly for the benefit of the readers.

The commenter identifies a minor typographical error in Table 4.3.Y, which does not change any significance findings. This has been edited in the FEIR. The value was correct in Appendix D of the DEIR, Table 58.

Response to Comment F-13-31. The commenter claims that there is no evaluation of operational emissions past 2022 when emissions will no longer include construction. However, as shown in Table 4.3.J, in the DEIR year 2022 does not include construction. Therefore, the year 2022 is operation only. Additionally, after the year 2022, emissions will continue to decrease because the vehicle and truck fleet would be newer and would incorporate more advanced technology. In the revised analysis, years 2021, 2027, and 2035 (buildout) were also estimated for emissions and corresponding impacts (FEIR Section 4.3). The emissions for the interim years were interpolated and are shown in Section 4.3 in the FEIR.

Response to Comment F-13-32. The commenter expressed concern that the EIR did not examine the project's consistency with several General Plan policies (Ultimate Goal VII, Goal 6.1, Objective 7.5, and Policies 7.5.1, 7.5.2, and 7.5.5) regarding air pollution. However, the commenter apparently failed to note that these goals, objectives, and policies are addressed in other sections of the DEIR that deal with specific environmental issues. For example, DEIR Section 4.16.4.2.3 4 in Utilities evaluates the project's compliance with General Plan Policies 7.5.1 and 7.5.2 which are related to energy conservation.

Ultimate Goal VII. Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards. CEQA documents in the City of Moreno Valley do not typically evaluate consistency with the ultimate goals as they are very broad and projects are typically evaluated against the most specific goals, objectives, and policies that implement the ultimate goals. However, consistency with this goal will be added to DEIR Section 4.14, *Public Services*, and DEIR Section 4.9, *Hydrology and Water Quality*, in response to this comment.

Safety Element Goal 6.1. “To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property.” FEIR Volume 2 Section 4.8, *Hazards and Hazardous Materials*, has been revised to include this policy.

Conservation Element Objective 7.5. “Encourage efficient use of energy resources.” FEIR Volume 2 Section 4.16.4.2.3 has been revised to include this policy.

Conservation Element Policy 7.5.5. “Encourage the use of solar power and other renewable energy systems.” The revised Specific Plan has a specific commitment to solar energy systems through implementation of MM 4.16.4.6.1C. FEIR Volume 2 Section 4.16.4.2.3 has been revised to include this policy.

Response to Comment F-13-33. The commenter notes the DEIR did not evaluate air pollutant emissions across the routes that will be used by project trucks, specifically those truck routes to the ports of Los Angeles and Long Beach.

In the health risk assessment contained in the DEIR, emissions and their resulting health risk impacts were estimated for individual freeway segments that extended from near Palm Springs to SR-71 near Corona, California. As a result of comments received on the DEIR, the number of freeway segments analyzed was extended from SR-71 westward along SR-60 and SR-91 to Interstate 710 to the ports of Los Angeles and Long Beach. Estimates of truck emissions along the routes were derived from the traffic volume data provided by the traffic impact model prepared by Parsons Brinkerhoff. The traffic analysis found that only a small percentage of WLC truck traffic would be to and from the ports. The inclusion of the traffic along the added freeway segments to the ports did not add any new impacts to those already included in the DEIR.

Response to Comment F-13-34. The commenter claims that several of the construction mitigation measures, such as MM 4.3.6.2A, are already required by law and therefore do not qualify as mitigation. The only measure already required by law is MM 4.3.6.2A(g), which requires compliance with SCAQMD Rule 403. Please see the FEIR Mitigation Monitoring Reporting Program for a list of the project’s mitigation measures.

The commenter desires MM 4.3.6.2A(c) to be edited to place restrictions to limit the hours of construction to 10 hours per day. The commenter is mistaken. The ten hours per day assumption does not reflect the amount of time construction activities will take during the course of the day. Rather, the 10 hours represents a conservative assumption of the amount of time any given piece of equipment would be in the “on” position. As noted in the DEIR, construction during some periods could go on for 24 hours per day. However, that construction represents different equipment operating at different times for different purposes. As discussed in the DEIR, it is expected that concrete will be poured during the night and early morning hours due to the difficulty of conducting large concrete pours when the sun is shining (see page 3-65 in the DEIR). Following the evening concrete pours, other construction activity will follow during the day. During all this activity it is not reasonably expected that any one piece of construction equipment would be in the “on” position for more than ten hours. In fact, CalEEMod, the model used to estimate construction emissions, typically uses an assumption of 6 to 8 hours per day (see Response to Comment F-3-28). For all these reasons, it is infeasible to limit to construction activity to 10 hours per day. For purposes of the air quality assessments, construction equipment was conservatively assumed to be in the “on position” from 6am to 4pm and concrete pouring would occur from midnight to 6 am.

Response to Comment F-13-35. The commenter indicates that “whenever possible” in MM 4.3.6.2C(d) be removed to make the mitigation legally enforceable. MM 4.3.6.2C has been edited to remove that requirement since it did not address air quality or greenhouse gases.

Response to Comment F-13-36. The commenter indicates that MM 4.3.6.3A does not prevent vehicles from accessing buildings on unpaved roads. MM 4.3.6.3A requires that during operation, vehicles must access buildings using paved roads.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-13-37. The commenter requests that MM 4.3.6.3B(f) and (g) be edited to require that all trucks be SmartWay 1.0 or greater carriers.

SmartWay features (low rolling resistance tires and aerodynamic devices) are required through California's Tractor-Trailer Greenhouse Gas Regulation. In addition, MM 4.3.6.3B encourages tenants to become SmartWay partners and maximize the number of SmartWay trucks. Tenants will be encouraged through the terms in the lease agreement, but the developer cannot require them to become SmartWay partners because their specific operational characteristics and financial arrangements are not known at this time, so it is unknown what that would mean to their business and operations.

Response to Comment F-13-38. The commenter indicates that MM 4.3.6.4A should be edited to provide storage lockers for a greater portion of full-time employees.

The commenter does not specify the quantity of storage lockers that would be acceptable to the commenter. The DEIR required a storage locker for 3 percent of the full-time equivalent employees based on a ratio of 0.50 employee per 1,000 square feet of building area. Thus, if the project is 40,600,000 square feet, there would be 20,300 employees and 609 storage lockers. The California Air Pollution Control Officers Association (CAPCOA) document does not specify an appropriate quantity of storage lockers for measure TRT-5. The California Green Building Code, as a non-residential voluntary measure, in Section A5.106.4.3, Changing Rooms, specifies one 2-tier locker for each 50 tenant-occupants. Therefore, if that ratio was used, there would be 487 storage lockers. Therefore, the project would provide more storage lockers compared with the voluntary Green Building Code.

The commenter indicates that MM 4.3.6.4A be edited to require 10 percent of vehicle parking spaces for additional electric vehicle charging. In the DEIR, the measure required two electric vehicle-charging stations at each building. The measure has been edited to also require for facilities with 100 parking spaces or more to have three percent of the total parking spaces capable of supporting electric vehicle charging. Any estimate of future demand for electric charging parking spaces is purely speculative. The State of California has had regulations requiring electric vehicles for over 20 years with no appreciable change in demand or availability of electric vehicles. Nonetheless, the project has committed to installing infrastructure based on the best available estimate of future demand, based on the building standard proposed by the California Buildings Standards Commission at Section 5.106, which calls for 3% of parking spaces being capable of supporting electric vehicle charging.

The commenter indicates that bicycle storage should be increased. However, the commenter does not provide a suggested quantity or a reference to support the increase. The CAPCOA document, Quantifying Greenhouse Gas Mitigation Measures (2010), measure SDT-6 suggests providing parking to meet "peak season maximum demand," but does not identify a quantity. In the DEIR, MM 4.3.6.4A requires that bicycle parking be provided for two percent of the parking spaces. This has been increased to five percent in the FEIR.

Response to Comment F-13-39. The commenter requests additional mitigation. Please refer to Response to Comments F-13-40 and F-13-41.

The commenter also claims that the project's significant air quality and health impacts justify project denial. The City Council will consider all comments on the project prior to making a decision on the project.

Response to Comment F-13-40. The commenter requests the mitigation measures as shown in the table below. Many of the suggested mitigation measures are covered under SCAQMD Rule 403, which the project will comply with (MM 4.3.6.2A requires that the project comply with the rule and page 4.3-55 of the DEIR discusses the rule). In addition, the project is considered a "Large Operation"

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

under Rule 403. Therefore, the project would comply with the additional measures as identified in the rule.

Suggested Mitigation Measure	Response
1. Gravel pads must be installed at all access points to prevent tracking of mud onto public roads.	Already in SCAQMD Rule 403. Section (d)(5) of Rule 403 states that at least one of the following should be at each vehicle egress from the site to a paved public road: (A) Install a pad consisting of washed gravel (minimum-size: one inch) maintained in a clean condition to a depth of at least six inches and extending at least 30 feet wide and at least 50 feet long. (B) Pave the surface extending at least 100 feet and at least 20 feet wide. (C) Utilize a wheel shaker/wheel spreading device consisting of raised dividers (rails, pipe, or grates) at least 24 feet long and 10 feet wide to remove bulk material from tires and vehicle undercarriages before vehicles exit the site. (D) Install and utilize a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the site. (E) Any other control measures approved by the Executive Officer and the U.S. EPA as equivalent to the actions specified in subparagraphs (d)(5)(A) through (d)(5)(D).
2. Install and maintain trackout control devices in effective condition at all access points where paved and unpaved access or travel routes intersect (e.g., install wheel shakers, wheel washers, and limit site access.)	
5. Pave all construction access roads at least 100 feet on to the site from the main road.	
3. All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.	Not Included. However, the project developer would likely choose to complete these as soon as possible. MM 4.3.6.3A requires that prior to operation the roads and parking lots must be paved. The Stormwater Pollution Prevention Plan (SWPPP) imposed by the Regional Water Quality Control Board (RWQCB) already requires Best Management Practices (BMPs) that include each one of the measures listed to prevent erosion and sediment discharges downstream. MM 4.9.6.2B addresses this issue. There is no need for additional mitigation.
4. Pave all construction roads.	Not Included. Travel on unpaved roads will be conducted pursuant to SCAQMD Rule 403. During grading and utility installation, construction roads can change daily, during building construction they change less often. Paving would be impractical as it would place wasteful energy and resources into something that is frequently changing.
6. Limit fugitive dust sources to 20 percent opacity.	Already Included in SCAQMD Rule 403. Section (d)(1)(B) states: No person shall cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area such that: (B) the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook), if the dust emission is the result of movement of a motorized vehicle.
7. Require a dust control plan for earthmoving operations.	Already Included in SCAQMD Rule 403. The project qualifies as a Large Operation; therefore, an AQMD approved dust control plan is required (see Section (e)(2)).
8. When materials are transported off-site, all	Already Included in SCAQMD Rule 403. Best Available

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.	Control Measures, control measure 09-2 for importing/exporting of bulk materials states, "Maintain at least six inches of freeboard on haul vehicles."
9. All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.	Already Included in SCAQMD Rule 403. SCAQMD Rule 403 requires "No person shall allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. Notwithstanding the preceding, all track-out from an active operation shall be removed at the conclusion of each workday or evening shift." Section (d)(4).
10. The contractor or builder shall designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite.	Already Included in SCAQMD Rule 403. SCAQMD Rule 403 specifies a dust control supervisor, which has the authority to employ sufficient dust mitigation measures to ensure compliance with all Rule 403 requirements (c)(17). Large operations must appoint a dust control supervisor (e)(1)(E).
11. Post a publicly visible sign with the telephone number and person to contact regarding dust complaints. This person shall respond and take corrective action within 24 hours.	Incorporated. This has been incorporated into MM 4.3.6.2A.
12. Extend grading period sufficiently to reduce air quality impacts below a level of significance.	Incorporated. As discussed in the revised Air Quality, Greenhouse Gas, Health Risk Assessment analysis, the grading period has been extended. However, impacts are still over the SCAQMD significance thresholds.
13. The simultaneous disturbance of the site shall be limited to five acres per day.	Not Incorporated. This measure is not feasible for the project given the size of the project. The WLCSP establishes a lower limit on the size of the high-cube warehouses at 500,000 square feet, or approximately 11 acres, with buildings four times that size possible. Obviously, to construct any one building would require disturbance of more than five acres. Assuming 5-foot cuts and fills over a five-acre site, grading would require the movement of 40,000 cubic yards, which could be accomplished in 4 hours. A grading operation can move 100,000 cubic yards or more per day. Limiting to 5 acres is not practical as grading is dependent on earthwork balances of cuts and fills and room to operate the equipment. The project is incorporating all feasible dust control measures and will comply with the requirements of SCAQMD Rule 403.
14. Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.	Already Included in SCAQMD Rule 403. Best available control measures (10-1) requires that soils, materials, and slopes be stabilized. Dust control measures for large operations indicates that inactive disturbed surface areas establish ground cover within 21 days (Table 2, 3c).
15. Any onsite stockpiles of debris, dirt or other dusty material shall be covered or watered three times daily.	Already Included in SCAQMD Rule 403. Dust control measures for large operations requires that unpaved roads be watered 3 times per day (Table 2, 4a); open storage piles would also be watered (Table 2, 5b).
16. Any site access points within 30 minutes of any visible dirt deposition on any public roadway shall be swept or washed.	Partially Included. SCAQMD Rule 403 requires that large operations prepare a dust control plan, which addresses these concerns. SCAQMD Rule 403 requires

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
17. A high wind response plan shall be formulated for enhanced dust control if winds are forecast to exceed 25 mph in any upcoming 24-hour period.	a dust control program for any soil disturbances and has measurements based upon microns of dust leaving the site. They also require sweeping of streets within 1 hour of any visible track out onto streets.
18. Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.*	
19. Develop a trip reduction plan to achieve a 1.5 AVR for construction employees.	<p>Not Incorporated. It is assumed that the commenter is referring to average vehicle ridership. The average vehicle ridership can be calculated by dividing the number of persons traveling by the number of private vehicle trips. So, in essence, a 1.5 Average Vehicle Ridership (AVR) would require 1 in 3 construction workers (or 33 percent) to travel by non-private vehicle method. This is not feasible for the project. Much of the construction workforce comes from home directly to the job site. The project would be drawing from all areas and directions (Beaumont, Redlands, San Bernardino, Riverside, Perris, Moreno Valley, Hemet, San Jacinto and beyond). If the traffic was one-directional then the project could setup a carpool lot, but that's not the case.</p> <p>MM 4.3.6.2A already requires that a ridesharing program be made available to construction employees and lunch options and/or a lunch shuttle service be provided for construction employees.</p>
20. Require high pressure injectors on diesel construction equipment.*	Not Incorporated. MM 4.3.6.2A requires Tier 4 construction equipment, the cleanest available construction equipment.
21. Restrict truck operation to "clean" trucks, such as a 2007 or newer model year or 2010 compliant vehicles.*	Incorporated. MM 4.3.6.2A has been edited to require 2007 or newer haul trucks.
22. Require the use of CARB certified particulate traps that meet level 3 requirements on all construction equipment.*	Not Necessary. MM 4.3.6.2A requires that Tier 4 equipment be used. Particulate traps are incorporated into the design of Tier 4 equipment.
23. Utilize only CARB certified equipment for construction activities.*	Already Included. MM 4.3.6.2A requires Tier 4 equipment. By law, all construction equipment must be CARB-certified for use in California.
24. The developer shall require all contractors to turn off all construction equipment and delivery vehicles when not in use and/or idling in excess of 3 minutes.*	Included. MM 4.3.6.2A requires that all contractors turn off diesel powered construction equipment or limit onsite idling to 3 minutes or less in any one hour.
25. Restrict engine size of construction equipment to the minimum practical size.*	Not Included. The construction contractor will determine what construction equipment size is appropriate for the job.
26. Use electric construction equipment where technically feasible.*	Already Included. MM 4.3.6.2A requires onsite electrical hookups and the use of electric tools where feasible.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
27. Substitute gasoline-powered for diesel-powered construction equipment.*	Not Included. Non-diesel powered equipment may not be available. In addition, MM 4.3.6.2A requires Tier 4 construction equipment.
28. Require use of alternatively fueled construction equipment, using, e.g., compressed natural gas, liquefied natural gas, propane, or biodiesel.*	
29. Use methanol-fueled pile drivers.*	
30. Install catalytic converters on gasoline-powered equipment.*	<p>Partially Included Under Regulation. Spark-ignition regulation applies to gasoline, propane, and compressed natural gas equipment. Compression-ignition regulation applies to diesel-powered equipment. MM 4.3.6.2A requires Tier 4 compression-ignition standards for diesel-powered equipment; see www.epa.gov/otaq/standards/nonroad/nonroadci.htm.</p> <p>California Air Resources Board's Large Spark-Ignition (LSI) Engine Fleet Regulation applies to equipment that uses LSI engines greater than 25 horsepower. To control LSI engines, there are automotive-style controls, such as a three-way catalytic converter, which controls hydrocarbons, NOx, and CO (ARB, Spring 2013, Course #505, LSI Engine Fleet Regulation Training, www.arb.ca.gov/msprog/offroad/orspark/presentations/lsi_fleet_regulation_tutorial_7-29-13.pdf). Forklift fleets must meet average emission level standards.</p> <p>The EPA's spark-ignition regulation is for gasoline powered engines. For engines at or below 19 kilowatts, the small spark-ignition standards apply (www.epa.gov/otaq/standards/nonroad/smallsi-exhaust.htm); otherwise the large spark-ignition engine standards apply (www.epa.gov/otaq/standards/nonroad/largesi.htm).</p>
31. Require the use of Alternative Diesel Fuels on diesel equipment used. Alternative diesel fuels exist that achieve PM ₁₀ and NOx reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14 percent reduction in NOx and a 63 percent reduction in PM ₁₀ compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.	Not Included. The ARB has verified Lubrizol's PuriNOx for 1988 through 2003 model year diesel engines used in on-road applications and 1996-2002 off-road (www.arb.ca.gov/diesel/verdev/vt/cvt.htm). This is consistent with the ARB's Verification Procedure, Warranty and In-Use Compliance Requirements for In-Use Strategies to Control Emissions from Diesel Engines (www.arb.ca.gov/diesel/verdev/reg/procedure_march2011.pdf). As such, it is not approved for use on the newer equipment that would be used on the WLC construction site or project.
32. Electrical powered equipment shall be utilized in-lieu of gasoline-powered engines where technically feasible.*	Already Included. MM 4.3.6.2A requires onsite electrical hookups and the use of electric tools where feasible.
33. All forklifts shall be electric or natural gas powered.*	Partially Included. Electrical hookups are provided during construction pursuant to MM 4.3.6.2A. However, the availability of construction electric or natural gas forklifts may not be available or feasible. The air quality analysis assumed use of diesel-powered forklifts during

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
	construction to provide a conservative emissions estimate. Nevertheless, MM 4.3.6.2A has been edited to require these if feasible during construction.
34. Suspend use of all construction equipment operations during second stage smog alerts.*	Partially Included. MM 4.3.6.2D requires that mass grading cease on days with an Air Quality Index greater than 150, which is when the air is unhealthy and equates to approximately 95 parts per billion of 8-hour ozone. The “smog alert” term is no longer used by the SCAQMD.
35. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.*	Already Included. Refer to MM 4.3.6.2B.
36. Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site.*	
37. Reroute construction trucks away from congested streets and sensitive receptor areas.*	Incorporated. This has been incorporated into MM 4.3.6.2B
38. Configure construction parking to minimize traffic interference.*	Already Included. Refer to MM 4.3.6.2B.
39. Prior to the issuance of a grading and building permit, the applicant shall submit verification that a ridesharing program for the construction crew has been encouraged and will be supported by the contractor via incentives or other inducements.*	Incorporated. MM 4.3.6.2A has been edited to require participation in a ridesharing program and lunch options (either onsite or a shuttle service).
40. Minimize construction worker trips by requiring carpooling and providing for lunch onsite.*	
41. Provide shuttle service to food service establishments/commercial areas for the construction crew.*	
42. Provide shuttle service to transit stations / multimodal centers for the construction crew.*	Not Included. If there is a demand for this service, it can be considered by the construction contractor and/or applicant.

* The commenter indicates that these measures would also reduce greenhouse gas emissions.
Source of suggested mitigation measure: Comment F-13-40

Response to Comment F-13-41. The commenter recommends the following mitigation measures:

Suggested Mitigation Measure	Response
1. All trucks accessing the Project site must meet 2010 standards or better at opening, improving to advance to higher standards by 2022. Results, including backup data shall be reported to the Planning Department semi-annually.*	Included (1 & 2). MM 4.3.6.3B requires that diesel trucks be model year 2010 or later. Compliance with the mitigation measure will be documented through the Mitigation Monitoring and Reporting Plan.
2. If the above mitigation is not feasible, the tenant shall phase-in trucks beginning with 30 percent 2010 standards or better at opening and continually improving, to introduce newer trucks faster than regulatory standards. (Alternatively, see 8-10 below)	

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
3. The Project shall not only provide infrastructure for alternative fuels (for example, electric or natural gas) but require that its usage be phased in as soon as such technology is technologically feasible. Such infrastructure must be adequate to provide alternative fuels for the entire project or, if deemed infeasible, at least 25 million square feet of logistics warehousing and its associated truck trips.	Partially Included. MM 4.3.6.3C requires onsite alternative fueling infrastructure. However, requiring alternative fueled technology is not feasible as discussed in Master Response- 3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment.
4. The tenants shall implement advanced technology demonstration and implementation Programs.	Included. The project would incorporate an alternative fueling station (MM 4.3.6.3C) and electric vehicle charging capabilities (MM 4.3.6.4A).
5. Tenants shall be required by contract to apply for funding to retrofit and replace older, dirtier trucks prior to purchase or lease of any portion of the site.	Not Required. Because all diesel trucks that access the project site be model year 2010 or newer, this measure is not required since there would not be “older, dirtier trucks” on the project site.
6. Incorporate another method of accelerated penetration of partial zero-emission and zero emission vehicles and trucks through funding assistance.	Not Included. See Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment, which addresses the infeasibility of zero and near-zero emission trucks.
7. Accelerate retirement of older light-, medium-, and heavy- duty vehicles, through funding incentives or contract specification.	Not Required. All diesel trucks that access the project site be model year 2010 or newer.
8. The operator of any Project facilities shall become SmartWay Partner.*	Partially Included (8-12). SmartWay features (low rolling resistance tires and aerodynamic devices) are required through California’s Tractor-Trailer Greenhouse Gas Regulation. In addition, MM 4.3.6.3B encourages tenants to become SmartWay partners and maximize the number of SmartWay trucks. Tenants will be encouraged through the terms in the lease agreement but the developer cannot require them to become SmartWay partners. It is unknown what that would mean to their business and operations.
9. All Project facilities shall meet SmartWay 1.25 ratings.*	
10. All Project facilities shall use only freight companies that meet SmartWay 1.25 ratings.*	
11. (ALTERNATIVELY from 2,3 above) The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long haul trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*	
12. The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve a 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidator trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*	

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
<p>13. All spaces utilizing refrigerated storage, including restaurants and food or beverage stores, shall provide an electrical hookup for refrigeration units on delivery trucks. Trucks incapable of utilizing the electrical hookup for powering refrigeration units shall be prohibited from accessing the site. All leasing documents shall include these requirements and provide that violation of those provisions will constitute a material breach of the lease that will result in the termination of the lease. Because of the fact that these terms of the lease are designed to benefit the public, the public shall be considered to be a third party beneficiary with standing to enforce the requirements of the lease.*</p>	<p>Partially Included. <u>Mitigation Measure 4.3.6.3E says, “Refrigerated warehouse space is prohibited unless it can be demonstrated that the environmental impacts resulting from the inclusion of refrigerated space and its associated facilities, including, but not limited to, refrigeration units in vehicles serving the logistics warehouse, do not exceed any environmental impact for the entire World Logistics Center identified in the program Environmental Impact Report. Such environmental analysis shall be provided with any warehouse plot plan application proposing refrigerated space. Any such proposal shall include electrical hookups at dock doors to provide power for vehicles equipped with Transportation Refrigeration Units (TRUs).”</u></p>
<p>14. Install catalytic converters on gasoline-powered equipment.*</p>	<p>Not Included. Onsite equipment would be powered by an alternative fuel, not diesel or gasoline.</p>
<p>15. Where diesel powered vehicles are necessary, require the use of alternative diesel fuels. Alternative diesel fuels exist that achieve PM₁₀ and NO_x reductions. PuriNO_x is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14 percent reduction in NO_x and a 63 percent reduction in PM₁₀ compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.</p>	<p>Not Required. During operation, MM 4.3.6.3B and project design features require non-diesel onsite equipment, forklifts, yard trucks, and emergency generators. If the commenter intended this to be applied to on-road diesel trucks, this is not feasible because of availability constraints. WLCSP Section 12.3 prohibits the use of diesel powered on-site service vehicles.</p>
<p>16. Electrical powered equipment should be utilized in-lieu of gasoline-powered engines where technically feasible.*</p>	<p>Partially Included. It is typical that most support equipment in a logistics facility is zero-emission. However, since it is unknown who the future tenants will be or what equipment will be specifically required onsite, it is not feasible to limit onsite technology beyond the current prohibition on the use of diesel equipment onsite.</p>
<p>17. Utilize only electrical equipment for landscape maintenance.*</p>	<p>Not Included. Landscaping emissions are negligible (less than 1 metric tons of Carbon Dioxide Equivalent (MTCO_{2e}) and less than 1 pound per day of VOC, NO_x, PM₁₀, and PM_{2.5}); therefore, this measure would not substantially reduce air pollutant or greenhouse gas emissions.</p>
<p>18. All forklifts shall be electric or natural gas powered.*</p>	<p>Partially Included. Project design features require non-diesel forklifts (WLCSP Section 12.3). Forklifts used inside warehouses are commonly electric.</p>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
19. Utilize only electric yard trucks.*	Not Included. MM 4.3.6.3B requires non-diesel yard trucks. However, it is not feasible to require an electric yard trucks because they are not commercially available and it is unknown whether they will become commercially available. See Master Response-3, Zero Emission and Hybrid Electric Trucks, Vehicles, and Equipment.
20. Prohibit idling of trucks for periods exceeding three minutes.*	Partially Included. MM 4.3.6.3B requires that trucks not idle for more than three minutes; the California Air Resources Board Airborne Toxic Control Measure (13 CCR, Chapter 10, Section 2485) also limits truck idling to 5 minutes at any location.
21. Provide electrical vehicle (“EV”) and compressed natural gas (“CNG”) vehicles in vehicle fleets.*	Partially Included. The project would encourage electrical vehicles by providing charging stations (MM 4.3.6.4A). In addition, the project would also provide an alternative fueling station (MM 4.3.6.3C).
22. Charge reduced or no parking fee for EVs and CNG vehicles.*	Not Applicable. There are no parking fees on the project site.
23. Install EV charging facilities for a minimum of 10 percent of all parking spaces.*	Partially Included. MM 4.3.6.4A requires that three percent of the parking spaces provide electrical charging facilities.
24. Install a CNG fueling facility.*	Partially Included. MM 4.3.6.3C requires an onsite alternative fueling station. However, the fuel is not identified to allow for flexibility for the potential for future alternative fuels.
25. Provide preferential parking locations for EVs and CNG vehicles.*	Included. MM 4.3.6.4A requires preferential parking for alternative fueled vehicles.
26. Implement parking fee for single-occupancy vehicle commuters.*	Not Included. Whether through incentives or disincentives, all tenants would be required to comply with SCAQMD Rule 2202 which seeks to discourage single-occupant commuting through multiple strategies. However, a parking fee is not going to be required as mitigation at this time.
27. Plant shade trees in parking lots to provide minimum 50 percent cover to reduce evaporative emissions from parked vehicles.*	Already Included. As shown in page 4.7-42 of the DEIR and in the WLCSP (Section 5.2.7.7), parking areas will be landscaped to provide a shade canopy (50 percent coverage at maturity).
28. Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.*	Partially Included (28 & 29). The WLCSP requires a drought tolerant native plant palette (Section 5.4.2, Section 6.0, Section 5.1.8.3). There are number of attributes that the project landscaping may possess. These include drought tolerance, native, low-VOC, shading, screening, and others. All of these attributes will be considered when selecting trees, but some attributes for considered more important, such as native and drought tolerant. In addition, some attributes may be more highly valued based on the proposed location, such as shading in a parking lot or screening along the project interface. All of these attributes will be taken into consideration during the project-specific environmental review.
29. Plant Low-OFP, native, drought-resistant, tree and shrub species, 20 percent in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.*	

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
<p>30. Orient 75 percent or more of buildings to face either north or south (within 30 degrees of N/S) and plant trees and shrubs that shed their leaves in winter nearer to these structures to maximize shade to the building during the summer and allow sunlight to strike the building during the winter months.*</p>	<p>Partially Included. There are number of factors that would be considered in the determining the orientation, each having their own potential environmental consideration. For example, the proposed project site has a downslope in the north-south direction. That means in order to orient buildings in the north-south direction, significant additional grading would be needed, increasing greenhouse gas emissions. While some buildings, depending on size and location, may be able to be accommodated in the north-south direction, other buildings may not. In addition, the location of interior roads, exterior access points, location of the San Jacinto Fault, existing natural gas pipelines onsite, etc. will affect the orientation of future buildings such that they may not all be able to be oriented north-south. For reasons such as this, Leadership in Energy and Environmental Design (LEED) certification is required (WLCSP Section 12.8 and MM 4.16.4.6.1C). LEED requirements take a holistic view to incorporate the greatest number of building attributes in order to create a green building. This suggested measure may be a LEED credit and will be considered when selecting LEED credits to apply to the project, if feasible.</p>
<p>31. Provide grass paving, tree shading, or reflective surface for unshaded parking lot areas, driveways, or fire lanes that reduce standard black asphalt paving by 10 percent or more.*</p>	<p>Already Included. The project would provide tree canopy shade coverage for at least 50 percent of the parking lots at maturity (WLCSP Section 5.2.7.7). In addition, MM 4.16.4.6.1A requires cool pavements.</p>
<p>32. Electrical outlets shall be installed on the exterior walls of all residential and commercial buildings (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.*</p>	<p>Included. This has been added to MM 4.3.6.4A.</p>
<p>33. Prohibit gas powered landscape maintenance equipment within residential, commercial, and mixed-use developments. Require landscape maintenance companies to use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.*</p>	<p>Not Included. Landscaping emissions are negligible (less than 1 MTCO_{2e} and less than 1 pound per day of VOC, NO_x, PM₁₀, and PM_{2.5}); therefore, this measure would not substantially reduce air pollutant or greenhouse gas emissions.</p>
<p>34. Implement parking cash-out program for non-driving employees.*</p>	<p>Partially Included. Employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.</p>
<p>35. Require each user to establish a carpool/vanpool program.*</p>	<p>Already Included. MM 4.3.6.4A requires that the tenants participate in Riverside County's rideshare program, which has a carpool/vanpool program. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.</p>

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
36. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.*	Not Incorporated. MM 4.3.6.4A requires the installation of electric vehicle charging systems. There is not expected to be any relationship between tenants at the WLC. As result, there is no need to for individuals to travel between buildings on a routine basis. As such, there is no need for a neighborhood electric vehicle system.
37. Provide preferential parking for carpool/vanpool vehicles.*	Already Included. MM 4.3.6.4A requires preferential parking for carpool/vanpools. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
38. Provide subsidies or incentives to employees who use public transit or carpooling, including preferential parking.*	Already Included. MM 4.3.6.4A requires that the tenants participate in Riverside County's rideshare program, which can provide incentives. In addition, employers operating at WLC will be required to comply with SCAQMD Rule 2202, which achieves the goals requested by the commenter.
39. Provide direct, safe, attractive pedestrian access from project to transit stops and adjacent development.*	Already Included. The Specific Plan and MM 4.3.6.4A requires safe pedestrian access.
40. Provide direct safe, direct bicycle access to adjacent bicycle routes.*	Already Included (40 & 41). MM 4.3.6.4A requires bicycle lanes.
41. Connect bicycle lanes/paths to city-wide network.*	
42. Design and locate buildings to facilitate transit access, e.g., locate building entrances near transit stops, eliminate building setbacks, etc.*	Already Incorporated. Public transit would be incorporated into the design of the WLC. See Section 3.4.6.2 of the FEIR.
43. Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc.*	Already Incorporated. Public transit would be incorporated into the design of the WLC. See Section 3.4.6.2 of the FEIR.
44. Provide a display case or kiosk displaying transportation information in a prominent area accessible to employees.	Incorporated. This has been incorporated into MM 4.3.6.4A.
45. Provide shuttle service to food service establishments/commercial areas.*	Not Included. MM 4.3.6.3D requires an onsite facility for the sale of food and convenience items.
46. Provide shuttle service to transit stations/multimodal centers.*	Not Included. Transit-oriented design would be incorporated into the design of the WLC. Transit service will be provided by the Riverside Transit Agency (RTA), which will determine what routes will best serve the WLC when service is extended to the WLC. In addition, a shuttle service may discourage the RTA from providing service to the project.
47. Provide onsite child care or contribute to off-site child care within walking distance.*	Not Included. The project health risk assessment did not account for children spending all day at the project site. The Specific Plan, project goals, and project objectives do not promote child care uses. Also, see Response to Comment F-9B-35 for why there is no suitable locations for offsite child care facilities.
48. Implement a compressed workweek schedule.*	Partially Included (48 and 49). MM 4.3.6.4A allows for some of these activities which may be appropriate for

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
49. Implement home-based telecommunicating program, alternate work schedules, and satellite work centers.*	some office workers, but warehouse workers must be onsite for specific shifts, even if they are during off-peak times. Future development will also comply with the City's established greenhouse gas policies.
50. All buildings shall be constructed to LEED Platinum standards.*	Partially Included. MM 4.16.4.6.1C requires LEED certification. Specification to Platinum is not needed for the project (see Response to Comment A-4-4).
51. Design buildings for passive heating and cooling and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.*	Already Included. Page 4.16-39 of the DEIR states, "The project will encourage passive heating and cooling opportunities into the design or modification of the high-cubed warehouse developments and ancillary land uses." MM 4.16.4.6.1B would place skylights where it does not affect placement of solar panels. In addition, MM 4.16.4.6.1B was also edited to include this measure.
52. Construct photovoltaic solar or alternative renewable energy sources sufficient to provide 100 percent of all electrical usage for the entire Project.*	Partially Included. MM 4.16.4.6.1C requires onsite solar for the office portion of the logistics warehouses.
53. Install an ozone destruction catalyst on all air conditioning systems.*	Not Included. Ozone destruction catalysts apply titanium dioxide coatings to air conditioning systems to, in theory, reduce ozone (O ₃) to oxygen (O ₂). This is unnecessary. Ozone is an unstable molecule and is not expected to survive as ozone travels through the HVAC system. In addition, research shows that titanium dioxide is likely to convert abundant ammonia to NO _x , an ozone precursor. http://newsinfo.iu.edu/news/page/normal/24329.html
54. Construct renewable energy sources sufficient to offset the equivalent of 100 percent of all greenhouse gas emissions from mobile sources (internal combustion engines) for the entire Project. *	Not Included. The project would incorporate onsite solar (MM 4.16.4.6.1C). However, it is not feasible to offset the greenhouse gas emissions from offsite mobile sources because the utility does not have the capability to accept the excess solar power generated.
55. Purchase only green/renewable power from the electric company.*	Not Included. The project would have onsite solar pursuant to MM 4.16.4.6.1C. In addition, The City does not currently have an option to purchase green power only thru Moreno Valley Utilities (MVU). This was confirmed by Jeannette Olko, Electric Utility Division Manager City of Moreno Valley, December 11, 2013.
56. Install solar water heating systems to generate all hot water requirements.*	Already Included. Instantaneous or solar water heaters are required as part of MM 4.16.1.6.1B.

* The commenter indicates that these measures would also reduce greenhouse gas emissions.
Source of suggested mitigation measure: Comment F-13-41

Response to Comment F-13-42. The commenter discusses the non-cancer health hazards from diesel PM as well as potential health impacts to schoolchildren at nearby schools.

The non-cancer health effects of diesel PM are discussed from Master Response-2: Health Effects of Diesel Particulate Matter. The commenter mentions two schools, Rancho Verde High School and El Potrero Elementary School, and claims they are 1 mile from the project. In actuality, the Rancho Verde High School is located about 5 miles southwest of the project and the El Potrero Elementary School is located about 3.5 miles southwest of the project at their closest points. The revised analysis (FEIR, Volume 2, Appendix D) examined potential cancer risks at 36 local schools within about 7 miles of the project. In all cases, the project's cancer risks for school exposures typical of

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

schoolchildren were less than the SCAQMD's cancer risk significance threshold. See also Response to Comment E-3-7 and Section 5 of the revised air quality analysis (FEIR, Volume 2, Appendix D).

The commenter also indicates that the Office of Environmental Health Hazard Assessment (OEHHA) recently approved a new methodology for estimating cancer risks that emphasizes added exposure risks to children. The revised analysis referred to in the above paragraph did apply the new methodology approved by the OEHHA that implements weighting factors that reflect the increased sensitivity of school-age children to exposures to diesel PM in estimating cancer risks. In addition, the revised OEHHA methodology was applied to the entire analysis. For additional information, see Response to Comment E-3-7.

Response to Comment F-13-43. The commenter expressed concern about asthma and other health related issues regarding diesel emissions. See Response to Comment Master Response-2 in Letter C-3.

The commenter also asks about truck safety on surrounding roadways. Section 4.8.5.3 Truck Related Hazards, evaluated the potential risks related to project trucks on surround roadways as requested by the commenter.

Response to Comment F-13-44. The commenter claims that the cumulative air quality analysis is deficient. The commenter claims that the DEIR did not consider the cumulative impacts of projects that would be constructed simultaneously. Given the uncertainty in the timing of construction of any project, it is speculative to derive any conclusions as to cumulative construction impacts as such timing depends of market demand, regulatory approvals, etc. While the timing of any specific construction project with relation to the proposed construction of the WLC is speculative, it has been determined that the proposed project has a cumulatively considerable contribution to air quality impacts. DEIR states, "...cumulative impacts associated with short-term air quality impacts would be significant and unavoidable" (page 4.3-83). The DEIR also states, "Implementation of the proposed project would unavoidably contribute to significant long-term cumulative air quality impacts" (page 4.3-87). This would include additional air quality contributions from the construction of related projects.

The commenter also claims that the cumulative projects considered in the cumulative impact analysis are not listed or disclosed. This information was in Exhibit 16 of Appendix D of the DEIR and in Appendix E.2 of Appendix D in the DEIR.

The commenter also claims that cumulative hot spots were not addressed. However, this is incorrect, as stated on page 4.3-47 in the DEIR, carbon monoxide hotspots use "plus project" traffic volumes in the assessment. The 2022 cumulative scenarios in the Traffic Impact Analysis incorporate all known land development projects and all funded roadway projects (revised Traffic Impact Analysis, FEIR Volume 2 Appendix L-1, Section 7).

Cumulative Regional Analysis. As discussed in Appendix D of the DEIR (pages 177-189), the cumulative analysis relies in part upon the regional significance thresholds and compliance with the air quality management plans. Because the project's regional emissions would exceed the SCAQMD's significance thresholds, it was determined that the project would result in a cumulative impact. In addition, because it was determined that the project could conflict with the air quality management plan, the project was also determined to be cumulatively significant. A cumulative list of projects for the regional analysis would not be appropriate because ozone is regional in its nature and therefore, all the projects within the South Coast Air Basin would need to be included, which is not feasible.

Localized Analysis. The localized analysis uses background air quality concentrations from the project area, which include current cumulative air quality air concentrations. As is discussed in the Executive

Summary of the revised air quality analysis (also contained in Master Response-1), concentrations of ozone and particulate matter have been decreasing steadily in both the South Coast Air Basin and in the Inland Empire. The SCAQMD's 2012 Air Quality Management Plan also predicts that emissions are expected to decrease in the future (see Figure 5-8 and Figure 5-9, page 5-13 in the 2012 Air Quality Management Plan, also reprinted in the revised air quality analysis, Exhibit 1 and Exhibit 2). Therefore, the use of existing background concentrations is appropriate, since it is conservative. In addition, the localized analysis uses cumulative traffic volumes from the Traffic Impact Analysis, which incorporate all known land development projects and all funded roadway projects.

Health Risk Assessment. There is no cumulative SCAQMD recommended cancer risk threshold. Therefore, for purposes of this project assessment, it was determined that because project-specific cancer risk was less than significant, that there would also be a less than significant cumulative cancer risk impacts (see page 4.3-87 in the DEIR). In addition, the DEIR discusses the SCAQMD Multiple Air Toxics Exposure Study (MATES)-III, which is just one indicator of the background toxic air contaminant risk in the South Coast Air Basin (pages 4.3-87 through 4.3-88 and Figure 4.3.14 in the DEIR). The FEIR discusses MATES-IV, which is an update to MATES-III.

The commenter also claims that the DEIR fails to consider risks in other higher risk areas (San Bernardino, Long Beach, etc.). As shown in Exhibit 12 and Exhibit 15 of Appendix D of the DEIR, the receptor network for the Health Risk Assessment and the localized analysis extends from near Palm Springs to the ports of Long Beach and Los Angeles and includes many higher risk areas such as Mira Loma, Long Beach, and San Bernardino.

Response to Comment F-13-45. (The nature of large-scale logistics operations (receiving, sorting, storing, tracking, repackaging and shipping of large volumes of product) requires the coordinated efforts of a number of operations to achieve the efficiency and productivity necessitated by modern materials-handling operations. These efforts are structured to be highly responsive to market demands and are structured to function on a 24/7/365 basis. Operation and maintenance of modern material-handling systems requires concurrent 24/7/365 on-site, hands-on, high-tech expertise. This coordination of highly-automated, mechanical systems and skilled personnel is incompatible with the concepts of flexible work-schedules, home-based telecommuting, compressed workweek schedules and satellite work centers which are centered around employees working at remote locations.

Response to Comment F-13-46. In support of the DEIR, project biologists conducted updated biological resource field surveys in 2013 (refer to FEIR Volume, Appendices E-1 through E-4) including focused surveys for burrowing owl and Los Angeles pocket mouse. The updated information was used to prepare the MSHCP Consistency Analysis (FCS-MBA 2013 – FEIR Volume 2, Appendix E-1). This report identifies all potentially significant impacts associated with the development of the WLCSP as well as the off-site project related impacts.

Since the EIR for WLCSP is a program level-document, it will not have the specific level of detail required for a project-level CEQA document. Mitigation measures are generally described at a program level, which is appropriate for this CEQA document. Additional environmental documentation prepared at a project-level of detail will be prepared and used to support permitting with the CDFW.

Response to Comment F-13-47. There are three isolated patches of Riversidean sage scrub within the WLCSP area. The first area is located in the southwestern corner and is located within an open-space area of the WLCSP and will not be impacted. The habitat quality is moderate to high with an average species diversity.

The second area is located in the northern portion of the WLCSP and is located on the east side of Theodore Street in the Metropolitan Water District Land. This area has been relatively undisturbed

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

and contains marginal quality Riversidean sage scrub. The vegetation is sparse with little to know understory.

The third area is located within an abandoned agricultural basin along Gilman Springs Road in the eastern portion of the WLCSP, just north of Alessandro Boulevard.

Response to Comment F-13-48. The DEIR (see FEIR Volume 2) has been revised. Stephen's kangaroo rat (SKR) is a covered species under the Western Riverside County MSHCP.

Response to Comment F-13-49. See Response to Comment F-1-39.

Response to Comment F-13-50. See Response to Comment A-1-1 which includes modifications to MM 4.4.6.3A regarding riparian resources.

Response to Comment F-13-51. According to available research, a 250-foot “clear” setback (i.e., no human activity or improvements) appears to be adequate for a buffer area relative to noise and lighting impacts. This buffer shall be enhanced by an additional setback of buildings, and by the presence of the CDFW Conservation Buffer Area, which was originally purchased to provide a buffer between Mystic Lake and development in Moreno Valley. A minimum 250-foot setback is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and the distance established in nesting bird surveys for setbacks from human activity. An additional 150-foot building setback will help provide an additional buffer from building lighting and noise.

A total setback of 400 feet within the WLCSP for any permanent buildings shall be enforced on the southern boundary of the WLCSP. This setback shall provide an additional buffer from building lighting, noise, and air quality concerns. The 400-foot distance to buildings from the boundaries of the Specific Plan will effectively mitigate potential direct and indirect impacts on the SJWA and Criteria Cells to indirect noise, light and air quality impacts associated with both the construction and operation of the facilities.

Response to Comment F-13-52. See Responses to Comments G-64-23, G-64-64, and F-7A-25 which includes a new MM 4.4.6.4C.

Response to Comment F-13-53. See Response to Comment F-7A-9.

Response to Comment F-13-54. The proposed 250-foot buffer area will incorporate many types of land-use options. The buffer area is approximately 70-acres; nearly half of the area will be used for detention basins with spreading structures and the creation of riparian habitat. While the buffer area will include some limited access drives, the detention basins and landscaping will separate the primary project area from the more sensitive habitat areas to the south. The vegetation and landscaping berms will help screen the adjacent habitat from lighting, attenuate noise, and assist in dropping out air-borne pollutants. Based on the most recent focused protocol level surveys, sensitive plant and Los Angeles pocket mouse (LAPM) are considered absent from the project site and will not require relocation (FCS-MBA 2013-FEIR Volume 2 Appendix E-1).

Response to Comment F-13-55. Project-related impacts resulting in quantifiable direct impacts to biological resources not currently covered under the MSHCP would be addressed subsequently through analysis at a lower tier, project-specific level of environmental review. However, conservation of lands purchased with MSHCP Development Fees for the long-term conservation of sensitive species covered under the MSHCP, will also provide similar conservation for plant and wildlife species not covered under the MSHCP. For instance, lands purchased in a Core Conservation Area that contains coastal sage scrub and/or chaparral will provide suitable habitat for Parry's spineflower, which is a covered species under the MSHCP. It will also provide habitat for Robinson's pepper

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

grass, which is not covered under the MSHCP. MM 4.4.6.1B, as listed in the DEIR, will reduce the project related impacts to a level less than significant. As a result, the contribution of impacts associated with project within the WLCSP, are fully mitigated and will not contribute to cumulative impacts within the region.

Response to Comment F-13-56. See Response to Comment F-13-54.

Response to Comment F-13-57. See Response to Comment A-1-1.

Response to Comment F-13-58. Jurisdictional features will be avoided and unavoidable impacts will be mitigated through the construction of compensatory wetland. Compensatory wetland mitigation will be provided at an appropriate ratio (no less than 1:1 replacement wetland to impacted wetland) to ensure no net loss of wetlands or aquatic resources. Wetland mitigation will be provided concurrent with or prior to impacts and will be provided on-site, if feasible. Significant impacts to jurisdictional drainage features may also be compensated by off-site mitigation or purchase of habitat in an authorized in-lieu fee program, if necessary. For each individual project as it is designed, a Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the USACE/USEPA's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios as discussed in MM 4.4.6.3A.

Response to Comment F-13-59. The commenter requested updated surveys and habitat preservation onsite. Protocol surveys for LAPM were conducted in 2005, 2010, and 2013 within suitable habitat of the WLCSP. In all the years of conducting surveys on the WLCSP, no LAPM have ever been observed within the WLCSP. This shows sufficient evidence that the WLCSP does not provide sufficient habitat to support LAPM, nor is it likely to provide suitable habitat in the foreseeable future. Since there has been no recorded occurrences of LAPM in the northern portion of the SJWA, then the relocation of any individuals to the 250-foot buffer area will not affect LAPM in the northern portion of the SJWA, and a comprehensive strategy is not necessary. A comprehensive strategy would be appropriate if several LAPM were consistently observed within the WLCSP during the previous LAPM surveys. However, based on MSHCP guidelines, each project within the WLCSP will still be required to complete protocol-level surveys for LAPM if they contain suitable habitat and based on the findings, will develop a strategy to handle LAPM issues on a project-level basis. If LAPM was observed within the project site, 90% of the suitable habitat within the WLCSP will be required for conservation until the conservation goals for this species has been met. If more than 90 percent of the suitable habitat onsite cannot be avoided, a Determination of a Biologically Equivalent or Superior Preservation (DBESP) will be required for impacts to LAPM. The DBESP will include all mitigation measures required to provide biologically equivalent or superior preservation of the species.

Response to Comment F-13-60. The commenter questions the feasibility of MM 4.4.6.4F. This mitigation measure, in concert with MMs 4.4.6.4G and 4.4.6.4H shown below, do contain a number of performance standards that will aid in their implementation and protect sensitive species within the 250-foot buffer area.

4.4.6.4F Prior to approval of any discretionary permits for development ~~along the southern border of the WLCSP within Planning Areas 10 and 12,~~ a Biological Resource Management Plan (BRMP) shall be prepared to prescribe how the 250-foot “safe zone” ~~setback area~~ outlined in Mitigation Measure 4.4.6.1A will be ~~managed/developed~~ and maintained ~~to provide a buffer and resources for wildlife of the adjacent SJWA.~~ This plan will identify frequent and infrequent vegetation management requirements (i.e., removal of invasive plants) and the planting and maintaining trees along both the north and south sides of the detention basins to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

provide roosting and nesting opportunities for raptors and other birds. ~~The BRMP~~The Biological Resource Management Plan will also describe how relocation of listed or sensitive species will occur from other locations as outlined in Mitigation Measures 4.4.6.2A, 4.4.6.4D, and 4.4.6.4E.

~~Preparation and implementation of the BRMP~~The Biological Resource Management Plan shall be ~~to reviewed and approved by the satisfaction of the City Planning Division Official~~ in consultation with the ~~SJWA~~ San Jacinto Wildlife Area Manager. ~~The BRMP~~The Biological Resource Management Plan shall cover all the land within the 250-foot setback zone ~~along the entire southern boundary of the WLCSP~~within Planning Areas 10 and 12. Implementation of the plan shall be supervised by ~~the Riverside Land Conservancy or a qualified conservation organization or biologist~~, to the satisfaction of the City Planning Division.

4.4.6.4G Mitigation Measure 4.4.6.1A specifies that a landscape plan shall be submitted with any development proposal for lots adjacent to the ~~CDFW~~California Department of Fish and Wildlife (CDFW) San Jacinto Wildlife Area (SJWA) property prior to issuance of a precise grading permit. The landscape plan shall be prepared by a licensed landscape architect in consultation with a qualified biologist and shall be consistent with the design standards contained in the Specific Plan. No plant species listed in Section 6.1.4 or Table 6.2 of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) shall be installed within the setback area. In conjunction with development adjacent to the ~~CDFW Conservation Buffer Area~~ San Jacinto Wildlife Area (SJWA), cottonwood trees shall be planted within along the southern boundary of the 250-foot “clear” setback zone area, consistent with the WLCSP landscaping plan and World Logistics Center Specific Plan plant palette (per DBESP MM 8).

During construction, the runoff leaving construction areas will be directed to onsite detention basins and away from downstream drainage features located offsite. All projects within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (as outlined in MM 4.9.6.2B). Regarding the 250-foot setback area, pedestrian and vehicular access to areas of riparian/riverine habitat will be prohibited except for controlled maintenance access. Finally, no grading shall be permitted within conserved riparian/riverine habitat areas except for grading necessary to established or enhance habitat areas (DBESP MM 6, 7, 9, and 10).

4.4.6.4H As outlined in Mitigation Measure 4.4.6.1A, development adjacent to the 250-foot open space setback shall have a six-foot chain link fence or similar barrier to help separate human activity and the buffer area. Any chain link fencing installed on any properties adjacent to the 250-foot buffer area shall have metal mesh installed below and above ground level to prevent animals from accessing new development areas.

Response to Comment F-13-61. The commenter suggests that nine prehistoric of 45 total cultural resources in the project site were tested for significance. It is argued that because testing by Michael Brandman and Associates (MBA) was of limited scope, the research was inadequate and therefore the EIR must be recirculated. There are actually 64 sites in and near the project area and this count will be updated in both the cultural resource assessment and the FEIR Volume 2, Appendix F. Of these, 12 cultural resource sites were evaluated for significance following CEQA Guidelines Section 15064.5 during the analysis. None of the 52 other sites named in the cultural resource assessment will be directly impacted by construction within the WLCSP or off-site infrastructure extensions and therefore no further work on testing for significance was needed or warranted.

In 2006, project archaeologists tested nine prehistoric archaeological sites for significance: CA-RIV-610, CA-RIV-860, CA-RIV-3238, CA-RIV-3343, CA-RIV-3344, CA-RIV-3345, CA-RIV-3346, CA-RIV-8006 and CA-RIV-8007 following CEQA Guidelines Section 15064.5. Each of the prehistoric sites

were placed into Open Space as part of the Specific Plan to comply with avoidance of prehistoric sites as a part of mitigation strategy. Two historic archaeological sites, CA-RIV-4201H and CA-RIV-4210H, were tested by MBA in 2012. These sites were also found to be not significant following CEQA Guidelines Section 15064.5. One decomposing historic structure, CA-RIV-5856, was examined during the 2012 survey and was similarly found not significant. In sum, all known cultural resources that will be directly impacted during construction are considered not significant; therefore, the findings in the EIR are adequate for the purposes of CEQA.

The MBA cultural resource survey that identified cultural resources in the Specific Plan was undertaken following a State Historic Preservation Office (SHPO)-recommended methodology known as the Archaeological Resource Management Report (ARMR) format. This survey was not limited nor vague. The survey fieldwork was undertaken over a period of years as project parcels were available for access. Off-site parcels and parcels in the Specific Plan that are not. Because the EIR accounts for all known cultural resources exposed to view in those parcels under direct control of the proponent, and because the mitigation measures in the EIR account for unknown cultural resources that could be impacted during earthmoving, the mitigation measures are neither vague nor inherently deficient.

Response to Comment F-13-62. The comment suggests that EIR MM 4.5.6.1A provides no option for avoiding significant archaeological or cultural resources. MM 4.5.6.1A is associated with potential impacts to cultural resources in the “Light Logistics parcels.” The measure has been modified to include consultation with interested parties prior to final disposition of any newly discovered site that is considered significant. The revised mitigation measure can be found in its entirety in Response to Comment A-3-23.

Response to Comment F-13-63. The comment suggests that EIR MM 4.5.6.1B should contain the caveats of avoidance as the preferred option. MM 4.5.6.1 has been modified to state that, when construction occurs in a parcel deemed part of the “off-site improvements”, the project archaeologist shall amongst other considerations:

“...action shall be taken to include but not be limited to: (a) planning construction to avoid archeological sites (preferred option); (b) capping or covering archeological sites with a layer of soil before building on the affected site...”

The original measure does take into account avoidance, but the revised measure has been modified slightly as a result of this comment to indicate the status of the preferred option. The revised mitigation measure can be found in its entirety in Response to Comment A-3-23.

Response to Comment F-13-64. The comment suggests that EIR MM 4.5.6.1C is vague and uncertain such that this particular mitigation measure is therefore inadequate. The comment also asks that EIR MM 4.5.6.1C(5) be changed such that avoidance of resources uncovered during grading is the preferred option and that excavation and curation is the not preferred option. If curation is required, the resources should be curated in a museum that has agreed to take the resources.

With regard to the comment that MM 4.5.6.1C(5) should be changed such that avoidance is preferred and that data collection/curation are not, CEQA Guidelines 15064.5(f) clearly delineates what the Lead Agency (City) must do when inadvertent archaeological finds are encountered during earthmoving. Under the Guidelines, if such resources are determined not significant by the Lead Agency through the work effort of the project Archaeologist, avoidance need not be the preferred option. If the resources are instead determined significant, the Lead Agency may determine that the resource cannot be avoided due to construction parameters, and excavation/curation would therefore be the only alternative possible. MM 4.5.6.1C(5) has been modified slightly to reflect our clarified

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

reasoning. The revised mitigation measure can be found in its entirety in Response to Comment A-3-23.

Response to Comment F-13-65. The commenter suggests that future paleontological assessments in off-site areas should be considered deferred mitigation and that such assessment(s) should have taken place before the mitigation measure was written.

The project research showed that there are two types of sediment/rock on the modern ground surface: Holocene Alluvium and Granite bedrock. Off-site areas were not assessed but most of them appear to contain the same soil and rock strata except northeast of the Specific Plan in the foothills of The Badlands.

Research performed for this project, and elsewhere in southern California, suggests that neither sediment/rock type has potential to bear fossils, therefore, where Holocene Alluvium and Granite bedrock exist there is “low” potential for future project-related impacts to significant fossil deposits. Pleistocene Alluvium does have potential for bearing significant fossils but, in this part of southern California, Pleistocene Alluvium occurs at varied depth (including extreme depth) and preservation of fossils within it depends on the lithology of the strata. Some of the Pleistocene sediment may be too coarse to bear fossils, whereas other sediments have good potential but upon visual inspection of cuts will appear sterile. Therefore, once project-related excavations begin, a qualified paleontologist can decide whether or not the exposed strata has a “medium” or “high” chance to bear fossils and paleontological monitoring would then proceed accordingly.

The analysis correctly examines the project area and the study allowed the development of a mitigation measure that allows the project Paleontologist to formulate an appropriate response when and if buried paleontological resources are uncovered during construction. The measure provides performance standards if and when paleontological resources are found during construction.

Response to Comment F-13-66. The comment suggests that the cumulative impacts analysis lacks comparative analysis. California Environmental Quality Act (CEQA) Guidelines Section 15130 require an analysis of cumulative impacts on the basis of either 1) past, present, and probable future projects, which are either approved or being considered for approval by the City or other municipalities (or anticipated to be submitted for consideration, including projects in the design phase or under construction); or 2) growth projections set forth in regional plans, including regional modeling plans. This statement is found in Section 2.0 page 2-22 of the WLC EIR. The growth projections method was used for the cumulative analysis.

The EIR concluded that since no known significant cultural resources will be directly impacted by construction, and all known prehistoric archaeological resources have been included in the Open Space designation within the Specific Plan, there will be no cumulative impacts to cultural resources as a result of this project.

In addition, the EIR has proposed measures that can adequately allow for proper mitigation during construction of the project. The EIR has therefore adequately analyzed the cumulative impacts following CEQA guidelines. It is acknowledged that the loss of cultural resources could have a cumulative effect by potentially reducing the scientific knowledge that can be obtained by the recordation and investigation of archaeological resources; however, since no significant resources will be impacted by the project, there are no cumulative effects.

Response to Comment F-13-67. The Soils Report references a detailed fault study completed in the area of the project where the City’s Seismic Hazard Zone for the postulated Casa Loma segment was projected into the project. Leighton’s detailed study (Leighton, 2013, FEIR Volume 2 Appendix G) concluded that active faulting did not exist in this location; however, the results of localized co-seismic deformation were observed. The Soils Report recommended appropriate mitigation measures for

such hazard, which included removal and compaction of surface soils to support proposed structures. For planning purposes, this over-excavation can be on the order of 5 to 10 feet below planned footing elevations. The actual extent of such mitigation measures will require preliminary design information such as proposed structure location, design grading plans to determine the depth of cut or fill underlying proposed structure, foundations loads as well as settlement tolerances of the structure. With those design criteria, a building specific mitigation approach can be easily provided.

Response to Comment F-13-68. The Soils Report (FEIR Volume 2 Appendix G) and DEIR clearly indicate that the site is considered suitable for the proposed development. The content of Soils Report content is typical of such EIR level studies and in the absence of design level site development plans, including building loads and locations. Preparation of additional studies or addendum reports will be required to further define and verify the extent of corrective measures needed for individual buildings. However, the overall constraints and mitigation measures have been defined in the Soils Report and a future geotechnical study will only be needed to verify the extent of remedial grading or structural setbacks from existing faults, based on those building locations and design requirements.

Response to Comment F-13-69. The recommendations of the Soils Report and any further geotechnical recommendations should be implemented during planning and construction phases of development.

Response to Comment F-13-70. The commenter indicates that the project would emit an exorbitant quantity of greenhouse gas emissions. The DEIR estimated that the project would emit approximately 721,000 MTCO₂e/year after buildout. The revised analysis has refined the greenhouse gas emissions estimate and now emissions have decreased by 47 percent (see Master Response-1 for details on a comparison of emissions as estimated in the DEIR and FEIR).

Response to Comment F-13-71. The commenter claims that greenhouse gas mitigation is insufficient and only requires waste mitigation measures. However, as discussed in FEIR Section 4.7, the waste mitigation measure (MM 4.7.6.1A) is the only one that is needed. Although the following mitigation measures are not required to reduce greenhouse gas impacts to less than significant levels, they would also reduce greenhouse gas emissions: MMs 4.3.6.3B, 4.3.6.3C, 4.3.6.3D, 4.3.6.4A, 4.16.1.6.1A, 4.16.1.6.1B, 4.16.1.6.1C, 4.16.4.6.1A, 4.16.4.6.1B, and 4.16.4.6.1C.

Response to Comment F-13-72. The commenter claims that the EIR fails to evaluate the project's consistency with the ARB Scoping Plan.

Page 4.7-38 of the DEIR states, "the strategies are either consistent with or not applicable to the project; therefore, the project does not conflict with the Scoping Plan." **Response to Comment F-13-73.** The commenter indicates that the uncertainty the EIR finds regarding climate change and the impact from international shipping is downplaying the project's effects.

Refer to the discussion on page 4.7-43 of the DEIR that classifies international shipping emissions as speculative.

Response to Comment F-13-74. The commenter states the many trucks onsite should be considered a project and cumulative hazard. Section 4.8 of the DEIR did examine a variety of potential hazards related to the proposed WLC project, including accidents involving trucks on the local freeways and roadways. However, truck safety, which would include fuel fires, explosions, etc. involving an individual truck are typically the purview of the California Highway Patrol (CHP) when trucks are on state routes, the county sheriff or fire department when trucks are on County roads, or the local police and fire departments when those trucks are on City streets. While each warehouse will have dozens of trucks in and around its loading areas at any given time, there is no evidence to

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

suggest they will be collected together in one place or in large enough numbers to constitute a significant public hazard.

However, to be thorough, the revised DEIR contains a statement in the cumulative analysis of hazardous materials (FEIR Volume 2 Section 4.8.7) that the substantial increase in trucks in and around the WLC site would incrementally increase the risks of accidents involving truck-related fuels (e.g., fire or explosion).

Response to Comment F-13-75. A Water Quality Monitoring Plan for the SJWA will be prepared, which will contain specific performance standards to ensure that runoff does not impact the SJWA.

Consistent with the comments provided by Letter F-13 (Sierra Club and Residents for a Livable Moreno Valley), the text in DEIR Section 4.9.6.3, Page 4.9-42 is amended to include more specific performance requirements to MM 4.9.6.3C. The modified mitigation measure resulting from the comment is not considerable, and is considered to be a minor refinement of the existing measure. The change to the DEIR does not result in a significant impact and has no material effect on the findings of the EIR. The revisions to the text of the DEIR are as follows:

4.9.6.3A Prior to ~~issuance of any grading or building permits~~ discretionary permit approval for individual plot plans a site-specific Water Quality Management Plan (WQMP) shall be submitted to the City Land Development Division for review and approval. The Water Quality Management Plan shall specifically identify site design, source control, and treatment control Best Management Practices that shall be used on site to control pollutant runoff and to reduce impacts to water quality to the maximum extent practicable. The Water Quality Management Plan shall be consistent with the Water Quality Management Plan approved for the overall World Logistics Center Specific Plan project. At a minimum, the site developer shall implement the following site design, source control, and treatment control Best Management Practices as appropriate:

Site Design Best Management Practices

- (a) Minimize urban runoff.
- (b) Maximize the permeable area.
- (c) Incorporate landscaped buffer areas between sidewalks and streets.
- (d) Maximize canopy interception and water conservation by planting native or drought-tolerant trees and large shrubs.
- (e) Use natural drainage systems.
- (f) Where soil conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration.
- (g) Construct on-site ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives.
- (h) Minimize impervious footprint.
- ~~(i) Maximize the permeable area.~~
- (j) Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.
- (k) Reduce widths of street where off-street parking is available.
- (l) Minimize the use of impervious surfaces such as decorative concrete, in the landscape design.
- (m) Conserve natural areas.
- ~~(n) Maximize canopy interception and water conservation by planting native or drought tolerant trees and large shrubs.~~
- ~~(o) Use natural drainage systems.~~

- (p) Minimize Directly Connected Impervious Areas (DCIAs).
- (q) Runoff from impervious areas will sheet flow or be directed to treatment control Best Management Practices.
- (r) Streets, sidewalks, and parking lots will sheet flow to landscaping/ areas that are planted with native or drought tolerant trees and large shrubs.

Source Control Best Management Practices

Source control Best Management Practices are implemented to eliminate the presence of pollutants through prevention. Such measures can be both non-structural and structural.

Non-structural source control Best Management Practices include:

- (a) Education for property owners, operator, tenants, occupants, or employees;
- (b) Activity restrictions;
- (c) Irrigation system and landscape maintenance;
- (d) Common area litter control;
- (e) Street sweeping private streets and parking lots; and
- (f) Drainage facility inspection and maintenance.

Structural source control Best Management Practices include:

- (g) MS4 stenciling and signage;
- (h) Landscape and irrigation system design;
- (i) Protect slopes and channels; and
- (j) Properly design fueling areas, trash storage areas, loading docks, and outdoor material storage areas.

Treatment Control Best Management Practices

Treatment control Best Management Practices supplement the pollution prevention and source control measures by treating the water to remove pollutants before it is released from the project site. The treatment control Best Management Practice strategy for the project is to select Low Impact Development (LID) Best Management Practices that promote infiltration and evapotranspiration, including the construction of infiltration basins, bioretention facilities, and extended detention basins. Where infiltration Best Management Practices are not appropriate, bioretention and/or biotreatment Best Management Practices (including extended detention basins, bioswales, and constructed wetlands) that provide opportunity for evapotranspiration and incidental infiltration may be utilized. Harvest and Reuse Best Management Practices (i.e., storage pods) may be used as a treatment control Best Management Practice will be used to store runoff for later non-potable uses.

Site-specific Water Quality Management Plans have not been prepared at this time as no site-specific development project has been submitted to the City for approval. When specific projects within the project are developed, Best Management Practices will be implemented consistent with the goals contained in the ~~m~~-Master Water Quality Management Plan. All development within the project will be required to incorporate on-site water quality features to meet or exceed the approved Master Water Quality Management Plan's water quality requirements identified previously.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-13-76. The commenter states a new General Plan must be adopted if such a fundamental land use change is approved for the WLC property. The City disagrees, but acknowledges that such a large change in planned land uses should be carefully considered by the City Council prior to making a decision on the proposed WLC property. Since the City Council is the highest elected body in the City, it is appropriate for them to make the determination if the proposed project is consistent with the General Plan, and if it is not, to determine if the proposed General Plan Amendment is in keeping with the overall development principals established by the City Council in the current General Plan.

Response to Comment F-13-77. Vibration impacts due to construction are minimal except for pile driving (see “Transportation and Construction Induced Vibration Guidance Manual,” Californian Department of Transportation, June 2004). No pile driving is planned for this project.

Response to Comment F-13-78. Similar to the Highland Fairview Corporate Park, construction of warehousing buildings within the Specific Plan can occur on a 24 hour-a-day, 7 day-a-week basis. However, any specific construction equipment will not be running for more than 10 hours per day, pursuant to mitigation. This is necessitated by the extensive use of poured concrete in the construction of building sites and the logistics buildings themselves. Major concrete pours are most efficiently and economically done in the cooler night and early morning hours. Additionally, the large number of concrete delivery trucks necessary for this construction has a minimal traffic impact in the nighttime hours. Additionally, some construction may be needed on a 24/7 basis to avoid delays for the construction of portions of the project. Therefore, a complete ban on 24/7 construction is infeasible. However, the following changes were made to MM 4.12.6.1D to better address construction noise impacts for onsite rural residences:

~~**4.12.6.1D** All discretionary approvals for development in the WLCSP shall include conditions of approval stating that no nighttime grading shall occur within 2,800 feet of residences south of SR-60 (between 8 p.m. and 6 a.m. on weekends and 8 p.m. and 7 a.m. on weekends or holidays). These restrictions shall be included as part of the Noise Reduction Compliance Plan. As an alternative to this requirement, a temporary construction sound barrier may be used in lieu of the construction buffer, per Mitigation Measure 4.12.6.1E.~~

4.12.6.1D No grading shall occur within 2,800 feet of residences south of State Route-60 between 8 p.m. and 6 a.m. on weekdays and between 8 p.m. and 7 a.m. on weekends. These restrictions shall be included as part of the Noise Reduction Compliance Plan per Mitigation Measure 4.12.6.1A (per Noise Study MM N-2, pg. 51)

See also Response F-13-79 below for examples of equipment noise limitations.

Response to Comment F-13-79. The City's construction noise limit is based on the Leq scale which is an averaging noise scale. The highest construction noise levels will be generated by heavy construction equipment; for example, graders, scrapers, front loaders and tractors. These equipment could operate anywhere on-site during construction. However, it is highly unlikely that a grader or some other high noise generator will be parked for an hour within 50 feet of a residence. Therefore, construction noise generation consistently within 50 feet of a residence is highly unlikely.

Response to Comment F-13-80. The commentator states that “a lesser increase is likely more significant at a lower levels as more noticeable.” This comment is not supported by any evidence and is contrary to standards adopted by for example the Federal Transit Authority (FTA). At lower noise levels there is minimal speech interference, sleep disturbance, and other activity interference. If the noise level goes up slightly in a low noise environment these activities still are not interfered. However, if the noise level goes up in a high noise environment, then activity interference will go up substantially. Therefore, the comment is inconsistent with adopted standards and with our

understanding of noise impacts. The commenter also states that the *“threshold is only wrongly applied to only traffic noise not stationary noise.”* This referenced threshold is not applied to stationary noise because the City has a noise standard that applies directly to stationary noise and is more appropriate for determining impacts.

Response to Comment F-13-81. The statement is incorrect; not all exceedances can be mitigated and therefore, the technical noise report (DEIR Appendix K, page 63) concludes that there will be significant impacts.

Response to Comment F-13-82. The traffic analysis, which the noise assessment is based, includes future planned projects. The cumulative noise impacts are presented in Section 2.3.2 of the technical noise report (Appendix K of the DEIR).

Response to Comment F-13-83. When MM 4.12.6.1A is combined with the other measures significant mitigation of construction noise will be achieved. Setbacks, temporary noise barriers, and other features are required for the control of construction noise. However, even with the mitigation measures, significant construction noise impacts may occur (DEIR Appendix K, page 63 of the technical noise report).

Response to Comment F-13-84. The commenter is correct; the first “weekends” should read “weekdays” for MM 4.12.6.1.D. The mitigation measure has been revised as follows:

~~**4.12.6.1D** — All discretionary approvals for development in the WLCSP shall include conditions of approval stating that no nighttime grading shall occur within 2,800 feet of residences south of SR-60 (between 8 p.m. and 6 a.m. on weekends and 8 p.m. and 7 a.m. on weekends or holidays). These restrictions shall be included as part of the Noise Reduction Compliance Plan. As an alternative to this requirement, a temporary construction sound barrier may be used in lieu of the construction buffer, per Mitigation Measure 4.12.6.1E.~~

4.12.6.1D No grading shall occur within 2,800 feet of residences south of State Route-60 between 8 p.m. and 6 a.m. on weekdays and between 8 p.m. and 7 a.m. on weekends. These restrictions shall be included as part of the Noise Reduction Compliance Plan per Mitigation Measure 4.12.6.1A (per Noise Study MM N-2, pg. 51).

Response to Comment F-13-85. The commenter is correct; two alternatives for mitigation are provided (see pages 49 and 50 of the technical noise report DEIR Appendix K). The alternatives provide more flexibility to the developer for mitigating construction noise and could result in better mitigation for the potentially impacted residents.

Response to Comment F-13-86. The measure proposed by the commenter would mitigate construction noise even more than required by the City’s Noise Ordinance and therefore, is not necessary.

Response to Comment F-13-87. Please refer to Response to Comment F-13-86.

Response to Comment F-13-88. The suggested mitigation measures contained in the comment either address issues that have been shown not to be an impact or are requiring mitigation above and beyond what is required by the Noise Ordinance. A quick comment on each of the suggested measures follows.

- (1) **Temporary Noise Barriers** – these are covered by MMs 4.12.6.1E and 4.12.6.1J.
- (2) **Use all electrical equipment** – this is covered by MM 4.3.6.2A in air quality.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- (3) **3-minute idling** – MM 4.3.6.2A limits idling to 3 minutes under air quality which is adequate.
- (4) **Provide “windows closed” conditions with mechanical ventilation** – The project noise report does not indicate residences along Merwin or other adjacent streets will have interior noise levels in excess of City standards (in addition, the Specific Plan does not allow warehouse buildings within 250 feet of existing residences).
- (5) **Upgraded windows for buildings within 250 feet and along major access** roadways - the Specific Plan does not allow warehouse buildings within 250 feet of existing residences, and MM 4.12.6.2A addresses residences along major project traffic routes.
- (6) **Keep roads away from “vibration sensitive areas”** – the commenter does not specify what these areas are but the project noise assessment evaluated all project-related noise impacts including vibration and recommended appropriate mitigation (MMs 4.12.6.2A – 4.12.6.2B).
- (7) **Resurfacing existing roads to reduce vibration** – the commenter did not specify what roads but project roads but once the streets are constructed by the developer they become public streets and are turned over to the City and the streets will be incorporated into the City’s street maintenance program.
- (8) **Rubberized asphalt** – the project noise report evaluated this potential mitigation and determined it would not provide sufficient or feasible mitigation over the long-term (FEIR, Volume 2, Appendix K, page 58).
- (9) **Maintain pavement quality with repairs upon notice** –Once the streets are constructed by the developer they become public streets and are turned over to the City and the streets will be incorporated into the City’s street maintenance program. Pavement both on and offsite will be maintained according to City standards and schedules for public streets. Project trucks will mainly utilize Theodore and the freeways, so there is no identified need to require a higher level of maintenance on area roadways than is currently provided throughout the rest of the City.
- (10) **Require resurfacing of roads** – the commenter does not say what roads but pavement both on and offsite will be maintained according to City standards and schedules for public streets. Project trucks will mainly utilize Theodore and the freeways, so there is no identified need to require a higher level of maintenance on area roadways than is currently provided throughout the rest of the City.
- (11) **Ban heavy trucks near noise sensitive uses** – project trucks will be restricted to established truck routes within the City, and most project trucks will mainly utilize Theodore and the freeways, and there is no evidence that project trucks would significantly impact noise sensitive uses (unless the commenter is referring to residential uses which are fully evaluated and mitigated to the extent feasible in the DEIR).
- (12) **Alternative equipment to reduce vibration** – the project noise assessment does examine noise and vibration impacts related to anticipated construction equipment and recommends appropriate mitigation. The DEIR Section 4.12.5.1 analyzed vibration and found it to be less than significant. CEQA requires mitigation to reduce impacts to less than significant levels, and the mitigation recommended in the project noise report and the DEIR section on noise does reduce construction-related noise to less than significant levels, so there is no requirement to implement “all feasible mitigation” in this regard. In any case, the construction activities mentioned by the commenter will not occur within 250 feet of any existing residence beyond the boundaries of the project site, so additional mitigation is unnecessary.
- (13) **Schedule construction to not conflict with “vibration sensitive operations”** – The DEIR Section 4.9.5.1 analyzed vibration and found it to be less than significant. However mitigation recommended in the project noise report and the DEIR section on noise does reduce construction-related noise to less than significant levels during construction. Refer to MMs 4.12.6.1A - 4.12.6.1J in Section 4.12.6.1 of the DEIR.

Response to Comment F-13-89. The commenter states their opinion that that the 2003 Truck Trip Generation Study prepared for the City of Fontana is not an adequate source of truck traffic information as truck traffic represents a much larger portion of WLC's traffic than is assumed in the Fontana study. The commenter states the TIA assumed that most WLC employees will be local and that half of the worker trips will occur on arterial streets and not freeways, and that this understates impacts.

The comment appears to be confusing inputs with outputs. The 2003 City of Fontana *Truck Trip Generation Study* was a traffic count survey taken to determine the truck trip generation characteristics of warehouses. So the truck trip characteristics reported in the study are survey results (i.e. outputs), not assumptions (inputs). The City of Moreno Valley has determined that this is the best available source of truck trip percentages for warehouses and has mandated it use in the City's *Traffic Analysis Guidelines*. Use of the Fontana vehicle mix percentages in the WLC study is therefore in accordance with City policy.

Regarding the residential location of WLC workers and the routes they take to work, the comment is again confusing inputs with outputs. The TIA study team input the WLC's proposed land uses into the Riverside County Traffic Analysis Model (RivTAM) model, the model then matched warehouse jobs with the residential locations of potential workers and, using survey data on commute trip behavior, produced a forecast of commute trips for the project. So the predicted locations of WLC workers and their likely routes to work were outputs from RivTAM, not assumptions imposed by the analysts. Given that the WLC project would be located in an area with an abundant labor force of potential workers whose skill sets match the demands of the logistics industry, the forecast distribution of commute trips from the RivTAM model is considered reasonable.

Response to Comment F-13-90. The commenter claims that the DEIR improperly relies upon the preparation of future traffic studies for individual development projects within the WLC. The commenter must remember that this DEIR is a programmatic document, and that future specific development requires that a subsequent traffic study be prepared for that specific development to identify the specific timing of improvements to support that proposed development. These subsequent traffic studies must be consistent with and tier off of the "master" TIA" prepared for the overall WLC project as part of this EIR.

Response to Comment F-13-91. See Response to Comment F-13-90.

Response to Comment F-13-92. The commenter claims that the project's mitigation plan relies on Transportation Uniform Mitigation Fee (TUMF) and Development Impact Fee (DIF) but does not identify which improvements are subject to the funding programs. The comment also claims a lack of evidence that payment of the fees is tied to actual implementation of the mitigation measures. For improvements not covered by TUMF or DIF, the commenter acknowledges that fair-share payments can be appropriate mitigation, but says that there is no evidence that other fair-share programs exist (besides TUMF and DIF). The commenter further cites a lack of evidence that the multi-jurisdictional efforts called for in the TIA will be pursued, and states that while fair-share fees can be adequate mitigation for cumulative impacts the applicant must be responsible for the implementation of any measures relative to direct impacts.

The TIA does identify which improvements are subject to TUMF and DIF. For example Table 80 in the TIA (now Table 76 in the TIA, FEIR Volume 2, Appendix L-1) entitled "Cumulative Intersection Impacts and Mitigations includes columns labeled "TUMF Facility?" and "DIF Facility?" with corresponding "yes" or "no" entries identifying which improvements are in the TUMF program and which improvements are in the DIF program. This information is also provided in the text descriptions of the mitigation measures.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The claim that there is a lack of evidence that the TUMF and DIF improvements will be implemented is also incorrect. As explained in Chapter 11, Section A of the TIA, since its inception TUMF has collected more than \$554 million in revenues, making it the largest multi-jurisdictional fee program in the nation. It has completed 54 projects in just nine years with several dozen more under development. The projects successfully funded by the program include a variety of road widening, intersection improvements, and freeway interchanges, including:

- Widening Pigeon Pass Road from 2 lanes to 4 lanes from Climbing Rose Dr. to Hidden Springs Dr.
- Widening the Ramona Expressway from 2 lanes to 6 lanes from I-215 to Evans Road
- Improvements to the Ironwood Ave./Moreno Beach Dr. Intersection
- Improvements to the Ironwood Ave./Nason Street intersection
- Adding a northbound lane to Lasselle Street from John F Kennedy Dr. to Alessandro Blvd.
- Widening Oleander Avenue from Perris Blvd to Indian Avenue
- The Van Buren Blvd./SR-91 Interchange project
- Widening State Street in Hemet from 2 to 4 lanes with a center turn lane
- Widening Sanderson Avenue from Menlo to Ramona Expressway

This track record of success is evidence that TUMF projects are very likely to be implemented. Between now and 2035, when the program is scheduled for completion, the TUMF Program is forecast to provide \$4.2 billion in arterial road, bridge, intersection and interchange improvements in Western Riverside County. The DIF program has a similar track record of successful implementation. Examples of projects successfully completed using DIF funds include:

- Iris Avenue from Indian Street to Perris Boulevard
- Lasselle Street/Bay Avenue traffic signal
- Lasselle Street/Cottonwood Avenue traffic signal
- Cactus Avenue eastbound improvements from I-215 to Veterans Way

This track record of success is evidence that DIF projects are very likely to be implemented. The DIF program supplements the TUMF program by funding elements of the City's General Plan Circulation Element not covered by TUMF, and for some projects by providing funds for additional capacity beyond what the TUMF project will provide.

Both TUMF and DIF are updated periodically to reflect changes in priorities as development occurs in different parts of the Western Riverside County. Future updates will provide the opportunity to prioritize improvements associated with the WLC.

The commenter is correct that the City cannot guarantee that the multi-jurisdictional efforts called for in the TIA will be successful. This is because it requires actions by third parties, such as Caltrans and other cities, which are not under the City of Moreno Valley's authority. This multi-jurisdictional framework, which is fully disclosed in the TIA, is a matter of state law and cannot be changed for this project. As such, mitigation that requires action on the part of other agencies results in the project impact remaining significant and unavoidable.

The issue of payments for direct impacts is also a matter of state law. The applicant is not responsible, and the City cannot require that an applicant be responsible, for rectifying existing deficiencies such as the condition of Gilman Springs Road. The City must follow the “rough proportionality” rule in the Mitigation Fee Act in determining the project’s financial responsibility for improvements.

Response to Comment F-13-93. See Response to Comment F-13-92.

Response to Comment F-13-94. The commenter describes the TIA’s mitigation plan for freeways as “convoluted” in that it describes a City policy to improve surface streets that “could serve as alternate routes to freeways.” He also suggests that some freeway mitigations were identified as infeasible due to cost or technical concerns without substantial evidence.

The TIA accurately describes complicated regional issues related to the expansion of freeways, which are unrelated to WLC (Chapter 11, Section E DEIR Appendix L). Unlike the surface streets, where intersection improvements are generally both feasible and desirable, the strategic issue for western Riverside County is that major freeway improvements are becoming increasingly problematic over time. A key problem is that the rights-of way are essentially built out in many locations and cannot be expanded without severely impacting existing communities (including loss of homes and businesses, visual intrusion, increased noise and air quality impacts, etc.) and incurring high costs in order to replace overcrossing structures. Moreover, there is a growing consensus that over-provision of freeway capacity facilitates long-distance commuting by car and leads to more auto-oriented residential development on the urban fringe, which in turn increases greenhouse gas emissions. This has resulted in a policy shift away from continued expansion of the freeway system, as reflected, for example, in Riverside County Transportation Commission’s (RCTC) Ordinance No. 02-001 which reads in part,

“State Routes 91 and 60 and Interstate Routes 15 and 215 cannot cost effectively be widened enough to provide for the traffic expected as Riverside County continues to grow. In addition to the specific highway improvements listed in Section 1 above, congestion relief for these highways will require that new north–south and east-west transportation corridors will have to be developed to provide mobility within Riverside County and between Riverside County and its neighboring Orange and San Bernardino Counties.”

In other words, as a matter of policy, with the exception of spot improvements in some specific locations, the overall strategy to relieve congestion on SR-60 and SR-91 is to improve the capacity of surface streets that could serve as alternate routes to freeways. The policy to forego further widening of some sections of SR-60 and SR-91 is also noted in the Riverside County Congestion Management Program (CMP) which permits LOS “F” for some of the study freeway sections because those sections already operated at LOS “F” when the CMP was established in 1991 (Riverside County Transportation Commission, “2011 Riverside County Congestion Management Program”, 2011, page 4-2). For these reasons some of the identified mitigation measures may not be pursued even if they are deemed feasible in an engineering sense.

This situation, which exists regardless of the WLC project, presents a complicated background within which freeway widening is addressed. The most straightforward traffic engineering approach is to identify locations where freeway widening would achieve an acceptable LOS, and that is the approach taken in the TIA. Nevertheless, it was felt that the TIA should disclose the fact that the designated congestion management agency for Riverside County, the RCTC, has determined that such widening may be undesirable and that the development of alternative corridors should be pursued instead. Thus the project’s payments into the TUMF and DIF programs, which fund the improvements to major surface street corridors, are mitigation because they help create viable alternative routes that would substitute for freeway travel for some trips. The TIA does not rely on this

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

approach to mitigate freeway impacts (it uses the freeway improvements measures identified in the TIA); it merely discloses to the public the fact that further widening may not occur as a result of the regional transportation strategy.

In the TIA, improvements were deemed to be infeasible if they would (1) require the acquisition of existing homes or businesses; (2) result in excessive air, noise, or vibration impacts on existing homes, businesses, or sensitive natural environments, or (3) create safety impacts that could be considered less acceptable than a reduced traffic LOS (Chapter 11, Section C DEIR Appendix L-1). The TIA characterized the impacts which could not be feasibly mitigated as significant and unavoidable. See TIA Chapter 11, Sections E and F. In cases where feasibility is uncertain the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities so the project's responsibilities would not be under-estimated.

Response to Comment F-13-95. The commenter states that MM 4.15.7.4A requires no mitigation of traffic impacts but only that a project-specific traffic study be prepared. He claims that this is insufficient in that it fails to incorporate any solution if the assumptions of the TIA are invalid.

The mitigation measure cited by the commenter sets a process in motion by identifying which of the identified mitigation measures are needed at the time each building comes on line. The requirement that the subsequent TIA study follow City guidelines, is intended to ensure that the study results are valid. The subsequent mitigation measures contain the requirements to mitigate the project-level impacts.

Response to Comment F-13-96. The commenter states that MM 4.15.7.4F requires only that the City contact Caltrans. The commenter states that the City has no authority over Caltrans and that this, "is the definition of uncertain and unenforceable mitigation." MM 4.15.7.4E and F have been deleted and replaced with the following:

4.15.7.4E In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the World Logistic Center Specific Plan Traffic Impact Analysis (i.e., under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to Mitigation Measure 4.15.7.4F). As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 et seq., and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies.

For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the World Logistic Center contributes to cumulatively significant impacts, and where the fair share contribution of the World Logistic Center project as a whole was computed to be 6.2%. If the City of Riverside establishes a fair share contribution program consistent with this Mitigation Measure 4.15.7.4F to improve that intersection, then when a certificate of occupancy is to be issued for a 2-million square feet high-cube warehouse in the World Logistic Center (approximately 5% of the entire World Logistic Center project) the amount of the fair share payment due from the Applicant to the City of Riverside would be computed as follows:

<u>Amount</u> <u>Due</u>	<u>≡</u>	<u>Total cost of</u> <u>Improvement</u>	<u>×</u>	<u>Total</u> <u>World Logistics</u> <u>Center fair share</u> <u>(6.2%) as</u> <u>determined by</u> <u>Traffic Impact</u>	<u>×</u>	<u>% attributable to the</u> <u>building that is subject to</u> <u>the certificate of</u> <u>occupancy (5%)</u>
-----------------------------	----------	--	----------	---	----------	--

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Analysis

$A \times B \times C = D$

<u>A= % attributable to the building that is subject to the certificate of occupancy (5%)</u> <u>B= Total World Logistics Center fair share (6.2%) as determined by Traffic Impact Analysis</u> <u>C= Total cost of Improvement</u> <u>D= Amount Due</u>

A similar calculation would be done for each subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire World Logistic Center to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with Mitigation Measure 4.15.7.4F.

4.15.7.4F ~~City shall participate in a multi-jurisdictional effort with Caltrans and adjacent cities to develop a study to identify fair share contribution funding sources to supplement other regional and State funding sources necessary to implement the State facility and extra-territorial improvements identified in Tables 4.15.AZ and 4.15.BC necessary to mitigate the identified programmatic impacts to less than significant levels. The study shall include fair share contributions related to other private and public development and shall be based on the nexus requirements contained in the Mitigation Fee Act (Govt. Code Section 66000, et seq.) and 14 Cal. Code of Regs. Section 15126.4(a)(4). The Study shall also be compliant with Government Code Section 66001(g) and other applicable provisions of law. The Study shall set forth a timeline and other agreed upon relevant criteria for implementation of the improvements recommended in this EIR. Once the study is approved, the City shall impose the fair share fees on each project that is developed under the World Logistics Center as part of the individual review of each development project. Prior to the adoption of the Study, City shall impose a fair share payment requirements on each development project processed under the World Logistics Center Specific Plan in accordance with the requirements of the Mitigation Fee Act. Required fair share payments shall be made prior to the issuance of occupancy permits for each requested development.~~

4.15.7.4F The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the project does not have a significant impact.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Fair-share contributions will be determined on a building-by-building basis as a share of the impact of the Project as a whole (for each segment or intersection where the World Logistics Center project as a whole has a significant impact identified in the Programmatic Environmental Impact Report) as determined by the Traffic Impact Analysis and will be due as each certificate of occupancy is issued. The fair share payments for the significantly impacted road segments and intersections identified in the Programmatic Environmental Impact Report will be required even though the impact resulting from a specific building does not, by itself, cause a significant impact.

As the commenter acknowledges, the City has no authority to compel Caltrans to implement the freeway mitigation measures identified in the TIA. By pledging to work with Caltrans to establish a funding mechanism the City is going as far as its legal authority allows. The TIA fully discloses this information and correctly identifies impacts to State freeways as “significant and unavoidable” because mitigation cannot be guaranteed by the City. See TIA Chapter 11, Sections E and F, DEIR Appendix L-1.

Response to Comment F-13-97. The commenter states that the project relies heavily on the TUMF and DIF programs to reduce impacts. He questions whether the improvements from these programs will be done promptly given that a significant amount of streets impacted are not funded.

As with the previous comment, the City cannot guarantee action by other agencies as the City has no authority over other partner agencies, and this information has fully disclosed this in the TIA. However, it is already the policy of RCTC to prioritize improvements that support economic development projects such as WLC. To quote from RCTC’s *Commission Policy Goals and Objectives* statement:

“Encourage Economic Development

Transportation decisions will consider the economic benefits derived from any improvement, and, where feasible and practical, will pursue transportation alternatives that enhance or complement economic development.

- *Commit to seek opportunities related to transportation projects that will create jobs and improve the economic base in the County.*
- *Support local agencies in the design and construction of interchanges that are in proximity to regional economic centers and developments.*
- *Support local projects, consistent with countywide transportation goals, which enhance business development, local employment, and area tourism.”*

So while the City is not in a position to guarantee that TUMF funds will be directed toward projects associated with the WLC, there is strong reason to believe that this will occur.

The City of Moreno Valley prioritizes the expenditure of DIF funds in periodic updates of its Capital Improvement Program (CIP). Projects are prioritized based on several factors, including consideration of where development is taking place. There has not been much development activity at the eastern end of Moreno Valley where the WLC site is located, so it has not been a high priority area for DIF funding. However, if the WLC is approved and development begins to take off there then projects in this area will receive a higher priority and get funded sooner.

Response to Comment F-13-98. The commenter cites passages from the 2011 Annual Report, Transportation Uniform Mitigation Fee Program in support of contention that TUMF cannot be relied on to mitigate project impacts. He states that TUMF improvements can take up to 9 years to become

reality. He adds citations about which projects are currently scheduled for funding and the fact that project prioritization, programming, and allocation of funds may present barriers to improvements.

The commenter's contention that some of the improvements are not on TUMF's current project funding list overlooks the fact that the project list is periodically updated. Projects designed to support the WLC are not on the list because the WLC has not yet been approved; if the City approves the WLC then the project list will be adjusted to reflect this major economic development (see Response to Comment F-13-97, which describes priorities used in project selection). The comment puts the cart before the horse in terms of how prioritization, programming, and allocation of funds work in the TUMF program.

The commenter's statement that project development can take "up to 9 years" seems to be derived by adding together the maximum time required for each of the six steps of project development identified by Western Riverside Council of Governments (WRCOG). Looking at the minimum time required for each step would produce a more accurate statement such as "TUMF improvements can require anywhere from less than 2 years to as long as 9 years to become reality." This timeframe is reasonable when compared to the time required to build out the WLC project.

Response to Comment F-13-99. The water supply impacts are assessed and mitigated as discussed in Section 4.16.1.6.1 *Adequate Water Supply* of the DEIR. Eastern Municipal Water District (EMWD) has sufficient supplies to meet the needs of this project. In accordance with the provision of Senate Bill 221 and Senate Bill 610, a Water Supply Assessment (WSA) was prepared by EMWD specifically for this project, the World Logistics Center. That document is included in the DEIR Appendix M Water Resources. As outlined in Section 5-4 Conclusion, page 24 of the WSA, "*Based on present information and the assurance that Metropolitan Water District (MWD) is engaged in identifying solutions that, when combined with the rest of its supply portfolio, will ensure a reliable long-term water supply for its member agencies, EMWD has determined that it will be able to provide adequate water supply to meet the potable water demand for this project as part of its existing and future demands.*"

Response to Comment F-13-100. As outlined in the DEIR Appendix M *Water Resources*, the WSA Section 3.2 Project Demand indicates that the projected water demand for the project is 1,991.25 acre feet per year. The water demand is made up of two components, building demand and irrigation demand. The WSA states that, "*A majority of the estimated demand would be for landscape irrigation. The developers of this project are proposing very low water use landscaping which would reduce the projected project demand significantly.*" To determine the potential reduction in demand with the low water use landscaping the difference in the project demand and building demand was determined. The building demand is 450 acre feet per year as outlined in the Technical Memorandum World Logistics Center Water Demands and Waste Water Generation for Buildings dated March 13, 2012. The maximum potential reduction in irrigation demand due to the use of drought tolerant plants is the difference between the WSA project demand of 1,991.25 acre feet per year and the building demand of 450 acre feet per year which equals 1,541.25 acre feet per year. MMs 4.16.1.6.1A, 4.16.1.6.1B, and 4.16.1.6.1C will be implemented to mitigate the water supply impacts to less than significant.

Additional information has been added to the *Hydrology and Water Quality Master Plan of Drainage Report* (FEIR Volume 2 Appendix J-1) to provide specific information for the drainage systems to include the size, capacity, design, function and maintenance requirements of the detention basins. The detention basins have been modified to combined detention and infiltration. Additional analysis has been performed to detail the infiltration capacity of the basins and indicates that runoff leaving the project site will be less than or equal to the existing condition. Infiltration after the project will be greater than the existing condition. Additional details on the spreading areas and mitigation of flow volumes and velocities at the project boundary have been added to the Master Plan of Drainage

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Report and are summarized in Responses to Comments B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Wildlife regarding water-related comments.

Response to Comment F-13-101. The commenter cites a court case regarding the analysis of alternatives. The DEIR did identify the Reduced Density Alternative as environmentally superior to the proposed project, but then rejected it as not meeting the project objectives to nearly the same degree as the proposed project. The commenter has provided no empirical evidence that any of the alternatives would substantially reduce or eliminate one or more significant impacts of the proposed project while largely meeting the objectives of the WLC project. It will be up to the City Council to weigh the benefits versus the impacts of the proposed project and all of the project alternatives before making a decision on the WLC project.

Response to Comment F-13-102. The commenter believes the alternatives analysis in the EIR is not adequate. The EIR does evaluate a reasonable range of alternatives, based on the potential significant environmental impacts of the project identified in the DEIR and the project objectives. The EIR examined impacts of the General Plan land use and Zoning designations at present (i.e., Moreno Highlands Specific Plan) with 7,736 residential units, a Reduced Density Alternative 1 with 30 percent less development than the proposed project, a Mixed Use Alternative 2 with a mix of 1,410 acres of logistics warehousing (22 million square feet), 1,000 acres of light manufacturing, assembly, or business park uses (20 million square feet), 50 acres of retail commercial uses (500,000 square feet), 100 acres of professional or medical office uses (1 million square feet), and 150 acres of open space, and Mixed Use B Alternative 3 which is the Moreno Highlands Specific Plan but with 603 acres of logistics warehousing instead of commercial uses. In addition, the DEIR identified a number of potential alternatives, including all residential uses, that were examined but rejected from further consideration. The commenter has failed to state why the alternatives selected for analysis in the DEIR are not reasonable.

Response to Comment F-13-103. The commenter states the DEIR does not explain Alternatives 1-3. The commenter is correct to some degree in that the DEIR does not provide a potential site plan for any of the proposed alternatives. However, it must be remembered that there is no site plan for the WLC project as proposed either, so it is reasonable to evaluate the potential alternatives at a programmatic level, similar to that in the DEIR for the proposed project. Section 6.3.1 of the DEIR provides a summary of development characteristics of each alternative, plus quantitative and qualitative comparisons to the other alternatives and the proposed project. None of the alternatives reduces air quality and traffic impacts to less than significant. This level of detail is appropriate given the nature of the proposed WLC project, as explained in Section 6 of the DEIR.

Response to Comment F-13-104. The commenter disagrees with the conclusions of the DEIR regarding Alternative 1 as the environmentally superior alternative. Section 6.3.6 of the DEIR did examine the potential environmental impacts of Alternative 1, and found it reduced a number of significant impacts of the project (i.e., incrementally with the reduction in square footage), but it could not reduce those impacts to less than significant levels due to the size and nature of the project and proposed land uses. In addition, Section 6.3.6 evaluated the degree to which Alternative 1 meets the goals of the proposed project, and found that it did not achieve them to nearly the same degree as the proposed project. Therefore, the DEIR correctly rejected Alternative 1 in favor of the proposed project because Alternative 1. However, it will be up to the discretion of the City Council to determine if these conclusions are correct, based on all the evidence available in the record at the time of decision on the project.

Response to Résumé. This attachment was not directly referenced in the comment letter. It provides personal qualifications and references for Raymond W. Johnson, the commenter on behalf of the Sierra Club. No response is necessary.

Response to Attachment 1. 2011 Annual Report, Transportation Uniform Mitigation Fee Program, Western Riverside Council of Governments, "Five Year Transportation Improvement Program). In Comment F-13-98, the commenter stated that "the roadways reliant on TUMF funds are not presently scheduled for improvement nor are the improvements funded." And attached the 2011 Annual Report, Transportation Uniform Mitigation Fee Program, Western Riverside Council of Governments, "Five Year Transportation Improvement Program (TIP), as a reference to that comment. The commenter apparently believes that if a roadway indicated for mitigation under the TUMF program is not shown in the 2011 annual report, then that improvement is not guaranteed and cannot be relied on when estimating the potential success of recommended mitigation. This is a false assumption, because the WRCOG schedules its TUMFs improvements by 5 year increments on a floating schedule based on fees collected and the prioritized need for various improvements over time. The TUMF by necessity does not show a construction schedule for every planned improvement, but rather includes them in their five year TIP as they are needed based on the TUMFs priority criteria.

Additionally, the transportation improvements assumed to be in place for the General Plan Year 2035 traffic scenario include the transportation improvements contained in the Federal Transportation

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Improvement Program (FTIP), the RTP Financially Constrained Project List, and the City of Moreno Valley General Plan road network. The 2012 FTIP covers the first four years of SCAG's 2012-2035 Regional Transportation Plan (RTP). The RTP Financially Constrained Project List covers transportation projects that are next in line to be programmed and included in the four year FTIP. These projects would occur in the 2016-2035 time frame. The General Plan network includes future planned improvements that are funded through the City's Development Impact Fee (DIF), WRCOG's TUMF, and improvements made directly by developers. The expectation that these improvements will be in place is appropriate for the long-term traffic analysis contained in this Program EIR because the General Plan Year 2035 traffic scenario also assumes buildout of the City's General Plan land uses. Most of the City's future transportation improvements will be funded through DIF and TUMF fees collected from future developments projects. If future developments projects do not fully buildout per the General Plan, then the LOS on the study streets and intersection would likely be better than shown in the TIA.

Response to Attachment 2. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to TUMF implementation, so see Response to Attachment 1 above.

Response to Attachment 3. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to WLC project employment projections, so see Responses to Comments G-90-1 and G-90-2.

Response to Attachment 4. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to air quality and health risk impacts of the WLC project, so see Response to Comment F-11-14.

Response to Attachment 5. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to air quality and health risk impacts of the WLC project, so see Response to Comment F-11-14.

Response to Attachment 6. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to air quality and health risk impacts of the WLC project, so see Response to Comment F-11-14.

Response to Attachment 7. (Cited but not attached). Since the material was not attached it is unclear why the commenter included it, but it is assumed it is related to air quality and health risk impacts of the WLC project, so see Response to Comment F-11-14.

Response to Attachment 8. Attached). This material was included to indicate State recommended procedures for Greenhouse Gas (GHG) emission calculations, and those procedures were followed in the GHG Assessment for the WLC project, as outlined in Section 4.7, Greenhouse Gas Emissions, of DEIR.

Response to Attachment 9. (Attached). This material was included to indicate Federal recommended procedures for construction noise calculations, and those procedures were followed in the Noise Assessment for the WLC project, as outlined in Section 4.12, Noise, of the DEIR, and DEIR Appendix K-1.

Response to Attachment 10. (Attached). This material was included to indicate federally recommended noise protection guidelines for construction workers. CEQA does not require assessment of noise impacts on workers that is covered by separate State and Federal laws and regulations.

Response to Attachment 11. (Attached). This dated material was apparently provided to illustrate Federal noise assessment and public safety guidelines regarding noise impacts. This material has largely been supplanted by more current references which were used in the Noise Assessment for the WLC project, as outlined in Section 4.12, Noise, of the DEIR, and DEIR Appendix K-1.

Response to Attachment 12. (Attached). This dated material was apparently provided to illustrate community noise and public safety guidelines regarding noise impacts. This material has largely been supplanted by more current references which were used in the Noise Assessment for the WLC project, as outlined in Section 4.12, Noise, of the DEIR, and DEIR Appendix K-1.

Letter F-14: Sierra Club, San Geronio Chapter (April 30, 2013)

SAN GORGONIO CHAPTER

*Regional Groups Serving Riverside and San Bernardino Counties: Big Bear,
 Los Serranos, Mojave, Moreno Valley, Mountains, Tahquitz, Santa Margarita.*

Good Morning Mr. Gross,

Re: World Logistic Center (WLC) Draft EIR

The Sierra Club wishes to add another comment to our letter of April 8, 2013 concerning the World Logistic Center's DEIR. On page three of that letter we mention that the WLC is displacing not replacing many of the Moreno Highlands Housing units. As a result of the updated (2011) Housing Element as well as the City Council's approval of item E.2 on their April 23, 2013 agenda (copied below) and other General Plan Amendments since 2006, the Sierra Club believes the Moreno Valley General Plan is now internally inconsistent – especially with the addition of the WLC. The World Logistic Center's Final EIR needs to prove that Moreno Valley's last General Plan the City approved in 2006 is not and will not be internally inconsistent with the approval of the WLC or the document will be inadequate. Item E.2 (the Alessandro Blvd Corridor Implementation project) has been in planning process since at least 2010 and perhaps for at least five years and therefore must be part of the WLC's traffic analysis.

Thank you,

*George Hague
 Sierra Club
 Moreno Valley Group
 Conservation Chair*

- E.2 [ALESSANDRO BOULEVARD CORRIDOR IMPLEMENTATION PROJECT, WHICH INCLUDES TWO GENERAL PLAN AMENDMENTS \(PA11-0028 & PA12-0046\), TWO CHANGES OF ZONES \(PA11-0029 & PA12-0047\), AND MUNICIPAL CODE AMENDMENT \(PA11-0030\). THE PROJECT INCLUDES REZONING AREAS ALONG ALESSANDRO BOULEVARD AND NEAR PERRIS BOULEVARD AND IRIS AVENUE TO R30 \(RESIDENTIAL UP TO 30 UNITS PER ACRE\), 10.46 ACRES TO OPEN SPACE, COMMERCIAL REZONING OF A PARCEL AT THE SOUTHWEST CORNER OF PERRIS BOULEVARD AND GENTIAN AVENUE, AND THE CREATION OF A MIXED USE DISTRICT OVERLAY. THE R30 REZONING WILL PROVIDE CONSISTENCY WITH THE CITY'S CERTIFIED HOUSING ELEMENT](#)

(Report of: Community & Economic Development Department)

RESPONSES TO LETTER F-14

Sierra Club, San Geronio Chapter

Response to Comment F-14-1. The commenter believes the City's General Plan will be inconsistent if the World Logistics Center Specific Plan (WLCSP) is approved (mainly relative to the Housing Element). The Traffic Impact Analysis (TIA) prepared for the WLC project did in fact account for the Alessandro Boulevard Corridor Improvement project in its list of planned improvements for 2010. In addition, City staff has conducted an evaluation of the proposed WLC project compared to the current General Plan and has found no inconsistencies as long as the proposed General Plan Amendment (GPA) is approved.

Page 3-12 of the DEIR states..."*The City's 2006 Housing Element identified the Moreno Highlands Specific Plan as a potential source of vacant land that could accommodate possible future residential growth in the City. In 2011, the City updated its Housing Element and anticipated possible land use changes from mixed use and residential to jobs producing warehouses in the eastern part of the City. The 2011 Housing Element concluded that redesignating the entire land area east of Redlands to the eastern City border for warehouse uses would not impede the City's Housing Element Objectives. The State Department of Housing and Community Development certified the City's Housing Element as being in compliance with State law on February 22, 2011. The proposed project is consistent with the City's current Housing Element.*"

The two General Plan Amendments and zone changes cited by the commenter have been accounted for in the latest Land Use Element of the General Plan, and the staff report at that time determined those actions were consistent with other elements of the General Plan. The commenter has not provided any empirical evidence that any elements of the General Plan are inconsistent with each other in relation to the WLC.

**Letter F-15: California Clean Energy Committee (June 25, 2013) and
Appendices 188–204 (On Flash Drive)**

California Clean Energy Committee

Re: Comments on Draft Program Environmental Impact Report
World Logistics Center Project
(SCH # 2012021045)

Dear Mr. Gross:

Additional documents in support of our letter are attached in a USB flash drive. Please let us know if you have any difficulty accessing them. 1

The mitigation for climate, air quality and energy impacts should require that the developer adopt covenants, conditions, and restrictions requiring all projects on the site to provide electric vehicle charging for employees using Level 2 or Level 3 charging stations that would be consistent with increasing usage needs over time. The development agreement should contain similar provisions. 2

The discussion of mitigation should consider the advantage of requiring employers to provide charging at no cost to employees as mitigation for impacts and should account for companies being able to install Smart Grid enabled charging stations to take advantage of revenues for ancillary grid services. 3

The Goods Movement Appendix to the 2012-2035 SCAG RTP illustrates how the Heavy Duty Truck model can be used to project daily truck trips based on land use designations and the impacts on congestion and air quality. The WLC project, the Heavy-Duty Truck Model should be used to analyze the impacts over time of the increased truck traffic produced by the WLC on major corridors and the EIR recirculated. 4

Also, it should be noted that that the statements in the EIR that the project will comply with Executive Order S-3-05 are unsupported. S-3-05 provides that GHG emissions will be 80 percent below 1990 levels by 2050. 5

Mr. Mark Gross, Senior Planner
June 25, 2013
Page 2

The EIR should also consider the CPUC self-generation incentive program (SGIP) available through the Gas Company which offers incentives up to \$5 million or 60 percent of eligible project costs. — 6

Respectfully submitted,

Eugene S. Wilson

RESPONSES TO LETTER F-15

California Clean Energy Committee

Response to Comment F-15-1. The commenter wants the City to know it submitted a number of additional materials on a flash drive. The City did receive them and has responded accordingly to each item.

Response to Comment F-15-2. Mitigation Measure (MM 4.3.6.4A) has been revised to state:

~~4.3.6.4A~~ Prior to the issuance of a building permit for each development within the WLCSP, the developer shall demonstrate to the satisfaction of the City that the project incorporates the following:

- ~~a) All tenants shall participate in Riverside County's Rideshare Program. The purpose of the program would be to discourage single occupancy vehicle trips and encourage alternate modes of transportation such as carpooling, transit, walking, and biking. The program shall provide employees with assistance in using alternate modes of travel, including carpooling encouragement, ride-matching assistance, and vanpool assistance.~~
- ~~b) Storage lockers shall be provided in each building for a minimum of three percent of the full time equivalent employees based on a ratio of 0.60 employee per 1,000 square feet of building area.~~
- ~~c) Class II bike lanes shall be incorporated into the design for Gilman Springs Road (SR 60 to Alessandro Boulevard), Theodore Street (SR 60 to project), Eucalyptus Avenue (Redlands Boulevard to Theodore Street), and the main roads in the project (Street A, Street B, Street C, Street D, Street E, and Street F).~~
- ~~d) The project shall incorporate pedestrian pathways between on-site uses.~~
- ~~e) Site design and building placement shall provide pedestrian connections between internal and external facilities.~~
- ~~f) The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.~~
- ~~g) A minimum of two electric vehicle charging stations for automobiles or light duty trucks shall be provided at each building.~~
- ~~h) Each building shall provide secure bicycle storage space equivalent to five percent of the automobile parking spaces provided.~~
- ~~i) Each building shall provide a minimum of two shower and changing facilities within 200 yards of a building entrance.~~
- ~~j) Each building shall provide preferred parking for low emitting and fuel efficient vehicles equivalent to at least eight percent of the required number of parking spaces.~~
- ~~k) All discretionary approvals for development shall include a 250 foot setback along the western portion of the site adjacent to Redland Boulevard, Bay Avenue and Merwin Street, from the CDFW property, and between residentially zoned property and logistics buildings in the WLC Specific Plan along Redlands Boulevard, Bay Avenue, and Merwin Street.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

- ~~l) Electrical power sources shall be provided for service equipment and docking of trucks to minimize idling emissions and emissions from transportation refrigeration units if such units are to be used. The project applicant shall include in all new lease documents the requirement that tenants shall use only trucks with transportation refrigeration units capable of utilizing electrical hook-ups.~~

4.3.6.4A The following measures shall be incorporated as conditions to any Plot Plan approval within the Specific Plan:

- a) All tenants shall be required to participate in Riverside County's Rideshare Program.
- b) Storage lockers shall be provided in each building for a minimum of three percent of the full-time equivalent employees based on a ratio of 0.50 employees per 1,000 square feet of building area. Lockers shall be located in proximity to required bicycle storage facilities.
- c) Class II bike lanes shall be incorporated into the design for all project streets.
- d) The project shall incorporate pedestrian pathways between on-site uses.
- e) Site design and building placement shall provide pedestrian connections between internal and external facilities.
- f) The project shall provide pedestrian connections to residential uses within 0.25 mile from the project site.
- g) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. In addition, parking facilities with 100 parking spaces or more shall be designed and constructed so that at least three percent of the total parking spaces are capable of supporting future electric vehicle supply equipment (EVSE) charging locations. Only sufficient sizing of conduit and service capacity to install Level 2 Electric Vehicle Supply Equipment (EVSE) or greater are required to be installed at the time of construction.
- h) Each building shall provide indoor and/or outdoor - bicycle storage space consistent with the City Municipal Code and the California Green Building Standards Code. Each building shall provide a minimum of two shower and changing facilities for employees.
- i) Each building shall provide preferred and designated parking for any combination of low-emitting, fuel-efficient, and carpool/vanpool vehicles equivalent to the number identified in California Green Building Standards Code Section 5.106.5.2 or the Moreno Valley Municipal Code whichever requires the higher number of carpool/vanpool stalls.

The following information shall be provided to tenants: onsite electric vehicle charging locations and instructions, bicycle parking, shower facilities, transit availability and the schedules, telecommunicating benefits, alternative work schedule benefits, and energy efficiency.

The commenter recommends the following mitigation:

Suggested Mitigation Measure	Response
The developer should adopt covenants, conditions, and restrictions requiring all projects on the site to provide electric vehicle charging for employees using Level 2 or Level 3 charging stations that would be	Included. MM 4.3.6.4A requires electric vehicle charging stations. Please see the Final Environmental Impact Report (FEIR) Mitigation Monitoring Reporting Program for a list of the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Suggested Mitigation Measure	Response
consistent with increased usage needs over time.	project's mitigation measures.

Response to Comment F-15-3. In the Draft Environmental Impact Report (DEIR) the project provides a mitigation measure that will require that each building provide a minimum of two electric vehicle-charging stations for automobiles or light-duty trucks. (MM 4.3.6.4Ag). Employees' compensation includes both direct components – wages – and indirect components – benefits. The total amount of an employee's compensation is a function of the employment market. Providing free electricity to employees would be an indirect benefit which require that other portions of the employees' compensation be reduced. There is currently no reason to believe that employees would choose free electricity over other direct or indirect compensation nor that it would be particularly effective in getting employees to use rechargeable electric vehicles in lieu of vehicles using more prosaic internal combustion motors. Most employees wouldn't choose electric cars for any number of reasons, including the high initial cost of the vehicle, its short driving range, and potential problems with a relatively new technology. Imposing a requirement that operators of logistics facilities provide free electricity to employees would thus prove a disincentive to both the operator of the facility – which would make getting qualified employees more difficult – and the employees themselves – who would, in large measure not take advantage of free electricity. Providing free electricity would thus be counter-productive and make the achievement of project objectives more difficult.

The commenter recommends the following mitigation:

Suggested Mitigation Measure	Response
Consider the advantage of requiring employers to provide charging at no cost to employees as mitigation for impacts and should account for companies being able to install Smart Grid enabled charging stations to take advantage of revenues for ancillary grid services.	Not Included. In the DEIR, the project provides a mitigation measure that will require that each building provide a minimum of two electric vehicle-charging stations for automobiles or light-duty trucks (MM 4.3.6.4Ag). Employees' compensation includes both direct components – wages – and indirect components – benefits. The total amount of an employee's compensation is a function of the employment market. Providing free electricity to employees would be an indirect benefit which require that other portions of the employees' compensation be reduced. There is currently no reason to believe that employees would choose free electricity over other direct or indirect compensation nor that it would be particularly effective in getting employees to use rechargeable electric vehicles in lieu of vehicles using more prosaic internal combustion motors. Most employees would not choose electric cars for any number of reasons, including the high initial cost of the vehicle, its short driving range and potential problems with a relatively new technology. Imposing a requirement that operators of logistics facilities provide free electricity to employees would thus prove a disincentive to both the operator of the facility – which would make getting qualified employees more difficult – and the employees themselves – who would, in large measure not take advantage of free electricity. Providing free electricity would thus be counter-productive and make the achievement of project objectives more difficult.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment F-15-4. The commenter requests that the project use the Heavy Duty Truck Model. Southern California Association of Governments' (SCAG) Heavy Duty Truck Model is a component of SCAG's regional traffic model, from which the Riverside County Traffic Analysis Model (RivTAM) model was derived. Therefore, when the Traffic Impact Analysis (TIA) used the RivTAM model it was also using the Heavy Duty Truck Model.

Response to Comment F-15-5. The commenter indicates that statements in the EIR that the project will comply with Executive Order S-3-05 are unsupported. Appendix D of the DEIR indicates that the project does not comply with Executive Order S-3-05; the DEIR Section 4.7 has typographical errors in this regard, which will be fixed in the FEIR.

Response to Comment F-15-6. It is understood that co-generation and self-generation facilities are widely used on large campus single owner parcels to distribute power and provide heating and cooling opportunities for all buildings. This option has been reviewed during the DEIR process and while it may also be used on similar projects outside of California, currently the state does not allow private co-generation systems such as this to cross Public right of way to serve individual property owners (California Public Utilities Code Section 218).

The California Public Utilities Commission (CPUC) self-generation incentive program is available for all future buildings in the WLC if the gas company continues to offer it. It cannot be guaranteed at this stage of development. The appropriate means of conserving natural resources such as natural gas will be determined when a project specific plot plan is processed and details of the specific building proposals are known.

Response to Appendix 170 (Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information supports the need for more warehousing space. The study's Executive Summary states the following:

- "According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet (Page ES-1; Exhibit O).
- During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available" (Page ES-2; Exhibit O).

The WLC will contribute to the supply of warehouse space necessary to satisfy a portion of this demand. This SCAG Report supports other data presented in its responses to DEIR comments that there will be more than sufficient demand to support the WLC.

Response to Appendix 188 (Honda, FCX Clarity Refueling). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to alternative hydrogen fueled vehicles.

Response to Appendix 189 (Hydrogenics, Hydrogenics' Electrolysis-Based Fueling Stations). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to alternative hydrogen fueling stations.

Response to Appendix 190 (Electric Vehicle World, Latest Employee Perk in Silicon Valley: Free Electric Car Charging (Mar. 15, 2013)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to illustrate an employee perk that could be initiated at the WLC.

Response to Appendix 191 (Coulomb Technologies, Meet Employee Demand for Electric Vehicle Charging and Energize Green Initiatives at the Workplace (Mar. 2010)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to workplaces providing charging stations for plug in vehicles.

Response to Appendix 192 (U.S. DOE, Plug-in Electric Vehicle Basics (Jan. 2013)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide general information related to plug in vehicles.

Response to Appendix 193 (U.S. DOE, EV Everywhere Workplace Charging Challenge). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to workplaces providing charging stations for plug in vehicles.

Response to Appendix 194 (U.S. DOE, Workplace Charging Challenge Pledge and Benefits). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to workplaces committing to installing charging stations for plug in vehicles.

Response to Appendix 195 (Plug-In Electric Vehicle Collaborative, A Toolkit for Community Plug-In Electric Vehicle Readiness (Aug 2012)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to preparation communities can take in response to the growth of electrical vehicles in their neighborhoods.

Response to Appendix 196 (National Renewable Energy Laboratory, Breakeven Prices for Photovoltaic on Supermarkets in the United States). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to breakeven prices for solar versus electricity purchased from the grid for supermarkets in the US.

Response to Appendix 197 (Wal-Mart, Wal-Mart Announces New Commitments to Dramatically In-crease Efficiency and Renewables). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to large companies (Walmart) committing to the use of renewable energy.

Response to Appendix 198 (California Environmental Protection Agency Air Resources Board, Regulatory Guidance Document). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the cap and trade program in California.

Response to Appendix 199. The California Clean Energy Committee's document does not directly refer to its Appendix 199, which is a manual describing how to participate in the Self Generation Incentive Program, which assists companies in the installation of new qualifying technologies to provide electrical energy to a system. To the degree that there is an economic incentive or a legal requirement to participate in such a program, the owners or tenants within the project will consider applying for such funding.

Response to Appendix 200. (Cool Business Districts - District Cooling System Offers Environmental and Financial Benefits). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to district cooling systems.

Response to Appendix 201 (Dablang, L. & Ross, C., Atlanta: A Mega Logistics Center in the Piedmont Atlantic Megaregion (2012)). The appendix was not directly referenced in the comment

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

letter. It is assumed the appendix is intended to provide additional information related to the comment “the Heavy-Duty Truck Model should be used to analyze the impacts over time of the increased truck traffic produced by the WLC on major corridors....” The appendix presents analysis on characteristics of the geography of the logistics industry, specifically “logistics sprawl” and the “polarization of logistics activities.”

Response to Appendix 202 (Dablan, L., Logistics Sprawl and Urban Freight Planning Issues in a Major City (forthcoming)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment the Heavy Duty Truck Model should be used. The appendix presents a study on the “spatial patterns of freight and logistics activities and the planning and policy issues associated with them, using Los Angeles as a case study.”

Response to Appendix 203 (American Council for an Energy Efficient Economy, Energy Efficiency Potential of the U.S. Freight System: A Scoping Exercise (May 2013)). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to the comment the Heavy Duty Truck Model should be used. The appendix presents a review of “*three studies on greenhouse gas reduction potential in the U.S. transportation sector...and their findings on reductions in the freight sector through energy efficiency strategies.*”

Response to Appendix 204. (Moreno Valley Utility Quarterly Report of Power Content). The appendix was not directly referenced in the comment letter. It is assumed the appendix is intended to provide additional information related to Moreno Valley Utility Power.

G. LETTERS FROM PRIVATE INDIVIDUALS

Letter G-1: Mike and Linda Cree (March 10, 2013)

MAR 12 2013

March 10, 2013
Re: World Logistics Warehouse Project, proposed

Dear Sirs

We wish to express our deep concern and opposition to the over-development of warehouses proposed in Moreno Valley's east end. The proposed World Logistics Center Project is ridiculous in scope, completely altering the nature of our valley. It would deteriorate the quality of life for residents and is grossly unfair to property owners who have invested in homes here.

1

Our objections are many-fold, including fears of transportation and traffic congestion, as well as deep concerns about air quality and health risks. If built, the entire corridor along Highway 60 will have increased traffic and air pollution. The effects would not only affect our valley, but be hazardous to surrounding communities as well.

2

The visual blight created by massive warehouses would create an eyesore ridiculed by passersby and surrounding community members. Nearby communities are quoted as regretting the development of warehouses for the same reasons named above ~ traffic, noise, pollution, health risks and visual blight. I hope Moreno Valley can learn from their mistakes and not ruin our valley in the same way.

3

Why are we even considering a huge project such as this? Surely not for jobs. It has already been shown that the number and quality of jobs are minimal ~ not the "high paying" jobs quoted by the proponents. Our valley is not the right location for a warehouse project of this magnitude. The natural smog pocket created by the "badlands" area will cause the pollution to pile up and poison all of us.

4

5

In summary, we implore our city council, of elected officials, to make the right choice in the development of our valley and to say NO TO WAREHOUSES. It is not the right nor the responsible choice for our valley. It alters our city's general plan and is a breach of trust for the citizenry.

6

Thank you for listening to our voices. Please defeat this bad idea.

Sincerely,

Mike & Linda Cree

Mike and Linda Cree, voters
28974 Gifford Ave
Moreno Valley (Rancho Belago), CA 92555

RESPONSES TO LETTER G-1

Mike and Linda Cree

Response to Comment G-1-1. The many potential environmental impacts of the proposed World Logistics Center (WLC) project are fully evaluated in the Draft Environmental Impact Report (DEIR), including substantial changes in views and land use on the site and for surrounding neighbors and neighborhoods. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-1-2. None of the comments apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project, if it decides to approve the project.

Response to Comment G-1-3. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project, if it decides to approve the project.

Response to Comment G-1-4. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project, if it decides to approve the project.

Response to Comment G-1-5. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project, if it decides to approve the project.

Response to Comment G-1-6. The proposed WLC project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and the GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Subject: WLC Project Questions

WORLD LOGISTICS CENTER PROJECT

DRAFT ENVIRONMENTAL IMPACT REPORT (SCH #2012021045) Mark Gross, AICP, Senior Planner,
Moreno Valley, California PlanningEmail@moval.org <PlanningEmail@moval.org>

Mr. Gross,

I have some general questions that I have not found an answer to yet. I listened to the city's information on the development, based on full occupancy, and I listened to the counter presentation at Valley View High School on March 9th. I felt both were one sided. I'm looking for more balanced information. I have not heard about the following:

1. How long is the life expectancy of the WLC? Are there any plans beyond the life expectancy of the WLC for the same area? 1
2. Are there any checks and balances as to what companies can locate into the WLC? 2
3. How will the widening of the Panama Canal affect the U.S. West Coast Logistics market? 3
4. Have mitigating factors been considered to segregate the WLC away from existing housing developments, i.e. green zones to the east of Redlands Blvd, south of the 60 Freeway? 4
5. Can traffic regulations/enforcement of regulations keep trucks out of thoroughfares where residences are located, i.e. Cactus from Heacock to Lasselle, and or Alessandro from Frederick to Lasselle, and or Nason Street from the 60 Freeway south, and or Moreno Beach from the 60 Freeway south, and or off Ironwood, or Redlands Blvd through to Redlands? 5
6. I understand the developer and his investors are supplying most of the capitol for the WLC development, but how much will the city have to kick in to fill the basic infrastructure for the WLC?... How much money will the city have to kick in to maintain the WLC per year? How much additional city wide road repair, enforcement costs, and other costs will be incurred annually? Where will that funding come from? As I understand there will be no sales tax generated from the warehousing... How will the city recover costs involved with the creating and maintaining the WLC? 6
7. Are there any plans/contingencies for rail access to the WLC? 7

Thank you for your time. Is there some where these questions can be posted when answered, or have these been answered already? I would be interested in reading other people's comments/questions.

8

I would prefer some other job creating enterprise other than warehousing, but I understand the limitations of government in obtaining those possibilities. Neither for or against the WLC yet...

9

Perry Johnson
11056 Aldren Court
Moreno Valley, CA 92555

cc: tomo@moval.org <tomo@moval.org>

RESPONSES TO LETTER G-2

Perry Johnson

Response to Comment G-2-1. The commenter would like to know the life expectancy of the World Logistics Center (WLC) and if there any plans beyond the life expectancy of the WLC for the same area. The proposed project does not have a specified “life expectancy.” The proposed zoning and uses of the site would remain until future action by the City modifies them. For the purposes of the EIR, analyses were conducted through 2035, with additional analyses for health risk looking at 30-year horizons in line with Current OEHHA Guidance.

Response to Comment G-2-2. The commenter is asking whether there are any checks and balances as to what companies can locate into the WLC. Companies operating at the WLC will be subject to all the conditions and mitigation measures contained in the Final Environmental Impact Report (FEIR), the World Logistics Center Specific Plan (WLCSP), and subject to the conditions of the proposed Property Owners Association of the WLC. In addition to complying will these requirements, prospective tenants would need to negotiate with property owners with regard to the terms of a property agreement.

Response to Comment G-2-3. The commenter is asking how the widening of the Panama Canal will affect the U.S. West Coast Logistics market. The widening of the Panama Canal is not expected to impact the overall logistics market. Southern California Association of Governments’ (SCAG) June 2010 report, *Industrial Space in Southern California*, estimates that by 2035 there will be a shortage of 228 million square feet of warehouse space in Southern California. As Southern California’s population and economy continue to grow, it is expected that there will be increasing demand for goods movement and logistics services. As a result, expected growth and the best available studies indicate there will be strong demand for warehousing in Southern California well into the future (Please refer to Response to Comment G-53-5 for more information on the Panama Canal).

Response to Comment G-2-4. The commenter is asking whether mitigating factors have been considered to segregate the WLC away from existing housing developments, i.e. green zones to the east of Redlands Blvd, south of the SR-60. A number of design features have been incorporated into the design of the WLC to reduce its impacts on the surrounding communities. Those features include prohibiting truck access to Redlands Boulevard, south of Eucalyptus, and between the WLC and Cactus and Alessandro. This would eliminate truck trips through community areas. Additionally, the WLC will have a 250-foot buffer at the project boundaries and 150-foot building setback. This means that all buildings will be a minimum of 400 feet from the project boundaries. Landscaping will also create a visual screen between the WLC and adjacent communities to reduce the visibility of the proposed warehouse structures and improving aesthetics.

Response to Comment G-2-5. The commenter is asking whether traffic regulations/enforcement of regulations keep trucks out of thoroughfares where residences are located, i.e. Cactus from Heacock to Lasselle, and or Alessandro from Frederick to Lasselle, and or Nason Street from the 60 Freeway south, and or Moreno Beach from the SR-60 south, and or off Ironwood, or Redlands Blvd through to Redlands. Cities and counties in California have the authority to adopt codes that restrict the use of trucks on public roadways, though not all jurisdictions choose to do so. The figure below shows the designated truck routes in the vicinity of the WLC. The Cities of Moreno Valley and Perris have designated specific routes while the County of Riverside does not (i.e. trucks may use any County road, though truck parking restrictions may apply).

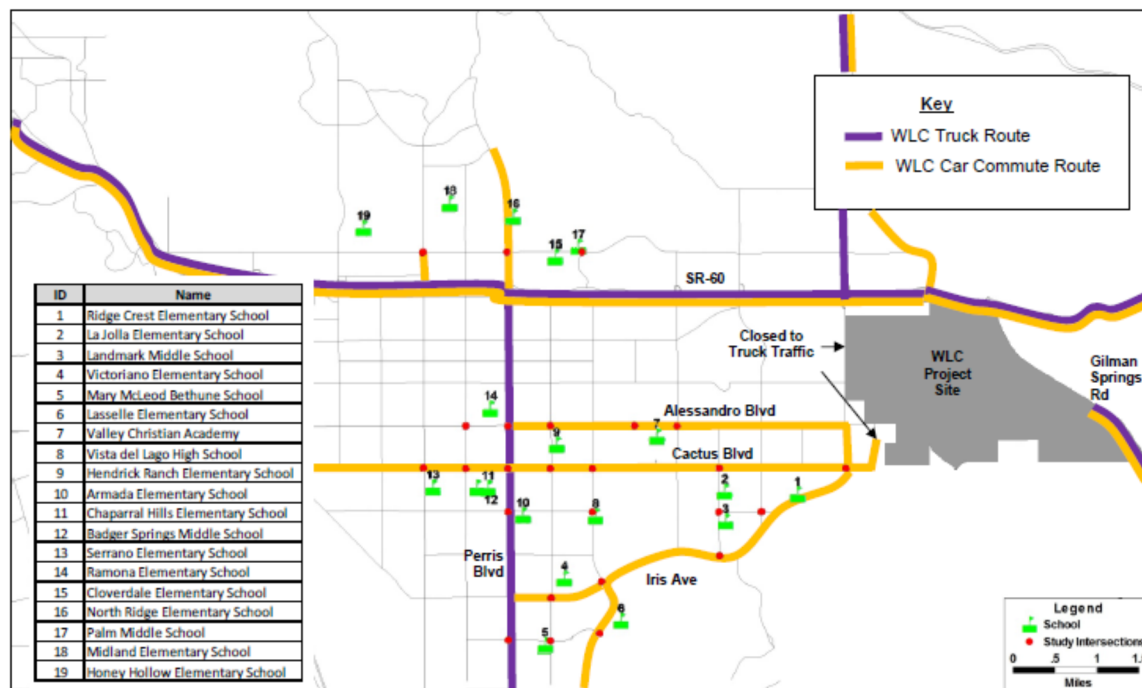

However, truck access to Cactus, Alessandro, and Redlands (south of Eucalyptus) will be prohibited as part of the project. As a result, the WLC Truck Routes will be SR-60, Redlands (north of Eucalyptus), Perris Boulevard, and Gilman Springs Road, as shown in Exhibit G-2-1 below.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Exhibit g-2-1: Routes Taken by WLC Trips in relation to Schools

Response to Comment G-2-6. The David Taussig & Associates report estimates that the proposed project would generate \$5.7 million in additional local government revenue, including fees that would provide funding to the general fund, fire/police services, and Moreno Valley School District (Final Environmental Impact Report (FEIR) Volume Appendix O-1).

Any commitments to cost participation by the City are identified in the projects development agreement. The Fiscal and Economic Impact Study (Appendix O of the Draft Environmental Impact Report (DEIR)) analyses recurring fiscal costs to the City in Section 3 of the report with the results summarized in Table 3B. These additional costs will be offset by project tax revenues. A detailed analysis of the project tax revenues are also provided in Section 3 of the study with results being summarized in Table 3A. The overall net fiscal impact to the City of Moreno Valley showing an annual recurring surplus of 5.7 million dollars is summarized in Table 3C. Overall, the proposed project would boost the financial position of the City.

Response to Comment G-2-7. Rail was not considered a viable component of the proposed project for number of reasons. In response to this comment and other similar comments, a detailed response regarding the infeasibility of rail serving the WLC site is now included in the revised Traffic Impact Analysis (TIA) as Section 4.F. Also, refer to Responses to Comments G-53-4 and G-70-5.

Response to Comment G-2-8. All comments received and the responses to those comments are contained in this FEIR, available on the City of Moreno Valley's website.

Response to Comment G-2-9. The existing land use under the Moreno Highlands Specific Plan (MHSP) called for the development of other types of commercial uses. However, the MHSP had two serious weaknesses. The first is the Southern California Association of Governments (SCAG) region has had an over-abundance of land designated for business park uses, which means only the most attractive locations are likely to be developed. Since the MHSP was adopted, most business park development has taken place in the coastal counties rather than in the Inland Empire. Within Moreno

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Valley, sites at the eastern end of the city have been less successful in attracting business park uses than sites at the western end, which are closer to March Air Reserve Base and the I-215. Therefore, despite being designated for business park development for the last 20 years, no such development actually occurred in the MHSP, and there is currently strong demand for warehousing in Southern California.

Letter G-3: Scott Thompson (email) (March 25, 2013)

To: MV Econ Dev Community Forum

Subject: FW: Tonight's Forum

Dear Leader's of Our Community,

Thank you for putting on the forum in regards to the WLC.

I was taken by the motto "Moreno Valley the best place to do business". I was hoping that it would be "the best place to live". It appears that we might be going from bad to worse. Tonight made me realize that I have an uphill battle to face. I live on the corner of Dracaea and Redlands, directly adjacent from where the WLC may be built.

We were hesitant to move to Moreno Valley, because of its, well known, bad reputation. We found a nice quiet area to live on the east end of town, as I commute the Coachella Valley for my job. We would have never moved to the east end of town or perhaps this community if it was planning on building 40,000,000 sq ft of warehouses there. Most people in my neighborhood pay over \$7000 a year in property tax. I don't suppose there are too many communities contributing as much as ours. Rancho Belago has some of the nicest

1

communities in Moreno Valley. Why would you want to ruin it by building huge warehouses here?

It was very apparent tonight that the mayor, council and staff are onboard with the plan, even after the DEIR. We live in a community where a very high percentage of our community doesn't have a higher education and or doesn't care about city politics. In the last election less than 5% of the residents voted for the open 5th district council seat. This was apparent again tonight by the low number of people and the lack of diversity in attendance. This community is relying on you to make the best decisions for them. I don't believe this city's leadership is qualified to make this big of a decision that will affect this community for years. Most Council Members and perhaps even the staff do not have the appropriate type of education or the background to comprehend the impact of such a major project.

I have only read a few hundred pages of the DEIR, but it was enough for me to realize that this project is not for this community and perhaps even the county. I realize I have a vested interest in how this turns out because of the proximity of my house to the WLC location. This was a night for the facts to be presented and instead we were given a sales pitch. We even had to be reminded by the mayor of the qualifications of the consultants and that they were a third party group. It appeared to be a justification of sorts.

I lost interest the minute I was told that the CEQA is self governed by the lead agency, our city leadership. When the leadership is on board with the WLC then what kind of results can we expect? Let's be real. There is plenty in the DEIR that should convince us that this is not the best thing for our city. Jobs are important but as was stated over and over, quality of life is what we are really after. I know the people on the east end of town will be negatively impacted, "significantly" as the DEIR states. These are the same households that pay the highest tax rates in Moreno Valley.

The economic impact report was a joke. I work for a large medical device manufacturer. I manage and hire warehouse people for a living. None of the warehouse personnel make \$40K per year, which was the amount used in the report. Most make between \$9-\$12 per hour and about one half are temporary. The technicians that manufacture and repair the medical devices only make \$15-\$18 per hour. I challenge the reports numbers. Are they comparable to what Harbor Freight and Walgreens pay? Also, the volume of jobs is suspect. That is based upon all buildings being occupied at one time. Do you really believe all 41,000,000 sqft. will be occupied at one time and if so by when? Will some not falter and new tenants need to be found? It would be interesting to see how Mira Loma is doing compared to their plan. If this information was available, it should have been shared. It just showed that real numbers were not used. A picture was painted to produce the desired results. There was no talk of initial capital outlay that we will need to support the 50K plus jobs that it will take to build these buildings. Why wasn't this mentioned in the economic report? The report only focused on revenue and should have included potential expenditures as well. This would have provided a complete picture of what we are facing.

We should be comparing what 7800 homes would bring to the community verses the WLC. We should review the potential revenue that those households would spend locally. Then compare that to the cost of building sound walls and road improvements to accommodate

the truck traffic and mitigate the noise of trucks running through our streets.. The communities that are thriving generally operate on a slow, smart growth model. See Santa Clarita compared to us. Since quality of life is really important to you and our citizens then why not look to the communities that have it and model after them.

3

If most of the jobs were going to be filled by Moreno Valley residents, as was suggested, how will our streets be able to handle the additional traffic? Workers from other communities will also put additional traffic on Hwy 60 and our city streets. Traffic already comes out as far east as Perris Blvd on the 60 during commute times. Lights have been installed on the freeway entrances to help mitigate the traffic. According to the DEIR, we will experience additional traffic almost immediately. How much further east will the traffic go, once the project starts? If anyone has driven on freeways for any length of time, they would know that replacing car traffic with truck traffic will be a disaster. Try driving through the badlands or any area when the truck traffic is heavy. I couldn't believe a reputable consultant would make such a statement.

4

We already live in an area with severe pollution levels. The DEIR indicates it will only get worse, especially as they grade the land and then a few years later with the additional traffic. Sketchers already lights up the sky out here. I can't imagine what 40 more building like that will do. My backyard will be like a stadium all lit up.

5

There is plenty more to review and discuss as I continue to read the DEIR. I was very disappointed with the "show" tonight it was very one sided. Being told that we would have to go into litigation if we wanted to fight it only made matters worse. I felt like those of us opposing were being challenged to try and stop you. To have 60 days to read and respond to the over 10,000 page DEIR is a little much to ask. More time should be granted, especially with a decision of this magnitude. I hope you were serious about working with the community because if you are not Moreno Valley is in for a rude awakening.

6

Please feel free to contact me if you wish to discuss further.

Scott Thompson
13258 Canterbury Downs Way
Moreno Valley, CA 9255

RESPONSES TO LETTER G-3

Scott Thompson

Response to Comment G-3-1. The City Council will consider all stated opinions and comments on the project and Environmental Impact Report (EIR) prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Attached to this Final Environmental Impact Report (FEIR) as Appendix O-4 is a presentation done by Beacon Economics that reflects their independent Economic Impact Analysis of the WLC. This study was commissioned separately from the David Taussig & Associates (DTA) study was part of the EIR analysis (Appendix O-1 in support of Draft Environmental Impact Report (DEIR) Section 4.13, *Population, Housing, and Employment*) to provide a “second opinion” and separate independent analysis of the potential jobs and other economic aspects of the WLC project. Beacon is a highly respected economics firm based out of Los Angeles, led by Chris Thornberg, a nationally renowned economist. The Beacon study indicates an even higher level of benefit/impact compared to the DTA study for the City of Moreno Valley as a result of the WLC. For example, the Beacon study estimated the WLC project could produce up to 32,201 employees (slide 29, Beacon 2013), while the project economic study (DTA 2014) estimated the WLC project would generate 24,642 employees (page 4.13-9, DEIR Section 4.13, *Population, Housing, and Employment*). The Beacon study is included as Appendix O-4 in the revised DEIR (FEIR Volume 2). The large numbers of employees and other economic factors are the result of the size of the WLC project and not the accuracy or source of the analyses.

Response to Comment G-3-2. The commenter’s February 27, 2013 email challenges the wage data used within the DEIR as well as other questions related to the study. The letter provides anecdotal information regarding the author’s personal experience with warehouse workers. The DEIR analysis relies exclusively upon governmental sources (i.e. Bureau of Labor Statistics, Employment Development Department and the Census Bureau) for the applicable wage data within the warehousing and logistics sector. Importantly, these numbers have been compiled from data sources within the County and Metropolitan Statistical Areas pertinent to the WLC, as explained in detail in the Responses to Comment G-90-1 and G-90-2. A wide variety of firms locate within a logistics facility such as WLC, and there are a range of employees who will be working there. Some will be characterized by lower incomes as cited by the author of this letter, while others will be more skilled, or involved in trucking or some other higher paid occupation. In terms of initial capital investment, there is no question that the Applicant will be investing significant amounts of capital funding into the project, both to build private structure and to finance the public infrastructure required by the City before the construction of WLC can begin. Neither the amount of the investment nor how it will be obtained are California Environmental Quality Act (CEQA) issues.

Response to Comment G-3-3. The DEIR did examine the potential impacts of developing the approved Moreno Highlands Specific Plan (a residential master-planned community) on the site rather than the proposed project. This is equivalent to the “7,800 homes” alternative stated by the commenter. Section 6.3.5, *No Project-Existing General Plan Alternative*, of the DEIR determined impacts of this alternative compared to the proposed WLC project were as follows:

“... short-term construction-related air quality would be similar to the proposed project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related air quality impacts would be reduced from that identified for the proposed project but would remain significant and unavoidable. Under this alternative, population and housing impacts would be greater in magnitude as residential uses are proposed. Similar to the proposed project, the associated increases in employment are accounted for in the City General Plan and other applicable local and regional plans.”

The development of the No Project/Existing General Plan Alternative would have increased demands on public services and recreation facilities due to the residential component and population growth. The payment of fees and adherence to development requirements would reduce these impacts to a less than significant level. Water supply availability is expected to be available although water demand is increased. Water demand was determined to be available for the proposed project. Because of the increase in vehicle trips achieved under this alternative, impacts to the operation of local roadways and intersections would be proportionally greater than what was identified for the proposed project; therefore, long-term traffic impacts would remain significant and unavoidable. Traffic-related noise would be greater in magnitude and noise impacts would be significant and unavoidable like the proposed project.

... Under this alternative, only some of the proposed project objectives would be met as a variety of uses would be built.... Development of this alternative would provide new employment opportunities for residents of Moreno Valley but not nearly to the degree as the proposed project.” (DEIR pages 6.15 – 6.22)

An evaluation of economic impacts, while something to be considered by the City Council, is not required of the CEQA process (State CEQA Guidelines Section 15131).

Response to Comment G-3-4. The commenter asks how SR-60 and city streets will handle traffic from workers from Moreno Valley as well as other communities. The commenter states the DEIR indicates the City will experience additional traffic almost immediately. He states replacing car traffic with truck traffic would be a disaster.

The impact of project traffic on city streets have been fully analyzed in the Traffic Impact Analysis (TIA) (see FEIR Volume 2 Appendix L-1), and the measures needed to mitigate these impacts have been described in the report.

The commenter's statement that impacts would occur almost immediately appears to be a misunderstanding concerning the Existing Plus Project scenario in the TIA. That scenario is an analytical tool designed to assign responsibility for mitigation improvements and does not represent an actual proposed plan. The project would be built out over a period of years and as each building is completed an additional traffic study would be conducted to identify which of the identified improvements are triggered by each successive building. Thus, road improvements would stay in step with project development and its generation of traffic.

The TIA does not say car traffic would be replaced with truck traffic. The TIA analysis found car traffic would be reduced at some locations and truck traffic would increase at some locations, which is fully accounted for in the LOS analysis. The difference in the driving characteristics of trucks and cars were accounted for using Passenger Car Equivalent (PCE) factors which vary depending on the type of terrain and design speed of the road. These characteristics were fully accounted for in the analysis using PCE factors approved by Caltrans (see TIA Chapter 2, Section A, sub-section entitled “Passenger Car Equivalents”).

Response to Comment G-3-5. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project, if it decides to approve the project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-3-6. The commenter asked for more time to review the EIR documents and make comments. The City granted a 60-day EIR review period, instead of the customary 45-days, that began on February 5, 2013 and ended on April 8, 2013, but has been accepting “late” comments submitted by several individuals and the City of Redlands since that time. It appears to be sufficient time for all parties to have reviewed and commented on the EIR.

Response to Comment G-3-7. As much as possible, real numbers were used, despite the fact that specific facility operators generally do not reveal their operating conditions or personnel information, actual industry information is used when it is available.

Response to Comment G-3-8. The commenter is referred to Exhibit A-9 of the fiscal component in the Beacon economic study (Appendix O-4 of FEIR Volume 2) that outlines approximately \$1.8M in annual/recurring operation and maintenance costs to support the WLC. For a discussion of one-time fees and charges, please see the text of the Beacon study (Appendix O-4 of FEIR Volume 2). Specifically, the capital outlays will be offset by the tens of millions in development impact and permitting fees that will be paid by future development within the WLC Specific Plan area.

Letter G-4A: Devlin Engineering (March 21, 2013)

March 21, 2013

Mr. John C. Terell, Planning Official
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92552

Subject: Objections and comments regarding drainage impacts of the World Logistics Center (WLC) that should be, but are not addressed in the Draft EIR (SCH #2012021045) and conditions for the project regarding drainage onsite and downstream. Planning Cases PA 12-0011, 0012, 0013, and 0015.

Dear John,

The World Logistics Center will have many more impervious surfaces than the residential uses that were part of the existing general plan for this area. As a result, it will greatly increase the size of the drainage facilities that will be required downstream if World Logistics Center does not provide adequate drainage basins onsite. The increased runoff will greatly affect the size of the drainage facilities in this area. Therefore, a portion of the Draft EIR (DEIR) should discuss the impacts on drainage on adjacent properties and all downstream projects and drainage facilities.

The Draft EIR should also discuss the affect of changes to the existing drainage basins brought about by the World Logistics Center. As one example, the World Logistics Center will grade out the existing 30+ acre drainage basin located at the Northeast corner of Alessandro Blvd and Merwin Street. The City of Moreno Valley has asked that County of Riverside Flood Control move the drainage basin to properties located at the Northeast corner of Wilmot Street and Cactus Ave. This location is on property owned y Multivac Inc., my client. This location is also shown on the revised Moreno Master Drainage Plan as the Cactus Basin. Riverside County Flood Control is presently preparing a Draft EIR for the revisions to the Moreno Master Drainage Plan.

Wrongfully, the World Logistics Center DEIR has utilized a proposed change to the Moreno Master Drainage Plan as if it has been passed and accepted by the Riverside County Board of Supervisors. It also utilizes this change to the Master Drainage Plan to avoid discussing these changes as an effect of their development. Of particular note this preliminary drainage plan shows a 30 acre debris basin relocated from the Northeast corner of Alessandro Blvd and Merwin Street to the Cactus Basin location, which is on Multivac Inc.'s, property. No mention of the relocation of this drainage basin is mentioned in the Draft EIR for World Logistics Center nor is it mentioned in any of the appendices. There are five such drainage basins shown relocated on

revised Moreno Master Drainage Plan. Are the locations of all five of the basins designated in the revised Moreno Master Drainage Plan actually the relocation of existing basins caused by construction of the World Logistics Center project?

I was told by City Engineering staff that the location of the Cactus Basin on the revised Moreno Master Drainage Plan is merely conceptual and would vary in location. I was also told that the City of Moreno Valley had no intention of taking Multivac's property without due compensation.

In talking with Kris Flanagan of Riverside County Flood Control I was told the same thing, that the input for the basin locations came from the City of Moreno Valley and the intent was that unlike pipelines, channels and box structures, these basins were located only conceptually and the text of the DEIR for the basin would reflect this. Kris advised me that the actual location would be wherever the City and Flood Control could purchase the appropriate land for the basin. However, I disagree, because in reality, engineers always fight over which side of the street a pipe is shown or on which portion of which particular property the drainage structure is shown. The Drainage Basins proposed as part of the revised Moreno Master Drainage Plan are no different. In fact the fighting has already begun. WLC is utilizing the proposed Moreno MDP as if it has already been passed. Therefore, they are not addressing the impact of their grading out the existing basins and requiring others to provide property for these basins.

The staff of the City of Moreno Valley and the County of Riverside Flood Control seem to have made an error and allowed CEQA to be by-passed by WLC. As to my clients property, they have ignored the most feasible sites for the Cactus Drainage Basin. World Logistics Center is a very large project covering over 3,900 acres. It makes more sense that the location for such a drainage basin be on WLC property. The WLC would get credits against its drainage fees and should be in a position to build and provide the facilities for the drainage basin during its grading operations. It is only appropriate that if World Logistics Center is allowed to grade out the existing 30+ acre basin, it provide the area for a new 30+ acre basin on its property east of Merwin Street at Brodiaea Ave or leave it in the existing location.

Additionally, WLC construction could precede all development in the area, making the basin functional from the beginning of any development. For the WLC sites to be left out in the discussions for the location and the feasibility of the Cactus Basin is to ignore the best possible site for such a basin. If the CEQA process continues without a discussion of the WLC site as a possible location of the Cactus Basin, as well as leaving the basin in its present location at Alessandro Boulevard all owners downstream of the intersection of Brodiaea Ave and Merwin Street will be detrimentally affected to the great benefit of World Logistics Center.

We do not feel that the City is or should be biased toward the WLC project. Therefore, the DEIR for World Logistics Center should include discussion of the existing location and the WLC property located adjacent and east of Merwin Street as possible locations for the Cactus Basin. If this basin is sized correctly, it would mitigate all increased runoff from the World Logistics Center property and keep all downstream drainage facilities the same size as indicated on the present Moreno Area Drainage Plan. To not discuss this area as a possible location of such a basin is to require larger drainage facilities and loss of property by smaller property owners downstream of WLC. To not discuss leaving the Cactus drainage basin and the other drainage

basins in their present location and any other location on the WLC property is also in our opinion, a violation of the CEQA requirements to discuss all effects of the proposed development. We think the other four drainage basins as shown on the revised Moreno Master Drainage Plan also need to be discussed.

We think this process of putting the relocation of drainage basins on the revised Moreno Master Drainage Plan also violates due process by inadequately informing property owners of the effect to their lands. The initial meeting to kick off the revised Master Drainage Plan was noticed in some local newspaper, which few land owners read. As a result there was little to no public turn out or input at the meeting. My clients object to this lack of notice. If we hadn't seen a copy of the revised MMDP in the appendices of WLC's DEIR we would not have known about the deleterious affect on the Multivac Inc. property. To this day, we have not received written notice of the proposed changes to the Moreno Master Drainage Plan. **We feel it is inappropriate to utilize the revision to the Moreno Master Drainage Plan as a vehicle to move drainage basins onto other people's lands without proper notification.**

Additionally, there is at this time, no mention in the DEIR for the World Logistics Center of a double 10 by 10 reinforced concrete box structure crossing Merwin Street north of Brodiaea as shown on the existing Moreno Master Drainage Plan. There is also a double 10 by 10 box culvert required in the existing MMDP crossing Alessandro Boulevard at Merwin Street that is not discussed. These items are shown on the present Moreno Area Drainage Plan and are facilities that would be the responsibility of World Logistics Center. Accordingly, the DEIR should discuss the requirement that World Logistics Center construct all facilities shown on the existing Moreno Master Drainage Plan.

We ask that all of the above drainage impacts be made a part of the DEIR text and discussions. We also ask that the following requirements be made a condition on the development of the World Logistics Center:

- 1. All runoff leaving World Logistics Center shall be designed to match the existing Moreno Master Area Drainage Plan of this area. There should be no increases in runoff from this property that could affect any downstream properties or require downstream properties to install increased or larger drainage facilities.**
- 2. World Logistics Center must be conditioned to construct all new drainage basins within their property and to replace all basins they are removing by construction of their project.**
- 3. WLC must be conditioned to replace the 30+ acre Cactus Basin on their property.**

My client, Multivac Inc. is very concerned not only about the taking of their property, but about the affect of increased runoff on its properties downstream of WLC and asks that the City be fair and impartial when locating drainage facilities. We are afraid that some bias or favoritism may enter the system as World Logistics Center is a project favored by the City Council.

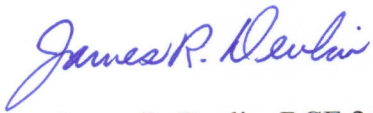

Thank you for your consideration of this matter we look forward to the discussions to follow that will be part of the EIR process.

Attached and made a part hereof, please see a letter addressed to Riverside County Flood Control objecting to the process used to develop the revised Moreno Master Drainage Plan and the notifications to property owners.

Thank you.

Sincerely,

Devlin Engineering

Attachment: Letter to RCFCFCD

cc: C. Moothart, Multivac

RESPONSES TO LETTER G-4A

Devlin Engineering

Response to Comment G-4A-1. The World Logistics Center Specific Plan (WLCSP) Draft Environmental Impact Report (DEIR) does discuss the impacts on drainage facilities in Section 4.9.6.1, Drainage Pattern and Capacity Related Impacts. In response to comments additional detail has been provided as outlined in *Appendix J-1 Hydrology and Water Quality Master Plan of Drainage Report*. The mitigation of impacts of the facilities are discussed in *Section 4, Mitigation of Impacts of Proposed Development*. Key elements are summarized in the Responses to Comments B-3-37 and B-3-39 in Letter B-3 from the California Department of Fish and Game, including changes to mitigation measures.

Response to Comment G-4A-2. There are no changes to existing Riverside County Flood Control and Water Conservation District (RCFC&WCD) basins brought about by the WLC project. There is no existing 30+ acre drainage basin at the Northeast corner of Alessandro Blvd and Merwin Street. There is a 4-foot high berm that was constructed by the property owner to prevent sediment-laden flows from sheet-flowing across Merwin Street and Alessandro Blvd. This berm is not a drainage basin. The Cactus Basin shown on the proposed revisions to the Moreno Master Drainage Plan (MMDP) is not a relocation of an existing basin. It is a new basin proposed by RCFC&WCD as part of their revisions to the MMDP.

Response to Comment G-4A-3. The revision to the MMDP by the RCFC&WCD is not being done as a result of or caused by the proposed WLC project. As discussed in Response to Comment G-4A-2 above, the proposed Cactus Basin is not a relocation of an existing basin. The locations of the proposed basins on the revised MMDP are not related to nor are they a result of the WLC project. The proposed WLC project will comply with the existing MMDP and is aware of the proposed revisions to the MMDP. Regardless of any changes to the MMDP ultimately approved by the County of Riverside, the proposed WLC will mitigate its runoff as outlined in Mitigation Measure (MM) 4.9.6.1A.

Response to Comment G-4A-4. As discussed in Response to Comment G-4A-2 there is no existing drainage basin at Merwin St. and Alessandro Blvd. and the proposed Cactus Basin by RCFC&WCD is not a result of the WLC project. Nor are any of the other basins proposed by RCFC&WCD revision to the MMDP a result of the WLC project. The effects of the proposed development are discussed in Section 4.9.6.1 of the DEIR and WLC is constructing 11 detention basins within the project to mitigate the project's runoff to predevelopment conditions as outlined in MM 4.9.6.1A.

Response to Comment G-4A-5. As shown on Figure 4.9.3 in the DEIR Line "A" is a proposed drainage system of the WLC project from Redlands Boulevard at the southerly end of the project to Eucalyptus Avenue at the northerly end. Line "A" is the same as Line "F" in the existing MMDP. The construction of Line "A" will include the construction of any necessary reinforced concrete box structures at the street crossings.

Response to Comment G-4A-6. The WLC is mitigating its runoff as outlined in MM 4.9.6.1A to match pre-development flows. The WLC project is not removing any existing drainage basins as part of the project but is constructing 11 detention basins within the project boundary. RCFC&WCD's proposed Cactus Basin as part of their revision to the MMDP is not related to nor affected by the WLC project, as such the WLC project is not required to replace it.

Response to Comment G-4A-7. The WLC is mitigating its runoff as outlined in MM 4.9.6.1A to match pre-development flows. The mitigation includes construction of detention basins within the project's boundary. The revision to the MMDP by the RCFC&WCD is not being done as a result of or

caused by the proposed WLC project. See separate response to the attachment in Response to Comments G-4B.

Letter G-4B: Devlin Engineering (March 21, 2013)

March 21, 2013

Mr. Kris Flanigan
Riverside County Flood Control
and Water Conservation District
1995 Market Street
Riverside, California 92501

Subject: Comments to be considered during the preparation of a DEIR for the Moreno Master Drainage Plan (MMDP) revision and the World Logistics Center (WLC) Draft EIR (SCH #2012021045).

Dear Kris,

My client, Multivac, Inc. objects to the process Flood Control has used to develop the proposed revision to the Moreno Master Drainage Plan (MMDP). My clients like so many other property owners did not receive any notification of the initial proceedings. We feel that notification of the Draft EIR review should be handled more appropriately with adequate notification given to each property owner that is affected by the project. Putting a notice in the paper and hoping that the thousands of affected property owners would get word is completely inadequate. This is particularly true of the Drainage Basins proposed on the revision to the Moreno Master Drainage Plan. In our phone conversation, you mentioned that there was a very low turnout at the kickoff meeting for this project. We believe this is a direct result of inadequate notification to the affected land owners.

We also feel Flood Control has located the drainage basins on the proposed master drainage study inappropriately. We have been told that the location of the basins is conceptual only and that the location could vary. However in the past, engineers and contractors have argued strongly on the location of the facilities as to what side of the street the line is drawn, and on what portion of what lot the facility was drawn. We feel the drainage basins will be no different. In fact, World Logistics Center, a 3,914 acre project abutting Merwin Street seems to have utilized your revised Moreno MDP plans as if it is already adopted and exempts its site from building the Cactus basin. Drawing these "conceptual" basins over one property versus another amounts to a taking of the land without compensation.

In regards to the Cactus Basin, it is our opinion that the city has requested this Basin location in order to facilitate the World Logistics Center project. The Cactus Basin is basically a relocation of a 30+ acre basin that exists at the Northeast Corner of Alessandro Blvd and Merwin Street. World Logistics Center will be grading over the existing basin

and as a result, the City needs to relocate this basin. This may be the reason the other four drainage basins have been requested on the revised MMDP. The Moreno Master Drainage Plan becomes a convenient instrument to accomplish these changes. World Logistics Center does not have to discuss the effects of grading out and moving the drainage basins. Notification to the public is limited and the World Logistics Center is not viewed as the bad guy nor is the City of Moreno Valley. Isn't this a violation of CEQA guidelines?

3

There are several locations for the Cactus Basin. One location is for it to remain in its existing location at the Northeast corner of Alessandro and Merwin Street. A second location would be to relocate it south of Alessandro Blvd, but North of Brodiaea Ave, which would keep it on World Logistics Center property. A third alternative is to move it to the location suggested on the revision to the Moreno Master Plan of Drainage, which is an area bounded on the east by Redlands Blvd, on the west by Wilmot Street, on the south by Cactus Ave and on the north by Brodiaea Ave.

4

In regards to the Cactus Basin placed as shown on the proposed MMDP, Flood Control has missed the most feasible, logical and reasonable location on the East side of Merwin Street at Brodiaea Ave. World Logistics Center has a 3,918 acre project along the east side of Merwin Street. They will be responsible for providing drainage fees to RCFCD for their 3,918 acres. They could gain credit toward these fees for design and building the Cactus basin within their project. In this way, the basin can be provided at the very beginning of the construction of World Logistics Center and would help mitigate their increased runoff from the impervious building and pavement they will be constructing.

5

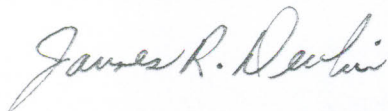

To leave this area out of the discussions for location of the Cactus drainage basin is to ignore the best possible site, one which is immediately accessible to build the facilities. Additionally, it would add greenbelt area to a project of warehouses that could blight the area indefinitely. Lastly, 30+ acres out of 3,918 or so would not have a significant effect on their project, unlike my clients property which will be taken completely if the revision to the Moreno Master Drainage Plan is approved.

6

I am enclosing a copy of a letter to the City of Moreno Valley regarding the DEIR on World Logistics Center. It has bearing on the location of the Cactus drainage basin shown on the proposed revision to the MMDP and as attached is made a part of this letter.

Sincerely,

Devlin Engineering

James R. Devlin, RCE 24655

attachment: Letter to City of Moreno Valley

RESPONSES TO LETTER G-4B

Devlin Engineering

Response to Comment G-4B-1. Riverside County Flood Control and Water Conservation District (RCFC&WCD) is responsible for the proposed revisions to the Moreno Master Drainage Plan (MMDP). The revision to the MMDP by the RCFC&WCD is not being done as a result of or caused by the proposed World Logistics Center (WLC) project. RCFC&WCD is responsible for noticing the public on that project.

Response to Comment G-4B-2. As discussed in Response to Comment G-4B-1, Riverside County Flood Control and Water Conservation District (RCFC&WCD) is responsible for the proposed revisions to the Moreno Master Drainage Plan (MMDP). The revision to the MMDP by the RCFC&WCD is not being done as a result of or caused by the proposed WLC project. The WLC is mitigating its runoff as outlined in Mitigation Measure (MM) 4.9.6.1A. RCFC&WCD's proposed location for the Cactus Basin as part of their revision to the MMDP is not related to nor affected by the WLC project.

Response to Comment G-4B-3. There are no changes to existing RCFC&WCD basins brought about by the WLC project. There is no existing 30+ acre drainage basin at the northeast corner of Alessandro Blvd and Merwin Street. There is a 4-foot high berm that was constructed by the property owner to prevent sediment-laden flows from sheet-flowing across Merwin Street and Alessandro Blvd. This berm is not a drainage basin. The Cactus Basin shown on the proposed revisions to the MMDP is not a relocation of an existing basin. It is a new basin proposed by RCFC&WCD as part of their revisions to the MMDP.

Response to Comment G-4B-4. RCFC&WCD's proposed location for the Cactus Basin as part of their revision to the MMDP is not related to nor affected by the WLC project. RCFC&WCD is responsible for evaluating potential locations of the proposed basin.

Response to Comment G-4B-5. See Response to Comment G-4B-4.

Response to Comment G-4B-6. See Response to Comment G-4B-4.

Letter G-5: Devlin Engineering (March 25, 2013) and Appendix 1 (on Flash Drive)

March 25, 2013

Mr. John Terell, Planning Official
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92552

Subject: Lack of Aesthetics and buffering by World Logistics Center, and an Alternative to Street D on WLC plans affecting Draft EIR (SCH #2012021045) and Planning Cases PA 12-0011, 0012, 0013, and 0015.

Dear John,

One year ago, I wrote a letter to you on behalf of my clients Multivac Inc., requesting reasonable conditions or inclusions to the World Logistics Center project. In this letter we asked that the project be planned or conditioned to provide buffers against noise, lights, building heights, truck traffic, architecture and land uses to protect adjoining residential neighborhoods. Additionally, up until the end of January of this year we were told by staff and by representatives of World Logistics Center that there were no drawings to review. Now after the Draft EIR is out for public review with only a two month window, maps and exhibits magically appear. The dates on the exhibits indicate that the drawings were available and probably reviewable a whole lot sooner. And, after reviewing the exhibits provided with the Draft EIR for World Logistics, it is apparent that the suggestions in my letter dated March 15, 2012 were ignored.

1

Truck Traffic - Location of Street "D"

World Logistics Center is proposing that Merwin Street, labeled Street D on their plans, be modified to a 112 foot Major Arterial from Alessandro to Cactus. This is not right. This is presently a residential neighborhood. Now, it will be very negatively impacted by an industrial park with no concerns for the citizens that already own homes here. Homes along Cactus Ave and homes along Merwin Street will all be negatively affected. WLC's Street D should have been located another 500 to 1,000 feet east to enter WLC's development where the water tanks meet Cactus Ave. The grades still work to make an intersection and the noise from trucks starting and stopping at an intersection will not affect existing and proposed home owners. Merwin Street should be left alone as a local collector for a residential neighborhood.

2

Noise

If Street D is relocated East 500 to 1000 feet, noise will be mostly eliminated as an issue. The plan as presently proposed with the placement of Street D over Merwin Street is not a good idea. The residences along Merwin and Cactus will be overwhelmed by truck and traffic noise. Traffic lights will be required at the Cactus and Merwin intersection and again at the Merwin and Alessandro intersection. These will magnify truck noise as starting and stopping trucks will create havoc. Please look at moving Street D, as it is shown on WLC's plans, 500 to 1000 feet east to intersect Cactus Ave inside the WLC project. Leave Merwin street as a residential collector for which truck traffic is not appropriate. An alternative and perhaps a better solution might be to close off Merwin Street between 300 feet south of Alessandro Blvd and 800 feet north of Cactus Ave and reroute and extend Cactus Ave as Street D into WLC. See below and on the attached Exhibit A for a description of the benefits of closing part of Merwin Street and part of Brodiaea Ave.

-3

Landscape Buffers

Originally, I thought that the building heights projected for World Logistics Center would be reasonable. In my letter I proposed landscaping setbacks of 20 feet or so. As the World Logistics Center is proposed, 100 feet may be more workable. These buildings will tower over the existing proposed residential uses along Merwin Street. On one of the proposed exhibits for building heights the designation along Merwin Street is for 60 foot tall buildings. Buildings 60 feet tall next to 28 foot high residential buildings is not a buffering use. This is placing overwhelming structures next to residential neighborhoods. And it is highly likely that these buildings will be placed right up against any fencing they are required to build. It will look like the industrial buildings along Newhope Street, just west of City Hall, where the view from any point is just overwhelming buildings with little aesthetic presence or pleasing appearance.

-4

Architecture

Unless some architecturally pleasing elements are added to the sides and rears of the proposed warehouses, World Logistics will become the next major blight on Riverside County. Have any of staff or the City Council driven the area of warehouses near Nandina Street and Perris Ave or the warehouses along Cactus Ave east of Frederick Ave? These are stark neighborhoods except for the frontage of the buildings. These rear and side views are what the majority of residential properties will see from their homes adjacent to the World Logistics Center. Relief has to be provided along the sides and rear of these buildings to make them more aesthetically pleasing to existing and proposed residential uses.

-5

Lights

Warehouse districts have lights, lots of lights. World Logistics Center will be no different. At the western edge of the property the buildings are proposed to be 60 feet in height. Lights placed 60 feet above the ground will be seen completely across the valley. Light placement on the buildings must be placed at a level of no more than 25 feet above the ground with cutoff luminaires. They must not be comprised of high density light such as mercury vapor lamps or

-6

halogen lamps. The lamps must be low pressure sodium or equivalent lamps with cutoff luminaires. If the 60 foot high buildings are on graded lots that have been raised 10 feet or more off the ground, then the lights must be lowered to 20 feet off the ground and have shrouds that cutoff or limit the distance at which the direct rays from the lamps can be seen.

6

Traffic Lights

Because of the large street section World Logistics Center is proposing for Merwin Street, two Traffic Lights will be required, one at the Intersection with Cactus Street at one end and one at Alessandro Blvd on the other end. These traffic lights will shine into the homes of residences nearby. Trucks and cars will have to stop at all hours of the day and night causing a lot of noise to be generated where presently there is only silence. The existing residences should be protected from the lights and noise generated by WLC, especially on a major arterial that was never supposed to be near this neighborhood. Taking Street D and making it a continuation of Cactus into the WLC development would eliminate both Traffic lights. See below for a description of eliminating Street D and making it an extension of Cactus Ave.

7

Residential Land Uses

We do not feel that the City of Moreno Valley is doing enough to protect the existing, home owners and proposed residential land uses from the massive impacts of World Logistics Center. We have never been against any project in this area if proper respect for existing land uses and residences are provided in the project design. World Logistics Center is different. It is more massive than any project proposed before. There are no buffering land uses, nor any residential or mixed use sites to buffer the massive monoliths that will be warehouses. We don't feel proper planning has gone into this project. With just a modicum of buffering this project would probably not be noticed from adjacent residential along Merwin Street and Cactus Ave. However, The designers have chosen to maximize their yield to the detriment of these neighborhoods and staff needs to make sure this is changed.

8

Alternative A, Closing Merwin and Brodiaea, rerouting Cactus Ave as Street D into WLC

One alternative not considered by WLC will eliminate most of the complaints in this letter. It will also save a lot of money and difficulty in engineering the hydraulics of WLC as well as adjacent properties. As shown on Exhibit A to this letter, if Merwin Street is closed off a couple of hundred feet south of Alessandro, the right of way can be utilized as a green belt buffer for WLC to be added on to a 20 to 40 foot buffer that WLC would be required to place their buildings from the western property boundary. This also eliminates the traffic light at Alessandro Blvd. and Merwin Street.

9

Closing Merwin Street 800 feet north of Cactus will provide the same benefits as the above closure, eliminating a second traffic light and providing a landscape buffer between WLC and the proposed residential uses on the East side of Merwin. My client's property along the west side of Merwin Street presently utilizes Merwin Street as a secondary access. However, we would gladly give up the rights to have an open intersection and street light at Cactus Ave and

Merwin Street. We probably won't need to utilize more than a half street plus 12 feet for our entry. We may need the right to have a left turn pocket into our development, but we won't be providing enough traffic to justify a street light.

Extending and realigning Cactus Ave as Street D on the WLC plan, as shown on Exhibit A to this letter, will allow the existing portion of Cactus to intersect with Merwin Street, a 56 foot wide street, with "T" intersection. This would provide a buffer to the existing residential uses along Cactus Ave east of Merwin Street. This will also eliminate all noise impacts of a major intersection. It will save the light problems associated with a lighted intersection. Additionally, this alternative also saves WLC from providing land and constructing a Major Arterial that was proposed to be their D Street although some of it will be given back by extending Cactus into their development.

Closing Brodiaea from Redlands Ave to Merwin Street would provide additional savings. It will allow Line F on the MMDP to be located completely in green belt, drainage basins or drainage channels eliminating two RCB drainage structures, one, crossing Brodiaea Ave. and a second RCB crossing Merwin Street. It also eliminates the need to relocate the drainage basin all the way to Cactus Ave and purchasing land for the drainage basin. This alternative may allow the existing channel elevations to be kept for drainage along this reach of the Line F channel eliminating the need to relocate a 30 inch High Pressure Gas Main owned by Southern California Gas Company, a possible \$200,000 expense.

Savings to WLC

By not constructing two Street lights, two RCB structures, relocating a 30 inch gas main, construction and construction of Street D, Alternate A will provide needed relief and buffering for the existing residential neighborhoods. Additionally, it will save over \$700,000 in drainage and traffic fees that would have been used for construction of the improvements. It would mean that drainage fees paid by WLC and other developers would be available to the City to build other facilities that are much needed.

We think the whole process for World Logistics Center may be blinding the City of Moreno Valley. By rallying around the need for jobs and virtually chanting "Jobs, Jobs, Jobs", at the meetings in favor of the World Logistics Center, the eyes of the City are being closed to the massive impacts of their development. Indeed, a City Director at the last public meeting was using the chant to promote the project. The possibility of creating 15,000 new jobs seems to have the whole City salivating heavily. The \$15 Billion in revenue touted by the City at the last public meeting also fed into this frenzy. In the end, the reality is that much of the touted benefits may not appear.

Has anyone gone to the Ontario Airport vicinity to see how these industrial parks appear after they are completed? Or, closer to home, take a look at the industrial buildings just a short distance west of City Hall along Newhope Street and North of Cactus Avenue across from the March Air Force Base or the Buildings in south Moreno Valley along Nandina Street and Indian Street. One can even look at the warehouse developments along Cactus Ave east of Frederick

Ave. The entrance areas may look interesting because of the paint schemes and building setbacks to Cactus Ave. However the look from the sides and rear of the buildings is much different. When one takes a look at the sides and rear of these buildings and fenced yards, they are stark, uninteresting and clearly a view one does not want to look at daily. From these angles, warehouse projects are not beautiful developments. They are stark neighborhoods. Many times, security lights shine brightly in all directions blinding anyone nearby. If cities allow these developments, they should take proper precautions and buffer adjacent residential areas from any and all excessive impacts caused by these developments. Too often, these projects are blights which are noticeable for decades after they are built. The neighborhoods are detrimentally affected for years and years to come.

11

Please make sure that The WLC project does not become the bad neighbor it seems to be. Only the City and its staff stand between this project and the existing land owners and residential homes that exist in this area. Only you have the power and standing to protect these neighborhoods from the excessive demands of a project this size. Please review the suggestions made in this letter and require changes to the plans for the World Logistics Center.

12

My clients and I feel the tremendous heat and pressure of being forgotten in the stampede to approve a project making such magnificent claims of benefitting the City. Soon the existing residences along Cactus Ave and Merwin Street will too. Please help us protect our interests and the interests of the existing home owners. Make sure there is adequate buffering as we suggest in this letter.

Sincerely,

EXHIBIT A TO LETTER DATED 3-25-2013

RESPONSES TO LETTER G-5

Devlin Engineering

Response to Comment G-5-1. The proper timing of review of conceptual plans of the World Logistics Center (WLC) project is during public circulation of the Draft Environmental Impact Report (DEIR). The Specific Plan and various graphic or visual representations of the WLC project were provided in Appendix H of the DEIR. Some of the World Logistics Center Specific Plan (WLCSP) graphics were revised a number of times based on review comments by City staff, so it could have been misleading or inappropriate to provide “early” versions of the Specific Plan graphics to the public which could have led to confusion or complaints about inaccurate or misleading information. The commenter’s letter dated March 15, 2012 was in fact reviewed as part of the Notice of Preparation and Environmental Impact Report (EIR) scoping process. In fact, all five of the mitigation issues raised or recommended in the commenter’s March 15, 2012 letter, including (1) truck traffic, (2) noise, (3) landscape buffer, (4) architecture, and (5) residential land uses, were not ignored and were addressed in the DEIR, as outlined in the following responses.

Response to Comment G-5-2. Truck Traffic – Location of Street “D.” The commenter has incorrectly assumed Street “D” is an extension of or connection to Merwin Street. Although Merwin Street and Street “D” appear very close to each other, Figure 2-1 and other graphics in the Specific Plan and EIR clearly show that Street “D” will be completely separate from Merwin Street, and in fact there will be no direct road connection between the residential neighborhoods along Redlands Boulevard and the WLC project, and the new Street “D” will be the only road connection from the WLC area southwest to Cactus Avenue. Truck traffic on Street “D” will be prohibited, so there will be no truck traffic or noise from trucks along Street “D” or Cactus Avenue. Street “D” will provide access only for project employees in their personal vehicles. Trucks are also prohibited on Redlands Boulevard south of Eucalyptus Avenue (at the new Skechers warehouse). The Specific Plan EIR clearly states this in Section 4.15.1.3 on page 4.15-24.

The commenter’s final comment is that “Merwin Street should be left along as a local collector for a residential neighborhood” which is what in fact will occur under the WLCSP.

Response to Comment G-5-3. Noise. The commenter is correct that homes along Cactus Avenue will be affected by project noise, but, the impact will only be from employee vehicles, not trucks. The noise impacts of the project to residents along Cactus Avenue were examined in Section 4.12, *Noise*, of the DEIR, and were determined to be significant over the long-term as it may not be physically possible to install the recommended walls on Cactus Avenue west of Redlands Boulevard for noise attenuation/mitigation, as described in DEIR Section 4.12.6.2, *Long-Term Noise Impacts*, on DEIR page 4.12-48 shown below:

Off-Site Areas Adjacent to the Specific Plan Area. For areas adjacent to the Specific Plan area, 22 segments would experience a noise increase that would be greater than significance criteria specified previously. These seven areas are described below.

Cactus Avenue (Redlands Boulevard to Street D). This area is occupied by a small group of single-family homes along Cactus Avenue between the future Street D and Redlands Boulevard. A significant noise increase is projected for all four time horizons. Currently, there is no soundwall along these homes. Therefore, this is a significant impact requiring mitigation.

Cactus Avenue (west of Redlands Boulevard). As identified in the noise study, this area shows noise increases ranging from 1.5 dB to 5.1 dB depending on the time horizon. Only the 2035 case results in a significant noise increase.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Later on in that section the DEIR (page 4.12-51) recommends the following mitigation to address noise impacts along Cactus Avenue:

Mitigation Measures. *Construction of the proposed WLC project would result in noise levels at the closest residences within and adjacent to the WLCSP area exceeding the maximum noise level allowed under the City's Municipal Code. The following measures would reduce long-term traffic related noise impacts associated with the proposed project:*

~~4.12.6.2A~~ Within the WLCSP, Street D shall be designed such that exterior noise levels at existing residential areas shall not exceed 65 CNEL, which may require installation of a soundwall or other noise attenuation improvements. The design and calculations of such improvements shall be incorporated into a report that shall be submitted to the City for review and approval prior to the issuance of construction permits for Street D.

4.12.6.2A When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to approval of discretionary permits for individual plot plans for the requested development:

Action 1: Perform a building-specific noise study to ensure that the assumptions set forth in the FEIR prepared for the programmatic level entitlement remain valid. These procedure used to conduct these noise analyses shall be consistent with the noise analysis conducted in the programmatic FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.

Action 2: If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the specific plan area, the Applicant shall implement the mitigation identified in the WLC FEIR. Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of non-owner occupants.

If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a no vote.

At the completion of the vote at the end of the 45 day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next 15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.

Action 3: Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement (per Noise Study MM N-8, pg.53)

~~4.12.6.2B~~ Prior to issuance of any discretionary approvals for development in the WLCSP, a WLC Noise Development Impact Fee study shall be submitted to the City for review and approval. The City shall require future development within the WLCSP to participate in a WLC Noise Development Impact Fee program to include soundwall attenuation to mitigate impacts from the proposed project based on the collection of fair share fee payments from each increment of development and the implementation of each soundwall in accordance with Mitigation Measure 4.12.6.2C. The update to the DIF shall be based on a nexus study in conformance with State law (i.e., AB 1600). The Nexus study shall examine the soundwalls specified below, shall include detailed cost estimates for each soundwall, and shall establish a pro-rated fee to be paid per square foot by all development proposals within the WLCSP. The soundwalls to be included in this study include:

~~**Cactus Avenue Soundwall from Redlands Boulevard to Street D.**~~ Construct an approximately 1,000-foot long, 6-foot high soundwall at the top of slope. The existing wrought iron fencing will be removed and replaced with the soundwall (e.g., masonry wall, berming, glass barrier, or combinations of these barriers). The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

~~**John F. Kennedy Drive, east side, Soundwall from Cactus Avenue to Bay Hill Drive.**~~ Construct an approximately 5,000-foot long, 6-foot high soundwall at the top of slope for the existing residences that are on the east side of John F. Kennedy Drive. The existing wrought iron fencing will be removed and replaced with the soundwall (e.g., masonry wall, berming, glass barrier, or combinations of these barriers). The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

~~**Moreno Beach Drive Soundwall between Locust Avenue and Ironwood Avenue.**~~ Construct an approximately 2,000-foot long, 6-foot high soundwall at the top of slope for the existing residences that are on the east side of John F. Kennedy Drive. The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

~~**Perris Boulevard Soundwall between John F. Kennedy Drive and Iris Avenue.**~~ Construct an approximately 1,500-foot long, 6-foot high soundwall at the top of slope for the existing residences that are on the east side of John F. Kennedy Drive. The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

~~**State Route 60 Soundwall from Redlands Boulevard to Theodore Street.**~~ Construct an approximately 580-foot long, 6-foot high soundwall for the existing residences. The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

~~**Iris Avenue Soundwall from Nason Street to Oliver Street.**~~ Construct an approximately 3,000-foot long, 6-foot high soundwall along the property line for the existing residences.

~~**Sycamore Canyon Boulevard Soundwall from College Boulevard and Central Avenue.**~~ Construct an approximately 1,000-foot long, 6-foot high soundwall at the top of slope for the existing residences. The soundwall would need to measure 6 feet as measured from the rear yard of the residences.

4.12.6.2B Prior to issuance/approval of any building permits, the centerline of Cactus Avenue Extension will be located no closer than 114 feet to the residential property lines along Merwin Street. An alternative is to locate the roadway closer to the residences and provide a soundwall along Cactus Avenue Extension. The soundwall location

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted to and approved by the City prior to issuing permits to construct the road (per Noise Study, pg. 51, Cactus Avenue Extension, ID #50).

4.12.6.2C ~~Prior to issuance of any building permits for development in the WLCSP, the City shall collect the Development Impact Fee (DIF) as modified in accordance with Mitigation Measure 4.12.6.2B. The City shall establish a schedule for installing the specific soundwalls listed in Mitigation Measure 4.12.6.2B consistent with the WLC Noise DIF program.~~

4.12.6.2C Prior to the approval of any discretionary permits, cumulative impact areas shown in the WLC EIR Noise Study shall be included in the soundwall mitigation program outlined in Mitigation Measures 4.12.6.2A and 4.12.6.2D (per Noise Study MM N-9, pg. 62).

4.12.6.2D Prior to issuance of a building permit, the applicant shall demonstrate that the development maintains a buffer with soundwall for noise attenuation at residential/warehousing interface (i.e., western and southwestern boundaries of the project site). To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line shall be located a minimum of 250 feet from the residential zone boundary, and a 12-foot noise barrier shall be located along the perimeter of the property that faces any residential areas. The 12 foot noise barrier may be a soundwall, berm, or combination of the two. The height shall be measured relative to the pad of the warehouse. This requirement shall be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone. This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, "All manufacturing and industrial uses adjacent to residential land uses shall include a buffer zone and/or noise attenuation wall to reduce outside noise levels" (per Noise Study MM N-10, pg.62).

Section 4.12 of the DEIR demonstrates that the commenter's first comment, about relocating Street D 500 to 1,000 feet east of Merwin Street, is not necessary to produce less than significant noise impacts to the homes on the segment of Cactus Avenue from Redlands Boulevard to Street D.

Response to Comment G-5-4. Landscape Buffers. The Specific Plan restricts warehouse buildings fronting on D street to a height of 60 feet (DEIR Figure 3-9) except for architectural details, and the buildings will be set back from residences along Merwin Street by at least 250 feet (DEIR Mitigation Measure (MM) 4.1.6.1A). Views of WLC project buildings from Merwin Street and surrounding residential areas are shown in Figures 4.1-4 and 4.1-5 in the *Aesthetics* Section of the DEIR (Views 5 and 6 are from Merwin Street, View 4 is from Bay Avenue, and Views 1-3 are from Redlands Boulevard).

Response to Comment G-5-5. Architecture. The commenter is referred to the many architectural views and photographs of example buildings in the WLC Specific Plan (DEIR Appendix H, Section 4.1 and 5.4) as well as Figures 4.1-4 and 4.1-5 in the *Aesthetics* Section of the DEIR (Views 5 and 6 are from Merwin Street, View 4 is from Bay Avenue, and Views 1-3 are from Redlands Boulevard). Figure 4.14 provides line-of-sight illustrations (i.e., horizontal cross section) so the reader can better see the spatial relationship of potential buildings to existing residential areas. MM 4.1.6.1B requires a more site-specific photographic rendering of actual buildings once a specific development is proposed. Due to the magnitude of the change in visual character, the DEIR concluded that aesthetic impacts of the

WLC project were significant even with mitigation, and would require a Statement of Overriding Considerations to be adopted (DEIR page 4.1-66).

Response to Comment G-5-6. Lights. Section 4.1.6.4, *Aesthetics – Lighting and Glare*, of the DEIR did examine the potential impacts of increased lighting related to the WLC project, but determined that they would be less than significant as long as they complied with the City's new Municipal Code Section 9.08.100 regarding night-time lighting. Page 4.1-75 of the DEIR states..."the Specific Plan includes the following guidelines regarding lighting (WLCSP page 127):

- 5.5.2.2 *All exterior on-site lighting must be shielded and confined within site boundaries. No direct rays or glare are permitted to shine onto public streets or adjacent lots.*
- 5.5.2.3 *Lighting fixtures are to be of clean, contemporary design.*
- 5.5.2.4 *Lighting must meet all requirements of the City of Moreno Valley.*
- 5.5.2.5 *Tilted wall fixtures (i.e., light fixtures which are not 90 degrees from vertical) are not permitted. Lights mounted to the roof parapet are not permitted. Wall-mounted light fixtures used to illuminate vehicular parking lots are not permitted.*
- 5.5.2.6 *Wall-mounted utility lights that cause off-site glare are not permitted. "Shoebox" lights are preferred.*
- 5.5.3.4 *All luminaires shall be metal halide or L.E.D.*
- 5.5.4.2 *Walkway lighting must have zero cut-off fixtures mounted at a uniform height no more than eight (8) feet above the walkway.*

Therefore, there appear to be sufficient controls over future night-lighting design to reduce impacts to less than significant levels, as outlined on page 4.1-76 of the DEIR.

Response to Comment G-5-7. Traffic Lights. As outlined in Responses to Comments G-5-1 and G-5-2 above, the commenter's assumptions about Merwin Street and Street "D" are incorrect, they will be separate roads and there will be adequate visual screening from existing residential areas to planned warehouse buildings. It does not appear from the site information available that lights from vehicular traffic on Street "D" will impact existing residences. In addition, Street "D" is not planned to have a traffic light so there will be no lighting impacts from those potential sources along Merwin Street.

Response to Comment G-5-8. Residential Land Uses. The goal of the WLC project is to create a contiguous regional logistics center in this area, so no other land uses have been proposed within the WLC project. As outlined in Responses to Comments G-5-1, G-5-2, G-5-4, and G-5-5 above, there will be a minimum 250-foot setback of future buildings from existing residential uses (including those on Merwin Street) and a series of berms, walls, and extensive landscaping to help shield the new warehouse buildings visually from existing residential uses.

Response to Comment G-5-9. As part of the FEIR the circulation of the project has been revised to reroute Cactus Ave as Street "D" into the WLC based on the Transportation Engineering Division's recommendations. Incorporating this road alignment impacts the original land plan for the southwestern portion of the Specific Plan to the point where approximately 100 acres of land in this area can no longer function as an integral part of the WLC project. Section 3.1 of the WLC depicts the revised circulation system. The revised circulation system severs the Alessandro street connections and reroutes Cactus as Street D into the WLC. The project limits are no longer adjacent to Merwin south of Alessandro and Brodiaea, and therefore are no longer part of the project. If the property owner adjacent Merwin and Brodiaea wish to have additional modification made to the existing circulation system they are required make a separate application request to the City.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-5-10. The employment and revenues for the proposed project have been estimated using industry standard data and methodologies, and appear to be accurate given the proposed land uses (logistics warehousing). For additional information on employment and revenues, see Responses to Comments G-3-1, G-3-2, G-3-5, and G-4-6 to Letter G-3 from Scott Johnson. The City Council will weigh the benefits to be derived from the project against the impacts that will result from it if it is approved.

Response to Comment G-5-11. The WLCSP does include physical setbacks and landscaped buffers between existing residences and future warehouse buildings, as outlined in the responses above. The issue of the potential appearance of future warehouse buildings was addressed in Response to Comment G-5-5 above. Future warehouses within the proposed WLCSP will likely appear similar to those in areas cited by the commenter, and as shown in the WLCSP (DEIR Appendix H). It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-5-12. Future development under the WLCSP will be reviewed by City staff to verify compliance with the Specific Plan and applicable City development guidelines and requirements. The suggestions made by the commenter were in fact reviewed during the Notice of Preparation period (i.e., Devlin Engineering letter dated March 15, 2012) and the issues raised were evaluated in the DEIR, as explained above.

Response to Appendix 1 (Annotated Map of Site Plan) The appendix was referenced in the comment letter in regards to the proposed location of D Street and the roadways proposed for the western portion of the project site. The appendix provides an annotated map of site plan showing requested closure points for Merwin Street and Brodiaea Avenue.

Letter G-6: Melissa Moore (email) (March 20, 2013)

From: mmoore7 [<mailto:mmoore7@student.rcc.edu>]

Sent: Wednesday, March 20, 2013 11:58 AM

To: Mark Gross

Subject: World Logistic Center

Dear Mr. Mark Gross,

As a concerned native Moreno Valley resident, I would like to express my attitudes toward the World Logistic Center. Moreno Valley is a community that is in need of economic growth opportunities, but these opportunities should not come at the cost of our health and environmental attributes. Since I have been a resident, for about 25 years, I have seen the city develop exponentially. This city must keep a balance between its business developments and keeping its aesthetic appeal. One of the most alluring characteristics that Moreno Valley possess is its open fields and small mountains that are habitats to wildlife and wonderful nature experiences for citizens of Moreno Valley to explore. Building such a large and obstructing structure will surely kill much habitat crucial to animal life as well as creating an unappealing obtrusive obstacle in the middle of our beautiful wetlands. It will create more congestion on our roads and pollution in our city. Thank you for your consideration.

—1

Sincerely yours,
Melissa Moore

RESPONSES TO LETTER G-6

Melissa Moore

Response to Comment G-6-1. Section 4.4, *Biological Resources*, of the Draft Environmental Impact Report (DEIR) examines potential impacts of the proposed project on existing vegetation and animals. It should be noted the site generally lacks important biological resources (including wetlands) due to the historical and ongoing disturbance by agricultural activities. The DEIR also examined potential impacts on the nearby San Jacinto Wildlife Area and Mystic Lake, and determined the project design, with proposed setbacks and landscaped buffers, and recommended mitigation measures would reduce potential impacts on these areas to less than significant levels. In addition, traffic and air quality impacts of the project were evaluated in DEIR Sections 4.15 and 4.3, respectively. Both were found to be significant, even with proposed mitigation, and will require a Statement of Overriding Considerations be adopted by the City Council if the project is approved. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-7: Daccomando (email) (April 2, 2013)

From: Dacomando [<mailto:dacomando@aol.com>]
Sent: Tuesday, April 02, 2013 6:05 PM
To: John Terell
Subject: "WLC"

To Whom It May Concern:

I am strongly opposed to the "WLC" being approved in the Eastern part of Moreno Valley. I have lived in the area over 13 years and the air quality, traffic and just over all quality of life has gone downhill. It is bad enough that Sketchers was approved but now this. I am the Vice president of a mortgage company in Moreno Valley so I am very much in touch with the Real Estate market. I can tell you 2 homes in our area just went up for sale and they are the original owners of 25 years. These people are selling before the proposed warehouse is approved. Nobody wants to live or raise a family in a warehouse district. More people are contemplating the same thing.. People moved out there for a reason and that was because it was rural and they could raise their kids in a safe environment. It is not that way anymore. Just this week I passed over 10 big rigs running up and down Redlands Blvd which to my knowledge is against the law. The traffic has increased tremendously. Any added warehouses will decrease the quality of life. I strongly urge you not to approve there is plenty of other areas in Moreno Valley that are already developed for this kind of activity.

— 1

Thank You

Dacomando

dacomando@aol.com<<mailto:dacomando@aol.com>>

RESPONSES TO LETTER G-7

Daccomando

Response to Comment G-7-1. The commenter does not take issue with the analysis of the Draft Environmental Impact Report (DEIR). Many of the comments regarding impacts of the World Logistics Center (WLC) project on the overall quality of life, specifically air quality and traffic, were addressed in the DEIR Sections 4.4 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decided to approve the project. It should be noted the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-8: Tom Hyatt (email) (March 30, 2013)

From: tom hyatt [<mailto:ubiquitous53@gmail.com>]

Sent: Saturday, March 30, 2013 7:35 AM

To: Tom Owings; Marcelo Co; Victoria Baca; Jesse Molina; Richard Stewart

Subject: World Logistics Center warehouses

City Council members, I was not able to attend any of the recent council meetings or town halls regarding the World Logistics Center project. I have been a resident of Moreno Valley since 1994 and live off of Moreno Beach (what you have re-named "Rancho Belago") I purchased a house near the SKETCHER warehouse and watched Mr. Benzeevi bus in a bunch of out of town warehouse workers who do not even live in Moreno Valley, hand out red "JOBS NOW" T-shirts and have the audacity to feed them hoagie sandwiches on the porch to the council chambers. They stacked the meeting and filled out comment cards to speak and drown out the opposition of real citizens who actually live here and have a vested interest in our community. You may call that shrewd politics, I call it nasty, conniving and dishonest politics.

I also watched as he has manipulated all of you like a pied piper and turned you into his minions. Yes, how does it feel to be a "minion"? I also watched Council Woman BACA and her rude daughter staff a flashy Benzeevi propaganda booth at the Moreno Valley Mall handing out polished and expensive brochures. When the rude daughter tried to hand me a brochure and talk to me, I politely told her I was opposed to the project. She asked me why and when I told her I live near the project and have a disabled son who I am concerned with and my environmental concerns, she called me 'crazy'!!! Is that how you treat someone with an opposing opinion??? So, yes I call her a rude daughter but a more appropriate description is ugly and nasty! Benzeevi mis-represented his employment and profit numbers for that project and now you follow him like lemmings to his next boondoggle, the WORLD LOGISTIC CENTER. Is there not already enough diesel exhaust and traffic on HWY 60? Didn't you follow Benzeevi and re-name Rancho Belago to be an "upscale part of the city"? Then why the big polluting warehouses? "\$\$\$\$\$" By now, you know the intent of my message is to voice my opposition to this project. Please re-consider your un-wavering support of this project and for this developer who has manipulated all of you like some cult leader.

Have a nice day,

Tom

Rancho Belago

RESPONSES TO LETTER G-8

Tom Hyatt

Response to Comment G-8-1. Most of the comments do not apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-9: Charles Moothart (March 27, 2013)

Letter to homeowners in Moreno Valley

March 27, 2013

Dear Homeowner,

Your immediate help is needed to avoid potential major problems associated with the World Logistics Center Development. Please understand that I am not suggesting opposition or support for the World Logistics Center – that is a personal decision. I do, however, feel that the impacts on the neighboring properties must be given more consideration. To date, all you have heard from the City is that the project will create jobs and more jobs in the City of Moreno Valley. You have not heard about the traffic noise, street lights, development lights and air pollution created by this development. Virtually nothing has been said by the City about the problems created by this development.

1

As the plan is proposed, the City of Moreno Valley is going to allow Highland Fairview to construct **40 to 50 more industrial developments like the Sketchers warehouses** on the East side of Merwin St. However, this will be in one development adjacent to your neighborhood. One can just look at Google Maps or the attached map where the Sketchers warehouse is built, and imagine the whole open space to the North and East of your property as an ocean of stark white buildings 60 to 80 feet tall with security lights and street lights blaring into your homes. That will be your total view for as far as you can see to the north and east of your property.

2

Warehouse districts have lights, lots and lots of lights. These lights must be controlled to point away from the existing residential neighborhoods. Does anybody want to have stark white security lights shining in through their windows at night? The City needs to make sure this does not happen.

3

Merwin Street north and south of Alessandro Blvd is projected to become a major thoroughfare with traffic lights and very tall street lights, closely spaced. Your neighborhood will be lit up like a shopping mall without any of the benefits. Dark, quiet nights will be a thing of the past unless the city adopts measures to eliminate the use of Merwin Street.

4

Additionally, if Merwin Street is used as a major arterial thoroughfare, The neighborhood will be impacted with truck traffic day and night throughout the year. Trucks will be starting and stopping at the traffic signals and other intersections. If you happen to live near Merwin Street, you will not be able to sleep much.

5

These problems can be avoided with proper buffering and traffic control. The City of Moreno Valley must require that World Logistics Center be barred from using Merwin Street. World Logistics Center must bring their thoroughfare roads into their project within their development and avoid adjacent residential neighborhoods. This will keep the truck noise and traffic noise out of the residential neighborhoods.

6

It is only fair that the project be built as a good neighbor. It should have adequate measures to eliminate its harmful effects on the residential areas it will invade.

7

The attached letter to the City demands that World Logistics Center's Development Plan be changed to move their Streets D and E away from the residential neighborhoods and include measures that will eliminate noise, lighting and traffic issues.

8

If you agree with the content of the letter, please sign and send the letter in the included envelope immediately. There is a blank space for you to fill in any additional issues you may wish to address. The deadline for the City to receive comments is April 8 at 5:00 p.m., so you must send this letter immediately. Please be sure to fill in your name and address and sign the letter.

Thank you for your consideration – I hope you will voice your opinion, whatever it may be.

Sincerely,

Charles F. Moothart, a fellow property owner

Subject: World Logistics Center's Draft EIR (SCH#2012021045) and
Planning Cases PA 12-0011, 0012, 0013, 0014 and 0015

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. 9
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. 10
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. 11

Sincerely,

(signature)

RESPONSES TO LETTER G-9

Charles Moothart

NOTE: Although this letter was not directly addressed to the City or the Draft Environmental Impact Report (DEIR), a number of residents used it as a template for submitting their own comment letters, so responses have been drafted to address all of these comments in one letter to avoid duplication.

Response to Comment G-9-1. The DEIR examined all the potential environmental impacts of the proposed World Logistics Center (WLC) project and concluded that a number of impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation. Under the California Environmental Quality Act (CEQA), the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted the City Council will consider all stated opinions and comments on the project and Environmental Impact Report (EIR) prior to making any decisions regarding the proposed WLC project.

Response to Comment G-9-2. Section 3 of the DEIR explains the various characteristics of the proposed WLC project, but the commenter's physical characterization of the WLC project at buildout is generally correct. The future warehouse buildings within the World Logistics Center Specific Plan (WLCSP) will generally be white to help with energy conservation, but will be partially shielded by landscaping and will have architectural treatments to help break up vertical and long horizontal lines of the buildings (per Specific Plan Section 5.3). However, the commenter's assertion that street lights and security lights will be "blaring" into adjacent homes is not correct (see Response to Comment G-9-3 below).

Response to Comment G-9-3. Section 4.1.6.4, *Aesthetics – Lighting and Glare*, of the DEIR did examine the potential impacts of increased lighting related to the WLC project, but determined that they would be less than significant as long as they complied with the City's new Municipal Code Section 9.08.100 regarding night-time lighting. Page 4.1-75 of the DEIR states..."the Specific Plan includes the following guidelines regarding lighting (WLCSP page 127):

- 5.4.2.2 All exterior on-site lighting must be shielded and confined within site boundaries. No direct rays or glare are permitted to shine onto public streets or adjacent lots.
- 5.4.2.3 Lighting fixtures are to be of clean, contemporary design.
- 5.4.2.4 Lighting must meet all requirements of the City of Moreno Valley.
- 5.4.2.5 Tilted wall fixtures (i.e., light fixtures which are not 90 degrees from vertical) are not permitted. Lights mounted to the roof parapet are not permitted. Wall-mounted light fixtures used to illuminate vehicular parking lots are not permitted.
- 5.4.2.6 Wall-mounted utility lights that cause off-site glare are not permitted. "Shoebox" lights are preferred.

Therefore, there appear to be sufficient controls over future night-lighting design to reduce impacts to less than significant levels, as outlined on page 4.1-76 of the DEIR. In addition, the commenter's assumptions about truck traffic, traffic lights, and lights from vehicular traffic on Merwin Street impacting local resident/residences are not correct, as explained in the other responses in this section.

Response to Comment G-9-4. The commenter's assumptions about Merwin Street and Street "D" are incorrect, they will be separate roads and there will be adequate visual screening from existing residential areas to planned warehouse buildings. It does not appear from the site information

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

available that lights from vehicular traffic on Street “D” will impact existing residences. In addition, Street “D” is not planned to have a traffic light so there will be no lighting impacts from those potential sources along Merwin Street. In addition, the commenter’s assumptions about truck traffic, traffic lights, and lights from vehicular traffic on Merwin Street impacting local resident/residences are not correct. In addition, 100 acres in the southwest portion of the WLCSP has been removed from the specific plan area shown in the original project (was 2,710 acres and now is 2,610 acres), so the only major construction in the area adjacent to these homes will now be from the construction/extension of Cactus Avenue onto the WLCSP property. Therefore, there will be substantially reduced construction-related impacts to the residential areas east of Redlands and south of Alessandro.

Merwin Street will **not** be used or modified in any way to be or function as a major arterial thoroughfare. The commenter has incorrectly assumed Merwin Street will be impacted by WLC project traffic, noise, and lights because Street “D” is an extension of or connection to Merwin Street under the old Specific Plan road layout. Although Merwin Street and Street “D” appear very close to each other in the original land plan, Figure 2-1 and other graphics in the Specific Plan and EIR clearly show that Street “D” will be completely separate from Merwin Street, and in fact there would have been **no direct road connection** between the residential neighborhoods along Redlands Boulevard and the WLC project, and the new Street “D” would have been the only road connection from the WLC area southwest to Cactus Avenue. Under the revised WLCSP land plan (minus 100 acres at the southwest corner of the project), there is now no “D” street and Cactus Avenue will now be extended east and north to connect up to Street E within the WLCSP. Truck traffic on Cactus Avenue will be prohibited, so there will be no truck traffic or noise from trucks along Cactus Avenue that would affect homes off of Merwin Street. Cactus Avenue will provide access only for project employees in their personal vehicles. Trucks are also prohibited on Redlands Boulevard south of Eucalyptus Avenue (at the new Skechers warehouse).

Response to Comment G-9-6. As outlined in Responses to Comments G-9-4 and G-9-5, the commenter’s assumptions about Merwin Street and the new Cactus Street extension (formerly Street “D”) are incorrect, they will be separate roads so it does not appear that vehicular traffic or noise on the extension of Cactus Avenue will impact existing residences. In addition, the extension of Cactus Avenue is not planned to have a traffic light so there will be no lighting impacts from those potential sources along Merwin Street.

Along the western, northern, and southern boundaries of the site, the Specific Plan restricts warehouse buildings to a height of 60 feet (DEIR Figure 3-9) except for special circumstances, and the buildings will be set back from residences along Merwin Street by at least 250 feet (DEIR Mitigation Measure (MM) 4.1.6.1A). Section 5.3.3 of the Specific Plan provides that alternative building heights may be approved to accommodate special interior uses or screening of special mechanical equipment unique to these facilities. Requests for such alternative standards would be processed per Section 11.3.3 of the Specific Plan which contains the provisions for any proposed variances to development standards. Variances up to 10% of the standard may be approved administratively in accordance with Section 9.02.090 of the Municipal Code. Other variance requests would be processed in accordance with Section 9.02.100 of the Municipal Code. It is expected that most buildings will adhere to the 60-foot building limit, so no significantly different visual impacts are expected as a result of this potential height exception, especially adjacent to residential areas where buildings will be visible.

Response to Comment G-9-7. The comment is general without specifics about what impacts are involved. However, the WLCSP does include physical setbacks and landscaped buffers between existing residences and future warehouse buildings, as outlined in the responses above.

Response to Comment G-9-8. As noted in Responses to Comments G-9-4 and G-9-5 above, the commenter’s statements about Merwin Street and truck traffic from the WLC project are incorrect. In addition, the WLCSP does include physical setbacks and landscaped buffers between existing

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

residences and future warehouse buildings, as outlined in the responses above. For additional discussion of these issues, see the Response to Comment G-5. Finally, the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-9-9. The comment is a form letter requesting the project move all truck traffic off Merwin Street. The commenter also requests that Streets D and E be relocated 500 to 1000 feet east of Merwin Street.

As explained in the revised TIA Chapter 4, Section B (FEIR Volume 2, Appendix L), Alessandro Blvd will be severed in the project site. This is being done specifically to prevent project traffic from entering the Old Moreno neighborhood. Project traffic will not use Merwin Street. Project-related car traffic heading west will be directed towards Cactus Blvd. Trucks will not be permitted to use the Cactus Blvd. access point and would instead be directed to SR-60.

The proposed on-site road network has been revised so that Street E is 400 ft. away from Merwin Street and Cactus is 1270 ft. away from Merwin Street. See Chapter 4, Section B, Figure 16 of the revised Traffic Impact Analysis (TIA).

Response to Comment G-9-10. The DEIR Section 4.1.2.2 *City of Moreno Valley Municipal Code* notes Section 9.08.100 of the code requires non-residential lighting to be fully shielded and directed away from surrounding residential uses. It also restricts non-residential lighting to not exceed 0.25 foot-candle of light measured from within five feet of any property line.

In addition, the WLCSP Section 5.5.2 *General On-Site Lighting Parameters* requires all exterior on-site lighting to be shielded and confined within the site boundaries. No direct rays are permitted to shine onto public streets or adjacent lots, this includes wall mounted lighting. The WLCSP does limit the light poles to a maximum of 25 feet in height and both pole and wall mounted lighting must use cut-off fixtures.

While the WLCSP contains lighting guidelines for future development, ambient light level impacts will need to be calculated and reviewed for conformance with the DEIR mitigation measures and WLCSP, through the City's site plan review process for each specific building proposed. The commenter is referred to letter G-3-3.

Responses to Comment G-9-11. The DEIR does provide a buffer area along Redlands Boulevard, Bay Avenue and Merwin Street through MM (MM) 4.1.6.1A which reads as follows:

4.1.6.1A ~~Prior to the issuance of any discretionary permit for development along the western boundary of the WLCSP, a minimum 250-foot setback shall be verified from closest residential property line along Redlands Boulevard, Bay Avenue, and Merwin Street to any truck access area of the WLC project. Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, planted and walls and landscaping sufficient to provide effective visual screening between the new development and existing residential areas upon maturity of the landscaping materials. Prior to development of the portion of the WLC Specific Plan property adjacent to Redlands Boulevard, the existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the City Planning Official Division.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

In addition, the minimum setback from all residential zoning to buildings along Redlands Boulevard, Bay Avenue and Merwin Street is 250 feet per the Specific Plan. Compliance with MM 4.1.6.1A and the minimum building setback, will provide for berms and landscaping that would exceed the suggested 100-foot wide greenbelt area in the comment letter.

Letter G-10: Alexander and Rachel Moreno (March 27, 2013)

RECEIVED

RESPONSES TO LETTER G-12

Paul and Kathy Dembowski

NOTE: This letter is based on a template provided by C. Moothart in Letter G-9. Reviewers are referred to responses to that letter for more detailed discussion of these comments.

Response to Comment G-12-1. See Response to Comment G-9-9 of Letter G-9 for a more detailed response to this comment.

Response to Comment G-12-2. See Response to Comment G-9-10 of Letter G-9 for a more detailed response to this comment.

Response to Comment G-12-3. See Response to Comment G-9-11 of Letter G-9 for a more detailed response to this comment.

Response to Comment G-12-4. The Draft Environmental Impact Report (DEIR) examines the land use issues involved in the requested General Plan and Zone Change and did conclude that impacts were significant. A significant amount of project-related traffic is not anticipated to use Alessandro Boulevard, but the project traffic study (DEIR Appendix E) does identify all streets and intersections in the City and surrounding jurisdictions that will be impacted by project traffic, both trucks and passenger vehicles. The DEIR concluded a number of project impacts (e.g., air quality, traffic, etc.) were significant even after implementation of mitigation. Therefore, the City Council will need to adopt a Statement of Overriding Considerations that states what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and Environmental Impact Report prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-15: Gloria Wike (April 1, 2013)

RECEIVED

APR 2 - 2013

CITY OF MORENO VALLEY
Planning Division

4-1-13

Attention: John Terrell

I received a letter from a Charles Mostbark regarding the "World Logistics Center Development". I do not know who he is and the charges he recommended to the Center and the affects it will have on our area.

I have been concerned ever since Sketches went in. It was just a prelude to more Warehouses in the east end and that is exactly what is happening. No projects such as this Grotonque Center should ever be built next to homes and Bird Sanctuaries. The 60 freeway coming and going is much to narrow and dangerous for more Truck Traffic. Where will the State and Caltrans get the money to expand the freeway thru the Badlands of California is critically in debt? Without that guarantee that in itself should for bid this project of such

enormous size to be built.

Noise Pollution, additional traffic, being built next to homes and Wildlife preserves are beyond reasonable, it is dangerous health wise and for traffic driving thru Ballands that has already proven how unsafe it is.

They state it will eventually bring 20,000 jobs. That is quite a sum if true, but the danger involved and the effects on homeowners with families is very serious. Look what it has done to Mira Jones.

Charles Moothart brought up some charges that should have been part of the ^{original} plan. I am sure he is part of this project also and that is suspect also.

Respectfully,

Ann P. Weber

28918 Mattby Ave.
Mojave Valley, Cal.
92555

RESPONSES TO LETTER G-15

Gloria Wike

Response to Comment G-15-1. The commenter is correct, if the World Logistics Center (WLC) project is approved, many more large logistics warehouse buildings will be constructed and operated in the area east of Redlands Boulevard which is now largely agricultural fields.

Response to Comment G-15-2. The commenter is correct, development of the WLC project will increase area traffic on local roads, including Gilman Springs Road (currently a 2-lane road), and area freeways including the SR-60 and I-215. Traffic impacts of the project were evaluated in Draft Environmental Impact Report (DEIR) Section 4.15 and were found to be significant, even with proposed mitigation. Approval of the project will require the City Council to adopt a Statement of Overriding Considerations explaining what project benefits outweigh the identified significant impacts of the project.

Section 4.4, *Biological Resources*, of the DEIR examines potential impacts of the proposed project on existing vegetation and animals. It should be noted the site generally lacks important biological resources (including wetlands) due to the historical and ongoing disturbance by agricultural activities. The DEIR also examined potential impacts on the nearby San Jacinto Wildlife Area and Mystic Lake, and determined that the project design, with proposed setbacks and landscaped buffers, and recommended mitigation measures would reduce potential impacts on these areas to less than significant levels.

The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-15-3. Section 4.13 of the DEIR did examine potential employment that could be generated by the WLC project. For more information in that regard, the reader is referred to the Response to Comment G-1-5 in Letter G-1 (Cree Family) and Responses to Comments G-3-1 and G-3-2 to Letter G-3 (Perry Johnson).

Response to Comment G-15-4. Charles Moothart did comment on the WLC project and Environmental Impact Report, as outlined in the Response to Comment G-9. For more information regarding Mr. Moothart's comments, the reader is referred to the responses to that letter.

Letter G-16: Jim, Rosemary, and Paul Hernandez (March 28, 2013)

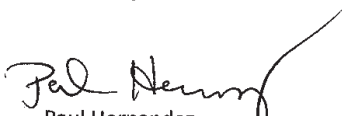

March 28, 2013

City of Moreno Valley Economic Planning Department:

This letter is written in response to the proposed World Logistics Center project. It is apparent that the City Planning Commission and City Council have chosen to approve recommendation of this project without concern for the citizens of this community. The environmental impacts of this project should be considered before this project moves forward. First of all, the pollution generated from the amount of trucks that are estimated to be traveling through the area will have adverse effects on the health of the residents and will deteriorate the air quality in the area. This increase in truck traffic will also affect the gridlock on the 60 freeway and surrounding streets. This is already a problem as there is only one way into the city and one way out, it will only be compounded by the addition of hundreds of more trucks. Also, these trucks bring additional noise that will affect the residents. This is all in contradiction to the general land use that was originally designated for this area. Agriculture and wildlife in the area will also be adversely affected as will the open spaces and aesthetics of the community. As residents of this community for 32 years we would like to voice our opposition to such a project. The proposed "benefits" do not outweigh the significant negative impacts.

RESPONSES TO LETTER G-16

Jim, Rosemary, and Paul Hernandez

Response to Comment G-16-1. The Planning Commission and City Council members will review the Draft Environmental Impact Report (DEIR) and Final Environmental Impact Report (FEIR), including responses to all comments on the DEIR, and all relevant project information before making a decision on the World Logistics Center (WLC) project. The DEIR examined all potential environmental impacts of the project and identified a number that were significant even after implementation of mitigation (e.g., air quality, health risks, traffic, noise, etc.). The DEIR did evaluate traffic impacts on the SR-60 freeway as well as local streets and intersections. It examined noise impacts from project trucks and vehicles, and recommended various noise attenuation improvements, but found that noise impacts would still be significant because a number of measures could not be implemented as recommended due to physical constraints of existing development. Impacts to area plants and animals were examined, as well as the loss of agricultural land (also determined to be significant). The City Council will consider all stated opinions and comments on the project and Environmental Impact Report prior to making any decisions regarding the proposed WLC project. Finally, approval of the project will require the City Council to adopt a Statement of Overriding Considerations explaining what project benefits outweigh the identified significant impacts of the project.

Letter G-17: Joanne Lindgren (April 1, 2013)

RECEIVED

APR 4 - 2013

CITY OF MORENO VALLEY
Planning Division

April 1, 2013

City of Moreno Valley

Community and Economic Development Department

Moreno Valley, CA 92553

RE: Proposed World Logistics Center Environmental Impact Report - PA12-0010 (General Plan Amendment); PA12-0011 (Development Agreement); PA12-0014 (Annexation); PA12-0012 (Change of Zone); PA12-0013 (Specific Plan) and PA12-0015 (Tentative Parcel Map)

I'd like to respond and ask some questions about the EIR for the World Logistics Center project. I read the traffic numbers for the current and *future* truck/vehicle traffic for our city because of this project. How can our city survive the impact of all the new truck traffic that will be funneled down streets like *Alessandro and Cactus*? We use to live in the City of Temecula and the *vehicle traffic* was the largest planning concern of the people in that area. That city is split by the 15 freeway, similar to Moreno Valley that has the 60 freeway running through the city limits. Many street widening projects were funded but still that city has enormous traffic jams on the main arteries of town as well as the freeway off ramps to Temecula. The World Logistics Center has these wide four lane streets within the complex but they empty out to smaller two lane roads like Redlands Avenue, between the 60 freeway and Dracaea Avenue. Is the developer going to widen Redlands Avenue in that area or are will our tax dollars go towards that improvement? As I see it, our city infrastructure is not there to support such a large project. The 60 freeway is currently being widened on the eastbound side, the intersection of the 60/215 north and the widening of the Nason Street overpass bridge. The amount of traffic at the intersection of the 60 freeway and the 215 currently has reached its capacity for the morning and evening commute. Seeing the current construction improvements that Caltrans is working on does not look like it would be enough to handle the increase *truck traffic* that the World Logistics Center would create. Our roads will need more maintenance (potholes and rough washboard ruts) and the taxpayers will be for asked to pay for this. Truck drivers are likely to wander or get lost in our community onto residential streets. Will the city post "*vehicles >10,000 lbs. are not permitted*" signs in all our neighborhoods? Does Caltrans have additional construction projects for widening the 60 and 215 freeways in the next 10 years? Has the surrounding cities, like Riverside and San Bernardino, been apprized of the enormous impact on their city streets and the air quality of the valley we share?

The City of Moreno Valley does not have the infrastructure to support a trucking logistics center of this size. The railroad runs along the 215 freeway and trucks will have to travel through our city to reach neither the rail or to the Los Angeles/Long Beach Ports for shipped merchandise. Had there ever been a dialog about proposing a rail expansion through our city? Will we be asked to endure that as residents

1

2

of Moreno Valley in the future? The developer of this project is proposing an airport facility in the Beaumont area. Are there plans to transport merchandise via trucks through the Badlands (Eastbound on the 60 freeway) to the World Logistics Center?

Appendix D (Air Quality, Greenhouse Gas and Health Risk Assessment Report), it speaks to the construction and operations of the World Logistics Center upon its completion. The health concerns of the children, sick and elderly are at great risk. During City Planning Commission meetings, a representative from AQMD will speak on the City's responsibility in continuing to approve warehouse development without any regard to the quality of air. But these projects continue to be approved and now the largest warehouse project in Southern California being proposed and even when the EIR report points out the devastating air quality that this project will contribute to our valley, the City Planners praise the project for its best use of space and the job benefits it will provide to our community. I worked in the City of Commerce for many years. During that time, AQMD had set up monitoring stations throughout the city and along the 5 freeway. These monitoring stations were to measure the levels of pollutants that the diesel trucks were contributing to the air quality of Los Angeles County. My work took me to the residential households of the City and there were several incidents relayed to me of a family member that had been diagnosed with lung cancer due to their environment. Once a father asked me to explain what kind of chemicals were present in a business next door that he suspected the reason his two children were born with learning disorders. We cannot always know what is being stored in warehouses! Fire Inspectors have annual inspection programs but are primarily concern with types of flammables and quantity of product for the prevention of fires. Health risks to the employees are OSHA's jurisdiction. But they don't do annual inspections! Residential homes that back up to major well-travelled streets are plagued by pollutants in their yards and HVAC equipment. These existing homes are not constructed with triple-pane windows and sound board on their exterior walls to prevent the noise and pollution of extension truck traffic. Housing values will go down on these homes along truck paths and near the project itself.

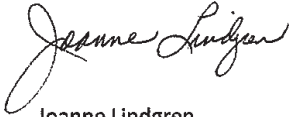

This World Logistics Center is being sold to the citizens of Moreno Valley as a solution to the inadequate number of jobs that keeps our residents commuting for employment. Warehouse employee unions have told us how poorly the employees are treating in this type of job. These are low skill workers that are paid low wages and are generally employed as part-time workers without benefits. The Sketchers' project was presented to the citizens as a number of new jobs would be generated from this development. This was not true. Neighbors have done number counts on vehicles in the parking lot and *Sketchers* has been a disappointing employment rate of one job per 18,000 square feet of building space. The city planners has estimated that even with automated warehousing projects the employment rate could be one job for every 2,200 square feet. This kind of guesswork and this type of jobs will not provide what the city needs in terms of local employment. Automated warehouses will only bring trucks to our community not jobs!

Even though our city will receive a substantial amount of permit and development fees initially, warehousing offers no sales tax base. Revenue will also serve to be inadequate in business license fees. Also building permit fees are forbidden by law to be used to benefit the general fund but must be collected to cover the actual cost of building inspection and plan checking. Riverside County has already

been sued in court over excessive permit fees for residential developments. We cannot subject our already deficit city budget with any devastating expensive lawsuit.

In conclusion, I believe the project is too large and creates too many problems for our little community. We need to reject this project and go back to the *General Plan* with mixed zoning which was approved by the people of Moreno Valley. This idea appeals to the residential and small business communities and presents itself as a healthful, quality way of life for the citizens of Moreno Valley.

Respectfully submitted,

Joanne Lindgren

Moreno Valley, CA 92555

Caminoray@aol.com

RESPONSES TO LETTER G-17

Joanne Lindgren

Response to Comment G-17-1. The commenter asks how the City can survive all the new truck traffic on streets like Alessandro and Cactus. The commenter cites his experience at his previous residence in Temecula where traffic jams existed despite road widening projects. The commenter claims that the World Logistics Center (WLC) would have 4-lane internal roads that empty out to small 2-lane roads like Redlands Avenue between SR-60 and Dracaea Avenue and asks if widening of Redlands Avenue would be paid for by the developer or tax money. The commenter opinion is city infrastructure cannot support such a large project and that current improvements on over-capacity SR-60 and I-215 will not be enough to handle the increased truck traffic from WLC. The commenter asks if Caltrans has planned widening projects on SR-60 or I-215 in the next 10 years. The commenter also asks if the City will post "vehicles >10,000 lbs. are not permitted" signs in all neighborhoods. He also asks if surrounding cities such as Riverside and San Bernardino have been apprised of the projects impacts on streets and air quality.

As explained in the revised Traffic Impact Analysis (TIA) Chapter 4, Section B (Final Environmental Impact Report (FEIR) Volume 2, Appendix L), Alessandro Blvd will be severed in the project site. Project-related car traffic heading west will be directed towards Cactus Blvd. Trucks will not be permitted to use the Cactus Blvd. access point and would instead be directed to SR-60. For these reasons, there is no project-related truck traffic expected on Alessandro Blvd. See Figure 16 in the TIA, copied below as Exhibit G-17-1.

Exhibit G-17-1: Proposed Roadways and Phasing

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The City plans to widen Redlands Avenue from Eucalyptus Ave. to SR-60 and the WLC will be required to pay its fair share for this improvement.

Caltrans completed a Route Concept Report for the SR-60/I-215 corridor in September 2012. The report is available at the City's Planning Department. This report focused on identifying the number of lanes required in each section of the corridor and did recommend additional lanes in some places, including adding a mixed-flow lane in both directions from the Redlands Blvd. interchange to the Gilman Springs Rd. interchange.

An additional figure (Figure 8) has been included in the TIA showing the designated truck routes in and around Moreno Valley. Trucks are legally restricted from using other route except when the destination is outside of the route, such as a moving van going to a house in a residential neighborhood. The City would typically not post truck prohibited signs as suggested by the commenter unless a recurring problem exists of trucks using roads they should not use.

The surrounding cities were apprised of the project by being sent both the Notice of Preparation and the Notice of Availability. The Cities of Perris, Riverside, San Jacinto, and Redlands submitted comments on the DEIR (see Comment letters E-1, E-2, E-4, and E-5 respectively).

Response to Comment G-17-2. The commenter points out that there is a railroad running along the I-215 and asks if there has been a dialog about rail expansion in Moreno Valley. The commenter asks if residents will "be asked to endure that." He also asks if there are plans to transport merchandise through the Badlands to a possible new airport in the Beaumont area.

An additional section (Chapter 4, Section F) has been included in the revised TIA (FEIR Volume 2, Appendix L) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors. Possible impact on city residents was specifically cited as a reason why rail is not considered a viable option.

The WLC project has no relationship with a possible new airport in the Beaumont area. Transportation of merchandise via trucks eastbound on SR-60 from the WLC is anticipated as part of the project. Caltrans has a project to build truck climbing lanes through the Badlands which will ease congestion there.

Response to Comment G-17-3. The "health effects from air pollution" information provided by the commenter is anecdotal and does not provide any specific scientific data or evidence in this regard. Any specific health to a specific person(s) would have to be investigated as to the health effect noted before any cause or causes could be established. It should be noted that Redlands Boulevard from Cactus Avenue north to Eucalyptus Avenue is not designated as a truck route and no heavy duty trucks will be allowed on this roadway – if any do use these roadways, they are subject to enforcement and ticketing by the City Police Department. The DEIR does explain health risks and whether the impacts outweigh the benefits will be decided by the City Council (refer to FEIR Volume 2 Section 4.3.3.4.)

The commenter presents several incidents of illnesses suffered by individuals, which the commenter claims are due to the environment in which they are living; worry regarding what is stored in the warehouses and the supposed lack of annual inspections; concern over the residences that are adjacent to heavily traffic streets and HVAC equipment; potential air pollution exposure for the residences along truck routes; and concern that values for the homes along truck paths and near the project would go down. With regard to the incidences of illnesses suffered by individuals, the stories are anecdotal and cannot be verified as to cause and effect.

With regard to storage of materials in warehouses and annual inspections, Section 4.8.2 of the DEIR explains all of the existing federal, state, county, and city policies and regulations that pertain to the

storage and handling of hazardous wastes and facility inspections. While the warehouse facilities themselves are not expected to utilize acutely hazardous materials, the possibility exists that such materials could be stored or transported to and from the project site. Both the Federal Government and the State of California require all businesses that handle more than a specified amount of hazardous materials or extremely hazardous materials to submit a Hazardous Materials Business Emergency Plan (HMBEP) to the local Certified Unified Program Agency (CUPA). The CUPA with responsibility for the City of Moreno Valley is the County of Riverside Community Health Agency, Department of Environmental Health. The HMBEP must include an inventory of the hazardous materials used in the facility, and emergency response plans and procedures to be used in the event of a significant or threatened significant release of a hazardous material. The HMBEP must also include the Material Safety Data Sheet for each hazardous and potentially hazardous substance used. The Material Safety Data Sheets summarize the physical and chemical properties of the substances and their health impacts. The plan also requires immediate notification to all appropriate agencies and personnel of a release, identification of local emergency medical assistance appropriate for potential accident scenarios, contact information of all company emergency coordinators of the business, a listing and location of emergency equipment at the business, an evacuation plan, and a training program for business personnel. Though the uses in the project area are not expected to utilize acutely hazardous materials in their daily operation, a potential for an accidental release of hazardous materials into the environment is present at the project site as it is at any commercial, retail, or industrial site. Compliance with the identified state and federal transportation safety standards will govern the handling of hazardous materials during truck and freight transfer operations. These standards include procedures to contain, report, and remediate any accidental spill or release of hazardous materials. The handling of hazardous materials in accordance with all applicable local, state, and federal standards, ordinances, and regulations will ensure that impacts associated with environmental and health hazards related to an accidental release of hazardous materials at the project site will be less than significant and no mitigation is required.

With regard to the potential for air pollutant exposures for residences along truck routes, a major feature of the plan is a road system that directs all heavy truck traffic to and from State Route 60 (SR-60) and Gilman Springs Road, eliminating the need to travel through residential areas to the west. Redlands Boulevard south of Eucalyptus Street and Cactus Avenue are not designated Truck Routes. Cactus Avenue will be designed to prohibit use by heavy trucks. The air quality impact analyses contained in the DEIR and revised analysis examined potential air quality impacts from the project. Based on the revised analysis, the air quality impacts outside of the project boundaries including the impacts from truck traffic originated from the project were found to be less than the South Coast Air Quality Management District's (SCAQMD) air quality significance thresholds.

While it is not possible to determine the impact of home values along designated trucks routes and that such economic issues are beyond the scope of California Environmental Quality Act (CEQA), it is important to note that the proposed project is not establishing any new truck routes. In fact, the proposed project will sever some truck routes, such as Alessandro, in order to prevent trucks from the proposed project from traveling through neighborhoods.

Response to Comment G-17-4. The original employment estimates for the Highland Fairview Corporate Park, which includes the Skechers warehouse, was on the order of 2,500 employees at full occupancy, however, the Skechers warehouse is only a part of that project's land use, and the current economy necessitates less than full activity for the Skechers facility at this time, which may be contributing to the lower numbers of employees cited by the commenter.

Section 4.13, *Population, Housing, and Employment*, of the DEIR presents detailed information and analyses on the potential number of jobs that could be generated by the WLC project over time. These estimates are based on extensive surveys and collecting data available from the logistics industry, and are different than "standard" or more historical types of warehousing uses (i.e.,

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

compared to more high tech logistics warehousing). An extensive analysis of employment issues, including those expressed by these commenters, is included in Responses G-3-1 and G-3-2 to Letter G-3 (Scott Thompson).

Response to Comment G-17-5. Despite the fact that specific facility operators generally do not reveal their operating conditions or personnel information, actual industrial project information was used for the WLC project fiscal studies when it was available. In addition to the fiscal study prepared by David Taussig & Associates (DTA)(FEIR Volume 2 Appendix O-1), an independent fiscal assessment was prepared by Beacon (FEIR Volume 2 Appendix O-4). Exhibit A-9 of the Beacon study indicates approximately \$1.8 million in annual/recurring operation and maintenance costs to support the WLC project. For a discussion of one-time fees and charges, please see the text of the Beacon study. Specifically, the capital outlays will be offset by the tens of millions in development impact and permitting fees that will be paid by future development within the WLC Specific Plan area.

Response to Comment G-17-6. The DEIR identified a number of significant environmental impacts associated with the proposed WLC project. Therefore, approval of the project will require the City Council to adopt a Statement of Overriding Considerations explaining what project benefits outweigh the identified significant impacts of the project. Finally, the City Council will consider all stated opinions and comments on the project and Environmental Impact Report (EIR) prior to making any decisions regarding the proposed WLC project.

RECEIVED

APR 1 - 2013

CITY OF MORENO VALLEY
Planning Division

March 14, 2013

Dear Sir,

I would like to take this opportunity to comment on the "World Logistics Center" planned for eastern Moreno Valley. I own a home in the Mission Grove neighborhood of Riverside that is located very near Alessandro Boulevard. I hope to retire there in nine years.

To lessen the negative impact of the development I would like to see railroad service extended through out the development. This would include freight and a passenger transit station. Rail is the most energy efficient method of moving freight and reduces the number of needed trucks and cars.

To mitigate the negative impact on wildlife the developer needs to create a wildlife corridor connecting Yosemite Canyon Wilderness Park and Box Springs Park. This would help lessen the impact of the increased traffic on wildlife created by the development.

The developer of the "World Logistics Center" needs to be held responsible for the impact of his actions on the entire Inland Empire region.

Sincerely,
T. Sam Ziady

1

3

RESPONSES TO LETTER G-18

Sam Ziady

Response to Comment G-18-1. The commenter is requesting extensive rail service extended or added to the World Logistics Center (WLC) project site and area. The commenter is correct that overall, rail service is more energy efficient than truck service for warehousing. However, other private commenters (e.g., Letter G-2 from Perry Johnson, Letter G-17 from Joanne Lindgren) have strongly discouraged any addition of rail service to this area due to the increased air pollutant impacts it would create over both the short- and long-term. The WLC project area, if built out as logistics warehousing, would not have a population density anywhere near high enough to support commuter or passenger rail, and the impacts associated with extending rail to the project site would be considerable, especially since there is no current right-of-way for rail service to the project site from any direction. See Traffic Impact Analysis (TIA) Section 4.F for further analysis.

Response to Comment G-18-2. The Sycamore Canyon Wilderness Park and the Box Springs Mountain Park are separated by rural and suburban residential development/neighborhoods, and it would be problematic at best to attempt connecting these open space areas. More importantly, the Draft Environmental Impact Report (DEIR) did not identify any specific impacts of the proposed WLC project on either of these open space areas, so there would be no justification for mitigation involving their connection, regardless of whether such connection provided benefits for area wildlife.

Response to Comment G-18-3. Comment on responsibility not related to issues addressed in the Environmental Impact Report (EIR). However, the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

To: 'markg' (markg@moval.org<<mailto:markg@moval.org>>)

Subject: Official Comments for the DEIR for WLC

I am absolutely opposed to the World Logistic Center in Moreno Valley after hearing the well-researched reports on the negative impacts of such developments. I attended the information meeting on March 9, 2013, and am convinced that the health risks (cancer, asthma, autism,...) from increased pollution of thousands of trucks a day should be a sufficient reason to stop this project. Our area already suffers from the Mira Loma pollution due to a significant increase in truck traffic to the warehouses there. Air pollution in Mira Loma is fourth worst in the WORLD and that pollution blows through our valley on most days. Mira Loma residents are suffering and cannot restore the quality of life enjoyed before the massive warehouses were built. Now is the time to stop the WLC in Moreno Valley, not after the warehouses are filled with unknown contents hauled in by thousands of polluting, noisy diesel trucks that clog city streets and cost the cash short city money to repair the truck damage. Mira Loma can only try to mitigate the many problems of air quality, noise pollution and congestion of streets. Proponents claim "good paying jobs" will result from the WLC; however, Sketchers workers were moved from their Ontario facility and the estimated 2,500 are actually about 500. Only one new job was created for a Moreno Valley resident. Working conditions at warehouses are generally poor, wages minimal, and benefits are non-existent for the majority of workers who are employed by temporary employment agencies, not by retail companies directly. Any claim that the city will

benefit from increased revenues is likely to be wishful thinking as residents of Mira Loma understand. Home values near warehouses plummeted. Businesses also are reluctant to locate nearby except those related to truck repairs and trucker interests. The land for WLC in Moreno Valley was changed from residential housing to industrial use without most residents understanding the drastic effect on their lives. Information is still being disseminated to those impacted by the WLC proposal. I live 3 homes away from I-215/60 East. The University City residents I contacted today are surprised by the WLC proposal and several are opposed to it, but their opposition is likely to be stated after they attend an information meeting that is scheduled at 6pm next Monday-too late for their e-mails to you . They do plan to attend the next information session on April 13 at Valley View HS. Our entire community will suffer from pollution of diesel exhaust as thousands of trucks per day slow down as they go up the Box Springs grade. As more is known of the microscopic particles in diesel pollutants, the more necessary it is to STOP construction of warehouses in the Riverside and San Bernardino valleys where the level of pollution is already dangerous to our health within 10 miles of the truck transportation corridor. Please allow more residents of affected areas to be informed of the WLC proposal. Residents all along I-60, I-215, I-10, I-15 in the Mira Loma to Moreno Valley warehouses and eastward need to have the facts about the impacts of this project on health, traffic congestion, noise, quality of life, and property values.

Please send me confirmation of receipt of this e-mail. Thank you for your assistance.

Betty Masters e-mail: mastersb@att.net<mailto:mastersb@att.net>

RESPONSES TO LETTER G-19

Betty Masters

Response to Comment G-19-1. Section 4.4 of the Draft Environmental Impact Report (DEIR) provided a very detailed evaluation of the anticipated air quality impacts of the World Logistics Center (WLC) project, which was based on a scientific study of air pollution, health risks, and greenhouse gas impacts of the project by Michael Brandman Associates (MBA). (DEIR Appendix D). The DEIR identified a number of significant environmental impacts associated with the proposed WLC project, including air quality. Therefore, approval of the project will require the City Council to adopt a Statement of Overriding Considerations explaining what project benefits outweigh the identified significant impacts of the project. For a thorough evaluation of similar comments regarding air quality, health risks, diesel particulates, etc., the reader is referred to the Master Responses in Letter C-3 from the South Coast Air Quality Management District (SCAQMD).

Response to Comment G-19-2. The original employment estimates for the Highland Fairview Corporate Park, which includes the Skechers warehouse, was on the order of 2,500 employees at full occupancy, however, the Skechers warehouse is only a part of that project's land use, and the current economy necessitates less than full activity for the Skechers facility at this time, which may be contributing to the lower numbers of employees cited by the commenter.

Section 4.13, *Population, Housing, and Employment*, of the DEIR presents detailed information and analyses on the potential number of jobs that could be generated by the WLC project over time. These estimates are based on extensive surveys and collecting data available from the logistics industry, and are different than "standard" or more historical types of warehousing uses (i.e., compared to more high tech logistics warehousing). An extensive analysis of employment issues, including those expressed by these commenters, is included in Responses G-3-1 and G-3-2 to Letter G-3 (Scott Thompson).

Response to Comment G-19-3. The DEIR was advertised in the Press Enterprise, a newspaper of local distribution, and posted on the City's website. There have been numerous articles in the local Moreno Valley newspaper and the Riverside Press Enterprise about the WLC project and that an EIR was being prepared. There have been several public meetings advertised City-wide regarding the WLC project at which City residents or any interested persons could obtain information about the WLC project.

Response to Comment G-19-4. The commenter makes a number of statements about air pollutant impacts of the project, especially relative to diesel particulate matter and other pollutants most directly associated with diesel truck exhaust. Much of the information is relative to the Mira Loma area which contains a large number of older more "standard" warehouses (see Response to Comment G-19-2 above). However, the warehousing proposed for the WLC project will be more automated and newer truck fleets have substantially reduced diesel emissions than older truck fleets. For a thorough evaluation of similar comments regarding air quality, health risks, diesel particulates, etc., the reader is referred to the Master Responses in Letter C-3 from the South Coast Air Quality Management District.

Regarding regional notification about the project, there is no California Environmental Quality Act (CEQA) requirement to legally notify residents along the freeways that would have project traffic of the WLC project or the EIR. However, it should be noted that this project has received national attention from the news media and conservation organizations, and has been the subject of more than one newscast on National Public Radio during the summer of 2013. There has been sufficient public notification regarding this project.

Letter G-20: Jack Weleba (April 5, 2013)

John Terell, Planning Official
Community & Economic Development Department
Planning Division
14177 Frederick Street
Post Office Box 88005
Moreno Valley CA 92552

Re: World Logistic center DEIR

Dear Mr. Terell,

I am a land owner in the San Jacinto Valley and a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

1

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

2

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

3

The previous statements express my feelings but I have added a few thoughts of my own to address the disgust I have for the disregard of the people's continued disregard of our natural resources and the decline of our wetlands, which by all accounts, are vital not only to those creatures that inhabit them but to all of us who depend on them for the cleansing of our environment.

This seems to be a poorly thought out development in an area that has been designated one of the only two areas in southern California set aside for the benefit of not only waterfowl on their migrations , but for the many other species that inhabit and use these pristine locations. These lands which have been saved from past developments through the hard work and dedication of not only hunters but all those who cherish the outdoors and respect the need for declining areas for the wildlife of California. We have as a whole the need and the responsibility to save what little areas that remain as a place for these creatures. To implement this new development in this area is a shame and an affront to the respect development has shown for those who cannot speak for themselves.

4

Yours truly,

Jack Weleba

Senior Structural Designer

Pasadena , California

RESPONSES TO LETTER G-20

Jack Weleba

Note: This letter was used by a number of residents as a template for submitting their own comment letters, so responses have been drafted to address all of these comments in one letter to avoid duplication.

Response to Comment G-20-1. The World Logistics Center Specific Plan (WLCSP) does not include any public lands, including any portion of the San Jacinto Wildlife Area (SJWA), as a form of mitigation. The Draft Environmental Impact Report (DEIR) has analyzed the impact of the development which will take place as part of the World Logistics Center (WLC) project in the CDFW Conservation Buffer Area. The 910-acre portion of the project area owned by the State is being rezoned to “open space.” It is California Department of Fish and Wildlife (CDFW) land acquired as a buffer (and for other reasons as well), between the high quality SJWA habitat and any proposed development to the north. Calling it the CDFW Conservation Buffer Area is not inaccurate or misleading.

The DEIR provides an assessment of both direct impacts associated with the WLCSP through the proposed construction of logistics facilities and provides an assessment of any direct or indirect impacts associated with the General Plan Amendment associated with the 910 acres of CDFW lands and the San Diego Gas and Electric (SDG&E) rezoning. Since the rezoning would have no direct impacts, no further discussion was considered necessary. A requirement of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) in Section 6.4.1 calls for an analysis of any Urban/Wildlands Interface issues. This is specifically stated to cover indirect impacts within conserved areas or areas considered for conservation under the MSHCP. This analysis was completed in the MSHCP Consistency Analysis (FCS-MBA 2013). The analysis covers indirect impact issues regarding light, noise, trash, emissions, vectors, fuel management, runoff and water quality, as outlined in appropriate sections of the DEIR (e.g., 4.1, *Aesthetics*, addresses night lighting facing the SJWA), although most potential impacts to the SJWA are addressed in Section 4.4, *Biological Resources*. There will be no direct impacts to any portion of the SJWA as part of the WLCSP and no mitigation measures are required.

It is a defined term in the DEIR (Section 4.4.1.16) and the commenter misunderstands the relationship of the state conservation land south of the WLCSP property. The 1000 acres south of the WLCSP property was purchased from or out of the Moreno Highlands Specific Plan (MHSP) property. The minutes from the Wildlife Conservation Board action at that time specifically says it will act as a buffer from planned urban development (i.e., at that time the rest of the MHSP). The existing state conservation land is being rezoned as part of the discretionary actions requested by the WLC project because at present those lands are still zoned for a golf course and various residential uses under the Moreno Highlands Specific Plan.

Response to Comment G-20-2. The commenter expressed concern about project traffic, diesel emissions, and light impacts on the wildlife area adjacent to the WLC. The DEIR and technical studies evaluated the project’s potential impacts regarding traffic In Section 4.15 of the DEIR and concluded there were no significant impacts in the wildlife area because there are no roads in the San Jacinto Wildlife Area. The DEIR and technical studies also evaluated the project’s potential impacts regarding air pollutants, including diesel emissions. Sections 4.3 and 4.4 of the DEIR addressed air quality and biological resources and determined project impacts on the wildlife area were less than significant. The DEIR also examined the lighting impacts of the project on the adjacent San Jacinto Wildlife Area (Section 4.1, *Aesthetics*, and 4.4, *Biological Resources*) and determined impacts were less than significant.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-20-3. The commenter worries about balancing jobs against loss of wildlife. The DEIR evaluated potential new employment as well as impacts, both direct and indirect, to wildlife in the San Jacinto Wildlife Area south of the WLC property. It determined that impacts to wildlife would be less than significant with the proposed buffer and other mitigation. The City Council will weigh all comments on the DEIR and the results of the EIR regarding significant impacts, and determine if the benefits of the project outweigh the environmental impacts. A Statement of Overriding Considerations will be needed if the City Council decides to approve the WLC project as currently outlined.

Response to Comment G-20-4. The commenter expresses concern for the loss of wetlands in the state and that this project will have serious impacts on Mystic Lake and the San Jacinto Wildlife Area. As outlined in the Response to Comment B-3-3, the DEIR evaluated potential impacts to wildlife in the SJWA and Mystic Lake. It determined that impacts to wildlife would be less than significant with the proposed buffer and other mitigation. The City Council will weigh all comments on the DEIR and the results of the EIR regarding significant impacts, and determine if the benefits of the project outweigh the environmental impacts. A Statement of Overriding Considerations will be needed if the City Council decides to approve the WLC project as currently outlined.

Re: World Logistic center DEIR

Dear Mr. Terell,

I am a land owner in the San Jacinto Valley and a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

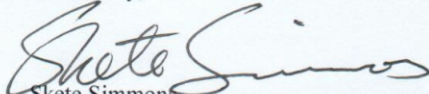

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

Yours truly,

Skete Simmons

Subject: Official DEIR Comments on the World Logistic Center

I am opposed to the World Logistic Center for several reasons:

1. Negative environmental impact as shown by the DEIR. I live adjacent to March Air Reserve Base which I believe has already caused medical problems with my children & pets. Do not want additional hazards in my community.
2. Economic injustice - Warehousing is generally planned in economically depressed areas where there is a source of those willing to work low paying jobs. Warehousing does not produce jobs that pay a living wage and have a history of employee abuse. Temporary employment is the major source of warehouse jobs. They offer no benefits, no protection for on the job injuries, nor the means to support a family. Many warehouse employees rely on additional government help (cash, food stamps, Medi-Cal). Taxpayers shouldering what the employer should be paying. Need jobs that pay a living wage for our city to prosper. Wages that empower employees to buy homes in our city and become part of our community.

-1

-2

3. The developer has a history of shouldering the community's taxpayer with fees he should be paying. There are not even any recreational trails showing on the WLC plans and the developer has made successful attempts to avoid his financial responsibility for these community improvements. 3
4. Infrastructure - who is going to pay for the necessary improvements? As shown, the developer will not. Just another taxpayer expense with no clear advantage 4
5. Deviation of City's General Plan. I consider this deviation breaking a contract between the city officials and those who have invested in our community. 5
6. Warehousing offers no benefit. If a deviation of the General Plan was necessary, I would have preferred a sports complex, performing arts center, or both. 6

A 27 year homeowner in Moreno Valley,

 Sent from my Verizon Wireless BlackBerry

RESPONSES TO LETTER G-27

Radene Hiers

Response to Comment G-27-1. The commenter merely states their opposition to the World Logistics Center (WLC) project because of the negative environmental impacts. Many of the comments regarding impacts of the WLC project on the overall quality of life and health, specifically air quality and traffic, were addressed in the Draft Environmental Impact Report (DEIR) Sections 4.4 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-27-2. The commenter emphasizes that warehousing is not a source of good well-paying jobs. DEIR Section 4.10.5.2, examines the employment and revenue-generating capabilities of the proposed project relative to existing conditions in the City of Moreno Valley. The City currently has high unemployment and the WLC project would help provide thousands of part-time and full-time positions as development occurred within the World Logistics Center Specific Plan (WLCSP). Wages for jobs within the WLC would naturally vary depending on hours and skill levels. The commenter is encouraged to review the cited section of the DEIR, as well as the three reports in DEIR Appendix O for more accurate information on anticipated revenues and jobs within the WLC project.

Response to Comment G-27-3. The commenter emphasizes the past history of the project developer and that there will be no trails in the project. Personal comments on the applicant for this project are not germane to the EIR or California Environmental Quality Act (CEQA) process and will not be addressed in these responses.

Regarding trails, the original project evaluated in the DEIR did propose a recreational trail along the boundary of the proposed open space area in the southwestern portion of the site. In addition, the commenter is referred to Section 1.3 of this Final Environmental Impact Report (FEIR) and the revised WLC Specific Plan (SP) (FEIR Appendix H) which describe the most current proposed trail through the southwestern portion of the WLC project which will connect to existing trails to the west (along Cactus and Redlands) and south (to the San Jacinto Wildlife Area (SJWA) and Mystic Lake).

Response to Comment G-27-4. The commenter asks who will pay for the infrastructure and complains that the General Plan should not be changed. Future development within the WLCSP will be required to fund their fair share of infrastructure improvement costs as part of the City's development review process. The City will not be expected to build or fund infrastructure in this area. The mitigation measures (MM) in Section 4.15 of the DEIR require installation of various infrastructure improvements and payment of Development Impact Fees (DIF) for infrastructure, including roads.

Response to Comment G-27-5. The City's General Plan allows for revision and updating as needed, and the DEIR provides an analysis of General Plan consistency in each environmental topic (Sections 4.1 through 4.16). The WLC project does represent a fundamental change in the planned land uses for this area, however, the review and approval process for a Specific Plan, such as the WLCSP, always requires a review of existing General Plan policies to make sure the proposed action is consistent with the General Plan, or a General Plan Amendment is required. Such was the case with the proposed WLC project.

Response to Comment G-27-6. The comment does not apply to the EIR analysis or conclusions, but is a personal observations about the project and project review process. The DEIR concluded that a

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Re: World Logistic center DEIR

Dear Mr. Gross:

I am a land owner in the San Jacinto Valley and a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

Mark Gross
April 5, 2013
Page 2

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

Sincerely,

Clinton L. Blain

Letter G-29: Stephen Coates (email) (April 5, 2013)

Dear Mr. Terrell,

I have had the pleasure of being a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a “Conservation buffer”. There is no such entity and the area described within this “Conservation buffer” is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false “CDFW Conservation Buffer” as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

Yours truly,

Dr. Stephen Coates

Letter G-32: Barbara and Bryon Johnson (email) (April 3, 2013)

From: Barbara & Byron Johnson [<mailto:myscubashp@aol.com>]

Sent: Wednesday, April 03, 2013 10:05 AM

To: Mark Gross

Subject: Official Comments for the DIER for the WLC

Mark: There was an article in the PRESS last week stating that the area around San Jacinto has an exceptually high rate of lung disease.

The past weeks the fog was exceptionally dense over Mystic Lake. This in not unusual. NOW, think of the large number of trucks

the WLC project will use...coughing poison fumes which will combine withe natural smog and float down the valley to SJ, Hemet and

other communities. I just hope the wind doesn't blow those fumes to the near west. That is where I live...along with a lot of other Moreno Valley residents.

1

Byron Johnson
14707 Grandview Dr.
951-243-5605

RESPONSES TO LETTER G-32

Barbara and Bryon Johnson

Response to Comment G-32-1. The commenter notes the possibility of emissions truck emissions from the project mixing with natural fog in the San Jacinto-Hemet area.

While it is certainly possible for fog to form in the Mystic Lake area on occasion, the project's emissions would more than likely be dispersed to background pollutant levels (levels unaffected by the project) well away from the residential areas of San Jacinto (9 miles away) and Hemet (13 miles away).

Letter G-33: Tom Behrens (email) (April 8, 2013)

Mr Terell and Mr Gross,

I oppose the World Logistic Center Project for the following reasons,

- 1. I do not feel that the city has looked fully into the long term effects this project will have on the residents of this city nor is the city looking out for the interest of its citizens.] 1
- 2. This project will increase traffic on the 60 freeway and arterial streets by hundreds if not thousands of vehicles day the 60 freeway can not handle this added traffic daily and the traffic will be using arterial streets as alternatives I do not think the city streets have been designed for this type of continues traffic use.] 2
- 3. Noise will be a concern as traffic will use the arterial streets which run through residential areas.] 3
- 4 Safety will be a concern as trucks use arterial streets to bypass the heavy traffic on the 60 freeway they will pass many school zones on Ironwood such as Box Springs Elementary, Palm Middle School, Calvery Chapel Christian School to name a few.] 4
- 4. Air quality will be a major concern with the added traffic most of the emmissions and soot from the trucks will linger in the valley to the south of the proposed project and may continue into the San Jacinto Valley.] 5
- 5. The views of the valley will be lost after the project is completed.] 6
- 6. The warehousing operations are modern and automated which will reduce jobs not increase jobs this was evident with Skecthers.] 7
- 7 Most of the jobs will be performed by temporary employees not permanent employs the helps keep cost down for the employers and make personal adjustments as necessary for the work load.] 8

8. There is nothing firm that city residents will be hired to work in these warehouse positions.] 9
- 9.. There are no truck stops in Moreno Valley so there will be very little tax revenue from fuel purchase but these large truck will be using the cities roads causing damage.] 10

April 7, 2013

Re: World Logistics Center Project, Moreno Valley California
SCH # 2012021045

MR. Terrell and Mr. Gross

I would like to comment on a few of the issues in the EIR report that was prepared for the World Logistic Center.

- | | | |
|---------|---|----|
| 4.1.6.1 | The views in this area can be very spectacular at certain times of the year that would be a great loss if this project were to be approved. | 11 |
| 4.2.6.1 | The east end of Moreno valley is the last area that has large open space and it should try to be preserved as such. If this project is allowed to proceed there will most likely be zoning changes in the future that will prevent residents from having livestock. | 12 |
| 4.3.6.1 | Air quality is a concern for everyone if approved this project will see a huge increase in truck traffic and also equipment used in and around the warehouse areas there will be idling trucks along roadways waiting to enter the yards increasing emission into the air which will linger in the valley to the south of this area. (This is a concern in Mira Loma) | 13 |
| 4.3.6.4 | Long term air quality should be a number 1 priority. There should not be large increases in emissions, exploring possibilities for reducing emissions should be of the highest priority. | 14 |

RESPONSES TO LETTER G-33

Tom Behrens

Response to Comment G-33-1. The commenter believes the City is not concerned about the long-term effects of the project or the interests of City residents. The Draft Environmental Impact Report (DEIR) evaluates the entire spectrum of potential environmental impacts of the project, and many impacts remain significant, even with implementation of recommended mitigation, mainly due to the size and nature of the project. It is up to the City Council to weigh the estimated benefits of the project against the potential environmental impacts of the project before making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-33-2. Section 4.15, *Traffic and Circulation*, of the DEIR evaluates the potential traffic impacts of the project on surrounding roads, intersections, and freeways including SR-60 within the City of Moreno Valley and surrounding jurisdictions (e.g., Redlands, Riverside, Perris, etc.). An extensive analysis of traffic-related issues, including those expressed by these commenters, is included in the Responses to Comments F-11-22. The commenters are encouraged to review the specific responses to Letter F-11.

Response to Comment G-33-3. The commenter is concerned about noise on City streets from project traffic. The project noise report (DEIR Appendix K) and the DEIR Section 4.12, *Noise*, assess the potential impacts of project traffic and related noise on local streets. It must be remembered that project trucks will be restricted to established truck routes in the City, and most project trucks will utilize Theodore, SR-60, and Gilman Springs Road for project access. The EIR identifies which local streets will require mitigation such as sound walls, and also a funding mechanism to provide the identified improvements. Truck traffic is barred from going through residential areas west and south of the project site.

Response to Comment G-33-4. Section 4.15, *Traffic and Circulation*, of the DEIR evaluates the potential traffic impacts of the project on surrounding roads, intersections, and freeways including SR-60 within the City of Moreno Valley and surrounding jurisdictions (e.g., Redlands, Riverside, Perris, etc.). An extensive analysis of traffic-related issues, including those expressed by these commenters, is included in the Responses to Comments F-11-36. The commenter is encouraged to review the specific responses to Letter F-11 relative to his own expressed concerns.

Response to Comment G-33-5. Section 4.3, *Air Quality*, of the DEIR evaluates potential air quality and health risk impacts of the proposed project, including diesel particulate matter from diesel truck exhaust and the project's location. An extensive analysis of air quality and health risk-related issues, including those expressed by these commenters, is included in the Master Responses in Letter C-3.

Response to Comment G-33-6. Section 4.1, *Aesthetics*, of the DEIR evaluates the potential aesthetic impacts of the project on neighboring residences and land uses, including views from locally designated scenic routes (SR-60 and Gilman Springs Road). In addition, MM 4.1.6.3A has been modified to preserve the upper two thirds of views of Mt. Russell (refer to Response to Comment F-8-3).

Response to Comment G-33-7. Section 4.13, *Population, Housing, and Employment*, of the DEIR presents detailed information and analyses on the potential number of jobs that could be generated by the WLC project over time. These estimates are based on extensive surveys and collecting data available from the logistics industry, and are different than "standard" or more historical types of warehousing uses (i.e., compared to more high tech logistics warehousing). An extensive analysis of

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

employment issues, including those expressed by these commenters, is included in the Responses to Comments F-8-105 and F-3-12.

Response to Comment G-33-8. The commenter believes most of the project jobs will be temporary. The project will hire thousands of construction workers as development occurs consistent with the Specific Plan over a period of at least 15 years. In comparison, the warehouses that will be built as part of the WLC project will hire both part-time (not necessarily temporary) and full-time workers, as outlined in the project economic study (DTA 2014) and Section 4.13, *Population, Housing, and Employment*, in the DEIR.

Response to Comment G-33-9. The commenter says there is nothing to require the project to hire City residents. Future users cannot be legally required to hire City residents, and there is no significant employment impact identified in Section 4.13 of the DEIR that requires mitigation. The Development Agreement includes a provisions for a Local Hiring Program.

Response to Comment G-33-10. The new alternative fueling station will generate tax revenues to the City based on the amount of fuel sold to alternative fuel trucks.

Response to Comment G-33-11. The commenter is concerned about loss of views (DEIR Section 4.1.6.1). MM 4.1.6.3A has been modified to require WLC project buildings to not block the upper two thirds of the vertical view of Mt. Russell from the SR-60 Freeway. While this will not eliminate visual impacts of the project, it will substantially reduce them.

Response to Comment G-33-12. The commenter is concerned about the loss of open space and keeping livestock (DEIR Section 4.2.6.1). As the WLC project develops, the existing vacant dry-farmed land that represents the “open space” referred to by the commenter will be lost as it is replaced by large warehouse buildings. This would be an inevitable process if the project is approved by the City. The only persons able to keep livestock right now on the project site would be at the 7 rural residences, and it is anticipated these uses will slowly leave the site as it is developed with warehousing uses. The keeping of livestock on other land within the City would not be affected by the WLC project.

Response to Comment G-33-13. The commenter is concerned about truck emissions (DEIR Section 4.3.6.1). The DEIR identifies a number of air quality impacts of the project in DEIR Section 4.3, *Air Quality*, and its attendant technical study, and also recommends a variety of mitigation to reduce potential impacts. However, long-term air quality impacts will be significant due to the size and nature of the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-33-14. The commenter expressed concern about long-term air quality (DEIR Section 4.3.6.4). The Response to Comment G-33-13 above addresses this concern as well.

Letter G-34: Lindsay Robinson (email) (April 7, 2013)

From: Lindsay Robinson [mailto:lindsay.robinson@ucr.edu]

To: Mark Gross
Cc: Lindsay Robinson
Subject: Official DEIR Comments for the World Logistics Center

To whom it may concern:

I am opposed to the World Logistics Center in Moreno Valley.

I have been a resident of Moreno Valley since 1997 and purchased my home after reviewing the general plan and zoning for my area. I SHOP Moreno Valley to support our city and tax base, and volunteer on a regular basis with non-profit organizations of many types. I used to encourage people to move here, but no more. Long time residents who can afford to move are doing so as they feel that the City Council has sold us out. Unfortunately for me, I don't know that I'll be able to afford to move so will suffer all the negative impacts this project will force on me.

I attended meetings when the new general plan was being developed. Residents and employees from throughout Moreno Valley participated in the process and came up with a well balanced general plan. This plan included a new high school at the eastern end of the city as well as keeping the zoning for large lots and animal keeping. It was a well thought out plan that was for the benefit of the residents and the city. That plan and zoning were changed once already to accommodate the Sketchers Warehouse. Mr. Benzeevi made lots of promises to the residents and city council in order to get that change and as most know, he did not fulfill his promises (beautiful freeway landscape, many jobs for residents, keeping the designated trail system etc). As most interested parties know, Mr. Benzeevi has also been very active in supplying funds to elect officials that will support him and he has been instrumental in getting

people removed who oppose his plans. Completely changing the general plan after all the hard work and cost goes against the residents and what is fair and honorable.

2

Many studies have been done that link diesel fumes with increased breathing problems especially with children and elderly people. Studies also show that there is a link to autism (Press Enterprise last week). Mira Loma has some of the worst air quality in the world and the Inland Empire is a basin that traps particulate matter and damages our health. Please look at all the studies provided by CEQE. It makes no sense to create such a large warehouse district in that area which is surrounded by mountains. Particulate matter travels quite far and will affect all the surrounding communities as well especially when the afternoon winds occur.

3

Additionally that location is unsuitable for increased numbers of trucks as the freeway narrows and winds thru the badlands to meet up with I-10. Accidents in either direction basically close down the narrow freeway, trapping commuters and forcing trucks and cars into residential neighborhoods to find alternate routes. Cities off the I-10 are consulting with Mr. Benzeevi and have stated in a recent Press Enterprise article that their airport district would be a suitable location for a mega-warehouse district. There is also rail line up there, Does that mean we'll be having 2 mega-warehouses within a short distance of each other? High volume truck traffic on narrow winding roads such as Redlands Blvd., San Timeteo Canyon, 60 Fwy east of Moreno Beach, Gilman Hot Springs etc is dangerous and should be taken into account when this project is examined. The residential areas were not designed for truck traffic and the city will not be able to afford to keep up with the repairs needed.

4

Having a mega-warehouse district this far removed from rail line also does not make any sense and again, this area was not planned for ware-houses. Changes in the Panama Canal will lessen the amount of cargo coming through LA not increase it. Why would any business want to truck to a warehouse so far from a rail line and then move it again by truck to the rail line. Economics says they won't.

5

Proponents of the warehouses keep touting high paying jobs and yet we all know that warehouses are automated now requiring fewer employees than ever- and the jobs for regular workers are not high paying. Mr. Benzeevi highly exaggerated the job creation and Sketchers always said they would be bringing their Ontario employees which again, meant few new jobs. The residents were proven correct when the jobs didn't materialize. Additionally during construction, liens were filed because of non-payment to construction companies and non-union electricians were used and the work had to be re-done by proper electricians. Are we going to have the same broken promises and shoddy business practices if this project goes through?

6

And lastly, how can a project of this magnitude be approved and allowed to go forward next to a wildlife preserve? Pollution effects on wildlife can be even more severe than on humans.

7

I realize the City Council of Moreno Valley has basically rubber stamped and approved this project before all the proper procedures were followed as demonstrated by their slide show last year. It's unfortunate that they are putting the wants of one person, Mr. Benzeevi, above the residents of Moreno Valley and surrounding cities who will all suffer if this project is allowed. I'll never understand this type of greed and dereliction of duty.

8

Thank you for allowing me to submit this in opposition to the World Logistics Center in Moreno Valley.

Lindsay Robinson
28399 Black Oak
Moreno Valley, CA 92555

RESPONSES TO LETTER G-34

Lindsay Robinson

Response to Comment G-34-1. The many potential environmental impacts of the proposed WLC project are fully evaluated in the Draft Environmental Impact Report (DEIR), including substantial changes to the general plan and zoning. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Response to Comment G-34-2. The proposed WLC project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). Also, the City does not have the authority to pick and choose which company can occupy which buildings, just as it cannot select which person can buy/rent which home in the City. The City regulates land uses, not individuals occupying specific parcels. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-34-3. Section 4.3, *Air Quality*, of the DEIR evaluates potential air quality and health risk impacts of the proposed project, including diesel particulate matter from diesel truck exhaust and the project's location. An extensive analysis of air quality and health risk-related issues, including those expressed by these commenters, is included in the Master Responses in Letter C-3.

Response to Comment G-34-4. Section 4.15, *Traffic and Circulation*, of the DEIR evaluates the potential traffic impacts of the project on surrounding roads, intersections, and freeways including SR-60 within the City of Moreno Valley and surrounding jurisdictions (e.g., Redlands, Riverside, Perris, etc.). An extensive analysis of traffic-related issues, including those expressed by these commenters, is included in the Responses to Comments in Letters E-2A and E-2B. The commenter is encouraged to review the specific responses to those letters relative to his own expressed concerns.

Response to Comment G-34-5. The commenter is correct that the proposed project site is not close to a rail line. The widening of the Panama Canal will divert some of the present Los Angeles/Long Beach port traffic to ports on the Gulf Coast and East Coast. However, Ports of Los Angeles/Ports of Long Beach (POLA/POLB) will remain the nation's busiest shipping ports and will continue to expand as imports levels continue to grow in the future.

The provision of a rail service to the project site has been studied to determine if it is an alternative which will reduce the number of trucks driving between ports and the site, and therefore reduce the number of significant impacts. However, it has been determined that this alternative is not a viable option due to the following reasons. The WLC site is not currently served by rail and would need to be aligned to an existing branch. All possible alignments would cause impacts equal or greater than the projected truck traffic. It was also determined that for a rail service to be economical 50 percent of all shipments must be shipped 500 miles or greater on rail. Shipments to the WLC would only be travelling from the ports of Los Angeles and Long Beach, a distance of about 70 miles. Additionally, the existing rail system is already at or near maximum capacity. Therefore, shifting cargo from trucks on freeways to rail would transfer the congestion problem from stressed freeway systems to stressed rail networks. Finally, the reduction in truck traffic to the WLC is projected to be as little as 2 to 7 percent. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project. For further discussion of rail refer to section 4.F of the Traffic Impact Assessment (TIA) Appendix L.

Response to Comment G-34-6. Section 4.13, *Population, Housing, and Employment*, of the DEIR presents detailed information and analyses on the potential number of jobs that could be generated

by the WLC project over time. These estimates are based on extensive surveys and collecting data available from the logistics industry, and are different than “standard” or more historical types of warehousing uses (i.e., compared to more high tech logistics warehousing). An extensive analysis of employment issues, including those expressed by these commenters, is included in the Responses to Comments F-3-12 and F-8-94. The commenters are encouraged to review the specific responses to Letters F-3 and F-8.

Response to Comment G-34-7. Section 4.4, *Biological Resources*, of the DEIR examines potential impacts of the proposed project on existing vegetation and animals. It should be noted that the site generally lacks important biological resources (including wetlands) due to the historical and ongoing disturbance by agricultural activities. The DEIR also examined potential impacts on the nearby San Jacinto Wildlife Area and Mystic Lake, and determined that the project design, with proposed setbacks and landscaped buffers, and recommended mitigation measures would reduce potential impacts on these areas to less than significant levels. In addition, traffic and air quality impacts of the project were evaluated in DEIR Sections 4.15 and 4.3, respectively. Both were found to be significant, even with proposed mitigation, and will require a Statement of Overriding Considerations if the project is approved. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-34-8. Most of the comments do not apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

major source of carcinogen and allergen pollution. The World Logistics Center proposes radically increasing the number of these highway trucks into and out of Moreno Valley. This will be an air pollution disaster for Moreno Valley and all the surrounding towns and counties that will not be mitigated.

2

3. The greatest harm will be to the people of Moreno Valley, especially to the children. There will be enormous increase in diseases, such as cancers, asthma, bronchitis, emphysema, etc. Infants and small children will develop much more slowly both physically and mentally. This will affect them for the rest of their lives and even affect their own children as well. To intentionally and knowingly cause this harm is irresponsible and unconscionable.

3

4. The logistics industry recognizes that movement of product by highway trucks is no longer the most effective, economical, or desirable method. Instead, the use of movement by railroad is being promoted by all the forward thinkers and planners in the logistics industry.

4

5. The area designated by the developer for this project was and is zoned only for residential use. It should remain so. We need to honor our commitments to ourselves and to each other that we made when we agreed to the zoning plan.

5

In summary, the World Logistics Center project is in the wrong place at the wrong time and it will not work no matter how much the city council and the developer tries to make it work. We are residents and property owners and we care that Moreno Valley does not become even more culturally anemic than it is already. It is very telling that the developer himself gives as his address Rancho Ballago, and not Moreno Valley, even if it is not a legitimate mailing address.

6

Peggy Hadaway and John Neal

RESPONSES TO LETTER G-35

Peggy Hadaway and John Neal

Response to Comment G-35-1. The commenter is concerned about the City's financial condition and if it can "afford" the World Logistics Center (WLC) project. Draft Environmental Impact Report (DEIR) Section 4.13, *Population, Housing, and Employment*, analysis the various economic costs and benefits of the WLC project. The Development Agreement between the City and the developer will outline the responsibilities for constructing various infrastructure improvements to support the WLC project. The analysis shows projected fiscal revenues to the City of Moreno Valley totaling \$11.2 million dollar (Table 4.13.G) and projected fiscal costs of \$5.5 million dollar (Table 4.13.H). The Net Fiscal Impact based on recurring revenues and costs shows a \$5.7 million dollar surplus to the City which is equal to 2.03 times the project annual City General Fund costs. (Table 4.13.I). Infrastructure needed to support the demands of the project would be constructed by the developer.

Response to Comment G-35-2. The commenter is concerned about air quality impacts. However, the DEIR does not "ignore" federal and state laws regarding air pollution, but does estimate the amounts and types of air pollutants that can be expected during development and occupancy of the WLC project. Due to the size and type of project, it is estimated the project will have significant air quality impacts, even with implementation of the recommended mitigation measures (see DEIR Section 4.3 *Air Quality*). This information will be presented to the City Council, and they will consider all comments and responses in this Final Environmental Impact Report (FEIR) document, prior to making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-35-3. Section 4.3, *Air Quality*, of the DEIR evaluates potential air quality and health risk impacts of the proposed project, including diesel particulate matter from diesel truck exhaust and the project's location. An extensive analysis of air quality and health risk-related issues, including those expressed by these commenters, is included in the Master Responses in Letter C-3.

Response to Comment G-35-4. The provision of a rail service to the project site has been studied to determine if it is an alternative which will reduce the number of trucks driving between ports and the site, and therefore reduce the number of significant impacts. However, it has been determined that this alternative is not a viable option due to the following reasons. The WLC site is not currently served by rail and would need to be aligned to an existing branch. All possible alignments would cause impacts equal or greater than the projected truck traffic. It was also determined that for a rail service to be economical 50 percent of all shipments must be shipped 500 miles or greater on rail. Shipments to the WLC would only be travelling from the ports of Los Angeles and Long Beach, a distance of about 70 miles. Additionally, the existing rail system is already at or near maximum capacity. Therefore, shifting cargo from trucks on freeways to rail would transfer the congestion problem from stressed freeway between systems to stressed rail networks. Finally, the reduction in truck traffic to the WLC is projected to be 2 and 7 percent over the next 50 years. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project. Refer to section 4.F of the Traffic Impact Assessment (TIA) FEIR Volume 2 Appendix L-1.

Response to Comment G-35-5. The proposed WLC project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-35-6. The comment does not apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

RESPONSES TO LETTER G-36

Scott Heveran

Response to Comment G-36-1. Many of the comments regarding impacts of the World Logistics Center (WLC) project on the overall quality of life, specifically air quality and traffic, were addressed in the Draft Environmental Impact Report (DEIR) Sections 4.4 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-36-2. See Response to Comment G-36-1 of Letter G-36 for a more detailed response to this comment.

Letter G-37: Robert Wilson (email) (April 7, 2013)

From: Robert Willson [<mailto:rwwillson@earthlink.net>]

Sent: Sunday, April 07, 2013 9:57 PM

To: Mark Gross

Subject: Official DEIR Comments for the World Logistics Center

Letter G-37

Dear Mr. Gross,

I am writing to oppose the approval of the proposed World Logistics Center. The issue that I am most concerned about is the effect that the Center would have on our air quality. As a result largely of regulations of emissions, that pollution problem has been improving gradually over the past two decades or so. But the addition of an estimated 14,000-20,000 additional diesel-emitting truck visits per day is bound to cause a degradation in the quality of the air that we all breathe. This especially affects our children, who like to play outside during the summers when the pollution is the worst. Many students in our schools already are afflicted by asthma, and exposure to diesel particulates can also increase the risk of cancer among those of all ages.

1

A second area of concern is damage to our streets from all of the trucks traveling over them. The proponents definitely can't guarantee that all of the trucks will stay on prescribed truck routes. Also, who is going to pay for the millions of dollars in infrastructure improvements that will be required?

2

Most of the home-owners on the east side of Moreno Valley purchased their houses under the assumption that the City would adhere to the general plan, which calls for high-end homes and small commercial development in the area. Instead, if this is approved, they will be getting an enormous warehouse complex which will be a magnet for many thousand of trucks each day.

3

I respectfully urge the City Council to not approve such a huge, destructive project.

Robert Willson
Moreno Valley

RESPONSES TO LETTER G-37

Robert Wilson

Response to Comment G-37-1. Section 4.3, *Air Quality*, of the Draft Environmental Impact Report (DEIR) evaluates potential air quality and health risk impacts of the proposed project, including diesel particulate matter from diesel truck exhaust and the project's location. An extensive analysis of air quality and health risk-related issues, including those expressed by these commenters, is included in the Master Responses in Letter C-3.

Response to Comment G-37-2. Mitigation measures in Section 4.15 of the DEIR to require installation of various road and intersections improvements and payment of Development Impact Fees (DIF) for infrastructure, including roads.

Response to Comment G-37-3. The proposed World Logistics Center (WLC) project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-42: Kathleen Dale (April 8, 2013) and Appendix 1 (on Flash Drive)

John Terell, Planning Official
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92552

RE: World Logistic Center (WLC) Project Draft EIR (SCH No. 2012021045)

Mr. Terell:

The following comments are submitted in response to the public review period for the referenced document. These comments are based upon a very preliminary review of the 1,094 page draft EIR document and indicate that there are substantial deficiencies that warrant recirculation of a revised draft EIR.

1. Alternatives

The build alternatives presented in the draft EIR represent an arbitrary range of scenarios with no relationship to the identified significant impacts of this project. CEQA Guidelines Section 15126.6 requires that an EIR include a reasonable range of alternatives that would avoid or substantially lessen the significant environmental impacts of the project. Also, the conclusory dismissal of an off-site alternative is predicated on an assumption that the project could only be located at another single site. There is no indication that agglomeration of a minimum square-footage of high-cube warehousing is a basic objective of the project. Accommodation of the indicated building area at more than one off-site location should also be addressed as a viable off-site alternative.

1

2. Project Description/Cumulative Projects/Traffic Impacts

Recent articles in the Press-Enterprise (March 25, 2013 – “City Seeks Guidance from Moreno Valley Developer” and March 26, 2013 – “Council Approves Negotiating Agreement with Moreno Valley Developer”) have disclosed dealings of the project proponent with the City of Banning to develop a multi-modal center entailing air, rail and logistics uses centered around Banning’s municipal airport, this proposed facility is referred to as the Morongo Inland Port and Intermodal Center. The March 25th article discloses that Highland Fairview has been under contract with the City of Banning for this proposal since last November and cites activities dating back to 2011.

2

It seems implausible that there is not a connection between the proposed WLC project and the proposed Morongo Inland Port and Intermodal Center. While the Banning project is clearly in early stages, the involvement of the same developer and the apparent timeline demands disclosure of this connection in the WLC EIR. In particular, this connection has substantial ramifications as to assumed truck trip distribution and all impact categories related to truck traffic (traffic, air, greenhouse gases, and noise). At page 4.15-32 of the draft EIR, it is stated that 82% of the truck traffic is assumed to be travelling to the west. With an inland port and multimodal facility situated to the east, this heavily skewed distribution of traffic to the west is suspect. At a minimum, an alternative or future scenario analyzing traffic patterns between the rail and air facilities to the east should be addressed.

3. Biological Resources Impacts/Western Riverside Multiple Species Habitat Conservation Plan Consistency

Mitigation Measure 4.4.4.6D for potential impacts to burrowing owl is not consistent with the provisions of the Western Riverside Multiple Species Habitat Conservation Plan, which also require more extensive habitat replacement provisions if more than three pairs of Burrowing Owls are found in pre-construction surveys (see objective 5 in MSHCP excerpt provided with this letter).

3

This section of the EIR repeatedly refers to the DBESP as a Determination of Biologically Equivalent or Superior Project, rather than Determination of Biologically Equivalent or Superior Preservation. This, together with the mischaracterization/lack of recognition of the MSHCP burrowing owl provisions calls into question the accuracy of the analysis of consistency with the MSHCP, to which the City is a signatory and participating entity. This section of the EIR should be revisited to ensure that provisions of the MSHCP are accurately identified and incorporated in the mitigation program.

4. Impacts of Off-site Traffic Improvements

The traffic study identifies an extensive inventory of road improvements required to maintain appropriate Level of Services Standards throughout the City of Moreno Valley and an extended regional influence area beyond. These improvements are identified specifically by location and nature of improvement, providing an adequate level of information to evaluate associated impacts of construction. It is not evident that the impacts of these off-site improvements were considered in the draft EIR. For instance, the added lanes noted for the intersection of Cactus Avenue and Elsworth Street would likely encroach upon the jurisdictional stream along the south side of Cactus Avenue and could impact the existing commercial uses at this intersection. Potential impacts associated with implementation of all off-site traffic improvements also require disclosure in a revised draft EIR.

4

I trust that these comments will be given due consideration in the analysis of comments on the draft EIR and that the City will arrive at the conclusion that circulation of a revised draft EIR is warranted. While it is not directly germane to the draft EIR review process, please note that I am opposed to the proposed WLC project and would hope that the City leaders and Council will acknowledge the extensive array of significant and unavoidable impacts within the City and throughout the extended region as a clear indication that this expansive change to the adopted General Plan should be denied.

Respectfully submitted,

Kathleen Dale
25157 Aleppo Way
Moreno Valley, CA 92553

RESPONSES TO LETTER G-42

Kathleen Dale

Response to Comment G-42-1. It is the commenter's opinion the alternatives studied in the Environmental Impact Report (EIR) are not a reasonable range as required by California Environmental Quality Act (CEQA). The alternatives analysis in the EIR does in fact represent a reasonable range of alternatives, including several with reduced impacts. However, those alternatives must be evaluated in light of project objectives, which in this case are to create a regional logistics center with significant new employment. Project objectives include:

- Create substantial employment opportunities for the citizens of Moreno Valley and surrounding communities.
- Provide the land use designation and infrastructure plan necessary to meet current market demands and to support the City's Economic Development Action Plan. See FEIR Volume 1 Response to Comments Section 1.5.1 for 2011 and 2013 Economic Development Action Plan objectives related to the WLC.
- Create a project that will provide a balanced approach to the City's responsibilities of fiscal viability, economic expansion, and environmental integrity.
- Encourage new development consistent with regional and municipal service capabilities.
- Significantly improve the City's jobs/housing balance and help reduce unemployment within the City.
- Provide thousands of construction job opportunities during the project's build-out phase.

A plan of this scope and scale must by its very nature have broad and large objectives, some of which could not be met by much smaller or very different projects. Indeed, it would be very difficult for just about any project of this size (i.e., 2,600 acres) to substantially reduce the significant impacts identified for the proposed project except possibly for air quality (i.e., health risks from diesel particulate matter and toxic air contaminants from diesel exhaust). All of the other project alternatives propose land uses that would not produce as many truck-related air emissions (e.g., No Project - Moreno Highlands Specific Plan, Less Intense Alternative, and Mixed Use Alternatives A and B). However, some would produce substantially more vehicular traffic and would not introduce nearly as much employment within the City of Moreno Valley as the proposed project which helps improve the City's jobs/housing balance.

CEQA also requires an evaluation of alternative sites that could reasonably support the proposed project as characterized in the EIR. The reason for this analysis is to determine if moving the project to some other site would reduce or eliminate one or more significant impacts. In other words, this analysis is to determine if there is something about the project site itself that generates a significant impact in combination with the proposed project. In this case, the proposed World Logistics Center (WLC) project is so large that its placement anywhere within the Southern California basin would likely generate similar types of impacts other than possibly aesthetic impacts (project site is near a locally scenic highway). It should be noted that the EIR used the ability of an alternative site to accommodate the proposed project, and the significant impacts of the proposed project as the two main factors to evaluate alternative sites.

Response to Comment G-42-2. First, the baseline conditions for the Draft Environmental Impact Report (DEIR) analysis were established well before any discussion of potential warehousing sites in Banning, as outlined by the commenter. Also, there is no relationship to the referenced project due to the City of Banning choosing not to pursue the project. The analysis of impacts to the proposed WLC site must necessarily be separate from analysis of any specific site or sites in other jurisdictions, other

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

than the “alternative sites” analysis described in the Responses to Comments G-52-1 and G-52-2. The EIR has been prepared a programmatic level so the analysis of potential alternative sites must also be at a programmatic level.

Response to Comment G-42-3. The commenter expresses concern about impacts to burrowing owls (BUOW). Section 4.4.6.4 of the DEIR examined in detail potential impacts to burrowing owls, which have not been found in abundance on this site. No more than a single pair of burrowing owls have been observed within the World Logistics Center Specific Plan (WLCSP) during any of the focused burrowing owl surveys conducted within the last eight years (See Section 4.4.3.6 of the DEIR). However, in the event that more than 3 pairs of burrowing owls are observed during an updated burrowing owl protocol survey or a pre-construction survey, 90 percent of the suitable habitat will be conserved until the conservation goals for burrowing owl have been met. This is a general requirement under the Riverside County Multiple Species Habitat Conservation Plan (MSHCP), and although not anticipated, it should be mentioned as a possibility. This procedure is outlined in MM 4.4.6.4D of the EIR. The use of the term DBESP has been corrected to Determination of Biologically Equivalent or Superior Preservation.

Response to Comment G-42-4. The commenter is concerned that implementation of recommended mitigation measures in the DEIR must be addressed in the EIR. While it is possible that the drainage course mentioned by the commenter might be affected by improvements at the cited intersection, it is also possible the design of future improvements may avoid impacts to the drainage, or it is possible that the drainage may have already been affected by improvements made by another proposed development. This is the case with a long-range programmatic EIR such as for the WLCSP. However, the DEIR clearly states that subsequent analysis of specific development, and its attendant specific mitigation, will be evaluated and implemented as appropriate in the future to maintain City standard levels of service, as outlined in the DEIR traffic impact assessment (TIA). For example, subsequent development in the future will require project specific traffic studies tiered off of the programmatic TIA in the WLCSP EIR.(FEIR Volume 2 Appendix L). The City Council will review all comments on the EIR and responses to these and all comments prior to making a decision on the WLC project.

Response to Appendix 1 (Table 9-2 Species Conservation Summary (MSHCP), pp. 9-59-9.61). This appendix was directly referenced in the comment letter. The reference identifies the habitat replacement is required for impacts to more than three pairs of burrowing owls are found during pre-construction surveys. This information is correct and has been corrected. The information was considered in preparing the response to comments. In addition, the commenter has asked that the DEIR be recirculated. The commenter is referred to Response to Comment F-7A-11 to address the issue of recirculation.

RESPONSES TO LETTER G-43

Catherine Yorkovich

Response to Comment G-43-1. Many of the comments regarding impacts of the World Logistics Center (WLC) project on the overall quality of life, specifically air quality and traffic, were addressed in the Draft Environmental Impact Report (DEIR) Sections 4.4 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-44: Jerry Villaneuva (email) (April 8, 2013)

From: Jerry Villanueva [<mailto:romans132004@aol.com>]

Sent: Monday, April 08, 2013 10:00 AM

To: Mark Gross

Subject: World Logistics Center DEIR

Greetings,

My name is Jerry N. Villanueva, I am (59) years old and I have been a resident of Moreno Valley since 1984. Our first home was near Fir Ave. and Willow Tree Ave but we now live at 28040 War Admiral St. near Cottonwood and Moreno Beach Drive.

I have made an attempt to read, review and understand the posted World Logistics Center DEIR but honestly there is a lot of information in the report which I am sure is complete and thorough but fails to meet the basic concerns of myself and my neighbors.

We know that despite our efforts we are losing the last area of Moreno Valley that offers rural living and the beautiful view of our fields and mountains. We also know that our neighborhoods will be overwhelmed with trucks, vehicle traffic, pedestrians, etc. and are not happy.

I have been in law enforcement for almost (35) years with the first (20) years working in a small suburb of Los Angeles and have witnessed first hand the result of warehouses in or near residential areas and the crime/destruction it brings to a city.

So I find all the plans, photos and words describing different results to be worthless.

1

Although I oppose the project, I was looking in the DEIR for any mention of how the police department will be supported in order to address the crime and traffic issues this project will bring. Is there any plan to provide the police department with a Commercial Vehicle Enforcement Unit? Will there be funding to train our officers and provide them with the proper equipment to enforce commercial vehicle laws as well as the vehicle code violations which are sure to occur? Will there be a specific number of officers assigned to this area?

2

If we are going to allow this project to continue, why not consider the handling of these issues now? By working with the traffic court judges and clerical staff, commercial enforcement can be a huge revenue source for the city. If the city were to adopt municipal codes similar to the vehicle code violations and train the officers to cite for those codes, the fines could go to the city instead of the DMV, State and other agencies.

3

If you are not the correct person to receive this objection and recommendation, could you please forward it to the right department and please acknowledge receipt of this email.

4

Thank you very much for your time and the work you do,

Jerry N. Villanueva
romans132004@aol.com

RESPONSES TO LETTER G-44

Jerry Villaneuva

Response to Comment G-44-1. Most of the comments do not apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Response to Comment G-44-2. The commenter is concerned about police services for this project. Section 4.14, *Public Services*, of the DEIR evaluated potential impacts of the World Logistics Center (WLC) project on existing police services, and determined they are less than significant and do not require mitigation. The City police department will consider and implement programs like the suggested programs as needed to continue to protect public safety within the WLC project. It is anticipated that the WLC project will provide additional tax revenues to the City, a portion of which will go for continued or expanded police service as needed as the WLC project develops (DEIR Section 4.14.6.1).

Response to Comment G-44-3. The commenter is correct that such a program or programs could generate additional revenues to the City and courts, and the City Council will consider all comments and responses like this before making a decision on the WLC project.

Response to Comment G-44-4. The commenter wanted to make sure the comments got to the right person. This is indeed the correct forum for presenting your comments, and the City Council will consider all comments and responses like this before making a decision on the WLC project.

Letter G-45: Ted and Marica Amino (email) (April 8, 2013)

From: Marcia Amino [mailto:tmamino@aol.com]

Sent: Monday, April 08, 2013 10:25 AM

To: Mark Gross; John Terell

Subject: OFFICIAL COMMENTS FOR DEIR FOR RORLD LOGISTICS CENTER "WLC"

E-MAILED APRIL 8, 2013

Please provide a confirmation of receipt of this e-mail.

We are opposed to the WORLD LOGISTICS CENTER PROJECT for the following reasons:

Chapter 4.3 in Air Quality Section Pg 4.3-36 states that Dr. James Enstrom believes that the risk from diesel PM is exaggerated (2008). However, http://oehha.ca.gov/public_info/facts/pdf/diesel4-02.pdf states that diesel health impacts are negative and our city, in order to protect our health and welfare owes it to the residents to use caution and protect us from negative development impacts, thus this project should not be approved.

1

Chapter 4.3 in Air Quality Section Pg 4.3-39 says that the localized significance threshold analysis in Scenario 1 having 2012 for phase 1 buildout is exaggerated because of cleaner diesel engines, so this presents a worst case scenario. Further Scenario 2 states buildout for phase 1 occurs in 2017 and and phase 2 occurs in 2022 and impact of diesel should be less because of the assumption that the future diesel fleets will have less emissions and resulting impacts in the air. California has postponed the more stringent diesel emission standards <http://www.dailyfinance.com/2010/12/17/california-postpones-its-diesel-emission-standards/> and https://www.cmca.com/pdf/maintenance/CTA_CARB_GUIDE_04.12.pdf and although phasing has started, I believe, it varies on year of truck, model, standard, etc. <http://www.truckline.com/AdvIssues/Environment/Documents/California%20Tractor-Trailer%20Regulation.pdf> so there will still be a period of time before all the appropriate equipment or upgraded trucks are on the roads and running, and in the meantime the diesel particulate matter will increase in Moreno Valley's area and negatively impact the health of residents, especially our children and elderly, thus this project should not be approved.

2

Chapter 4.3 in Air Quality Section Pg 4.3-49, Section 4.3.6.1: Implementation of the proposed project has the potential to conflict with implementation of the SCAQMD 2012 AQMP. This project has the likelihood of adding to air quality degradation and include air quality violations which is not acceptable to an area that currently has some of the worst air quality in the nation per our SCAQMD <http://www.pe.com/local-news/topics/topics-environment-headlines/20121221-moreno-valley-district-raps-warehouse-plans.ece>

3

Mitigation in a vacuum is no in name only. Moreno Valley residents deserve a high quality of life and that includes air that does not contribute to asthma in all age groups, especially our most vulnerable and a city council that understands that their job is to protect the quality of life in our city and that promising cheap jobs that may or may not materialize is not doing their job.

4

This project is being viewed alone and not in conjunction with the accompanying development of numerous other warehouses that are now active in Moreno Valley, and as such, all the estimated air quality impacts and accompanying mitigations measures are inadequate. Refer to SCAQMD letter dated 12-14-12 to John Terrel, Planning Director, Community & Economic Dev Dept. for the City of Moreno Valley.

5

There are many reasons this project should not be approved, and the Press Enterprise editorial of 1-6-13 says it best, <http://www.pe.com/opinion/editorials-headlines/20130106-editorial-restrict-air-pollution-from-moreno-valley-warehouses.ece>

P-E Editorial 1-6-13

Moreno Valley needs to take a more stringent approach to air pollution from warehouse traffic than the city now proposes. A city contemplating a vast expansion of warehouse space should take every possible step to curb diesel emissions — **for the good of city residents and the region.**

6

The South Coast Air Quality Management District says that Moreno Valley is pushing ahead with warehouse projects without doing enough to protect air quality. The district last month urged the city to put stronger restrictions on the proposed 1.5 million-square-foot March Business Center, slated for land east of Heacock Street near March Air Reserve Base, which is still moving through the city's approval process. The district wrote the city after the project's environmental report in November rejected the agency's suggestions for cutting pollution from truck traffic as impractical.

Air quality should be a fundamental concern for any city proposing to become a warehouse center, as Moreno Valley is. Warehouses are at best a mixed proposition for a city already grappling with heavy traffic congestion in a region with some of the dirtiest air in the nation. Exhaust from diesel engines is a primary source of pollutants, particularly the tiny particle pollution linked to a variety of heart and lung ailments, including cancer and early death. Not surprisingly, fears of deteriorating air quality are one of the biggest reasons for public opposition to city warehouse projects.

So Moreno Valley should address that issue aggressively, especially given the city's plans for millions more square feet of warehouse space — including one proposal for a massive warehouse complex equal in size to more than 700 football fields. If the projects advance, strict air quality requirements from the start could help the city avoid becoming an object lesson in pollution-spewing planning.

Yet the city's response to the air quality regulators' concerns hardly builds public confidence that the city is carefully considering its rush to build warehouses. The air agency said the city could, for example, require trucks serving the warehouse to meet 2010 emissions standards, or create a plan to phase in newer, cleaner trucks as quickly as possible. The city could also require warehouse tenants to apply for government grants to retrofit or replace older trucks, among other steps. The city's reaction: Moreno Valley has no control over truck emissions, which fall under state and federal law. The city also called the air quality agency's proposed solutions infeasible.

Other local governments do not share that view, however. The air district points to projects in San Bernardino and Mira Loma, where planners imposed such conditions on warehouse proposals. Those examples suggest that the issue is not legality and feasibility, but political will.

And council members' complaints that the air quality district is unfairly picking on Moreno Valley miss the point. The real issue is whether the city is acting responsibly in pursuing warehouse development. The city envisions a massive logistics hub, and yet wonders why anyone would complain when officials wave off concerns about pollution from truck traffic? Moreno Valley should not have to sacrifice air quality for the city's future. Southern California has managed to greatly improve its air even as the region's economy expanded, but not by scrimping on pollution control measures. Moreno Valley can grow and still do everything possible to protect residents' health and the region's air — but not if the city takes a hands-off approach to diesel pollution.

Moreno Valley would do well to look at California Cities with high environmental and quality of life standards as both go together, much as the City of Berkeley has stated very well,

"Goal #3: Protect local and regional environmental quality: Without a healthy environment, the high quality of life in Berkeley will be degraded for present inhabitants and future generations. This Plan emphasizes the protection of the environment, both locally and regionally. It addresses City programs and actions, the importance of regional solutions, and the importance of the actions of the individual in day-to-day decisions on the health of the environment."

Improve Air Quality and Conserve Resources. Air quality in the Bay Area is threatened by increased emissions from motor vehicle use and other sources. The City Council recently the Resource Conservation and Global Warming Abatement Plan. Many policies from that plan are incorporated into the General Plan. The Plan's Transportation Element contains policies to reduce automobile use and the Land Use Element encourages housing development along transit corridors to reduce the need for automobiles. <http://www.ci.berkeley.ca.us/contentdisplay.aspx?id=488>

Ted and Marcia Amino
Morneo Valley Residents

tmamino@aol.com

RESPONSES TO LETTER G-45

Ted and Marica Amino

Response to Comment G-45-1. The commenter notes the citation from Enstrom in the Draft Environmental Impact Report (DEIR) that concluded that risk from diesel particulate matter (PM) is exaggerated and then cites a study from the Office of Environmental Health Hazard Assessment (OEHHHA) that discussed the negative health effects of diesel PM. The intent of including the citation from Enstrom was to provide an alternative viewpoint for discussion and informational purposes. The potential negative health effects from diesel PM are discussed at several locations as discussed in the Master Response-2: (refer to Letter C-3) Health Effects of Diesel Particulate Matter.

Response to Comment G-45-2. The commenter notes that because of some rescheduling of compliance dates by the Air Resource Board (ARB), the expected truck emission reductions may also be delayed, resulting in higher emissions than under the original compliance date phase-in schedule.

The project has already committed in a project design feature as well as in Mitigation Measure (MM) 4.3.6.3B to require all diesel trucks that access the project to be compliant with Model Year 2010 or better engines, the cleanest diesel engines required under regulation. Thus, there will be no delay in implementing clean trucks as part of the project.

The commenter says the project should not be approved. This information will be presented to the City Council, and they will consider all comments and responses in this Final Environmental Impact Report (FEIR) document, prior to making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-45-3. The commenter questions some of the phasing assumptions relative to air pollutant estimates. The commenter should note that project phasing was extended from 10 to 15 years which would allow more time for the state emission control regulations to be enacted, including for World Logistics Center (WLC) project trucks. In addition, the project was reduced by 3 percent and the traffic and air quality reports revised to respond to the many comments on the DEIR and utilize more accurate assumptions about project-related air pollutant emissions. Therefore, the City continues to believe the estimates of air pollution impacts during project phasing are still worst case estimates. See also Response to Comment G-45-5 for more information on cumulative impacts and the Air Quality Management Plan (AQMP).

The commenter indicates the project has the potential to conflict with implementation of the South Coast Air Quality Management District (SCAQMD) Air Quality Management Plan. The commenter is correct. The commenter also indicates that adding air quality violations is not acceptable. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents such as the South Coast Air Quality Management Plans seek to reduce air emissions through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development.

Response to Comment G-45-4. The commenter expresses concern about mitigation and the City's decision-makers. This does not make a specific comment about the WLC project or EIR, but the City Council will consider all comments and responses on the project and EIR before making a decision. The commenter indicates that Moreno Valley residents deserve air that does not contribute to asthma. The comment is noted; the City Council will consider all comments on the project prior to making a decision on the project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-45-5. The cumulative analysis in Section 4.3.7 of the DEIR examined cumulative air emissions from the project and expected growth in the project area through 2035, as outlined in Section 3.6, *Project Description – Cumulative Projects*, of the DEIR. Section 4.3.7 of the DEIR determined the project was not consistent with the 2012 AQMP. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts, including air pollution. The Traffic Impact Assessment (TIA) incorporates cumulative traffic from all known land development projects and all funded roadway projects, as stated in Section 7 in the revised TIA (FEIR Volume 2 Appendix L-1). The air quality localized analysis and the health risk assessment take into account this cumulative traffic on the freeways and roadways in Moreno Valley (see revised air quality analysis in FEIR Volume 2 Appendix D-1). Therefore, the project analysis does take into account the other development in the area.

The commenter refers to the SCAQMD letter dated 12-14-12. We believe this letter refers to the SCAQMD's comments on the FEIR for the proposed March Business Center. (http://www.aqmd.gov/ceqa/igr/2012/December/MarchBC_RTC.pdf). The commenter is wondering if the March Business Center has been included as a cumulative project. As of the time the notice of preparation (NOP) was issued, no portion of the March Business Center was completed and generating traffic, therefore it was not included in the baseline conditions for the TIA. However, it was included as part of the cumulative growth projections in the TIA.

Response to Comment G-45-6. The commenter urges the City to curb diesel emissions. Section 4.3 of the DEIR provided an extensive analysis of air quality impacts, including diesel particulate matter (DPM), and provided a number of mitigation measures to help reduce air emission impacts. The project air quality study and Section 4.3 of the DEIR were subsequently revised in large part to respond to comments about air quality impacts of the project. The Master Responses 1 through 5 in Letter C-3 from the South Coast Air Quality Management District provide more information relative to air quality impacts of the project in response to comments on the DEIR. The City Council will consider the information presented in the DEIR and revised technical studies regarding mitigation for air quality impacts and health risks from air pollution. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts, including air pollution.

Response to Comment G-45-7. The commenter wants to phase in newer trucks. In fact, the revised air quality study requires earlier implementation of newer and cleaner trucks (Mitigation Measure 4.3.6.3B which requires that diesel trucks be model year 2010 or later).

Response to Comment G-45-8. The commenter refers to air quality mitigation in other areas. Information on measures enacted in other jurisdictions may be useful to decision-makers when considering appropriate mitigation for the WLC Project. However, there is no legal requirement for the City of Moreno Valley to implement measures developed by and in other jurisdictions, the mitigation for WLC project impacts must be proportional and appropriate given the characteristics of this specific project. MM 4.3.6.2A requires 4 Tier 4 equipment and MM 4.3.6.3B requires that diesel trucks during operation be model year 2010 or later. These two mitigation measures will require the cleanest diesel technology available under the current regulatory requirements.

Response to Comment G-45-9. The commenter hopes that project job estimates will not outweigh air pollution concerns. The City Council will consider all comments and responses in this FEIR document, prior to making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-45-10. The commenter refers to Berkeley General Plan Goal #3 regarding air pollution. The City Council will consider the project's consistency or inconsistency with the Moreno Valley General Plan, as well as all comments and responses on the project and the EIR prior to making a decision on the WLC project. It should be noted that the Housing Report (DEIR Appendix O-3) indicated that poverty and unemployment create worse health effects on minorities and low income individuals compared to diesel particulate matter (DPM).

Letter G-46: Tracy Hodge (email) (April 8, 2013)

From: Tracy Hodge [<mailto:Tracy@wrridge.com>]
Sent: Monday, April 08, 2013 10:25 AM
To: John Terell; Mark Gross
Cc: tracy@wrridge.com
Subject: DEIR Comments for the WLC

To whom it may concern:

I am a homeowner on the east side of Moreno Valley and have reviewed the Draft Environmental Impact Report with regard to the proposed World Logistics Center and find this project to have insurmountable consequences to our region if approved.

The Health impact, traffic impact, infrastructure impact and loss of economic benefits to our community does not warrant the approval of such a project. This scope development should be deemed unlawful to be situated near residential communities that could even remotely be burdened by the ongoing significances that the project is proposing.

It is my opinion that not enough due diligence has been practiced by our local city officials to make an educated decision on the magnitude of such a project. If they have then where is proof of their deliberations and what supporting documents will they provide to prove they have full awareness and acceptance of the consequences of their decision?

Also, where in the justice system does it give a City Council permission to cause direct and indirect physical harm to the citizens due to their decision before their actions become criminal?

Also, with the DEIR presenting the significant impacts with no mitigation to resolve the impact, where is the protection by our City Council to the community to protect us from this sort of demise on every impact level?

To approve this project shows such lack of consideration for the protection of our citizens what charges could this government be held accountable for? There is not enough tax base or ongoing proof of employment to warrant this kind of disregard for the impending consequences.

There will be thousands of residents directly in harm's way due to every significant impact this project promises. What will be the City Council's retribution to the citizens within the region with the quality of life willfully being revoked by them due to their decision? This project not only brings health consequences, infrastructure deterioration that our community cannot afford but what about the blighting of our communities and deliberate theft by our City Council of the property owners value and equity of their real estate?

Our elected officials have an amazing opportunity to pay close attention to the communities like Temecula, Riverside, Corona, Rancho Cucamonga just to name a few, that got it right! We are at a pivotal moment in our city's history to make decisions that lay the groundwork for impressive financial rewards that could last for many generations to come. Give us roof tops to house the high wage earners that the medical corridor will attract. Give us Business Parks to bring high wage earners such as medical professionals, engineers, law offices, and high end business components that come to Moreno Valley to do their business instead of having to travel to outlying cities because we do not have those key components to house them. This is an opportunity to bring stable tax base business to our city and build on creating a livable community for all.

I oppose this project and any decision to approve such a horrific development within our community! There are no acceptable overriding consideration that could justify approving it as proposed!

Tracy Hodge
13097 Shubert Street
Moreno Valley, CA 92555

RESPONSES TO LETTER G-46

Tracy Hodge

Response to Comment G-46-1. The commenter believes the project will have many impacts, and the air quality/health risk impacts do not outweigh the economic benefits. The potential environmental impacts of the World Logistics Center (WLC) project on both the natural and man-made environment are evaluated in the Draft Environmental Impact Report (DEIR) Sections 4.1 through 4.16. The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise, and traffic but that impacts to biological resources would be reduced to less than significant levels by project design implementation of recommended mitigation measures. The DEIR identifies a number of air quality impacts of the project in DEIR Section 4.3, Air Quality, and its attendant technical study, and also recommends a variety of mitigation to reduce potential impacts. However, long-term air quality impacts will be significant due to the size and nature of the WLC project, the City Council will consider all comments before deciding whether to approve the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-46-2. The commenter questions the City's decision making process and elected officials. The project review process is outlined in the Response to Comment G-46-1. The remaining comments about the City Council and legal protection do not comment on the project or EIR so they will not be responded to here. The City Council will consider all comments and responses on the project and EIR before taking action on the WLC project.

Response to Comment G-46-3. Most of the comments do not apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-47: Louann Moore (email) (April 8, 2013)

Subject: Re: World Logistic Center

Letter G-47

Good morning,

Thank you for your response. My name is Louann Moore. I live at 26418 Capay Bay Court, Moreno Valley, CA 92555. I am the original owner/occupant and have lived there over 25 years. I am actually pro-development, but not for this project.

1

In addition to my other email, I also want to say that the estimated top wage/salary range of \$60,000 for the World Logistics Center is very low. Considering that is the "high" estimate, it seems the low would be pretty dismal. The warehouse workers will probably never be able to afford a house at that wage, especially since the banks seem to be selling all the foreclosures to investors with cash. Since the recession started, we have wound up with a lot more multiple-family tenants occupying single-family homes in our neighborhood.

2

It is wrong to put industrial development right next to Lake Perris recreational area where people are supposed to be able to have a wilderness experience camping, fishing, boating, and enjoying the outdoors. It does seem like the investors and developers, who don't and won't live in Moreno Valley, will be benefiting and making a profit from the World Logistics Center project, but the residents will be long-term losers, left with massive unsightly industrial buildings and low paying jobs. I doubt that individually we will see benefits from any taxes the City may collect from this project.

3

I think Moreno Valley would be better off to pursue the medical developments and the jobs and professional careers that will follow. The planned locations for those projects are also far more acceptable and compatible with existing uses.

4

Thank you,
Louann Moore

Subject: Fwd: World Logistic Center

Dear Mr. Gross,

I am the owner/occupant of 26418 Capay Bay Court. I agree completely with my daughter's email to you (below). While Moreno Valley needs more business and economic development, we should not be rezoning our beautiful natural habitat for giant warehouses. Warehouses should be located by the 215 and 60 freeways and by City Hall where the land is already zoned for commercial/industrial uses. There should also be more infill redevelopment for places like the old Home Base on Hemlock and other vacant or eyesore spots in the city. Commercial and industrial development should be limited to freeway-side locations and not inland, especially in nature conservancy areas. I do not want to be stuck in gridlock breathing diesel fumes, and I don't think that all the children playing sports at our wonderful Morrison park, Valley View High School and Mountain View Middle School ball fields should be breathing the pollution either.

5

Thank you for your consideration,
Louann Moore

RESPONSES TO LETTER G-47

Louann Moore

Response to Comment G-47-1. The comment does not apply to the Environmental Impact Report (EIR) analysis or conclusion but is a personal introduction. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Response to Comment G-47-2. The commenter's April 8, 2013 email questioned the wage/salary maximum for the WLC, although the author did not suggest a specific salary range. The Draft Environmental Impact Report (DEIR) relied on average wages provided by governmental sources (i.e. Bureau of Labor Statistics, Employment Development Department and the Census Bureau) for the applicable data within the warehousing and logistics sector, as explained in the Responses to Comments G-90-1 and G-90-2. Importantly, these numbers have been compiled from data sources within the County and Metropolitan Statistical Areas pertinent to the WLC.

In terms of the WLC's anticipated "maximum" employee income, the commenter indicated that an estimated top wage/salary range of \$60,000 for the WLC is very low. We are not clear on where the commenter determined that this would be the maximum remuneration paid by the employers to be located in the WLC. While the Applicant expects a wide salary range for warehouse and logistics workers, an average income of \$41,076 was applied as a reasonable estimate based on wages provided by the governmental sources listed above. While it is certainly true that many WLC employees may fall into lower income categories, it wouldn't be prudent to suggest that an annual salary of \$60,000 is the ceiling as it would neglect a significant number of positions within management, as well as those requiring higher skills and/or educational levels. For example, according to Salaries.com, the median income (salary plus bonus) for an Information Technology generalist working in Moreno Valley is \$55,594, with 25% of these employees earning over \$66,750 (Exhibit R). As Information Technology generalists are necessary to assure that computer systems are adequately operated and maintained at most businesses, there will be employees filling this position at many firms located WLC. Furthermore, even the lower income jobs that will be provided at the WLC will be an important component of the City's economy, as they meet the needs of students and other individuals who are new to the labor market and/or seeking part-time work due to other obligations, as well as family members from dual-income households.

While not every employee working in a logistics facility will be able to purchase a home, this state of affairs is not atypical of Moreno Valley residents in general, as according to the U.S. Census, 62.9 % of the City's households actually owned their own home between 2008 and 2012. In some cases, WLC employees may be students or retired individuals who at this point in their lives do not intend to own their own homes. In addition, those employees with higher salaries, as well as those with lower salaries who are the second or third income sources in their families, may very well reside in owner-occupied homes. To imply that WLC employees will be buying homes in lower percentages than current Moreno Valley residents may be incorrect.

Response to Comment G-47-3. None of the comments apply to the EIR analysis or conclusions, but are personal and political observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., traffic, air quality, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project.

Response to Comment G-47-4. The comments do not apply to the EIR analysis or conclusions, but are personal desires for the outcome of the project. It should be noted that the City Council will

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-47-5. None of the comments apply to the EIR analysis or conclusions, but are personal desires for the outcome of the project. Many of the comments regarding impacts of the WLC project on the overall quality of life, specifically air quality and traffic, were addressed in the DEIR Sections 4.4 and 4.15, respectively. Aesthetics was also discussed in DEIR Sections 4.1. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

RESPONSES TO LETTER G-48

Donna Castelos

Response to Comment G-48-1. The comment does not apply to the Environmental Impact Report (EIR) analysis or conclusion but is a personal objection to the proposed project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-49: Karen Jakpor (April 8, 2013)

Comments on the Environmental Impact Report for the Proposed World Logistics Center in Moreno Valley, California

From: Karen Jakpor, MD, MPH
Physician Volunteer with the American Lung Association in California
16941 Mockingbird Canyon Rd.
Riverside, CA 92504

To: Mr. John Terrell
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

RE: Comments on the Environmental Impact Report for the Proposed World Logistics Center in Moreno Valley

April 8, 2013

Dear Mr. Terrell:

I am a Riverside resident and a physician volunteer with the American Lung Association. I have experienced firsthand the trials of living in an area with severe air pollution as an asthmatic, as I have been admitted to the hospital or ER on numerous occasions with asthma. I am certainly not alone in this struggle, as the prevalence of asthma in Riverside County is 14.5%. If you have ever lost your health, you would realize that as important as jobs are, health is even more important.

I am deeply concerned about the proposed 41.6 million-square-foot World Logistics Center, because upon reviewing the DEIR I found **no less than six “significant and unavoidable impacts.”** Please refer to Addendum1-The Executive Summary 1.2 of the “Air Quality, Greenhouse Gas, and Health Risk Assessment Report, World Logistics Center, City of Moreno Valley, California” prepared by Michael Brandman Associates.

The American Lung Association’s 2012 State of the Air Report gives the Moreno Valley and surrounding Riverside County region an F grade for all three pollutants: ozone, year-round particle pollution and short-term particle pollution. The Riverside-Los Angeles County region was ranked #1 in the nation for worst ozone pollution, #3 in the nation for annual particle pollution, and #4 in the nation for 24-hour particle pollution.(1) Riverside County has 111 unhealthy ozone days and 29 unhealthy particulate matter days per year.(2) As Moreno Valley is already one of the most air-polluted cities in the nation, I would expect the Moreno Valley City Council to reject any proposal that would have numerous **“significant and unavoidable impacts”** that are not mitigated in the environmental impact report.

The proposed area for the development is currently a “nonattainment” area for both federal and state standards for PM2.5, PM10, and ozone. With the current state of air pollution in Moreno Valley, and lack of rail and adequate freeway infrastructure along the winding part of the 60 freeway through the “Badlands,” it would be hard to find an area in the nation more unsuitably situated for one of the largest warehouse complexes in the world.

- How can the city of Moreno Valley help reach “attainment” of state and federal air quality standards by building a 41.6 million-square-foot warehouse complex the equivalent of 700 football fields and adding an estimated 14,682 truck trips per day?

- What contributions have Moreno Valley city planners made to help the region attain these standards?

5

I would like to remind Moreno Valley's city council and city planners that air pollution has multiple significant impacts on a community (even when many individuals appear to be unaware of how air pollution affects them.) Approximately 9,200 Californians die each year from particulate air pollution, more than twice the number killed in car accidents. (3, 4) Small particulates are so small that they get absorbed into the bloodstream which carries the particulates to all parts of the body. These particulates are associated not only with lung diseases such as asthma and COPD, but they are also associated with heart attacks, stroke, and cancer. The County of Riverside Department of Public Health released a report which states that Riverside County ranks 32nd in health out of 54 counties. (5, 6) Air pollutants play a role in each of the top 4 causes of death in Riverside County: 1. heart disease, 2. cancer, 3. chronic lower respiratory disease (CLRD), and 4. stroke. When comparing mortality rates from these four diseases with other California counties, Riverside County ranked 54th, 47th, 45th, and 42nd, respectively.(6)

6

I acknowledge that the DEIR includes estimates on the impact of the project on additional cases of cancer. However, air pollution causes numerous health impacts other than cancer.

7

- Please calculate the impact of the additional truck traffic from the proposed World Logistics Center on the additional rate of premature deaths from heart disease, chronic lower respiratory disease, and stroke.
- Please calculate the additional health costs that result from the additional disease burden of heart disease, cancer, chronic lower respiratory disease, and stroke.

8

9

The County of Riverside Department of Public Health estimates that the prevalence of asthma is 14.5% in Riverside County, and among blacks in Riverside County, it is even higher—30.6%.(6) Increasing air pollution is known to be associated with an increased number of cases of asthma, ER visits and hospitalizations for asthma. Millions of lost school and work days occur each year in California due to the health effects of air pollution. The South Coast Air Quality Management District estimates that the monetary costs of air pollution in Southern California alone are at least \$14.6 billion dollars per year. (7) In 2005, the cost of asthma hospitalizations in California was \$763 million. And approximately 61% of these costs were born by the government through Medicare and Medicaid. (8)

10

- What is the additional economic burden caused by the air pollution produced by the World Logistics Center?
- And what proportion of the additional economic burden caused by increased health costs will be paid for by the World Logistics Center? By the county and state governments? By local health insurance plans? By individuals for out-of-pocket costs for expensive inhalers costing \$50 per month?

11

12

Any quality analysis of air pollution health effects in the Inland Empire would certainly not omit discussing the findings in USC's classic "Children's Health Study" which included studying children from Riverside and Mira Loma, California—a highly relevant study. One of the key findings was that children growing up in the most air polluted regions had a stunted rate of lung function growth. In fact, the children of Mira Loma, an area known for a huge number of warehouses and truck traffic, had among the most stunted growth in lung function of the thousands of children studied in Southern California communities. (9) Other key findings in the study showed that there were more asthma exacerbations as traffic-related pollution increased. There were also more newly diagnosed cases of asthma in children in areas with high ozone levels.

13

- Why does this environmental impact report not include information from the USC Children's Health Study in its analysis? 14
- Why is there not a more careful examination and calculation of non-cancer health risks, both acute and chronic? 15

Additional Questions:

- How will using such a large piece of land for warehousing and resultant trucking allow the City of Moreno Valley to comply with SB375 and AB32? 16
- Enumerate the cumulative effects of emissions from other nearby proposed warehouse projects such as this same developer's proposed project in the City of Banning. How much more will the impact be on the emissions of criteria air pollutants for the region when you consider the cumulative effects? What are the cumulative effects of the additional health risks, both acute and chronic, both cancer, and non-cancer effects? What other big warehouse projects are you aware of being considered in neighboring communities which will also burden the freeway infrastructure? 17
- Will the 60 freeway need widening, especially if one considers the cumulative effects of neighboring cities building large warehouse complexes such as Morongo Intermodal? What additional effects would this have on air pollutants? 18
- Why is this large warehouse project being considered in an area that currently has no rail line, so that "cleaner trains" are not even a current option for goods movement? Or are there railroad plans in the works that we are not aware of? If so, how will this impact air quality in the region? Already the current Riverside-Line of Metrolink has comparatively few trains running, as it shares its track with freight trains. If a rail link were expanded to Moreno Valley to service the warehouses, would this reduce available mass transit by Metrolink? What impact would this have on emissions? 19

The draft EIR mentioned that more jobs would be created in Moreno Valley, which could reduce automobile trips by people working and living in Moreno Valley. But previous experience with Mr. Benzeevi's Sketchers warehouse proved that his job creation estimates fell extremely far short. Some suggest the construction of the warehouse caused a net job-loss for the Inland Empire and that people who worked for Sketchers plants in Ontario now commute to Moreno Valley, after they were transferred when the Ontario plants closed. That suggests longer commutes and higher automobile emissions. 20

- Have you considered the impact of commuters traveling to Moreno Valley to work on the level of emissions? 21

According to the Press-Enterprise:

"Predicting warehouse jobs already has proven tricky for Moreno Valley.

The Skechers warehouse, which Benzeevi has held up as a model for buildings at the World Logistics Center, has not delivered on the 1,000 jobs that supporters were trumpeting as the project navigated city approval processes. A city survey in January found 600 jobs there — a rate of one job per 3,000 square feet. 22

Skechers also shed jobs last year, around the time its distribution operations moved from Ontario to Moreno Valley."

The shoe company had employed about 1,000 people in five smaller warehouses before consolidating and moving to Moreno Valley. Skechers notified state officials that it would terminate 339 people at four Ontario locations on Oct. 31.” (11)

22

In conclusion, based on the enormous size of the proposed World Logistics Center, I am concerned that the project would have an enormous impact on truck traffic, air pollution, health, and health care costs in the surrounding region. As the size of the proposed warehouse complex appears unprecedented, the modeling used in the environmental impact report may have overstated benefits and underestimated risks. I am personally strongly opposed to the proposed project, especially in the absence of adequate mitigation measures.

23

Sincerely,

Karen Jakpor, MD, MPH

Addendum 1:

Executive Summary 1.2 of the “Air Quality, Greenhouse Gas, and Health Risk Assessment Report, World Logistics Center, City of Moreno Valley, California” prepared by Michael Brandman Associates.

The Executive Summary 1.2 states:

“The following is a summary of the analysis results:

- The project would exceed the SCAQMD regional emission significance thresholds for VOC, NOX, CO, PM10, and PM2.5 during construction.
- The project would exceed the SCAQMD regional significance thresholds for VOC, NOX, CO, PM10, and PM2.5 during operation.
- The project would exceed the SCAQMD localized significance threshold for nitrogen dioxide (NO2) and PM10 during operation under worst-case conditions assuming that the project would be operational in the existing year 2012.
- The project would exceed the SCAQMD localized significance thresholds for nitrogen dioxide, PM10, and PM2.5 concentrations during construction and during overlapping construction and operation under the proposed development schedule.
- At final build out, the project would exceed the SCAQMD localized significance threshold for PM10 and PM2.5 concentrations during operations under the proposed development schedule.
- The project generated construction and operational emissions of diesel particulate matter would exceed the SCAQMD 70-year lifetime cancer risk significance threshold at the existing residential areas located within the Specific Plan and to the west of the project across Redlands Boulevard.

•The project-generated traffic would not result in a carbon monoxide hot spot at project- impacted intersections.

Impact AIR-1:

The project would conflict with or obstruct implementation of the applicable air quality plan. **Significant and unavoidable impact.**

Impact AIR-2: The project would violate air quality standards or contribute substantially to an existing or projected air quality violation. **Significant and unavoidable impact.**

Impact AIR-3:

The project would result in a **cumulatively considerable net increase of criteria pollutants for which the project region is in nonattainment** under an applicable federal or state ambient air quality standard (including releasing emissions, which exceed quantitative thresholds for ozone precursors). **Significant and unavoidable impact.**

Impact AIR-4:

The project would expose sensitive receptors to substantial pollutant concentrations. **Significant and unavoidable impact.**

Impact AIR-5:

The project would not create objectionable odors affecting a substantial number of people. Less than significant impact.

Impact AIR-6:

The project would generate direct and in direct greenhouse gas emissions that would result in a significant impact on the environment. **Significant and unavoidable impact.**

Impact AIR-7:

The project could conflict with an applicable plan, policy or regulation of an agency adopted to reduce the emissions of greenhouse gases. **Significant and unavoidable impact.**

RESPONSES TO LETTER G-49

Karen Jakpor

Response to Comment G-49-1. The commenter notes that that the project would have six air quality-related significant and unavoidable impacts as shown in the Draft Environmental Impact Report (DEIR). The comment is noted and acknowledged but does not raise any new issues.

Response to Comment G-49-2. The commenter notes the statistics on the state of air quality published by the American Lung Association for the greater Riverside County region including Moreno Valley.

The commenter did not raise any new issues. Air quality in the region has significantly improved in the past two decades, as discussed in the DEIR (Figure 4.3.1: Percent of Days Basin Exceeds Federal Ambient Air Quality Standards (AAQS); Figure 4.3.2: Exceedances of 1-Hour and 8-Hour Federal Standards; Figure 4.3.3: Number of Days per Month Federal Ozone Standard Exceeded, 1976–2000; Figure 4.3.4: NO_x, VOC, and Ozone Trends in the South Coast Air Basin; and Figure 4.3.5: Particulate Matter Trends in the South Coast Air Basin).

Further, a review of PM_{2.5} air quality trends in the Inland Empire including air monitoring data at Mira Loma, Fontana, San Bernardino, and Riverside Rubidoux have shown marked downward trends in the Inland Empire since 2001. PM_{2.5} is often used as a surrogate for airborne particulate matter such as diesel particulate matter (PM). These trends are evident despite the urban and logistics warehouse development during this time period. These trends are shown in the exhibit, Particulate Matter Trends and Emissions Forecast, contained in the revised analysis.

Response to Comment G-49-3. The commenter notes that because of air quality nonattainment in the project region, the site is unsuitable for such a large project and that the project should not be approved

The entire South Coast Air Basin is in nonattainment. If the project were not constructed in the proposed site, warehouses would likely be constructed elsewhere in the air basin. Also see Response to Comment G-49-2. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents like the South Coast Air Quality Management District (SCAQMD) Air Quality Management Plans seek through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development. The City Council will consider all comments made on the project before making a decision on the project.

Response to Comment G-49-4. The commenter inquires how the city can help reach attainment of ambient air quality standards by approving the project. See Response to Comment G-49-3.

Response to Comment G-49-5. The commenter asks how city planners have helped achieve state and federal air quality standards. Local planners help in this regard by requiring individual development projects to comply with established laws and regulations regarding air pollution, and by recommending appropriate mitigation for such projects in the California Environmental Quality Act (CEQA) documents that must be prepared and approved prior to development of such projects. Planners also help achieve these standards by recommending General Plan goals, policies, and objectives that guide future development and City activities in ways that help achieve these standards. However, it is the decision-makers who must adopt and are ultimately responsible for the implementation of the General Plan (see DEIR MMs 4.3.6.2A-D, 4.3.6.3A-D, and 4.3.6.4A).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-49-6. The commenter provides several statistics that indicate the severity of air pollutants and their health impacts in California and Riverside County. Please refer to Response to Comment G-49-2.

Response to Comment G-49-7. The commenter notes that air pollution causes numerous health impacts other than cancer. Non-cancer health hazards are discussed in the Master Response-2: Health Effects of Diesel Particulate Matter in Letter C-3.

Response to Comment G-49-8. The commenter asks for the calculation of the additional rate of premature deaths from heart disease, chronic lower respiratory disease, and stroke.

Particulate matter (PM₁₀ and PM_{2.5}) is a public health concern, as it is known to impact both the respiratory and cardiovascular systems. PM₁₀ and PM_{2.5} deposition in the lungs and penetration into the bloodstream (for the smallest particles) triggers a range of inflammation responses and exacerbates health problems such as asthma and chronic bronchitis. Individuals susceptible to higher health risks from exposure to airborne PM include children, the elderly, smokers, and people of all ages with low pulmonary/cardiovascular function. The Air Resource Board (ARB) reviewed and summarized the non-toxic health effects (mortality and morbidity) of PM exposure and presented a health effect model attempting to quantify these impacts based on concentration-response functions.³⁹ This ARB model has been used, for example, to estimate the number of cases of disease and premature deaths linked to PM and ozone exposure from ports and goods movement activity in California.⁴⁰

Although the ARB model has also been used to quantitatively assess project-specific incremental levels of public mortality and morbidity, such calculations are subject to significant uncertainty. Sources of uncertainty include emission estimates, population exposure estimates, concentration-response functions⁴¹, baseline rates of mortality and morbidity that are entered into concentration response functions (C-R functions), and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as sulfur dioxide, nitrogen dioxide, carbon monoxide, and ozone that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions. Health risk estimates derived in the presence of significant uncertainty tend to rely on very conservative assumptions that may greatly overestimate the potential adverse health effects. As stated by ARB in a 2006 study of diesel PM exposure from ports and goods movement in California: "Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted. Risk assessment is thus best understood as a tool for comparing risks from various sources, usually for purposes of prioritizing risk reduction, and not as literal prediction of the community incidence of disease from exposure."

However, perhaps the most compelling use limitation of C-R functions for site-specific projects is the consideration of whether it is valid to apply the C-R functions to changes in PM concentrations that are far below the ambient concentration. For example, the Air Resource Board/ Office of Environmental Health Hazard Assessment (ARB/OEHHA) analysis applied a threshold of 18 µg/m³ for the long-term mortality C-R function for PM₁₀ and 9 µg/m³ for PM_{2.5}, representing the lowest

³⁹ Concentration-response functions are used to predict the effect of changes in ambient PM concentrations on health effects such as premature deaths, cardiac and respiratory hospitalizations, asthma and other lower respiratory symptoms, lost work/school days, etc.

⁴⁰ ARB 2006. Emission Reduction Plan for Ports and Goods Movement in California. April 20.

⁴¹ Concentration-response functions may be location-specific, since the composition of particulate matter varies significantly by region, and not all types of particulate matter are expected to have the same health effects. Therefore, the application of concentration-response functions obtained from epidemiologic studies conducted, for example, outside of California may introduce significant errors in estimating impacts in the South Coast Air Basin.

concentration level observed in the long-term mortality studies evaluated⁴². In other words, ARB/OEHHA assumed that the C-R functions were continuous and differentiable down to threshold levels. In the case of trying to quantify project-specific impacts, it may not be appropriate to use C-R functions that were developed with a threshold significantly higher than the change in PM due to the project.

Despite these uncertainties in the analysis methodology, the estimated increase in mortality was calculated for the project. The most common forms of the C-R function are represented in the log-linear form as discussed in the Health Risk Assessment of the Port of Long Beach Middle Harbor Project.⁴³

$$\Delta y = y_0 (e^{\beta \Delta PM_{10}} - 1) \times \text{population}$$

Where:

Δy = changes in the incidence of a health endpoint corresponding to a particular change in diesel PM

y_0 = baseline incidence rate per person for the South Coast Air Basin (= 0.001768)

β = coefficient (diesel PM: 0.005827); this coefficient is based on the relative risk that is associated with a particular concentration and varies from one study to another; and

ΔPM_{10} = change in diesel PM concentration ($\mu\text{g}/\text{m}^3$)

Population = population of the impacted area (for this case greater than 30 years of age)

From the health risk assessment contained in the revised analysis, the highest annual average diesel PM concentration increase due to the project noted prior to mitigation was approximately 0.103 $\mu\text{g}/\text{m}^3$ south of the project. The population noted within this census tract at this location based on the 2010 census data was 3,784 (or 2,081 at 55 percent of the total population). Inserting these values into the above mortality equation yields an increase in mortality (cases per year) of 0.002 at this location and a total of an additional 0.2 cases per year over all of the census tracts contained in the air dispersion modeling domain. The revised air quality assessment provides the results for additional health risk endpoints including chronic illness (chronic bronchitis), hospitalization (Chronic obstructive pulmonary disease), hospitalization (pneumonia – Age 65+), hospitalization (cardiovascular-Age 65+), hospitalization (asthma-Ages 0-64), and emergency room visits (asthma).

Response to Comment G-49-9. The commenter asks for the calculation of additional health care costs that result from the additional disease burden of heart disease, cancer, chronic lower respiratory disease, and stroke.

Health costs are speculative due to several levels of uncertainties in establishing concentration-response relationships between pollutant levels and a particular health outcomes (i.e., mortality, hospitalizations, etc.) and then assigning monetary cost relationships between pollutant levels and health effects, uncertainties in population dynamics, uncertainties in estimating emission levels and their corresponding impacts on air quality, and establishing the linkage between the toxicity of various air pollutants and their effects on health effects⁴⁴. These uncertainties are rooted in incomplete

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

scientific knowledge. When benefits are estimated for future target populations, the cumulative magnitude of the uncertainties can be formidable. Many of them can be reduced by further research, but on the whole, they are likely to remain high. Because of the inherent speculative nature involved in the cost estimation process, no further discussion is necessary.

Response to Comment G-49-10. See Response to Comment G-49-9.

Response to Comment G-49-11. The commenter asks, "what is the project's economic burden on air quality." California Environmental Quality Act (CEQA) does not require the analysis of economic impacts of a project unless there is a direct correlation to adverse physical changes in the environment. In the case of the World Logistics Center (WLC) project, the economic study prepared for the project, (DTA 2014) clearly outlines the direct and indirect costs and benefits of the project on the City finances. Appropriate assumptions and methodologies have been clearly established in the David Taussig & Associates (DTA) study for this level of analysis. However, the commenter does not define what is meant by economic burden, and the DTA study does not provide overly speculative estimates of more general or indirect regional economic impacts of the project that are likely intended under the category of "economic burden."

Response to Comment G-49-12. The commenter asks, "what are the health costs of air pollution from the project." As outlined in the Response to Comment G-49-11, the project economic study and EIR did not examine overly speculative issues such as economic burden, including health costs from air pollution. Such a level of analysis is not required and is even discouraged by CEQA (State CEQA Guidelines Section 15145).

Response to Comment G-49-13. The commenter notes the finding of the USC Children's Health Study and questions why it was not included in the project analysis. The Children's Health Study is discussed in the Master Response-2: Health Effects of Diesel Particulate Matter, in Response to Comment F-11-A6, and in the revised air quality analysis.

Response to Comment G-49-14. See Response to Comment G-49-13.

Response to Comment G-49-15. The commenter questions why there was not a more thorough examination of non-cancer health risks, both acute and chronic. The DEIR did examine the chronic non-cancer health risks from the project's emissions and concluded that the project's diesel PM emissions would not result in a significant non-cancer impact, that is exceed the non-cancer health hazard significance threshold established by the SCAQMD. In the revised analysis, more attention was focused on potential acute non-cancer hazards by examining the various chemical constituents of the gasoline and diesel total organic emissions from the project. To accomplish this, estimates were made of the maximum hourly emission rates of TOGs from all of the project's vehicles including gasoline-powered vehicles and diesel-powered vehicles. This is fully discussed in Response to Comment E-3-6. The assessment of acute non-cancer hazards concluded that the project's emissions from gasoline and diesel vehicles would not results in any significant impacts based on the significance threshold established by the SCAQMD for assessment acute non-cancer hazards.

Response to Comment G-49-16. The commenter wonders how the project will help the City comply with SB 375 and AB 32. The WLC project will generate a large amount of greenhouse gases (GHGs) due to its size and type of land use. However, most of these emissions are capped by AB 32 through its cap-and-trade program. The project's uncapped GHG emissions are less than the SCAQMD's significance threshold. In addition, the project will implement many programs and strategies to limit GHG emissions from future users (DEIR MM 4.7.6.1A) to help reduce "business as usual" (BAU) emissions by 30 percent or more, which complies with the goals of AB 32. In addition, the creation of a large job center in a housing rich/jobs poor areas such as Moreno Valley will incrementally help the region achieve a better balance of jobs and housing, and will ultimately reduce regional air pollutants and GHGs by reducing commuting distances for future workers within the WLC and the City of

Moreno Valley (refer to the discussion of AB 32 and SB 71 in DEIR Section 4.7 on pages 17 through 20).

Response to Comment G-49-17. The commenter inquires about the cumulative effects of emissions from other nearby proposed warehouses on health risks. The DEIR, Section 4.3.7.4 Health Risk Impacts examined the cumulative impacts of the project in combination with existing, proposed, and reasonably foreseeable projects in the area surrounding the project and concluded that the cumulative impacts of the project would be significant. The results contained in the revised analysis confirm the conclusions in the DEIR. The revised analysis, Section 5 Cumulative Impacts and the DEIR both concluded that the project would have a cumulatively considerable impact.

Response to Comment G-49-18. The commenter inquires as to the cumulative effects of the I-60 freeway widening on air pollutants. The widening of the I-60 Freeway would lead to a more efficient flow of traffic and lower emissions and consequently lower air quality impacts.

Response to Comment G-49-19. The commenter asks why rail was not considered, or if there are rail plans in the works. He points out that the Riverside line of Metrolink has comparatively few trains running as it shares its track with freight trains, and asks if rail expansion to warehouses would reduce track availability for mass transit. An additional section (Chapter 4, Section F) has been included in the revised TIA (FEIR Volume 2, Appendix L) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, and capacity constraints within the rail system.

Response to Comment G-49-20. The commenter expresses concern that workers at the new Skechers facility only transferred from the Ontario facility and regional workers were actually a net loss. First, it must be noted that this comment is about the Skechers facility rather than specifically about the proposed World Logistics Center (WLC) project. The Skechers facility has been used as a negative model in evaluations of the WLC project, with commenters assuming job estimates from future development within the World Logistics Center Specific Plan (WLCSP) would be much lower and just transfer from other areas. Several points must be made in this regard. First, the job estimates widely touted for the Skechers facility were actually for the entire Highland Fairview Corporate Park, of which Skechers was only a part. Second, it is true the Skechers facility was an existing warehouse that transferred from the Ontario area, but future warehouses within the WLC project will be of many different types, most likely to be new warehouses, rather than simply transfers from other areas. Third, the Skechers facility opened just before a major downturn in the local and national economy, so even now it is not operating at full capacity or employment. Fourth, the Skechers facility is highly automated, but the degree of automation in future warehouses within the WLC project would probably vary tremendously (e.g., automated warehouses have fewer but higher skilled workers, while less automated warehouses may have many more unskilled or lower skilled workers). Finally, the amount of part-time to full-time workers, as well as the degree of skilled workers, each warehouse employs will vary tremendously. The employment assumptions used on the DTA study, both the original study and the revised study, were based on industry standard regional values which have proved to be reliable over the years in estimating future employment from new uses such as logistics warehousing.

Response to Comment G-49-21. The commenter queries as to whether the impact of commuters traveling to Moreno Valley on level of emissions was considered. All traffic (by employees and delivery trucks) resulting from the project was accounted for in the development of the traffic impacts from the project. The traffic volumes, in turn, were used to estimate the project's traffic emissions and resulting air quality impacts from the project. The daily traffic volumes used in the air quality and greenhouse gas emissions analyses in the DEIR are identified in Table 17 and Table 18 in Appendix D in the DEIR. The trip generation rates for the "local" trips as estimated in the DEIR (which are assumed to be primarily employee trips) are shown in Table 16 in Appendix D in the DEIR. In the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

revised analysis, the revised traffic analysis provided the traffic volumes and the fleet mix on roadways on project impacted roadways and freeways. The emissions from trucks and commuters were input into a dispersion model for the localized analysis and health risk assessment to determine air pollution and cancer risk impacts to the surrounding communities.

Response to Comment G-49-22. The commenter's April 9, 2013 letter questions the projected number of warehousing jobs to be created by the WLC on the basis that the Skechers warehouse project did not generate as many jobs as may have been expected. The DEIR analysis relied on information compiled from data sources within the County and Metropolitan Statistical Areas pertinent to the WLC, as explained in detail in the Response to Comment G-90-1. Notably, as the Skechers warehouse project has not completed their second phase of development, and the company was negatively impacted by the Great Recession, it is not known yet whether it will ultimately generate the number of jobs that were initially expected. Furthermore, while both the Skechers warehouse and the WLC both provide a location of logistics-type activities, the WLC is a much larger project that it is expected to encompass a much wider range of logistics facilities. Some of these facilities may be highly robotized and less labor intensive, while others (e.g.; fulfillment centers) are likely to be more labor intensive and will require a higher number of employees per square foot. Therefore, even if the Skechers plant does not ultimately generate as many jobs as were expected, it is unfair to apply the number of Skechers jobs with the employment expected in much larger and more versatile facilities as are anticipated for the WLC.

Response to Comment G-49-23. The commenter is concerned about the size and impacts of the project and that it has inadequate mitigation for air quality impacts. The WLC project is a regional logistics center large and proposes a large amount of new warehousing in this area. The original air quality study contained extensive mitigation for air pollutant impacts, and the revised study (based on the many comments received on the DEIR) provide additional mitigation for both onsite and offsite air quality impacts. It will up to the discretion of the City Council to determine if the benefits of the project outweigh its significant environmental impacts, and the Council will consider all comments and responses on the project and EIR prior to making a decision on the project.

Letter G-50: Ann McKibben (April 8, 2013)

Via e-mail: markg@moval.org

Mark Gross, Senior Planner
Community & Economic Development Dept.
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92557

Dear Mr. Gross:

Re: World Logistics Center Project, Draft Environmental Impact Report (SCH
#2012021045)

The following are my comments on the Draft Environmental Impact Report (DEIR) for the World Logistics Center Project.

The project design is extremely poor land use planning. The proposed project is 41.6 million square feet of warehousing, approximately the size of 700 football fields set in the midst of low density residential and agricultural lands. The land use is incompatible with surrounding land uses and does not match the city's general plan.

1

There is not adequate infrastructure in place (such as rail facilities and highways) to serve the project. Thousands of trucks will clog our already traffic-filled freeways and local roads; it will increase freeway congestion. The taxpayers of Moreno Valley and the entire inland region will end up subsidizing infrastructure improvements through their local, county, state and federal taxes. It places an unfair tax burden on the residents of Moreno Valley and the Inland Empire.

2

The Inland Empire already has some of the worst air quality in the country. The project will increase air pollution, fine and ultra-fine diesel particulates which are known to have negative effects on children's health, those with asthma, lung disease and the elderly. The following source ([http://www.catf.us/diesel/dieselhealth/Diesel Soot Health Impacts; Clean Air Task Force; map](http://www.catf.us/diesel/dieselhealth/DieselSootHealthImpacts;CleanAirTaskForce;map)) states that: "The average lifetime diesel soot cancer risk for a resident of Riverside County is 1 in 3,917. This risk is 255 times greater than EPA's acceptable cancer level of 1 in a million."

3

The proposed project will have devastating impacts on the state-owned 11,000 acre San Jacinto Wildlife Area (SJWA). The SJWA shares a common boundary with the proposed WLC project lands. The wildlife area is a Multi-Species Habitat Conservation Plan (MSHCP) reserve for the County of Riverside. Its purpose is to preserve threatened and endangered plants and animals for future generations. Lights, noise, air pollution will affect the viability of the SJWA as an MSHCP reserve and its recreational uses such as hunting and observing birds and other wildlife.

4

World Logistics Center/DEIR Comments/ATMcKibben/Page 2

Lastly, I do not support this project. It is extremely disappointing to see the city of Moreno Valley lower its standards and work to promote a project that will in the long term destroy the quality of life of our city. It is obvious to anyone that the economic benefits touted by the city and its band of supporters will not be attained. Here is a city that has a population of almost 200,000 residents but yet chooses to ignore the comments of its residents and has denied them the ability to be part of the planning process from the inception of the project. The city holds 'public forums' that do not allow the residents to ask questions or make comments saying that opportunities will come. You can do a better job.

5

Thank you for considering my comments. Please notify me of all meetings, documents and any other information related to this project. My contact information is listed below.

Sincerely,

Ann Turner McKibben
23296 Sonnet Drive
Moreno Valley, CA 92557-5403
atmckibben@roadrunner.com

RESPONSES TO LETTER G-50

Ann McKibben

Response to Comment G-50-1. The proposed World Logistics Center (WLC) project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, Land Use and Planning). The City Council will consider all stated opinions and comments on the project and Environmental Impact Report (EIR) prior to making any decisions regarding the proposed WLC project.

Response to Comment G-50-2. The commenter their opinion that there is not adequate infrastructure in place (such as rail facilities and highways) to serve the project. "Thousands of trucks will clog our already traffic-filled freeways and local roads; it will increase freeway congestion. The taxpayers of Moreno Valley and the entire inland region will end up subsidizing infrastructure improvements through their local, county, state and federal taxes. It places an unfair tax burden on the residents of Moreno Valley and the Inland Empire."

The project does not propose to use rail services. An additional section (Chapter 4, Section F) has been included in the revised Traffic Impact Assessment (TIA) (FEIR Volume 2, Appendix L) that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors. Limitations on the ability of rail infrastructure to accommodate additional loads were specifically cited as a reason why rail service is not considered a viable option.

The TIA analyzes the project's impacts on surface streets and freeways, identifies where impacts would occur, and describes the improvements needed to mitigate these impacts. The project will be required to pay its fair share for these improvements. Chapter 11, Section E of the TIA describes the project's contribution to for improvements needed to mitigate direct impacts. Chapter 11, Section F similarly describes the project's fair-share contribution towards the improvements needed to mitigate cumulative impacts.

Response to Comment G-50-3. See Response to Comment E-3-6.

Response to Comment G-50-4. The DEIR correctly spells out measures associated with the requirements of Section 6.1.4 of the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) on the Urban/Wildlands Interface to protect adjacent resources. These include, light, noise, toxics, and water quality. Based on the revised MSHCP Consistency Analysis Document (FCS/MBA 2013), Mitigation measures will be imposed by the City of Moreno Valley through its processing of entitlements on a project-by-project basis regarding light, noise, trash, emissions, vectors, fuel management, runoff and water quality, as outlined in the various sections of the DEIR (e.g., 4.1, *Aesthetics*, 4.4, *Biological Resources*). All project operations within the WLCSP will be required to prepare a Water Quality Management Plan (WQMP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of toxic contamination to any downstream water body. All project construction activities within the WLCSP will be required to prepare a Storm Water Pollution Prevention Plan (SWPPP), which will specifically detail all of the required safety precautions necessary to eliminate the risk of construction related contamination to any downstream water body. All development within the project area will be required to obtain a statewide general National Pollutant Discharge Elimination System (NPDES) construction permit for all construction activities associated with the proposed project and will be subject to the County of Riverside's regulations to implement the NPDES program. The NPDES requirements are discussed in detail in Section 4.9 of the DEIR, Hydrology and Water Quality. Lastly, the portions of the WLCSP that are specifically located adjacent to Core Conservation Areas, which are located along the eastern and southern boundary of the WLCSP, will require project specific design features and

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

measures related to light, noise, trash, emissions, vectors, fuel management, runoff and water quality as part of the MSHCP requirements for projects affecting a recognized Urban/Wildlands interface. Mitigation measures will include specific project designs such as:

1. Light directing/restricting covers on light poles,
2. Vegetated buffer along the southern and western edge of the WLCSP to reduce noise impacts adjacent to residential development and the conservation area,
3. Street sweeping and trash removal requirements to reduce on-site and off-site trash issues,
4. The vegetated buffer mentioned above as well as a perimeter wall will be used to reduce the emissions leaving the WLCSP,
5. All detention basins will be designed to facilitate water quality improvements and will require assessments by vector control to reduce or eliminate standing water, and
6. The SWPPP and NPDES for each project will adequately address all fuel management, runoff water quality requirements.

Response to Comment G-50-5. The comment does not apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-51: Michael McCoy (email) (April 7, 2013)

April 7, 2013

TO: City of Moreno Valley Planning Dept, Attn: Mr Mark Gross at markg@moval.org
City Hall, 14177 Frederick St, Moreno Valley, CA 92552

FROM: Michael McCoy, 10304 Crossing Green Cir, Moreno Valley CA 92557 at
mikeandnan@mac.com

SUBJECT: Official Comments for the Draft Environmental Impact Report (DEIR) for the
World Logistics Center (WLC) proposed for Moreno Valley, State Clearinghouse No.
2012021045

A. Opening General Comments on Overall Project:

Thank you, City Council for allowing others and me to comment on the environmental impacts of the proposed World Logistics Center in Moreno Valley. The EIR document is generally adequate although I will point out some important omissions and weak spots. The consultants the developer hired under City advisement are generally some of the best in the business and I respect their hard work. However, the citizens also should have an equal chance to voice their concerns and try to get the City Council to slow down the review process and listen to the people. The Mayor recently admitted that "trust" was a major problem between the people and elected officials that cried out to be remedied. If the WLC is given a complete and total airing of all views and allows all questions to be proposed by both the developer and project opponents it would go a long way to re-establishing that trust. Steamrolling a project through does not bide well for trusting the Council and their motives.

1

How the City deals with the vast list of unavoidable and severe environmental impacts the project would generate will illustrate that level of trust and of belief in the valid concerns of the general public. Will the City require even more mitigation? Will the project be declined in total and the developer shown the door? Will the City leaders go forth with the potentially divisive "overriding considerations" strategy, under CEQA to force the project on the community? Would the City put the project up to a vote of the people? Deep questions need supportable answers and so far I have mostly heard a lot of concealment and avoidance of unfriendly opinions from City Hall.

2

It's no secret that I am an opponent of the World Logistics Center as now envisioned by the developer and its cheering section on the City Council. My comments in the following pages show that I am invoking much of the data and predictions found in this Draft EIR as glaring proof that the WLC is totally inappropriate for this particular location, for Moreno Valley and for the entire Inland Region. The developer acquired some relatively cheap land and is maneuvering the approval process to its liking and claiming it will be a 'jobs bonanza' despite a track record to the contrary. The Skechers project brought insignificant new jobs to Moreno Valley's citizens and indeed now only employs about 160 workers compared to the 2,000 originally promised.

3

During these forthcoming debates over approval of the project, I propose a moratorium on any job predictions for the WLC. Neither the City, the developer or its consultants can guess years ahead what tenants will build there, the nature of their logistics and warehouse operations, or at what future date they will be up and running. Final build out is predicted for either 2022 or 2035 in the EIR. Any such job numbers for that far ahead are pure fiction.

The World Logistics Center is in my opinion, also doomed to failure in this location because it faces significant loss of business potential due to forthcoming shifts in global goods movement as a result of the long-forecasted widening of the Panama Canal. No matter what is proposed for Moreno Valley, factors far beyond our control will constrain and reduce the need for west coast warehouses. In a once-in-a lifetime paradoxical shift due to the Canal, West Coast ports will lose their competitive edge and regional warehouses could be left vacant.

The WLC, especially, will be "left behind" as a desirable freight staging area as goods movement shifts from the Ports of LA and Long Beach to Mexican, Gulf Coast and East Coast harbors closer to cargos' ultimate destination. The other entry ports are usually cheaper to operate, also. Recent LA Times news articles indicate LA-based officials are now concerned and local California ports, railroads and trucking services are fighting back. However, improved rail and air facilities plus more robust freeway and cargo transferring resources exist elsewhere, all of which are lacking at the WLC site. Better accessed warehouse complexes in Palmdale, Victorville and other desert locations that have plenty of rail, air, interstate freeway and room for innovative cargo-handling facilities, including "high cube" design will hang on to whatever logistics business remains tied to the West Coast.

B. Comments pertaining to Section 1.0 Executive Summary:

1.3 Public Involvement

In some respects the City as Lead Agency has not been as pro-active with encouraging and incorporating expressions of concern and alternative views from the public on the WLC as should be expected with a project as important and controversial as this is. In my opinion, the City has breached the public trust by only barely complying with the legal requirements under CEQA and has avoided or shunned any kind of fair and equal debate. This "doing as little as possible" or "meeting the letter of the law and nothing more" attitude has damaged the integrity of the Council, the review process by not having a true dialog addressing the concerns of the General Public.

All meetings, so-called "forums" and presentations have been almost totally one sided and favoring only the City Council's position regarding the WLC, being one of unwavering support for it. Project opponents have been limited to brief three-minute speeches at meetings and face other limited opportunities. For example, no procedure was provided by the City Council for the public to comment on or ask questions to

taxpayer-paid presenters at recent forums, impeding any fair assessment of all sides of the issue in a public meeting.

When I asked Mayor Owings after the Feb. 26 "Forum" if there would be a future opportunity to ask questions and comment on his statements and those of the consultants made that evening, he told me to e-mail him and that he was also planning for a more genuine question and answer forum soon... but I have never heard back or seen any announcements thereto. Project opponents have had to organize and operate their own meetings and programs, which, curiously, were attended by City staff and the WLC developer.

6

Even the City's internet presence for this Draft EIR seemed buried in the many diverse sections of the municipal website. Due to its controversy and public interest, perhaps it should been tagged somehow on the home page or directly in the Planning Dept section. Search line entries for "DEIR" and other guesses by the public usually failed because the user didn't enter the proper arcane jargon. Oh, no laws were broken and maybe this wasn't on purpose and I'm certain the tech-savvy among us had no serious issues, but its just another example of the City sometimes unfairly makes it tough on opponents of the project while it smoothes the way for the developer.

1.4 Areas of Controversy and Issues to be Resolved

Some of the points I raised following the March 2012 Notice of Preparation (NOP) Hearing were not mentioned in this section that claims to be a fair summary. The usually highly-thought-of and reputable LSA staff must have considered some topics either not controversial or not subject to comment or responses under CEQA, including:

- ⌚ A conceptual site plan showing generalized street network and building placement. Later on I did find a basic street network but not any buildings.
- ⌚ Air Quality emission impacts beyond just the "nearby residential" area.
- ⌚ Alternative fuels as potential mitigation to excessive pollutant emissions.
- ⌚ Review of WLC's position in the real-world global logistics and goods movement picture, especially with respect to the widening of the Panamá Canal.

7

Most of these topics are covered in the detailed portions of the EIR or in the appendices but not including them in the Executive Summary is a disservice because most of the public cannot spare the time to investigate those thousands of pages.

1.5 Significant Impacts

I agree that these 10 bullet points will obviously be significant, however this list is incomplete should be greatly expanded, even at the Executive Summary level, because this is the only section of the DEIR that the vast majority of the public can absorb.

8

1.6 Alternatives to the Proposed Project

This section does a commendable job of mentioning alternatives to the project. I have no further comments on it.

9

1.7 Impacts and Mitigation Summary Table

I note or recommend the following:

On Agricultural Impacts Section 4.2.6.1A, the donation by Highland Fairview for a 5-acre heritage farm is noted but some might see this as a cruel joke considering the overall loss of farmland under WLC warehouses and accessways. However, this idea has potential and the developer should work with gardeners or clubs to find the best soil or accessible site in the WLC for the amenity.

10

I strenuously object to the description of air quality Impact 4.3.6.1 and lack of feasible mitigation offered. I contest the statement "substantially improve the jobs/housing balance" and predict that if WLC is built out it will only marginally, at best, expand employment in Moreno Valley. The "jobs" argument in favor of this project is a Big Lie, as evidenced by past and current performance of Highland Fairview and Skechers.

11

Regarding Construction Phase Air Quality impacts 4.3.6.2 in general, the mitigation described is the usual boilerplate language for these kinds of large projects and I see little technological advancement over what's been done for decades. My concerns are with this huge, 41 million sq ft WLC project dragging on for years, with construction emissions becoming more "permanent" and having continual, nagging negative impacts on the entire eastern "Rancho Belago" section of Moreno Valley, and would suppress property values, positive attitudes and quality of life for a generation.

12

I object to the project's Air Quality 4.3.6 evaluation that will evidently lead to "significant and unavoidable" impacts as the WLC is built out. Lady and Gentlemen of the Council, severe truck-related local and long-term regional air pollutant emissions and chronic health risks are simply not worth it just to attain a marginal employment value and enrich the developer. This project's scope, impact and unfavorable location are simply incompatible with public health throughout the Inland Counties.

13

Impact 4.6.6.1 regarding mapped earthquake faults and Alquist-Priolo Fault Zone setbacks is adequately covered in the summary, however, I question the usefulness and reliability of work-around special engineering devices and schemes for building on or near the faults. The developer should refrain from building in these areas even though it would reduce the overall square-footage of the WLC.

14

I contest the statements in Impact 4.10. regarding WLC conflict with existing and applicable land use plans and policies where it promises the WLC "will substantially improve the City's jobs/housing balance" and therefore can avoid any stigma of

15

inconsistency with the General Plan upon its amendment to favor the project. Again, this huge 'jobs goldmine' is a greatly over-valued contention by the City, the developer and the Environmental Consultant. I predict only a marginal or inconsequential positive employment impact, especially with the price being paid by the community to accept this WLC boondoggle being forced on us.

15

Perhaps the WLC would not precisely "Physically Divide an Established Community", (see also in Impacts section 4.10,) but it will threaten and isolate the quality of life of the more rural and relaxed eastern side of Moreno Valley. Established neighborhoods such as the attractive Canterbury Downs and neighboring streets just west of Redlands Blvd, with large lots, horse stables, country clubs and even a few working farms will be negatively impacted forever by the poorly conceived World Logistics Center.

16

The quiet, established neighborhood of Old Moreno will be directly adjacent to WLC property and will suffer serious and needless impacts in many ways. The mitigation suggested in the EIR will be insufficient to maintain livability in Old Moreno and people will become disgusted with the overall environment and will have to fight a long battle to maintain their quality of life and property values. For example, see the story that's been in the press about the little neighborhood in Jurupa Valley at the NE corner of the 60 Freeway and Etiwanda Ave that is now ground zero for particulate pollution in the South Coast region, mostly due to transportation-generated emissions from trucks.

17

Long-term property values will likely suffer due to the intrusive presence of the WLC. This part of Moreno Valley should have been set aside for a rural gentry neighborhood similar to Riverside's Arlington Heights or parts of Redlands and Banning. It could be the pride of an upscale Moreno Valley instead of a Regional headache, eyesore and so-out-of-place industrial zone.

18

The section on traffic Impacts 4.15.7 seems, in my opinion to "hope and pray" the City can work with Caltrans and other agencies to "employ measures" to construct additional facilities needed for truck access to the WLC. The Executive Summary here retreats to the "significant and unavoidable" position yet fails to draw (or is concealing a point-by-point illustration of it) any nexus between truck traffic generated by 41 million square ft of warehouses and the subsequent need for widened freeways, interchanges and the expenses of truck-only climbing lanes through the Badlands to move WLC-based cargo to Eastern destinations. These upgrades will take a decade to complete and just don't appear by magic. In a state strapped for highway funds, there is no guarantee they could ever be built in time for 2035's full occupancy of the WLC and the resulting snafus would lead to night-and-day traffic nightmares throughout the Inland Region, as documented later in the EIR under Traffic and Circulation.

19

Table 1.B. List of All Mitigation Measures.

I'm glad the developer will have to preserve the olive trees along Redlands Blvd.

20

Glare from buildings will have negative impacts throughout the region and even stricter regulation of lighting glare will be needed to preserve “dark skies”. The proposed mitigation is a good step in the right direction but needs to be beefed up.

21

The many construction phase mitigation measures (4.3 & 4.4) are a valiant effort to clean up the messiest part of any project but most nearby residents and businesses are concerned that these measures will still fall short of adequately protecting existing neighborhoods. For example, dirt hauler trucks are chronic violators by the nature of their independent driver speed-up and by-the-load method of payment by vendors. This often leads to reckless, short cut driving behavior by some at times, as trucks descend on projects by the dozens, often in numbers beyond police power to control them. What can be done? The accumulative impacts of the construction traffic, hazards, fugitive dust and other annoyances will ruin the atmosphere in the east end of Moreno Valley for years, despite these efforts to mitigate them.

22

Besides, the current developer has a pattern of weaseling out of conditions of approval and other regulations during the actual discretionary review process – as exhibited when Skechers went thru Planning - and in my opinion this behavior will not change and some of the mitigation measures will end up existing only on paper. The developer’s friends on the City Council will likely coddle and protect their benefactor.

23

In Measure 4.5.6.2B, I’m glad the developer will contribute to a Juan Bautista de Anza historic marker.

24

Under Noise Mitigation measures, Section 4.12.6 regarding sound walls, many of the proposed sound walls are quite distant from the World Logistics Center, indeed one is contemplated for somewhere along Riverside’s Sycamore Canyon Blvd. near Central Ave, (unclear in Mitigation Measure text as to its precise location) nearly 10 miles distant from the WLC, along the steep “Box Springs Grade” of Interstate 215 and State Route 60. This is apparently to reduce traffic noise from vastly increased truck movement resulting from the project. The Final EIR needs to better explain the rationale behind requiring a sound wall so distant from the project site. Some explanation is given in The Traffic and Circulation portion of the EIR, later on.

25

Despite the noise studies, I doubt the effectiveness of all these distantly placed sound walls. Indeed, I find that this particular Sycamore Canyon one illustrates the impacts of additional truck traffic noise that could affect all existing residential and commercial neighborhoods all across Moreno Valley adjacent to the 60 Freeway. It will become a “river of noise” impacting the lifestyle of the heart of the City. This underscores the little-publicized nuisance and intrusion of truck traffic noise brings into existing homes.

26

As an additional mitigation measure, the speed limit for all big rig trucks along the 60 Freeway, for 10 miles either side of the WLC, should be reduced to 45 mph for safety and noise-reduction reasons. The EIR’s noise consultant should perform the calculations showing how noise levels would be mitigated.

27

Regarding Traffic and Circulation Mitigation Measures, in Section 4.15.7, I oppose the unfair degree of reduced TUMF and DIF fees to be assessed on individual warehouse development projects. The City Council brokered this cozy arrangement by consultation with and undue political pressure upon WRCOG to benefit the developer to use this fee reduction as a marketing selling point. I have seen these reductions used in real estate ads for competing logistics complexes in Adelanto and Victorville, for example. Although some minor relief from DIF and other fees for warehouses is common, nationally, in my opinion, this "gift" to the WLC developer is excessive and unfair to others who have participated in these fee assessments.

28

Any TUMF fee reduction for high cube warehouses would be especially unwise considering that these heavily overweight trucks serving the project would disproportionately assail and damage the public roads in comparison with other traffic that pays more than their share of the highway repair bills. Trucks are always beating up the pavement and crashing into overpasses. Our little automobiles don't do either. This is another example of a cushy deal that benefits only the developer, warehouses and trucking companies while the general public pays an unfair share for infrastructure.

29

I don't have a lot of confidence in any agency, especially the City of Moreno Valley to successfully identify and implement adequate funding sources for State and "extra-territorial improvements" (alas, unwelcome transportation jargon for "widening the 60 Freeway between Riverside and Beaumont") as written in 4.15.7.4F. The cost of such a project alone would approach \$1 billion in scarce highway widening funds. Such a costly concept for widening 60 would have to compete, politically, with hundreds of other worthy projects on the drawing boards, statewide. I feel the same way regarding all the interchange improvements needed.

30

C: Comments on Section 2.0, Introduction and Purpose.

I agree that the Program EIR is the appropriate CEQA process for the World Logistics Center however that processing benefit to the developer needs to be balanced with greater public input and discourse than has been allowed and encouraged by the City Leadership, so far. A project of this vast local and regional significance deserves every opportunity to go beyond the minimum that the law requires and not be, to any degree, 'railroaded' through the approval process. In my opinion, the City has not been fair about this and in fact has given undue voice and even tax dollars to support to promote and favor the developer, primarily and not a fair and comprehensive public discussion.

31

The 45 issues identified in Table 2.B seems to be an adequate basis for discussion.

32

D: Comments on Section 3.0 Project Description:

I reject, resist and will not personally adhere to using the "Rancho Belago" mis-designation of eastern Moreno Valley. This appellation is an artificially created

33

marketing device of dubious value and has not been supported by polling data or anecdotal comments from the citizens of Moreno Valley, including former City leaders. Although a few current City Council members have to various degrees supported the label, it evidently has little public support. This designation has never been put to a citywide referendum because there is doubt it would be approved.

33

I generally support the intent and land use designations as depicted in the existing but not implemented Moreno Valley Highlands Specific Plan. To me they are imminently preferable over the World Logistics Center. Although development as envisioned by that plan has not occurred, an improving economy seems to have increased interest in residential uses, especially "rural estate" or similar type larger homes which could be available at bargain rates in Moreno Valley, with some proper marketing initiatives.

34

Sections 3.4.2 and 3.4.6.1 fail to adequately describe the distinctions between "high cube" and conventional truck dimensions. The revised EIR needs to explain the etymology of the appellation "high cube", especially as it applies to global logistics standards and patterns of efficient goods movement both in the field and in warehousing facilities. Why is it called "high", compared to what, people are asking.

35

Further, this expanded High Cube descriptive section needs considerable expansion and enhancement to compare dimensions, especially the height, the cargo weights both empty and full and the braking distances at various speeds between the High Cube tractor- trailers and smaller conventional trucks that still dominate the trucking business. The California Highway Patrol probably has some methodology to make the calculations. Current literature in trade magazines and other sources (such as WRCOG's studies) provide plenty of data and interpretation of the role of High Cube trucks and its safety, congestion and cargo-carrying consequences.

36

My point is that by leaving out this necessary safety data, the project proponents are again concealing vital information that could reveal further negative impacts that the public and first responders need to know the WLC will cause. I can't help but feel this descriptive data was a deliberate omission.

37

The Section 3.4.8, Architectural Guidelines, needs a list of some local examples of 60 and 80 ft warehouse building heights (approximately, of course) that can be viewed by interested parties onsite and in person so that their true visual impacts could be gauged. 80 feet (8 stories?) will be judged by many to be too tall. The Skechers building would be a prime example to list, as would the soon-to-be-vacated Fresh & Easy Warehouse off the 215 Freeway near Van Buren Blvd and also other warehouses in the southwest section of Moreno Valley.

38

Its noted in the Phasing Section 2.4.13 that full WLC build out of both phases is tentatively projected for 2022 while elsewhere in the document I believe it states 2035. Please clarify.

39

Comments on Section 4.0 Environmental Impact Evaluation:

In the Aesthetics Section, 4.1, the developer has made a valiant effort as depicted in the many artist's renderings to shield and screen warehouses and truck parking areas from nearby residential properties by means of landscaping and robust earthen berms. Viewsheds from various developer-selected locations on the project perimeter are detailed and well evaluated but they still lack a vital component of the overall Aesthetics impacts of the WLC, as follows:

40

This section barely and inadequately addresses the very important issue of Community Gateway views, the aesthetic impressions that impact westbound motorists who may be seeing our city of Moreno Valley for the first time when they emerge from The Badlands. I'm afraid that a 41 million square foot sea of warehouse walls and rooftops will have leave an immediate and lasting negative impression on visitors and long-time residents alike. The EIR should include a section addressing the Community Gateway issue.

41

Most cities leaders and community groups such as Chambers of Commerce are very sensitive to how visitors view their community as seen from its entrances. Despite the dubious promises of improved employment, is a negative community visual image worth the costs of the project? I could cite several examples of where Moreno Valley has tried to improve its gateways (such as at Alessandro and Old 215) and where Corona, Temecula, Riverside and others have made vast scenic and often acclaimed gateway modifications and improvements. In my opinion, having a rather ugly and obtrusive World Logistics Center as our "Welcome to Moreno Valley" entry statement will put us near the bottom of the list, aesthetically, among Inland area cities. Such a view may be heavenly to a developer but not to the traveling public. I think we could do better. And our warehouses belong in the southwestern part of the city, not at a primary gateway.

42

Section 4.3, Air Quality, there appears to be no mention that the northeast portion of Moreno Valley constitutes a minor geographic basin, lobe or "pocket" as it is partially surrounded by hills that tend to capture air pollution as spread by prevailing west winds, 90% of the time. This is the area where much of the WLC would be sited and where the vast majority of incoming and outgoing truck traffic would be travelling and emitting pollutants. Such pockets will collect and concentrate a substantially higher level of pollutants and allow them to persist for longer periods than flatter lands.

43

Were any air quality monitoring devices placed at the intersection of the 60 Freeway and Theodore, for example, over 9 months or so, providing a representative sampling of existing air quality at the WLC project site? If not, accuracy of air quality readings and predictions falls off rapidly with the distance from the WLC, despite modeling protocols. The nearest monitoring station is near Downtown Riverside, 15 miles west of the project site.

44

I note that Figure 4.3.8, a map of "Change in Air Toxics, 1998 to 2005" in the South Coast Air Basin indicates that the worst increases, more than 250% over those 7 years, is air pollution occurring near the Ports of Los Angeles and Long Beach. The WLC is envisioned by its promoters as a dependent sub-concentration of cargo traffic closely dependent those ports and therefore its connecting routes would tend to drag this area of increasing pollution in the direction of Moreno Valley.

45

Still in the Air Quality section, it is also curious why the EIR mentioned Dr Enstrom's discredited, truck-industry financed study that declared the subset of career truck drivers as actually having healthier lungs than the general population. The study seeks to minimize the health effects of diesel particulates. Sounds like those "smoking is good for you" declarations by the tobacco industry in the 1950s! It almost makes us want to move next door to the World Logistics Center to improve our overall health.

46

Its noted that the developer and environmental consultant interpreted air quality modeling and Air District regulations to arrive at a trip rate for the WLC of 1.68 trips per thousand square feet of warehouse space, described as a conservative basis for consequent complicated air quality calculations applicable to the WLC at full build out.

47

Nevertheless, several statements in the Air Quality analysis reveal that the overall project in both construction and operational phases will exceed most air quality standards and impede overall regional clean air attainment plans, thus leading to reversed progress in improved air quality both locally and regionally. This situation is unacceptable to the people of Moreno Valley and the Inland Counties. This is a primary reason why we oppose the World Logistics Center project.

48

Yikes! Compelling Figure 4.3.10 and other illustrations show the modeled Cancer Risks as particularly hazardous along the 60 Freeway corridor and especially around the WLC site. Compared with the No Project alternative or the Moreno Valley Highlands Specific Plan, these figures demonstrate the likelihood of a great increase in air toxics, bringing Eastern Moreno Valley into the same category as the current (2012) ground zero of pollution near the Ontario Airport. It also appears that, even with mitigation, the Old Moreno neighborhood will suffer more than double the amount of life-threatening pollution as compared to the WLC not being built.

49

The Soils and Geology Section, 4.6, I note that the EIR seems to adequately deal with the potential effect of earth-movement faults within or near the project site. State regulations will be observed and all building codes related to tilt-up concrete construction will be enforced as development occurs. There will be further geologic investigation as necessary for particular building parcels adjacent to the active San Jacinto Fault.

50

I might point out that my own calculations regarding a serious earthquake impacting Moreno Valley suggest the San Jacinto fault has a greater than 50% chance of creating a 7.0 earthquake over the next 30 years. Subsequently, I have purchased full quake

51

coverage for my home in Moreno Valley, located about 4 miles from the fault. Most geologists agree that in general, this area is "long overdue" for a serious seismic event. This insurance would pay for full replacement value in case my home is red-tagged and could not be occupied due to damage that a 7.0 shaker might produce. Will the buildings and occupants of the WLC be ready in case of such an earthquake?

51

In Section 4.10, regarding transit service, it is fair or correct for the developer to refer to Riverside Transit Agency's Route 35 as having a potential to directly serve the World Logistics Center? It would take more than mere rerouting. Route 35 has a limited schedule, makes very few stops and currently uses smaller rolling stock than the standard 40-passenger bus. The developer or other agency should recognize that the WLC would be a significant generator of new bus demand, even if the rosy employment projections are scaled back. I recommend the City stay in touch with RTA planners.

52

The developer or the City should eventually approach RTA to determine if a new or revised route could more effectively serve a built out WLC. Since warehouse staffing tends to be two or even three shifts, employing mostly part-time, labor-contractor personnel, a more robust RTA service will eventually be necessary. Low-paid workers tend to use transit more, recent studies indicate.

53

In the Noise Section, 4.12, under Long-Term Traffic Noise Impacts, it states that there would be about 50 more peak hour trips added due to the project, evidently including both truck and employee traffic. With truck traffic, and the nature of the business of shipping, this amount of trips would likely continue for most of the 24-hr day, making truck noise near the project and indeed all along the 60 Freeway corridor a serious nuisance that most nearby residences will find objectionable.

54

Some of the noise modeling charts for the built out project also suggest negligible increases in noise due to the project but I personally find that hard to accept and would be more worried about the constant and continuing din of additional truck traffic on the 60 Freeway. However, later on, text explanations describe significant future noise impacts near the project.

55

One isolated location in the text, Placentia Ave near Evans Rd is actually way, way south of the site in the middle of the City of Perris and is sheltered by Lake Perris' mountains from the WLC. I wonder how this paragraph got into the study? A proofreading error, perhaps, when some other project's text was copied and pasted into the WLC noise materials? This location is quite far from the project. Indeed, there are several other locations in the text, such as Day St between Cottonwood and Alessandro that seem out of place in the text and I believe instinctively that they would not suffer a "significant and unavoidable" impact. I'm no noise modeling expert but some parts of this study seem very out of place or not well thought out as applicable to the WLC.

56

Further, I didn't spot a handy area map in the Noise Section depicting the location of all these noise monitoring stations so that they could be studied logically. Therefore a map is needed, and probably a reality-check review of the Noise Section. 57

Table 4.13.F for Employment estimates is in my opinion, overly optimistic about the number of eventual jobs generated by the WLC project. The Skechers operation, for example, has not proved to be the employment dynamo its promoters promised the community. A person familiar with the Skechers operation told me just last week that only 160 people work there compared to the 2,000 that was originally predicted by the developer. Even the City scaled down the estimates over the months of construction from 2,000 down to 500 and even that amount has not come forth. The track record of jobs prediction for WLC-related warehouses has not turned out as promised. It's a wholesale misleading of the public to continue throwing out these job numbers to misguide the public into approving the project. 58

I also contend that the projected annual wages for warehouse workers at the WLC are highly inflated and need to be revised to reflect real conditions. An independent survey (not overseen by employers) is needed to determine the actual take home pay occurring at Skechers. Besides, global logistics patterns will be changing in years ahead, reducing business interest in the WLC and its ill-conceived location, further lowering employment and salary expectations. 59

My review of the Traffic and Circulation Section 4.15 indicates a total of about 71,000 trips per day as a result of the built out World Logistics Center. Unfortunately I was not able to fully review this section. Parsons & Brinckerhoff have done their usual thorough job on the traffic analysis, a very complicated part of the EIR. Although I don't have anything further to add until I study the materials further, I note several key points such as 80% of the vehicle trips to warehouses are via employee vehicles, not trucks. 60

However, I instinctively fear that the built-out project will have a tremendous and negative traffic impact on the City of Moreno Valley that is difficult even for the experts to predict through the modeling. All aspects of heavy and continual truck traffic will bring more noise, pollution, loss of levels of service, road damage, congestion and accidents to our community and on these grounds alone, the WLC is demonstrated to be a detriment to the City despite the dubious job growth predictions. The traffic analysis seems to back up many of opponents' fears as the EIR's claims of significant impacts being unavoidable and that impacts will remain despite mitigation measures. 61

In the Traffic mitigation measures portion of 4.15, the extensive list of road projects alone needed to improve capacity, signalization, and other circulation infrastructure improvements will place a staggering financial burden on the general public, despite any contributions by the developer or eventual occupants. I'm astounded at the millions of dollars these projects will take from tax revenues and other sources. This money could be better spent on other needs, first. The existing Moreno Valley 62

Highlands Specific Plan, if instead implemented over time, would reduce the need for the WLC's level of improvements and save millions of tax dollars.

62

The negative effects on the already-stressed Freeway 60 "Mainline" are extremely challenging to existing and future traffic patterns and community comfort levels as described in the Traffic Study. In fact, impacts to the uphill portion of 215-60 near the Central Ave. interchange, for example, are so bad as to be unavoidable and without any means of significant mitigation. There's no room left to widen the freeway, the study states without threatening existing homes and businesses. This assessment of "unavoidable impacts to the Mainline" is repeated dozens of times throughout the freeway system in the Inland Counties, according to the EIR text. The WLC-based additional traffic, 71,000 trips more per day, will basically ruin and totally gum up what little mobility we have now on those routes. The 60 is maxed out, ladies and gentlemen!

63

Ironically, such congestion would also negatively impede WLC-bound truck traffic, making the WLC less accessible, becoming a stuck-in-gridlock waste of travel time, and less attractive as a warehouse staging and storage area, as seen in competition with other warehouse centers such as in Victorville and Palmdale along more freely-flowing Interstate routes.

64

Further, the study mentions that Caltrans plans to add a truck lane through The Badlands but I have my doubts as to when, if ever, this improvement becomes operational.

65

Finally, in Section 5.0, Other CEQA Topics, a huge list of unavoidable environmental bad stuff welcomes us to this part of the discussion. How discouraging to read this list and wonder how it would negatively erode the quality of life in Moreno Valley, despite the promise of 24,000 jobs.

66

This concludes my comments on the Draft EIR for the World Logistics Center. Good luck ladies and gentlemen in incorporating the EIR into the complicated debate on whether or not to approve this project.

67

Thank you.

Michael McCoy

RESPONSES TO LETTER G-51

Michael McCoy

Response to Comment G-51-1. The comment does not apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process and political statements.

Response to Comment G-51-2. The commenter wonders what decision path the City will take regarding this project. It does not contain a comment on the EIR or California Environmental Quality Act (CEQA) process.

Response to Comment G-51-3. The comment does not apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

The commenter also questions the job predictions for the project because of the Skechers project. The Skechers facility has been used as a negative model in evaluations of the WLC project, with commenters assuming job estimates from future development within the World Logistics Center Specific Plan (WLCSP) would be much lower and existing employees would be transferred from other areas. Several points must be made in this regard. First, the job estimates widely touted for the Skechers facility were actually estimates for the entire Highland Fairview Corporate Park, of which Skechers is only a part. Second, it is true the Skechers facility was an existing warehouse complex that transferred from the Ontario area, but future warehouses within the WLC project will be of many different types, including new warehouses, rather than simply transfers from other areas. Third, the Skechers facility opened just before a major downturn in the local and national economy, so even now it is not operating at full capacity or employment. Fourth, the Skechers facility is highly automated, but the degree of automation in future warehouses within the WLC project would likely vary (e.g., more automated warehouses may have fewer but higher skilled workers, while less automated warehouses may have more lower skilled workers). Finally, the number of part-time to full-time workers, as well as the degree of skilled workers, each warehouse employs will vary. The employment assumptions used on the David Taussig & Associates (DTA) study, both the original study and the revised study, were based on industry standard regional values which have been proven to be reliable over the years in estimating future employment from new uses such as logistics warehousing.

Response to Comment G-51-4. The commenter is correct that predicting the number jobs that the project will generate in the future is speculative, but the California Environmental Quality Act (CEQA) requires the projects' environment impacts be evaluated based upon the best available information at the time of the EIR preparation. An estimate of the number of jobs is needed in connection with several topical items including the fiscal evaluation of the project. Accordingly, the EIR has utilized several recognized sources for estimates on the number of jobs that the project will generate. It is the best currently available information.

Response to Comment G-51-5. Contrary to the inference of the commenter, the WLC project is not highly dependent on port-related traffic, rather it is the goods movement in the Southern California/Western United State (US) region that generates the need for warehousing. No more than 7% of WLC truck trips are projected to be port-related trips between initial operation and 2035 (see Section 12.F of Traffic Impact Analysis), and only a small percentage of that traffic would be impacted

by improvements to other national and international ports. The need for warehousing close to the demand (i.e. the Southern California Association of Governments (SCAG) region) will keep WLC competitive over locations in the desert areas. In addition, SCAG's June 2010 report, Industrial Space in Southern California

(<http://www.valleyconnect.com/~valleyco/images/stories/Library/reports/IndustrialSpaceInSouthernCalifornia.pdf>), estimates that by 2035 there will be a shortage of 228 million square feet of warehouse space in Southern California. As Southern California's population and economy continue to grow, there will be increasing demand for goods movement and logistics services. As a result, expected growth and the best available studies indicate there will be strong demand for warehousing in Southern California in general, and the Inland Empire in particular, well into the future.

The Traffic Impact Analysis discusses the viability of using rail for the WLC project and concludes that in addition to a number of physical constraints, rail is not economically viable at distances less than 500 miles (see Section 4.F). This precludes use of rail not only for WLC but also warehouse complexes in the Southern California desert areas. Air service for goods movement has long proven to be a prohibitively-expensive option except for highly specialized products. The WLC offers as much interstate access as most cities with its convenient proximity to SR 60, I-10, I-215, and I-15.

Response to Comment G-51-6. The commenter believes the public needs more opportunities for input on the project. The residents of the City were encouraged to participate in a public scoping session hosted by the City on March 12, 2013. Comments were solicited from the public and from public agencies during the 30-day notice of preparation (NOP) period and during the 63-day public comment period on the Draft EIR, and comments have been accepted long past established review period for the DEIR ended (April 4, 2013). The entire DEIR and all technical studies have been on the City's website since issuance of the DEIR on February 4, 2013. In addition, public comments will be allowed at several public hearings for the project (before both the Planning Commission and City Council) prior to a decision on the project. In these ways, City residents have been, and will be, afforded ample opportunity to comment on the proposed WLC project.

Response to Comment G-51-7. The commenter expressed concern about air pollutant emissions, alternative fuels, the Panama Canal, and the absence of a project-specific Site Plan to review. As presented in numerous places in the DEIR, the WLC project and the EIR are programmatic in nature, meaning that the WLC Specific Plan and this EIR address the overall project issues rather than building-specific issues. Additional CEQA review will be required when site-specific future development proposals are submitted for City review. Section 4.3 of the DEIR, its supporting technical study, the revised technical air study (FEIR Volume 2 Appendix D-1), and the revised DEIR section (FEIR Volume 2) all provide very detailed information on air pollutant estimates at various distances from the project site, including adjacent to the project site and along the major freeways that will serve the project. Section 3.4.6.1 of the DEIR Project Description describe the alternative fueling station that will be located on the WLC site. While some of the trucks accessing the WLC project may use alternative fuels (e.g., liquefied natural gas, compressed natural gas, or electric), to make a worst case estimate of WLC air pollutant emissions, it was necessary to assume no widespread use of alternative fuels on the site. Finally, Response to Comment G-2-3 provides more information about the WLC project relative to the Panama Canal.

Response to Comment G-51-8. The commenter wants the list of significant impacts expanded. The list in Section 1.5 of the Executive Summary is based on the detailed analysis of potential impacts to 16 different environmental issues or categories (DEIR Sections 4.1 through 4.16). The specific items listed are based on the CEQA significance thresholds identified in the appropriate sections of the DEIR. Since this section is an executive summary, it provides a sufficient level of detail for a summary of impacts.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-51-9. The commenter compliments the DEIR on its summary of the project alternatives.

Response to Comment G-51-10. MM 4.2.6.1A has been modified to require the acquisition of an agricultural conservation easements.

Response to Comment G-51-11. Please refer to Responses to Comments F-8-94, F-8-95, and G-49-22.

Response to Comment G-51-12. The commenter believes more stringent mitigation for air quality impacts are needed. The commenter should note that the air quality and greenhouse gas emission technical study was revised based on the revised traffic study and the many comments on the DEIR regarding air pollution and public health risks from diesel truck exhaust. The commenter is encouraged to review the revised and additional mitigation measures regarding air pollution.

Response to Comment G-51-13. The commenter believes the project's air pollution impacts outweigh its jobs benefits. The City Council will consider the information in the DEIR and its technical studies, both the original and revised versions, as well as all comments and responses to written comments before making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts, including air pollutants and health risks.

Response to Comment G-51-14. As presented in the Soils Report, (Leighton 2013), no structures for human occupancy will be located over active faults or within the State Alquist Priolo (AP) Zone, unless structural setbacks are established from active faults identified within the AP Zone. The setbacks will be based on fault trenching performed in accordance with State and County guidelines.

Response to Comment G-51-15. The commenter's April 7, 2013 email questions the jobs/housing balance ratio in the City. While it is likely that some of the jobs may be filled by City residents who possess the skills and/or education required, it is expected that many project employees will be commuting to the project from other locations in the Inland Empire and may eventually move to the City to live closer to work, thereby increasing the population and ultimately the demand for homes within the City over a period of time. The impact of the project on the jobs/housing balance in both the City and throughout the Inland Empire cannot help but be improved by the potential 20,000 jobs to be generated by the WLC, especially because the project itself contains no residential development within a City that has one of the lowest jobs/housing balances in all of the Inland Empire. In fact, both the City and the Inland Empire have a surplus of homes versus jobs, which causes residents to drive to Los Angeles (LA) and Orange County for work, leading to traffic congestion, less family time and an overall lower quality of life. As noted in Section 4(III) of the DEIR, the City's Jobs-Housing Balance is currently 0.47, which is one of the lowest of any City in the Inland Empire. Riverside County as a whole only has a Jobs-Housing Balance of 0.74. As the norm throughout Southern California ranges between 1.0 and 1.29 jobs per household according to SCAG's landmark 2001 study *"The New Economy and the Jobs/Housing Balance in Southern California,"* both the City and the County are badly in need of jobs. As a result, the average commute distance for a Riverside County resident of 21.6 miles according to the study was higher than any other County in Southern California. Improving the jobs/housing balance is one of the many attributes of the WLC.

Response to Comment G-51-16. The commenter says the project will conflict with many nearby residential neighborhoods. Sections 4.1, *Aesthetics*, and 4.10, *Land Use and Planning*, both evaluate potential impacts of the WLC project on neighboring land uses, including the neighborhoods mentioned by the commenter, although they are not mentioned by name. The conclusion of significant land use impacts was actually based on impacts to onsite rural residences and not surrounding neighborhoods. The City Council will consider all comments and responses to written comments before making a decision on the project.

Response to Comment G-51-17. The commenter expresses concern about impacts to the Old Moreno neighborhood just west of the project site. Each of the environmental analysis sections of the DEIR (4.1 through 4.16) evaluates potential impacts of the WLC on the adjacent residential neighborhood to the west (i.e., Old Moreno) where appropriate (e.g., aesthetics, traffic, noise, air quality, etc.). The commenter does not indicate what mitigation he believes is inadequate, but he is encouraged to read the air quality and greenhouse gas emission technical study which was revised based on the revised traffic study and the many comments on the DEIR regarding air pollution and public health risks from diesel truck exhaust, including impacts on the adjacent residences. The commenter is encouraged to review the revised and additional mitigation measures regarding air pollution.

Response to Comment G-51-18. The commenter believes the project site should support rural residences. Note that Section 6.2.1 of the DEIR explains why planning the area for rural residences was not considered in detail in the DEIR. This type of housing usually does not generate sufficient property taxes to support the level of municipal services needed and expected in upscale communities unless the housing prices are very high (e.g., Marin County, South Pasadena, Malibu, etc.), and housing prices in the eastern end of Moreno Valley would not be expected to be high enough to exceed service costs. The City Council will consider all comments prior to deciding whether to approve the project.

Response to Comment G-51-19. The commenter states an opinion that the section on traffic impacts seems to "hope and pray" that other agencies will employ measures to mitigate the traffic impacts. He claims that the DEIR retreats to a "significant and unavoidable" position and fails to draw any nexus between the project traffic and the need to widen freeways, interchanges, or the expense of truck climbing lanes through the Badlands. The commenter also states there is no guarantee that these upgrades will be built in time for the full occupancy of the WLC.

The City has no authority to compel Caltrans or other jurisdictions to implement changes to facilities under their control. By pledging to work with Caltrans and other jurisdictions to establish funding mechanisms the City is going as far as its legal authority allows. The Traffic Impact Assessment (TIA) fully discloses this organizational framework and correctly identifies traffic impacts and the improvements needed to mitigate those impacts (Chapter 11, Sections E and F). However, mitigation to facilities outside of the City's jurisdiction have been characterized as "significant and unavoidable" because mitigation cannot be guaranteed by the City. See TIA Chapter 11, Sections E and F.

Response to Comment G-51-20. The commenter was glad the old windrow along Redlands Blvd. was going to be preserved. However, the commenter should note that MM 4.1.6.1A only requires temporary preservation of the windrow... *"the existing olive trees shall remain in place as long as practical to help screen views of the project site."* The photo renderings of views along Redlands Blvd. indicate only the tops of some warehouse buildings will eventually be visible with the combination of berms, walls, and mature growth of the planned landscaping. To clarify this condition, the measure will be reworded slightly to emphasize that keeping the olive trees in place will only be temporary.

4.1.6.1A ~~Prior to the issuance of any discretionary permit for development along the western boundary of the WLCSP, a minimum 250-foot setback shall be verified from closest residential property line along Redlands Boulevard, Bay Avenue, and Merwin Street to any truck access area of the WLC project. Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, planted and walls and landscaping sufficient to provide~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

effective—visual screening between the new development and existing residential areas upon maturity of the landscaping materials. ~~Prior to development of the portion of the WLC Specific Plan property adjacent to Redlands Boulevard, the~~ The existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the City Planning Official Division.

Response to Comment G-51-21. The commenter says more mitigation is needed for glare and “dark sky” impacts. The WLC project will comply with the City’s lighting ordinance that was recently revised to deal with the “dark sky” issue. Compliance with the ordinance and the lighting plan for the WLCSP will help reduce but not eliminate night lighting from new buildings at night and glare from new buildings during the day. These impacts were examined in detail in Section 4.1.6.4, *Aesthetics – Light and Glare Impacts*, in the DEIR.

Response to Comment G-51-22. The commenter is concerned construction impacts will be greater than anticipated when contractors break posted rules, speed limits, and laws. The DEIR process relies on project activities complying with established local, state, and federal laws and regulations as enforced by appropriate agencies. If they do not, they are subject to a variety of penalties including fines and withholding of subsequent permits. It is overly speculative and beyond the scope of a CEQA document to assume contractors will break established rules and laws.

Response to Comment G-51-23. The comment does not raise an issue regarding the DEIR and no comment is required. The City will consider all comments in connection with its deliberations on the project. Mitigation Measures are incorporated as Conditions of Approval as applicable to project entitlement approvals and are implemented by the City of Moreno Valley.

Response to Comment G-51-24. The commenter is glad the project will contribute an historical marker relative to San Juan Bautista.

Response to Comment G-51-25. The traffic study has been revised, and Sycamore Canyon will not have a significant noise impact.

Response to Comment G-51-26. The traffic study is comprehensive in the roadway links examined. All of the potentially impacted areas are identified in the noise assessment.

Response to Comment G-51-27. The reduction of truck traffic speed limits along the 60 Freeway is not considered feasible because the speed limits posted along freeways are Caltrans responsibility, and therefore, analysis of this effect is not warranted.

Response to Comments G-51-28. The commenter states the opinion that the reduced Transportation Uniform Mitigation Fee (TUMF) and Development Impact Fee (DIF) fees for warehouses are unfair. The comment further states that the City Council pressured Western Riverside Council of Governments (WRCOG) into adopting the reduced fee as a market selling point, and states that the commenter has seen other reductions in ads for competing logistics complexes in Adelanto and Victorville. While the comment acknowledges that some relief from local fees is common for warehouses nationally, in the commenter’s opinion this reduction is excessive and unfair. It is also the commenter’s opinion that the reduced fee does not consider the greater impact that trucks have on roads compared to cars.

In California impact fees are required to meet the “rough proportionality” test in the Mitigation Fee Act. This requires that fees be roughly proportional to the impact of the development. Surveys show that high-cube warehouses generate far fewer trips per square foot of floor space than other types of industrial development, as can be seen from these daily trip-generation rates from the Institute of Transportation Engineers:

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

• General Light Industrial	6.97 vehicle-trips per thousand square feet per day
• Industrial Park	6.83
• Manufacturing	3.82
• Conventional Warehousing	3.56
• High-Cube Warehousing	1.68

The City's adoption of lower TUMF and DIF rates for high-cube warehouses compared with other industrial developments within its jurisdiction properly reflects the requirement for the fee to be roughly proportional to the expected impact.

As the commenter acknowledges, jurisdictions sometimes reduce local fees for policy purposes as well. For example in 2009, 10 of the 16 TUMF jurisdictions chose to enact a temporary 50% reduction in TUMF fees on developments within their jurisdiction, with the agency taking responsibility for paying the other 50%. This was done to spur economic activity in the midst of a recession. This type of incentive is considered a legitimate policy option. As acknowledged by the commenter, there is competition among cities to attract the logistics and distribution industries and Moreno Valley's competitors are offering this type of incentive to attract businesses to their cities.

Response to Comments G-51-29. Please refer to response G-51-28.

Response to Comment G-51-30. The commenter is concerned all the traffic improvements identified in cooperation with other agencies will not be carried out. The timing and schedule of the traffic improvements that are outside of the City's jurisdiction (i.e., State and extra-territorial transportation facilities) are not in the City's control. The EIR appropriately states that the impacts necessitating the need for the improvements would remain significant and unavoidable. However, the EIR includes MM 4.15.7.F requiring that the City participate in a multi-jurisdictional effort with Caltrans and adjacent cities to develop a study to identify fair-share contribution funding sources to supplement other regional and State funding sources necessary to implement the State facility and extra-territorial improvements identified in the EIR. The EIR also includes MM 4.15.7.G requiring that the City coordinate with WRCOG with the goal of shifting TUMF funding priorities so they align with the improvements identified by the City and in the proposed project's TIA and EIR. Lastly, the EIR includes MM 4.15.7.H requiring that the City work with the WLCSP development and other jurisdictions to coordinate the funding and installation of intersection and roadway improvements outside of the City's jurisdiction. With these MMs, the City has established a process that will provide the necessary first step towards the eventual multi-jurisdictional coordination needed to implement the traffic improvements that are outside of the City's jurisdiction. Even with such coordination, it is appropriate for the City to consider impacts to these State and extra-territorial transportation facilities significant and unavoidable.

In addition, it would be disingenuous to suggest with a reasonable amount of certainty that the City and/or the proposed project implement the roadway improvements outside of the City's jurisdiction because the necessary first steps of creating a multi-jurisdictional coordination with Caltrans and adjacent cities has not been taken. Such a hypothetical mitigation measure would lack the ability to be implemented and would therefore be considered a infeasible. For this reason, the EIR appropriately states that the impacts necessitating the need for the improvements outside of the City's jurisdiction (i.e., State and extra-territorial transportation facilities) would remain significant and unavoidable.

Response to Comment G-51-31. The commenter believes a programmatic EIR is appropriate for this project but the City has not allocated enough time for public review and discussion regarding this project. The commenter is referred to Response to Comment G-51-6 for a description of the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

opportunities the public has had and will have to comment on the WLC project before a decision is made by the City Council.

Response to Comment G-51-32. The commenter says Table 2.B is adequate for discussion purposes.

Response to Comment G-51-33. The commenter does not accept the Rancho Belago designation for east Moreno Valley. The City has accepted that designation to generally refer to the vacant lands within the City east of Redlands Blvd. and south of the SR-60 Freeway.

Response to Comment G-51-34. The commenter believes the Moreno Highlands Specific Plan (MHSP) has the most appropriate land uses for the project area. The MHSP was evaluated as the No Project – Existing General Plan Alternative to the WLC project in Section 6.3.4 in the DEIR. That section explains why the MHSP is no longer the “best” land use for the project property based on current economic and employment conditions. The City Council will consider all comments before it decides whether to approve the project.

Response to Comment G-51-35. The commenter says the DEIR does not adequately define high cube and logistics warehousing. The term “high-cube” is in reference to the proposed warehouse buildings and the storage of manufactured goods. It is not related in any way to vehicle heights or weights and consequently does not create any increased safety hazard for trucks traveling the roadways. Such vehicle regulations are established and enforced by the state.

The term “high-cube warehouse” is defined in the Specific Plan as follows:

***“High-cube warehouse** – A building used for the storage and/or consolidation of manufactured goods prior to distribution to secondary retail outlets, generally 500,000 square feet or more, often divided for multiple tenants. High-cube warehouse and logistics facilities include ancillary office and maintenance space along with the outdoor storage trucks, trailers, and shipping containers.*

“High-cube logistics warehouses are generally constructed with vertical-lift dock-high roll up doors to allow access for the loading and unloading of products from truck/trailers. Building interiors are typically large and open to accommodate the temporary storage and consolidation of the products to be distributed.”

The definition used in the Specific Plan is consistent with the generally accepted definition. See the ITE Trip Generation Manual volume 2, page 266 (9th ed. 2012). Also see the definition in the WLCSP at section 13.2. Section 3.4.6.1 of the DEIR and Section 13.2 of the WLCSP define high cube or logistics warehousing as following:

High Cube-Logistics Development (LD). The WLC Specific Plan project proposes to develop approximately 2,610 acres with up to 40.4 million square feet of high cube logistics warehouse space. This represents approximately 99.5 percent of the total building area of the WLC Specific Plan project. Land uses allowed under this classification include high cube logistics warehouse buildings of 500,000 square feet or greater. High cube logistics warehouses are characterized by a high level of automated material handling systems and typical truck activities outside of the peak hour. High cube logistics warehouses are generally used for the storage of manufactured goods prior to their distribution to retail outlets (see Section 4.15 and Appendix J of this EIR). Warehouses permitted in the LD portion of the WLC would be no smaller than 500,000 square feet, with a maximum height of 80 feet. The Specific Plan prohibits buildings over 60 feet in height along the western, northern, and southern boundaries of the site (see Figure 3.9).

Warehousing and logistics activities consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities and retail outlets will be permitted throughout the Specific Plan. Ancillary office and maintenance space is included along with the outdoor storage of trucks, trailers, and shipping containers. LD land uses provide a location for businesses to sort, organize, and transfer products from one shipping process to another.

By comparison, the nearby City of Perris adopted the following definition of “high cube warehousing” and added it to their municipal code in 2009 ...

“High-cube Warehousing” means warehouses and distribution centers with a minimum gross floor area of 200,000 square feet, a minimum ceiling height of 24 feet, and a minimum dock high door loading ratio of 1 door per 10,000 square feet. High-cube warehouses are characterized by a small employment count due to a high level of automation. High-cube warehouses shall not be used for manufacturing or labor-intensive purposes, nor exceed the ratio of 25 employees per acre.”

It is unclear what effect or impact the definition of these uses will have on the analysis or conclusions of the DEIR, given that traffic is one of the major issues relative to these uses and the Institute of Transportation Engineers (ITE) has clearly defined these types of uses in the 9th edition of its Trip Generation Manual (2012). The term “high” merely refers to the raised ceiling height which allows for higher stacking of products that can be accessed by robotic machinery.

Response to Comment G-51-36. The commenter believes that more information about high cube warehouse characteristics is needed because the trucks that utilize them are in some ways different than standard warehousing, and those changes would influence the traffic study. The project traffic impact assessment (TIA) used ITE and other trip generation data specifically for high cube or logistics warehouses, and the air quality study used the latest information from the California Air Resources Board (CARB) on vehicle fleet age and mix for its calculations. It must also be remembered the EIR for the WLC project is a programmatic document, and no detailed information is available as yet on specific building sizes or locations, or actual occupants that might locate to this area or the kind of vehicle fleet they might operate. In addition, future development within the WLCSP will be required to provide subsequent traffic studies and CEQA compliance documentation, consistent with this EIR and the TIA for the overall WLC project (DEIR Appendix L-1). Therefore, information the commenter requests is beyond the scope of this EIR and not necessary for the programmatic analysis of traffic and related impacts from the WLC project. See also Response to Comment G-51-35.

Response to Comment G-51-37. The commenter believes the “high cube” data he requested in Comments G-51-35 and -36 is being deliberately withheld from public review. As outlined in the Response to Comment G-51-36, this is a programmatic EIR and details about specific buildings, land uses, occupants, or truck fleet mix are simply not known at this time based on the level of information in the WLC Specific Plan. See Response to Comment G-51-35.

Response to Comment G-51-38. The Skechers facility is a good example to estimate the scale of 60- to 80-foot tall buildings. In general, the main body of the Skechers building where the truck dock doors occur is approximately 50 ft. in height. The main entry at the southeast corner of the building is approximately 55 ft. high, measured from the adjacent ground to the top of the utility screen on the roof, a good approximation of a 60 ft. high building. The glass façade on the northeast corner of the building is approximately 66 ft. from the adjacent ground to the top of the glass wall. Add 14 feet height to visualize an 80 foot-high building.

Response to Comment G-51-39. The commenter says the EIR uses two different buildout numbers for the project. First, it should be noted the buildout of the WLC project has been extended from ten years as indicated in the DEIR to 15 years under the Final EIR. The traffic and air studies have been

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

revised as well to account for this modified buildout plan. The Final EIR now examines 2022 as the end of Phase 1 (2015 to 2022) and 2035 as the end of Phase 2 (i.e., project buildout). Year 2035 was used in the original DEIR as a second buildout horizon because the General Plan, along with its Circulation Element and City-wide traffic study, use 2035 as a City buildout figure. That buildout horizon has been maintained to keep continuity with the previous traffic analysis to the extent possible. There is no evidence to predict a faster buildout.

Response to Comment G-51-40. The commenter notes the many photographic renderings provided in the Draft EIR. The commenter should note that the captions on several renderings have been clarified, and several more renderings are being added to the revised DEIR to more fully illustrate potential views from areas surrounding the WLC site. These illustrations include one view toward Mt. Russell from SR-60 (traveling westbound on SR-60) and one additional view toward the Badlands and Mt. San Jacinto (traveling eastbound on SR-60). Please refer to FEIR Volume 2, Section 4.1 Aesthetics, Figures 4.1.5J and 4.1.5K).

Response to Comment G-51-41. The commenter believes the aesthetics analysis is deficient (“community gateway” views). The DEIR provided an analysis of views from many angles surrounding the WLC site in an attempt to accurately characterize the change in views that would occur as the WLC project developed in the future. In fact, the DEIR acknowledged that views would change to the degree that the visual impacts were significant. In response to many comments regarding views, MM 4.1.6.3A was modified (see below) to preserve the upper two thirds of the vertical view of Mt. Russell from SR-60, the main gateway into the Moreno Valley community. We believe these changes will address, at least to some degree, the commenter’s concerns about views and community gateways.

4.1.6.3A ~~Prior to the issuance of any discretionary permit for development under the WLCSP, the developer shall provide a site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that demonstrate changes in views of Mount Russell, the Badlands, and/or Mystic Lake for travelers along SR-60 or Gilman Springs Road, as appropriate. The renderings shall be sufficient to demonstrate typical views based on proposed site and landscaping plans, but the location and number of view presentations shall be at the discretion of the City Planning Division. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource.~~

4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.

Response to Comment G-51-42. The commenter again talks about community gateway views and that the project should be in the southwest portion of the City instead. The discussion of gateway views, and especially the modified mitigation to address views, is provided in the Response to Comment G-51-41. It should be noted there are no sites remaining in the City’s Industrial Park area (i.e., southwest portion of the City) that can support a regional logistics project like WLC. The City Council will consider all comments before deciding whether to approve the project.

Response to Comment G-51-43. The commenter notes a geographic feature in the project area where pollutants could collect and persist for longer time periods than in flat terrain.

There are two important components that are part of the air quality and health risk assessments prepared for the project: terrain and the prevailing meteorological conditions. Finely resolved terrain data were obtained from the United States Geological Survey for the region extending from near Palm Springs to the ports of Los Angeles and Long Beach. These terrain data act to influence the amount of dispersion of air pollutants. Meteorological data act to influence both the direction of pollutant transport but also the rate of dispersion of the pollutants. The meteorological data used in the project air assessment was obtained from the SCAQMD and is considered representative of meteorological condition in the project area. Thus, the influences of both terrain and air transport and dispersion were included in the assessments.

Response to Comment G-51-44. The commenter inquires as to whether any air monitoring was done at the intersection of the 60 Freeway and Theodore Street.

The air monitoring data used to establish a background for the WLC site was derived from the Riverside Rubidoux and Magnolia air monitoring stations. The commenter is correct in that the Riverside monitoring stations are located about 15 miles from the project site. The use of the Riverside data to characterize the background air quality at the site should provide conservative estimates (in terms of higher pollutant levels) of background pollutant concentrations, than would be expected at the project site. This is because of the locations of the Riverside monitoring sites in a highly urbanized area with surrounding industrial sources and several major freeways compared with the project site, which is influenced by one main freeway.

Response to Comment G-51-45. The commenter notes the possible influence of emissions from the ports of Los Angeles and Long Beach dragging their pollution into the Moreno Valley.

Actually as discussed in Response to Comment E-2A-7, the project Traffic Impact Analysis analyzed project impacts on freeways to the ports. The air quality analysis included that freeway activity and found that only a small percentage of WLC truck traffic would be to and from the ports and very small estimates of cancer risk from these freeways leading to the ports.

Response to Comment G-51-46. The commenter disagrees with the inclusion of the Enstrom discussion on the health effects of diesel PM. See Response to Comment G-45-1.

Response to Comment G-51-47. The commenter notes that the traffic and air quality modeling used a trip generation rate of 1.68 vehicular trips per thousand square feet per day (VT/KSF/day), which is described as a conservative basis for the air quality calculations. The explanation why the rate was used was provided in the TIA report (Chapter 2, Section A).

Response to Comment G-51-48. The commenter is concerned about air quality and does not believe the benefits of the project outweigh its air quality impacts. Section 4.3 of the DEIR and the original and revised air quality technical studies, all evaluate the potential air pollution impacts of the WLC project in considerable detail. The EIR concluded that the WLC project would have significant air quality impacts that could not be mitigated to less than significant levels, even with the recommended mitigation, due to the size and nature of the WLC project. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-51-49. The commenter notes that there will be increases in cancer risks resulting from the project.

Since the DEIR was published, there have been multiple updates in the area of air quality analysis. Recently, CARB published updated emissions factors for heavy-duty trucks based on actual testing,

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

which show that emissions are significantly lower than previously estimated. Also, in response to comments, mitigation measures were strengthened and added further lowering emissions. When these changes are taken together, there is no longer any health risk impact based on the latest research conducted by the Health Effects Institute and sponsored by USEPA and CARB which demonstrates that new technology diesel exhaust do not contribute to cancer (HEI study).⁴⁵ Through the mitigation measures adopted by the proposed project, traditional diesel engines are prohibited from the project, eliminating the health risk associated with diesel engines. More information is discussed in Master Response-1 and Master Response-2.

Response to Comment G-51-50. The commenter believes the analysis of geotechnical impacts is adequate.

Response to Comment G-51-51. Refer to DEIR Section 4.6. Moreno Valley, like much of Southern California is in an area of high seismic activity in which destructive earthquakes pose a threat to property and lives. Recent nearby studies of the Claremont segment of the San Jacinto fault zone have estimated the most recent ground rupture to have occurred in the early 1800s with an estimated magnitude of 6.8. This segment of the San Jacinto fault is estimated to have a rupture reoccurrence interval of about 160 to 210 years and therefore it is believed the next earthquake is theoretically overdue or could occur within the next 50 years.

Proposed buildings will be designed according to the latest assessments of earthquake ground motions and in accordance with California Building Code (CBC) and the American Society of Civil Engineers (ASCE) minimum design standards. Those assessments use a Probable Maximum Capable Earthquake scenario, such an earthquake event will only have a 2% probability of exceedance in a 50 year design life. Looking at this conversely, the structural design uses an assumption that the maximum capable earthquake will have a 98% chance of occurrence during the design life of a given structure. It should be noted that the seismic design of structures to resist the maximum capable earthquake is to prevent catastrophic collapse, and not intended to prevent structural damage.

Response to Comment G-51-52. The commenter believes Riverside Transit Agency (RTA) bus route 35 may not be appropriate to serve the project. The City will require future development to coordinate with RTA regarding bus stops and future service. At a point in time when expected ridership reaches appropriate levels RTA could reconfigure an existing bus route or add a new bus route to serve the WLC project. As provided in the WLC Specific Plan, all project streets will be designed to accommodate bus service at such time as determined by the RTA.

Response to Comment G-51-53. The commenter encourages the developer and the City to work together to plan bus service to the project. As indicated in Response to Comment G-51-52, at the appropriate time in the future when RTA believes there is sufficient ridership, it will make appropriate changes or additions to its bus routing to accommodate the WLC. As a result of this and other comments, the developer has agreed to contact RTA to discuss potential timing of additional service for the WLC area.

Response to Comment G-51-54. The 24-hour truck traffic, and indeed, all of the traffic generated by the project was addressed in the noise analysis. All roadways including freeways with any substantial project-generated traffic were assessed. The results are presented in Sections 2.3.1 and 2.3.2 of the technical noise assessment.

⁴⁵ "Advanced Collaborative Emissions Study" published by the Health Effects Institute (HEI) in 2015 (Research Report 184 final). The HEI consists of governmental and private industry representatives including the U.S. Department of Energy, U.S. EPA, engine manufacturers, the petroleum industry, CARB, emission control manufacturers, the National Resources Defense Council, and others

Response to Comment G-51-55. The comment is correct in that several roadway segments have been identified in the noise report as having significant noise impacts that cannot be mitigated (see Section 4.0 of the technical noise assessment). The potential traffic noise impact has been assessed in detail in the technical noise assessment. The City's development review process requires coordination with RTA regarding bus stops and related improvements, however there is no required mitigation requirements.

Response to Comment G-51-56. The commenter asks if several locations mentioned in the DEIR and noise assessment are from other reports. The commenter must remember that many locations distant from the WLC site were required to be evaluated in the project traffic impact assessment (TIA) due to a recent court case involving a nearby residential development in Riverside County ("Villages of Lakeview"). It is therefore possible that some remote locations "show up" in the EIR, and some intersections are shown to have significant traffic impacts because they are in another jurisdiction (like the City of Perris) and thus implementation of mitigation cannot be guaranteed by the lead agency.

The noise study is based on the traffic forecasts and there may be many reasons why project-generated traffic gets focused on roadways distant from the project. The traffic study has been revised since the original analysis. The new analysis does not show significant noise increases along the segments of Placentia Avenue and Day Street referenced in the comment.

Response to Comment G-51-57. The commenter asks for a map of noise monitoring stations in the DEIR. While preparing the EIR, it is always important to determine that level of detail from the related technical study must be included in the DEIR text (i.e., does it clarify the analysis?). In this case, the locations of the monitoring stations is shown graphically in the project noise assessment (DEIR Appendix K, Exhibit 5) and it was felt if someone wanted to see that detailed data they could easily find it in the noise assessment. In addition, there is no CEQA requirement to provide a "handy area map" as part of the noise study. The noise impacts are listed and are presented in alphabetical order, which should be adequate.

Response to Comment G-51-58. Please reference Response to Comment G-49-22.

Response to Comment G-51-59. Please refer to Responses to Comments F-11-37 and G-3-2.

Response to Comment G-51-60. The commenter was in general agreement with the traffic study but was not able to fully review it. Section 4.15 of the DEIR describes how the project traffic study was conducted, what assumptions were used including fleet mix and breakdown of trucks to passenger vehicles, consistent with industry standards for similar types of traffic studies for high cube/logistics warehousing facilities. This information was provided in the TIA report (Chapter 4, Section C)(FEIR Volume 2 Appendix L-1).

Response to Comment G-51-61. The commenter reiterates his concern about the job estimates and traffic impacts. The issue of jobs has already been addressed in the Response to Comment G-51-3. Section 4.15 of the DEIR examines the traffic-related impacts of the WLC project. The EIR concluded that traffic impacts of the project would be significant even with implementation of recommended mitigation, largely because many of the improvements that would be needed to achieve level of service standards are located in other jurisdictions (including Caltrans) and are not under the control of the lead agency. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-51-62. The commenter notes the large amount of circulation infrastructure needed for the project and states their opinion that this will place a staggering financial burden on the public despite any contributions made by the developer or eventual occupants. It is the commenter's opinion, the Moreno Highlands Specific Plan would reduce the need for improvements and save millions of tax dollars.

The commenter's opinion is acknowledged. As was described in Chapter 4, Section E of the TIA, several traffic studies were conducted for the Moreno Highlands Specific Plan before the plan was approved in 1992. The studies are available at the City of Moreno Valley Planning Department. The final traffic study, which served as the basis for approval of that plan, forecast a total of 178,608 average vehicle trips per day (ADT) being generated by the Specific Plan. That would be more than two-and-a-half times, or 256% as many trips as are forecast for the WLC (69,542 ADT), refer to Chapter 4, Section C, Table 23 (of revised TIA). The Moreno Highlands traffic studies did not distinguish between car and truck traffic and so did not provide a forecast in terms of PCEs. However, even if the Moreno Highlands Specific Plan were to generate no truck trips at all (only auto trips), it would still generate nearly twice as many PCEs trips as the WLC. So it is the commenter's opinion, the WLC would generate a larger need for circulation infrastructure than the Moreno Highlands Specific Plan is incorrect.

Response to Comment G-51-63. The commenter is concerned about traffic on SR-60. The original and revised traffic impact assessments (TIAs) for the WLC project both provided extensive discussion and analysis of potential impacts on SR-60 under various development scenarios (Existing plus project buildout in 2012, Year 2022 plus Phase 1, and Year 2035 plus project buildout). The commenter is correct that the EIR shows the SR-60 will continue to be congested as growth occurs in the City and surrounding areas. However, the project TIA does indicate that the WLC project will introduce a large amount of employment in an area that has long been planned for residential uses, which will help improve the City's jobs/housing ratio and actually help reduce regional congestion over the long-term compared to what would have occurred under the currently approved Moreno Highlands Specific Plan. While it is contrary to CEQA to base the determination of significant impacts on a "plan to plan" comparison such as this, the fact remains that regional congestion will be incrementally reduced over the long-term if the WLC project is approved.

Response to Comment G-51-64. The commenter believes project traffic will be stuck in freeway congestion. However, the project traffic study clearly shows that WLC traffic is distributed throughout the day and does not coincide with freeway congestion during typical peak hours of the day (refer to FEIR Volume 2 Appendix L). In that way this type of project will have less impact, and be less impacted by, freeway congestion during peak hours.

Response to Comment G-51-65. The commenter expresses doubts about when Caltrans will provide truck climbing lanes through the Badlands.

The 2012 Regional Transportation Plan (RTP) Federal Transportation Improvement Program (FTIP) (the list of projects for which funding is available in the short term) includes project RIV120201 which is the construction of new east- and west-bound truck climbing lanes on SR-60 from Gilman Springs Road to 1.6 miles west of Jack Rabbit Trail. The project should be complete within ten years.

Response to Comment G-51-66. The commenter is correct, Section 5.1 of the DEIR lists the significant impacts of the WLC project as identified in Sections 4.1 through 4.16 of the DEIR.

Response to Comment G-51-67. The commenter thanks the City for being able to review the EIR.

Letter G-52: Steve Jiannino (April 8, 2013)

Response to the DEIR for the World Logistics Center:

I am writing to state one of my comments to the DEIR for the proposed World Logistics Center project.

I am opposed to this project being developed on the East side of Moreno Valley. I feel a smaller version of this project around March Air Base area where there is access to additional transportation modes would be a better designed project. With the poor existing air quality in the Inland Empire a project of this size with high concentration of diesel trucks would be a large detriment to the entire region.

1

My comment regards section 6, alternatives

Under traffic you make the assumption that an 18 wheeler has the same traffic impact as an automobile. In terms of congestion on the streets, highways, freeway ramps and intersections, I would venture to say that is not the case at all. Under the section on alternative sites you also assume that the alternative sites will not have access to rail or air transportation facilities as the current site does. The southwest area of Moreno Valley around March Air Base has access to both and would therefore lessen daily trips. Noise and air impacts would also be different at an alternative site with access to additional modes of transportation i.e. rail and air.

2

Steve Jiannino

24701 Valley Ranch rd.

Moreno Valley, CA

4-8-13 (e-mail)

RESPONSES TO LETTER G-52

Steve Giannino

Response to Comment G-52-1. The commenter suggests a smaller logistics project near the March Air Reserve Base and is concerned about air pollutants from trucks. The alternatives analysis did look at less intense development (~20% square feet) but did not look at significantly smaller project sites in other locations, as that was not the proposed project and California Environmental Quality Act (CEQA) requires the analysis of alternative sites to be able to support the project as proposed to see if some other site, by its very nature, would result in less environmental impacts. The Environmental Impact Report (EIR) did not look at other locations for smaller projects in the southwestern portion of the City (i.e., the Moreno Valley Industrial Park) as there are no large sites left in that area (ProLogis Eucalyptus Business Park EIR, Section 6.3.9, *Alternatives to the Proposed Project – Alternative Sites*, February 2013). The revised Traffic Impact Assessment (TIA)(Parson Brinckerhoff December 2013)(Final Environmental Impact Report (FEIR) Volume 2 Appendix L-1 Section 4.F) had an extensive analysis of potential rail service to the World Logistics Center Specific Plan (WLCSP) site, and determined that it could not be provided in an economical or environmentally responsible manner (i.e., had more impacts than no rail). Some of that discussion would apply to any potential logistics site in Moreno Valley or surrounding areas that did have rail service. Even if rail service were available to an alternative site, logistics uses in the Southern California area do not necessarily benefit from rail service as the majority of trips are within the South Coast Basin, and rail service only becomes economically and physically viable for trips across the country or at least to the mid-west or further. An additional issue with rail discussed in the TIA is the over capacity state of the existing railroad lines.

Response to Comment G-52-2. The commenter says for the project alternatives that truck impacts would not be the same as cars, and alternative sites might be able to take advantage of rail service and might have less noise and air impacts if rail service was available. The Response to Comment G-52-1 explains why rail service, even to an alternative site, might not be economically viable for logistics warehousing within the Southern California region. If rail service is not viable, then it is doubtful there would be any traffic or air quality benefits from rail service if the project were built on another site in the same general area, whether it was in the City or Moreno Valley or some other nearby jurisdiction. The commenter is correct that trucks produce different traffic impacts than passenger vehicles, but CEQA does not require a detailed traffic study for each potential alternative to the proposed project, especially when the CEQA document is a programmatic EIR such as for the WLCSP project. The alternatives analysis did provide a trip generation comparison of the various alternatives to the proposed project. Table 6.G indicated trip generation for most of the alternatives was greater than the proposed project (Draft Environmental Impact Report (DEIR) Section 6.4). The less intense development alternative would generally have the same truck/passenger vehicle ratio as the proposed project, while the other alternatives (Moreno Highlands Specific Plan, two mixed use plans) would have a lower truck/passenger vehicle ratio. Even with these differences, the traffic analysis of alternatives does provide an order of magnitude comparison of the potential traffic impacts of the alternatives compared to the proposed project, which is what is required under CEQA.

Letter G-53: Deanna Reader and Kenny Bell (email) (April 8, 2013)

From: Late98765@aol.com [<mailto:Late98765@aol.com>]

To: John Terell

Subject: Comments for World Logistics Center DEIR

To: John Terell and Mark Gross of the Moreno Valley Planning Department

Draft Environmental Impact Report comments for the World Logistics Center

I am opposed to this project because the economic benefits are seriously inflated and the negative impacts are understated. At first blush the Draft Environmental Impact Report seems to have covered everything but it really doesn't. There are alternatives and impacts that weren't explored.

1

The overly inflated economic projections are way too rosy and the employment projections are unreasonable. Warehouse automation is much like computer technology. Each successive generation is more efficient than the last. And in warehouse automation that means fewer and fewer jobs at technologically advanced fully automated warehouse. Those of us that went to the project hearings from this same developer know how many jobs we were promised. I was one of the only people that brought up the fact that a fully automated warehouse was not going to bring the employment numbers quoted. The quotes weren't even close. First 2500, then 1000 but City Official claim 500 to 600 depending on the day, and claim that is only because the facility isn't at capacity. The fact is the facility was designed for only 300 employees. The actual number of employees is less because the facility isn't at capacity because of the recession. The other reason sales are probably down is because of the \$40 million class action lawsuit against the company that lied to its customers. How does this City expect to foster a positive community environment if it doesn't disclose accurate employment numbers to its residents from past projects? (1) How does a community trust its leaders when they refuse to require an independently produced record of the true employment and salary figures of past projects? How can the residents expect the economic benefits touted from this project will be accurate if this developer was not forthcoming with its last project?

2

This developer's last project was estimated to contribute \$150 million of economic benefit to the City of Moreno Valley. The Mall, every warehouse and every business in the City along with property and sales taxes combined only amount to \$77 million in general fund dollars a year for the City of Moreno Valley. I have asked since this last project was built how that economic benefit figure was determined but have yet to get an answer. I have asked and the Mayor has agreed to provide current economic benefit data, but it hasn't been produced. The last figure the Financial Services Director gave was that the City was getting about \$200,000 in property taxes a year and that sales tax were essentially non-existent from the project. The difference between \$150,000,000 claimed and \$200,000 actually received is astronomical. How are this City's residents supposed to believe the economic benefits of this current project when the city won't give currently accurate data from the last project? Why would anyone believe the data from this project when it was produced by the same persons responsible for producing the inaccurate data from the last project?

3

The project is economically unfeasible because it does not include rail, or rather it doesn't include the cost of the rail needed to make any logistics hub location viable. The role of this project will be to accept trucks with loads originating from overseas thru the ports of Los Angeles and Long Beach. The trucks will come from the west fully loaded and go back to the harbor area empty. More trucks will come from the east to pick up the freight once sorted to deliver to eastern markets. Because trucks are either local (harbor to here and back) or long haul (here to eastern half of continent) there will be twice as many trucks to carry the same amount of cargo. Moreno Valley is surrounded by beautiful majestic mountains that trap pollution. There are calls for this freight to come from overseas in containers that are pre-sorted for the intended destination. The freight would then travel the continent to the east by rail. There is no plan by the state or any local public agency to bring freight rail to this facility. This alternative has not been addressed in the DEIR at all. To be economically viable a logistics hub must be serviced by rail. The location of this facility is not conducive to freight rail and it would be cost prohibitive. A flat area not surrounded by mountains would be a better and more cost effective alternative.

4

The Deir has not adequately addressed how the widening of the Panama Canal will affect the need for additional logistics when it opens next year. If the Panama Canal takes at least 25% of the overseas freight that comes from the ports on the west coast, how will that affect the need for this project?

5

Moreno Valley has been primarily a bedroom community. Most of its residents live in single family homes. The City's general plan was thoroughly vetted by all stake holders and approved in 2006. The general plan has a little of everything. Thousands of people moved into brand new houses in the early 2000's based on the promises of the general plan. This project will change the rural east end that is next to the San Jacinto Wildlife Preserve into a mega-warehouse or logistics hub. This is not a small insignificant change but a completely new general plan by way of a mega project. This area was supposed to have over 7000 single family houses as well as many other mixed use businesses. If this project were to go forward the amount of land available for single family homes would be seriously compromised. The only way to accommodate the number of new residents expected would be high density housing. If this project were to go forward this city's future would be warehouses and apartments. Thousands and thousands of people moved here because of the promise of a city life in a rural environment. How does this city expect to foster a positive environment if they remove the reason most people moved to this city?

6

The city produced and paid for an infomercial for this project over a year ago. This developer only plans to build high cube warehouses in this development and this past year the City reduced only the fee for high in half. No other city in California has cut the fee for high cube warehouses to half that of a traditional warehouse. The City Council has instituted a 20% reduction in the electricity bills for high cube warehouse (and medical uses which this particular developer says he intends to build). The City's Economic Development Action Plan states all the things the city is going to do for this project after it is approved. The mayor has stated (at a public meeting) that the city intends to offer assistance for the half a billion dollars that the infrastructure for this project will cost. How does this city intend to increase public participation when most residents think this a done deal and the city doesn't care what they have to say?

7

Sincerely,

Deanna Reeder & Kenny Bell

Moreno Valley CA 92555

RESPONSES TO LETTER G-53

Deanna Reader and Kenny Bell

Response to Comment G-53-1. The commenter believes the few benefits of the project will not outweigh its many impacts.

Response to Comment G-53-2. The commenter's April 8, 2013 letter questions the validity of employment projections for the World Logistics Center (WLC) because of the variance in projected employment figures for the Skechers warehouse when compared to current estimates. As explained under Response to Comment G-49, it is unclear at the present time what the total employment in the Skechers facility will be once it is fully built and the economy has totally recovered. Importantly, the Skechers project was not used as a basis for the employment projections made for the WLC project. Furthermore, the employment projections for the WLC are meant to reflect the average employment over the entire project, which will share a variety of types of logistics facilities. Therefore, the average employment figures are expected to be close to the projections stated in the Draft Environmental Impact Report (DEIR). Item 2 of G-90 provides more detailed information on the methodology utilized to determine the number of projected employees.

Response to Comment G-53-3. The commenter is confusing property tax revenues with economic benefit. Economic benefit is defined as overall economic output (i.e. total expenditures including sales or gross receipts, or other operating income) as a result of the project. For example, salaries earned by persons directly or indirectly employed as a result of a development project are considered to be part of an economic benefit projection, as are the dollar amounts of retail or wholesale sales generated directly or indirectly as a result of a project. But none of these revenues would be reflected in the amount of property taxes collected. A detailed analysis of the overall economic output to be generated by the project is included in Section 4 of the Fiscal and Economic Impact Study (Appendix O). A detailed analysis of the project tax revenues is provided separately in Section 3 of the Fiscal and Economic Impact Study (Appendix O), with results summarized in Table 3A. The methodology, sources of information and the model limitation have thoroughly been described in the Impact Study. The City Council will consider all comments on the project before making a decision on the project.

Response to Comment G-53-4. The provision of a rail service to the project site has been studied to determine if it is an alternative which will reduce the number of trucks driving between ports and the site, and therefore reduce the number of significant impacts (Please see Chapter 4, Section F of the revised Traffic Impact Assessment (TIA)). However, it has been determined that this alternative is not a viable option due to the following reasons. The WLC site is not currently served by rail and would need to be connected to an existing branch. All possible connections would cause impacts equal or greater than the projected truck traffic. It was also determined that for a rail service to be economical 50 percent of all shipments must be shipped 500 miles or greater on rail. Shipments to the WLC would only be travelling from the ports of Los Angeles and Long Beach, a distance of about 70 miles. Additionally, the existing rail system is already at or near maximum capacity. Therefore, shifting cargo from trucks on freeways to rail would transfer the congestion problem from stressed freeway systems to stressed rail networks. Finally, the port-related truck traffic to the WLC is projected to be between 2 and 7 percent of the total WLC truck traffic between now and 2035 (TIA). It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

National Association of Industrial and Office Properties (NAIOP) projections indicate a need nationally for about 700 million square feet of warehouse and distribution space over the next decade, on top of 300 million square feet of normal replacement of existing facilities (<http://www.naiop.org/~media/Research/Research/Research%20Reports/Logistics%20Trends%20and%20Specific%20Industries/LogisticsTrendsandIndustries.ashx>). The rapid growth of web-based sales with deliveries to consumers coming straight from the warehouse, rather than through

traditional brick and mortar retail stores, will further increase the demand for warehouse space throughout the West, including in the Inland Empire.

Furthermore, a study prepared by the Southern California Association of Governments ("SCAG") titled *"Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities."* supports the need for more warehousing space. The study's Executive Summary states the following (<http://www.valleyconnect.com/~valleyco/images/stories/Library//IndustrialSpaceInSouthernCalifornia.pdf>):

- "According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet (pg. ES-1).
- "During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available" (pg. ES-2).

The WLC will contribute to the supply of warehouse space necessary to satisfy a portion of this demand. This SCAG Report supports other data presented in responses to DEIR comments that there will be more than sufficient demand to support the WLC (Comment Letter F-10-7).

Response to Comment G-53-5. While the current expansion of the Panama Canal will increase the Canal's ability to handle cargo, and in particular, larger ships, the increased level of demand for logistics facilities nationally should generate greater need for port facilities on both the East and the West Coasts. NAIOP projections indicate a need nationally for about 700 million square feet of warehouse and distribution space over the next decade, on top of 300 million square feet of normal replacement of existing facilities (<http://www.naiop.org/~media/Research//Research%20Reports/%20Trends%20and%20Specific%20Industries/.ashx>). The Port of Long Beach's Master Plan calls for the acquisition of 450 acres of landfill to house additional cargo handling facilities due to increased demand (<http://www.polb.com/civica/filebank/blobdload.asp?BlobID=2266>). Currently, the Panama Canal only receives 20% of Asian impacts and exports because it takes three days longer to deliver goods to the east coast than it does by ship and train from the West Coast. This more lengthy delivery time will also continue to impact the Panama Canal's ability to take over West Coast import export business, even after its expansion. Finally, the rapid growth of web-based sales with deliveries to consumers coming straight from the warehouse, rather than through traditional brick and mortar retail stores, will further increase the demand for warehouse space throughout the West, including in the Inland Empire.

Response to Comment G-53-6. The commenter expresses a number of concerns and doubts about the project, including loss of planned housing and a rural lifestyle. The WLC project is proceeding through the General Plan Amendment and Specific Plan process to address the many concerns and issues that arise when a fundamental change to land use is proposed for an area, especially such a large piece of land adjacent to housing and the San Jacinto Wildlife Area (SJWA). It will be up to the City Council to determine if this project is in keeping with the overall plans for development in the City, and if its benefits outweigh the significant project impacts identified in the EIR. The City Council will consider all comments and responses on the project and EIR before taking action on the WLC project.

Response to Comment G-53-7. The commenter incorrectly states that City has only cut development impact fees for high cube warehouses. The City in fact has cut development fees across the board and was supported by a Nexus Study prepared by the City (<http://sirepub.moval.org/sirepub///i1aqtvbfebqn2lqt/244285912132013045943227.PDF>). It should also be noted Western

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Riverside Council of Governments (WRCOG) has reduced Transportation Uniform Mitigation Fee (TUMF) by at least 50% for high cube warehouse over 600,000 square feet ([http://www.wrcog.cog.ca.us// items/.original.pdf](http://www.wrcog.cog.ca.us//items/.original.pdf)). This reduction was in part was based on traffic characteristics of High-Cube Warehouses and is fully analyzed in the TUMF Nexus Study. The commenter correctly notes that the City has instituted a reduction electricity rates to promote economic development within the City. Any commitments to cost participation by the City would be identified in the project development agreement. The City Council will consider all comments in the project before making a decision on the project.

Letter G-54: Jose and Alicia Espinosa (email) (April 8, 2013)

I oppose the World Logistics! These was not part of the General Plan when I moved and the employment hiring numbers are misleading. Trucking fumes are also a factor to my health and the health of our resident children. No to warehousing ! } 1

Sent from my iPhone

RESPONSES TO LETTER G-54

Jose and Alicia Espinosa

Response to Comment G-54-1. The proposed World Logistics Center (WLC) project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, Land Use and Planning). The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

APR 08 2013

CITY OF MORENO VALLEY
Planning Division

Ref: **DRAFT ENVIRONMENTAL IMPACT REPORT (SCH #2012021045)**

The DEIR fails to adequately address any mitigation methods to overcome the "significant cumulative impacts" to my house (14670 Gilman Springs Road) and the other houses along Gilman Springs Road. The DEIR admits there are significant cumulative impacts to views, scenic resources, night lighting, and glare as well as noise, air quality and traffic impacts to those houses on Gilman Springs Road yet there is not one mention about the Moreno Knolls Homeowners Association and the Moreno Knolls Development. No one has sought the input from the Homeowners Association or the individual homeowners other than have an opportunity to comment on the DEIR prior to the publication for public review.

The exclusion of any mitigation measures for these minimum 2.5 acre estate properties; just because they are in the unincorporated county area is clearly an Environmental Justice issue. This is especially true when taken into consideration the significant proposed mitigation measures outlined for the properties within the city limits of Moreno Valley. The houses in the city limits other than those in the project don't have anywhere close to these significant cumulative environmental impacts.

It is very clear that the City of Moreno Valley is only concerned about pushing through this project without consideration for any property owners other than those within the city limits and then that is only very limited. My property is the closest developed property to Gilman Springs Road yet no noise studies were conducted on my property to measure the impacts.

The DEIR is misleading and unclear in the description of how high the structures can be along Gilman Springs Road and how close they can be to the residences

and roadway. This is especially true in front of my property. They casually mention that the existing grade will be lowered about 30 feet along Gilman Springs Road and the perception in the report is that will be the case all along Gilman Springs Road. When I read further into the report it says that will not be the case in all locations and it appears that the grade on the south side of Gilman Springs Road will not be reduced more than a couple of feet near my property at the most. I assume this is due to the 16 inch high pressure gas line would be exposed if the site were over-excavated.

The report goes on to say that some of the structures could be up to 80 feet high or higher in this area yet the report tries to lead us to believe that no buildings will be more than 55 feet above the 1,795 foot elevation level. That elevation is the highest elevation point in entire project. When it gets to my property the elevation is about 1,620 feet. That could conceivably allow buildings up to 175 feet tall in front of my property. Building of 55 to 80 feet tall is still like a 5 to 8 story building in front of my house (but instead looks like a concrete wall).

Right now my house enjoys an unobstructed view of Old Moreno, Lake Perris Mountains, open farm land, duck ponds, Mystic Lake and clear down to San Jacinto. All of my views will be completely wiped out with 55 to 80 foot monolithic concrete walls. I just finished spending several hundred thousand dollars rehabbing my property so that we could move in and retire there, enjoy the openness, peace and quiet and views without having any close neighbors. I wouldn't have minded residential neighborhoods as originally planned and approved for this area. A residential area would not have destroyed our views as the zoning height would only be 35 feet above existing grade.

Job Creation Claims to Justify Project

The claim of job creation does not meet the level of justification for such drastic negative impacts the whole east end of Moreno Valley and the San Jacinto Valley area. These new giant distribution warehouses are extremely automated and the DEIR study fails to honestly take into consideration the level of automation that will be going into these warehouses and the resulting job creation. The automation will vastly reduce the number of jobs that would be created. The jobs

being touted will not materialize as presented in the report other than the resultant heavy transportation trucking.

Additional Roadway Impacts

This project will place thousands of trucks onto the same Freeway (Route 60) that approximately 70 percent of the residences of Moreno Valley use for commuting to jobs and school. The DEIR also fails to take into consideration the proposed County of Riverside proposal to allow trash hauling from LA to the Riverside County Dumps at both the Badlands site and the Lamb Canyon site. These trucks are very slow moving and would add considerable congestion and truck traffic to the freeway and roadways that was not taken into consideration in the DEIR.

This DEIR report is replete with failures of The City of Moreno Valley General Plan Policies including:

Policy 2.5.2 "Locate manufacturing and industrial uses to avoid adverse impacts on surrounding land uses". **Note:** The city has already designation the southern portion of the city along I-215 as the primary industrial development area in the general plan.

Conservation Element

Objective: 7.7 "Where practicable, preserve significant visual features, significant views and vistas.

Policy: 7.7.5 "Require development along scenic roadways to be visually attractive and allow for scenic views of the surrounding mountains and Mystic Lake".

I am not opposed to the development of this area but this is not an acceptable project for this location.

This DEIR has Significant Cumulative Failures in so many areas that I am unable to adequately respond to them all.

Annexation:

I am also adamantly opposed to any annexation of the unincorporated county land into the City of Moreno Valley as proposed through this EIR process.

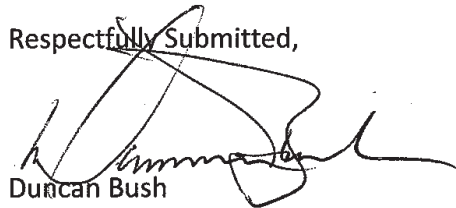

This is just an arrogant mechanism to circumvent the LAFCO process and does not give the property owners an opportunity to comment before the Commission on a supposed LAFCO action that will be enacted by this proposal.

By circumventing the annexation through the EIR process, the LAFCO Commission is turning its "State" authorized powers over to the City of Moreno Valley City Council. Where is the legislation for such an action?

The City of Moreno Valley via the EIR process is effectively taking unincorporated county land zoned W-2 (minimum 2.5 acres for one residential unit) that is currently being used as agricultural land and bringing it under the city control to allow a project that will put massive industrial distribution warehouses right next to my rural residential estate property. They are also taking away scenic vistas and severely degrading the value of my property as a result of Significant Cumulative Impacts with NO attempts to even try and mitigate the damaging impacts.

This project is not my "California Dream", much closer to a "Nightmare".

Respectfully Submitted,

Duncan Bush
29307 Highland Blvd
Moreno Valley, CA 92555

951-333-3540

RESPONSES TO LETTER G-55

Duncan Bush

Response to Comment G-55-1. The commenter is concerned the Moreno Knolls community was not mentioned in the Environmental Impact Report (EIR). The Draft Environmental Impact Report (DEIR) did not mention specific housing tracts or development, but rather emphasized general land uses away from the WLC project site to the east, west, north, or south as appropriate. The residents of the City, including the Moreno Knolls community, were encouraged and notified to participate in a public scoping session hosted by the City on March 12, 2012. The commenter also correctly indicated that input from the Moreno Knolls community was solicited during the 63-day public comment period on the Draft EIR, and more comments will be allowed at the public hearings for the project (Planning Commission and City Council) prior to a decision on the project. In these ways, residents of the Moreno Knolls community have been able to comment on the proposed World Logistics Center (WLC) project.

Response to Comment G-55-2. The commenter expressed “environmental justice” concerns and lack of mitigation for the Moreno Knolls community. It should be noted that the term environmental justice refers to significant environmental impacts that are “inflicted” on minority and/or lower socioeconomic communities because they have less political influence. That does not appear to be the case with this particular community with 2.5-acre lots, but instead presents more community-wide or City-wide environmental issues, as evidenced by the many comments received on the DEIR.

Response to Comment G-55-3. A number of the environmental studies that were prepared along with the DEIR included impacts along the east side of Gilman Springs Road, such as biological and drainage impacts associated with the Badlands area, visual or aesthetic impacts mentioned by the commenter (DEIR Section 4.1.6.1 views from east of Gilman Springs Road, geotechnical constraints, traffic along Gilman Springs Road, and noise levels along both sides of Gilman Springs Road (DEIR Section 4.12, *Noise*). While the emphasis of the document is impacts to City residents, services, etc., the EIR did not ignore impacts to other areas or residents.

Response to Comment G-55-4. Section 3.4.6.1, *Project Description –Land Use Plan* and Figure 3.9 of the DEIR which indicate warehouse buildings along the north, west, and south boundaries of the WLC project. The commenter is correct, buildings along the west side of Gilman Springs Road can would be approximately 80 feet tall, but will be set back from the roadway in most locations where the San Jacinto Fault passes through this area parallel and just west of Gilman Springs Road. It must be remembered the WLC project and the DEIR that accompanies it are programmatic in nature, so specific development characteristics such as building footprints, building heights, and final grade elevations are not known at this time, including along the west side of Gilman Springs Road. In addition MM 4.1.6.3A has been modified to preserve views of Mt. Russell.

Response to Comment G-55-5. The commenter is concerned about the heights of buildings and blockage of views from his property. In response to this and other comments regarding views, MM 4.1.6.3A has been modified to require WLC project buildings to not block the upper two thirds of the vertical view of Mt. Russell from the SR-60 Freeway (refer to MM 4.1.6.3A) While this will not eliminate visual impacts of the project from homes east of Gilman Springs Road, it will substantially reduce them. The commenter is also referred to Response to Comment F-8-3.

Response to Comment G-55-6. The commenter expands on his concerns regarding loss of views. Views will substantially change from vacant dry-farmed land considered general “open space” to many large warehouses if the WLC project is approved. However, the mitigation for loss of views has been modified as outlined in Response to Comment G-55-5 above which will help preserve some views east of Gilman Springs Road.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-55-7. Employment projections for the WLC project are contained in a 2013 report entitled, “Fiscal and Economic Impact Study, WLC, Moreno Valley, California” prepared by David Taussig & Associates, Inc. (DTA). This report is provided in Appendix O of the DEIR. In this report, an estimate of 0.50 employees per 1,000 square feet of building square feet was used to project the number of employees that could be located at the WLC project. Based on the proposed land uses and building areas, this would equate to approximately 20,808 employees. The 0.50 employees per 1,000 square feet factor was based on data supplied by the Southern California Association of Governments (SCAG), the National Association of Industrial and Office Parks, and the U.S. Energy Information Administration. These projections are discussed at length in the DTA report. Additional information regarding these employment projections can be found in the Responses to Comments G-90-1, and A-1 through A-4.

Response to Comment G-55-8. The commenter states the project would place thousands of trucks on SR-60, which approximately 70 percent of Moreno Valley residents use for commuting. The DEIR also fails to consider a proposal by the County of Riverside to allow trash hauling from Los Angeles to the Riverside County dumps at the Badlands and Lamb Canyon.

Chapter 3 Section E of the revised TIA (FEIR Volume 2, Appendix L) discusses Moreno Valley residents’ heavy reliance on long-distance commuting on the freeways, and points out that the WLC project would benefit the residents who now commute to work outside the city by providing more than 20,000 jobs locally. The WLC would offer city residents the option to work near their home rather than commute long distances on the freeway system. The WLC would have some impacts on the freeway system and these impacts have been fully disclosed in the TIA.

The comment appears to refer to a recent (2013) decision by Riverside County to possibly accept trash from Los Angeles County. At this point Riverside County has voted merely to keep the option to accept this trash open, having earlier voted unanimously to vacate their earlier bid on a contract to accept trash from the Sanitation Districts of Los Angeles County. If this option is pursued then the trash hauling project would be subject to environmental review including identification of impacts to the freeway system and the measures needed to mitigate those impacts.

Response to Comment G-55-9. The commenter expressed concern regarding the project’s inconsistency with General Plan policy 2.5.2 regarding separation of residential and industrial uses, and General Plan Objective 7.7 and Policy 7.7.5 regarding visual features and scenic views. The DEIR examines the project’s consistency with these policies in Sections 4.10, Land Use and Planning and 4.1, Aesthetics, respectively. The project does in fact provide a buffer between residential and warehouse uses equal or greater than that identified in the City’s Municipal Code (Section 9.05). As noted previously, MM 4.1.6.3A has been modified to preserve significant views from SR-60 and Gilman Springs Road. Refer to Response to Comment G-95-18. Other potential impacts of the project are evaluated and mitigated as necessary in appropriate sections of the DEIR. The City Council will have to decide whether the project is consistent with the General Plan policies and objectives.

Response to Comment G-55-10. The commenter is concerned about the annexation aspect of the project. Annexation of the property would still ultimately be up to Riverside County’s Local Agency Formation Commission (LAFCO). LAFCO would have to take separate action to approve the annexation. The property west of Gilman Spring Road within the WLC project that will be annexed is within the City’s Sphere of Influence and has been since the City was incorporated. The subsequent steps in the annexation process all are under the authority of Riverside County’s Local Agency Formation Commission (LAFCO). Part of the LAFCO application is to provide appropriate environmental documentation, and this WLCSP EIR is that documentation. The WLC EIR confirms that the City will provide all municipal services for the entire WLC project, including the parcel to be annexed. Other regional agencies, such as Eastern Municipal Water District (EMWD), will continue to provide services as they currently do. The applicant cannot file an application with LAFCO until the WLC EIR is certified by the City.

Letter G-56: Ned and Dawn Newkirk (April 8, 2013)

Attn: Mark Gross and John Terrell
 From: Ned and Dawn Newkirk
 Subject: Official Comments for the DEIR for The World Logistics Center
 Date: April 8, 2013

As we live in the affected area of the World Logistics Center and were pulled into this area as a non conforming entity in May of 2012, we wish to express our opposition to this center for a variety of reasons:

We oppose this project as we were pulled into this area without our consent. On Page 25 of the DEIR in the Executive Summary it is stated that the "WLC is located in the eastern end of the city, so its development would not physically divide an established community. However, development could adversely affect seven existing rural residences onsite, and the land plan cannot accommodate residences within logistics warehousing areas." The DEIR further states that no feasible mitigation is available even though the level of significance is significant and unavoidable. This is totally unacceptable as we feel mitigation is possible. If the city is going to diminish or destroy the quality of life for the residents in the seven homes of the World Logistics Center as far as property values, health, pollution/diesel particulates, noise, and lighting and glare are concerned, why isn't the city offering to help these residents relocate to comparable residences or offer financial compensation for all the adverse affects residents within the WLC will have to endure? (see attachment, pages 1-6).

As the city made the seven residences in May 2012, a part of the WLC, these residences have been in a state of limbo as far as zoning is concerned. How do we sell our property when it may become industrially zoned? Therefore, if we can't sell our property, how can we buy another house to which we can relocate as we have no money or equity from our existing home that can't be sold?

We are opposed to the World Logistics Center as to the harmful effects it could have on the residents of the seven residences within the area of the WLC as well as the warehouse workers and other workers within that area. In the section, Land Use and planning, on page 34, the DEIR states: "It is possible that, as development of the project site occurs according to the WLCSP, large warehouse buildings may eventually be located in close proximity to existing residences. It would be ineffective and inefficient to try to incorporate these residences into the WLCSP land plan of large logistics warehouses to accommodate these residences. In addition, logistics

RECEIVED

APR 08 2013

CITY OF MORENO VALLEY
 Planning Division

operations would cause air pollutant, noise, lighting, and health risk impacts on residents living in these units if they were adjacent to operating warehouses. This is a significant land use impact."

3

Why is the city not protecting the seven residences from air pollution, noise, and other health risks by providing buffers between the warehouses and the residences?

4

The DEIR states that there is no effective way to protect the seven residences from adverse health effects. If the city can't protect its citizens occupying those seven residences from adverse health effects within the WLC area, then why is the city going forward with the project?

We are opposed to the WLC because it does not provide protection and safety to residences within the WLC in regards to dangerous air quality or other health risks. In section 4.10 in land use, page 34 in mitigation measures, the DEIR states: "Installation of solid block walls around the warehouse building or the existing residence would help reduce noise and lighting impacts, but they would not help reduce air pollutants or health risk impacts. Therefore, there is no effective mitigation available to protect or separate these existing residences from future warehousing buildings and operations." Since it is the responsibility of government to protect all of its citizens, who will pay for medical expenses, or compensate for pain, injury, and/or death from harmful effects created by the WLC to the residences within the WLC area? Just to say that because the residences are there and that they could be severely and unavoidably impacted is not acceptable. The City needs to find ways to protect all residents within and adjacent to the WLC area.

5

We oppose the WLC for forcing the seven existing residences to have to "eventually convert to 'light logistics' uses" (Executive Summary, table 1.a, P.29.). Why must our zoning and the general plan be changed to "light logistics" when that is not our desire to pursue that venture?

6

Although there are fifteen plus references to the seven residences within the WLC footprint in the DEIR, it appears as if they are "trapped" there with no intention of the city to help mitigate their obstacles and plight.

We oppose the WLC because of the lack of a necessary infrastructure system needed to support the huge warehouse district. The DEIR addresses part of this concern in Traffic and Circulation/
4.15.7.2 The City of Moreno Valley Development Impact Fee Program

The City of Moreno Valley's Development Impact Fee (DIF) program is used to fund road and intersection improvements needed to accommodate new residential, commercial, and industrial development for funding roadways and intersections. The program collects fees from three categories of residential development (single-family, multifamily, and mobile homes) and five categories of commercial

7

development (general commercial, regional commercial, general industrial, high-cube warehouse, and office) based on their respective trip generating characteristics. In many cases, developers dedicate right-of-way and/or construct improvements that are part of the TUMF or DIF programs in lieu of paying the fees.

However, what other components would be needed to provide an adequate infrastructure for the WLC. If so, would citizens or would the developer have to fund these needed components.

We oppose the WLC for the impact it will have on the region. Mira Loma has one of the poorest air quality in the world and many of their children have developed respiratory diseases. Why would the City of Moreno Valley want to bring in thousands of diesel trucks for goods transport when diesel particulates spewing into the air can cause a myriad of health problems such as cancer, cardiovascular, and respiratory diseases? What research has the City of Moreno Valley conducted to assess how air quality will be affected when pollution from both Mira Loma and Moreno Valley come in the basin between the two cities? (see attachments pages 7-32).

We oppose the WLC because of the inaccuracy in the Skecher's numbers of jobs that were projected (2500) and only six hundred jobs materialized. Although there have been statistics released on the number of jobs the WLC will create, how will the city guarantee the 20,000 plus jobs they have predicted the WLC will produce? Additionally, warehouse automation is rapidly advancing. How can the city predict such a large number of jobs that the WLC will create when robots are continually replacing vast numbers of warehouse workers? (see attachments pages 33-36).

Thank you for your time and attention to our concerns and questions.

Respectfully submitted,

Ned Newkirk

RESPONSES TO LETTER G-56

Ned and Dawn Newkirk

Response to Comment G-56-1. The commenter occupies one of the 7 rural onsite residences and objects to the World Logistics Center (WLC) plan including them. The WLC project applicant has proposed the boundaries of the WLC Specific Plan along natural or appropriate boundaries, taking into consideration existing uses and the objectives of the project. In this case, the western boundary of the specific plan is the existing residences east of Redlands Boulevard both north and south of Alessandro Boulevard. This boundary allows for the largest contiguous area for logistics warehouses but unfortunately does include the 7 rural residences mentioned by the commenter. Excluding these 7 properties would significantly break up the potential land plan for which large areas of contiguous property are needed to efficiently design and support large warehouses. Relocation and financial assistance are not California Environmental Quality Act (CEQA) issues and are not addressed in this response.

Response to Comment G-56-2. The commenter questioned the zoning of their property given the WLC project. The 7 rural properties currently have General Plan and zoning designations consistent with the Moreno Highlands Specific Plan, as shown below (map data from City website, lot sizes taken from Table 9.03.040-6 in the City's Municipal Code):

Location of Rural Residence(s)	Gen. Plan	Zoning
2 lots just east of Redlands	R2 (2 du/ac)	RA2 (20 k SF min lot size)
1 lot just west of Theodore	OS (open space)	OS (open space)
4 lots east of Theodore	R5 (2 du/ac)	R5 (7200 SF min lot size)

du/ac = residential dwelling units per acre SF = square feet

Upon approval of the project, existing residentially-developed properties which are changed to non-residential General Plan and zoning land use designations are permitted to continue the residential use of the property indefinitely as "legal, non-conforming uses" subject to the restrictions contained in Municipal Code section 9.02.180, "Legal nonconforming uses, improvements and parcels." Ownership of these properties is not affected by their non-conforming status. The parcels can be bought and sold as legal, non-conforming uses and the residential use can be continued indefinitely by a new owner subject to limitations on the expansion, modification or abandonment of the use or residential structure as detailed in the above-referenced section of the Municipal Code.

Response to Comment G-56-3. The commenter correctly cites the Draft Environmental Impact Report (DEIR) in that it concludes land use impacts are significant for the 7 rural residences. Due to the overall goal of the project (i.e., to support a regional logistics center) the rural residences cannot be incorporated into the project land plan as they currently exist, but are shown as Light Logistics uses for some time in the future. See Response to Comment G-56-2 above.

Response to Comment G-56-4. The commenter is correct the DEIR did not identify specific air quality mitigation for the onsite rural residences. However, there are mitigation measures to address construction-related noise impacts (MMs 4.12.6.1A and 4.12.6.1B). The City Council will consider the effect on the existing residences when it decides whether to approve the project.

Response to Comment G-56-5. The commenter continues explaining concerns about air quality impacts on the rural residences and other offsite residences. As explained in Response to Comment G-56-4, mitigation has been added to install air conditioning filters for the rural onsite residences, but the revised air quality study has determined that air quality impacts for residents adjacent to the WLC project (i.e., west along Redlands Boulevard) will not be significant so no mitigation is proposed.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-56-6. The comment raises no issue with the adequacy of the DEIR and no response is required. Development of the private property within the World Logistics Center Specific Plan (WLCSP) would not occur without the express permission and approval of the property owners (i.e., no other entity could propose or process any development proposals on the owner property without owner's express consent). Existing residential uses would be grandfathered as legal non-conforming uses for as long as anyone wants. Please see Response to Comment F-13-9 for information on proposed mitigation measure related to onsite rural residential uses. The City Council will consider all comments on the project before making a decision on the project. As explained in Response to Comment G-56-1, the City has discretion to establish the boundaries of a specific plan along natural or appropriate boundaries, taking into consideration existing uses and the objectives of the specific plan project.

Response to Comment G-56-7. The commenter repeats the TIA's description of the Development Impact Fee (DIF) program. The commenter asks what other components would be needed to provide adequate infrastructure for the WLC, and whether citizens or the developer would fund those components. The commenter resides in one of the seven houses on the site and seems to be asking if existing residents of the project site would be required to pay for WLC infrastructure. The answer is no, they would not be asked to pay for the infrastructure required for the WLC (see MM Trans-3 in Chapter 11, Section G of the Traffic Impact Assessment (TIA)).

Response to Comment G-56-8. See Response to Comment G-56-7 above.

Response to Comment G-56-9. The commenter inquires as to how air quality will be affected when pollution from both Mira Loma and Moreno Valley comeingle in the basin between the two cities. From a review of the prevailing wind patterns in the area, the most frequent wind patterns at both locations are generally from the northwest, not towards each location. Therefore, there should be a minimum degree of comingling of emissions from both locations. In addition, as part of the localized significance air quality impact analysis, the cumulative air quality impact from the project's emissions when added to the highest measured air quality levels from all other emission sources surrounding the project, including those emissions from the Mira Loma, area did not violate any ambient air quality standards for locations outside of the project boundaries.

Response to Comment G-56-10. While the City cannot guarantee the exact number of jobs the project will generate, as that will be dependent on the mix of users ultimately locating within WLC, the DEIR projects future employment figures based on the average employment per square foot for a variety of types of logistics facilities. Please reference the Response to Comment G-90-2 for more information.

Planning Division

Re: Comments for the Draft Environmental Impact Report for the World Logistics Center

To whom it may concern:

I oppose this project because a 41 million square foot warehousing complex is not economically feasible without freight rail and additional highway infrastructure to support its shipping and receiving demands. Plus the Lead Agency has not disclosed how much it will cost in tax dollars for this project. Without knowing that amount, neither the public nor the Lead Agency can determine the economic feasibility. It creates unavoidable health consequences as well as traffic and infrastructure burdens that cannot be effectively mitigated.

1

In direct reference to the Draft Environmental Impact Report (DEIR), section 4.0 there is reference that a "new Specific Plan will be adopted to govern development of the WLC." What is the schedule release date of this Specific Plan for public review and comment? And how does this proposed project conform to the overall regional goals for the Inland Empire?

2

The DEIR states there will be a separate zoning amendment of the 1104 acres of open space. When will the hearing be scheduled and what is the position of the FNSJWL on this rezoning map?

3

Section 4.1 Existing Policies and Regulations references the rezoning of the area within the project boundaries. What will be the allowable uses and restrictions of this area for manufacturing and industrial uses? Who will police the daily activity and what will be the Lessor/Lessee obligation to disclose to the City what their operations entail?

4

In direct reference to section 4.1.2 Existing Policies and Regulations, Objective 2.5; this states "promote a minimum of Industrial uses which provide a sound and diversified economic base and ample employment opportunities for citizens of Moreno Valley with establishment of Industrial activities that have good access to the regional transportation system, accommodating the personal needs of workers and business visitors, and which meets service needs of local businesses." But how is this accomplished if our community already experiences the Level of Service for traffic circulation of an E or F level rating?

5

Comments by Tracy Hodge

Page 1

Comments for the Draft Environmental Report
For the World Logistics Center

To designate residential traffic arteries within communities as truck routes does not improve this LOS rating it makes it worst.

6

Who will pay for the upkeep of our community infrastructure of the traffic routes that become designated as truck routes, the tax payer or will there be a special assessment for the occupant in the commercial building that is using those truck routes to support their business?

7

Section 2.5.4 of the same 4.1.2 as noted above references "design industrial developments to discourage access through residential areas." What streets will be specifically designated as Not a Truck Route and what will the penalties be for those who choose to violate those restrictions. Who will be responsible for infrastructure repairs when unauthorized/overweight vehicles damage residential streets?

8

Currently, as a resident who lives on Shubert Street off Redlands Blvd., our street does become a used route for all vehicles when traffic is diverted off Redlands Blvd. to Eucalyptus or Dreacaea. What measures will be put in place to ensure the diesel trucks are NOT using our neighborhood streets?

9

Objective 2.10 of the same 4.1.2 as noted above shows consistent exemplary design is contrary to the installation of sound walls along existing residential neighborhoods as well as displaying inadequate setbacks and streetscape obligations to be provided by the developer. How will this be handled?

10

Policy 2.10.4 of the same 4.1.2 as noted above Landscape buffers and transitions will be a very important part of setting the esthetics benchmark for the development. Will uniformity be a requirement for each parcel so to not detract from an adjacent property? Will the landscape tree and shrub count include enough elements and separation to absorb the diesel particulates to reduce the exposure of diesel toxins to the neighbor/neighborhood?

11

Policy 2.10.11 of the same 4.1.2 as noted above to screen and buffer non-residential projects from adjacent residential properties does not clearly identify the minimum setback requirements to reduce the exposure of diesel particulates to the residential neighborhood adjacent to the commercial building nor does it address the requirements of the No Idling Restrictions. These measures not being clearly addressed will affect the quality of life for any person subjected to the impacts of this project.

12

My concern with this very topic is that cities and counties adopt design standards for Residential neighborhoods with details of maximum rooflines, minimum number of units, setback requirements, colors & materials, walls & fence design standards, lighting restrictions by ordinances, maximum lot coverage, minimum space between structures, watercourse and drainage design to protect the natural and forms, reverse frontage treatments for landscape street medians and parkways, minimum landscape requirements, drainage plan and flood control. What is the design criteria for this project so that the same development standards are applied to the commercial project that would be applicable to a residential project? This DEIR may reference proposed placement of buildings and proposed line of sight based on a specific location, but how do we know this will be the standards of what becomes the finished product?

13

Comments for the Draft Environmental Report
For the World Logistics Center

Policy 2.10.5 of the same 4.1.2 as noted above freeways are the only road identified to have landscape buffers. Why aren't the residential neighborhood streets adjacent to the project also included in this buffer requirement?

14

Table 3.A of the Moreno Highland SP (Current Land Use Designation) states the developer owns or controls 46% of an area being planned so how does the developer or the City have any right to override the remaining 54% of the land designation that is owned by other private, none supportive parties?

15

How does warehouses sustain a pleasant "living and working environment" when the output is toxic to our air we breathe, stifles our flow of traffic, deteriorates our infrastructure and completely changes the economics and esthetics of the community? What is pleasant about any of these facts?

16

The Noise Assessment for the World Logistics Center dated January 24, 2013 identifies residents of Site 9 along Shubert Street which was included in this referenced noise study as being a quiet residential area. What actions and traffic restrictions will be put in place to maintain the current quality of life I experience as a property owner on Shubert Street?

17

According to the historical opinion of our past governing body and according to our Community General Plan, specifically noted on page 7-12, Scenic resources contribute to the overall desirability of a community. The distinctive physical setting of Moreno Valley creates much of the city's appeal as a place in which to live. Thus Moreno Valley's visual resources are also of economic value to the Community. So if it has been the opinion for many years, what is the economic value that is being placed on warehouse verses the current expired General Plan? What research has been put in place to validate the economic decision of warehouses instead of the currently expired General Plan and when will that comparison be made available to the general public for review?

18

Many qualities that once promoted a positive livable environment will become dramatically altered when this project becomes reality for this community. We will struggle with the health challenges each of us within the region will have to face which will diminish our quality of life. The road ways that are already congested with the daily demands of our region as of today will become even more of a difficult encounter when diesel trucks are added to the community. Our region already has recorded data of being amongst the worst air quality in the state. The 22,000 additional trucks per day is a nuisance that can be avoided in an area that cannot support that demand. Fact is that 200 vehicles are equivalent to 1 diesel truck when it comes to the health impact on the region. The health impacts alone are overwhelming to try and comprehend and for our local leaders to overlook these facts willfully put our community in harm's way.

19

In closing, I fully support the currently expired General Plan because it develops the east side area in a way that makes the most practical sense to our community. Many of us homeowners read this General Plan to see the vision of the community leadership that aided us in making the decision to buy here in Moreno Valley instead of elsewhere. I support the plan that will attract businesses to our city for it to prosper. As a vested homeowner in this east side community, I respectfully request the reconsideration of these unavoidable impacts and consider choosing a sustainable master plan that provides a livable environment for all. Warehouses are of the poorest economic choice that could be considered for this

20

Comments by Tracy Hodge

Page 3

Comments for the Draft Environmental Report
For the World Logistics Center

area and as I see it, it only makes economic sense for one entity and we the people who make up this community deserve better than that!

20

Respectfully,

Tracy Hodge

Homeowner in Moreno Valley

13097 Shubert St.
Moreno Valley, Ca. 92555

RESPONSES TO LETTER G-57

Tracy Hodge

Response to Comment G-57-1. The Traffic Impact Analysis (TIA) prepared as part of the Draft Environmental Impact Report (DEIR), addressed the infeasibility of rail (see Section 4.F of the TIA) and the impacts of the World Logistics Center (WLC) on the City's existing infrastructure, and more information can be found there related to the mitigation of such impacts and the adequacy of the infrastructure once these mitigation measures have been put in place. Furthermore, the DEIR includes a fiscal impact study that analyses the revenues (e.g.: property taxes) as well as expenditures (e.g.: services provided by the City) as a result of the WLC. Notably, Section 3, Table 3C of the Fiscal Impact Analysis shows a positive impact to the City's General Fund, which means that revenues to be collected by the City from the WLC project will outweigh the expenditures to the City from the project.

Response to Comment G-57-2. The Specific Plan was/is available and is included as Appendix H-1 of the DEIR. From the Riverside County service goals and strategies website, the Board of Supervisors feels strongly that the creation of jobs and the promotion of economic diversity are keys to the accomplishment of the County's Strategic Vision. Accordingly, County government will emphasize and promote quality commercial and industrial development in the County through a comprehensive economic development strategy. The county seeks to Encourage Commercial and Industrial Development by: focusing financial incentives on attracting high-skill, high-pay industries such as: semiconductors; biomedical instruments and products; environmental technology; food processing; alternative fuel vehicles; and, distribution and light manufacturing.

Response to Comment G-57-3. The hearing for the rezoning map will be scheduled concurrently with the EIR and Specific Plan. The Friends of Northern San Jacinto Valley Wildlife is in favor of the rezoning.

Response to Comment G-57-4. The allowable uses and restrictions for the WLC will be governed by the WLC Specific Plan Section 2.0 (Land Use Plan), included as Appendix H-1 of the DEIR. Manufacturing and chemical processing are not permitted uses within the WLCSP.

The Lessees are required to disclose what their operations entail upon application for occupancy permits (Moreno Valley Municipal Code and Uniform Building Code). The City's existing code enforcement program will be responsible for ensuring compliance with restrictions on industrial uses.

Response to Comment G-57-5. The commenter refers to Section 4.1.2 of Existing Policies and Regulations, Objective 2.5 in the DEIR which states the City will promote industrial uses to accommodate the needs of workers and business visitors and which meets service needs of local businesses. The commenter asks how this can be accomplished if the city already has Level of Service (LOS) E or F for traffic circulation. The commenter states designating residential traffic arteries within communities as truck routes does not improve LOS but makes it worse.

The WLC would provide a new set of roads specifically designed to accommodate the needs of warehouses. These would have LOS of D or better. Please see TIA Chapter 4, Section B, the sub-section entitled Proposed Road Network. See Figure 16 in the TIA, copied below.

An additional figure (Figure 8) has been included in the revised TIA showing the designated truck routes in and around Moreno Valley. Trucks are prohibited from all other streets except to the extent that it is necessary to access delivery destinations not directly accessible along designated truck routes.

Figure 16: Proposed Roadways and Phasing

Response to Comment G-57-6. See Response to Comment G-57-5 above.

Response to Comment G-57-7: As noted in the Response to Comment G-57-1, the DEIR includes a fiscal impact study that analyses the revenues (e.g.; property taxes) as well as expenditures (e.g.; services provided by the City) as a result of the WLC. The fiscal impact analysis shows a positive impact to the City's General Fund, and the surplus generated by the City will be available to support not only the maintenance of infrastructure adjacent to the project, but also other infrastructure Citywide.

Response to Comment G-57-8. Redlands Blvd south of Eucalyptus Ave and Cactus Ave are both designated as not truck routes. Moreno Valley Police Department is responsible for enforcing truck routes by either responding to community input or proactively patrolling City streets (Moreno Valley Municipal Code Section 12.36). Penalties for violations of the truck route are established and collected by the Riverside County Court system. Likewise the City of Moreno Valley is responsible for infrastructure repairs, but they may seek remedies of habitual violators.

Response to Comment G-57-9. The commenter states their residential street is used by all vehicles when it is used as a diversion route when Redlands Blvd is closed to Eucalyptus or Dracaea. The commenter asks what measures will be put in place to ensure that diesel trucks would not use their neighborhood streets.

The Moreno Valley City Council rescinded Redlands Blvd.'s designation as a truck route south of Eucalyptus Avenue (the section cited in the comment). Previously trucks had been allowed south as far as Alessandro Blvd. See Moreno Valley Ordinance No. 836 dated January 10, 2012.

Response to Comment G-57-10. The setbacks of the project from existing residents are unrelated to the impacts requiring sound walls in existing residential areas. Roadway noise from existing streets

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

adjacent to residential homes are the source of the impact that is being mitigated by the proposed sound walls.

Response to Comment G-57-11. The World Logistics Center Specific Plan (WLCSP) emphasizes landscaping and energy conservation or sustainability concepts as an integral part of project design consistent with Policy 2.10.4. The energy conservation and sustainability concepts are outlined in Section 6 of the Specific Plan. Uniformity will be required for Buildings and Landscaping as outlined in Section 5 of the Specific Plan.

The effectiveness of vegetative barriers is highly complex and depends on a number of factors including particle size, wind speed, leaf area density, gaps in the vegetation, tree species, and season. The project proposes to plant a wide variety of vegetative species, as shown in the WLCSP, Section 5.4, Onsite Landscaping, which could act as a vegetative barrier. At this time, it is not possible to gauge the effectiveness of the vegetative barriers in absorbing air pollutants and any attempt to do so would be speculative. However, a recent South Coast Air Quality Management District (SCAQMD) forum, Near-Road Mitigation Measures and Technologies featured several presentations that showed that vegetative barriers had measurable benefits in reducing pollution. (<http://www.aqmd.gov/tao/ConferencesWorkshops/NearRoadMitigation/Agenda-presentations.pdf>),

The commenter also inquires as to the landscape count and separation to absorb the diesel particulates to reduce exposures to the neighborhood. The effectiveness of vegetative barriers is highly complex and depends on a number of factors including particle size, wind speed, leaf area density, gaps in the vegetation, tree species, and season. The project proposed to plant a wide variety of vegetative species, as shown in the World Logistics Center Specific Plan, Section 5.4, Onsite Landscaping, which could act as a vegetative barrier. At this time, it is not possible to gauge the effectiveness of the vegetative barriers in absorbing air pollutants. However, a recent SCAQMD forum, Near-Road Mitigation Measures and Technologies, featured several presentations that showed that vegetative barriers had measurable benefits in reducing pollution.

Response to Comment G-57-12. While the City of Moreno Valley's General Plan Policies do not contain a minimum setback distance as described in Policy 2.10.11, Section 4.1.6 of the DEIR clearly states the following:

"The Specific Plan establishes a minimum setback of 250 feet along the west boundary of the project site between sensitive receptors (i.e., houses) and buildings or parking/circulation areas within the WLCSP. The Specific Plan also includes specific landscaping and other design criteria for this buffer (see WLCSP Section 4.2, Offsite Landscaping). It should be noted that the width of the adjacent street outside of the WLC project boundaries (e.g., Redlands Boulevard, Bay Avenue, and Merwin Street) is included in the 250-foot buffer distance."

The regulations that prohibit idling in excess of 3 minutes are described in detail in Section 4.3.2.3 of the DEIR and mitigation measure (MM) 4.3.6.2A and 4.3.6.3B provide additional requirements to ensure that idling is prevented within the proposed project area. In addition, the 250-foot setback has been determined to be sufficient to make the health risk to neighboring residences from diesel particulates insignificant, citing the appropriate portions of the risk assessment.

The commenter also requests clarification of the minimum setback distances and idling restrictions. The setback distances are covered in the World Logistics Specific Plan Section 2.2 Logistics Development Category, wherein it is stated that the minimum building setback distances would be 250 feet from California Department of Fish and Wildlife-owned property and 250 feet from residentially zoned or occupied property. Section 6.0 of the Specific Plan, Sustainability, specifies a limit of 3 minutes for engine idling).

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-57-13. While the City of Moreno Valley's General Plan Policies do not contain a minimum setback distance as described in Policy 2.10.11, Section 4.1.6 of the DEIR clearly states the following:

The Specific Plan establishes a minimum setback of 250 feet along the west boundary of the project site between sensitive receptors (i.e., houses) and buildings or parking/circulation areas within the WLCSP. The Specific Plan also includes specific landscaping and other design criteria for this buffer (see WLCSP Section 4.2, Offsite Landscaping). It should be noted that the width of the adjacent street outside of the WLC project boundaries (e.g., Redlands Boulevard, Bay Avenue, and Merwin Street) is included in the 250-foot buffer distance.

The regulations that prohibit idling in excess of three minutes are described in detail in Section 4.3.2.3 of the DEIR and MM 4.3.6.2A and 4.3.6.3B provide additional requirements to ensure that idling is prevented within the proposed project area.

The WLC Specific Plan addresses on-site design standards in Section 5, this section provides standards regarding maximum rooflines, setback requirements, colors and materials, walls and fence design standards, lighting restrictions by ordinances, and landscape requirements. Building square footage by planning area is provided in Section 2 of the Specific Plan. Section 3.5 of the Specific Plan provides information on utilities including drainage and flood control facilities.

Line of sight for future buildings will be addressed through mitigation measure, MM 4.1.6.1B. The mitigation measure has been revised to reflect that the purpose of the renderings is to show visual impacts from adjacent residential land uses in order for the City to evaluate and ensure consistency with the General Plan Objective 7.7.

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

Response to Comment G-57-14. Policy 2.10.5 is a City of Moreno Valley General Plan policy. This policy is outlined in Section 4.1.2 and evaluated in Section 4.1.6.3. Treatment of project edges adjacent to residential streets is addressed in Section 4.2.4 of the Specific Plan. In addition, each individual building in the WLC will go through a discretionary plot plan process to evaluate each building's consistency with the Specific and General Plan. In Specific Plan Section 2.5 there are designated special edge treatment areas adjacent to residential neighborhood streets including 250-foot setbacks. The treatment areas are explained in greater detail in Specific Plan Section 4.2.4.

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

Response to Comment G-57-15: General Plan amendments, rezonings and specific plans are legislative actions but landowners have the right to comment and be involved in the review process for such actions. Ultimately the City Council will make the final decision regarding all land use change requests.

Response to Comment G-57-16. The commenter says the project does not promote a pleasant living and working environment per the General Plan. There are many land uses that are necessary for a healthy economy to operate effectively and efficiently. Large warehousing projects can provide thousands of local jobs and helps the regional economy. Warehouses can be attractive and good neighbors with the proper planning and buffers. It will be up to the City Council to determine if this project is in keeping with the overall plans for development in the City, and if its benefits outweigh the significant project impacts identified in the EIR, including traffic, air quality, and noise.

Response to Comment G-57-17. The technical noise assessment (page 59 of DEIR Appendix K, the technical noise report) shows homes along Shubert Street will have a “potentially significant impact” which cannot be mitigated. This significant impact will be caused by traffic associated with the project. Noise from the logistic uses on-site will be mitigated with soundwalls and setbacks, and will not be a significant impact on the residences in this area.

Response to Comment G-57-18: The Moreno Highlands Specific Plan was never implemented because it was not economically feasible. While the WLC may not visually enhance the scenic aspects of Moreno Valley, the project is expected to satisfy the economic development aspects of the current Community General Plan and will therefore add economic value to the City itself, as compared with more residential development in a City that currently provides few employment opportunities for its residents.

Response to Comment G-57-19. The commenter notes several negative effects of the project including health effects and traffic congestion. The DEIR (section 4.3) discusses and quantifies the new sources of emissions that would have a significant impact on air quality.

The commenter incorrectly indicates a total of 22,000 additional trucks per day that would service the project. The actual number is approximately 14,000 trucks per day⁴⁶. The 22,000 trucks noted are not the actual number but are in the form of passenger car equivalents (PCEs). A passenger car equivalents (PCE) is essentially the impact that a mode of transport has on traffic variables (such as headway, speed, density) compared with a single car as a multiple of number of passenger cars. In the project Traffic Impact Analysis⁴⁷, the following PCEs were used:

- Passenger car: 1 for surface streets and freeways
- Light heavy-duty truck (large 2-axle trucks): 1.5 for surface streets and freeways
- Medium-heavy duty trucks (large 3-axle trucks): 2.0 for surface streets and 1.5 for freeways
- Heavy-heavy duty trucks (large 4+ axle trucks): 3.0 for surface streets and 1.5 for freeways

Response to Comment G-57-20. The comment does not apply to the EIR analysis or conclusions, but are personal objections to the project and support of the expired General Plan. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

⁴⁶ See Table 24 of the Traffic Impact Analysis Report for the World Logistics Center, October 2013.

Subject: Official Comments for the DEIR for the World Logistics Center

Dear Mr. Gross:

I am opposed to the World Logistics Center because of the tremendous negative impact it will have on Moreno Valley and the surrounding area. The WLC will destroy air quality, which will lead to severe health issues for many residents, especially children and senior citizens. The numerous trucks will emit Diesel particulates with cancer-causing carcinogens. The trucks will also add an incredible amount of noise pollution, cause traffic congestion, and damage road systems. With huge warehouses and hundreds of Diesel trucks running daily, the Moreno Valley community will have an industrial feel and become a far less desirable place for people to live and rear families. Moreno Valley stands to lose too much with the WLC!

Could you please send a confirmation of receipt of this email. Thank you very much for your help!

Respectfully submitted,
Faith Wong

RESPONSES TO LETTER G-58

Faith Wong

Response to Comment G-58-1. None of the comments apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Letter G-59: Thomas Harris (email) (April 8, 2013)

From: Tom Harris [<mailto:harristom@outlook.com>]

Sent: Monday, April 08, 2013 3:32 PM

To: Mark Gross

Subject: Official DEIR Comments for the World Logistics Center

Letter G-59

I oppose this project because the adverse health effects of diesel particulate pollution from 41 million square feet of warehousing trucks are not fully known. Research has just become available that has linked pollution during pregnancy to increased autism risk. The beautiful majestic mountains that surround our city keep pollution trapped here. Why hasn't an alternative site that is not surrounded by mountains been identified with a corresponding map?

1

I don't think the employment numbers are correct. The previous project from this developer which is Sketchers promised 2500 jobs, but the building was only designed for 300 because it is so modern and electronically advanced. Warehouse electronics are just like computer technology, it's outdated almost as soon as it's finished. That means that each warehouse constructed will have fewer employees than the one before. How can the City or the developer properly estimate the number of jobs? How can the residents trust the City or the developer when they continue to falsify employment numbers?

2

Sincerely

Thomas F Harris

25581 Sierra Leone Ct
Moreno Valley CA 92551

RESPONSES TO LETTER G-59

Thomas Harris

Response to Comment G-59-1. The commenter notes research linking pollution during pregnancy to increased autism risk and mountains that trap pollutants and the need to site the project at an alternative location not surrounded by mountains that trap air pollutants.

Please see Master Response-2: Health Effects of Diesel Particulate emissions. The comment does not provide any references that substantiate the linkage between air pollution and autism. The comment, however, likely refers to a recent study published by Volk, et. al (2010)¹ that tracked children in the Los Angeles area. This study examined the association between autism and proximity of residences to freeways and major roadways during pregnancy and near time of delivery, as a surrogate for air pollution exposures. The conclusion of the study indicated that mothers living close to a freeway have twice the risk of autism compared to living away from a freeway. Heather Volk, the lead author of the study, however, stated that “This study isn’t saying exposure to air pollution or exposure to traffic causes autism. But it could be one of the factors that are contributing to its increases.”² The study did not directly implicate air pollution as a risk factor for autism because the study did not have a way of directly measuring how much air pollution the mothers were exposed to during pregnancy nor how much time the mothers spent at home or working or commuting. Complicating this type of relationship is the fact that recent increases in the rates of autism may be due in large part to the result of better diagnosis and detection and wider awareness and broader and shifting definitions of autism³. The linkage is by no means certain and requires substantially more research on cause and effects.

With regard to the effects of mountains, the effects of terrain on air dispersion modeling was included in the assessment of the project’s pollutant impacts. In addition, as noted in Section 6.3.9 of the Draft Environmental Impact Report (DEIR), an analysis was performed to determine if any alternative locations in the surrounding region could be identified that would reduce or eliminate one or more of the project’s significant impacts. This analysis was based on feasible sites that could realistically support the proposed project (i.e., a contiguous site for 40.4 million square feet of high-cube logistics warehouse uses as envisioned by the World Logistics Center (WLC) Specific Plan). The analysis indicated that there are no feasible alternative sites in the surrounding or nearby jurisdictions that could support the proposed project (i.e., that have enough vacant land zoned or available for logistics warehousing with good freeway and/or rail access).

Response to Comment G-59-2. We are unclear why the author of this letter believes that the Skechers facility was only designed for 300 employees, which is factually untrue. Please reference the discussion in the Responses to Comments G-90-2 and G-57-1, above for more information.

Sent: Monday, April 08, 2013 4:35 PM

To: Mark Gross

Subject: Official comments for the DEIR for the World Logistics Center

I am opposed to The World Logistics Center as I feel the project will not create nearly as many jobs as has been predicted by various economists. In addition, there are too many health risks the center would pose with emissions from thousands of trucks.

1

Respectfully submitted,

Tiffany Newkirk
12795 Moreno Beach Dr. Unit 1103
Moreno Valley, Ca. 92555

Please send me confirmation of receipt of this email

RESPONSES TO LETTER G-61

Tiffany Newkirk

Response to Comment G-61-1. The commenter is concerned that project job promises are overstated and will outweigh air pollution concerns. Many commenters referred to “lower than expected” job estimates for the Skechers warehouse as a reason to mistrust the current projections. A discussion of Skechers job numbers is provided in the Response to Comment G-49-20. The job estimates for the project are based on industry-wide standards for similar types of uses, and so are considered appropriate for this project as well. The City Council will consider all comments and responses in this Final Environmental Impact Report (FEIR) document, prior to making a decision on the project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts, including air pollutants. The Draft Environmental Impact Report (DEIR) has discussed the Health risks associated with the project extensively (refer to DEIR Section 4.3.3.4)

Letter G-62: Barbara Smith (email) (April 8, 2013)

From: Barbara Smith [<mailto:meowmynana@yahoo.com>]

Sent: Monday, April 08, 2013 3:49 PM

To: Mark Gross

Subject: Official Comments for the DEIR for the WLC

Letter G-62

I oppose the World Logisitics project mainly because of the drastic adverse effects of the health on my community. Surrounding communities are also affected negatively, since the pollution encompasses a twenty mile radius from the center of the project. The health of citizens is jeopardized by the building of massive warehouses in densely populated areas. Living in close proximity to freeways that carry thousands of trucks to a facility, such as the one proposed, causes, as the 2002 study by the AQMD of the air quality in Mira Loma shows, cancer risks, cardio-vascular problems, asthma, and other respiratory problems.

1

Therefore, I vehemently oppose this project.

Barbara J. Smith
Riverside resident

RESPONSES TO LETTER G-62

Barbara Smith

Response to Comment G-62-1. The commenter notes the potential health effects from locating large warehouses in densely populated areas.

The health effects from emissions of diesel particulate matter were discussed in Master Response-2: Health Effects of Diesel Particulate Matter. The project has committed to minimizing its health impacts through the imposition of several mitigation measures and project design features designed to reduce its air emissions. These measures were discussed in Response to Comment letter E-3-8.

Letter G-63: Shelly Mesa (email) (April 8, 2013)

From: Shelly Mesa [<mailto:shellymesa@roadrunner.com>]

Sent: Monday, April 08, 2013 4:44 PM

To: Mark Gross

Subject: Official Comments for the DEIR for the "WLC."

Letter G-63

Dear Mr. Gross,

I am a concerned resident of Moreno Valley (Rancho Belago) district 5, and I'm writing in "Opposition Of the WLC project.

My home is less than 500 ft. adjacent to Redlands blvd. and Dracaea Ave.

I want to know how you can ignore the "significant cancer risk increases from deisal exhaust, " the engines emit a complex mixture

of pollutants, composed of gaseous and solid material.also known as particulate matter or PM.

Deisal trucks also contribute to California's fine particulate matter (PM2.5) air quality problems. The most vulnerable are children as well as the elderly who have their own health problems. A report written by Caif. Air Resources Board (CARB) and peer reviewed by the EPA, that (PM2.5) causes 9,200 premature deaths in California each year.

Particulate pollution is categorized into 3 main sizes, PM10 measures up to 10 microns in diameter and appears as black dust or soot.PM2.5 measures 2.5 microns or smaller in diameter and PM0,1 (ultra fines) make up more than 90% of deisal particulates. the smaller the size the greater the health

risk. It's very discouraging to have read that these Ultra Fine particles are not regulated by law are not considered in the EIR being conducted by WLC.

Are the residents located where the Deisal trucks will be traveling along Cactus Ave. aware of these hazards? There are a multitude of neighborhoods as well as two elementary schools, and Hospitals along this route, that will be Impacted by Dirty Deadly Diesel.

I'm sure that the six feet soundwalls being built around those areas, will not protect the air everyone will be breathing?

Never mind the financial burden of Cancer Treatment, who will be responsible for picking up future bills from residents being affected by these Warehouses and the hazerdous air quality, Itto Benzeevi or the City Council of Moreno Valley?

And what about the Workers who will be employed by these Manufactures, what will be their rights as to the air they breathe?

Who will be taking care of their medical costs, when their bodies start developing health issues from the Hazerdous enviroment their working in?

My convictions tell me "To Whom Much Is Given Much Is Required."

I challenge you to stick to "The General Plan," 700 houses, and Small Business Park where residents are encouraged to open their own business, instead of commuting! I read that would entail 21,000 jobs, where WLC would only promise 20,000 jobs?

The Future is'nt in "200, 000 square feet of warehouses? It's in a city that has become self sustaining and encouraging the farmers, and

the 7-residents, instead of buying them out or better yet forcing them out with the WLC project. I encourage you to way all options of

Community Developement (land use); Circulation; Parks, Recreation, and Open Space; Safety; Conservation; and the General Plan Goals and Objectives. A suggestion check out " The Riverwalk Developement," located in the "La Sierra," area adjacent to 91 freeway.

Sincerely
Shelly Mesa

RESPONSES TO LETTER G-63

Shelly Mesa

Response to Comment G-63-1. The commenter refers to project impacts dealing with diesel exhaust and particulate matter as well as travel along Cactus Avenue

The potential air quality and health risk impacts were fully documented and disclosed in the Draft Environmental Impact Report (DEIR) and the revised analysis (see Section 4.3.6.5 Impacts to Sensitive Receptors in the DEIR and Section 5 Air Quality Impact Analysis in the revised analysis). These assessments examined emissions of not only diesel particulate matter (PM) but also emissions of what are referred to as criteria pollutants for which ambient air quality standards have been established by the Environmental Protection Agency (EPA) and the Air Resource Board (ARB). These criteria pollutants include nitrogen dioxide, carbon monoxide, volatile organic carbon, and particulate matter (PM₁₀ and PM_{2.5}). Using methods approved by the South Coast Air Quality Management District (SCAQMD) and the ARB⁵¹, emissions were estimated for construction and operation of the project including emissions from the motor vehicles that would visit the project site every day. Based on these emissions, estimates were made of the potential air quality and health risk impacts that would result from the project. The results indicate that the project would result in impacts that would exceed the significance thresholds established by the SCAQMD and would remain so after application of all feasible mitigation measures. One such measure requires all diesel trucks to be equipped with truck engines that are compliant with the Model Year 2010 engine standards, the cleanest diesel truck engines available. See also Response to Comment Letter E-3-8.

The commenter is correct that ultrafine particles (UFP) are not regulated by law. Ultrafine particles are a part of PM_{2.5}, since PM_{2.5} contains particles less than 2.5 microns in size. The revised analysis provides a discussion of ultrafine particulate matter but does not quantify them because there is no methodology or standards by which to determine the results or identify significance. There currently are no ambient air quality standards applicable to ultrafine particulate matter. See also Section 2.2.3 of the revised analysis, which discussed the scientific perspectives of the SCAQMD and EPA on ultrafine particulate matter. Potential impacts to school-age children are discussed in Response to Comment E-3-7.

Response to Comment G-63-2. The comment expresses concern regarding the welfare of the workers who will be employed at the warehouses. Please refer to the Response to Comment F-11-27 concerning potential impacts to worker receptors.

Response to Comment G-63-3. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project and project review process. The DEIR concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

⁵¹ The methods applied were the CalEEMod land use emission model and the ARB EMFAC2014 mobile source emission model

Letter G-64: Rosamonde Cook (April 8, 2013)

Comments on World Logistics Center Draft Environmental Impact Statement

April 8, 2013

Regarding: Habitat Assessment, MSHCP Consistency Analysis and HANS Review,
Section 5.2.8 Biological Compliance Issues Not Covered by MSHCP and data summarized in
Tables 2 and 3 of that section.

Much of this information in this section is inaccurate. The authors used data from the California Natural Diversity Database (CNDDDB) only. This database is a valuable repository for local occurrence records of rare and endangered species. However, it does not include all of the data available for the species it covers. Furthermore, there is frequently a backlog of data that remains to be entered in the database at any given point in time. The backlog can span multiple years. The Biological Monitoring Program (BMP) of the Western Riverside Multi-Species Habitat Conservation Plan (MSHCP) conducts inventory and monitoring surveys of 146 plant and animal species covered by the Plan. With few exceptions, BMP surveys are conducted only within lands currently in conservation. Results are available in the form of annual reports which are posted every year on the Riverside Conservation Authority's (RCA) website and available to the public. Data are available by request to the Monitoring Program and the State of California's Biological Information System (BIOS) database.

1

To the best of my knowledge, BMP data were never requested by Michael Brandman Associates nor any other party involved in preparation of the DEIR. These data are far more complete and up-to-date compared with what is represented in the Habitat Assessment. As a result, the DEIR represents an inaccurate assessment of the distribution and frequency of occurrence of the plant and animal species covered in Section 5.2.8 with respect to the proposed boundaries of the World Logistics Center. The historic frequency of occurrences described, and the distance of observations from the proposed WLC boundaries require revision based on BMP data. In particular, I am greatly concerned that many of the species considered in this section have numerous records of occurrence much closer to the proposed boundaries than indicated in Tables 2 and 3 which suggest 1) that their probability of occurrence within the proposed boundaries of the WLC may be higher than represented in the DEIR and 2) that the impact of the WLC may be much greater on these species than indicated. I believe this analysis should necessitate re-consideration of the potential impacts through the Urban/Wildlands interface on these species.

2

Below I contrast the data in Tables 2 and 3 of Section 5.2.8 with data collected by the BMP from 2005 to 2012 and stored in the MSHCP database. I include only species for which there is a discrepancy. Each record of occurrence noted represents a unique location where an observation has been made.

Plants

Atriplex coronatum var. *notatior* – The MSHCP database has the closest record of occurrence at 1.56 miles south of the nearest proposed WLC boundary. Data in Table 2 has it at 2.5 miles southeast.

3

Brodiaea filifolia – MSHCP database has the closest record of occurrence at 3.73 miles due south. Data in Table 2 has it at 5 miles south.

4

Centromadia pungens ssp. *laevis* – The MSHCP database has the closest record of occurrence at 2.37 miles due south. Data in Table 2 has it at 3 miles south.

5

Lasthenia glabrata ssp. *coulteri* – The MSHCP database has the closest records of occurrence at 0.72, 1.32 miles due south and southeast, respectively, and there are 13 records of occurrence within 2 miles of the proposed WLC boundaries. (Data in Table 2 has it at 2 miles south)

6

Animals

Amphispiza belli belli – The MSHCP database has the closest record of occurrence at 4.34 miles due south. Data in Table 3 has it at 4 miles northwest. The species is apparently more widespread within the vicinity of the WLC than indicated.

7

Polioptila californica californica – The MSHCP database has closest records of occurrence at 0.28 and 0.35 miles due south of the proposed WLC boundary. Table 3 has this species closest occurrence at 4 Miles northeast.

8

Buteo regalis – The MSHCP has 45 records within 2.0 miles of the closest WLC boundary, mostly to the due south. Three observations are within the proposed boundaries. Table 3 gives the closest occurrence at approximately 1 mile northeast of the study area.

9

Vireo bellii pusillus – The MSHCP has 3 records within 2.0 miles of the closest WLC boundary. Table 3 lists its closest occurrence at 3 miles.

10

Lanius ludovicianus - The MSHCP has 13 records of occurrence within 1.0 miles of the nearest proposed WLC boundary and 115 records within 2.0 miles. Table 3 states that it has been observed within the study area.

11

Perognathus longimembris brevinasus – The MSHCP database has closest records of occurrence at 1.8 and 1.92 miles south of the closest proposed WLC boundary and 16 observations within 2.0 miles. Table 3 states that the closest observation is 3 miles south of the study area.

12

Falco columbarius - The MSHCP database has closest records of occurrence at 0.58 and 0.72 miles due south of the proposed boundaries of the WLC, and 15 observations within 2.0 miles. Table 3 states no observations on record within 7 miles of the study area.

13

Crotalus rubber rubber – The MSHCP database has closest records of occurrence at 0.89, 0.97, and 1.06 miles due south and seven observations within 2.0 miles. Table 3 claims only one observation 1.0 mile south and that was 80 years ago.

14

Chaetodipus fallax fallax – The MSHCP database has the closest record of occurrence at 0.70 miles of the nearest proposed WLC boundary and 233 observations within 2.0 miles. Table 3 stated the closest occurrence in 1.0 mile north and south.

15

Falco peregrinus anatum – The MSHCP database has the closest records of occurrence at 0.80, 0.86, 0.94, and 0.95 miles due south, and a total of 12 observations within 2.0 miles of the nearest WLC boundary. Table 3 states no occurrences within 7.0 miles of the study site.

16

Lepus californicus bennettii – The MSHCP database has the closest records of occurrence at 0.83 and 1.29 miles due south of the nearest boundary of the proposed WLC site, and 7 observations within 2.0 miles. Table 3 states the closest observation at 7.0 miles east of the study area.

17

Aimophila ruficeps canescens – The MSHCP database has the closest records of occurrence at 0.28, 0.31, and 0.46 miles of the nearest proposed WLC boundary, and 41 observations within 2.0 miles of it. Table 3 has the closest observation at 4 miles west of the study area.

18

Agelaius tricolor – The MSHCP database has the closest records of occurrence at 0.4 and 0.83 miles due south, and 7 observations within 2.0 miles of the closest proposed WLC boundary. Some of these observations were of foraging birds. Nesting colonies have been established as close as 1.28 miles south of the nearest proposed WLC boundary with others at 1.28, 2.01, 2.15, 2.88 and 3.12 miles south. All are within the current boundaries of the San Jacinto Wildlife Area. Table 3 states that there is no suitable nesting vegetation remaining within the study area. However, it fails to recognize the critical importance of off-nesting site foraging habitat for this species. Foraging for the purpose of provisioning nestlings is known to occur up to 5 miles from the nest site (Beedy and Hamilton 1999). The study area does support sufficient foraging habitat during years when insect production is high (Biological Monitoring Program 2011).

19

Spea hammondi – The MSHCP Database has the closest record of occurrence at 0.68 miles due south of the nearest proposed WLC boundary. Table 3 states that the closest occurrence in 2.0 miles south and west.

20

Plegadis chihi – The MSHCP database has 8 records of occurrence within 1.0 miles of the nearest proposed boundary of the WLC and 40 within 2.0 miles. Table 3 states the closest occurrence at 3.0 miles.

21

Elanus leucurus – The MSHCP database has 6 records of occurrence within 1.0 miles of the nearest proposed boundary of the WLC, and 64 within 2.0 miles. Table 3 states no records of occurrence within 7.0 miles.

22

The San Jacinto Valley is recognized by the Audubon Society as a Globally Important Bird Area, in large part because of the large diversity and abundance of raptors that over-winter in the area. Many species depend on the resources of the San Jacinto Wildlife Area and surrounding agriculture fields; many have been observed numerous times in the San Jacinto Wildlife Area just to the south of the proposed boundary of the WLC. The DEIR fails to recognize the importance of this area for over-wintering raptors. Information in Table 3 fails to represent both the local occurrence of several species as well as the sheer numbers of observations made within the very near vicinity of the WLC study site. Of particular mention include *Elanus leucurus* (White-tailed kite), *Falco peregrinus anatum* (Peregrine falcon), and *Falco columbarius* (Merlin), all of which Table 3 lists as having a Low Potential to Occur. Although the MSHCP database has numerous records of occurrence for these species within 2.0 miles of study site, the DEIR reports no observations within 7.0 miles of it.

23

Table 3 also describes *Buteo regalis* (Ferruginous hawk) as a Low Potential to Occur, and states that the study area “contains open flat area that is considered marginally suitable foraging habitat, but not suitable nesting habitat.” MSHCP database records include 45 observations of this species within 2.0 miles of the proposed WLC boundary, and several observations inside it. Most of these observations were made during the winter, non-breeding season.

24

It is unclear whether any surveys conducted for raptors by Michael Brandman Associates occurred during the spring/early summer nesting period or in the fall/winter months when most species are present in the San Jacinto Valley. Regardless, it is clear that the lack of nesting substrate is not especially relevant to a species that uses the San Jacinto Valley primarily as over-wintering habitat.

25

Other species with a substantially higher probability of occurrence within the study site than suggested by the DEIR include *Lepus californicus bennettii* (San Diego jack-tailed jackrabbit) and *Crotalus ruber ruber* (Northern red-diamond rattlesnake). Table 3 states no occurrence of either species within 7.0 miles of the proposed WCL site, while the MSHCP database contains numerous observations.

26

Other species that occur at higher frequencies in the near vicinity of the proposed WCL site than suggested by the DEIR include *Athene cunicularia* (Burrowing Owl) and *Dipodomys stephensi* (Stephen’s kangaroo rat). In total, the MSHCP database contains 18 records of occurrence of Burrowing Owl within 2.0 miles of the nearest proposed WLC boundary. Table 3 categorizes this species as a high probability of occurrence but that “focused surveys conducted in 2010 and 2012 found the study area and surroundings to be unoccupied.” By contrast, the MSHCP database has two records of occurrence within 2.0 miles in 2011, one in 2012 and one in 2010.

27

Table 3 describes Stephens kangaroo rat as Moderate Potential to Occur, and states that “the study area contains areas similar to grasslands with very sparse canopy, but is heavily disturbed. Recorded approximately adjacent to the general study area on the west and south.” The MSHCP contains 239 recorded observations within 2.0 miles of the WLC study site and show a steady rate of occupancy during the years surveyed (2006, 2007, 2010, 2011).

28

To reiterate, I believe the analysis above necessitates re-consideration of the potential impacts on these species by both the loss of habitat caused by development of the site as a WLC, but also the

impacts to species inhabiting the San Jacinto Wildlife Area and in close vicinity to the proposed boundaries of the WLC. At the least, a sufficient and effective buffer area should be created beyond the 1,086 acres of California Department of Fish and Wildlife lands and the San Diego Gas and Electric property, as these lands belong to those agencies and support foraging habitat for species including Ferruginous hawk, Merlin, Loggerhead Shrike, and White-face Ibis, all of which have been observed on these properties (MSHCP database).

Placing the largest logistics center in the country next to some of the most important wildlife habitat in Riverside County (one of only two Type A CDFW Wildlife Areas in southern California is, in my opinion, a grave mistake. Not only is this area of great importance to raptors but it is the largest staging area for waterfowl north of the California/Mexico border and a bird watching destination for thousands of people each year. I urge you to retain the original zoning and land use plans for this area as exist in the Moreno Valley General Plan. This would have much less of an impact on the wildlife area and all of the species that depend on it as well as the open space and foraging habitat around it.

RESPONSES TO LETTER G-64

Rosamonde Cook

Response to Comment G-64-1. While the California Natural Diversity Data Base (CNDDDB) does not always supply the most accurate data available and that there is a lag with regard to entering the data into the database. On-site Biological resource surveys have been conducted for over eight years. The weaknesses of the CNDDDB data was not considered a hindrance to identifying species that actually occurred within the project site.

Resource Conservation Authority (RCA) staff was contacted to obtain the most recent species occurrence data for the area around Mystic Lake, which also included the World Logistics Center Specific Plan (WLCSP). In addition, the California Native Plant Society Electronic Inventory was also queried to obtain a more comprehensive list of sensitive plant and wildlife species recorded within the vicinity of the WLCSP. This information was all included in the Draft Habitat Assessment and (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013) (hereafter MSHCP Consistency Analysis). The data from the BMP should have been included in updates to the CNDDDB by either the California Department of Fish and Wildlife (CDFW) and/or RCA.

Response to Comment G-64-2. In June 2013, Michael Brandman Associates Senior Biologist Scott Crawford contacted Laurie Correa at the RCA to obtain Geographic Information Systems (GIS) information on the Biological Monitoring Program. This was after consultation in the RCA Annual Reports for various species monitored under the Best Management Practice (BMP) that could potentially occur within the study area.

No BMP surveys occurred directly within the WLCSP as these lands are privately held. Adjacent areas associated with the San Jacinto Wildlife Area and the Lake Perris State Recreation Area were included in the BMP survey areas for the various species.

In June 2013, the MSHCP Consistency Analysis (FCS-MBA 2013) was updated to include information from the 2013 survey season. Fieldwork was conducted for both burrowing owl and Los Angeles pocket mouse within the WLCSP and areas with proposed offsite facilities. An additional survey buffer of 500 feet was also included in compliance with recommendations for burrowing owl as provided by RCA. Surveys for sensitive plants were not conducted in 2013 due to limited rainfall for the season. There was a discussion with both RCA and CDFW with regard for the viability of sensitive plant surveys in 2013. The DEIR adequately represented species that have the potential to occur in the project area and accurately characterized what was found on the WLCSP. These data were not from a single year from over eight years of examination.

The GIS data for the BMP surveys has been incorporated into the 2013 MSHCP Consistency Analysis report with appropriate adjustments to Tables 3 and 4. The potential for occurrence of sensitive species within the WLCSP area is no higher than represented in the DEIR. Impact of the WLCSP on sensitive species is no greater than that indicated in the DEIR. While the BMP data may be more comprehensive, in most instances the 2012 report did indicate that the species were in the vicinity, in some instances at the same distance and in others much closer to the WLCSP. Due to space limitations, the tables do not provide information on every sighting of a species and generally, only whole numbers were given. Both Tables 2 and 3 also include a category on suitable habitat. That category, combined with location data, were used by the project biologist in determining the potential for the species to occur within the WLCSP.

Response to Comments G-64-3 through G-64-22. The GIS data for the BMP surveys has been incorporated into the MSHCP Consistency Analysis (FCS-MBA 2013) with appropriate adjustments to Tables 3 and 4. While the BMP data may be more comprehensive, in most instances the 2012 report

did indicate that the species were in the vicinity, in some instances at the same distance and in others much closer to the WLCSP. Tables 3 and 4 do not provide information on every sighting of a species, as this information could quickly become redundant. Generally, only whole mile numbers were given for sightings. Both Tables 3 and 4 also include a category on suitable habitat. That category, combined with location data, provide the assessment on the potential for the species to occur within the WLCSP.

Understanding that not all available data is entered into the CNDDDB and BMP database, the City must make assumptions that species identified within 3 miles of the project site have a much higher potential to occur than those that are recorded to occur beyond a 3-mile radius. In determining the potential for a species occurrence within the WLCSP, there is no difference if a species was observed 0.5 miles or 3.0 miles from the project site, all of these species are regarded as being observed within the vicinity of the project site. As indicated in Tables 3 and 4 of the MSHCP Consistency Analysis (FCS-MBA 2013), the following criteria were used to determine potential for occurrence.

Not Likely to Occur - There are no present or historical records of the species occurring on or in the immediate vicinity (within 3 miles) of the WLCSP and the diagnostic habitats strongly associated with the species do not occur on or in the immediate vicinity of the site.

Low Potential to Occur - There is a historical record of the species in the vicinity of the WLCSP and potentially suitable habitat onsite, but existing conditions (e.g., density of cover, prevalence of non-native species, evidence of disturbance, limited habitat area, isolation) substantially reduce the possibility that the species may occur. The site is above or below the recognized elevation limits for this species.

Moderate Potential to Occur - The diagnostic habitats associated with the species occur on or in the immediate vicinity of the WLCSP, but there is not a recorded occurrence of the species within the immediate vicinity (within three miles). Some species that contain extremely limited distributions may be considered moderate, even if there is a recorded occurrence in the immediate vicinity.

High Potential to Occur - There is both suitable habitat associated with the species and a historical record of the species on or in the immediate vicinity of the WLCSP (within 3 miles).

Species Present - The species was observed in the WLCSP at the time of the survey or during a previous biological survey.

Response to Comment G-64-23. Specific surveys for raptors were not conducted, however, every observation in the field during all of the surveys conducted from 2005 through 2013 have been documented. These surveys were generally conducted in late winter through midsummer and not during the overwintering period (which is typically from November to February). The goal of the studies was to provide general biological information on the project site with a focus on sensitive species. Since the fields of the WLCSP were generally plowed in late summer/early fall thereby removing most burrows for small mammals and then covered in dryland grain crops throughout winter and into late spring, the area was not a prime area for raptors and thus wintering surveys were not conducted. The lack of survey data for overwintering species is not a significant issue since the project site contains low-quality habitat and a small prey-based based. Many sensitive raptor species occur within the vicinity of the WLCSP during the winter, based on data obtained from CDFW and RCA in 2013. The project biologist agrees that many off-site areas near the WLCSP provide high quality foraging habitat that contain both diverse vegetative cover and a large prey base, which are necessary components for significant raptor foraging habitat.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table 4 of the MSHCP Consistency Analysis (FCS-MBA 2013) has been corrected to list white-tailed kite as present. It was observed foraging near the San Jacinto Wildlife Area (SJWA) during the 2013 surveys. There are no potential nesting sites.

While the distance listings for peregrine falcon, merlin and ferruginous hawk may not reflect the closest recorded occurrences, the fact remains that the continually plowed fields of the WLCSP and the immediately adjacent CDFW Conservation Buffer Area provide a marginal prey base for foraging raptors. As stated on pages 74-75, the foraging habitat within the WLCSP is marginal due to repeated agricultural disturbances. The SJWA, Lake Perris State Recreation Area (LPSRA) and the Badlands to the south, west and east respectively, provide ample foraging habitat for the limited number of raptors that appear to occupy the area. The WLCSP is not affecting any areas slated for conservation under the MSHCP and all of the sensitive raptor species that potentially occur within the WLCSP are amply covered species under the MSHCP. Although it is not anticipated that the loss of low-quality foraging habitat will result in a significant impact with regard to the loss of raptor foraging habitat, the white-tailed kite and golden eagle are both California fully protected species and any impact associated with these species is considered significant. Mitigation for impacts associated with these species is through payment of the MSHCP Development Fee. These fees may be used to purchase off-site land within a core conservation area, which is required for the long-term conservation of raptor foraging habitat.

Response To Comment G-64-24. Based on the revised DEIR and the MSHCP Consistency Analysis (FCS-MBA 2013), the loss of marginal quality foraging habitat is a potentially significant impact requiring mitigation. Although we do not discount the findings the McCrary et al and the Beckman et al reports, the WLCSP is dominated by routinely disked agricultural fields that are dry-land farmed and rely on natural rainfall for irrigation. This type of habitat does not provide moderate to high quality foraging habitat for ferruginous hawk. The majority of the suitable foraging habitat in the vicinity of the WLCSP includes artificially irrigated alfalfa fields, and dairy farms. Due to the close proximity of the SJWA, which contains moderate to high quality raptor foraging habitat, impacts to the WLCSP may be considered potentially significant and will require mitigation to off-set potentially significant impacts. Based on Development Mitigation Fees associated with the MSHCP, approximately 2610 acres of commercial development will generate approximately \$14 million in fees. These fees will be used to purchase land to contribute to the core conservation areas established under the MSHCP. This land will be used to compensate for the loss of marginal quality raptor foraging habitat.

Response To Comment G-64-25. Specific surveys for raptors were not conducted, however, every observation in the field during all of the surveys conducted from 2005 through 2013 have been documented. These surveys were generally conducted in late winter through mid-summer and not during the overwintering period. We did not feel that winter surveys were necessary due to the poor condition of the foraging habitat within the WLCSP. As stated on pages 74-75, the foraging habitat within the WLCSP is marginal due to repeated agricultural disturbances. The SJWA, LPSRA and the Badlands to the south, west and east respectively, provide ample high-quality foraging habitat for the raptors that appear to occupy the area. The WLCSP is not impacting any areas slated for conservation under the MSHCP and all of the raptor species will maintain high-quality foraging areas within the Core H and Proposed Core 3 as protected under the MSHCP.

Response To Comment G-64-26. The MSHCP Consistency Analysis (FCS-MBA 2013) Table 3 has been revised to include the presence of the San Diego black-tailed jackrabbit. It was observed during the 2013 field surveys. Northern red diamond rattlesnake while potentially present in suitable habitat in the region and present within the survey areas associated with the BMP are not found in the primarily disturbed agricultural areas associated with the WLCSP. Again both species are covered under the MSHCP and take authorization is provided in the Implementing Agreement. Mitigation for the loss of habitat is through payment of the Development Fees as established in the MSHCP in Section 8.5.1. The original MSHCP was prepared with a proposed a \$4,800/acre development fee for commercial development. Due to the change in the economic market, the development fee has also

changed and is currently \$6,597 per acre. The development fee will be calculated at the time of the project-specific-development based on the most up-to-date fee schedule.

Response To Comment G-64-27. We acknowledge that burrowing owl are present within the WLCSP. Over the 8 years that surveys have been conducted, burrowing owls have been observed in 2005, 2008, 2012 and in 2013. Over the 2,610-acre WLCSP survey area, no more than one nesting pair has ever been recorded during any single survey season. We do not deny that owls have been found within 2 miles of the WLCSP lands, but the proof resides in the fact that the project site itself has limited occupancy of burrowing owls and a single pair does not trigger onsite habitat preservation efforts for owls. As the various developments of the Specific Plan are evaluated and approved, new surveys for burrowing owl will be required and any future nesting pairs will be protected under the MSHCP as appropriate. As discussed in Response G-4-2, the loss of foraging habitat is a potentially significant impact and mitigation is provided through the MSHCP by payment of fees.

Response To Comment G-64-28. Similarly, Stephens' kangaroo rat can be found adjacent to the WLCSP, but the agricultural nature of the site limits the potential for Stephens' kangaroo rat to occur within the WLCSP. The fact that it is present in the vicinity is not surprising as Core Areas for the species occur to the south, west and east as established by the Stephens' kangaroo rat HCP. Section 6.3 of the MSHCP Consistency Analysis (FCS-MBA 2013) document clearly spells out the procedures associated with Stephens' kangaroo rat outside of Core Areas. The project will comply with the HCP requirements and pay per acre mitigation fee. Table 4 of the revised MSHCP Consistency Analysis and HANS Review report was updated and lists the potential for SKR to occur within selective portions of the WLCSP as High. This does not change the required mitigation for development of the WLCSP.

RESPONSES TO LETTER G-65

Ladona Jempson

Response to Comment G-65-1. The commenter states concerns over impacts of the World Logistics Center (WLC) project on the impact of air quality and traffic. These impacts were addressed in the Draft Environmental Impact Report (DEIR) Sections 4.3 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Karen L. Drennen

Plant Program Lead

Biological Monitoring Program

Western Riverside Multi-Species Habitat Conservation Plan

Specifically regarding the Habitat Assessment, MSHCP Consistency Analysis and HANS Review, it is my opinion that results of the surveys conducted by Michael Brandman Associates for the DEIR may under-represent the occurrence of the species surveyed within the WLC study area.

 NAFO- Spreading navarretia (*Navarretia fossalis*)
 NAST- Mud nama (*Nama stenocarpum*)
 ORCA_ California Orcutt grass (*Orcuttii californica*)
 TWWR- Wright's trichocoronis (*Trichocoronis wrightii*)

Dates of surveys for these species, according to Section 3.1 Survey Protocol pg. 10 were June 9, 10, 11, 16, 22, 23, and 24, 2010 (page 338).

The DEIR surveys were all conducted during June of 2010, which presents the following problems:

- The assumption is that species will always be identifiable in the full range of when it may be present, but this varies from year to year. If June is the beginning or tail end of a species' range, it may be long gone or not yet germinated.
- Early germinating species such as *Allium munzii* are usually not present at the same time as late germinating species such as *Centromadia pungens* ssp. *laevis*. Just because the potential ranges *appear* to overlap, does not mean they occur simultaneously. If weather conditions cause an early season, species will likely be present at the beginning of their respective ranges. Likewise, they may be present at the end of their ranges, or not at all, depending on conditions.
- Many of these species are particularly sensitive and have very specific germination requirements. They are not found every year. For example, *Trichocoronis wrightii* was not found by the Biological Monitoring Program until 2011, though surveys were repeatedly conducted in the same location beginning in 2005.
- Depending upon the weather conditions, the length of species presence can vary as well. Some species may only be detectable for a couple of weeks, if at all, in a dry year. 2010 was a relatively dry year.

3

In conclusion, surveys conducted in one month of one dry year are insufficient to determine species presence. Results of the surveys conducted by Michael Brandman Associates for the DEIR may under-represent the occurrence of the species surveyed within the WLC study area.

RESPONSES TO LETTER G-66

Karyn Drennan

Response to Comment G-66-1. According to Section 15125 of the California Environmental Quality Act (CEQA) Guidelines, "An Environmental Impact Report (EIR) must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. The description of the environmental setting shall be no longer than is necessary to an understanding of the significant effects of the proposed project and its alternatives." The Notice of Preparation for the World Logistics Center (WLC) was February 21, 2012.

In support of the Draft Environmental Impact Report (DEIR), project biologists conducted biological resource field surveys for the World Logistics Center Specific Plan (WLCSP) and additional areas to characterize the biological resources present at the site and identify sensitive resources and communities that may be impacted by the proposed project. This assessment included a combination of California Natural Diversity Data Base (CNDDDB) searches to establish what species could be potentially in the area and an assessment of habitat suitability. Biological surveys were conducted between 2005 and 2013 to provide base-line information within the WLCSP with regard to habitat suitability (refer to Table B-3.A in Response to Comment Letter B-3 CDFW)). The focus was on sensitive habitats and any areas with the potential to support sensitive flora or fauna species. These data are on both the CNDDDB occurrences and information from the Biological monitoring Program of the MSHCP coupled with an assessment of habitat suitability are provided in Tables 4.4.B and 4.4.D of the DEIR for both plants and wildlife respectively.

In addition, project biologists conducted focused surveys for burrowing owl, Los Angeles pocket mouse, and a comprehensive sensitive plant survey. A delineation of jurisdictional waters and wetlands was also conducted. Table 1 in Response to Comment B-3-4 summarizes the survey dates, the type of survey, and FCS-MBA lead staff. Information on where the surveys were performed as the project evolved through time are presented in Exhibit 5 of the Draft Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013, FEIR Volume 3 Appendix E-1). In addition, project biologists contacted RCA staff to obtain recorded occurrence data for sensitive plant and wildlife species observed within and adjacent to the SJWA.

The DEIR identifies potentially significant impacts associated with the WLCSP and provides appropriate mitigation measures to reduce the impacts to levels that are less than significant with regard to sensitive biological resources. An updated Habitat Assessment and MSHCP Consistency Analysis (FCS-MBA 2013, FEIR Volume 3 Appendix E-1) was prepared to update existing conditions within the WLCSP area. The development of the WLCSP will potentially impact sensitive plants, nesting birds, six sensitive wildlife species (including burrowing owl) and jurisdictional drainage features. All feasible mitigation measures discussed in Section 4.4.6 of the DEIR will reduce project related impacts to a less than significant impact.

Prior to the approval of a Plot Plan for any development project, the project applicant shall submit a new biological analysis will be prepared by a qualified biologist to document the current existing conditions at a project-specific level. Mitigation measure will vary from project to project based on the sensitive biological resources that are located within a specific project area. The mitigation measures shall be implemented to the satisfaction of the City Planning Division prior to issuance of a grading permit.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-66-2. Thank you for the information on the ranges of sensitive flowering plants that occur within the MSHCP. These data were taken into consideration on the timing of the sensitive plant surveys in June 2010.

Response to Comment G-66-3. Focused plant surveys were conducted for those species that were determined to have a moderate to low potential to occur within the project site. Although all plant species were considered during the plant survey in 2010, the surveys were conducted during the optimal flowering period for those species that had potential to occur within the project site. At the time, no sensitive plant species were identified. Surveys were not conducted in 2012 or 2013 due to a lack of sufficient rainfall.

Since this is a program-level document and individual projects within the specific plan will be subjected to additional surveys on the specific areas, the potentials for sensitive plants within each of these individual projects can be evaluated and if appropriate surveys for specific sensitive plant species within these areas can be completed before final siting approvals are given. MM 4.4.6.2B will be required to document the presence/absence of sensitive plant species on a project-by-project basis.

If any of the sensitive plant species that potentially occur within the project site including Thread-leaved brodiaea, smooth tarplant, Coulter's goldfields, and slender-horned spineflower, Parry's spineflower, Plummer's mariposa lily, and Robinson's peppergrass are observed within the project site during focused surveys for sensitive plant species, project-related impacts may be considered significant and require mitigation measures.

Thread-leaved brodiaea, smooth tarplant, Coulter's goldfields, Parry's spineflower, and slender-horned spineflower are all covered species under the MSHCP and if found within the project site during focused plant surveys, payment of the MSHCP fee will fully mitigate impacts to these species.

Plummer's mariposa lily (CNPS 4.2) and Parry's spineflower (CNPS 1B.1) are conditionally covered species under the MSHCP. These species will become completely covered under the MSHCP once they meet a specific conservation goal. Since the WLCSP has an extended build-out period, these two species may become covered prior to construction of individual projects, and payment of the MSHCP fee will fully mitigate impacts to these species. Until then, if these species are observed within the WLCSP during focused surveys before the conservation goals are met, then 90% of the occupied habitat must be avoided until the conservation goal is met. If the 90% cannot be avoided, then a Determination of a Biologically Equivalent or Superior Preservation (DBESP) for impacts to Plummer's mariposa lily will be required.

Robinson's pepper grass (CNPS 4.3) and San Bernardino aster (CNPS 1B.2) are not covered under the MSHCP and have no legal protection under the federal or state Endangered Species Act. If these species are identified within a project site during project-specific focused plant surveys, then an assessment must be conducted to determine the significance of the population that is found. The loss of a few individual plants would not be considered a significant impact, since it would not reduce the population of this plant to a level that is no longer self-sustaining. However, if a large population of these plants are observed with a project site, and the removal of those plants will likely cause the population to fall below a self-sustaining level, then avoid, minimization, and mitigation measures will be required. The preferred method of mitigation is to redesign the proposed project and avoid the plant population. If avoidance is not an option, then off-site purchase of land that contains occupied habitat may be required. Alternatively, an appropriate impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species on the WLC project site. A third option is to relocate these plants to the proposed buffer area and placed into conservation. A plant relocation plan will be required prior to relocation. The CDFW does not recommend this option, since it is

extremely hard to relocate sensitive plant species and maintain a viable population, but is included as an option.

Response to Comment G-66-4. Focused plant surveys are often difficult to schedule in the arid southwest that often has multiple years of drought conditions. Due to the disturbed nature of the WLCSP, it is highly unlikely that sensitive plant species occur within the actively disked agricultural lands. The majority of the suitable habitat areas are contained in undeveloped areas. The project biologist agrees that weather conditions have a significant effect on acceptable survey results although conducting current focused plant surveys was not feasible, the proposed avoidance, minimization, and MM 4.4.6.2A would reduce the impacts to sensitive plant species to a less than significant level. Focused plant surveys will be required during the environmental review process on a project-by-project basis within suitable habitat areas and is included in that measure.

Letter G-67: Michael Eberhard (April 8, 2013)

April 8, 2013

John Terell, Planning Official
Community & Economic Development Department
Planning Division
14177 Frederick Street
Post Office Box 88005
Moreno Valley CA 92552

Re: World Logistic center DEIR

Dear Mr. Terell,

I own property adjacent to the San Jacinto Wildlife Area in the San Jacinto Valley; I visit the San Jacinto Wildlife Area frequently and appreciate the sanctuary it provides to a broad spectrum of wildlife.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is factually incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

1

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

▲ 1

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

2

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California and the county of Riverside. There are alternative locations that would achieve the employment benefits desired without damaging forever a unique wildlife area. I urge you to explore alternative sites for your expansion plans. The San Jacinto Wildlife Area is a unique treasure that needs to be protected and preserved. The development plans proposed would compromise this unique area.

3

Yours truly,

Michael Eberhard

MikeEberhard@me.com

RESPONSES TO LETTER G-67

Michael Eberhard

Response to Comment G-67-1. See Response to Comment G-20-1 of Letter G-20 for a more detailed response to this comment.

Response to Comment G-67-2. The Draft Environmental Impact Report (DEIR) Section 4.1.2.2 *City of Moreno Valley Municipal Code* notes that Section 9.08.100 of the code requires non-residential lighting to be fully shielded and directed away from surrounding residential uses. It also restricts non-residential lighting to not exceed 20 feet⁵² in pole height or 0.25 foot-candles of light measured from within five feet of any residential property line. It should also be noted that since the Specific Plan and DEIR Mitigation Measure (MM) 4.1.6.1A both require a minimum 250-foot setback from residential properties, no WLC project light poles will be within located 100 feet of any existing residences.

In addition, the World Logistics Center Specific Plan (WLCSP) Section 5.5.2 *General On-Site Lighting Parameters* requires all exterior on-site lighting to be shielded and confined within the site boundaries. No direct rays or glare are permitted to shine onto public streets or adjacent lots, this includes wall mounted lighting. The WLCSP does limit the light poles to a maximum of 25 feet in height and both pole and wall mounted lighting must use cut-off fixtures.

While the WLCSP contains lighting guidelines for future development, ambient light level impacts will need to be calculated and reviewed for conformance with the DEIR mitigation measures and WLCSP, through the City's site plan review process for each specific building proposed.

Section 4.15 of the DEIR examines the traffic-related impacts of the WLC project. The EIR concluded that traffic impacts of the project would be significant even with implementation of recommended mitigation, largely because many of the improvements that would be needed to achieve level of service standards are located in other jurisdictions (including Caltrans) and are not under the control of the lead agency.

Section 4.3 of the DEIR, its supporting technical studies, the revised technical air study (FEIR Volume 2 Appendix D-1), and the revised DEIR section (FEIR Volume 2) all provide very detailed information on air pollutant impacts including health risks from diesel truck emissions. The EIR concludes that air quality impacts of the WLC project are significant, even with implementation of the recommended mitigation.

The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts (e.g., traffic, air quality, etc.).

The commenter also expresses concerns regarding the effects of diesel pollution and light pollution on the wildlife areas with which the state partners in its conservation easement program. The WLCSP provides for a number of project design features to address potential impacts to the San Jacinto Wildlife Area (SJWA) as discussed in Section 4.4.6.1 of the DEIR. A number of these features would also serve to reduce air pollutant levels that would be transported from the project to the SJWA. These features would include enhanced landscape features, restrictions on lighting, a 250-foot setback from the southern-most property line along the SJWA boundary. There is, however, no

⁵² Specific Plan Section 5.5.3.1 indicates parking lot light poles at 20 feet and driveway poles at 25 feet most likely to prevent conflicts with trucks turning into parking areas.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

accepted approach to measure or assess the impact of diesel emissions on wildlife. As a result, any discussion of impacts would be speculative.

Response to Comment G-67-3. The commenter states,

“This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California and the county of Riverside. There are alternative locations that would achieve the employment benefits desired without damaging forever a unique wildlife area. I urge you to explore alternative sites for your expansion plans. The San Jacinto Wildlife Area is a unique treasure that needs to be protected and preserved. The development plans proposed would compromise this unique area.”

According to Section 6.3.9 of the DEIR: This alternative examines different sites in the surrounding region to determine if an alternative location would reduce or eliminate one or more significant impacts of the project. This analysis must be based on feasible sites that could realistically support the proposed project (i.e., a contiguous 2,635-acre site for 41 million square feet of high-cube logistics warehouse uses as envisioned by the WLCSP). The surrounding jurisdictions were contacted to identify potential alternative sites for the proposed project. Figure 6.1 shows the locations of the various jurisdictions that were contacted and/or analyzed in this evaluation and Table 6.R presents the results of that analysis.

Table 6.R indicates that there are no feasible alternative sites in the surrounding or nearby jurisdictions that could support the proposed project (i.e., that have enough vacant land zoned or available for logistics warehousing with good freeway and/or rail access). Therefore, none of these sites will be evaluated further.

Subject: World Logistics Center Project

Letter G-68

To: Mark Gross

marg@moval.org

From: Craig R. Givens and Joan Givens

26961 Cimarron Canyon Drive

Moreno Valley 92555

I am against the World Logistics Center Project in our city. This project will have adverse health effects from the diesel particulate pollution caused by the trucks that will be coming from the 41 million square feet of warehousing project. The beautiful majestic mountains that surround our city will keep the pollution trapped here.

1

I moved to Moreno Valley in 2001. I was told by my fellow citizens that the far south eastside of the city near Mystic Lake would have a housing development called Moreno Valley Highlands according to the General Plan. I love the scenic beauty of this part of Moreno Valley. It appears that the World Logistics Center Project incompatible with the current general plan. I would not have bought a home in this part of Moreno Valley had

known the general plan was going to be changed without having a new general plan. How does the city plan to promote a sense of pride in the community when the people feel they have been deceived? How are the residents going to fill a sense of community when they know the city's plans are for warehouses.

2

Furthermore if the city was concerned about the welfare of its citizens and their quality, it would have developed the appropriate infrastructure (rail and airport) to accommodate the large volume of goods that would need to be moved to and from the warehouse complexes. Rail development through the canyon would have mitigate the pollution and traffic that the trucks will cause. The narrow 60 freeway cannot accommodate the commuter traffic that goes through this area every day. There are times in the day that you can walk on top of the cars because they have come to a complete stop. Trucks will make this freeway a death trap.

3

Also, the promises of jobs are false. The developer has been in the city since 1985 – 1987 time period. He had promised 30, 000 to 50,000 jobs from Moreno International Trade Center, a project that include a 10, 000 foot runway. This project did not happen. In addition, the previous project from this developer which is Sketchers promised 2500 jobs, but the building was only designed for 300 because it is so modern and electronically advanced. How can the City or the developer properly estimate the number of jobs? How can the residents trust the City or the developer when they continue to falsify employment numbers?

4

RESPONSES TO LETTER G-68

Craig and Joan Givens

Response to Comment G-68-1. The many potential environmental impacts of the proposed WLC project are fully evaluated in the Draft Environmental Impact Report (DEIR), including impacts to air quality from diesel pollution and substantial changes in views and land use on the site and for surrounding neighbors and neighborhoods. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project

Response to Comment G-68-2. The proposed World Logistics Center (WLC) project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). The City Council will consider all stated opinions and comments on the project and Environmental Impact Report (EIR) prior to making any decisions regarding the proposed WLC project.

Response to Comment G-68-3. The provision of a rail service to the project site has been studied to determine if it is an alternative which will reduce the number of trucks driving between ports and the site, and therefore reduce the number of significant impacts (Section 4.F of the Traffic Impact Assessment (TIA) appendix L). However, it has been determined that this alternative is not a viable option due to the following reasons. The WLC site is not currently served by rail and would need to be aligned to an existing branch. All possible alignments would cause impacts equal or greater than the projected truck traffic. It was also determined that for a rail service to be economical 50 percent of all shipments must be shipped 500 miles or greater on rail. Shipments to the WLC would only be travelling from the ports of Los Angeles and Long Beach, a distance of about 70 miles. Additionally, the existing rail system is already at or near maximum capacity. Therefore, shifting cargo from trucks on freeways to rail would transfer the congestion problem from stressed freeway systems to stressed rail networks. Finally, the reduction in truck traffic to the WLC is projected to be between 2 and 7 percent. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-68-4. The comment states, *"Also, the promises of jobs are false. The developer has been in the city since 1985 – 1987 time period. He had promised 30, 000 to 50,000 jobs from Moreno International Trade Center, a project that include a 10, 000 foot runway. This project did not happen. In addition, the previous project from this developer which is Skechers promised 2500 jobs, but the building was only designed for 300 because it is so modern and electronically advanced. How can the City or the developer properly estimate the number of jobs? How can the residents trust the City or the developer when they continue to falsify employment numbers?"*

The comment does not raise an issue with the adequacy of the DEIR. No response is required. The City Council will consider all comments prior to taking any action on the project.

Employment projections for the WLC project are contained in a 2013 report entitled, "Fiscal and Economic Impact Study, WLC, Moreno Valley, California" prepared by David Taussig & Associates, Inc. (DTA). This report is provided in Appendix O of the DEIR. In this report, an estimate of 0.50 employees per 1,000 square feet of building square feet was used to project the number of employees that could be located at the WLC project. Based on a the proposed land uses and building areas, this would equate to approximately 20,808 employees. The 0.50 employees per 1,000 square feet factor was based on data supplied by the Southern California Association of Governments (SCAG), the National Association of Industrial and Office Parks, and the U.S. Energy Information Administration. These projections are discussed at length in the David Taussig and Associates, Inc.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

(DTA) report. Additional information regarding these employment projections can be found in the FEIR's responses to comment letter G-90, comments A-1 through A-4.

Letter G-69: Kathy Schmitt (April 9, 2013)

9. All areas within 50 miles of this project must be considered regarding the impacts on climate, growth and quality of life issues of this warehouse project. I- 9

Richard L. Schmitt

Kathy Schmitt

RESPONSES TO LETTER G-69

Kathy Schmitt (April 9, 2013)

Response to Comment G-69-1. The commenter is concerned about traffic on SR-60. The original and revised traffic impact assessments (TIAs) for the World Logistics Center (WLC) project both provided extensive discussion and analysis of potential impacts on SR-60 under various development scenarios (buildout plus baseline in 2012, Phase 1 plus baseline in 2022, buildout plus future baseline in 2030, and buildout in 2035).

Response to Comment G-69-2. The commenter is concerned about air pollution impacts on the San Jacinto Wildlife Area (SJWA). The issue of direct and indirect air quality impacts on the SJWA was evaluated in Section 4.4.6.1, *Biological Resources – Endangered Species*, in the Draft Environmental Impact Report (DEIR). It determined that project emissions with the proposed development and building setbacks and with recommended mitigation would have less than significant impacts on the resources of the SJWA.

Response to Comment G-69-3. The commenter is concerned about light pollution impacts on the San Jacinto Wildlife Area (SJWA). The issue of direct and indirect lighting impacts on the SJWA was evaluated in Section 4.4.6.1, *Biological Resources – Endangered Species*, in the Draft EIR. It determined that project lighting with the proposed development and building setbacks and with recommended mitigation would have less than significant impacts on the resources of the SJWA.

Response to Comment G-69-4. The commenter expressed concern about growth inducement and its effect on water supply. The growth-inducing impacts of the WLC project are examined in DEIR Section 5.3, *Growth-Inducing Impacts*, including water supply. Other water supply-related issues are addressed in DEIR Sections 4.9, *Hydrology and Water Quality*, and Section 4.16, *Utilities – Water*. DEIR Section 4.16.1.6.1, *Adequate Water Supply*, states ... “both the CH2M Hill figure of 450 AFY and the EMWD’s worst-case estimate of 1,991 AFY figure will be used relative to water consumption.” These two figures are relatively far apart based on the assumptions for onsite water use, with the higher Eastern Municipal Water District (EMWD) figure resulting from extremely “worst case” assumptions while the lower CH2M Hill figure resulting from more reasonable and feasible water consumption estimates. According to the Water Supply Assessment prepared by the Eastern Municipal Water District, it can accommodate over the next 20 years even under multiple drought-year conditions (refer to FEIR Volume 2 Appendices J and N).

Response to Comment G-69-5. The commenter expressed concern about impacts to endangered species. DEIR Section 4.4.6.1, *Biological Resources – Endangered Species*, examines potential project impacts to endangered species and determines that, with the recommended mitigation measures, WLC project impacts will be less than significant.

Response to Comment G-69-6. The commenter questioned what impacts the WLC project would have on the Mid-County Parkway (MCP) project. The MCP project was not included in the analysis because only one or two hundred daily trips, equivalent to 10 or 20 peak hour trips, would be added at buildout of the proposed project, well below the 50 peak hour trip study area criteria. By definition, impacts to roadway segments or intersections affected by less than the 50 peak hour trip study area criteria are considered less than significant because such changes will have an insignificant effect on roadway and intersection operations.

Response to Comment G-69-7. The commenter wondered what impacts the project would have on Gilman Springs Road. The widening of Gilman Springs Road from a two-lane road to a six-lane road is included in the Southern California Association of Governments (SCAG) Federal Transportation Improvement Program (FTIP) (Project ID RIV080908 for the segment between SR-60 and Alessandro

Boulevard and Project ID RIV080909 for the segment between Alessandro Boulevard and Bridge Street) and the FTIP shows full funding of both of the Gilman Springs Road segments will be obtained in fiscal year 2016/2017. For this reason, the Traffic Impact Assessment (TIA) included the widening of Gilman Springs Road from a two-lane road to a six-lane road in the Year 2035 circulation network assumptions. The TIA further determined that Gilman Springs Road would need to be widened from a six-lane road to an eight-lane road (the segment between Alessandro and Bridge Street) in Year 2035 with buildout of the proposed project. In addition, the TIA determined that Gilman Springs Road would need to be widened from a two-lane road to a four-lane road in Year 2022 with or without Phase 1 of the proposed project. At project build out in Year 2035, the WLC project is expected to contribute up to 6,421 trips per day to Gilman Springs Road which would be approximately 11.4 percent of its six-lane road design capacity.

Response to Comment G-69-8. The commenter expressed concern about how another development project in Banning proposed by the developer of the WLC project might affect the impact analysis of the WLC EIR. There is no relationship to the referenced project due to the City of Banning choosing not to pursue the project.

Response to Comment G-69-9. The commenter stated that the cumulative analysis for project impacts must extend out to 50 miles. There is typically no set distance for the analysis of cumulative impacts, the potential affected area or universe for cumulative impacts always depends on the size and type of project, its location relative to other development and land uses, and a variety of other factors. This is why the universe for each cumulative impact issue may be different (e.g., South Coast Air Basin for air quality impacts, western Riverside County for biological impacts, etc.). The universe for each cumulative impact issue was identified at the outset of the discussion for each environmental topic (DEIR Sections 4.1 through 4.16).

Letter G-70: Amora Johnson (email) (April 9, 2013)

From: amoraj@verizon.net
 Date: Apr 8, 2013 2:27:02 PM
 Subject: Official DEIR Comments for the World Logistic Center
 To: markg@moval.org

"Official DEIR Comments for the World Logistics Center"

I am opposed to this project because of Environment, Aesthetic, Safety, Health and Financial reasons.

It is incompatible with the current general plan which I read before I bought the property and built a house on it. The plan would be to sell the property as part of our portfolio for retirement funds. Having the warehouses built will impact the environment, too, for the California State wildlife sanctuary.

1

I would not have bought and built on it if I had known the general plan was going to be changed.

I oppose this project because it is not environmentally sound as what had happened with the study at the Mira Loma warehousing location – this will be worse as human beings and the wildlife area will both be affected.

2

To have the designation as a wildlife area, the State of California must have studied the area prior to all these proposed changes. With more pollution because of the diesel trucks' traffic as a result of the proposed warehouses, there won't be any more wildlife.

3

I oppose this project because the adverse health effects of diesel particulate pollution from 41 million square feet of warehousing trucks are not fully known. Research has just become available that has linked pollution during pregnancy to increased autism risk. The beautiful majestic mountains that surround our city keep pollution trapped here. Why hasn't an alternative site that is not surrounded by mountains been identified with a corresponding map?

4

I oppose this project because a 41 million square foot warehousing complex is not economically feasible without freight rail. Additionally the Lead Agency has not disclosed how many tax dollars that will be needed for this project. Without knowing that amount neither the public nor the Lead Agency can determine the economic feasibility. In a City that is threatening to turn off the streetlights because they are broke, how can the Lead Agency determine whether the infrastructure costs to the taxpayers are worth it if they aren't disclosed? How does the City propose to pay for infrastructure when they claim they can't afford to pay for streetlights?

5

How does this City intend to keep a positive community environment when they threaten to turn off public utilities needed for safety but propose to pay for developer required infrastructure?

5

I oppose this project because I don't think the employment numbers are correct. The previous project from this developer which is Sketchers promised 2500 jobs, but the building was only designed for 300 because it is so modern and electronically advanced. Warehouse electronics are just like computer technology, it's outdated almost as soon as it's finished. That means that each warehouse constructed will have fewer employees than the one before. How can the City or the developer properly estimate the number of jobs? How can the residents trust the City or the developer when they continue to falsify employment numbers?

6

RESPONSES TO LETTER G-70

Amora Johnson

Response to Comment G-70-1. The proposed World Logistics Center (WLC) project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, Land Use and Planning). Also, Section 4.4, *Biological Resources*, of the Draft Environmental Impact Report (DEIR) examines potential impacts of the proposed project on existing vegetation and animals. It should be noted that the site generally lacks important biological resources (including wetlands) due to the historical and ongoing disturbance by agricultural activities. The DEIR also examined potential impacts on the nearby San Jacinto Wildlife Area and Mystic Lake, and determined that the project design, with proposed setbacks and landscaped buffers, and recommended mitigation measures would reduce potential impacts on these areas to less than significant levels. The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-70-2. The commenter compares the project to the Mira Loma warehousing area and says wildlife and humans will both be affected. The potential environmental impacts of the WLC project on both the natural and man-made environment are evaluated in the Draft EIR Sections 4.1 through 4.16 with impacts to biological resources addressed in Section 4.4 of the DEIR. The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise, and traffic but that impacts to biological resources would be reduced to less than significant levels by project design implementation of recommended mitigation measures.

Response to Comment G-70-3. Section 4.4, *Biological Resources*, of the DEIR examines potential impacts of the proposed project on existing vegetation and animals. It should be noted that the site generally lacks important biological resources (including wetlands) due to the historical and ongoing disturbance by agricultural activities. The DEIR also examined potential impacts on the nearby San Jacinto Wildlife Area and Mystic Lake, and determined that the project design, with proposed setbacks and landscaped buffers, and recommended mitigation measures would reduce potential impacts on these areas to less than significant levels.

Response to Comment G-70-4. The commenter remarks about the adverse health effects of diesel pollution and research linking pollution during pregnancy to increased autism risk.

Please refer to Master Response-2: Health Effects of Diesel Particulate Matter. The statement regarding linkage between pollution during pregnancy and increased autism risk is not supported by any reference material in this comment letter.

Response to Comment G-70-5. Please reference Response to Comment G-57-1.

Response to Comment G-70-6. Please reference Responses to Comments G-57-1 and G-59-2.

Re: World Logistic center DEIR

Dear Mr. Terrell,

I am a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

↑ 1

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

| 2

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

| 3

Yours truly,

Lawrence Woodward

RESPONSES TO LETTER G-71

Lawrence Woodward

NOTE: This letter is based on a template provided by J. Weleba in Letter G-20. Reviewers are referred to responses to that letter for more detailed discussion of these comments.

Response to Comment G-71-1. See Response to Comment G-20-1 of Letter G-20 for a more detailed response to this comment.

The World Logistics Center Specific Plan (WLCSP) does not include any public lands, including any portion of the San Jacinto Wildlife Area (SJWA), as a form of mitigation. The Draft Environmental Impact Report (DEIR) has analyzed the impact of the development that will take place as part of the WLC project in the California Department of Fish and Wildlife (CDFW) Conservation Buffer Area. The 910-acre portion of the project area owned by the State is being rezoned to “open space.” It is CDFW land acquired as a buffer (and for other reasons as well), between the high quality SJWA habitat and any proposed development to the north. Calling it the CDFW Conservation Buffer Area is not inaccurate or misleading.

The General Plan Amendment provides for the designation of this CDFW land and portions of the San Diego Gas and Electric (SDG&E) lands as permanent open space. The WLC project does not “take credit” for re-zoning this area as open space. The current zoning for the property is a mix of residential, public and open space designations that are proposed to be removed since those uses are no longer planned and will never be developed. There will be no direct impacts to any portion of the SJWA as part of the WLCSP and no mitigation measures are required. There will be no direct impacts to any portion of the SJWA as part of the WLCSP and no mitigation measures are required.

The CDFW land was incorporated into the San Jacinto Wildlife Area following a sale the subject lands to the State in 2001. The May 18, 2001 Wildlife Conservation Board Agenda (page 43) recommended that 5 separate parcels totaling approximately 1,000 acres (910 acres of which were part of the Moreno Highland Specific Plan) be purchased as expansions of the California Department of Fish and Game’s San Jacinto Wildlife Area. “Acquisitions of the proposed expansions will allow for the protection of a portion of Mystic Lake and its associated upland habitat which is important to a number of sensitive plant and animal species.” “The CDFW has identified the subject properties as being a Significant Natural Area and has recommended the purchase of the property as an addition to the existing WLA. The acquisition of the subject properties are important to the wildlife of the area as they will serve as a buffer from development north of the WLA and add significant wildlife benefits to the WLA. It is anticipated that the addition of these properties will enhance public recreational opportunities, as the upland habitat and wetland areas are restored.”

These parcels within the CDFW Buffer Area have been incorrectly zoned for the past 12 years. The General Plan Amendment included as a part of the project corrects this discrepancy for the CDFW Buffer Area and designates the lands as permanent open space.

These lands, while a part of the SJWA are currently used by CDFW for the same agricultural pursuits as the Highland Fairview-owned properties and generally consists of disked fields with winter grain crops planted and harvested yearly. Based on the 2001 Wildlife Conservation Board Agenda, long-range plans of the 910 acres call for restoration to upland habitat suitable for supporting a number of sensitive plants and animals. Nothing in the WLC Specific Plan alters or degrades what was the stated purchase of the property. A buffer of 400 feet has been provided in the DEIR. This buffer would exclude buildings but would allow for roads, landscaping, water retention basins, and other infrastructure.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

The lands within the CDFW Conservation Buffer Area are further protected by the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) by a series of Criteria Cells (1364, 1370, 1377, 1386, 1389, 1390, 1483, 1482, 1477, and 1577) which require justification for any development within them. In addition to the Criteria Cell protections, they are also considered Public/Quasi Public Lands according to the MSHCP and would require amendments to the MSHCP to allow development.

The DEIR correctly spells out measures associated with the requirements of Section 6.1.4 of the MSHCP on the Urban/Wildlands Interface to protect adjacent resources. These include, light, noise, toxics, and water quality. Site-specific studies related to compliance the Urban/Wildlands Interface where appropriate will be conducted and compliance with Section 6.1.4 of the MSHCP completed.

There has never been an attempt to take credit for these lands as mitigation or compensation for habitat loss as that will be accomplished through the payment of fees in accordance with the MSHCP formula.

The updated Habitat Assessment and MSHCP consistency analysis (FCS-MBA 2013, FEIR Volume 3 Appendix E-1) fully analysis all WLCSP development related direct and indirect impacts associated with sensitive biological resources in the SJWA.

Response to Comment G-71-2. See Response to Comment G-20-2 for a more detailed response to this comment.

Response to Comment G-71-3. See Response to Comment G-20-3 for a more detailed response to this comment.

Subject: World Logistics Center's Draft EIR (SCH#2012021045) and
Planning Cases PA 12-0011, 0012, 0013, 0014 and 0015

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. 1
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. 2
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. 3
-

Sincerely,

(signature)

RESPONSES TO LETTER G-74

D. Moore

NOTE: This letter is based on a template provided by C. Moothart in Letter G-9. Reviewers are referred to responses to that letter for more detailed discussion of these comments.

Response to Comment G-74-1. See Response to Comment G-9-9 for a more detailed response to this comment.

Response to Comment G-74-2. See Response to Comment G-9-10 for a more detailed response to this comment.

Response to Comment G-74-3. See Response to Comment G-9-11 for a more detailed response to this comment.

Response to Comment G-74-4. The comment is a form letter requesting that the project move all truck traffic off Merwin Street. The comment also requests that Streets D and E be relocated 500 to 1,000 feet east of Merwin Street. The commenter also requests that there be no truck traffic on Redlands or Cactus Blvd.

As explained in Traffic Impact Analysis (TIA) Chapter 4, Section B, Alessandro Blvd will be severed in the project site. This is being done specifically to prevent project traffic from entering the Old Moreno neighborhood. Project traffic will not use Merwin Street. Project-related car traffic heading west will be directed towards Cactus Blvd. Trucks will not be permitted to use the Cactus Blvd. access point and would instead be directed to SR-60.

The proposed on-site road network has been revised so that Street E is 400 ft. away from Merwin Street and Cactus is 1,270 ft. away from Merwin Street.

The Moreno Valley City Council rescinded Redlands Blvd.'s designation as a truck route south of Eucalyptus Avenue (the section cited) Previously trucks had been allowed south as far as Alessandro Blvd. Please refer to Ordinance No. 836 dated January 10, 2012. Trucks will be prohibited from using the Cactus Avenue Extension, and therefore World Logistics Center (WLC) trucks will not be using Cactus Avenue.

Response to Comment G-74-5. The commenter only states “Jobs for Americans” in this comment. This makes no direct reference to the WLC project. In response to comments, the Development Agreement includes a provision for a local hiring program that will encourage local (i.e., City of Moreno Valley) hiring within the WLC project as outlined in Response to Comment G-33-9. Even with the inclusion of a hiring program, there is no effective or legal way to guarantee that all companies within the WLCSP will fill short-term construction or long-term warehousing jobs with legal U.S. residents. As with other issues, the City Council will consider all comments and responses on the project and Environmental Impact Report (EIR) before making a decision on the WLC project.

Response to Comment G-74-6. The commenter wants the project to “eliminate all harmful effects.” There is no way to eliminate all harmful effects and still satisfy the project objectives. The potential environmental impacts of the WLC project on both the natural and man-made environment are evaluated in the Draft EIR Sections 4.1 through 4.16 with impacts related to hazards and hazardous materials addressed in Section 4.8 of the DEIR. The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise, and traffic. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-74-7. The commenter does not want to lose their “peace and quiet.” The potential noise impacts of the project are examined in Section 4.12 of the DEIR which were determined to be significant even with mitigation. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Response to Comment G-74-8. The commenter stated the project required more than a 100-foot greenbelt area. The DEIR does provide a buffer area along Redlands Boulevard, Bay Avenue and Merwin Street through Mitigation Measure (MM) 4.1.6.1A which reads as follows:

4.1.6.1A ~~Prior to the issuance of any discretionary permit for development along the western boundary of the WLCSP, a minimum 250-foot setback shall be verified from closest residential property line along Redlands Boulevard, Bay Avenue, and Merwin Street to any truck access area of the WLC project. Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, planted walls and landscaping sufficient to provide effective visual screening between the new development and existing residential areas upon maturity of the landscaping materials. Prior to development of the portion of the WLC Specific Plan property adjacent to Redlands Boulevard, the existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the City Planning Official Division.~~

In addition, the minimum setback from a residential zoning to a building along Redlands Boulevard, Bay Avenue and Merwin Street is 250 feet per the Specific Plan. Compliance with mitigation measure (MM) 4.1.6.1A and the minimum building setback, will provide for berms and landscaping that would exceed the suggested 100 foot wide greenbelt area in the comment letter.

Along Redlands Boulevard the future right of way is planned as 110 feet, subtracting this from the 250 foot setback would leave a 140 foot buffer area. Along Bay Avenue and Merwin Street the right of way is 60 feet, subtracting this from the 250 foot setback would leave a 190 foot buffer area.

Re: World Logistics Center

Dear Mr. Terrell:

I am writing this letter in response to the notice I received from you regarding the World Logistics Center.

I am unable to just sign the attached letter regarding Merwin St. due to the fact that I as well as most of my neighbors do not want the World Logistics Center coming to our neighborhood **AT ALL**. The increase in traffic, pollution, etc. will happen whether or not there is an entrance on Merwin. Just changing the access road will not solve the problem.

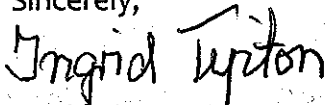

My family and I have lived in this neighborhood since 1978. We moved out here for the rural, quiet atmosphere and for the most part that has been maintained for the last 35 years. The World Logistics Center will destroy the neighborhood we live in and drive the value of our property down to an all-time low!

There are so many other areas in Moreno Valley already zoned for that type of industry with plenty of space to build more. Many of the new warehouses are sitting empty already!

Why should we have to lose the peace that we have cherished in our neighborhood since before Moreno Valley ever became a city, so certain city officials can realize their own greedy dreams?

However, if the logistics center is allowed to be built out here, I definitely feel that Merwin should not be used as the access road. Thank you.

Sincerely,

Ingrid Tipton
14065 Wilmot St
Moreno Valley, CA 92555

RESPONSES TO LETTER G-78

Ingrid Tipton

Response to Comment G-78-1. The commenter wishes the City to deny the project, not modify it as some of his neighbors suggest. The City Council will consider all comments and responses before making a decision on the World Logistics Center (WLC) project and Environmental Impact Report (EIR).

Response to Comment G-78-2. None of the comments apply to the EIR analysis or conclusions, but are personal observations about the project. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Response to Comment G-78-3. The commenter says there are other areas to build warehouses and many existing ones are vacant. The economic study for the WLC project (DTA 2014)(DEIR Appendix O-1) indicates that logistics warehousing is and will continue to be a rapid growth sector of the Southern California economy for many years. The only location in the City where enough land is available for a regional logistics center of over 1,000 acres is in the Rancho Belago area (eastern Moreno Valley). The “alternative sites” analysis in DEIR Section 6.7 evaluated 16 different potential project sites in 12 different jurisdictions and determined there were no feasible alternative sites available in the surrounding area to house the proposed project.

Response to Comment G-78-4. The commenter states that if a logistics center is allowed to be built at this location, Merwin Street should not be used as the access road.

As explained in TIA Chapter 4, Section B, (FEIR, Volume 2, Appendix L) Alessandro Blvd will be severed in the project site. This is being done specifically to prevent project traffic from entering the Old Moreno neighborhood. Project traffic will not use Merwin Street. Project-related car traffic heading west will be directed towards Cactus Blvd. Trucks will not be permitted to use the Cactus Blvd. access point and would instead be directed to SR-60.

Re: World Logistic center DEIR

Dear Mr. Terell,

As a land owner in the San Jacinto Valley and a frequent user of the San Jacinto Wildlife Area, I am very concerned with the World Logistic center DEIR.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

William D. Dyer

Mailing Address: 16 A Journey, Ste. 150, Aliso Viejo, CA. 92656

Email: dyer5@aol.com Ph.: 949-302-2048

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

1

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

2

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California. Please protective this vital wildlife area.

3

All the best,

William D. Dyer

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

↑ 2

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

↑ 3

Sincerely,

John M. Cargasacchi

Letter G-83: Louis and Lavine LaBelle (March 28, 2013)

March 28, 2013

City of Moreno Valley Economic Planning Department:

This letter is written in response to the proposed World Logistics Center project. It is apparent that the City Planning Commission and City Council have chosen to approve recommendation of this project without concern for the citizens of this community. The environmental impacts of this project should be considered before this project moves forward. First of all, the pollution generated from the amount of trucks that are estimated to be traveling through the area will have adverse effects on the health of the residents and will deteriorate the air quality in the area. This increase in truck traffic will also affect the gridlock on the 60 freeway and surrounding streets. This is already a problem as there is only one way into the city and one way out, it will only be compounded by the addition of hundreds of more trucks. Also, these trucks bring additional noise that will affect the residents. This is all in contradiction to the general land use that was originally designated for this area. Agriculture and wildlife in the area will also be adversely affected as will the open spaces and aesthetics of the community. As residents of this community we would like to voice our opposition to such a project. The proposed "benefits" do not outweigh the significant negative impacts.

Louis + Lavine LaBelle
28815 Kimberley Ave.
Moreno Valley, CA 92555

RESPONSES TO LETTER G-83

Louis and Lavine LaBelle

Response to Comment G-83-1. Many of the comments regarding impacts of the World Logistics Center (WLC) project on the overall quality of life, specifically air quality and traffic, were addressed in the Draft Environmental Impact Report (DEIR) Sections 4.4 and 4.15, respectively. The DEIR concluded that air quality and traffic impacts would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-83-2. Although trucks would bring additional noise to the surrounding areas, the proposed WLC project includes a General Plan Amendment (GPA) that identifies those portions of the City's General Plan that will be revised if the WLC project is approved, and that GPA was evaluated in appropriate sections of the EIR (e.g., 4.10, *Land Use and Planning*). The City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed WLC project.

Response to Comment G-83-3. The commenter is concerned about impacts to aesthetics (open space and views), agriculture, and wildlife. These issues are addressed in Sections 4.1, 4.2, and 4.4 of the DEIR, respectively. The DEIR determined the WLC project would have significant impacts on views and agriculture, even with mitigation, while impacts to wildlife were determined to be less than significant with mitigation. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Subject: World Logistics Center's Draft EIR (SCH#2012021045) and
Planning Cases PA 12-0011, 0012, 0013, 0014 and 0015

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. 1
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. 2
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. 3
- 3

Sincerely,

John S. Mamulski

To: Mark Gross
Subject: Re: The World Logistic Center in Moreno Valley

Mark:

Thank you for your letter and the information regarding the proposed WLC.

I live in the golf course community on Cactus and Moreno Beach Drive and am very concerned about this project and the way it will impact my (and my family's) quality of life. I moved from LA 10 years ago for this same reason; to live better and in a nice community. I'll be sure to attend Saturday's meeting. In the interim, my question is. Can we, Moreno Valley residents, do anything about it? Do we have any say in whether this project flies or not? Or is it a done deal? Anyway, I'm sure I'll find that out on Saturday. Please send me more information or let me know what I can do to get more informed. I'm truly concerned. **1**

RESPONSES TO LETTER G-85

Ana Hernandez

Response to Comment G- 85-1. The commenter expresses concern in general about the project. The commenter is encouraged to review the Draft Environmental Impact Report (DEIR) and this Final Environmental Impact Report (FEIR) with its revised technical studies and changes to the DEIR document. The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise, and traffic. The City Council will consider all comments and responses on the project and EIR before making a decision on the World Logistics Center (WLC) project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

Re: World Logistic center DEIR

Dear Mr. Terell,

I am a land owner in the San Jacinto Valley and a frequent user of the San Jacinto Wildlife Area.

The Draft Environmental Impact Report (DEIR) incorrectly designates an area adjacent to the San Jacinto Wildlife Area (SJWA) and part of the World Logistic Center project as a "Conservation buffer". There is no such entity and the area described within this "Conservation buffer" is owned and maintained by the California Department of Fish and Wildlife as part of the San Jacinto Wildlife Area. This area was acquired by the Wildlife Conservation Board in 2001 for addition to the San Jacinto Wildlife Area for endangered and threatened species habitat along with conservation efforts for wildlife in the county of Riverside. This was never meant to be or considered anything other than part of the San Jacinto Wildlife Area. This designation is incorrect and misleading.

The area in question is also included in the Multi-Species Habitat Conservation Plan (MSHCP) developed in 2004 for Riverside County. It was not described as a buffer zone but as MSHCP Conservation habitat.

None of the direct and indirect impacts to the MSHCP and other species on the SJWA are properly analyzed in the DEIR.

The EIR must address these issues, correctly identify the false "CDFW Conservation Buffer" as part of the SJWA and properly analyze an appropriate buffer for the SJWA. Any buffer proposed must be justified by evidence-based research that supports the size of such buffer.

The people of the state of California have over 100 million dollars invested in the SJWA and any threat or compromise of that investment needs to be thoroughly evaluated.

The current DEIR does not meet that criteria and, in its current form, is woefully inadequate in its evaluation of the detrimental effects of this project on the San Jacinto Wildlife Area.

This is only one of many issues that I am concerned about with this project. The amount of increased traffic from cargo trucks, the increased diesel emissions and light pollution created will all have a tremendous detrimental effect on the wildlife area and the adjacent lands that the state partners with in their conservation easement program.

This project may create jobs but will do so at the expense of what little wildlife habitat is left in Southern California and is not in the best interest of the people of the State of California.

Yours truly,

RESPONSES TO LETTER G-87

E. Madera

Response to Comment G-87-1. Most of the comments do not apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project and project review process. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-88A

Mr. Mark Gross
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92553

Dear City of Moreno Valley,

We are the property owners of the 640 acres located directly east of the World Logistics Center project (Our property has Riverside County Assessor Parcel Numbers: 422-160-008, 009, and 010). We have concerns about some of the elements of the World Logistics Center project and have outlined them below:

(1) After reviewing map Figure 4.4.1, we noticed that there is a 1,000 foot buffer placed around the eastern, southern, and a portion of the northern boundaries of the World Logistics Center project area. This 1,000 foot buffer area is outside the project footprint and actually covers a portion of our property. We do not exactly know the purpose of this "buffer" area; however, we do not want any portion of our property having setbacks or restrictions as a result of this project. As such, we would like to ask that you make sure there are no new or additional restrictions placed on our property relating to this project or buffer area.

(2) We are concerned that the utilities for the project stops away from Gilman Springs Road. We would like to request that you make sure that the roads (or open space areas) where the utilities are located have easements allowing us to extend the utilities to our own property. Also, please make sure the developer of the World Logistics Center builds in enough extra capacity in each of the various utility lines (i.e. sewer, water, gas, telephone, electric, etc.) to handle our property and the surrounding area.

(3) We are also concerned about how the drainage control for the World Logistics Center is being handled. It appears that there may be one or more drainage basins on our property. I want to make sure that no one is putting the drainage control burden for the World Logistics Center project on our property.

I want to thank you for your time and consideration on this matter. If you have any questions, please let us know.

Best Regards,

Conchita Marusich

Conchita Marusich
Beneficial Owner
The Wolfskill Trust.

RESPONSES TO LETTER G-88

Conchita Marusich

Response to Comment G-88-1. The commenter stated,

“After reviewing Figure 4.4.1, we noticed that there is a 1,000 foot buffer placed around the eastern, southern, and a portion of the northern boundaries of the WLC project area. This 1,000 foot buffer area is outside the project footprint and actually covers a portion of our property. We do not exactly know the purpose of this “buffer” area, however, we do not want any portion of our property having setbacks or restrictions as a result of this project. As such, we would like to ask that you make sure there are no new or additional restrictions placed on our property relating to this project or buffer area.”

Figure 4.4.1 in the Draft Environmental Impact Report (DEIR) depicts the “Onsite Vegetation Communities” and includes an area labeled as a “1,000 ft. Buffer Area.” This area is simply an area designating the limits outside the proposed project boundary that were studied to understand, in this case, what offsite vegetation exists around the project boundary. It does not establish any sort of a restriction on the properties within the “1,000 ft. Buffer Area.” The figure uses this term of a 1,000 ft. buffer area, which has caused confusion. The revised DEIR Figure 4.4.1 indicates this area as the study area for biological resources.

When a project evaluates its environmental impacts it typically includes evaluation existing conditions outside the project area (offsite), to understand how the project will interface with adjacent areas.

Response to Comment G-88-2. All of the proposed utilities will be located within public rights of way, no easements will be necessary to allow offsite property owners to tie into the World Logistics Center’s (WLC) utilities lines that will serve the WLC. Eastern Municipal Water District (EMWD) and other utilities require that facilities be sized to accommodate future development. EMWD and the other utilities are responsible for any upsizing of facilities and will seek reimbursement from future developers.

Response to Comment G- 88-3. No drainage basins are proposed on offsite property. The drainage conditions upstream of the WLC project area were evaluated because they contribute flows to the WLC project area. Flows from the WLC do not impact upstream properties. Upstream properties contribute runoff to the WLC project area. It is pointed out in the revised Appendix J of the Draft Environmental Impact Report (DEIR) Section 6.2 of *the Master Plan of Drainage Report* that sediment could be generated from these offsite tributary areas upstream of Gilman Springs Road. As stated in Section 6.2, in the existing condition, the majority of the sediment will deposit upstream of Gilman Springs Road. In the future, sediment basins could be constructed upstream of Gilman Springs Road to contain the existing sediment and minimize the total suspended solids in the runoff. However, because sediment basins upstream of Gilman Springs Road are not to be constructed as part of this project, it is expected that some of the offsite sediment will continue to be transported through the culverts along Gilman Springs Road. The proposed drainage facilities in the WLC project have been sized to convey the expected sediment load. As such, these sediment basins are not needed nor required for this project. The project onsite area will not generate significant amount of sediment due to the proposed logistics land use. The sediment that proceeds through the Gilman Springs Road culverts will be transported to the proposed detention basins on the WLC area. The proposed basins will settle the sediment before exiting the project boundary, similar to how the sediment settles in the existing channels and overland area in the existing condition.

Response to Comment Appendix 1. Appendix 1 identifies the property owned by the respondent. The property is located east of the WLC Project. No proposed drainage basins are proposed on this

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

property. The drainage conditions upstream of the WLC project area were evaluated because they contribute flows to the WLC project area. Flows from the WLC do not impact upstream properties. Upstream properties contribute runoff to the WLC project area. It is pointed out in the revised Appendix J of the DEIR Section 6.2 of the *Master Plan of Drainage Report* that sediment could be generated from these offsite tributary areas upstream of Gilman Springs Road. As stated in Section 6.2, in the existing condition, the majority of the sediment will deposit upstream of Gilman Springs Road. In the future, sediment basins could be constructed upstream of Gilman Springs Road to contain the existing sediment and minimize the total suspended solids in the runoff. However, because sediment basins upstream of Gilman Springs Road are not to be constructed as part of this project, it is expected that some of the offsite sediment will continue to be transported through the culverts along Gilman Springs Road. The proposed drainage facilities in the WLC project have been sized to convey the expected sediment load. As such, these sediment basins are not needed nor required for this project. The project onsite area will not generate significant amount of sediment due to the proposed logistics land use. The sediment that proceeds through the Gilman Springs Road culverts will be transported to the proposed detention basins on the WLC area. The proposed basins will settle the sediment before exiting the project boundary, similar to how the sediment settles in the existing channels and overland area in the existing condition.

Re: Draft EIR World Logistics Center Project, City of Moreno Valley (SCH 2012021045)

Dear Mr. Terell,

We have reviewed the Draft Environmental Impact Report (DEIR) for the World Logistics Center (WLC). The project applicant is seeking entitlements to build 41.6 million square feet of warehouse and associated uses on 2710 acres of existing agricultural lands. The WLC southern project boundary will immediately abut the California Department of Fish and Wildlife (CDFW), San Jacinto Wildlife Area (SJWA), the principal Multiple Species Habitat Conservation Plan (MSHCP) Conservation Reserve and the most important biodiversity conservation site in western Riverside County. The City's election to prepare a Programmatic EIR for this project does not provide the necessary information and analysis for the public, lead, responsible and trustee agencies to make informed and well-reasoned decisions on this project. For that reason, the City's consideration of this environmentally harmful project must be deferred pending preparation and public review of a legally sufficient document.

1

I. The DEIR misrepresents the San Jacinto Wildlife Area/MSHCP Conservation Area lands as being a "CDFW Conservation Buffer Area".

A. An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR. *County of Inyo v. City of Los Angeles* (1977) 21 Cal. App. 3d 185 (an enigmatic or unstable project description impedes public input). The DEIR reference to the SJWA/MSHCP Conservation lands is an intentional misrepresentation¹:

4.4 BIOLOGICAL RESOURCES

For the purposes of analysis in this section of the EIR, the project area has been divided into three sections. The first includes the Specific Plan area and associated off-site facilities referred to as the Specific Plan Area.

The second section includes the California Department of Fish and Wildlife (CDFW) conservation area as well as the SDG&E-owned lands and will be referred to as the CDFW Buffer Area.²

The third includes a 1,000-foot wide area along the south and east boundaries of the site to examine possible indirect impacts on the San Jacinto Wildlife Area and referred to as the "Off-site Analysis Zone."³ (DEIR pg. 4.4-2 & Figure 4.4.1)

4.4.1.10 WILDLIFE, SJWA AND MYSTIC LAKE

The SJWA is 20,000 acres of man-made wetlands and open water ponds and is the first state wildlife area to utilize reclaimed water to enhance its wetlands. It is located south of the project area and the CDFW Conservation Buffer Area.⁴ (DEIR pg. 4.4-15)

¹ Misrepresentation: to give an inaccurate or deliberately false account of the nature of somebody or something. An assertion or manifestation by words or conduct that is not in accord with the facts.

² With no explanation or justification, the SGD&E natural gas compression plant lands are also included in the alleged "CDFW Buffer area".

³ See figure 4.4.1: For purposes of analyzing indirect impacts to the SJWA, the EIR moves the boundary of the SJWA to the mythical "conservation buffer" boundary. By analyzing impacts 1000 feet around the 1065 acres of the SJWA/MSHCP conservation lands, the EIR analyzes the direct and indirect impacts of the SJWA area on itself.

⁴ The San Jacinto Wildlife Area is located immediately south of the Specific Plan Project Site. The mythical CDFW Conservation Buffer Area boundary is incorrectly imposed on the public lands of the SJWA.

...In 1995⁵ the Board [Wildlife Conservation Board] acquired an additional 921 acres of upland farmland within the southern portion of the Moreno Highlands Specific Plan⁶ property to incorporate into the SJWA. In 2001, the Board Acquired an additional 274 acres in this same area. This land was purchased to provide a buffer between the land surrounding Mystic Lake and the planned urban development within Moreno Valley.⁷ (PG. 4.4-16)

CDFW CONSERVATION BUFFER AREA

The entirety of the state-owned land south of the project is referred to as the SJWA.⁸ However, the land purchased out of the Moreno Highlands Specific Plan is referred to in this EIR as the CDFW Conservation Buffer Area to denote the reason for its original purpose. The 1195 acres acquired by the Wildlife Board during the past twenty years was intended to serve as an effective barrier between the SJWA and the development expected to occur north of the SJWA area (the present mixed use Moreno Highlands Specific Plan)....(DEIR pg. 4.4-16)

4.4.1.18 OTHER USES

a. Setbacks

In evaluating the potential impacts of project development on the SJWA and Mystic Lake, it will be important to consider that the CDFW Conservation Buffer was originally purchased by the state to provide a buffer between the SJWA/Mystic Lake and future development within the Moreno Highlands Specific Plan (now the proposed project area) (DEIR pg. 4.4-51).⁹

B. "[A]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal. App. 4th 713, 730.) The characterization of the May 18, 2001, Wildlife Conservation Board (WCB) land acquisition for the expansion of the San Jacinto Wildlife Area (SJWA) as the "CDFW Conservation Buffer Area" is in error. Neither are the DEIR statements recounted above

⁵ The WCB purchased these lands in 2001.

⁶ The Moreno Highlands Specific Plan expired in 2011.

⁷ In 2001 the WCB purchased, in fee, approximately 1,000 acres of land as an expansion of the SJWA.

⁸ Because the DEIR defines the project as including 1195 acres of the SJWA, the SJWA is defined as being located south of itself.

⁹ This is a misrepresentation. The lands were acquired in fee by the WCB in 2001 as an expansion to the SJWA and for the restoration of habitat for threatened and endangered species and for the purpose of promoting the recovery of those species.

or the project consideration and impact analysis as to these critically important wildlife conservation land in accord with the facts.

For inclusion in the Administrative Record, we have attached a copy of the Wildlife Conservation Board minutes of May 18, 2001, (Attachment # 1) Agenda Item # 31, San Jacinto Wildlife Area Expansions 15 through 19, Riverside County reports as follows”

“Mr. Wright reported that this proposal is to consider the acquisition of five separate ownerships consisting of approximately 1,000 acres of land as expansions of the Department of Fish and Game’s (DFG) San Jacinto Wildlife Area (WLA), located in western Riverside County.”

“Acquisition of the proposed expansions will allow for the protection of Mystic Lake and its associated upland habitat which is important to a number of sensitive plant and animal species. The upland areas and hills surrounding the lowland flood plain of Mystic Lake are dominated by Riversidian sage scrub and patches of grasslands are found on the uplands and alkali flats. Numerous sensitive plants endemic to the Mystic Lake area, including the thread-leaved brodiaea (state listed endangered and federally proposed threatened), San Jacinto saltbush (federally endangered) and spreading Navarretia (federally proposed threatened)¹⁰ are found on site. The WLA and adjoining lands support 38 species of amphibians and reptiles. Mammal species are well-represented and range from the desert shrew to the southern mule deer. The Stephens’ kangaroo rate (state listed threatened and federally listed endangered) is a resident mammal on the WLA.”

“Since 1982, over 240 species of birds have been recorded on, or adjacent to the WLA. Twenty-two over-wintering raptor species are known to utilize the San Jacinto Valley, including osprey, ferruginous hawk, golden eagle and short-eared owl. The San Jacinto Valley consistently ranks in the top one to two percent in species diversity for the North American Christmas bird counts. Historically, the San Jacinto Valley

¹⁰ These three plants species were subsequently listed by the US Fish and Wildlife Service as federal endangered or threatened plant species and are now included as covered endemic plant species in the MSHCP.

has consistently proved to be an important southern California wintering and nesting area for migratory shorebirds and waterfowl. Three federally or state listed endangered birds have been documented on the WLA, including bald eagle, peregrine falcon and the California brown pelican."

"The DFG has identified the subject properties as being within a Significant Natural Area and has recommended the purchase of the property as an addition to the existing WLA. The acquisition of the subject properties are important to the wildlife area as they will serve as a buffer from development north of the WLA and add significant wildlife benefits to the WLA. It is anticipated that the addition of these properties will enhance public recreational opportunities, as the upland habitat and wetland areas are restored. Therefore, consistent with long-range planning purposes, staff of the Board presents the following five proposals for Board consideration:"

The minutes of the May 18, 2001, WCB meeting indicates further the wildlife conservation board approved the acquisition of the San Jacinto Wildlife Area Expansions 15 through 19 as proposed and allocated \$15,100,000.00 from the Safe Neighborhood Parks, Clean Water, Clean Air and Coastal Protection Bond Act (Proposition 12) sec. 5096.350(a)(3) T & E for the purchase price and associated costs. Excerpts from the text of Proposition 12 (Attachment #2) indicate Sec. 5096.350 made available for expenditure by the Wildlife Conservation Board funds "for the restoration, or acquisition from a willing seller, of habitat for threatened and endangered species or for the purpose of promoting the recovery of those species."

C. The Western Riverside County Regional Conservation Authority (RCA) was created in 2004 to implement the Multiple Species Habitat Conservation Plan (MSHCP) intending to protect 146 native species of plants and animals and preserved a half million acres of their habitat. Of the 1.26 million acres covered by the MSHCP, 500,000 acres, or 40% is designated for preservation. Of that, half a million acres, 347,000 acres or 69% is already conserved as public or quasi-public land. The acquisition of the remaining land (153,000 acres) to establish the ultimate MSHCP Conservation Area is now being implemented by the RCA and is its most important activity. (See attachment # 3—"About RCA" http://www.wrc-rca.org/about_rca.asp

The SJWA lands erroneously designated as the “CDFW Conservation Buffer Area” in the Draft EIR were recorded for inclusion in the MSHCP Conservation Area immediately after the creation of the RCA in 2004. Attachment #4, the RCA “Interactive Map” (www.wrc-rca.org/interactive_map.asp) depicts these SJWA lands acquired in fee by the Wildlife Conservation Board (WCB) in 2001 as “RCA Acquisitions” included in the then newly emerging (2004) MSHCP Conservation Area. Attachment # 5, the RCA “Area # 3 Detail 01 (03-01)” [click on interactive map, northern boundary of SJWA] also depicts the WCB lands acquired in 2001 for the expansion of the SJWA as being recorded for inclusion in the MSHCP Conservation Area having a “record date” of 11.2001-6/2003. In addition, the March 19, 2013 letter from Charles Landry, Executive Director of the RCA confirms the SJWA/MSHCP Conservation Area lands erroneously designated and evaluated in the draft EIR as “CDFW Conservation Buffer Area” are now counted and included in the MSHCP Conservation Area (see attachment # 6).

The Draft EIR has failed to provide an accurate description of the physical environmental conditions in the vicinity of the project, as they exist at the time the environmental analysis commenced. The environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant. CEQA commands (Guidelines 15125) that knowledge of the regional setting is critical to the assessment of environmental impacts. Special emphasis should be placed on environmental resources that are rare or unique to that region and would be affected by the project. The EIR must demonstrate that the significant environmental impacts of the proposed project were adequately investigated and discussed and it must permit the significant effects of the project to be considered in the full environmental context.

CEQA commands (Guidelines 15125) further that the Draft EIR shall discuss any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans. Such regional plans include, but are not limited to Wildlife Habitat Conservation Plans and Natural Community Conservation Plans. Because the project applicant’s mythical “CDFW Conservation Buffer Area” does not exist, the Draft EIR has failed to meet this burden.

The EIR must be re-written with all references to the mythical "CDFW Conservation Buffer Area" removed. The actual environmental setting, with the SJWA/MSHCP Conservation Lands and the natural gas compression plant lands on the southern boundary of the Specific Plan, must be properly analyzed. All Biological Analysis must be based on impacts to the actual SJWA/MSHCP Conservation Lands without reference to the mythical "CDFW Conservation Buffer Area."

16

II. The Draft EIR Fails to Consider the Direct, Indirect and Cumulative Impacts of the World Logistics Center Project on the Stephens' kangaroo rat.

We have attached a copy of the California Department of Fish and Wildlife (formally DFG) **Management Authorization** (May 6, 1996) in order that it is included in the administrative record. We are also incorporating by this reference the *Final Joint Environmental Impact Statement and Environmental Impact Report regarding Authorization for Incidental Take and Implementation of a Long-Term Habitat Conservation Plan for the Stephens' Kangaroo Rat western Riverside County, California-February 1996* (<http://www.skrplan.org/index.htm>) and request this document also be included in the CEQA administrative record for this project.

17

The state **Management Authorization** implementing the Stephens' kangaroo Rate Habitat Conservation Plan (SKRHCP) was issued to the Riverside County Habitat Conservation Authority (RCHCA) pursuant to the California Endangered Species Act.(Fish and Game Code: 2080-2085) and the Natural Community Conservation Planning Act. (Fish and Game Code: 2800-2835). The state NCCP Act does not exempt a project in a Natural Community Conservation Planning area from the California Environmental Quality Act (CEQA) or alters or affects the applicability of CEQA (Fish and Game Code 2826). In addition, the California Endangered Species Act (CEQA) specifies incidental take of endangered species **shall be minimized and fully mitigated** and the **mitigation** required for the incidental take **shall** be roughly proportional in extent to the authorized take.

18

Even though the World Logistics Center Specific Plan site and adjoining public lands (San Jacinto/Lake Perris SKR Reserve) is known occupied habitat for the Stephens' kangaroo rat (SKR), the Draft EIR fails to qualify and quantify direct and indirect incidental take this project will precipitate on the endangered SKR. Nor does the CEQA analysis examine measures/alternatives to **minimize and fully mitigate** incidental take. The Draft EIR does not include a cumulative analysis of SKR take. A cumulative incidental take analysis is particularly important because the DFG **Management Authorization** allows the incidental take of one half of the extant SKR populations (15,000 occupied acres) at the time the incidental take permit was issued to the RCHCA. CEQA Guidelines 15065, Mandatory Findings of Significance, requires a lead agency shall find a project may have a significant effect on the environment if the project has the potential to: "threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species."

The Draft EIR consideration of significant project impacts to Biological Resources is just plain wrong. The Biological Resource impact analysis must be redone and recirculated for public comment.

Tom Paulek, Wildlife Biologist

Susan Nash, Attorney at Law

RESPONSES TO LETTER G-89

Tom Paulek and Susan Nash (April 5, 2013)

Response to Comment G-89-1. The purpose of the Environmental Impact Report (EIR) is to identify conceptual project related impacts and appropriate mitigation measures at a programmatic level that will reduce the level of impacts to a less than significant level. The Draft Habitat Assessment and (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis (FCS-MBA 2013) provides the necessary information and analysis for the public, lead, and responsible and trustee agencies to make a decision on this project. Project specific impacts and mitigation measures will be analyzed during a project-level California Environmental Quality Act (CEQA) analysis on a project-by-project basis. This EIR is a legally sufficient document to address the program level project as proposed.

Response to Comment G-89-2. The World Logistics Center Specific Plan (WLCSP) does not include any public lands, including any portion of the San Jacinto Wildlife Area (SJWA), as a form of mitigation. The Draft Environmental Impact Report (DEIR) has analyzed the impact of the development, which will take place as part of the WLC project in the California Department of Fish and Wildlife (CDFW) Conservation Buffer Area. The 910-acre portion of the project area owned by the State is being rezoned to “open space.” It is CDFW land acquired as a buffer (and for other reasons as well), between the high quality SJWA habitat and any proposed development to the north. Calling it the CDFW Conservation Buffer Area is not inaccurate or misleading, nor is it an intentional misrepresentation. The commenter is referred to Response to Comment Letters G-20-1 and G-71-1 for further discussion.

Response to Comment G-89-3. The commenters are correct that these lands are not a part of the CDFW lands, but are considered a part of the General Plan Amendment. Since the San Diego Gas and Electric (SDG&E) lands are generally within the area outside of the specific plan boundaries and within the General Plan Amendment boundaries as single term was used. The revised Habitat Assessment MSHCP Consistency Analysis (2013) document has made the distinction clearer (see pages 5 and 6). The lands discussed as CDFW Conservation Buffer Area including the SDG&E lands are not a part of the WLC Specific Plan, but are a part of the General Plan Amendment and Zoning changes. There will be no direct impacts to these lands.

Response to Comment G-89-4. The MSHCP Consistency Analysis (FCS 2013) document has made the distinction clearer (see pages 5 and 6). The 1,000-foot Indirect Impact zone is now associated with the edge of the WLC Specific Plan boundaries and extends into proposed conservation areas in order to identify any indirect impacts of the development of the specific plan. Since the lands called the CDFW Conservation Buffer Area are a part of the General Plan Amendment and therefore addressed in the EIR related they fall within areas that require an Urban/Wildlands Analysis according to Section 6.2.4 of the MSHCP. There will be no direct impacts to these lands.

Response to Comment G-89-5. The comment specifically addresses the description of the CDFW Conservation Buffer Area. The CDFW land was incorporated into the San Jacinto Wildlife Area following a sale the subject lands to the State in 2001. The May 18, 2001 Wildlife Conservation Board Agenda (page 43) recommended that 5 separate parcels totaling approximately 1,000 acres (910 acres of which were part of the Moreno Highland Specific Plan) be purchased as expansions of the California Department of Fish and Game’s San Jacinto Wildlife Area. “Acquisitions of the proposed expansions will allow for the protection of a portion of Mystic Lake and its associated upland habitat which is important to a number of sensitive plant and animal species.” “The DFW has identified the subject properties as being a Significant Natural Area and has recommended the purchase of the property as an addition to the existing WLA. The acquisition of the subject properties are important to the wildlife of the area as they will serve as a buffer from development north of the WLA and add

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

significant wildlife benefits to the WLA. It is anticipated that the addition of these properties will enhance public recreational opportunities, as the upland habitat and wetland areas are restored.”

These parcels, identified in the DEIR as the CDFW Conservation Buffer Area based on the statements from the May 18, 2001 Wildlife Conservation Board Agenda have incorrectly zoned for the past 12 years. The idea of the General Plan Amendment included as a part of the DEIR is to correct this discrepancy and place the lands a permanent open space. The commenter is referred to Response to Comment Letter G-89-2 for further discussion.

Response to Comment G-89-6. This comment calls into question why the CDFW Conservation Buffer Area was not described as being the SJWA and is similar to Comment G-89-2 and G-89-5. See Responses to Comments G-89-2 and G-89-5 for more information.

Response to Comments G-89-7. The commenters are correct that the CDFW Conservation Buffer Area was purchased by the State in 2001.

Response to Comment G-89-8. The Moreno Highlands Specific Plan did not expire in 2011. It remains the current zoning applicable for the majority of the project area, including the 910 acres of CDFW lands referred to as the CDFW Conservation Buffer Area.

Response to Comment G-89-9. The commenter says the state bought 1000 acres as an expansion of the San Jacinto Wildlife Area. While this statement is correct, it is also correct it was purchased from or out of the Moreno Highlands Specific Plan (MHSP) property and the Wildlife Conservation Board action in that regard specifically says it will act as a buffer from planned urban development (i.e., at that time the rest of the MHSP). Please refer to Response to Comment F-10-9 for more information in this regard.

Response to Comment G-89-10. The commenter says the SJWA cannot be south of itself. In Section 3.4.1, *Project Terms*, and at the beginning of each environmental analysis section DEIR (4.1 through 4.16), the relationship of the various properties involved in the WLC project was explained. One of those areas is the 1,086 acres of conservation land owned by the state that is south of the land planned for development as logistics warehousing. The reason the state conservation land is mentioned is that it is being rezoned as part of the discretionary actions requested by the WLC project because at present those lands are still zoned for a golf course and various residential uses under the Moreno Highlands Specific Plan (MHSP). It is unfortunate if the commenter was confused on this point. The DEIR Section 3.4.1 defines the CDFW Conservation Buffer Area as part of the SJWA.

Response to Comment G-89-11. The commenter is only partially correct, the lands were purchased for conservation but the DEIR clearly shows, from the minutes of the Wildlife Conservation Board action, that purchase of the 1,000 acres was not only for conservation but also as a buffer from planned urban development (i.e., at that time the rest of the MHSP)(DEIR Section 4.4.1.10). Please refer to Response to Comment F-10-9 for more information in this regard.

Response to Comment G-89-12. The EIR appropriately describes the purchase of the 910 acres by CDFW.

Response to Comment G-89-13. The DEIR acknowledges that thread-leaved brodiaea, San Jacinto saltbush (crownscale) and spreading Navarretia are now listed species and covered under the MSHCP (See Table 4.4.B of the DEIR). The DEIR and the revised Biological Resources Assessment/MSHCP Consistency document also clearly indicate that there is a low potential for these species to occur within the WLCSP as there is no suitable habitat.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-89-14. The proposed project simply applies open space designation to lands to the 910 acres of CDFW lands that are currently zoned for mixed use residential designations. The project does not suggest any changes to the MSHCP, the CDFW, the SJWA or any other regulatory program.

Response to Comment G-89-15. Biological surveys were conducted on these lands and recent contact with CDFW on access to the CDFW Conservation Buffer Area for surveys in 2013 was denied. CDFW and the project proponent both acknowledge that no impacts will occur within the CDFW Conservation Buffer Area including the SDG&E lands and the SJWA area. The DEIR and supporting biological technical studies provide an adequate description of the existing environment for all of these areas.

Response to Comment G-89-16. The DEIR discusses consistency with the MSHCP and Stephens' kangaroo rat (SKR) Habitat Conservation Plan (HCP) in Section 4.4.2.3 and Section 4.4.6.2. Since there is no development planned for the CDFW Conservation Buffer Area, there is no consistency issues with the MSHCP and SKR HCP.

Response to Comment G-89-17. The document has been added to the record.

Response to Comment G-89-18. The MSHCP Consistency Analysis (FCS-MBA 2013, FEIR Volume 3 Appendix E-1) document acknowledge that Stephens' kangaroo rat has a high potential to occur within suitable habitat areas of the WLCSP and the WLCSP is within the Stephens' kangaroo rat HCP fee area. Since the project site is not within an SKR Core Area, the project will comply with the payment of fees established in the HCP.

Based on extensive studies of the project site over the past eight years, the WLCSP itself contains very little suitable habitat for Stephens' kangaroo rat and no trapping program is required, since the WLCSP is not within a core conservation area. Since there is little potential to impact SKR the idea of discussion of incidental take should not be necessary. Areas with suitable habitat, in particular the southwestern corner of the WLCSP with suitable habitat was placed as open space. The lands within the SJWA immediately south of the WLCSP have habitat similar to the WLCSP, e.g., disked and dryland farmed areas. Again the potential for Stephens' kangaroo rat is low within the majority of the WLCSP.

Response to Comment G-89-19. Cumulative impacts on all biological species were considered in the DEIR in Section 4.4.7. Since the WLCSP has limited suitable habitat for SKR and the CDFW Conservation Buffer Area lands have similar dryland farming activities, it is unlikely that impacts to SKR outside of those considered in the SKR HCP would occur. The project proponent will be required to pay all applicable fees, like any other group that falls within the SKR HCP and is under the signature of an authorized agency, e.g., the City of Moreno Valley.

Response to Comment G-89-20. The DEIR and the Biological Resources Assessment /MSHCP Consistency document (F FCS-MBA 2013, FEIR Volume 3 Appendix E-1) cover all aspects of the project as required by CEQA. Confusion with impacts to SJWA lands versus lands that have been under dryland agriculture for at least 80 years have been clarified. The WLCSP lands with its long history of agriculture has limited suitable habitat for most species that would be subject to CEQA review. The MSHCP has clear outlines for lands it wished to conserve and the vast majority of the WLCSP does not fall within those areas. Payment of substantial fees to purchase conservation lands to satisfy MSHCP conservation areas will be provided as projects are proposed and additional surveys conducted on each development parcel.

Response to Appendix 1 (Minutes from the State of California, Department of Fish and Game, and the Resource Agency Wildlife Conservation Board meeting on May 18th, 2001). The appendix was directly referenced in the comment letter. The project biologist assumes that the

appendix is intended to provide information regarding the San Jacinto Wildlife Area expansion, which includes the CDFW Conservation Buffer Area. The information was considered in preparing the response to comments.

Response to Appendix 2 (The text of Proposition 2 by the Safe Neighborhood Parks, Clean Water, Clean Air, and Coastal Protection Bond act of 2000). This appendix was directly referenced in the comment letter. The project biologist assumes that the appendix is intended to provide additional information with regard to the specific language in Article 5 –Wildlife Program of the Proposition 12. The proposition states that funds be available for expenditure by Wildlife Conservation Board for the acquisition of land for conservation purposes. The information was considered in preparing the response to comments.

Response to Appendix 3 (A document about the Western County Riverside Regional Conservation Authority). This appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the MSHCP and the Riverside County Regional Conservation Authority (RCA). The information was considered in preparing the response to comments.

Response to Appendix 4 (A document about the Western County Riverside Regional Conservation Authority). This appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the location of RCA Acquisition land as well as Public/Quasi-public lands. The information was considered in preparing the response to comments.

Response to Appendix 5 (A document and map about the Western County Riverside Regional Conservation Authority). This appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the areas already acquired by the RCA for conservation. The information was considered in preparing the response to comments.

Response to Appendix 6 (A reply to the Public Records Act Request for Western County Riverside Regional Conservation Authority by Tom Paulek). This appendix was not directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the SJWA conservation area. The information was considered in preparing the response to comments.

Response to Appendix 7 (The California Endangered Species Act Management Authorization for Implementation of Stephens Kangaroo Rat Habitat Conservation Plan in Western Riverside County by the Riverside County Habitat Conservation Agency). This appendix was directly referenced in the comment letter. It is assumed that the appendix is intended to provide additional information related to the Stephens' kangaroo rat Habitat Conservation Plan with regard to meeting the requirements of the CDFW. Adherence to the approve SKR HCP Implementing Agreement and Management Authorization will not result in jeopardy to its continued existence. This information was considered in preparing the response to comments.

Letter G-90: Mr. and Mrs. H.W. Wolterbeek (April 8, 2013)

April 8, 2013

City of Moreno Valley Community and Economic Development Department
14177 Frederick St.
Moreno Valley, CA 92553

RECEIVED

APR 08 2013

**CITY OF MORENO VALLEY
Planning Division**

Gentlemen:

As directed by the Guidelines of the Draft Environment Impact Report for the World Logistics Center, persons wishing to make comments on the DEIR, must submit, their comments in writing to the City of Moreno Valley Community and Economic Development Department by no later than the conclusion of the 60-day review period, or by 5:30 pm on Monday, April 8, 2013. These pages are to be considered such a written response to the request for comments, and will address comments on the following topics:

- A. Employee Density
- B. Wages
- C. Occupancy of the WLC
- D. Build Out
- E. Residency
- F. Job-Housing Ratio
- G. Trip Generation Rate
- H. Cerrell Effect
- I. Miscellaneous
- J. DEIR

Each of these comments is presented in the corresponding section of this document; i.e. Comment A is presented and discussed in Section A, Comment B in Section B, and so forth. All comments are to be assumed as individual comments, and, as such, each should be considered and answered individually.

This document is our personal opinion on a matter of great importance to Moreno Valley. Any negative comments are not intended as slander or defamation of any person or any organization, but are our opinions of the facts.

Thanking you for the opportunity of commenting the Draft Environment Impact Report for the World Logistics Center to be located in Rancho Belago, Moreno Valley, Ca., we remain,

Sincerely Yours,

Mr. & Mrs. H.W. Wolterbeek
11521 Slawson Ave.
Moreno Valley, CA 92557

CC: Emailed to mvedcommunityforum@moval.org

A: **COMMENT:** The number of employees/KSF quoted in the DEIR may be overstated by as much as 26%, and further employee/KSF information must be obtained before proceeding with Phase 2 of the WLC.

- A.1. In Appendix O of the DEIR, the *Fiscal & Economic Impact Study of the WLC* document, Table 4-A and Exhibit 3 of Appendix A, David Taussig & Associates (DTA) uses the employment metrics of **.50 employees/KSF** for Logistics (LD/LL) and **2.5 employees/KSF** for Retail. These amounts are given as sourced from the DTA Public Works Database, which, in turn, is said to be confirmed by "*Employment Density Study*" SCAP (2001), and "*Logistics Trends and Specific Industries*," NAIOP Research Foundation (March 2010).
- A.1.a. The DTA Public Works Database seems to be a proprietary database, and its contents may not have been published for general research. If this is the case, then DTA must be faulted as using data which cannot be verified by the research of any person(s) wishing to comment of the validity of the information presented in the DEIR of WLC. Lack of access to this database prevented a validation of the assertion that the WLC would support .5 employees per KSF as stated in the DEIR.
- A.1.b. Table B-1 (Employment Densities (employees per acre) by Anderson Code) found in the SCAP source cited above ("*Employment Density Study*" SCAP (2001)) gives the value of 16.32 employees/acre for the Anderson Code of 1340 (Wholesaling & Warehousing). This, then, is equivalent to **0.37 employees/KSF**, which is 26% less than the .5 employees/KSF used by DTA in its employment metric for the WLC.
- A.1.c. The NAIOP source cited above ("*Logistic Trends and Specific Industries*") used inventory, employment and square feet per employee as identified through the Energy Information Administration Commercial Buildings Energy Consumption Survey for 1992, 1995, 1999, and 2003 (the most recent year available at the time of the survey).
- A.1.c.(1) The NAIOP source qualified its research results by stating "the limitations of this research result from limited data availability for recent time periods and for more specific building types and characteristics." They continue by stating that "the uncertainty of employment projections, especially from the 2008 base year at the start of the recession, is also an important caveat."
- A.1.c.(2). According to the research done for the NAIOP study, "the real estate inventory for logistics buildings (including refrigerated warehouses, non-refrigerated warehouses, distribution or shipping centers, self-storage and flex buildings of 50 percent or more

1

warehouse and storage activities) ranged from 11.4 billion to 10.1 billion square feet for the four available years of survey information between 1992 and 2003. Employment related to this inventory has ranged from 4.5 million to 6.2 million employees for the same years. The ratio of inventory to associated employment averaged 2,059 square feet per employee with no clear trend in direction, and was 2,241 square feet per employee in 2003, the most recent year." This converts to between **0.49 employees/KSF to 0.45 employees/KSF**.

A.1.c.(3) Attempts to verify this information in the NAIOP source document proved fruitless, since online access to the underlying Energy Information Administration Commercial Buildings Energy Consumption Survey for 1992, 1995, 1999, and 2003 database was unavailable. However, specific Tables and Summary Reports were accessible. Included below is a copy of Table 3 (Building Size Inventory and Employment for Logistics Buildings) from *"Logistics Trends and Specific Industries," NAIOP Research Foundation (March 2010)*.

A.1.c.(3).a. Table 3 of the NAIOP study is listed below. Note that this table has building size, inventory size, and number of workers.

Table 3 of the NAIOP:

Building Size in Sq.Ft	Inventory in MSF	Number of Workers
1,001-5,000	905	491,362
5,001-10,000	912	493,605
10,001-2,5000	208	961,104
25,001-50,000	1,048	602,526
50,001-100,000	1,494	646,284
100,001-200,000	1,162	454,007
200,001-500,000	1,322	377,733
500,000-1000,000	684	364,879
1000,000+	552	142,317

A.1.c.(3).b. There is also a (Table B14, Part 2) in the EIA Summary Tables, (Floor space for Non-Mall Buildings, 2003) that included data for 10,078 buildings in the Principal Building Activity of Warehouse and Storage. This EIA Table is discussed in Section A.1.c.(4) below.

A.1.c.(4) Definitive data giving the number of workers per floorspace was not directly available in the EIA Summary Tables, however Table B14, Part 2 (Floorspace for Non-Mall Buildings, 2003) included the following data for 10,078 buildings in the Principal Building Activity of Warehouse and Storage:

EIA Summary Table B14, Part 2 , (Floor space for Non-Mall Buildings, 2003):

Building Size in Sq.Ft	Warehouse and Storage (MSF)
1,001-5,000	895
5,001-10,000	868
10,001-2,5000	2,064
25,001-50,000	1,043
50,001-100,000	1,494
100,001-200,000	1,162
200,001-500,000	1,322
Over 500,000	Q

A.1.c.(4).(a) These Tables allow direct verification that the information of the two tables probably came from the same source. In this case, the NAOIP Table probably came from an Energy Information Summary Table, or directly from the Energy Information Summary Data.

A.1.c.(4).(b). Note that this table does not include an estimate for the number of workers in these buildings, only the size of the building. (Note that the designation "Q" in the EIA table signifies that data was withheld either because the relative standard error was greater than 50%, or that fewer than 20 buildings were sampled.) Furthermore, even though verification of the number of workers in each

category of building, as stated in the NAIOP document, could not be obtained, it is possible that NAIOP had access to data not generally available to online researchers. However, the qualifier, "Q", above shows that for buildings over 500,000 Square Feet, the Energy Department considers its data "unreliable", and should not have been used by the NAIOP study.

- A.1.c.(5) Attempts to verify the information regarding the number of employees in Table 3 of the NAIOP study (shown above) were unsuccessful because direct online access to the data for the Energy Information Administration (EIA) Commercial Buildings Energy Consumption Surveys of 1992, 1995, 1999, and 2003 was unavailable. However, the EIA did provide some summary tables online, and Table B1, from the EIA, provided the following data for the Warehouse and Storage Subcategory of Principal Building Activity:

EIA Summary Table B1 , (Total and Means of Floorspace, Number of Workers, and Hours of Operation for Non-Mall Buildings, 2003):

Number of Buildings in Thousands	Total Floor Space in Millions Square Feet	Total Number of Workers in Thousands	Mean Square Foot Per Building in Thousands	Mean Square Foot per Worker
597	10,078	4,369	17,000	2,306

- A.1.c.(6) The EIA Reports indicate that the **Mean Worker/KSF** was .43 for buildings supporting warehouse and storage activities.

- A.2. In summary, there exist several estimates for the number of warehouse workers per KSF for the Warehouse and Storage category. The DTA uses **0.5 employees/KSF** based on its apparently proprietary database. DTA supports this number by referencing "*Employment Density Study*" SCAP (2001), which states that the number is **0.37 employees/KSF**. DTA also states that its number is supported by referencing "*Logistics Trends and Specific Industries*," NAIOP Research Foundation (March 2010), which maintains that there are **0.45 employees/KSF**. There does not appear to be a solid, reliable number for the number of employees per KSF for buildings greater than 500,000 Square Feet, and the number quoted in the DEIR may be overstated by as much as 26%.

- A3. A better determination of employees/KSF must be made to ensure that Moreno Valley managers can properly plan for the safety, security, and welfare of WLC employees, and for Moreno Valley citizens. It is imperative that more data be obtained before Moreno Valley proceeds with Phase 2.

B: COMMENT: The annual wages/employee stated in the DEIR may be overstated by as much as 26%, and further information must be obtained before proceeding with Phase 2.

B.1. In Appendix O of the DEIR, the Fiscal & Economic Impact Study of the WLC document, Table 4A states that the average wage of the WLC employees will be \$42,341.

B.1.a. The wage assumptions are as follows: 90% of all employees will earn \$41,229 annually, and 10% of all employees (the managers) will earn \$52,346 annually, giving an annual average wage of \$42,341.

B.1.b. Table 4A states that this data was obtained for warehouse and transportation workers from *U.S. Census Bureau, Longitudinal Employer-Household Dynamics Reports (California, 2010) for Riverside-San Bernardino-Ontario Metropolitan Area and Riverside County; confirmed by Bureau of Labor Statistics (May 2010)*.

B.2. Since Appendix O did not provide adequate specificity of the sources from which the data was drawn, it was impossible to verify the wage numbers.

B.2.a. References to the Census Reports and/or Bureau of Labor Statistical documents, just name the document, without providing any information as to the search criteria used for analysis, nor any specific table numbers or report page which may have been utilized. Appendix O did not define either the various labor codes that were used to arrive at the wage numbers, nor the probable number of workers in each of the various labor codes. This information is crucial in determining an accurate estimate of the average wage earned by the employees, as well as in determining the probability those workers will be located in Moreno Valley, and the potential impact on such items as sales tax revenue to Moreno Valley.

B.2.b. Therefore it was necessary to review the entire sourced document and resulted in the conclusion that the Fiscal and Economic Study was either based on erroneous information, or that the study's conclusions were based on an improper data set.

B.2.b.(1). The Census Bureau and the Department of Labor use different codes for the various labor categories. The Census Bureau data base was studied for the Warehouse and Transportation Category Group (Census Bureau codes 48 and 49) for the metropolitan area for Riverside and San Bernardino County in 2010.

B.2.b.(1).(a). The average wage for this category is listed as \$38,463.

- B.2.b.(1).(b). Note that this value is lower by approximately 10% from the \$42,341 value in Table 4A of Appendix O.
- B.2.b.(1).(c). The decision to use Category Groups 48-49 in the Census Database is valid since these categories are called "Transportation and Warehouse" within that database and Appendix O, Table 4A states that the Census Data was used for the category group "Warehouse and Transportation."
- B.2.b.(1).(d). The wage number \$42,341 was not reproducible using Census Data for Category Groups 48-49, hence it would appear that DTA did not use these Category Groups. If DTA used other Category Groups for data, it should have specified which Category Groups they were using.
- B.2.b.(2). However, note that the 48-49 Category Groups are, in reality, too broad for application to the WLC, since these categories include, for example, aircraft transportation workers, marine transportation workers, etc. The use of category groups in obtaining results from the Census database is too general. Consequently, it is assumed that DTA used more specific categories to obtain their results.
- B.2.b.(3). In addition, by using various category data, Appendix O should have included an estimate of the number of employees expected to work in the WLC in each category in order to determine a valid estimate of the annual wage.
- B.2.c. To determine a better estimate of the average annual wage for the WLC project, wage information from the 2010 Census (the same database used by DTA) for the metropolitan area of Riverside and San Bernardino County for the Census Code 4931 (the code specifically for warehousing and storage employees) was analyzed. This gave an average wage of **\$33,504, approximately 21% lower than that stated in Appendix O."**
- B.3. Data was then obtained from the Bureau of Labor Statistics in May 2012 (not May 2010) for the Standard Occupational Classification (SOC) Codes 53-0000 and 43-0000. (The different date of the report is not relevant for the purpose of this wage study since the

wages did not change by 20% between 2010 and 2012). The information was used since the data is more recent and therefore more relevant to Moreno Valley managers.

- B.3.a The code 53-0000 was included since this category includes freight and stock material movers. (However, note that while this category group includes truck drivers, it also includes commercial pilots and boat captains.) The code 43-0000 was included since this group includes billing clerks, stock clerks and order clerks. (However, note that this category group also includes postal mail carriers, brokerage clerks and order clerks.)
- B.3.b. The annual wage for the code 53-0000 was **\$33,940**. Observe that the wage quoted in this Bureau of Labor Statistics for heavy truck/tractor-trailer truck drivers (category 53-3032) was listed at \$44,610. Further refinement was obtained for category 53-6099 (generic transportation workers with an average annual wage of \$25,870), category 53-5071 (industrial truck and tractor operators with an annual wage of \$32,450), category 53-7061 (laborers and material movers with an annual wage of \$26,030, and category 53-7064 (packers and packagers with an annual wage \$24,080).
- B.3.c. Similarly, the annual wage for code 43-0000 was **\$34,130**. Wages for this category were not refined since most of these wages average about \$30,000 to \$34,000, and are not sufficient to raise the average wages to the number quoted in the DEIR.
- B.3.d. Note that most of the workers in the 43 and 53 labor standard category group classifications do not earn over \$40,000. It was not possible to duplicate the stated average WLC wages of \$42,341. Again, it must be stated that DTA must define the labor categories used in the WLC report and specifically should refine the data to include probable numbers of each category. If that cannot be done, then the data from the generic category groups 43 and 53 must stand as valid and that the estimate of \$42,340 in Table 4A of the Fiscal Impact Study is wrong.

- B.4. The quarterly Publication of the University of California, Riverside, Volume 5, Issue 2, Summer 2012, states that the warehouse industry in the Inland Empire, hired about 114,000 workers in Riverside and San Bernardino counties in 2010. The document continues that most of these workers are Latino, of which half are immigrants. It states that most of these warehouse workers are temporary workers who lack benefits and are paid low wages, without benefits, and work in an unsafe and unhealthy environment.

It also states that most of the region's warehouse workers are employed through temporary employments services. This study references information from Allen 2010, and Delara 2009. It further states that the median hourly wages (i.e. half of the workers earn less than this amount) in the Inland Empire range from \$9.11 to \$13.08. This implies an annual wage of **\$17,500 to \$25,000**. The UCR study also stated that

temporary workers are frequently paid less than this (41% of these blue-collar workers are paid less than \$10.50 per hour (Bonacich and DeLara 2009)).

B.5. In an attempt to test the validity of the premise that most workers at WLC will be earning wages of approximately \$20,000, an empirical data test (thought experiment) was performed on March 29, 2013, by the commentator. A data set of actual job openings in the warehouse/storage industry, within a radius of 25 miles of Moreno Valley, was obtained from the *Indeed.com* website.

B.5.a. The obtained data set resulted in 640 job openings with a wage distribution that included a typical wage distribution pattern that one might expect when setting up a warehouse. The data distribution should be considered typical of the WLC wage distribution in current dollars. The following table and chart summarize that data:

Wage Range	Number of Available Jobs March 2013
20K+	461
40K+	120
60K+	48
80K+	16
100K+	13

B.5.a.(1). The weighted average wage was calculated to be \$29,605. Note that the total number of available positions was 658. This is a

sufficiently large statistical sample to be considered a valid forecaster of the anticipated wage pattern of the WLC in current dollars.

- B.5.a.(2). A smaller subset was obtained from openings on that date in Moreno Valley. This is shown in the table below:

Wage Range	Number of Available Jobs March 2013
20K+	23
40K+	10
60K+	6
80K+	0
120K	1

- B.5.a.(3). Since it is very probable that most of this data was probably included in the data for openings within 25 miles, this data will not be counted separately, even though this data set has a higher mean wage of \$33,500.

- B.5.b. Continuing with the empirical test, the ratio of job numbers versus wages can be applied to the projected WLC employment.

- B.5.b.(1). The following chart shows the empirical text percentage data:

- B.5.b.(2). Assuming that there are 20,808 actual jobs available in the WLC, and applying these percentages to the WLC employment projection, we have the following results:

B.5.b.(3). This gives an average projected wage for all WLC employees as \$39,407. However the majority of employees would be earning approximately \$30,000 or less.

B.5.b.(4). The DTA wage breakdown, as taken from *Appendix O of the DEIR, the Fiscal & Economic Impact Study of the WLC document, Table 4A*, is provided in the following chart.

B.6. In conclusion it appears that the wage numbers for WLC workers in 2013 dollars is much less than \$42,341 as presented by Appendix O. Indeed, it appears from this analysis, as well as from the empirical experiment, and from extrapolation from the UCR study that

the annual wages/employee stated in the DEIR may be may be overstated by as much as 26%.

- B7. In order for Moreno Valley to better understand the true economic impact of the WLC on Moreno Valley, better wage information must be obtained before proceeding to Phase 2.

C: COMMENT: The DEIR must include realistic projections of occupancy of the WLC over time. The projection must include considerations of fluctuations in the economic conditions of Southern California.

- C.1. The DEIR Fiscal and Economic Impact Study (Appendix O) assumes full occupancy for its validity. This is unrealistic. The following discussion shows that full occupancy of the buildings of Phase 1 will probably not be completed until the ninth year after the first buildings of Phase 1 begin to be occupied. The discussion shows that occupancy of Phase 2 buildings is not needed until the ninth year after the first buildings begin to be occupied. It is imperative that the DEIR include a realistic projection of the probable occupancy over time. This projection must include assumptions of economic conditions of Southern California as they may affect the WLC.
 - C.1.a. No project as large as the WLC can be fully occupied from day one. This is unrealistic. In addition, the DEIR does not include anticipations of the reasonable effects on the WLC of variations from the probable economic fluctuating conditions for the next 15 years.
 - C.1.b. Because the DEIR states that the WLC is aimed at Southern California markets, which in turn depend heavily on the health of the rest of the United States, the DEIR must address the potential economic effects of the Southern California economy on the occupancy rate.
 - C.1.c. It is imperative that the Moreno Valley City Council require that the DEIR be modified to include a realistic determination of the probable occupancy of the WLC buildings over the next 15 years.
- C.2. The DEIR states that the WLC in Moreno Valley will consist of 41.6 million square feet of warehouse buildings, of which 41.4 million square feet will be devoted to high cube industrial warehouses. The minimum size of these high cube buildings will be 500,000 square feet.
 - C.2.a. For lack of further definition of the specific size of individual high cube buildings, the following analysis assumed that the WLC will have 80 tenants of 500,000 square feet and one tenant of 1.6 million square feet. This analysis will only address the occupancy rate of the 500,000 square ft buildings, and will not address the occupancy rate of the 1.6 millions square feet building.
 - C.2.b. The DEIR states that the First Phase of the build out, consisting of about half of the project, will be completed by 2017. The Second Phase of the build out is scheduled to be completed by 2022.
 - C.2.b.(1). The city and the owner of the WLC property will need to aggressively market those 80 buildings to tenants who not only can

afford the operational cost of a 500,000 square foot building in Moreno Valley, but also can set up the necessary logistics to make the buildings economically profitable.

C.2.b.(2). Several assumptions were made for a reasonable occupancy profile for the WLC.

C.2.b.(2).(a). The first assumption made was that even though Phase 1 is not completed until 2017, the project can receive the first tenants in 2015.

C.2.b.(2).(b). The second assumption was an equation for the probably occupancy rate of the WLC over time.

C.2.b.(2).(b).1. Assumptions of quadratic or exponential occupancy curves, for the occupancy rate over time discussion, appear unreasonable. Even a linear occupancy curve, where the number of buildings occupied is equal to 5.5 times the number of years after 2015, is unrealistic, since it is logical that it will be easier to find tenants once the WLC has buildings already occupied. That is to say that it is not logical to assume that the same number of new buildings will be occupied in 2026 as will be newly occupied in 2016.

C.2.b.(2).(b).2. Probably a more realistic assumption is a projection that the warehouse occupancy increases each year at a rate of $[1+x]$ where x is 0 for the first year (2015), one for the second year (2016), etc., until full occupancy.

C.2.b.(2).(b).3. The following chart depicts such an occupancy rate.

3

C.2.c. This graph shows the WLC build out as a function of time between 2015 and 2027, where 2015 is year 1, 2016 is year 2, etc.

C.2.c.(1). The graph shows that with this build out, the WLC will, assuming excellent economic conditions, be fully occupied in 2027. Note that this occupancy rate would be significantly affected if the nation's economy goes through one or more recessions. The effect of such recessions is not included in this analysis. The probability is very great that any economic slowdowns could extend the date of full occupancy well into the 2030's. This, therefore, implies that the WLC will probably have empty warehouse buildings well into the 2030's.

C.2.c.(2). The bar graph shows that the WLC will not reach full occupancy of the projected Phase 1 build out (40 buildings) until 2023. Note that in 2020, (year 6 in the above chart), approximately 20 buildings constructed in Phase 1 may be occupied. Or put another way, 20 buildings from Phase 1 may still be empty.

3

D: **COMMENT:** Phase 2 build out does not need to start in 2017. The occupancy rate will be sufficiently low that Phase 2 can be delayed until 2021 or 2022.

D.1. Comment C (above) discussed the projected occupancy of the WLC as:

D.2. This graph shows the WLC build out as a function of time between 2015 and 2027, where 2015 is year 1, 2016 is year 2, etc.

D.2.a. The graph shows that with this build out, the WLC will be fully occupied in 2027. Note that this occupancy rate would be significantly affected if the nation's economy goes through one or more recessions. The effect of such recessions is not included in this analysis. The probability is very great that any economic slowdowns could extend the date of full occupancy well into the 2030's. This, therefore, implies that the WLC will probably have empty warehouse buildings well into the 2030's.

D.2.b. The bar graph shows that the WLC will not reach full occupancy of the projected Phase 1 build out (40 buildings) until 2023.

D.3. Furthermore, this graph shows that since full occupancy of the projected Phase 1 build out (40 buildings) won't be reached until 2023, buildings from Phase 2 won't be needed until 2024. Therefore the **Phase 2 build out does not need to start in 2017**, but, indeed, can be delayed until 2021, even 2022.

E. COMMENT: Moreno Valley must make concessions to prospective WLC occupants to induce the hiring of existing Moreno Valley residents, since non-Moreno Valley residents will not relocate to Moreno Valley, and thus will not reduce commuting.

E.1. According to the DEIR (Page 57, Appendix L, Traffic), "One consequence of the existing imbalance between jobs and housing is that a large majority (70%) of Moreno Valley workers commute to jobs outside the city, and in many cases far outside the city. According to the U.S. Census Bureau, 21.7% of Moreno Valley workers currently commute more than 50 miles one way to work, and another 20.8% drive 25 to 50 miles one way. Nearly four out of five Moreno Valley workers drive to work alone. Since other Inland Empire cities have similar commute characteristics, the resulting transportation pattern is one of heavy westbound flows in the morning and eastbound flows in the evening, overwhelming the freeway system during peak commuting hours. Another consequence is the high cost of commuting both in terms of out-of-pocket expenses and reduced quality of life for the commuters and their families."

E.1.a. The DEIR implies that one consequence of bringing 20,000+ jobs to Moreno Valley is the decrease in commuting distances, thereby alleviating congested freeway traffic patterns.

E.1.b. The *Claremont McKenna College – UCLA Inland Empire Forecast, October 2012*, study states that workers that are more than 50 miles away from the Los Angeles county line are not concerned about employment in Los Angeles; instead they are concerned about jobs within 50 miles of their residence.

E.1.b.(1). It can be inferred from this study that most people will not relocate to another residence (closer to their place of employment) if the job is located within 50 miles from their home. This implies that workers at WLC whose residence is within a reasonable driving range (say 25 to 50 miles) from the WLC will not relocate and will not become Moreno Valley residents. Hence those employees

will not have any direct effect on traffic pattern changes.

E.1.b.(2). The DEIR (Page 21, Appendix O, Fiscal/Economic Impact) states that "because the Center does not involve a residential component, the jobs generated by the Center do not need to support new households as a result of direct or indirect employment." This can be taken to imply that the DEIR agrees with the fact that most WLC employees will not relocate to Moreno Valley.

E.1.b.(3). It is necessary that Moreno Valley make concessions during discussions with potential occupants of the WLC, to induce those companies to hire Moreno Valley residents. This will help improve the Moreno Valley unemployment rate and help reduce traffic in Riverside County.

E.2. No evidence is given that simply by establishing 20,000+ new jobs in Moreno Valley at the WLC there will be any significant freeway traffic pattern changes due to commuting employees. In fact, the reverse is true, and there is a study (*Claremont McKenna College – UCLA Inland Empire Forecast, October 2012*), which indicates that **employees will travel up to 50 miles one way for jobs.**

5

F. **COMMENT: The DEIR needs to state explicitly that even though the WLC may improve the Job-Housing Ratio, it may not improve the job situation for Moreno Valley residents.**

F.1. Many Moreno Valley residents are of the opinion that the WLC will bring jobs to current Moreno Valley residents. While it is possible that some Moreno Valley residents will have jobs at the WLC, it is highly probable that most WLC jobs will go to non residents of Moreno Valley.

F.1.a. The DEIR (Page 21, Appendix O, Fiscal/Economic Impact) states that "at build out, the Center will significantly affect the Jobs-Housing balance". It is true that if Moreno Valley gets more jobs and if no new housing is built, then the ratio of jobs to housing improves from its current value. However, this ratio is deceiving for Moreno Valley residents, many of whom assume that this means that Moreno Valley residents will get the new jobs.

F.1.b. This is validated by the fact that when Sketchers shuttered several places in the Inland Empire in order to relocate to Moreno Valley, the new facility, apparently, hired only one more Moreno Valley resident.

F.1.b.(1). Mayor Stewart is quoted in a Press Enterprise article of February 1, 2012 that "he knows of one Moreno Valley man who was hired for an engineering job".

F.1.b.(2). In the same article, Moreno Valley's Economic Development Director Foster was quoted "that ...the last time I talked to them they said 600 jobs, and said a lot are coming from Ontario."

F.1.b.(3). The article also states that "Foster ... know[s] of no local recruitment events by the company".

F.1.b.(4). As discussed in Section D.1.a.(2) and D.1.a.(2).a., given above, **employees will travel up to 50 miles, one way, for jobs, and the establishment of 20,000+ new jobs in Moreno Valley, in the WLC, does not imply that these new position will be filled by Moreno Valley residents.**

F.2. The DEIR needs to state explicitly that even though the WLC may improve the Job-Housing Ratio, it may not improve the job situation for Moreno Valley residents.

F.2.a. Moreno Valley residents need to be educated on this fact by the Moreno Valley City Council.

F.2.b. While the Moreno Valley City Council cannot force occupants of the WLC to hire Moreno Valley residents, the city needs to make concessions during discussions with potential occupants

that will entice them to hire Moreno Valley residents. As noted above, Sketchers, apparently, did not attempt to hire Moreno Valley residents via recruitment events.

G: **COMMENT:** The Trip Generation Rate Parameter in the WLC is overly pessimistic for Traffic Data, and is questionable for Air Quality Data. The data from the DEIR is suspect and may result in improper mitigation measures. In order to evaluate the actual traffic impact and air quality impact, and thus determine the feasibility of implementing Phase 2, the developer should conduct Air Quality and Traffic Analysis Studies during, and after, build out of Phase 1, and continue while Phase 1 is being occupied.

G.1. A study was performed by Urban Crossroads in response to a request by Moreno Valley on the "NAIOP High Cube Warehouse Trip Generation Study", 2011. This report can be found in Appendix T, Urban Crossroads Peer Review of the NAIOP Study, 2011, of the DEIR. It included an excellent summary of various attempts to determine the trip generation rate (trips/1000 sq ft of warehouse or trips/KSF).

G.1.a. Many studies have determined different values for the parameter "trips/KSF", but only a few have included data for facilities greater than 500,000 square ft.

G.1.b The following table summarizes some of these studies, and provides some of the individual characteristics of the data set in these studies.

Source of Trip Generation Rates	Reference Number (See Bottom of Section)	Daily Trips/KSF	General Comments
2003 Fontana Study	1	1.97	4 Buildings > 200,000 SF and 1 Building > 500,000 SF**
2005 NAIOP Study	2	1.096	1 Building > 200,000 SF and Two Building Totaling 800,000 SF**
2007 NAIOP Study	3	1.11	4 Buildings > 500,000 SF and 9 Buildings approximately 300,000 SF**
2008 ITE, 8th Ed.	4	1.44	11 Buildings > 500,000 SF and Occupancy Rate and Rail Accommodations Unknown**
2011 SCAQMD Study	5	2.59	2 Sigma Estimate and Not All Buildings in South California**
2011 NAIOP Study	6	0.99	31 Buildings > 500,000 SF**
2012 ITE, 9th Ed.	7	1.68	National Average Not Related to Southern California and Were Not Automated*
*Comment on 2012 ITE			Source: WLC EIR
** Comment on other entries			Source: Urban Crossroads, 2012

G.2. All the data given in the table above was listed in a study by Urban Crossroads, 2012. In evaluating this data, it becomes clear that there is wide disagreement in the warehouse community regarding the selection of a valid trip generation value. All of the studies prior to 2011 used a very small statistical sample of buildings larger than 500,000 square feet. This is important since it appears to be self evident that buildings of that size have their own unique efficiencies and air quality generation characteristics. It appears that the older studies should be ignored.

G.2.a. The *2011 SCAQMD study* was meant to assess the greater pollution impact of the heavier trucks used by the larger warehouses. The study did include larger warehouses. The study is criticized by the Urban Crossroads study for presenting two sigma trip generation values.

G.2.b. The comment by the DEIR authors consider the *2012 ITE study* invalid for application to the WLC since the *2012 ITE study* included warehouses throughout the country, and because the study included non-automated warehouses. The unstated conclusion here is that the WLC is expected to contain only automated warehouses.

G.2.c. The *2011 NAIOP study* included 31 buildings greater than 500,000 square feet, but no smaller buildings were included. Even though this study seems to be appropriate for the use of traffic analysis for the WLC, the applicability of the *2011 study* to air quality effects cannot be evaluated at this point.

G.3. Consequently, the fact remains as to which value should be used for air quality assessments and traffic analysis.

G.3.a. The DEIR states that "a decision was made to use the *ITE* rate as a "worst-case" scenario for the WLC project, even though the author disagreed with the *ITE* result. Consequently, the value of 1.68 was used to evaluate both traffic impacts and air quality degradation.

G.3.b. The use of the number 1.68 for trip generation, for traffic analysis, appears to be too high. The number .99 from the *2011 NAIOP study* seems to be more relevant to traffic studies in the Inland Empire, since this study included the

traffic impacts on Inland Empire traffic from 31 buildings greater than 500,000 square feet.

G.3.c. However, the use of the 1.68 parameter in air quality studies may or may not be sufficient. The question seems to be open as to whether the 1.68 value is appropriate or whether the 2.58 value (even though this seems to be a two sigma value) is better for Moreno Valley. Since the .99 value seems to be appropriate for traffic studies, which included heavy trucks, the value of .99 may be proper for air quality. More data is needed.

G.4. There currently is no data available to help the City Council determine a true cost/benefit analysis based on the fact that some of the "cost" drivers are not just financial, but also social in nature.

G.4.a. It is important that the dual "cost" drivers on the environment and the traffic degradation be fully understood because each of these can cause the City, County, and State, to perform costly mitigation measures that are either inadequate or are "overkill".

G.4.b. For example, one valid question is whether air filters are measures needed for Moreno Valley schools? Similarly, are all anticipated traffic mitigation efforts really necessary? Each of these components has a cost impact to the City, County, or State.

G.5. It is recommended that, as a condition for development, the WLC developer obtain and install appropriate traffic monitors at appropriate locations in Moreno Valley and Riverside County, and that the collected data be reviewed and used by proper government agencies to make appropriate decisions relating to traffic scenarios.

G.6. It is recommended that, as a condition for development, the WLC developer obtain and install appropriate air quality monitors in the Moreno Valley area for use by the SCAQMD for evaluation of air quality degradation due to the WLC project.

H. COMMENT: The potential "Cerrell Effect" of the WLC will reduce the ability of Moreno Valley to attract high-paying jobs of the proposed Medical School of the University of California, Riverside, and will galvanize citizens to become politically active.

H.1. According to the 1984 report *"Political Difficulties Facing Waste-to-Energy Conversion Plant Siting"* by Cerrell Associates, Inc., the California Waste Management Board commissioned the consulting firm of Cerrell Associates to define communities that won't resist siting of LULUs (Locally Undesirable Land Use). This was done to combat the offensiveness displayed by local citizens when a "trash dump site" was to be created in their neighborhood. Since then, the term "LULU" has evolved into an idiom connotating any land usage which the general populous considers as undesirable for the local community. And similarly, the "Cerrell Effect" describes the fact that proponents of some projects face the strong public opposition to these projects.

H.1.a. The Moreno Valley City Council, in conjunction with the WLC, is attempting to change the Moreno Valley Specific Plan to bring a LULU to this city. The added noise, pollution, and traffic which the WLC will bring to Moreno Valley is not in the interest of the citizens of Moreno Valley.

H.1.a.(1). By devoting a large portion of the city to warehouses, the City Council is condemning Moreno Valley to becoming a "lower class city", where new residents will think twice before relocating, and the current residents will be looking to move "up in the world" to other cities. The City Council is creating a LULU.

H.1.a.(1).(a). Instead of enticing the graduates of the proposed Medical School of the University of California, Riverside Campus, to live and work in Moreno Valley, the City Council is saying that we are more interested in bringing 20,000 low-paying "blue collar" jobs to the city, with no guarantee that any of our local

businesses will see a real increase in long-term revenue.

H.1.a.(1).(b). The city is touting its plans for a large biotechnical research development within its borders. This goal will not come to fruition if the WLC is built. These developments will seek sites in more prestigious locales, like Redlands, Corona, or even Orange County. Instead of helping Moreno Valley grow, the LULU will keep the city a "small, blue-collar, town" with bad air and bad traffic

H.1.a.(2). And while the Moreno City Officials are eyeing the projected \$5 million in excess city revenue as a blessing which could be used to possibility increase city employee wages and benefits, and to build the city infrastructure, (i.e., a beautiful symphony hall or performing arts center, etc.), they are ignoring the fact that long-time residents want a respectful, safe, city, where their families can enjoy the good air and open environment.

H.1.b. Since the WLC will be offering jobs typically associated with low education, Moreno Valley runs the risk of seeing more homeless or poor immigrants coming to the city. This will increase the need of providing assistance in food and shelter for some. Charitable organizations, like the Salvation Army, currently are not getting donations to support the current need, let alone an increase caused by the LULU.

H.2. As the "Cerrell Effect" takes hold, more citizens of Moreno Valley will become vocal. Citizen Interest Groups will increase. More citizens will become politically active, and many will become motivated to seek election on the basis that they do not support the LULU. When the "Cerrell Effect" maximizes, current elected city officials may see their chances of re-election being minimized, and notice a real backlash from the voting public.

I: **COMMENT: If the Moreno Valley City Council elects to proceed with the build of Phase 1 of the WLC,**

- a. It is recommended that the Council only approve Phase 1, 9
- b. It is recommended that the Moreno Valley City Council not commit to any changes to the Moreno Valley Planning Document that would prevent the City from not continuing with Phase 2, 10
- c. It is recommended that there be a data collection period of environmental, traffic, economic, and social data during the build out of Phase 1 and after the completion of Phase 1 for approximately three years, 11
- d. It is recommended that another EIR be developed and evaluated in 2020, 12
- e. It is recommended that the Moreno Valley City Council then use this second EIR before deciding whether to continue with Phase 2. 13

I.1. There are many different values that can be used to estimate the number of truck trips and car trips at the WLC facility. It was observed during recent analysis that even studies from 2011 and 2012 give conflicting information on the expected number of trips/Kilo Square Foot or trips/KSF of warehouse space.

Since this figure is used to estimate the impact on the WLC traffic, as well as on the Moreno Valley air quality, a reasonable man would conclude that additional information is needed for Moreno Valley officials to properly assess the impact of the WLC on both air quality and traffic conditions. Arbitrary use of the number 1.68 will probably result in an overestimate of traffic impact, while its use in estimating air quality is uncertain. 14

I.1.a. It is recommended that Moreno Valley require the developer of the WLC to obtain air quality sensors in Moreno Valley and traffic density evaluation sensors at appropriate locations around Moreno Valley beginning in 2013. It is further recommended that these sensors be operated by the developer for various government agencies, or that the developer turn these data sensors over to the appropriate government agencies.

- I.1.b. It is recommended that Moreno Valley and other government agencies collect and evaluate this data beginning in 2013, in order to determine better estimates for trip generations at the WLC during the build out of Phase 1, as well as during the beginning of occupancy of Phase 1 buildings. Since only a few buildings will be occupied in 2017, insufficient trip rate data during occupancy will have been collected by 2017. It is imperative that the data collection period be extended past 2017. Section D3 shows that delays of the build out of Phase 2 until 2021 or 2022 will not materially affect the occupancy of the WLC.
- I.1.c. It is recommended that another EIR be developed in 2020, in order to insure that Moreno Valley has good traffic data and environmental data from Phase 1 of the WLC, before continuing with Phase 2.
- I.2. The DEIR lists the probable number of employees per thousand square feet (KSF) as .5 employees/KSF.
- I.2.a. The David Taussig & Associates (DTA) study of the fiscal and economic impacts, lists the DTA Public Works database as a basic source for its estimate of .5 employees/KSF at the WLC. This database was inaccessible for online review by this author, and is probably a proprietary database. If the database is not proprietary, this database should be an online database. If the database is online, the DTA document should have indicated the website for that database.
- I.2.b. Reviews of the reference data sources indicate that the DTA value could not be verified. It is possible that the number may be as low as .37, or as high as .49
- I.2.b.(1). It appears that a reasonable man might conclude that the attained value in the DTA study in the DEIR cannot be relied upon for estimates of the number of employees in the WLC.
- I.2.b.(2). It is imperative that employment data must be collected once buildings begin to be occupied, to help insure that Moreno Valley officials can adequately plan for WLC impacts relating to economic, safety, and welfare. The collected data should be included in a subsequent EIR for the WLC.

- I.3. The DEIR is very optimistic in that all presented data in the document is based on a nearly 100 percent occupancy, without regard to the potential economic fluctuations in Southern California. This is unrealistic.

It is imperative that Moreno Valley obtain realistic estimates of the impact of economic fluctuations on the occupancy of the WLC. Recent history has shown that recessions can severely impact the economic health of Southern California, of the Inland Empire, and of Moreno Valley in particular. Even at this date, in 2013, the economic future of the Inland Empire is in question. It is imperative that any future EIR include an estimate of the probable effect on the WLC, and therefore, on Moreno Valley due to economic fluctuations.

- I.4. Phase 1 build out will be completed in 2017. During this phase, about 40 buildings of 500,000 square feet will be built. It is planned that another 40 buildings be built during Phase 2. The planned start date of Phase 2 is 2017; the planned completion date of Phase 2 is 2022.

An estimate was made of the probable occupancy of the 80 buildings of the WLC. This estimate indicated that the 40 buildings of Phase 1 will probably not be occupied until sometime in 2023. This indicates that Phase 2 does not need to be available for occupancy until sometime in 2023. Consequently, a delay of Phase 2 will not materially affect the marketing of Phase 2o buildings.

- I.5. It is recommended that there be a data collection period of environmental, economic, and social data both during the build out of Phase 1, as well as a period of approximately three years after the completion of the build out of Phase 1. It is important that such data be collected during the initial occupancy of the WLC buildings, and be included in the subsequent EIR.

- I.6. It is recommended that another EIR be developed and evaluated in 2020.

- I.7. It is recommended that the Moreno Valley City Council then use this second EIR before deciding whether to proceed with Phase 2.

- J. COMMENT: The DEIR was an excellent report. Specifically, the traffic analysis was thorough and well done. The major weakness of the report was that some major conclusions were made on some old or proprietary data.

RESPONSES TO LETTER G-90

Mr. and Mrs. H.W. Wolterbeek

G-90-0 Summary

In summary, the 0.50 employees per 1,000 building square feet figure utilized in the Draft Environmental Impact Report (DEIR) is a conservative estimate that is supported by all of the available documentation, including data published by the Southern California Association of Governments ("SCAG") (Exhibit A see DTA Exhibits on Flash Drive), the National Association of Industrial and Office Parks ("NAIOP") (Table 12 of Exhibit B see DTA Exhibits on Flash Drive), and the U.S. Energy Information Administration (Exhibit D see DTA Exhibits on Flash Drive). Claims in the commenter's letter that the number of logistics employees per 1,000 building square feet should be 0.37, or 0.43 or 0.45 all involve the use of data that has been misinterpreted, either because (i) it refers to square footage of land rather than building square footage, (ii) it is based on an arithmetic miscalculation, or (iii) it reflects employee ratios for all non-mall commercial properties, of which warehouses are only a small portion (12.9%). Additional data is not needed to support the 0.50 employees per 1,000 building square feet.

In terms of World Logistics Center's (WLC) anticipated average employee incomes, David Taussig & Associates, Inc. (DTA) is confident that the \$41,076 average income assessment (Exhibit F see DTA Exhibits on Flash Drive) for employees in the Transportation and Warehousing labor category for the Riverside-San Bernardino-Ontario Metropolitan Area (the "Metropolitan Area") according to the U.S. Census Bureau is a reasonable estimate. DTA has conducted additional research and has found similar data validating this average income estimate for Riverside County and for the Metropolitan Area as published by the State Economic Development Department ("EDD") and the U.S. Bureau of Labor Statistics ("BLS") (Exhibits H & G respectively see DTA Exhibits on Flash Drive). Both of these agencies list average incomes in 2012 for both the Warehousing and Storage labor category and the Transportation and Warehousing labor category in 2012 ranging from \$40,123 to \$41,709, all of which are within 2.3% of the \$41,076 figure. These incomes match those for all current City residents, for whom the median income according to the BLS is \$40,123. While it is certainly true that many WLC employees may fall into lower income categories, there is no justification for claiming that most jobs in the project are going to fall into the very low income categories cited in the commenter's letter. Furthermore, even these lower income jobs are an important component of the City's economy, as they meet the needs of students and other individuals who are new to the labor market and/or are seeking part-time work due to other obligations, as well as blue collar workers, family members from dual-income households, and other individuals who may be underemployed or unemployed. In any case, additional data is not needed to support an average project income of \$41,076.

Response to Comments G-90-1. The analysis included in the DEIR asserts that the project will include 0.50 employees per 1,000 building square feet. These employees are Full Time Equivalent ("FTE") employees, meaning that part-time employees are only counted based on the percentage of 40 hours per week that they are working. It takes two 1/2 time employees to equal one FTE employee. While supporting data indicating the number of FTE employees per 1,000 square feet in a database prepared on behalf of a client is proprietary to that client, we are also basing our conclusion, as explained in the Fiscal and Economic Impact Study included in the DEIR Appendix O on data from the Employment Density Study prepared for the Southern California Council of Governments ("SCAG") in 2001 (Exhibit A see DTA Exhibits on Flash Drive), as well as on information provided in "Logistics Trends and Specific Industries," which was prepared by the National Association of Industrial and Office Parks ("NAIOP") in 2010 (Exhibit B see DTA Exhibits on Flash Drive). While the proprietary database cannot be made public, the point in the DEIR was to rely on the two public studies cited in the previous sentence, both of which are easily found on the Internet. In utilizing the 0.50 employees per 1,000 building square foot figure, the lowest ratio provided by these two public studies was used, thereby reflecting the minimal number of employees that will be generated by the

project. While the commenter's letter cites these same studies, it miscalculates or misinterprets the data to uphold its position that these documents only support 0.37 employees per square foot, thereby alleging that the DEIR figure overstates the actual employee density by as much as 26%. The commenter's conclusions are therefore incorrect, as explained below.

Incidentally, the actual occupancy at the project will likely vary depending on the economic conditions existing at different points in time, with some years providing a greater demand for warehousing than others. Because it is impossible to predict which market conditions will prevail at any given time, the economic impact analysis included in this response is based on the assumption that the project will operate at full capacity. For comparison purposes, the DEIR has been revised to include a discussion of occupancy.

1. Commenter Overlooks Conclusions of SCAG Report and then Misinterprets Building Square Footage with Land Square Footage

The commenter's analysis of the SCAG Report is problematic for several reasons. First, the commenter appears to ignore data in Tables 9A, 9B, 10A, and 10B of the SCAG Report (Exhibit A see DTA Exhibits on Flash Drive) which clearly state that the median building square footage for a logistics employee in Riverside County is 819 to 1,390 square feet, and that the average building square footage for a logistics employee in Riverside County is 581 to 953 square feet. Square footage per employee averages are stated as ranges because the SCAG Report employee density calculations are based on two separate Floor Area Ratio ("FAR") assumptions; the median building square footage (0.31) and the mean building square footage (0.50). However, no matter which assumptions are chosen, the employees per 1,000 building square feet reflected in the SCAG Report far exceeds the 0.50 projection, much less the commenter's proposed 0.37 ratio. For example, using average employees and the average FAR, the number of employees per 1,000 building square feet based on the SCAG Report ranges from 1.05 to 1.72. These figures are more than double the 0.50 assumption, thereby confirming that an extremely conservative position regarding the number of employees to be generated by the project was taken.

Second, the commenter proposes using a 0.37 logistics employees per 1,000 building square feet projection that it claims to have derived from data in the SCAG Report. However, this figure has no validity because it reflects a miscalculation on the part of the commenter. Instead of dividing the SCAG Report's 16.32 logistics employees per acre in Riverside County by the number of building square feet constructed on a typical acre, based on an appropriate FAR for a logistics parcel, the Letter's authors divided the 16.32 logistics employees per acre (Table 10B of Exhibit A see DTA Exhibits on Flash Drive) by all of the square footage in an acre (43,560 square feet). The commenter's 0.37 employee ratio is based on the total square footage of land within an acre, not the building square footage located on an acre, which was the metric that was utilized throughout the DEIR and is clearly shown on the four SCAG tables cited above. Applying a 0.31 or a 0.50 FAR to the 0.37 land-based ratio and employing the identical net acreage and building efficiency factors utilized in the SCAG Report would generate the same 1.05 to 1.72 employees per 1,000 building square feet ratio described above.

2. Commenter Overlooks 0.50 Employees Per 1,000 Building Square Feet Factor Recommended in NAIOP Report

The commenter also overlooks language in the NAIOP Report (Exhibit B see DTA Exhibits on Flash Drive) that directly states that 0.50 employees per 1,000 building square feet is an appropriate number to use for this type of analysis. First, the commenter initially misquotes the range of square footage inventory listed in Table 1 of the NAIOP Study for four measurement years between 1992 and 2003 (8.48 to 11.48 million square feet) and then incorrectly states that these figures convert to between 0.45 and 0.49 employees per 1,000 building square feet. A weighted average analysis of the

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

figures in Table 1 was prepared and came out with 0.50 employees per 1,000 building square feet, which was the ratio that was utilized in the DEIR. The validity of this calculation is further supported in Table 2 on the following page of the NAIOP Report, which breaks down the logistics employees per 1,000 building square feet by U.S. region, with the “West Region” (in which the project will be located) yielding a ratio of 0.63 employees per 1,000 building square feet, which is also higher than the 0.50 ratio employed in the DEIR.

The NAIOP Report then further validates the 0.50 ratio by stating: “Given the variation, and the lack of data post 2003, the most reasonable assumption for projecting space needs is to use the average of 2,000 for the four measurement years, with the understanding that the reality could cover a wide range.” (Page 11, Exhibit B see DTA Exhibits on Flash Drive)

This concept of one employee per every 2,000 building square feet of warehouse is identical to the DEIR assumption of 0.50 employees per 1,000 building square feet.

3. NAIOP Data Sources Cited in DEIR Are Accessible

The commenter claims that the NAIOP support data for the 0.50 ratio could not be located. However NAIOP's main website (<http://www.naiop.org>) includes a research section that contains detailed reports on the characteristics of industrial warehouses constructed in recent years. There are separate reports entitled “How Office, Industrial and Retail Development and Construction Contributed to the U.S. Economy” in 2010 and 2011. For Table 12 in the reports for 2010 and 2011 from that site (see Exhibit C see DTA Exhibits on Flash Drive) reflect an average of 900 building square feet per employee for warehouses constructed in 2010 (equivalent to 1.11 employees per 1,000 building square feet) and 450 building square feet per employee for warehouse/flex buildings constructed in 2010 (equivalent to 2.22 employees per 1,000 building square feet). Again, these figures confirm that an extremely conservative estimate of logistics employee density was utilized in the DEIR. These figures also mitigate one of the commenter's concerns related to a NAIOP statement circa 2008 that “the uncertainty of employment projections, especially from the 2008 base year at the start of the recession, is also an important caveat.” The attached NAIOP tables were prepared after this statement was released and indicate that, if anything, the number of employees per thousand building square feet have increased in new logistics buildings since the recession began.

4. Commenter Cites Non-Applicable Employee Density Data from the Energy Information Administration

Finally, the commenter cites employee per 1,000 building square feet data from an Energy Information Administration (“EIA”) Commercial Buildings Survey published in 2003 as contradicting the logistics employee density ratios. However, the EIA data that the Letter cites applies to a whole range of commercial buildings, of which logistics buildings are only a small part. The commenter cites “EIA Summary Table B1, (Total and Means of Floorspace, Number of Workers, and Hours of Operation for Non-Mall Buildings, 2003)”, and then claims that “The EIA Reports indicate that the Mean Worker/KSF⁵³ was 0.43 for buildings supporting warehouse and storage activities.” But in actuality, the 0.43 figure in Table B1 reflects the number of employees per 1,000 building square feet for a large variety of types of commercial development, and excludes only retail mall facilities. As evidenced in Table B11 from this same EIA Report (attached as Exhibit D see DTA Exhibits on Flash Drive), out of 4,645 buildings surveyed to generate the 0.43 figure, only 597 (12.9%) were “warehouse and storage” buildings. Also included in the commenter's analysis were 824 office buildings, 443 retail buildings (other than those located in malls), 386 schools, 523 food sales and food service buildings, and many other commercial uses. As a result, the 0.43 employees per 1,000 building square feet estimate generated in the EIA Reports reflects employee density in a range of

⁵³ KSF= thousand square feet

commercial uses, not just warehouse and storage activities. Therefore, it does not contradict the 0.50 employee density for warehouse and other logistics uses cited in the DEIR.

Summary Response to Comment G-90-1

In summary, claims by the commenter that the number of logistics employees per 1,000 building square feet should be 0.37, or 0.43 or 0.45 are unsupported by any of the documentation provided, and are in fact contradicted by evidence from these same sources. The 0.50 estimate is the most conservative of any of the ratios provided by our documentation, and if anything, the logistics employees density that will ultimately be generated by the project may be higher, particularly with the increasing use of logistics projects for fulfillment facilities, which average higher numbers of employees per 1,000 building square feet. Additional data is not needed to support this conclusion.

Response to Comments G-90-2. The DEIR originally established an average income of \$42,341 for warehousing/transportation employees in Riverside-San Bernardino-Ontario Metropolitan Area. This income figure was based on data published in the U.S. Census Bureau's Longitudinal Employer-Household Dynamics Reports and confirmed by the U.S. Labor Statistics in May 2010 (both attached as Exhibit E see DTA Exhibits on Flash Drive). The data available from these two sources was then increased slightly (approximately 3% over the Census income average) to reflect a salary bump for management staff anticipated to be working within the project. However, in deference to DTA's desire to include only conservative estimates, we are eliminating the salary bump from the DEIR, and have rerun our model assuming that the project's employees will earn an average salary of \$41,076, as further explained below.

1. U.S. Census Data is Accessible and Supports an Average Warehouse Income of \$41,076

While the commenter claims that the data confirming the DEIR average income estimates could not be found on the Internet, such data is actually accessible by entering in Google the title of the U.S. Census Bureau report cited in the Study. The website for "U.S. Census Bureau's Longitudinal Employer-Household Dynamics Reports" includes an LED Extraction Tool that allows the user to access the DEIR average income numbers. Specifically, using the Extraction Tool, a user would choose California, Metropolitan Area, Riverside-San Bernardino-Ontario, Transportation and Warehousing, Male and Female All Ages, Full Quarter Employment Earnings, 1st Quarter 2012. At that point, a spreadsheet appears indicating a monthly income of \$3,423 per month over the past twelve months, or \$41,076 per year (see Exhibit F see DTA Exhibits on Flash Drive). The \$41,076 represents a 3.0% decrease in average salary from the DEIR's \$42,341, and reflects the average income figures for the latest reported 12-month period.

2. 2012 BLS and EDD Income Data Support the \$41,076 Average Income Estimate for WLC

As reflected in Table G-90.A, below, comparable County of Riverside and Riverside-San Bernardino-Ontario Metropolitan Area average income data for the Warehousing and Storage sector, as well as the larger Transportation and Warehousing sector, provided by BLS and EDD are consistent with the \$41,076 average income estimate discussed above. The five average income projections provided by these public agencies range from a low of \$40,123 to a high of \$41,742, all of which are comparable to the Census' \$41,076 average income estimate. As the U.S. Census, EDD and BLS are probably the three most credible sources of income information for the California workforce, to presume that the \$41,076 average income figure overstates the anticipated average earnings of an FTE employee, based purely on anecdotal information, would be inappropriate.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Table G-90.A: 2012 Average Income Data For Warehousing Industry Categories From California Economic Development Department And U.S. Bureau Of Labor Statistics

JURISDICTION/INDUSTRY	EDD [1]	BLS [2]
County - Warehousing & Storage	\$40,730	\$41,709
County - Transportation & Warehousing	NA	\$40,658
Metro - Warehousing & Storage	NA	\$40,123
Metro - Transportation & Warehousing	NA	\$41,742

County: County of Riverside | **Metro:** Riverside – San Bernardino – Ontario Metropolitan Area

1. Source: Employment Development Department ("EDD"). 3rd Quarter - 2012 statistics for Riverside County.
2. Source: Bureau of Labor Statistics ("BLS"). 2nd Quarter - 2012 average annual wages for all occupations in each respective sector.

Notably, the greater likelihood is that the \$41,076 average income figure understates the average income of future project employees. A typical logistics project does not include only warehousing and storage businesses. It also includes (i) wholesale trade, (ii) courier and messenger companies and (iii) truck and transportation businesses. While it is impossible to project the exact mix of industries likely to locate within the project, an estimate based on the current proportion of total employees that work in warehousing and storage in both Riverside County and in the Metropolitan Area, as compared with the total employees in each of these other three industries was prepared. An average employee income estimate for WLC using a weighted average of all four industries produced average incomes ranging between \$44,283 and \$49,753, as listed in Table G-90.B.

Table G-90.B: 2012 Average Income Data For All Projected Industries Likely To Locate In World Logistics Center, Based On Current Total County And Metro Employment Data

JURISDICTION/INDUSTRY	EDD [2]	BLS [3]
County - Four Categories (Blended) [1]	\$44,283	\$46,776
Metro - Four Categories (Blended) [1]	NA	\$49,753

County: County of Riverside | **Metro:** Riverside – San Bernardino – Ontario Metropolitan Area |

Notes:

1. Average of four applicable sectors defined by NAICS (#42-43 - Wholesale Trade, #492 - Couriers & Messengers, #484 - Truck & Transportation, and #493 - Warehousing & Storage), weighted by the number of employees in each sector.
2. Source: Employment Development Department ("EDD"). 3rd Quarter - 2012 statistics for Riverside County.
3. Source: Bureau of Labor Statistics ("BLS"). 2nd Quarter - 2012 average annual wages for all occupations in each respective sector.

While the FEIR will still utilize the \$41,076 average income derived from Census data and further supported by the government data sources reflected in Table G-90.A, there is actually reasons to believe that the average incomes might be higher than \$41,076, depending upon the mix of industries ultimately locating within the project.

3. Commenter's Survey of Available Jobs' Salary Levels Does Not Reflect Average Earnings Levels of Employees Working at WLC

The commenter collected salary information on warehouse/storage job offerings in the vicinity of the project by checking on indeed.com for new jobs that are located within 25 miles of Moreno Valley. The results of this salary search were average salaries between \$29,605 and \$39,407 per year. However, one only needs to review the same Census data previously reflected in Exhibit E (see DTA Exhibits on Flash Drive) and previously considered by the commenter to recognize that the salaries associated with job openings in the Inland Empire are consistently lower than those of permanent employees in that industry. As noted in Exhibit E (see DTA Exhibits on Flash Drive), while the average monthly earnings for the first quarter of 2012 were \$3,423 for transportation and warehouse employees in Riverside and San Bernardino Counties, the average new hire earnings in these two counties were only \$2,294. This means that the average worker in the transportation and warehouse sector earns almost 50% more than a new employee, which makes complete sense, since most new

employees have less experience and are hired in at lower entry level wages. Since the logistics sector does not only employ new hires, the fact that the commenter's survey of new hires generates a lower average wage than that which is earned by an average logistics employee should come as no surprise. Increasing commenter's survey results by 50% to get to the salary level of an average transportation and warehouse employee would further confirm the higher average salary level utilized in the DEIR.

4. The UC Riverside Publication Data Used by the Commenter to Justify Low Income Distributions for the Project are Not Reflective of the Entire Workforce to be Employed at the Project

The commenter further justifies its projected income distributions for WLC by quoting a UC Riverside publication that states that the hourly wages in the Inland Empire's warehouse industry are allegedly much lower than the figures suggested in the DEIR.

"The median hourly wages (i.e. half of the workers earn less than this amount) in the Inland Empire range from \$9.11 to \$13.08. This implies an annual wage of \$17,000 to \$25,000. The UCR study also states that temporary workers are frequently paid less than this (41% of these blue collar workers are paid less than \$10.50 per hour (Bonacich and DeLara 2009)."

Unfortunately, the commenter does not explain how *Bonacich and DeLara* purposefully selected specific segments of warehouse employees for its study. In reality, the intent of the *Bonacich and DeLara* study was to analyze **a specific subset of occupations in warehousing that are categorized as "blue collar"** who in fact earn significantly less than other occupations within the warehousing industry. The occupational titles addressed in the *Bonacich and DeLara* study are: "Shipping, Receiving and Traffic Clerks", "Stock Clerks and Order Fillers", Industrial Truck and Tractor Operators", Laborers and Freight, Stock and Material Movers, Hand", and "Packers and Packagers, Hand." These titles were taken from the Occupational Employment Statistics ("OES") published by the California Employment Development Department ("EDD"). But within the OES, there are actually a total of 56 occupational titles that fall under the "warehouse" category, and the five categories utilized in the *Bonacich and DeLara* study, which represent 56.2% of the employees working in the Storage and Warehouse category nationally according to May, 2012 released by the Bureau of Labor Statistics¹, are among the lowest paying. Among the 51 positions not included on *Bonacich and DeLara's* list are skilled mechanics, electricians, plumbers or any white collar positions such as administrative personnel, sales staff, computer professionals, engineers and management, among dozens of others. The *Bonacich and DeLara* study, even assuming that its income data is accurate, was never intended to reflect the income distribution of all of the employees working in a logistics facility. For the commenter to use this data as a justification for stating that "most workers at WLC will be earning wages of approximately \$20,000" is at best disingenuous. To further allege that "most of these workers are Latino, of which half are immigrants" is both irrelevant and inappropriate.

5. A Range of Job Opportunities at a Variety of Salary Levels Will Be Made Available Through the Project

The commenter includes a series of graphs that imply that the DEIR does not recognize that there will be a wide distribution of incomes among workers in the project. The concept of "average" income for an FTE WLC worker was used in the fiscal and economic impact studies for purposes of measuring the total sales tax revenues, economic output and other factors generated by the project, and was in no way intended to imply that every employee will earn the average income. The commenter includes a graph in Section B.5.B (4) that presents the DEIR salaries as two monolithic lines representing average non-management and management salaries, as compared with the commenter's own graph

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

which includes a distribution of incomes. The former graph misstates the DEIR's position, as we are in complete agreement that there will be a distribution of incomes around our average income figures.

However, the DEIR does not agree with the specific income levels listed and graphs provided by the commenter, as the sources utilized by the commenter to reflect income distributions significantly overstate the low incomes associated with logistics facilities. As explained above, the earnings indicative of new hires in Moreno Valley are much lower than those associated with average employees in a Moreno Valley logistics facility. In fact, the average earnings of a logistics employee are 50% more than the average earnings of a new hire. Therefore, the distribution of average incomes for all logistics employees will typically be 50% higher than the incomes shown in the commenter's income distribution graphs which are entirely based on new hire incomes.

6. Commenter's Average Income Estimate from Census Data Includes Employees Who Worked Only a Portion of the Quarter or Who Worked Part-time

The commenter apparently was able to find the Census Bureau table utilized in the DEIR, but identifies an average wage of \$38,463. In reviewing that same table, an income average that was exactly identical to the Letter's \$38,463 could not be identified, but was able to come up with a number that was close (\$38,652). But that figure is misleading, as it includes the average monthly earnings for the quarter of all employees who worked on the last day of the reference quarter. This includes employees who were only employed for a portion of the quarter, as well as part-time workers, so their incomes are not representative of those who were employed full-time for the entire quarter, which is the projected average income used for the project. There are several reasons why the commenter's Census average income figure was not utilized. First, it is likely that some of the employees who only worked for part of the quarter are actually full-time workers and first started their jobs during the quarter, meaning their total earnings for this particular quarter are not representative of their future earnings on the job. The income figure used represents all employees who worked the entire quarter, which is clearly more representative of a FTE employee than the incomes of those who did not work the entire quarter. Second, including the total earnings of employees who worked only part-time over a three-month period leads to an understatement of both the average pay levels of FTE employees, and the average hourly salary paid to workers in the project, since these employees did not work the 520 hours commensurate with a standard quarter. All of the data provided in the DEIR, including the 0.5 employees per 1,000 building square feet assumptions discussed above, refer to FTE employees, which means either full-time employees, or combinations of part-time employees who, when combined, equal one full-time employee. Defining each part-time employee as a separate employee would increase the number of employees per building square foot, but would also be misleading in terms of measuring the actual numbers of employees generated. Similarly, including part-time employees' income in determining average annual incomes would produce average income data that is not reflective of the incomes of the FTE employees who will be working at the project.

Finally, while a certain portion of project employees will earn less than the average projected income because they work part-time or in jobs requiring lesser skills, any implied denigration of this type of work as it relates to the project underestimates its importance. Part-time jobs, for example, make a significant contribution to the local economy and the overall community. These jobs are often the only sources of income for students, working parents with childcare responsibilities, caregivers for elderly relatives, retired persons, employees with other part-time jobs, and individuals who just wish to work part-time for other reasons. In addition, in many cases a part-time job may be held by an individual in a two-income or even three-income household, so the income of the part-time employee is not in any way reflective of the overall economic status of the household to which the employee belongs.

7. Bureau of Labor Statistics Data Sources Cited in DEIR Are Accessible

The commenter asserts that its authors were unable to locate the BLS figures used to project the project's average income levels. This information is available through the main www.bls.com webpage. The main webpage includes a "Databases and Tools" option, and after choosing that option and selecting "State and County Salaries and Wages" and "One Screen Data Search," a Query Tool appears. Using this tool, one needs to select California, Riverside County, Transportation and Warehousing, Privately Owned, All Establishment Sizes, and Average Annual Pay, at which point a listing of average annual pay for this sector from 2001 through 2011 appears (see Exhibit G see DTA Exhibits on Flash Drive). The average salary listed for 2011 is \$41,008, which is slightly lower than the \$42,301 originally used in the DEIR as a result of the management income bump added. But as noted above, the management income bump has been removed, so that the EIR will now be using the Census' most recent four-quarter income average of \$41,076 (see above). This is almost identical to the \$41,008 average income figure for the Transportation and Warehouse labor category provided by the BLS, and is therefore a conservative estimate.

Summary Response to Comment G-90-2

The information compiled, as described in the DEIR and this response, is more than sufficient to justify a projected average income level of \$41,076 for the project. The data provided by the commenter is not applicable to the broad spectrum of skill levels and experience anticipated for persons employed in the project, and the Census, EDD and BLS documentation discussed in the DEIR and this response clearly support the \$41,076 projected average income.

Regarding the issue of WLC employee incomes, one key theme that appears consistently in this section is an inherent bias regarding the characteristics of the employees likely to work in the project. There is an implication throughout the comments that a typical project employee is somehow of lesser economic status than is appropriate for the City. Project employees are assumed to be overwhelmingly entry level, unskilled and/or temporary workers who will earn as little as \$9.11 per hour and will be a burden to the existing community. This implication is ironic because, in point of fact, the current median income for a Moreno Valley resident is \$40,124 according to the BLS 2007-2011 American Community Survey 5-Year Estimates. While this BLS figure is the median income rather than the average income and therefore is somewhat differently defined, it is informative on a comparative basis that the City's median income is actually slightly less than the \$41,076 average income projected in the DEIR for the project. Contrary to the inference by the commenter that the WLC's jobs would somehow constitute a burden on the City, it appears that the incomes associated with these jobs are similar to the earnings of current Moreno Valley residents, many of whom are likely to be attracted to these work opportunities, especially when compared to the alternative of underemployment or unemployment. Furthermore, as previously stated, it is likely that a percentage of the jobs in the project will be held by individuals who belong to dual-income households or families, and in some cases even three-income households (e.g., students living a home). To imply that a two or three income family in which one family member earns \$41,076 will have a negative impact on the City's economy is an unreasonable assumption.

This is not to say that some of the employees working in the project won't be single earner households receiving incomes below \$41,076. For example, a recent study published in the August, 2010 edition of "Monthly Labor Review" noted that 19.4% of the employees in the "Transportation and Material Moving" sector nationwide were "temporary help service employees (see Exhibit G on Flash Drive). As noted in the study, "workers in the temporary help services industry, also referred to as contingent, contractual, seasonal, freelance, just-in-time, or "temp" employees, are those whose salaries are paid by a temporary help services agency that supplies them, upon request, to employers looking to fill a temporary full- or part-time staffing need." Clearly, many of these employees are likely to earn below the \$41,076 mean income reflected in the documentation cited in this memo. However, this fact does nothing to invalidate the average income cited in the DEIR, as 80% of the employees in

Final Programmatic Environmental Impact Report

Volume 1 – Response to Comments

World Logistics Center Project

the "Transportation and Material Moving" industry are not temporary workers hired through a help services agency.

Furthermore, even the lower paying jobs would constitute an asset for the City, as many of the residents of Moreno Valley and its environs are blue collar workers from a variety of ethnic groups for whom work in a logistics facility represents an outstanding economic opportunity. Similarly, unskilled laborers also require work, and some of the lesser skilled jobs are crucial to their subsistence. With the decline in manufacturing jobs throughout the Inland Empire due to the outsourcing of this work to other countries, the logistics sector is one of the few growing job sources for Moreno Valley and Inland Empire residents who do not have postsecondary degrees. These positions include not only opportunities for blue collar work related to trucking, dock work and freight handling, but also white collar occupations such as logistics and sales management and freight forwarding. The commenter's lack of recognition of the job opportunities associated with the project in the context of the qualifications of the available workforce residing in the Inland Empire, as opposed to the commenter's preoccupation with an alleged overabundance of lower income jobs, is indicative of its less than objective assessment of the project.

Response to Comments G-90-3. In response to comments prepared by the commenter, the Economic Impact Analysis (EIA) has been revised to include a discussion relating to occupancy and absorption rates. Per the applicant's projections, the project is expected to be built-out by 2031. Given current market conditions, the project is expected to achieve a high rate of occupancy during and after build-out, notwithstanding the cyclical impacts of the economy. For purposes of demonstrating the impacts of vacancies, a 10% vacancy rate has been incorporated into the EIA calculations for comparison purposes. While it is true that the market is cyclical in nature and changes in absorption are inevitable and difficult to predict, we do know that there is currently a substantial demand for logistics facilities within the Inland Empire, which is encouraging in terms of our expectations regarding the first phase of the project.

Furthermore, a study prepared by the Southern California Association of Governments ("SCAG") titled *"Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities."* (Exhibit O see DTA Exhibits on Flash Drive) supports the need for more warehousing space. The study's Executive Summary states the following:

- "According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet (Page ES-1; Exhibit O see DTA Exhibits on Flash Drive).
- During the year 2035, there will be a **projected shortfall of space of about 228 million square feet**, unless other land not currently zoned for warehousing becomes available." (Page ES-2; Exhibit O see DTA Exhibits on Flash Drive).

The WLC will contribute to the supply of warehouse space necessary to satisfy a portion of this demand. This SCAG Report supports other data presented by DTA in its responses to DEIR comments that there will be more than sufficient demand to support the WLC.

The commenter is also concerned about the projected mix of modern high-cubed and regular warehousing in the project. While it is impossible at this time to project the actual mix that will be constructed, future construction will reflect the specific future demands of the logistics marketplace during the buildout process. As a result, the applicant has sufficient confidence in the overall longevity and success of WLC that it has been and continues to invest millions of dollars to entitle the project and build the necessary upfront infrastructure.

Response to Comments G-90-4. Please refer to Response to Comment G-90-3. While the applicant is confident regarding the projected build-out period, decisions relating to the ultimate construction time-line/schedule will be based on actual market conditions.

Response to Comments G-90-5. The commenter reiterates the Traffic Impact Analysis' (TIA) discussion of the existing commuting patterns of Moreno Valley residents and the TIA's claim that the WLC will shorten commute distances. He cites the *Claremont McKenna College – UCLA Inland Empire Forecasts, October 2012* which the commenter says states that workers that are more than 50 miles away from the Los Angeles county line are not concerned about employment in Los Angeles; instead they are concerned about jobs within 50 miles of their residence. Based on this the commenter states that workers will not relocate to live in Moreno Valley to work at WLC and that there is no evidence that there will be any significant change in freeway traffic pattern due to the WLC. He suggests that the City make concessions with potential occupants of the WLC to induce them to hire Moreno Valley residents.

The commenter appears to be misinterpreting the *Claremont McKenna College – UCLA Inland Empire Forecasts, October 2012* study. The passage of the report cited in the comment is shown below (from page 24 of the report):

"There is substantial variation across these cities, spanning from less than 7% in Chino Hills and La Quinta to greater than 18% in Adelanto, Coachella, Perris, and San Jacinto. Excluding the cities in the Coachella Valley, there appears to be a geographical pattern: cities bordering Los Angeles, Orange, and San Diego Counties tend to have lower unemployment rates. Note that unemployment rates are measured by residency, not by location of employment. For example, a resident of Rancho Cucamonga who commutes to Los Angeles County for employment and who loses her job will increase the unemployment rate of Rancho Cucamonga and San Bernardino County, but not the unemployment rate of Los Angeles County. This is true for many workers in the Inland Empire given that roughly one-third of the region's labor force commutes cross-county for employment.

To test our hypothesis that the distance to the nearest coastal county line matters for city unemployment rates, we look at a cross plot of city unemployment rates and distance between the respective cities and their "point of entry" to the west and south. We exclude the six largest cities of the Coachella Valley from our analysis since very few workers from this area commute to Los Angeles or Orange County. Figure 4 supports our hypothesis that location matters in determining city unemployment rates: moving 20 miles into the Inland Empire increases city unemployment rates by approximately 5 percentage points (see, for example, Upland and Fontana). This effect becomes less significant when a worker commutes an additional 20 miles - Moreno Valley's unemployment rate is only another 2.5 percentage points higher than the previous 5 percentage points. Unsurprisingly, geographical distance to the county line ceases to display an effect after 50 miles: commuters from Victorville are more concerned about the job situation in Rancho Cucamonga than in Los Angeles."

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Figure 4 City Unemployment Rates in the Inland Empire and Distance to Greater Los Angeles/San Diego County Line, 2011

The passage refers to the author's theory that distance from the job centers in Los Angeles and San Diego Counties affect the unemployment rate of cities in neighboring counties but that this effect appears to disappear for cities more than 50 miles from the Los Angeles County line (the cities are shown in red dots in the graph above, which was copied from the report). There is no connection between this theory and whether or not workers might relocate to Moreno Valley if the WLC were to be built.

The TIA's statement that building an employment center in an area with an existing large labor force but few jobs would enable some workers to obtain employment at WLC and thus make shorter commutes is supported by traffic modeling and everyday experience (TIA, Chapter 4, Section D).

Response to Comments G-90-6. The commenter questions the jobs/housing balance ratio in the City. While it is likely that some of the jobs may be filled by City residents who possess the skills and/or education required, it is expected that many project employees will be commuting to the project from other locations in the Inland Empire and may eventually move to the City to live closer to work, thereby increasing the population and ultimately the demand for homes within the City over a period of time. The impact of the project on the jobs/housing balance in both the City and throughout the Inland Empire cannot help but be improved by the potential 20,000 jobs to be generated by the WLC, especially because the project itself contains no residential development within a City that has one of the lowest jobs/housing balances in all of the Inland Empire. In fact, both the City and the Inland Empire have a surplus of homes versus jobs, which causes residents to drive to LA and Orange County for work, leading to traffic congestion, less family time and an overall lower quality of life. As noted in Section 4.3 of the DEIR, the City's Jobs-Housing Balance is currently 0.47, which is one of the lowest of any City in the Inland Empire. Riverside County as a whole only has a Jobs-Housing Balance of 0.74. As the norm throughout Southern California ranges between 1.0 and 1.29

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

jobs per household according to SCAG's landmark 2001 study *"The New Economy and the Jobs/Housing Balance in Southern California,"* both the City and the County are badly in need of jobs. As a result, the average commute distance for a Riverside County resident of 21.6 miles according to the study was higher than any other County in Southern California. Improving the jobs/housing balance is one of the many attributes of the WLC.

In addition, the Development Agreement includes a provision for a local Hiring Program that will help give hiring preference to Moreno Valley residents (see Response to Comment G-33-9).

Response to Comments G-90-7. The commenter states that the trip generation rate in the TIA (the ITE trip generation rate of 1.68) is too high for the traffic analysis and possibly too low for the air quality analysis. The commenter then goes through the trip generation rates found in different studies and concludes that the older studies are flawed and should be ignored. He states that trip generation rate of 0.99 from the NAIOP study seems to be appropriate for traffic studies in the Inland Empire. He also requests that air quality monitors be installed to enable South Coast Air Quality Management District (SCAQMD) to evaluate air quality degradation due to the WLC.

The City concurs that the trip generation rate used in the study for high-cube warehouses (1.68 vehicular trips per thousand square feet per day (VT/KSF/day)) is conservative, that the AQMD rate (2.58 VT/KSF/day) is not appropriate (the AQMD does not recommend its use when more than 10 warehouses are analyzed together) and that the rate found in the NAIOP study (0.99 VT/KSF/day) represents a more likely outcome. The City does not see the logic behind, and disagree with, the commenter's suggestion that an over-estimate of truck volumes might result in an under-estimate of truck emissions.

Ambient air quality monitors would not effectively monitor emissions from the WLC. Ambient air quality monitors are unable to monitor emissions from specific sources; instead they measure the contribution of all sources of air pollution to local air quality. Air quality surrounding the WLC site would be impacted by project-related trips, background trips in Moreno Valley (particularly from SR-60), and from upwind sources from Los Angeles County to Riverside. In addition, much of the air quality impact from the proposed project is disperse, spread out along arterial roadways and freeways some distance from the WLC. SCAQMD has already established a network of regional air quality monitors to provide air quality data for the South Coast Air Basin. As a result, the proposal for SCAQMD monitors at the WLC site would not effectively monitor project impacts.

Mitigation Measure Trans-1, described in Chapter 11 of the TIA (FEIR Volume 2) and included in the EIR as Mitigation Measure (MM) 4.15.7.A, requires the submittal to the City of a subsequent TIA with each Plot Plan application for subsequent projects within the WLCSP. This would include new traffic counts and LOS analyses to determine whether the existing or increases in the capacity of the road network has kept pace with the growth in traffic. The purpose of the subsequent TIAs is to determine if any of the traffic improvements listed in Tables 72 through 77 of the TIA prepared for the EIR are required to be completed prior to the issuance of a certificate of occupancy for each building in the Plot Plan. Based on the City approved subsequent TIA, improvements required to be constructed in order to ensure traffic impacts resulting from operation of the building shall be made a Condition of Approval of the Plot Plan and the improvements must be constructed prior to the issuance of a Certificate of Occupancy for the building.

The commenter recommended that as a condition for development, the WLC developer obtain and install appropriate air quality monitors in the Moreno Valley for use by the SCAQMD for evaluation of air quality degradation due to the WLC project. Installation of air quality monitors in the Moreno Valley area would not be able to uniquely distinguish any impacts from the project vis-à-vis impacts from the surrounding region. This is the reason why air dispersion modeling was used to isolate the specific impacts from the WLC project. The air dispersion modeling takes the project's specific emissions and

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

disperses these emissions by the prevailing meteorological data to derive project-specific impacts at both nearby and distant receptor locations.

Response to Comments G-90-8. The commenter states that the “potential Cerrell Effect of the WLC will reduce the ability of Moreno Valley to attract high paying jobs of the proposed Medical School of the University of California, Riverside and will galvanize citizens to become politically active.” According to the commenter, the “Cerrell Effect” describes the fact that proponents of some projects face strong public opposition to projects that result in a locally undesirable land use; otherwise known as a “LULU.” While the warehousing industry may not pay wages that are as high as those of a Medical School, the highest and best use for property is determined based on the economic demand for a particular land use for a site in a given location. As the current owner of the property, the applicant has determined that the comparative demand for various land uses for the WLC site is such that logistics is the highest and best use for the site. In particular, the need for logistics facilities in the area is immediate, while the location of a medical school on the site is speculative at best. Furthermore, the construction of the project is expected to attract additional non-residential development that is necessary to provide services to the WLC, which in turn will draw more businesses to the City. In addition, employees wanting to live near their place of work will increase demand for nearby residential communities, thereby driving up residential property values in other portions of the City. Finally, the WLC itself will increase the City's revenues. Per the DEIR, the assessed value (once the WLC is built-out) is expected to be approximately \$3.7 billion, which will significantly increase the City's tax base. The City Council will decide if the project is a locally undesirable land use.

Response to Comments G-90-9. The commenter encourages the City to only approve Phase 1 (approx. 20 million square feet). It is up to the discretion of the City to determine what action should be taken on the project application. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

Response to Comments G-90-10. The commenter encourages the City Council to not approve Phase 2 at this time relative to the “Moreno Valley Planning Document” (assume that means the General Plan). It is certainly up to the discretion of the City to approve the project as proposed, approve only a portion of the proposed development at this time with time restrictions, or to approve the entire development conditional on it achieving certain performance standards (e.g., trip generation). However, the WLCSP is the project submitted to the City for review and action, including the evaluation in this EIR. There would need to be legal justifications denial or for substantial modifications or delays other than what has been outlined in the project applications. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

Response to Comments G-90-11. The commenter has asked the City to require actual data from Phase 1 before approving Phase 2. As outlined above in the Response to Comment G-90-10, the City has the discretion to approve the project as proposed, approve only a portion of the project with time restrictions, or to approve the project subject to certain performance standards.

Response to Comments G-90-12. The commenter has asked the City to prepare a second EIR after 2022 to see if the actual impacts match the predictions. As outlined above in the Response to Comment G-90-10, the City has the discretion to approve the project as proposed, approve only a portion of the project with time restrictions, or to approve the project subject to certain performance standards.

Response to Comments G-90-13. The commenter has asked the City to prepare a second EIR after Phase 1 has been completed to see if the actual impacts match the predictions. As outlined above in the Response to Comment G-90-12, the City has the discretion to determine what action should be taken on the project application.

Response to Comments G-90-14. The commenter repeats his statement that the trip generation rate in the TIA (the ITE trip generation rate of 1.68) will probably result in an over-estimation of traffic impact. He suggests that the project's impact on air quality is uncertain and repeats his request that air quality monitors be installed to enable SCAQMD to evaluate air quality degradation due to the WLC. He would like for this to occur during Phase 1 of the WLC before continuing to Phase 2.

The City concurs that the trip generation rate used in the study for high-cube warehouses (1.68 VT/KSF/day) is purposefully conservative to ensure that there would be no under-estimation of traffic impacts. With regard to air quality monitors, please see Response to Comment G-90-7.

The commenter also questions the use of the trip generation figures used in the EIR, and ties it back to only approving Phase 1 development now. The trip generation data used in the project traffic impact assessment (TIA) was based on data collected on many similar types of developments by the Institute of Transportation Engineers (ITE) in its latest Trip Generation Manual (2013). Further, as pointed out in the comment, the trip generation factor used may have overestimated the traffic and its impacts.

The commenter requested air monitoring for the project. However, the air quality in this area is complex based on the result of air movement and pollutants transported from the Los Angeles and Orange Counties, and would not yield results directly applicable to the WLC project. It would be much more appropriate to identify specific mitigation for individual developments within the WLCSP and monitor implementation of those measures, based on the comprehensive air quality analysis supporting the EIR and subsequent air studies for future development once specific development projects are proposed.

Response to Comments G-90-15. Please reference Response to Comment G-90-1

Response to Comments G-90-16. Please refer to Response to Comment G-90-3.

Response to Comments G-90-17. Please refer to Responses to Comments G-90-3 and G-90-4.

Response to Comments G-90-18. The commenter again wants the City to approve only Phase 1 and collect environmental data on that development to determine if Phase 2 should be built. As outlined above in the Response to Comment G-90-9, the City has the discretion to determine what action should be taken on the project application.

Response to Comments G-90-19. The commenter again recommends a second EIR in 2022 after Phase 1 has been built. The City has the discretion to add this into the project approvals, but it should be noted that Phase 1 of the WLC project has already been moved from 2017 to 2022 based on current market conditions and the pace of the CEQA process for the project. The technical studies have all been revised to address this new phasing plan. CEQA review will be required in connection with each plot plan application. A Supplemental EIR will be required if there are significant changes in the circumstances surrounding the project or if something new is learned. See CEQA Guidelines Section 15162. Also see DEIR Section 3.7.2.4.

Response to Comments G-90-20. The commenter asks the City to use the second EIR (in 2022) to decide if they want to proceed with Phase 2. This comment is addressed in the Responses to Comments G-90-19 and G-90-12. The City does have the discretion to identify sequential review points for the WLC project.

Planning Cases PA 12-0011, 0012, 0013, 0014 and 0015

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. 1
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. 2
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. 3
-

Sincerely,

Gary Mathew

Consideration the wishes of the citizens of Moreno Valley. Look at all the empty warehouses at the West end and then justify the building of this center. A simple NO is all we need from the City Council in its entirety. We need street repairs at this end of

the valley not more foul air and traffic added to what we already have. The Mayor Tom Downing came to our house before the elections, we spoke for a good hour on different subjects, one being the Logistics Center. I expressed our feelings about this and he told me that would be his first priority if he was elected. The following week I read in the local paper where he had accepted a large donation ~~and~~ from Bengeser and now is turning the other checks. Between him, Co & Stewart they will send us here at the East end down the tubes. At sometime in life people have to say no to companies like Highland Fairview & Bengeser. Shouldn't we start by doing it now.

Letter G-93: Heather Walsh (April 15, 2013)

RECEIVED

APR 15 2013

CITY OF MORENO VALLEY
Planning Division

March 28, 2013

City of Moreno Valley Economic Planning Department:

Letter G-93

This letter is written in response to the proposed World Logistics Center project. It is apparent that the City Planning Commission and City Council have chosen to approve recommendation of this project without concern for the citizens of this community. The environmental impacts of this project should be considered before this project moves forward. First of all, the pollution generated from the amount of trucks that are estimated to be traveling through the area will have adverse effects on the health of the residents and will deteriorate the air quality in the area. This increase in truck traffic will also affect the gridlock on the 60 freeway and surrounding streets. This is already a problem as there is only one way into the city and one way out, it will only be compounded by the addition of hundreds of more trucks. Also, these trucks bring additional noise that will affect the residents. This is all in contradiction to the general land use that was originally designated for this area. Agriculture and wildlife in the area will also be adversely affected as will the open spaces and aesthetics of the community. As residents of this community we would like to voice our opposition to such a project. The proposed "benefits" do not outweigh the significant negative impacts.

Moreno Valley CA 92555

RESPONSES TO LETTER G-93

Heather Walsh

Response to Comment G-93-1. The commenter is concerned about air pollution and additional truck traffic on the 60 freeway. Section 4.3 of the Draft Environmental Impact Report (DEIR) and the original and revised air quality technical studies, all evaluate the potential air pollution impacts of the World Logistics Center (WLC) project in considerable detail. The Environmental Impact Report (EIR) concluded that the WLC project would have significant air quality impacts that could not be mitigated to less than significant levels, even with the recommended mitigation, due to the size and nature of the WLC project. Section 4.15 of the DEIR examines the traffic-related impacts of the WLC project, including impacts along the SR-60 Freeway. The EIR concluded that traffic impacts of the project would be significant even with implementation of recommended mitigation, largely because many of the improvements that would be needed to achieve level of service standards are located in other jurisdictions (including Caltrans) and are not under the control of the lead agency.

Response to Comment G-93-2. The commenter is concerned about noise generated by project truck traffic. Section 4.12 of the DEIR examined the noise-related impacts of the WLC project and concluded that impacts would be significant even with implementation of recommended mitigation. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

Response to Comment G-93-3. The commenter is concerned about impacts to aesthetics (open space and views), agriculture, and wildlife. These issues are addressed in Sections 4.1, 4.2, and 4.4 of the DEIR, respectively. The DEIR determined the WLC project would have significant impacts on views and agriculture, even with mitigation, while impacts to wildlife were determined to be less than significant with mitigation. The City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project. If the City Council decides to approve the project, a Statement of Overriding Considerations will be necessary to show what project benefits outweigh the significant project impacts.

RESPONSES TO LETTER G-94

Artie Melton

NOTE: This letter is based on a template provided by C. Moothart in Letter G-9. Reviewers are referred to responses to that letter for more detailed discussion of these comments.

Response to Comment G-94-1. See Response to Comment G-9-9 of Letter G-9 for a more detailed response to this comment.

Response to Comment G-94-2. See Response to Comment G-9-10 of Letter G-9 for a more detailed response to this comment.

Response to Comment G-94-3. See Response to Comment G-9-11 of Letter G-9 for a more detailed response to this comment.

Letter G-95: Thomas Thornsley (email) (April 8, 2013)

Thomas Thornsley
29177 Stevens Avenue, Moreno Valley, CA 92555

April 8, 2013

Mr. Mark Gross
City of Moreno Valley
14177 Frederick Street/P.O. Box 88005
Moreno Valley, California 92552

Via e-mail: MarkG@moval.org

Dear Mr. Gross:

Re: Comments to the Draft Environmental Impact Report for the World Logistics Center Specific Plan, SCH#: 2012021045

As a concerned resident, a land use planner, and a member of Residents for a Livable Moreno Valley, who lives on the east end I have great interest and concerns about development in our area. Therefore, I have taken an extensive amount of time to review the Draft Environmental Impact Report (DEIR) for the proposed World Logistics Center Specific Plan (WLCSP). I cannot agree with some of the conclusions because this project goes so far beyond good planning as placement of land uses that it should never have been encouraged by the City or the developer.

With a rewrite of the General Plan the City and the developer begin the process of justifying the project. And to date I have not heard any member of City's upper management, the planning department or the City Council say they question the logic of this proposal. It appears that most impacts are being written off because the City simply will not take a strong stand on potential development impacts or adopt stricter mitigation measures to assure that development impacts are brought down to the lowest feasible point. It appears that this project has some significant impacts that could be mitigated to some extent but are being completely written off because even with some mitigation the impacts cannot be mitigated to below a level of significance. However, several impacts could be lessened with further mitigation than what is proposed; most notable with regard to Aesthetics, Agricultural, Air Quality, Land Use, and Traffic Impacts. In these instances it would be prudent to impose mitigation(s) to further lessen those impacts, thereby diminishing the intensity of impacts that will be overridden by the City Council.

I believe that the City will approve this project therefore additional tougher mitigation should be added to offset local and regional impacts to the fullest extent possible before overriding what cannot be achieved. If these mean reducing the size of the project to reduce environmental impacts, as suggested in the alternatives, then it should be seriously considered.

The following should serve to explain any shorthand in this document:

Section page numbers or topic numbers are used as best possible for referenced comments.

WLCSP – World Logistics Center Specific Plan

SP – World Logistics Center Specific Plan

MHSP – Moreno Highlands Specific Plan

GP – General Plan

Section 3.0 Project Description

The Project Description is obligated to mention everything carried out with this one proposal. However, the portion of the Project dealing with the General Plan Amendment includes the GP land use change to properties not under the control of the Project developer nor is that property a part of the WLCSP. Throughout the document it repeatedly states the project will convert 1,000 plus acres to Open Space which is misleading to the true project which is the World Logistics Center. Additionally, those 1,000 plus acres are used in calculations and analysis through the document and the supporting studies which could/does change the data provided for analysis. The project description should make it very clear that these 1,000 acres are in no way related to the WLCSP and should not be referred to in any project analysis.

1

Pg. 3-19: Why is a debris basin proposed easterly of Gilman Springs Road and impacting property not associated with this project? Why is the basin not within the project boundary? There is no explanation here or in the section on hydrology.

2

Pg. 3-25: The GPA will not "establish logistic land uses on the 3,814-acre property," because there are two other categories of land uses for over 1,104 acres this figure will includes.

3

Pg. 3-26: Identify that the project site for high-cube warehouse facilities does not have multiple forms of transport available.

4

Pg. 3-72: Explain the appropriateness of adding a new land use category to the General Plan verses just modifying the uses under Business Park. What is written here is project an site specific and not proposed to be utilized anywhere else in the city.

5

Section 4.01 Aesthetics

Pg. 4.1-3: How is the rural northeast portion of the City issue discussed in the MHSP? Wasn't this area also considered the rural area of the City when the City incorporated and before this development came forward?

6

Fig 4.1.2: Photo locations are off, 2 and 3 need to be switched to be consistent with the photos in Fig. 4.1.3a. Several other markers and photos are incorrectly located and identified.

7

Objective 2.5 and Policy 2.5.1 should only be applied to locations where these designations currently exist.

8

- Pg. 4.1-17: What will be done to lessen the significant impacts of the aesthetic impacts? 9
- Pg. 4.1-33: Based on Fig. 4.1.4G explain why there isn't a freeway landscape buffer (strip) as required in GP Policy 2.10.5, which states that "development projects adjacent to freeways shall provide landscaped buffer strips along the ultimate freeway right-of-way." 10
- Fig 4.1.4H: Why is there not a level landscape strip between the maintenance road and the bank of the detention basin? Plantings on the banks and the basin bottom are more likely to be damaged or stressed. 11
- Fig. 4.1.4I - Explain why the uppermost cross section does not have a screen wall nor landscaping on the downward slope. 12
- Fig. 4.1.4J - Please explain the distance between the R-O-W and the marked 20' min. landscape buffer. Also explain why such a small 20' landscape buffer is being proposed. This is not a significant buffer in those areas where screening for aesthetics reasons will be needed to screen the development. 13
- Pg. 4.1-61: As stated white building will be more visible at longer distances thereby adding to the impact. Consideration should be made to utilize more earth-tone colors throughout the project area. If the change in color will so greatly affect the energy consumption or greatly increase the "heat island" effect then provide data to substantiate this claim to justify the color choice. 14
- Pg. 4.1-62: The 250-foot setback as defined by the distance from residential property lines fails to address the true lack of adequate screening. Along Redlands Blvd. and Merwin Ave. where the roadway width alone could be greater than half the setback distance. Nothing precludes the remaining area from including parking lots, drive aisles, internal roads or storm drains. Residential property along Merwin loses the 250-foot to 66' of Merwin roadway, 125' flood control channel, 112' Street "D". Where does the buffer come in to the equation? You already have 303 feet of setback before a project site property line but very little of that area can create a visual barrier from the residential properties. 15
- Explain what minimum level of buffering would be required with all these open area elements between a residential property line and the building. Explain what can go between the building and the project site property line when it is beyond the 250-foot setback. 16
- Pg. 4.1-62: As described in paragraph 2 the landscape setback will be far less than where it is adjacent to streets with narrower right-of-ways. Provide reasoning as to why the buffer is not measured from the right-of-way adjacent to the development. This would assure consistent perimeter landscape buffer setbacks. 17
- Pg. 4.1-62: Indicate what building and/or screen wall characteristics will aid the aesthetics of the buffer zone. 17

Thomas Thornsley
April 8, 2013

*Comments to the DEIR for the
World Logistics Center Specific Plan*

Pg. 4.1-62: The lost views along SR-60 can be mitigated to a reasonable extent by limiting the height of those building nearest the highway to somewhere below the view line of the distant mountains.

18

Pg. 4.1-66 MM 4.1.6.1A - The 250-foot setback as defined by the distance from residential property lines fails to address the true lack of adequate screening. Along Redlands Blvd. and Merwin Ave. where the roadway width alone could be greater than half the setback distance. Nothing precludes the remaining area from including parking lots, drive aisles, internal roads or storm drains. Residential property along Merwin lose the 250-foot to 66' of Merwin roadway, 125' flood control channel, 112' Street "D". Where does the buffer come in to the equation? You already have 303 feet of setback before a project site property line.

19

Explain what minimum level of buffering would be required with all these elements between a residential property line and the building. Explain what can go between the building and the project site property line.

Pg. 4.1-66: With 4.1.6.1A better define the setback from residential property. Are you talking about any on-site improvements, parking areas, drive aisles, or pure landscaping until the buildings?

Provide additional options/mitigations that could be used to lessen this loss of these scenic vistas. Create a new foreground scenic vista along these thoroughfares. A proposed **Mitigation Measure should include the option for either extensive landscaping along all these roadways and a lower building height for the buildings along SR-60 to preserve the views of Mt. Russell and San Jacinto.** This is possible because the building pad elevation is likely to be 30 feet or more below the surface grade of SR-60, as it was with Sketchers. Full considerations should be given to this option.

20

Pg. 4.1-69: Identify the mitigation measure. Should it be MM 4.1.6.2?

21

Pg. 4.1-70: The facade accents described in the SP appear to provide minimal accent treatments that will not break-up the huge mass of the buildings in such a way as to provide substantial vertical and horizontal relief. Considering the size and length of these buildings, corner treatments will only be found at the extreme ends of what could be buildings hundreds of feet and beyond a 1,000 feet long building. **Include MM to provide more substantial relief.**

22

Pg. 4.1-70: The landscape standards do not define a minimum landscape buffering area between the right-of-way and the on-site development. Incorporating the street width and citing a 250-foot separation fails to define a consistent landscape buffer.

23

The landscape design standards provide no information that would guaranty that a sizable planting area will be provided at road grade to support sufficient landscaping to achieve screening.

Table 4.1.C:

Thomas Thornsley
April 8, 2013

*Comments to the DEIR for the
World Logistics Center Specific Plan*

Objective 2.5: It would not appear that this project's proposal for one type of use on such a large scale in the City could be conclude as being "consistent" given the City's current lack of other types of industrial uses. Since so much of the available Industrial land within the City is utilized for warehousing the City does not and has not created a diversified economic base or ample employment opportunities for its citizens outside of this on particular use.

24

Policy 2.5.1: Should read, "Somewhat consistent" considering the scale of the project and the limited land use areas within the City that would remain to be available for the other Business Park/Industrial uses envisioned in the General Plan.

25

Policy 2.5.2: Cannot consider a landscape buffer to be enough separation between residential and industrial uses to avoid adverse impacts. All well trained planner know that less impacting uses such as neighborhood commercial, commercial, office, parks and open space constitute a buffer between residential and industrial. This EIR consistently references the unavoidable impact this project will bring to the surrounding land uses yet a 250-foot setback that includes roadways, drainage channels and a few feet of landscaping seems to be consider an acceptable buffer to offset the impact. A proposed **Mitigation Measure would require that a least a 1,000-foot alternative land use buffer permitting offices, commercial, parks, open space and public uses be placed between all proposed warehouses uses and residential property.** With this type of buffer and mitigation you could say compliance with Policy 2.5.2 is consistent.

26

Policy 2.5.3: Concluding the consistency of this policy is an assumption prior to seeing how the setback and screening methods will be implemented in a Plot Plan.

27

Policy 2.10.3: The SP's design guidelines fall short of effectively achieving several of the listed criteria because of the minimal relief offering comparative to the size and mass of the proposed high-cube warehousing. **Mitigation should be included that defines the parameters for greater relief and facade treatments.**

28

Policy 2.10.5: Nothing in the SP indicates that a landscape buffer strip will be provided along the freeway that can effectively provide for a landscape buffer. If parcels adjacent to SR-60 are graded similar to Sketchers to the east all of the landscaping will be planted on slopes below the grade of the highway. Additionally, the master developer had this condition waved on the neighboring project. Therefore you cannot conclude that this project is consistent with policy.

29

Policy 2.10.7: An analysis of consistence can only be made after plot plans are actually reviewed. Defined standards and mitigation measures should be in place before making determination of consistency with this policy.

30

Policy 2.10.9: Not entirely consistent because the WLCSP Section 5.2.12 states that "only minor changes of material and finishes are appropriate." The wall standard should address wall plane off-sets to break up the long continuous expanse of walls near the street. Additionally, a greater land scape buffer area should be required between the sidewalk and the wall. In some areas the landscape buffer is proposed to be drainage swales or filtration basins limiting the landscapeable area and the density of the landscape plantings that can affectively screen and compliment the walls and on-site development.

31

Thomas Thornsley
April 8, 2013

Comments to the DEIR for the
World Logistics Center Specific Plan

Policy 2.10.10: Again the evaluation of this policy states the freeway frontage will be fully landscaped but development of the site will dictate a downward slope from the freeway with no guarantee that screening landscape material will be place at roadway grade. **A Mitigation Measure needs to be included that requires a sizeable level area at or near grade with SR-60 in which sufficient landscaping can be planted to effectively screen the building and loading areas.** 32

Policy 2.10.11: See comment regarding more defined methods of assuring that this buffer area is effective. 33

Provide a Mitigation Measure that assures sufficient grade level landscaping adjacent to the roadways and SR-60 to accommodate landscape plantings that can effectively aid in the screening of the on-site improvements. 34

Provide a Mitigation Measure that guarantees a minimum 200-foot buffer area from right-of-way to on-site improvements. 35

Provide a Mitigation Measure that requires variations in the gradient of publicly visible slopes to avoid having continuous 2:1 slopes that would contribute to the monotony of the long expanse of the slope. Require this of slopes greater than 200 lineal feet. 36

Provide a Mitigations Measure that requires the landscape buffer facing the residential areas be designed in similar fashion to other streetscape landscaping in residential subdivisions. Installing this area with landscaping designed for the WLS will simply accentuate the fact that an industrial use is across the street and thus further degrading the residence's sense of well-being. Making this change with create a distinct variation between the industrial uses and the residential areas and aid in the appearance that these uses are separate. 37

Pg.4.1-73, MM 4.1.6.3A: **Provide additional mitigation measures that assure proper screening of the on-site improvements** as previously noted in the preceding comments. 38

Define the need to use light sources the produce "white" light for color rendition. This project area does not appear to need this source of light for viewing purposes like with outdoor auto sales or public activity area. Additionally, the use of "white" light when not necessary violates the Dark Skies requirements for Mt. Palomar Zone B. 38

Propose to amend the parking lot light standard for the WLCSP so lower light levels are considered acceptable to help mitigate the excess night glow.

Provide a Mitigation Measure that requires parking lot lights to go off after working hours or that they be activated my motion sensors where and when needed.

Pg. 4.1-74: **Include a mitigation measure that limits the height of all pole and wall mounted lights where located along residential areas. In no case shall wall-pack type security lighting be installed on buildings elevations facing towards residential neighborhoods.** 39

Pg. 4.1-75: Reference to the SP guidelines regarding lighting. – **Provide a mitigation measure limiting the height, number, and placement of street lights within the WLCSP area. Utilize lighting standard similar to rural lighting standard that only require street lights at roadway intersections and site access points.** Spillover lighting from on-site will likely cast enough ambient light onto the roadways. The streets within the WLC will not be utilized by the general public nor may they be heavily used at night. 40

Pg. 4.1-76: MM4.1.6.4A should also indicate the ambient night light levels at the project side of the right-of-ways. 41

MM 4.1.6.4B should permit solar panel use as shade covers in parking and storage areas following these same worst case conditions. 42

MM 4.1.6.4C: Since LPS is acceptable on the south side of buildings then it should the norm for all outdoor, uncovered lighting. 43

Section 4.02 Agricultural and Forestry Resources

Pg. 4.2-2: 4.2.1 Existing Setting – The 2,710 acres of the WLCSP are the only lands with that should be evaluated in the Agricultural Resources Assessment report Appendix C-2. The remaining area is not proposed for development nor is it a part of the WLCSP. It is only a part of the "project" because it requires change of land use on the General Plan Land Use Map. 44

Pg. 4.2-7: The 2,685 acres is the area that should have been assessed in the LESA Modeling. 45

Fig. 4.2.2: Why is this area in the middle of the project site eliminated from the calculations? 46

Pg. 4.2-14: Should only be assessing the WLCSP acreage. See Methodology. 47

Pg. 4.2-15: Agriculture is no longer a permitted use in any area of the proposed Specific Plan. The SP now only allows ag if it is established before project approval. 48

Pg. 4.2-16: The mitigation measure outlined in Section 4.1 cannot mitigate the loss of the most prominent existing natural resources; therefore this statement should reflect that it is inconsistent. 49

Pg. 4.2-16: The land discussed in the section is not a part of the specific plan and is only listed in the project because it is an administrative matter, therefore it cannot be used to credit Objective 4.1 for consistency. 50

Pg. 4.2-16: The right to farm only applies to those lands with legally established agricultural operations at the effective date of the WLCSP. 51

Pg. 4.2-17: Not acceptable to leave this to the City to implement. They will site lack of staff and resources to implement and monitor and therefore the mitigation will be lost. 52

Thomas Thornsley
April 8, 2013

*Comments to the DEIR for the
World Logistics Center Specific Plan*

- Pg. 4.2-17: Are there State run agricultural land banks that can accept the mitigation funds? Can other entities involve with land preservation be used to mitigate this lost resource? — 53
- Pg. 4.2-18, last paragraph: The 1,000 acres being given the Open Space designation and part of the Wildlife area are currently being farm and cited previously in this document. The statement "little, if any, of the adjacent land" is incorrect and should reflect that use. — 54
- Pg. 4.2-19: The SA sub-score would likely be higher because of errors made in configuring the Zone of Influence area. See comment under the Ag Resources Assessment. — 55
- Pg. 4.2-20: This is MM that places a burden on the City and will likely never be implemented. — 56
- Under 4.2.7 Cumulative Impacts it states that it will remove 3,389 acres of designated farmland when the project will only remove the 2,710 acres within the WLCSP. — 57
- Why is there no analysis to assess localized farming options as means to limit greenhouse gas emissions due to the increasing need to ship food stuffs greater distances? **Consideration should be made to implement mitigation measures offset the negative affect of longer shipping distances.** — 58

“Agricultural Resources Assessment for WLCSP DEIR” by Parsons-Brinckerhoff

Page numbering in this document did not covert correctly in the PDF file so the page numbers listed correspond to the actual page count in the file.

- Pg. 4: Explain why the evaluated project area includes the entire 3,814 acres when the project area includes over 1,000 acres that are not a part of the development plan. This acreage was lumped into the "project" only for the purpose of changing the land use designation as part of the GPA. — 59
- Pg. 9: Limits of the SP are incorrect because they include the open space area which in only part of the GPA. — 60
- Pg. 10: Not the correct crop info for the Moreno Valley area. Citrus was not the primary crop in this area. — 61
- Pg. 11: Water cost associated with on-site wells has not been assessed. There is no mention of the availability of water from wells or the option to install wells within the project acreage of the WLCSP. Some properties in project area have wells and or water rights. — 62
- Pg. 12: Need to make mention of the egg production ranch that was on the project site and demolished in the past decade. — 63
- Pg. 13: Verify rainfall for our region. — 64

Thomas Thornsley
April 8, 2013

*Comments to the DEIR for the
World Logistics Center Specific Plan*

Pg. 14: Describe them as man-made ponds and lakes.

65

Pg. 15: Elevation range is incorrect unless it is incorrect in the bulk of the other sections of the WLCSP DEIR. As noted elsewhere it should be 1,760 to 1,480 feet above sea level.

66

Pg. 26: The Lake Perris Recreation area comprises far less than 50% (see map) of the Zone of Influence Area. The boundary of the projects area's Zone of Influence is overstated because it includes land that is not part of the specific plan and therefore should not be counted because it falsely expands the influence area. Additionally, the geometric shape used to encompass the project area should be drawn on a diagonal to more tightly configure the area. You could also use a six-sided configuration to incorporate the project area to give you the zone of influence.

67

Pg. 28: The conclusion made in Section 3.4 is incorrect and needs to be reassessed. The area south of the WLCSP is owned by CDFG and is being used for agricultural purposes at this time.

68

Section 4.9 Hydrology

Pg. 4.9-21: Explain if any of the surrounding areas fall within the 100-year flood zone. The homes in the area west of Merwin Ave were flooded twice in the past six years, the most recent being in August of 2012. Verify impacts with the City's Public Works Department. This has a bearing on the drainage to the southwest of the project site. Should project flows exceed historic levels there would be need for further mitigation.

69

Pg. 4.9-25: The last paragraph identifies Line "F" but it should be Line "A".

70

4.13 Population, Housing and Employment

Pg. 4.13-2 & 3: In tables on these two pages are three different housing unit figures from various sources and the range is more than 4,000 units in a one year period. This is a 9% difference which will skew all calculations for housing to jobs ratios. These unit variations cannot be related to recent housing growth because the City has issued few home construction permits in the past three year. An accurate total should be used and the statistics in these sections revised to reflect a more accurate standing of the community characteristics.

71

Opening Comment: The job figures and revenue projections are not consistent within throughout or within Sections 4.13 Population and Housing, Section 5.0 Other CEQA Topics, and Appendix O-1 Fiscal and Economic Impact Study. The number of inconsistencies are too numerous to note but they tend to taint the validity of the information or the results. It is likely these figures are also inconsistent throughout the other sections of the EIR. Please correct.

72

PG. 4.13-9: Why are 24,642 employees considered a "worst-case" estimate for environmental impacts when the GP goals and objectives encourage job creation thus besting the jobs to housing ratio. Using the larger figure appears to skew the reality of what may really happen - fewer jobs for the impacts incurred. Please explain how this benefits the community and aids the decision maker in assessing the value of the project against its impacts.

73

Pg. 4.13-10: Please explain how this calculates out based on the available workforce in the City and the number of residents that would desire these jobs.

Provide calculations based on the available workforce in the City, 2010 Census data on employment categories for the residents, and then figure how many residents would like have the talent or desire to work in the logistic industry. If this figure is less that the job produced then you can expect people to be drawn to the City thus inducing growth.

74

Pg. 4.13-11: Recurring costs should be calculated over the life of the project and projected for 20-years after predicted build-out. Over time service cost typically out pace tax increment increase thus eliminating the surplus. Property taxes will only rise at the rate set by Proposition 13 while the police and fire services alone will be going up at a greater rate. In each of the next two fiscal years the City is obligated through public safety contracts to 5% annual pay raises. Additionally, other services and cost will rise at the rate of inflation or higher. Either way these rates will outpace the property tax increment rise. Discuss why this is not been addressed. See attached example of a fiscal impact analysis required by Riverside County for business park development.

75

Pg. 4.13-12, Table 4.13.J: Please make note whether this annual salary is for permanent staff or all staff including temps needed for the operation. Most researched information on warehouse operations indicates that a large percentage of those working on-site are temporary hires not on the operating payroll thus not factored it the average salary shown.

76

Pg. 4.13-13: Table and text for number of construction job is not consistent with the fiscal report Apdx. O-1.

Paragraph two states 16,395 full-time equivalent jobs but nowhere in the text does it say that this is the total job count over a 10 period. Explain why this is not addressed or have it incorporated into the analysis. How do you defend the assumption that a lot of these jobs are likely to be in the vicinity and therefore within the City?

77

Based on the Fiscal and Economic Impact Study the potential jobs has a low range near 13,000 that should also be included in this discussion. Why is it not?

Pg. 4.13-14: Summary of Impacts use figures for surplus that are not consistent with the fiscal report Apex. O-1.

78

Under 4.13.5.2 there should be a discussion about the job housing balance that it offered and the total jobs it would have created. The abandonment of MHSP not only changed the housing count it displaced the jobs it would have created.

79

Section 5.0 Other CEQA Topics

Pg. 5.5, Paragraph 3: The new job figures are not consistent with those found in Section 4.13 or Appendix O-1 Fiscal and Economic Impact Study.

80

Thomas Thornsley
April 8, 2013

Comments to the DEIR for the
World Logistics Center Specific Plan

The next paragraph again has job and revenue figures that cannot be found in either of the documents listed. In review of all three documents the figures used are not consistent throughout the EIR.

81

5.4 Urban Decay: Planning studies throughout America have analyzed the inherent condition of urban decay in neighborhood near industrial development. The typical finding are that the home value decline in neighborhoods next to industrial operations and over time decay and become blighted areas of those communities. The Fiscal and Economic Impact Study does not take into the secondary effect the WLC will have on the neighboring communities and how it will likely depress property values and thus lessen the anticipated property tax revenue the City receives. Why was this not addressed?

82

6.0 Alternatives to the Proposed Project

Did the Existing GP Alternative reduce the total dwelling unit count based on the land area lost to CDFW?

No Project, General Plan – Moreno Highland SP: Please explain the rational for the stated housing units expressed in this analysis. It appears to be very close to the number of dwelling units in the SP yet about half of the residential area was sold off to the CDFG in the year prior to MHSP's approval. This alternative could never have been built and therefore is not a valid alternative to assess. What should have been assessed was a modified version of the MHSP less the residential area removed from development. Based on the purchase date of over one quarter of the MHSP project area it would appear that the developer had no intention of ever developing this land when they entered into a development agreement with the City designating the land uses be in place for 20 years. See your project site history in the project summary.

83

Thank you for the opportunity to comment on the Draft EIR for this project. I request to be informed of all meetings and public hearings related to this project or other consideration in east end of Moreno Valley. Please let me know if it is possible to receive a copy of all comment to the DEIR as soon as they are available. I would also like to request copies of any follow-up documents related to this project (the Development Agreement, 2nd DEIR and/or Final EIR). Feel free to contact me if you have any questions regarding my comments.

Sincerely,

Thomas Thornsley
909-797-1397
e-mail: tomthornsley@msn.com

Attachment: Thomas Thornsley's Resume

RESPONSES TO LETTER G-95

Thomas Thornsley

Response to Comment G-95-1a. The commenter believes the City should adopt stronger mitigation, alternatives, or a much smaller project. The City has the discretion to determine what action should be taken on the project application. The City Council will consider all comments and responses on the project and Environmental Impact Report (EIR) before making a decision on the World Logistics Center (WLC) project.

Response to Comment G-95-1b. The commenter is concerned the 1000 acres of state conservation land south of the World Logistics Center Specific Plan (WLCSP) property is mentioned as part of the project. The commenter misunderstands the relationship of the state conservation land south of the WLCSP property. The 1000 acres south of the WLCSP property was purchased from or out of the Moreno Highlands Specific Plan (MHSP) property. The minutes from the Wildlife Conservation Board action at that time specifically says it will act as a buffer from planned urban development (i.e., at that time the rest of the MHSP)(DEIR Section 4.4.1.16). The existing state conservation land is being rezoned as part of the discretionary actions requested by the WLC project because at present those lands are still zoned for a golf course and various residential uses under the Moreno Highlands Specific Plan (MHSP). Refer to Response to Comment F-10-9 for further details.

Response to Comment G-95-2. The commenter asked why the debris basin east of Gilman Springs Road is not inside of the project. The potential debris basins depicted on the easterly side of Gilman Springs Road are a function of future improvements to Gilman Springs Road. The purpose of the debris basins are to trap the sediment and debris from storm water runoff coming from the Badlands before it reaches the culverts under Gilman Springs Road. Once debris reaches the culverts it will reduce the ability for storm water runoff to pass under the roadway, and in the worst case, plug the culverts completely. This situation exists today where the existing culverts are partially, and in some cases, completely plugged.

Placing debris basins downstream of the culverts, and within the project boundary, would not provide any benefit to prevent the culverts from becoming plugged. Excess flows that can't cross under Gilman Springs Road will cross over the road jeopardizing the roadway and public safety.

Response to Comment G-95-3. The commenter complained that the General Plan Amendment (GPA) would not establish logistics warehousing on the 3,814 acres of the WLC project because there are two other categories of land uses for over 1,104 acres of that total (DEIR page 3-25). The commenter is correct, the General Plan Amendment description on page 3-25 of the DEIR has been changed to clarify what areas of the project will have logistic land use designations.

Response to Comment G-95-4. The commenter wants text added in the EIR that multiple forms of transportation are not available to this site. Text will be added to DEIR page 3-26 in this regard.

Response to Comment G-95-5. The commenter asked for an explanation of why the project is adding a new land use category to the General Plan verses just modifying the uses under Business Park. The WLCSP is site specific and is not proposed to be utilized anywhere else in the City. The comment does not raise an issue with the adequacy of the Draft Environmental Impact Report (DEIR). In this case, no response is required because that is the project that was proposed by the applicant and duly reviewed in the DEIR. However, the City Council will consider all comments prior to taking any action on the project.

Response to Comment G-95-6. The commenter asks how the Moreno Highlands Specific Plan addresses the rural northeast portion of the City. How the MHSP dealt with this area is not at issue here, that land use plan is the currently approved General Plan and zoning for the WLC site. Section

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

4.1 of the DEIR addresses aesthetic issues of the WLC project relative to surrounding land uses and scenic routes, and concludes aesthetic impacts are significant. However, Mitigation Measure 4.1.6.3A has been revised to preserve the upper two thirds of views of Mt. Russell.

Response to Comment G-95-7. The commenter points out several labeling errors in the DEIR relative to the photographic renderings for the project. These have been corrected in the revised DEIR (Final EIR Volume 2, Section 4.1, Aesthetics).

Response to Comment G-95-8. The commenter says Objective 2.5 and Policy 2.5.1 should only apply where appropriate. The City Council will determine whether approval of the project is consistent with the objectives and policies of the General Plan.

Response to Comment G-95-9. The commenter asks what will be done to reduce aesthetic impacts. As outlined in Response to Comment G-95-6, MM 4.1.6.3A has been modified to preserve views of Mt. Russell.

Response to Comment G-95-10. The commenter is concerned about freeway landscaping buffers per General Plan Policy 2.10.5. That policy states that... *“Development projects adjacent to freeways shall provide landscaped buffer strips along the ultimate freeway right-of-way.”* The policy does not mandate the landscape buffer be level, upslope, downslope, bermed or otherwise. It is the intent of the policy is to provide a soft buffer in addition to the minimum building setback along the freeway. As depicted in Figure 4.1.4G of the DEIR, a landscape buffer is proposed between the freeway and the development. It will be a down slope condition from the freeway, very similar to the existing condition along the south side of the freeway segment between Redlands Boulevard and Theodore Street.

Response to Comment G-95-11. The commenter asked why there is not a level landscaping strip between the maintenance road and the bank of the detention basin per Figure 4.1.4H. The City grading code requires and general practice is to provide a minimum 2 foot level area between a roadway and a top or toe of slope or bank. The depiction in Figure 4.1.4H is not at a scale that allows to depict such a level of detail nor was it intended too. This will be a detail incorporated during design level drawings and City review and plan check.

Response to Comment G-95-12. The commenter asked why there would not be landscaping or a screen wall on the downslope shown in Figure 4.1.4I. Figure 4.1.4I has been updated to depict landscaping on the downward slope. The section does not depict a screen wall as it is the intent to screen the view into the truck yard with a combination of landscaping and a screen wall in the 8-foot buffer adjacent to the sidewalk. The commenter is referred to the updated Specific Plan which shows enhanced landscaping and screening for the residential buffer treatment area (Special Edge Treatment Areas, WLCSP Section 2.5) along Redlands, Bay, and Merwin.

Response to Comment G-95-13. The cross sections in Figure 4.1.4J depict a minimum 20-foot landscape buffer along all streets, and outside of the street ROW. This is to control the development edge and ensure a continuous and uniform landscape treatment along all streets. The landscape buffer will actually be greater than 20 feet when you add in the additional 8 feet of level landscape area between the ROW. and the top or toe of the slope. From the perspective of a pedestrian there will be 28 feet of landscape buffer. From the perspective of the motorist, there is an additional 6 feet of parkway landscape between the sidewalk and the street curb, totaling 34 feet of landscape buffer. These allow room for extensive landscaping and plant maturity. Individual projects will likely provide additional landscaping on each building site. Those details will be reviewed and approved by the City during the required Plot Plan process.

Response to Comment G-95-14. The commenter recommend a color palette with more earth tones or justification why basically white is so important (e.g., heat island). The DEIR provides mitigation measures for substantial screening of buildings along the project boundaries (MM 4.1.6.1A). In

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

addition, a mitigation measure for buildings adjacent to California Fish and Wildlife area (southern boundary) is included requiring those buildings along the southern boundary be an earth tone color (Specific Plan Section 5.3.12). It is a project design feature for all remaining buildings and walls to be white in color to meet the WLCSP architectural goals of clean and simple architecture. White colors do reflect heat and it is a project goal to be LEEDs certified which provide points for use of white roofs and light colored pavement. This would also include walls. The building color is a detail included in the review of each proposed building. The specific building location, size, configuration and color and its potential impacts on adjacent uses will be reviewed at that time.

Response to Comment G-95-15. The commenter discusses topics including streets, flood control improvements, etc. within the 250-foot setback. The 250 foot setback is to provide a horizontal separation between existing sensitive land uses adjacent to the project and the proposed buildings and truck yards. The 250 foot setback is not necessarily for screening, but will allow for opportunities to provide screening. As the commenter notes where an existing roadway such as Redlands Boulevard, Bay Ave. or Merwin Street exist they are included in the 250 feet, but as the sections depict, screening will be accomplished with berms, landscaping and site walls in the area remaining. Within the 250-foot setback, vehicle parking (no trucks) and emergency access aisles are allowed, but will be screened as depicted in the DEIR, required in the WLCSP, and as provided for in the mitigation measures (Specific Plan Section 2.5). Future project level approvals such as site plans and plot plans will demonstrate adherence to these requirements and will be further conditioned to comply.

Response to Comment G-95-16. The commenter asked why the 250-foot buffer is not measured from the property lines. The reader is referred to the Response to Comment G-95-15. The 250-foot setback is consistent relative to the adjacent sensitive land uses. The project does propose a landscape buffer and it will vary in width, and will have substantial width to provide the necessary screening of the buildings as depicted in the DEIR, required in the WLCSP (Section 2.5), and as provided for in the mitigation measures (MM 4.1.6.1A).

Response to Comment G-95-17. The commenter asked what building and/or screen wall characteristics will “aid in the aesthetics of the buffer zone” per page 4.1-62 in the DEIR. The potential visibility of each proposed building will be one of the details reviewed in connection with each project-specific Plot Plan to be reviewed and approved by the City. Building architecture, landscaping, and walls will all contribute to providing a pleasing aesthetic treatment where buildings may be visible from perimeter streets. No buildings will be allowed in the 250 foot buffer zone, but screen walls may (Specific Plan Section 2.5). Walls of varying types are often incorporated into landscaped setbacks to provide architectural character and offer some diversity in the aesthetics of the landscape. Screen walls can be utilized as a trellis to support growth of vines, or offer wind breaks or shading to support a plant’s growth.

Response to Comment G-95-18. The loss of views along SR-60 has been mitigated to a reasonable extent by creating a building pad that is forty feet below SR-60 as depicted on the concept grading plan (see figure 4.1.5K). Additionally, MM 4.1.6.3A has been modified to limit the height of the building(s) along SR-60 in order to preserve 67% of the view to Mount Russell.

4.1.6.3A ~~Prior to the issuance of any discretionary permit for development under the WLCSP, the developer shall provide a site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that demonstrate changes in views of Mount Russell, the Badlands, and/or Mystic Lake for travelers along SR-60 or Gilman Springs Road, as appropriate. The renderings shall be sufficient to demonstrate typical views based on proposed site and landscaping plans, but the location and number of view presentations shall be at the discretion of the City Planning Division. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource.~~

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.

Response to Comment G-95-19. The commenter asked why the 250-foot buffer is not measured from the property lines. The setback area will include improvements, non-truck parking, landscaping, drainage improvements, maintenance access, etc., no buildings or truck access areas are permitted (Specific Plan Section 2.5). The DEIR does provide for project by project review of all buildings within the WLC including details regarding site landscaping, screening and visual impacts from adjacent residential areas and SR-60. Refer to the Response to Comment G-95-15 for further detail.

Response to Comment G-95-20. The commenter wants the 250-foot buffer better defined, and wants more specificity in the aesthetic mitigation. The buffer is intended as a building setback, but walls, landscaping, and drive areas can be located within it as long as they are effectively screened from the adjacent residential areas (see revised MM 4.1.6.1B).

4.1.6.1B ~~Prior to the issuance of any discretionary permit for development under the WLCSP adjacent to Redlands Boulevard, Bay Avenue, and Merwin Street, the developer shall provide a plot plan or site plan, landscaping plan, and visual rendering(s) consistent with the WLCSP that accurately illustrate the appearance of the proposed development. The renderings shall be sufficient to demonstrate that views of the buildings and trucks will be effectively screened from view by existing residents upon maturity of planned landscaping. The location and number of view presentations shall be at the discretion of the City Planning Division.~~

4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.

Based on the requirements of the WLC Specific Plan (see Section 2.5), and with the mitigation proposed, only about a third of the tops of the warehouse buildings will be visible at most, and the planned berms, walls, and mature landscaping are expected to visually block views of the lower portions of the warehouse buildings. In addition, see Response to Comment G-95-18, which describes how MM 4.1.6.3A has been modified to preserve views of Mt. Russell.

Response to Comment G-95-21. The commenter believes the action listed on DEIR page 4.1-69 should be listed as Mitigation Measure 4.1.6.2A. See Response to Comment G-95-20 for changes to MM 4.1.6.1B related to views from the residential areas along Redlands Blvd. See also Response to Comment G-95-18 for changes to MM 4.1.6.3A related to views from SR-60.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-22. It is the commenter's opinion the façade accents described in the Specific Plan will not provide "substantial vertical and horizontal relief" per page 4.1-70 of the DEIR. The Specific Plan establishes design standards and development guidelines to ensure a consistent and attractive appearance throughout the entire project. The WLCSP Section 5.3 sets forth architectural guidelines, and the City Council will decide whether they are sufficient and will consider the comment before making a decision on the project.

Response to Comment G-95-23. The commenter points out the landscape standards do not define a minimum landscape buffer area. The Specific Plan includes a series of exhibits that illustrate a variety of design treatments along adjacent streets. The details of these areas will be included in project specific plot plans, however in general terms there will be at least 40 feet of landscape area behind the closest street right of way.

Response to Comment G-95-24. The City's General Plan provides ample opportunities for all types of residential and non-residential development within the City limits. While there are other planned logistics facilities within the City, there is also a considerable amount of industrial zoned land available for other uses available within the City to create a further diversified economic base to boost employment opportunities. The City Council will decide whether the project is consistent with the General Plan and will consider the comments prior to deciding whether to approve the project.

Response to Comment G-95-25. The commenter says the project is only "partially consistent with Policy 2.5.1. The City Council will determine whether the project is consistent with the Policy.

Response to Comment G-95-26. The commenter believes a 1,000-foot wide buffer of non-industrial land uses is needed for the west side of the project, then it is consistent with General Plan Policy 2.5.2. General Plan Policy 2.5.2 requires that industrial land uses be located to avoid adverse impacts. The 250-foot buffer that has been proposed for west side of the project provides a buffer, which includes landscaping and a berm or wall, will reduce projects impacts on adjacent uses, The air quality analysis determined that extending the buffer to 1,000 feet would not substantially further reduce the impact over a 250-foot buffer. Specifically, the results for the maximum incremental cancer risk are essentially the same for the 250-foot buffer and the 1,000-foot buffer. The buffer would not substantially reduce air quality impacts.

As shown in Section 4.3 of the EIR, the locations of the 10 in one million cancer risk contour line for the project design and the 1,000-foot buffer under the 30-year exposure duration are mostly coincident and overlap each other. The standard for implementing mitigation under CEQA is not whether it would have any benefit. The standard, as described in CEQA statute, is whether the proposed mitigation would avoid or "substantially reduce" a significant impact. A 1,000 foot buffer does not meet that standard and therefore does not need to be implemented. The City's Municipal Code Section 9.05.040B(9) requires a 250-foot setback between residential and industrial uses, based on project specific noise and air quality studies. Therefore, there is no need for a 1000-foot wide buffer of non-industrial land uses to be consistent with General Plan Policy 2.5.2. In addition, a buffer analysis indicates that a 1,000-foot buffer does not substantially reduce the impact (please refer to Master Response 4).

Response to Comment G-95-27. The commenter says a plot plan is needed to determine consistency with Policy 2.5.3. Since this is a programmatic EIR, future discretionary approvals will require additional California Environmental Quality Act (CEQA) analysis based on more details such as building size, location, architecture, and landscaping. The City would then require the plot plan to be consistent with this policy during their discretionary review process.

Response to Comment G-95-28. The commenter believes the Specific Plan does not have enough detail regarding façade treatments and mitigation is needed. The WLCSP Section 5.3 sets forth

architectural guidelines, and the City Council will decide whether they are sufficient and will consider the comment before making a decision on the project.

Response to Comment G-95-29. The commenter expressed concern about landscaping along the SR-60 Freeway. The Specific Plan provides design guidelines for the SR-60 area. The Plot Plan process provides for the City to review and approve every building proposal to insure compatibility with these guidelines and the General Plan policy cited in the comment. The ultimate decision on consistency will be made by the City Council.

Response to Comment G-95-30. The commenter had several specific design suggestions. Nothing in the proposed project suggests that the cited General Plan policy will not be carried out in the development of the WLC project. The Plot Plan process required by the Specific Plan allows for the City to review each building proposal and evaluate its consistency with the General Plan policies. The ultimate decision on consistency will be made by the City Council. The commenter says consistency with Policy 2.10.7 can only be done at the plot plan level. As outlined in the Response to Comment G-95-27 above, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require plot plans to be consistent with this policy during their discretionary review process. In addition, restrictions on lighting are already required as outlined in DEIR Section 4.1.6.4.

Response to Comment G-95-31. Section 5.2.12 of the Specific Plan 'Walls and Fences' lists design features that may include varied heights, wall plane offsets and angles. This addresses the commenter's concern.

The landscape areas shown in various cross sections in Section 4.2.8 illustrate that there is a minimum 20 foot landscape buffer as well as an additional 8 foot landscape area as part of the streetscape. This provides a total of 28 feet of landscaping between the sidewalk and the edge of development which is where a wall could be built. Additionally, the bioswales are in front of the sidewalk and therefore will not affect the landscaping for the purposes of screening.

Response to Comment G-95-32. The commenter wants mitigation added for a flat area next to SR-60 to provide for landscaping to effectively shield the buildings from freeway views. As outlined in the Response to Comment G-95-27 above, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require landscaping plans to effectively screen buildings from the freeway during their discretionary review process. See Response to Comment F-8-3 for text of new MM 4.1.6.2B to assure views will be effectively shielded from existing residential (only top quarter of the buildings can be visible under the revised measure).

Response to Comment G-95-33. The commenter wants more specificity regarding the landscaping buffer to be consistent with Policy 2.10.11. As outlined in the Response to Comment G-95-27, this is a programmatic EIR, future discretionary approvals will require additional CEQA analysis, and the City would require landscaping plans to effectively screen buildings from adjacent uses, consistent with this policy, during their discretionary review process. The ultimate decision on consistency will be made by the City Council.

Response to Comment G-95-34. The commenter is concerned about landscaping along the SR-60 Freeway. The reader should see Response to Comment G-95-10 and G-95-32 on this issue.

Response to Comment G-95-35. The commenter wants mitigation for a 200-foot no improvements buffer. The established 250-foot setback is to provide a horizontal separation between existing sensitive land uses adjacent to the project and the proposed buildings and truck yards. In general terms there will be at least 40 feet of landscape area behind the closest street right of way. Future project level approvals such as plot plans will demonstrate adherence to these requirements and will be further conditioned to comply. MM 4.1.6.1A identifies the appropriate buffer for the project/residential interface which will have extensive landscaping, walls and berms to provide

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

effective visual screening. The commenter has not indicated why a different buffer definition is needed. See also Response to Comment G-95-15 for additional information in this regard.

Response to Comment G-95-36. The commenter was concerned about 2:1 slopes for landscaping. Once the landscaping is established, the variation in ground cover itself will provide relief to the topography of the 2:1 slopes.

Response to Comment G-95-37. The commenter said the special landscaping would simply highlight there were industrial buildings nearby. The special edge treatment discussed in the specific plan (2.5) illustrates a landscape treatment that is residential in nature as compared to the internal street treatments proposed within the WLC.

Response to Comment G-95-38. This comment raises several issues. Section 4.1.6.4 of the EIR discusses the potential light impact of the project, and MMs 4.1.6.4A and B contain specific requirements for lighting impacts to be measured, evaluated and mitigated to minimize light spillage into the San Jacinto Wildlife Area (SJWA). The plot plan process is the best possible measure to evaluate the specific impacts of specific buildings when they are proposed, particularly as it relates to the screening of buildings from adjacent land uses. The light levels proposed for projects within the WLCSP will be designed to specifically address the needs of each individual building, its users, its operating hours and operating characteristics. Lighting plans will be a required part of each plot plan application to allow these details to be evaluated.

The commenter asks for additional screening of onsite improvements under MM 4.1.6.3A, and also has several comments about night lighting. It must be remembered this is a programmatic EIR and additional discretionary review will occur when specific development plans are submitted in the future. The WLC Specific Plan already requires that onsite improvements be screened (WLCSP Section 5.2.12) and the City requires screening during its standard development review process. Therefore, additional mitigation is not necessary regarding onsite screening.

The commenter asked that “white light” on the project be restricted per the Mt. Palomar Zone B requirements. Relative to onsite lighting and dark sky requirements, future development will be required to comply with the City’s lighting ordinance. MM 4.1.6.3A requires the WLCSP will be consistent with the City’s new lighting ordinance 851 (Moreno Valley Municipal Code Section 9.08.100). More information on “white light” spillage and low pressure sodium lighting along the SJWA boundary is provided in Responses to Comments F-1-21 and G-95-43.

The commenter asked that the Specific Plan standards be reduced for parking lot lighting and timers or motion sensors be added to switch off parking lights when not needed. The City has the discretion to require these types of controls under their revised lighting Ordinance 851, with which MM 4.1.6.4A requires compliance.

Response to Comment G-95-39. The commenter wanted the heights of light poles and wall mounted lights limited. Between the guidelines contained in the Specific Plan (Section 4.3), MM 4.1.6.4A and the requirement for building specific plot plan reviews, including lighting, the potential impacts on residential neighborhoods can be fully evaluated and addressed. See also Response to Comment G-95-38 for additional information.

Response to Comment G-95-40. The commenter wants the placement of street lights specified in the Specific Plan. The streets within the WLC are public streets and they may be used by anyone at any time. The City of Moreno Valley will determine the lighting necessary for these roadways and the project will be required to install said lighting at such time as development occurs.

Response to Comment G-95-41. The commenter wants light pole heights and building lights limited so they won’t affect nearby residents. Future development will be required to comply with the City’s

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

revised lighting ordinance (MM 4.1.6.4A) which limits industrial lighting impacts on adjacent residential uses, including light pole heights and building light placement, consistent with the commenter's direction. Therefore, no additional mitigation is needed.

Response to Comment G-95-42. The commenter said solar panels should be used as shade covers in project parking lots. It is most likely solar panels will be roof-mounted installations to minimize intrusion of panels into developable space. While no parking lot solar panel assemblies are proposed at this time, such installations would be in keeping with the sustainable nature of the WLC project. Therefore, they would be considered on a case-by-case basis on future submittals. In addition, Aesthetics MM 4.1.6.4B was modified as follows:

4.1.6.4B ~~Prior to the issuance of any building permits for development under the WLCSP, the developer shall provide an analysis of any solar panels to be installed on the roof of the new building. The analysis shall demonstrate that, under "worst case" annual conditions, glare from the proposed panels will not leave the confines of the roof, based on building roof parapet design, and affect adjacent residential uses or public travelers along perimeter roadways. Design or construction modifications necessary to meet these requirements shall be implemented to the satisfaction of the City Planning Division.~~

4.1.6.4B Each Plot Plan application for development shall include an analysis of all proposed solar panels demonstrating that glare from panels will not negatively affect adjacent residential uses or negatively affect motorists along perimeter roadways. Design details to meet these requirements shall be implemented to the satisfaction of the Planning Official.

Response to Comment G-95-43. The commenter recommends low pressure sodium (LPS) lighting throughout the WLCSP area. MM 4.1.6.4C in the original DEIR stated..."Prior to the issuance of any building permit for development under the WLCSP, low pressure sodium (LPS) lighting shall be installed on the south sides of any building adjacent to the San Jacinto Wildlife Area (SJWA) to minimize "white" light spillage into the SJWA. This measure shall be implemented to the satisfaction of the City Planning Division based on consultation with the SJWA manager." However, the measure was eliminated due to low pressure sodium lights being prohibited in the City's new Ordinance 851 which amends City Municipal Code Section 9.08.100. The project will still need to minimize white light spillage into the adjacent SJWA and will comply with Ordinance 851. Light intensity levels will be maintained at levels outlined in that ordinance (i.e., prohibit lighting in excess of 0.25 foot candles within 5 feet of adjacent property lines). The reader should also see Response F-1-21 regarding low pressure sodium lighting.

Response to Comment G-95-44. The commenter states only the Specific Plan area should be evaluated using the (California) Land Evaluation and Site Assessments (LESA) model. The LESA analysis in the PB agricultural report (DEIR Appendix C-2) was rerun using just the new 2,610-acre area of the Specific Plan, and the LESA score goes from significant to less than significant. A second agricultural report was prepared by Cushman-Wakefield (Final EIR Volume 2, Appendix C-4) that supported this conclusion of a less than significant impact relative to the loss of agricultural land. However, additional mitigation for loss of agricultural land in the form of a conservation easement on offsite agricultural land to compensate for the loss of onsite unique farmland. The commenter is referred to Response to Comment F-7A-39 for wording of addition MM 4.2.6.1A.

Response to Comment G-95-45. The commenter again indicates only the Specific Plan area should be included in the LESA calculation. The LESA model was re-run to do this as outlined in the Response to Comment G-95-44.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-95-46. The commenter asks why middle of the property is excluded from the calculation as shown in Figure 4.2.2. The referenced map shows agricultural land as indicated by the State Farmland Mapping Program, it does not relate directly to the LESA calculation process, which did use the entire Specific Plan area, plus the state conservation land to the south in the original analysis (DEIR Appendix C-2). As outlined in the Response to Comment G-95-44, the LESA model was re-run using just the WLCSP property and determined loss of agricultural land was actually a less than significant impact – this conclusion was supported by a second independent report prepared by Cushman-Wakefield (Final EIR Volume 2 Appendix C-4).

Response to Comment G-95-47. The commenter again says the LESA model calculations should only apply to the specific plan area. The Response to Comment G-95-44 above addresses this concern, and the model has been re-run to address this concern.

Response to Comment G-95-48. The commenter states agriculture would no longer be an approved use under the Specific Plan. The commenter is correct, as the land transitions from agriculture to warehousing, those activities are not generally compatible due to dust, farm vehicles on local roads, etc. However, existing farming activities, which are currently on most of the project site, could continue until in an area until that area develops.

Response to Comment G-95-49. The commenter expresses concern about the visual mitigation in Section 4.2 of the DEIR. The commenter should note that MM 4.1.6.3A has been revised to allow for the preservation of two thirds of the vertical view of Mt. Russell, as outlined in Response to Comment F-8-3.

Response to Comment G-95-50. The commenter is concerned the project will take credit for existing state conservation land. The WLC project is not “taking credit” for the state conservation land included in the General Plan Amendment and Zone Change, the DEIR was trying to explain the relationship of the various areas within the WLC project. Section 4.4.1.16 explains the history of the state conservation areas south of the WLC development area.

Response to Comment G-95-51. The commenter mentions the right to farm ordinance only applies to existing agricultural uses on the property at present. That is correct, and the rationale for that is explained in the Response to Comment G-95-48 in this letter. The definition of the CDFW Conservation Buffer Area can be found in FEIR Volume 2 DEIR Section 4.4.

Response to Comment G-95-52. The commenter says MM 4.2.6.1A cannot be left to City staff to implement. However, this mitigation measure has been replaced with a new measure that requires the provision of an offsite agricultural conservation easement which is now considered the appropriate mitigation for the agricultural impacts of the WLC project (i.e., loss of 25 acres of Unique Farmland).

Response to Comment G-95-53. The commenter wonders if the state can run an agricultural mitigation bank. As outlined in the Response to Comment G-95-44, new MM 4.2.6.1A requires the developer to acquire a conservation easement on offsite farmland of equal productivity.

Response to Comment G-95-54. The commenter asks that a minor correction be made to page 4.2-18 in the DEIR regarding farming of the state conservation land to the south. This correction will be made in the revised DEIR (Final EIR Volume 2).

Response to Comment G-95-55. The commenter says the LESA Model SA score would be higher. In fact the LESA model was re-run per the commenter’s earlier suggestions and the score went from significant to less than significant as the SA score went below 20 (19.5 in one calculation, 18 in the other). For additional information, see the Response to Comment G-95-44.

Response to Comment G-95-56. The commenter says the heritage farm will place a burden on the City. This mitigation measure has been replaced with a new measure MM 4.2.6.1A that requires the provision of an offsite agricultural conservation easement which is now considered the appropriate mitigation for the agricultural impacts of the WLC project (i.e., loss of 25 acres of Unique Farmland).

Response to Comment G-95-57. The commenter asks that a number be corrected in the cumulative agricultural impacts section. That correction will be made in the revised DEIR (Final EIR Volume 2).

Response to Comment G-95-58. The commenter asks why local farming options were not explored that would reduce greenhouse gas emissions. As outlined in Section 4.2.7, *Agricultural Resources – Cumulative Impacts*, continued farming on the project site is not economically feasible given the high cost of water and property taxes on the vacant land. Local groundwater, which could be available via several onsite agricultural wells, cannot be used to irrigate crops due to its high nitrate and salinity levels based on irrigation limits established by the Regional Water Quality Control Board and the Eastern Municipal Water District. At present, dry farming with its low planting and maintenance costs is the only economical agricultural activity on the project site, so keeping a large portion of the project site in agriculture to offset greenhouse gas emissions from new warehouses is not feasible given current economic conditions. In addition, Response to Comment F-7A-45 explains why local groundwater cannot be used to irrigate onsite crops.

The developer has indicated the farmers that utilize the WLC property try to market their winter wheat as close as possible to the City to minimize transportation costs, which is one of the main reasons to dry farm compared to raising irrigated crops (i.e., low cost). In addition, the Greenhouse Gas (GHG) analysis for the WLC project assumed no existing emissions from onsite activities to provide a worst case estimate of WLC emissions (i.e., only from new development) and also did not claim any credit for reductions of GHG from onsite absorption from onsite vegetation of local sales of onsite dry farmed crops. Such emissions would be a miniscule portion of the estimated tons of GHG emissions from the WLC project that such minor contributions, positive or negative, would have demonstrable effect on the outcome of the analysis.

Response to Comment G-95-59. The commenter asks for clarification for why over 1,000 acres of area not included in the development plan were evaluated in the Agricultural Resource Assessment. In the Original Agriculture Resources Assessment, the State conservation area was included in the calculations in an attempt to overestimate and not minimize potential impacts to the surrounding area. The agricultural assessment has been revised to exclude the State conservation area and the LESA model calculations were reanalyzed based on this smaller acreage. The smaller acreage caused the results of the LESA model calculations to change the level of significance to less than significant.

Response to Comment G-95-60. The commenter states that the limits of the WLCSP are incorrectly shown in the Agricultural Resource Assessment due to the inclusion an open space area which is only part of the GPA. The area that the commenter refers to is the CDFW Conservation Buffer Area which has been taken out of the Agricultural Resource Assessment (Appendix C-2 of the FEIR Volume 2) and the agricultural analysis of the project site has been revised.

Response to Comment G-95-61. The commenter states that the crop information in regard to citrus growth in the project is incorrect. The project area has supported a wide variety of agriculture, over the years including citrus. The commenter is referred to the Revised Agricultural Resources Assessment page 6-7 in Appendix C-2 of FEIR Volume 2 for additional information and references. According to historical records, and as outlined in Section 4.2.1 of the DEIR, the Moreno Valley has supported a number of agricultural crops over the years, including citrus. In fact, until recently, there were over 50 acres of citrus growing on a nearby property northwest of the WLC property (the ProLogis site just east of the auto center off of Auto Center Drive and the 60 Freeway. However, to be

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

responsive to the comment, the cited text will be changed to say the following... Historically one of the important crops in the region was irrigated citrus fruit.

Response to Comment G-95-62. The commenter requests an evaluation of using onsite well water for crop irrigation. As outlined in Responses to Comments G-95-58 above and F-7A-45, onsite groundwater cannot be used because it is too expensive and does not meet the water quality limits established by Eastern Municipal Water District for crop irrigation.

Response to Comment G-95-63. The comment states that an egg production ranch that used to be on the project site needs to be described in the agricultural assessment. The requested update has been made and the commenter is referred to the Revised Agricultural Resources Assessment page 7 in Appendix C-2 of FEIR Volume 2.

Response to Comment G-95-64. The commenter requests that the rainfall for the proposed project area be verified. As published by the Moreno Valley city website the annual rainfall for Moreno Valley is approximately 9.9 inches. The commenter is referred to the Revised Agricultural Resources Assessment page 8 in Appendix C-2 of FEIR Volume 2 for references.

Response to Comment G-95-65. The commenter wants a term changed to “man-made ponds and lakes” on page 14 of the agricultural report prepared by Parsons Brinckerhoff (revised December 2013). However, the commenter did not state what term should change and it is not clear to what term he was referring. It should be noted the PB agricultural report was revised based on a number of comments and changes in the WLC project. The commenter is encouraged to read the revised version of that document.

Response to Comment G-95-66. The commenter points out an inconsistency between the site elevations given in the DEIR and the Agricultural Resources Assessment. In response to this comment, the elevation in the Revised Agricultural Resources Assessment has been updated to reflect the correct project site elevations. The commenter is referred to the Revised Agricultural Resources Assessment page 8 in Appendix C-2 of FEIR Volume 2 for changes.

Response to Comment G-95-67. The commenter states that the Lake Perris Recreation area comprises less than the 50% of the Zone of Influence Area. The agricultural assessment has been revised based on revisions to the WLCSP and this comment. The revised assessment lists the recreation area as comprising less than 25% of the revised Zone of Influence.

The commenter also states that a six sided geometric shape should be used instead of a rectangle when determining the Zone of Influence. According to the *California Agricultural Land Evaluation and Site Assessment Model*, a rectangle with a 0.25 mile buffer from the project boundary is the prescribed shape that must be used when determining the Zone of Influence for a project area.

Response to Comment G-95-68. The commenter states that Section 3.4 of the Agricultural Resources Assessment is incorrect and needs to be reassessed. The agricultural assessment has been revised based on revisions to the WLCSP and this comment. The revised Agricultural Resources Assessment concludes that there is not a significant impact on farmland of local importance. The commenter is referred to the Revised Agricultural Resources Assessment page iv and 25 in Appendix C-2 of FEIR Volume 2 to see specific changes.

Response to Comment G-95-69. As shown on the Federal Emergency Management Agency Flood Insurance Rate (FIRM) Maps 06065C0760G, 06065C0770G, and 06065C0790G; none of the surrounding residential areas fall in the Zone A, 100-year flood plain. This does not mean that localized flooding does not occur. Existing conditions for the project are documented in the Master Plan of Drainage, Appendix J of the DEIR. In the existing condition, localized flooding does occur at Gilman Springs Road and the southwest corner of the property near Merwin Avenue. Watershed Area

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

“A”, shown in Figure 3, drains to this area. In a significant storm, runoff from Watershed Area “A” will sheet flow across the agricultural land to the southwest corner of the project at Alessandro Boulevard and Merwin Street. In the existing condition, flows leave the project boundary via a culvert under Alessandro Boulevard which outlets to an existing ditch. The capacity of the existing ditch south of Alessandro Blvd was evaluated and does not have the capacity to convey the 100-year storm in the existing conditions. In the proposed condition, flows leaving the project’s boundary will be mitigated to less than the existing flow with the construction of Detention Basin A1 shown on Figure 1, Proposed Storm Drains and Basins. Also, the ultimate Moreno Master Drainage Plan open channel facility from the Basin to Redlands Avenue will be constructed. These facilities will be designed to convey the 100-year storm and will reduce the risk of flooding.

Response to Comment G-95-70. The commenter recommended changes to the text on page 4.9-25 of the DEIR. This change has been made in the revised DEIR.

Response to Comment G-95-71. The commenter questions an inconsistency in housing figures on pages 4.13-2 and 4.13-3 in the DEIR. These figures has been made consistent in the revised DEIR.

Response to Comment G-95-72. The commenter points out various inconsistencies in employment and fiscal benefit figures in several places in the DEIR. These inconsistencies has been resolved in the revised DEIR.

Response to Comment G-95-73. The 24,642 employees noted in the DEIR is not a “worst-case” estimate, and is not cited as such in the document. The projection is simply an estimate based on the successful construction of 40.6 million square feet of logistics facilities and the expected number of direct, indirect and induced jobs anticipated from this square footage. Regarding infrastructure needs, while the number of roads and sewer and water facilities required by the project may be relatively static and not be impacted by relatively small changes in the number of jobs actually created within the WLC (and in fact will be entirely funded by the project), the magnitude of many public services and maintenance costs will be a direct function of the number of employees generated by the project. For example, the number of calls for fire and police protection services, the need for road maintenance and the garbage and sanitation service requirements of the project will all correlate to some extent with the number of employees who are generated. The implication that the generation of “only” 20,000 or 22,000 jobs will mean that the project is no longer beneficial to the City is incorrect. In reality, the benefits associated with significantly increased employment opportunities in a City that is as “job-poor” as Moreno Valley are significant, and outweigh minor increases in public costs per new job, should such increases even exist.

Response to Comment G-95-74. According to the 2010 U.S. Census, of the 56,429 employed persons residing in Moreno Valley in 2010, 17.6% were employed in production, transportation and material moving occupations, 14.9% were employed in service occupations and 11.3% worked in construction, extraction and maintenance occupations. Many of these 24,609 employed residents will find suitable employment in WLC, especially those residents that currently commute to Los Angeles or Orange Counties, or other parts of the Inland Empire, for work.

OCCUPATION	No. of Residents By Occupation	Pct. of Residents By Occupation
Management, professional, and related occupations	14,206	25.2%
Service occupations	8,408	14.9%
Sales and office occupations	17,328	30.7%
Farming, fishing, and forestry occupations	205	0.4%
Construction, extraction, and maintenance occupations	6,377	11.3%
Production, transportation, and material moving occupations	9,905	17.6%
Total	56,429	100.0%

**Source: Census Bureau. See Exhibit Q.*

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

In addition, there will be a significant number of sales and office workers employed in the WLC, as well as management staff, engineers and computer professionals, many of whom also currently reside in Moreno Valley. There is therefore considerable opportunity for current residents of Moreno Valley to find work in WLC.

Furthermore, the concept of workers from outside of Moreno Valley being attracted to jobs in WLC is not a valid argument against the construction of the project. First, many of these employees might seriously consider moving closer to work, thereby enhancing property values within the City and drawing in more businesses and services jobs to meet the needs of these new residents. In addition, it is to the benefit of the entire Inland Empire to provide more jobs in locations within its borders, as employees driving to Moreno Valley from Riverside, Perris and other local communities will no longer be clogging the roads to LA and Orange County, and will have more family time and an overall improved quality of life. Please refer to Response to Comment G-51 for a more detailed response to this item.

Response to Comment G-95-75. Note: The commenter refers to an example analysis in the response, but neglected to attach the document.

The intent of the fiscal impact analysis is to analyze the “fiscal balance” at build-out of the WLC, in terms of how the project will affect the City General Fund. Notably, the study does not address any cost of living increases or inflation as these projections would be speculative at best and hard to predict over a 20-year span. Similarly, on the revenue side, the concept of increasing real estate taxes from property appreciation, increasing sales taxes due to price inflation, increasing user charges, etc. are also not accounted for. Again, it would be speculative to assign rates of increase in potential revenue streams over a 20-year span, so as is the case for most fiscal impact analyses, the DEIR uses costs and revenues based on constant (2013) dollars. Fiscal issues aren’t CEQA issues, CEQA Guidelines Section 15131, but the City Council will consider all comments before deciding whether to approve the project.

Response to Comment G-95-76. The DEIR relied upon governmental sources (i.e. Bureau of Labor Statistics, Employment Development Department and the Census Bureau) for the applicable wage data within the logistics sector. Importantly, these numbers have been compiled from these data sources based on County and Metropolitan Statistical Area data pertinent to the WLC. Specifically, the analysis utilized a monthly wage for full-time equivalent employees working within the logistics industry taken from the U.S. Census Bureau and annualized that number. It would follow that even if employees are temporary, their monthly salary would be equivalent to that of a permanent worker, and as the Census figure represents full-time equivalent employees, a worker only employed for a portion of a month would only be counted within the Census data for the portion of the month that they were actually employed.

Response to Comment G-95-77. The economic impact report portion of the DEIR addresses the full-time equivalent job number of 16,395 one-time construction workers by acknowledging that since the actual construction will occur over a 10-year period, this figure is equivalent to approximately 1,700 jobs per year. The report also makes the assumption that half of the total indirect and induced jobs generated in the County will be realized within the City. In general, the impact realized within the City is determined using Impact Analysis for Planning (IMPLAN) zip code data that analyzes the economic activity allocated to each of the zip codes within the County.

Response to Comment G-95-78. The commenter states the revenue figure shown on page 4.13-14 of the DEIR is not consistent with the project economic report. The economic report has been revised based on changes to the Specific Plan, and this inconsistency will be corrected in the revised Draft EIR (Final EIR Volume 2).

Response to Comment G-95-79. The commenter says the “loss” of the Moreno Highlands Specific Plan (MHSP) would also result in a loss of jobs from that land plan. It must be remembered CEQA does not allow a “plan to plan” comparison for the purposes of determining significance, but can only be used for comparison to show what could happen if existing conditions continue, as was done under the No Project – Existing General Plan Alternative examined in Section 6.3.5 of the DEIR. The estimate of jobs for the WLC project should not be “masked” by the paper comparison of jobs that might have been introduced if that land plan was developed instead of the proposed WLC project. However, it is at least interesting to note that the MHSP would indeed have introduced some small amount of new employment into this area, but on the order of approximately 24,000 jobs with a mixture of office and retail workers, based on the current land plan (DEIR Table 3.A and Figures 3-4 and 4.10-2).

The commenter is correct and the Section 6.3.2 of the revised Draft EIR (Final EIR Volume 2) has been revised to remove the land uses proposed for the subsequently approved CDFW Conservation Buffer Area land. That analysis shows reduced development-related impacts (e.g., traffic, air quality still does not meet the project objectives to nearly the same degree as the proposed WLC project because it is still largely residential and does not introduce a large amount of employment-generating uses.

Response to Comment G-95-80. The commenter says the job figures on page 5-5 are not consistent with the project economic study. This inconsistency has been corrected in the revised Draft EIR (Final EIR Volume 2).

Response to Comment G-95-81. The commenter says there are additional job and revenue figures on page 5-5 that are not consistent with the project economic studies. These inconsistencies have been corrected in the revised Draft EIR (Final EIR Volume 2).

Response to Comment G-95-82. Home values are often affected by a myriad of circumstances that are hard to predict, however, the construction of the project is expected to attract additional non-residential development that will provide services to the WLC, which in turn will draw more business to the City. While there is a possibility that the proximity of a warehouse and potential truck traffic could negatively affect the price of a home, it is also likely that the addition of employees wanting to live near their place of work will increase demand to residential communities, thereby driving up residential property values in other portions of the City, albeit not directly adjacent to the WLC. Finally, the WLC itself will improve the City's tax base as described above. CEQA is concerned with physical impact of urban blight and not mere decreases in value.

Response to Comment G-95-83. The commenter asked of the No Project – Existing General Plan alternative took into account the loss of 1000 acres for the land purchased by the state as conservation land. No project would mean no change. There is no “loss” of 1,000 acres.

The commenter is correct and the Section 6.3.2 of the revised Draft EIR (Final EIR Volume 2) will be revised to remove the land uses proposed for the subsequently approved CDFW Conservation Buffer Area. That analysis shows reduced development-related impacts (e.g., traffic, air quality still does not meet the project objectives to nearly the same degree as the proposed WLC project because it is still largely residential and does not introduce a large amount of employment-generating uses.

Letter G-96: Margie Breikreuz (April 8, 2013)

TO: Mark Gross
City Planner

FROM: Margie Breitkreuz

DATE: April 8, 2013

RE: Response to DEIR – WLC Warehouse Project

This letter is written in response to the World Logistic Center warehouse project's draft EIR. I appreciate the opportunity to provide my concerns with the project.

Air Quality

How will issues of air quality and diesel soot be addressed when Southern California, specifically the Inland Empire, already has the worst air quality in the nation? Adding 41.6 million square feet of warehouse space and associated diesel truck pollution will only exacerbate our current poor air quality.

The Clean Air Task Force website based on the 92555 area code states: "The *lifetime* cancer risk from *diesel soot* in our community exceeds the risk of all other air toxics tracked by EPA combined.

- The average lifetime diesel soot cancer risk for a resident of Riverside County is 1 in 3,917.
- This risk is 255 times greater than EPA's acceptable cancer level of 1 in a million."

Pollution levels will greatly intensify with the WLC as our surrounding mountains act as a natural barrier and currently trap pollution blown in from Los Angeles County.

NRDC investigators found in a majority of cases the greatest concentration of diesel vehicles – at bus stops, distribution centers, and industrial facilities – were typically located in low-income communities. This pattern is consistent with numerous studies showing that a higher percentage of environmental hazards are concentrated in such areas.

The DEIR does not sufficiently address the airborne cancer risks of the number of diesel trucks servicing the WLC warehouse project.

Economic Impact

How will the financial burdens of the WLC are addressed in the following areas:

- The lack of mixed-use, diversified businesses; (many warehouses throughout the Inland Empire remain unoccupied).

1

2

- The impact of heavy truck traffic to our infrastructure.
- Low square footage to employment levels.
- The cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.
- The consensus that logistics/warehouses provide a relatively poor return on public investment and generally do not represent the highest and best use to which real-estate should be devoted. (O’Connell)
- The cost to the community for medical coverage for seasonal and part-time employees.
- The low tax base.

▲
— 2

Traffic Issues

The DEIR does not address the traffic issues such as:

- The lack of access to rail, airport and freeway accommodations increasing the driving time for diesel trucks.
- The impact of 24-hour/seven day a week businesses to traffic patterns and freeway capacity.
- Inadequate lanes on the 60 freeway to handle increased truck traffic.
- Increased commuter time due to inadequate freeway ingress/egress. Current improvements only address current needs. How will current freeway exits handle the increased truck traffic?
- The cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.

— 3

Livable Communities

How will the DEIR for the WLC address livable community resources?

- Reduced quality of life issues impacting home sales in Moreno Valley.
- The need to build sound walls to protect current neighborhoods from noise levels destroying city views.
- Reduced home values caused by clustered, mega-scale warehouse complexes.
- The impact to homes surrounded and bordered by the WLC.
- The impact 24-hour truck traffic will have on resident commute time impacting their participation in school and community events, parental supervision of children, cost of extended day care, etc.
- The impact of truck traffic noise and lights.
- The lack of job opportunities that provide adequate salaries, job security, and promotion opportunities.
- Few if any jobs for local residents.

— 4

Nature

How will the WLC protect Moreno Valley residents and the resources of the San Jacinto Wildlife Area from diesel and noise pollution?

— 5

RESPONSES TO LETTER G-96

Margie Breikreuz

Response to Comment G-96-1. The commenter indicates that the Draft Environmental Impact Report (DEIR) does not sufficiently address cancer risks of the number of diesel trucks servicing the World Logistics Center (WLC) project.

The health risk assessment contained in both the DEIR and the revised analysis provided detailed estimates of the project's diesel truck emissions and their resulting health risk and non-cancer hazards to nearly 5,000 individual receptor locations. The diesel emissions were estimated for on-road diesel vehicles that would travel on nearly 500 individual roadway segments from Palm Springs to the ports of Los Angeles and Long Beach, as well as support equipment that would operate on the project site, including emergency standby diesel generators, yard hostlers, and forklifts. The resulting cancer risks and non-cancer hazards were fully discussed therein.

Response to Comment G-96-2. (bullet points 1-7).

1. Please reference the Response to Comment G-95-24.
2. Please reference the Response to Comment G-57-1.
3. Please reference the Response to Comment G-53-2.
4. The City will enforce existing traffic laws to assure compliance by WLC traffic with these laws. The Traffic Impact Analysis prepared as part of the DEIR discusses these issues in further detail in Section 12C. Costs are covered because of net benefit to City revenues.
5. The highest and best use for property is determined based on the economic demand for a particular land use for a site in a given location. Based on the current demand for logistics facilities versus other uses in this portion of Moreno Valley, Applicant has determined that logistics is the highest and best use for its property.
6. Please reference the Responses to Comments for F-9A-40, F-9A-41, and F-11-21.
7. Per the Final Environmental Impact Report (FEIR), the assessed value (once the WLC is built-out) is expected to be approximately \$3.7 Billion, which will increase the City's tax base significantly. Please reference Response to Comment G-95-82.

Response to Comment G-96-3. The commenter requests that the Traffic Impact Assessment (TIA) analyze rail access, inadequate lanes on SR 60, and adequacy of the current freeway exits to handle increased truck traffic. Also the cost of monitoring unlawful truck parking, traffic patterns, and idling as currently exhibited in Mira Loma.

An additional section (Chapter 4, Section F) has been included in the TIA that analyzes the potential for serving project trips by rail. The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, and capacity constraints within the rail system.

The adequacy of SR-60 to handle the WLC traffic was fully analyzed in the TIA and needed mitigation measures were identified. As discussed in Chapter 4, Section B of the TIA the current freeway exits at Theodore Street are inadequate for the forecast WLC traffic volumes. Improvements to the Theodore Street Interchange are currently being studied by the City and Caltrans. The WLC developers will be required to pay their fair share of these improvements, as they paid for the earlier

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

improvements done in conjunction with the Skechers warehouse. See MM Trans-5, Chapter 11, Section G.

The cost of enforcing traffic local laws is covered by taxes. The WLC will be one of the largest taxpayers in Moreno Valley. The adequacy of the taxes paid by the WLC to cover the costs incurred by the City, including police costs, is discussed in the financial analysis.

Response to Comment G-96-4. The commenter expressed a variety of concerns regarding the project, as outlined below:

(1) reduced quality of life and home sales – the term quality of life is somewhat vague but the potential environmental impacts of the WLC project on both the natural and man-made environment were evaluated in the Draft EIR Sections 4.1 through 4.16, some of which the commenter would probably agree constitute quality of life (traffic, noise, views, etc.). The DEIR determined there would be significant impacts related to views, agriculture, air quality, climate change, land use, noise and traffic. California Environmental Quality Act (CEQA) does not require an analysis of economic impacts such as home prices or sales. However, to date there has been no empirical evidence or case studies presented that would demonstrate the WLC would result in fewer homes sales or lower property values in the City.

(2) Sound walls and loss of views – Section 4.12 of the DEIR does recommend a variety of sound walls to help reduce noise impacts along a number of City streets as a result of WLC passenger vehicle traffic contributing to increased noise levels in the future. It is likely that installation of some of these sound walls will reduce views from the affected residential lots, however, installation of the sound wall would be at the discretion of the affected property owner, and the City Council will consider all comments and responses on the project and EIR before making a decision on the WLC project.

(3) decreased home prices – see response #1 above.

(4) 24-hour traffic affecting community activity – the revised traffic impact assessment (TIA) for the project indicated truck traffic from the WLC project would not have significant impacts on local schools, and there is no way to quantify or correlate project-related traffic to any changes in community activity participation, nor is there any reason to believe traffic in general affects decisions by parents or persons to participate in any activity outside of their residences.

(5) Trucks generating more noise and light – Section 4.12 of the DEIR examines potential noise impacts of the WLC project on local roadways, but it must be remembered that local traffic will be mainly passenger vehicles going to and from the project site because trucks will be limited to established truck routes and most project truck traffic will utilize Theodore, SR-60, and Gilman Springs Road. General lighting impacts of project development were evaluated in DEIR Section 4.1.6.5, however, lighting from vehicles traveling on roadways is not considered a significant impact. Onsite truck lighting is not considered significant due to the planned berms, landscaping, fencing, and other visual screening required of the project (see revised MM 4.1.6.2B related to project screening).

(6) lack of new jobs – the economic report (DTA 2014) indicates the WLC could generate over 20,000 new jobs in the community at a variety of income levels with both part-time and full-time conditions.

(7) few local jobs – As outlined in the Responses to Comments G-33-9 and G-74-5, a Local Hiring Program will provide City residents with information on construction or warehousing jobs within the World Logistics Center Specific Plan (WLCSP) before the information is advertised regionally.

Response to Comment G-96-5. The commenter asked how the WLC project would protect Moreno Valley residents and resources of the San Jacinto Wildlife Area from diesel and noise pollution.

The project will implement a number of project design features and mitigation measures to minimize its impacts to residents and the resources of the San Jacinto Wildlife Area. These measures and features include allowing only the cleanest diesel trucks to access the project, as well as several other measures discussed in Response to Comment Letter E-3-8. Other features include prohibition of truck travel along several roadways that are run through populated areas, such as Redlands Boulevard south of Eucalyptus Avenue and Cactus Avenue, minimum building setback of 250 feet from residentially occupied or zoned property, and special edge treatments along the Redlands/Bay/Merwin edge in the west and southwest portions of the project and along the San Jacinto Wildlife edge to the south that would prohibit buildings, truck courts, loading areas, truck circulation areas, or truck or trailer storage areas in these area (see the World Logistics Specific Plan for additional details).

Letter G-97: Otana Jakpor (April 8, 2013)

Mr. John Terell
 City of Moreno Valley
 14177 Frederick Street
 Moreno Valley, CA 92553

Otana Jakpor
 16941 Mockingbird Canyon Rd.
 Riverside, CA 92504
 April 8, 2013

Dear Mr. Terell:

I have long been concerned about air pollution, as I have grown up in Riverside and have seen firsthand how air pollution has affected people I care about. I am a volunteer for the American Lung Association and a student at the University of Southern California double-majoring in Global Health and Biology. I have previously interned with the USC-UCLA Southern California Environmental Health Sciences Center studying the goods movement industry and its impact on health. I received a Clean Air Award from the South Coast Air Quality Management District and was given the President's Environmental Youth Award for EPA Region 9 by President Bush in 2008 for my research and public policy advocacy concerning air pollution.

As we look at goods movement, it is readily apparent that the key to minimizing the health impacts of goods movement is strategic placement of intermodal facilities and the use of greener technologies. The proposed location of the World Logistics Center, with no access to railroad for the possibility of "clean trains," means a massive increase in diesel truck traffic. Please explain why such a massive warehouse complex with an associated massive increase in truck traffic would be situated in an area that is already in non-attainment according to federal and state air standards. The American Lung Association has given this region an "F" grade for air quality, and there could hardly be a worse area in the United States for situating a massive warehouse complex, as we already have some of the worst air quality in the country. I am glad that the World Logistics Center plans to use LED lights and become LEED certified, but I fail to understand how that will mitigate the effects of a massive increase in diesel truck traffic and its resulting pollution.

1

In my own research studies, I found several people to have asthma that had not been previously diagnosed. Even if people fail to recognize the impact of air pollution on their health, it does not mean that the poor air quality is not having an impact. In fact, we just need to look at published scientific studies to see that air pollution is having a huge impact on the health and economy of our region.

I believe that the draft environmental impact report failed to sufficiently evaluate the impact of the resultant increase in air pollutants upon pulmonary health. There was much focus on cancer risk, but insufficient focus on asthma, COPD, and the pulmonary development of children. The draft environmental impact report failed to even reference the landmark USC Children's Health Study that found a stunted rate of lung function growth, particularly in Mira Loma—a nearby example of a "warehouse city." The report also failed to calculate the economic costs from rising health impacts of increased air pollution. There has not been a true cost-benefit analysis of this project. The increased health costs would off-set some of the economic benefits of new jobs in Moreno Valley.

2

The draft environmental impact report also failed to address the impact of the increase in air pollutants on cardiovascular health. Particulate air pollution is associated with heart attacks and strokes. Please calculate this impact and the resulting economic cost of this impact. Such a large project as this could have a negative effect on life-expectancy in Moreno Valley.

3

I am strongly opposed to the building of the World Logistics Center which has a number of "significant and unavoidable impacts" on air pollution in this region, and therefore on the health and economy of this region.

Sincerely,

Otana Jakpor

RESPONSES TO LETTER G-97

Otana Jakpor

Response to Comment G-97-1. The entire South Coast Air Basin (SCAB) is in nonattainment. Air quality in the region has significantly improved in the past two decades, as discussed in the Draft Environmental Impact Report (DEIR) (Figure 4.3.1: Percent of Days Basin Exceeds Federal Ambient Air Quality Standards (AAQS); Figure 4.3.2: Exceedances of 1-Hour and 8-Hour Federal Standards; Figure 4.3.3: Number of Days per Month Federal Ozone Standard Exceeded, 1976–2000; Figure 4.3.4: NO_x, VOC, and Ozone Trends in the South Coast Air Basin; and Figure 4.3.5: Particulate Matter Trends in the South Coast Air Basin).

Further, a review of PM_{2.5} air quality trends in the Inland Empire including air monitoring data at Mira Loma, Fontana, San Bernardino, and Riverside Rubidoux have shown marked downward trends in the Inland Empire since 2001. PM_{2.5} is often used as a surrogate for airborne particulate matter such as diesel PM. These trends are evident despite the urban and logistics warehouse development during this time period. These trends are shown in Exhibit 2, Particulate Matter Trends and Emissions Forecast, contained in the revised analysis and shown in Master Responses in Letter C-3.

Section 4.F of the Traffic Impact Assessment (TIA) (FEIR Volume 2 Appendix L-1) analyzes the use of rail for the project. It is infeasible to ship cargo from the port to the WLC as it will actually have worse environmental impacts to the surrounding area, requires high fixed costs for handling rail cargo, and is physically impractical based on the topography of the area.

There is significant demand in Southern California for high-cube warehousing. In fact, the SCAG Warehouse forecast titled "Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities" estimates that the demand for warehousing in Southern California will exceed available land and that by 2035 there will be a shortfall of 228 million square feet in available warehouse facilities. If the project were not constructed at the proposed site, warehouses would likely be constructed elsewhere in the air basin. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents like the South Coast Air Quality Management Plans seek through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development.

(http://www.valleyconnect.com/~valleyco/images/stories/Library/reports/SCAG_IndustrialSpaceInSouthernCalifornia.pdf)

The commenter wonders why there is no rail access for the project. An additional section (Chapter 4, Section F) has been included in the TIA that analyzes the potential for serving project trips by rail (FEIR Volume 2 Appendix L-1). The analysis showed that rail service to the project site is not viable due to a range of factors, including high fixed costs, secondary impacts on the community, and capacity constraints within the rail system.

The commenter also wonders why the project is situated in a nonattainment area. The entire South Coast Air Basin is in nonattainment. If the project were not constructed in the proposed site, warehouses would likely be constructed elsewhere in the air basin. The policies of the region do not seek to attain compliance with ambient air quality standards through prohibiting growth. In fact, regional planning documents like the South Coast Air Quality Management Plans seek to reduce air emissions through the application of advanced emission control technology, which this project is implementing through measures such as requiring 2010-compliant trucks. All of the air quality

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

improvements in the South Coast Air Basin over the 50 years have been achieved through the use of cleaner technologies, not prohibitions on development.

Response to Comment G-97-2. The commenter indicated that the DEIR failed to sufficiently evaluate the impacts of the resultant increase in air pollutants on pulmonary (lung) health.

The health risk assessment contained in the DEIR addressed health impacts associated with both cancer risk and chronic (long-term exposures) non-cancer hazards. The chronic non-cancer hazards include reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system, birth defects, or other adverse environmental effects. Each toxic chemical has a unique chronic toxicological profile. Chemicals may affect the body through different mechanisms and target organs, and cause different chronic health effects. The assessment of chronic non-cancer hazards due to the project were estimated using the methodology recommended by the South Coast Air Quality Management District (SCAQMD). Using this methodology, the maximum chronic non-cancer hazards resulting from the project's emissions of diesel particulate matter (PM) were found to be less than the SCAQMD's significance threshold of 1.0.

Potential acute (short-term exposure) non-cancer hazards was expanded in the revised analysis to examine potential non-cancer hazards associated with both the total organic gas (TOG) emissions from gasoline- and diesel-fueled vehicles. Acute risks are non-cancer adverse health impacts, commonly associated with exposures to high concentrations of toxic air contaminants over short periods of time, as in minutes or hours. Typical symptoms of acute exposure may include headaches; dizziness; nausea; eye, nose, or throat irritation; and/or skin rash. Each toxic chemical has a unique acute toxicological profile. Chemicals may affect the body through different mechanisms and target organs, and cause different acute health effects. To estimate the project's acute non-cancer hazards, detailed estimates were made of the project's TOG emissions for both gasoline and diesel vehicles. The TOG emissions were then broken down into their major chemical components from which an estimate of the acute non-cancer hazards was made at over 2,500 receptor locations surrounding the project. On the basis of this assessment, the maximum acute non-cancer hazard was found to be 0.05, substantially less than the SCAQMD's significance threshold of 1.0.

The discussion of health effects of air pollution contained in the revised analysis has also been expanded to include a summary of the University of Southern California (USC) Children's Health Study, as discussed in Master Response-2: Heath Effects of Diesel Particulate Matter.

Response to Comment G-97-3. The commenter claims the DEIR fails to address the impact of the increase in air pollutants and cardiovascular health.

Both the DEIR and revised assessment contain a comprehensive evaluation of the health impacts from the project. Health effects from diesel pollution, for example, are discussed in Master Response-2: Health Effects of Diesel Particulate Matter (refer to Responses to Comment Letter C-3). Response to Comment G-49-8 discusses methodology and results of an estimation of the additional rate of premature deaths from heart disease, chronic lower respiratory disease, and stroke from the project's diesel PM. The results of this estimation show that there would be no substantial increase in mortality and morbidity as a result of the project.

Subject: Request

Dear Mr. Gross:

My wife and I recently had a chance to review the DEIR for the WLC. As a way of introduction, we are both long time residents of Moreno Valley and are now retired. We are both trained physicists and have spent our careers in technical and management areas in various industries. We feel that our background allowed us to make an objective and unbiased review of the document.

The DEIR is a good document, very well organized and written. The traffic analysis was very detailed. We were especially impressed by the fact that the trip generation rate was peer reviewed in Appendix T.

The WLC will have high cube warehouses. Very little data is available for such facilities. They tend to be efficient, require less employees, and may require fewer truck trips per KSF than smaller warehouses. The DEIR makes some very

big conclusions on very small data samples, which are sometimes based on contradictory data, or even erroneous data. For example, the trip generation rate of 1.68 was used in the DEIR (ITE edition 9). However, I agree with the argument in Appendix T that the 2011 NAIOP study makes a good case for the use of the smaller number 0.99 for traffic analysis. The use of the 0.99 number would greatly reduce the estimate of truck trips which would help reduce the estimate for the impact of the WLC on traffic density. However, what number should be used for air quality? It appears to us that no proper engineering estimate can be made at this time, by anyone, for the impact on air quality for high cubes. There is just not enough data available for anyone or any organization to make an evaluation of this parameter.

1

We also reviewed the fiscal and economic analysis in the DEIR. We were unable to duplicate various important parameters in this section of the document including the number of employees for the WLC and the wage information. A detailed review by us appears to indicate that the presented information is wrong. (In scientific and engineering circles, data that cannot be verified is suspect). In other areas, the wrong source data was used in the analysis. In addition, the document assumes 100% occupancy from day one and gives the impression that the city income will be \$5 million dollars by 2022; when in fact this is very unlikely, even in a positive economic cycle.

2

The discussion on construction is a self contradictory. For example, the label in Figure 3.19, seem to indicate that 20 MSF of warehouses will be built by 2017, and another 20 MSF will be built by 2022. The document elsewhere states that an average of 1700 FTEs will be employed to accomplish phases 1 and 2. These two data points give the impression that all 40 MSF will be completed by 2022. However, other sections of the document clearly indicate that the buildings will be customized, i.e. need to have a tenant before they will be built. There appears to be no probable and realistic schedule for building completion and building occupancy.

3

What is actually built, and when, pertains directly to the construction income to the city and fiscal responsibilities that come to the city when those buildings are completed. These statements will cause civic leaders to assume income from the WLC at an earlier date than can be reasonably expected, without having a clear understanding of the timeline for the city's future responsibilities.

4

No realistic cost/benefit analysis can be prepared by anyone at this time.

I believe that our findings in some of these areas are of definite interest to you before you make any recommendations to the city council on general plan modifications. We are not against the project at this time; but we have specific recommendations for you regarding modifications to planned changes to the General Plan.

We would appreciate the chance to meet with you to discuss some of these findings. I have a couple of suggestions that we feel you may be interested in.

Thank you for considering my request.

Sincerely , Hans and Barbara Wolterbeek

RESPONSES TO LETTER G-98

Hans and Barbara Wolterbeek

Response to Comment G-98-1. See Response to Comment G-90-7. The commenter repeats the statement from Comment Letter G-90 that the trip generation rate in the (Traffic Impact Analysis (TIA) (the Institute of Transportation Engineers (ITE) trip generation rate of 1.68) will probably result in an over-estimation of traffic impact. The comment also repeats his earlier suggestion that there is insufficient data to analyze air quality impacts.

The trip generation rate used in the TIA study for high-cube warehouses (1.68 vehicular trips per thousand square feet per day (VT/KSF/day)) is purposefully conservative to ensure that there would be no under-estimation of the project traffic impacts.

The air quality analysis relied on the results of the TIA using the ITE trip generation rate of 1.68 VT/KSF/day. In providing a conservative estimate of project-related trips, it also provides a conservative basis for the calculation of air quality impacts. Since the majority of air quality impacts, particularly with regard to operation, is the result of mobile sources, therefore it can be assured that air quality impacts have also not been underestimated.

Mitigation Measure Trans-1, described in Chapter 11 of the TIA, includes successive analyses of traffic conditions as the project builds out. This would include new traffic counts and level of service (LOS) analyses to determine whether the increases in the capacity of the road network was kept pace with the growth in traffic.

Response to Comment G-98-2. See Responses to Comments G-90-0 (Summary), G-90-2, and G-90-3.

Response to Comment G-98-3. See Responses to Comments G-90-0 (Summary) and G-90-2.

Response to Comment G- 98-4. See Responses to Comments G-90-0 (Summary) and G-90-2.

**RE: World Logistics Center Project Draft
Environmental Impact Report (SCH #2012021045)**

Dear Mr. Gross:

My husband and I object to the City's approval of the World Logistics Center Specific Plan, General Plan, Amendments and Development Agreement because of the environmental and property value issues. There are three schools in our area where the children would be breathing the toxins from the trucks roaring down the streets.

We also have a lot of seniors in our area. We moved to Moreno Valley because it was a nice quiet place to live. It will not remain so if the warehouses that Mr. Benzeevi wants to build are allowed.

We would like to be placed on the mailing list for future notices regarding this project. (lbkilday@msn.com)

Kilday*

RESPONSES TO LETTER G-99

Loretta and William Kilday (April 19, 2013)

Response to Comment G-99-1. None of the comments apply to the Environmental Impact Report (EIR) analysis or conclusions, but are personal observations about the project. The Draft Environmental Impact Report (DEIR) concluded that a number of project impacts (e.g., air quality, traffic, etc.) would be significant even after implementation of mitigation, and the City Council would need to adopt a Statement of Overriding Considerations for the project that state what benefits of the project outweigh the identified significant impacts of the project, if it decides to approve the project. It should be noted that the City Council will consider all stated opinions and comments on the project and EIR prior to making any decisions regarding the proposed World Logistics Center (WLC) project.

Letter G-100

Sent: Monday, May 13, 2013 3:55 PM

To: Mark Gross

Subject: In Favor of World Logistic Center Warehouse Proposal

Our family is in favor of the World Logistic Center Warehouse proposal. We live north of the 60 freeway between Moreno Redlands Boulevard and Moreno Beach Drive. There is no difference in our neighborhood with the arrival of the Skechers Warehouse than before it was built. And Skechers Warehouse is very tastefully situated and eye-catching as you drive along the freeway. In considering the alternatives - homes and or retail centers - the pollution and congestion probably outweigh the WLC proposal. The average person does not take into consideration the amount of cars and trips per day factored in to each proposed new house, or the congestion caused by the Walmart and Target Centers.

We were approached a few years ago by a lady who lives in our area and is against the warehousing at the City's 4th of July celebration. She had a declaration petition against the warehouse development which we declined to sign. She said she wanted to see a "Hospitality Lane" type development. This is not the area for that. I discussed the alternatives - housing and retail centers - along with the amount of trips per car per day for these and she said it gave her something to think about. I think the problem may lie in the fact that these people against the WLC do not like the developer for some reason. We are fairly new to Moreno Valley/Rancho

Belago, moving here 8 years ago from Orange County, but we specifically selected Moreno Valley and we love our area and our home. Our grown children have even moved here and live on the next street over from us.

There is a lot to be considered, but overall we are in favor of the World Logistic Center Warehouse proposal.

Mary Coil

RESPONSES TO LETTER G-100

Mary Coil

Response to Comment G- 100-1. The commenter made various comments about how well the Skechers project was done and her neighbor was fighting against the current project. This does not contain any comments on the World Logistics Center (WLC) project or Environmental Impact Report (EIR), and will not be responded to here. The City Council will consider all comments and responses on the project and EIR before taking action on the WLC project.

I/we, the undersigned, are homeowners in the City of Moreno Valley at the address listed below. We want to make sure that the World Logistics Center has as little impact on our neighborhood as possible. We ask that you incorporate the following mitigation measures:

- Please move all truck traffic off Merwin Street. Relocate Streets D and E as shown on the World Logistics Center Site Plan 500 to 1000 feet east of Merwin Street. Remove all truck traffic from Merwin street. 1
- Please require all security lights to use cutoff luminaires and be located on buildings no higher than 25 feet off the ground. 2
- Please require a 100 foot wide greenbelt area between the residential neighborhoods and the World Logistics Center buildings or streets. 3

Sincerely,

Subject: World Logistic Center DEIR

Dear Mr. Gross,

I would like to make the following comments concerning the DEIR for the World Logistic Center.

Agriculture :

The agriculture land that surrounds the San Jacinto Wildlife Area (SJWA) contributes enormously to the success of the SJWA. The loss of thousands of acres of farmland will have a significant negative effect on the SJWA. The DEIR does not adequately address this issue. The DEIR needs to study the effects of the loss of this agriculture land to the wildlife within and surrounding the SJWA. This existing agriculture land provides food and habitat which is different from that found in the SJWA. What effects will the loss of several thousand acres of Ag land have on the wildlife in this area? In  lity, the DEIR has almost no designated open space within the project. It would be good to have a portion of this agriculture land used as an "open space" Ag buffer between the World Logistic Center and the SJWA. These agriculture open space areas should become conservation easements under the oversight of a local entity with authority to accept conservation easements.

1

Open Space:

It is totally unacceptable to designate land outside of the jurisdiction of the developer as open space. The 1000+ acres of the SJWA should in no way be discussed as open space for this development. The DEIR needs to be revised to discuss adequate open space areas within the development itself.

2

Biology:

There are several large, deep drainage channels located within this project. These areas have, over the years, become habitat for many species of plants and animals. The larger drainage channels should be preserved in their existing condition, and a vegetative buffer of 50 feet or more should be placed on each side of the channel to protect this habitat and prevent erosion. These buffer areas should be fenced and planted with native vegetation to attract wildlife and reduce irrigation requirements. Detention basins should be placed near these channels to capture storm runoff and filter the water before it enters these channels. These channel/buffer areas could help this project meet its open space requirements, and serve as a visual screen to the numerous industrial buildings in the project.

3

Ownership:

How can this developer justify such a large project when a considerable amount of the property within the Specific Plan does not belong to the developer, and is not under his control? The DEIR map shows that close to half of the land within the proposed specific plan is not owned by the developer. Changing the zoning on the land not under the developer's control should not be allowed without the permission of all of those property owners. The DEIR needs to explain how it can justify a project without either owning the property or having an option to buy on all of the property within the Specific plan.

4

Sincerely,

Robert S. Hewitt
42913 Johnston Ave.
Hemet, Ca. 92544

RESPONSES TO LETTER G-103

Robert Hewitt

Response to Comment G-103-1. The commenter is concerned about loss of agricultural land/open space and its impact on the San Jacinto Wildlife Area (SJWA). Section 4.4.6.4 of the Draft Environmental Impact Report (DEIR) determined that impacts to raptors and other avian resources of the SJWA would be potentially significant but that payment of the (Western Riverside County) Multiple Species Habitat Conservation Plan (MSHCP) fee and its eventual acquisition of conservation land in western Riverside County would help offset regional loss of raptor foraging habitat (additional information in DEIR Sections 4.4.1.13 and 4.4.1.17). In addition, a new mitigation measure has been added, in response to many similar comments, to acquire offsite farmland for the loss of unique farmland on the World Logistics Center (WLC) property.

Response to Comment G-103-2. The commenter says the 1,000 acres of SJWA property should not be designated open space under the proposed project. The commenter misunderstands the relationship of the state conservation land south of the WLCSP property. The 1,000 acres south of the World Logistics Center Specific Plan (WLCSP) property was purchased from or out of the Moreno Highlands Specific Plan (MHSP) property. The minutes from the Wildlife Conservation Board action at that time specifically says it will act as a buffer from planned urban development (i.e., at that time the rest of the MHSP)(DEIR Section 4.4.1.16). The existing state conservation land is being rezoned as part of the discretionary actions requested by the WLC project because at present those lands are still zoned for a golf course and various residential uses under the MHSP (refer to Response to Comment F-8-3).

Response to Comment G-103-3. Drainage 9 will be preserved and a 25-foot buffer area along each side of the drainage will be enhanced to promote local wildlife travel (see Section 4.4.6.3A of the DEIR). Portions of Drainage 12 will be realigned and enhanced for flood control purposes (See Section 4.4.6.3 of the DEIR and Section 1.3 in this FEIR Volume 1). An updated wetland delineation report (FCS-MBA 2013) was prepared to address concerns regarding regulatory agency jurisdiction over the drainage features within the WLCSP as outlined in the original DEIR in 2013.

All identifiable and potentially jurisdictional drainages on the site were mapped and included in the revised DEIR and the draft wetland delineation. The applicant shall secure a jurisdictional determination with the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property are subject to jurisdictional authority and protection. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies if needed prior to initiation of construction as discussed in MMs 4.4.6.3A and 4.4.6.3B.

Jurisdictional features will be avoided and unavoidable impacts will be mitigated through the construction of compensatory wetland. Compensatory wetland mitigation will be provided at an appropriate ratio (no less than 1:1 replacement wetland to impacted wetland) to ensure no net loss of wetlands or aquatic resources. Wetland mitigation will be provided concurrent with or prior to impacts and will be provided on-site, if feasible. Significant impacts to jurisdictional drainage features may also be compensated by off-site mitigation or purchase of habitat in an authorized in-lieu fee program, if necessary. For each individual project as it is designed, a Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the USACE/USEPA's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the USACE's Standard Operating Procedure for Determination of Mitigation Ratios as discussed in MM 4.4.6.3A.

Final Programmatic Environmental Impact Report
Volume 1 – Response to Comments
World Logistics Center Project

Response to Comment G-103-4. The commenter points out that the developer does not own all of the property within the WLCSP boundary. Highland Fairview currently owns or controls development rights on 1,754 acres or 67 percent of the total 2,610 acres within the WLCSP. The remainder of the project area property is owned by private individuals or entities such as the San Diego Gas & Electric Company, Southern California Gas Company, Metropolitan Water District, and California Department of Fish and Wildlife. Figure 3.5 in the DEIR depicts the property ownership within the WLC project area (see FEIR Volume 2 Figure 3.5 in Section 3.3.1, Project Description).

State law allows a City to designate areas within their jurisdiction as a Specific Plan if that plan would provide a comprehensive land plan that may be different from but have advantages over the existing zoning on the property. In this case, the existing zoning is the Moreno Highlands Specific Plan which was a mixed residential master planned community. At this time, the economy would not support development of such a large residential project, and over the years the City of Moreno Valley has found it does not have enough land zoned for employment-generating uses (i.e., it is a housing rich but jobs poor area).

Moreno Valley, California In The Beginning

"The glittering speculations which promised so much and performed so little brought disappointment to so many"

(Moreno Valley Voice, March 16, 1895)

By

VIOLA F. HAMNER

2003

Chapter 14

ORIGINAL STREET NAMES AND THEIR NAMESAKES

In 1890 the Bear Valley and Alessandro Development Company bought 25,000 acres in what is now Moreno Valley and went to work in a "vigorous, systematic and intelligent manner" to develop it into a "magnificent colony."

Working with a blank canvas, so to speak, the company plotted the undisturbed land into ten-acre parcels, carefully laid out the streets and avenues in a grid pattern and then named them in alphabetical order. They recorded their subdivision map in San Bernardino County on November 3, 1890 (SBC Map Bk. 11 p. 10).

On the original subdivision maps of our valley, two wide boulevards were dedicated—Alessandro and Redlands. Both with a width of 120 feet. Alessandro Boulevard, so named because it was the main thoroughfare from the railroad town of Alessandro to the new city of Moreno.

Redlands Boulevard was given that name as it was the main route between Redlands and the town of Moreno. Grading and clearing of vegetation for the two boulevards was the company's first intrusion into our pristine and peaceful valley.

Historic Alessandro Boulevard, our best known byway, has been extended over the years and now stretches seventeen miles from Gilman Springs Road westerly into the City of Riverside. On November 11, 1988, it was designated a City of Moreno Valley landmark (Resolution CPAB 88-2). It has been, over the years, a San Bernardino County road, a Riverside County road, a California State highway, part of the transcontinental U.S. Route 60, part of the old "Jack Rabbit Trail" and lastly, a city boulevard.

Another city resolution, CPAB 89-3 dated December 7, 1989, gave landmark status to the other historic avenue and street names. This was to protect them from change and thus preserve an important part of Moreno Valley history.

The tract was designed with a half mile between streets and a quarter mile between avenues. Residents and travelers, if they knew the system, could easily figure out how far it was from one point to another by knowing the alphabet. They could then calculate how long it would take to get to a destination if walking, riding a horse, traveling by horse and buggy, or peddling a bicycle.

Avenues north of Alessandro Boulevard were given tree names. Those south of Alessandro were given other botanical names.

The avenues were dedicated as eighty feet in width, running east and west, and a quarter of a mile apart. Alessandro Boulevard was used as the "A" street in the alphabetical listing.

Avenues North of Alessandro

Bay
Cottonwood
*Dracaea
Eucalyptus
Fir

Avenues South of Alessandro

Brodiaea
Cactus
Delphinium
*Eschscholtzia
Filaree

RESPONSES TO ITEM G-106 ORAL INFORMATION

Unknown Source

Response to Information G-106. This information was provided subsequent to the circulation of the DEIR. Although not a written comment submitted on the DEIR, this information appropriately describes how in 1988 the Cultural Preservation Advisory Board (CPAB) of the City of Moreno Valley designated the entire length of Alessandro Boulevard as a City Historical Landmark (Resolution CPAB 88-2). At that time, the CPAB made the alignment, right-of-way, and name of Alessandro part of the historical designation. In response to this information, various portions of Section 4.05, Cultural Resources, in Volume 2 of the Final EIR (the Revised Draft EIR) have been revised. Additional background on the historic characteristics of Alessandro Boulevard has been provided in DEIR Section 4.5.3.1, Phase 1 Research. In addition, language has been added to DEIR Section 4.5.6.2, Historic Resources, describing how the revised project design accommodates the historic nature of Alessandro Boulevard. Based on this information, the alignment of Alessandro Boulevard (formerly referred to as Streets C and E) have been realigned to follow the historical alignment of Alessandro (see Figure G-106, and the east-west portion of this roadway will be called Alessandro Boulevard. It should be noted that a short segment of the historical alignment, just east of Merwin Street, will not be connected to Alessandro west of Merwin Street so that WLC project traffic, including trucks and passenger vehicles, will not travel through the existing residential neighborhoods east of Redlands Boulevard along Alessandro Boulevard. The eastern end of Alessandro Boulevard will also intersect Gilman Springs Road at approximately the same location and orientation as its historical alignment. With these project changes, the WLC project will not have a significant impact on the historical landmark designation of Alessandro Boulevard.

3.0 MITIGATION MONITORING AND REPORTING PROGRAM

3.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program (MMRP) has been prepared for use in implementing mitigation for the:

World Logistics Center

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2012021045) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

- 1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
- 2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
- 3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the FEIR.

3.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate. The following table presents the MMRP.

THIS PAGE INTENTIONALLY LEFT BLANK

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.1 Aesthetics						
4.1.6.1A Each Plot Plan application for development along the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing or planned residential zoned uses) shall include a minimum 250-foot setback measured from the City/County zoning boundary line and any building or truck parking/access area within the project. The setback area shall include landscaping, berms, and walls to provide visual screening between the new development and existing residential areas upon maturity of the landscaping materials. The existing olive trees along Redlands Blvd. shall remain in place as long as practical to help screen views of the project site. This measure shall be implemented to the satisfaction of the Planning Official.	City Planning Division	Once before permitting	Prior to Plot Plan Approval	Plot Plan Review		Withhold Building Permits
		Once before permitting	Prior to issuance of Building permit.	Building Permit		Withhold Plot Plan Approval
		Once before issuance of certificate of occupancy.	Prior to issuance of certificate of occupancy.	On-site inspection		Withhold Certificate of Occupancy
4.1.6.1B Each Plot Plan application for development adjacent to Redlands Boulevard, Bay Avenue, or Merwin Street, shall include a plot plan, landscaping plan, and visual rendering(s) illustrating the appearance of the proposed development. The renderings shall demonstrate that views of proposed buildings and trucks can be reasonably screened from view from existing residents upon maturity of planned landscaping and to ensure consistency with the General Plan Objective 7.7. "Effective" screening shall mean that no more than the upper quarter (25%) of a building is visible from existing residences, which shall be achieved through a combination of landscaping, berms, fencing, etc. The location and number of view presentations shall be at the discretion of the Planning Division.	City Planning Division	Once before permitting	Prior to Plot Plan Approval	Plot Plan Review		Withhold Building Permits
		Once before permitting	Prior to issuance of Building permit.	Building Permit		Withhold Plot Plan Approval
		Once before issuance of certificate of occupancy.	Prior to issuance of certificate of occupancy.	On-site inspection		Withhold Certificate of Occupancy

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.1.6.1C Prior to the issuance of a certificate of occupancy for buildings adjacent to the western, southwestern, and eastern boundaries of the project (i.e., adjacent to existing residences at the time of application) the screening required in Mitigation Measure 4.1.6.1A shall be installed in substantial conformance with the approved plans to the satisfaction of the Planning Official	City Planning Division	Once before issuance of certificate of occupancy.	Prior to issuance of certificate of occupancy.	On-site inspection		Withhold Certificate of Occupancy
4.1.6.1D Prior to the issuance of permits for any development activity adjacent to Planning Area 30 (74.3 acres in the southwest portion of the Specific Plan), the entirety of Planning Area 30 shall be offered to the State of California for open space purposes. In the event that the State does not accept the dedication, the property shall be offered to Western Riverside County Regional Conservation Authority or an established non-profit land conservancy for open space purposes. In the event that none of these organizations accepts the dedication, the property may be dedicated to a property owners association or may remain in private ownership and may be fenced and access prohibited.	City Planning Division	Once before permitting of any development activity adjacent to Planning Area 30.	Prior to issuance before of any discretionary permit	Review and Approval of Site Plans		Withhold Discretionary Permit
4.1.6.3A Each Plot Plan application for development shall include plans and visual rendering(s) illustrating any changes in views of Mount Russell and/or the Badlands, for travelers along SR-60, as determined necessary by the Planning Official. The plans and renderings shall illustrate typical views based on proposed project plans, with the location and number of view presentations to be determined by the Planning Official. These views shall be simulated from a height of six feet from the edge of the roadway travel lane closest to the visual resource. The renderings must demonstrate that the	City Planning Division	Once before plot plan review.	Prior to issuance of building permit.	Review and Approval of Renderings		Withhold Building Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
development will preserve at least the upper two thirds (67%) of the vertical view of Mt. Russell from SR-60.						
4.1.6.4A Each Plot Plan application for development adjacent to residential development shall include a photometric plot of all proposed exterior lighting demonstrating that the project is consistent with the requirements of Section 9.08.100 of the City Municipal Code. The lighting study shall indicate the expected increase in light levels at the property lines of adjacent residential uses. The study shall demonstrate that the proposed lighting fixtures and/or visual screening meet or exceed City standards regarding light impacts.	City Planning Division	Once before plot plan review for any building adjacent to residential development.	Prior to issuance of any building permit	Review and Approval of Lighting Study		Withhold Building Permit
4.1.6.4B Each Plot Plan application for development shall include an analysis of all proposed solar panels demonstrating that glare from panels will not negatively affect adjacent residential uses or negatively affect motorists along perimeter roadways. Design details to meet these requirements shall be implemented to the satisfaction of the Planning Official.	City Planning Division	Once before plot plan review Once before Building Permit	Prior to issuance of any building permit	Review and Approval of Building Plans for solar panels.		Withhold Building Permit
4.2 Agriculture						
4.2.6.1A Prior to the issuance of any grading permit affecting land designated as "Unique Farmland" (Figure 4.2.2 in the World Logistics Center Environmental Impact Report), an Agricultural Conservation Easement shall be recorded over land of equivalent or better agricultural economic productivity of the offsite easement property compared to the World Logistics Center property. The analysis will include a comparison of the project's "Unique Farmland" considering its relative economic	City Planning Division	Once before issuance of grading permits on lands that contain unique farmland.	Prior to issuance of any grading permits.	City review of form and content of agricultural easement proposed by the developer. And City receives written verification of an agricultural easement.		Withhold Grading Permit.

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
specifications.						
d) All diesel powered construction equipment, delivery vehicles, and delivery trucks shall be turned off when not in use. On-site idling shall be limited to three minutes in any one hour.						
e) Electrical hook ups to the power grid shall be provided for electric construction tools including saws, drills and compressors, where feasible, to reduce the need for diesel-powered electric generators. Where feasible and available, electric tools shall be used						
f) The project shall demonstrate compliance with South Coast Air Quality Management District Rule 403 concerning fugitive dust and provide appropriate documentation to the City of Moreno Valley.						
g) All construction contractors shall be provided information on the South Coast Air Quality Management District Surplus Off-road Opt-In "SOON" funds which provides funds to accelerate cleanup of off-road diesel vehicles.						
h) Construction on-road haul trucks shall be model year 2007 or newer.						
i) Information on ridesharing programs shall be made available to construction employees.						
j) During construction, lunch options shall be

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>provided onsite.</p> <p>k) A publicly visible sign shall be posted with the telephone number and person to contact regarding dust complaints per AQMD Standards.</p> <p>l) Only non-diesel material handling equipment may be used in any logistics building in the WLC.</p> <p>m) Off-site construction shall be limited to the hours between 6 a.m. to 8 p.m. on weekdays only. Construction during City holidays shall not be permitted.</p>						
<p>4.3.6.2B Prior to issuance of any grading permits, a traffic control plan shall be submitted to and approved by the City of Moreno Valley that describes in detail the location of equipment staging areas, stockpiling/storage areas, construction parking areas, safe detours around the project construction site, as well as provide temporary traffic control (e.g., flag person) during construction-related truck hauling activities. Construction trucks shall be rerouted away from sensitive receptor areas. Trucks shall use State Route 60 using Theodore Street, Redlands Boulevard (north of Eucalyptus Avenue), and Gilman Springs Road. In addition to its traffic safety purpose, the traffic control plan can minimize traffic congestion and delays that increase idling emissions. A copy of the approved Traffic Control Plan shall be retained on site in the construction trailer.</p>	Transportation Division	Once prior issuance of any grading permits to issuance of any grading permits.	Prior to issuance of any grading permits.	Review and Approval of Traffic Control Plan.		Withhold Grading Permit

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.3.6.2C The following measures shall be applied during construction of the project to reduce volatile organic compounds (VOC): a) Non-VOC containing paints, sealants, adhesives, solvents, asphalt primer, and architectural coatings (where used), or pre-fabricated architectural panels shall be used in the construction of the project to the maximum extent practicable. If such products are not commercially available, products with a VOC content of 100 grams per Liter or lower for both interior and exterior surfaces shall be used. b) Leftover paint shall be taken to a designated hazardous waste center. c) Paint containers shall be closed when not in use d) Low VOC cleaning solvents shall be used to clean paint application equipment. e) Paint and solvent-laden rags shall be kept in sealed containers.	City Engineering and Building and Safety and Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2D No grading shall occur on days with an Air Quality Index forecast greater than 150 for particulates or ozone as forecasted for the project area (Source Receptor Area 24).	Land Development Division/Public Works	As needed during construction	During construction	Review of Construction Documentation and On-site Inspection		Issuance of a Stop Work Order
4.3.6.3A Prior to issuance of occupancy permits for each warehouse building within the WLCSP, the developer shall demonstrate to the City that vehicles can access the building using paved roads and parking lots.	City Planning Division	Once Before Permitting	Prior to issuance of occupancy permits for each warehouse	Review and Approval of building plans.		Withhold Occupancy Permit

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
implemented to the satisfaction of the City Planning Division and Riverside County Resource Conservation Agency ("RCA").						
4.4.6.3A Prior to the issuance of grading permits the applicant shall secure a jurisdictional determination from the United States Army Corps of Engineers (USACE) and confirm with the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) if drainage features mapped on the property to be developed are subject to jurisdictional authority. If the features are subject to regulatory protection, the applicant will secure permit approvals with the appropriate agencies prior to initiation of construction. Compensatory riparian habitat mitigation will be provided at a minimum ratio of 1:1 (replacement riparian habitat to impacted riparian habitat) to ensure no net loss of riparian habitat or aquatic resources. It should be noted that this is a minimum recommended ratio but the actual permitting ratio may be higher. These detention basins will be oversized to accommodate the provision of areas of riparian habitat. Maintenance of the basins will be limited to that necessary to ensure their drainage and water quality functions while encouraging habitat growth. Riparian habitat mitigation will be provided concurrent to or prior to impacts. A Compensatory Mitigation Plan will be prepared for all unavoidable impacts and will be consistent with the United States Army Corps of Engineers (USACE)/United States Environmental Protection Agency's Compensatory Mitigation for Losses of Aquatic Resources; Final Rule and the United States Army Corps of Engineers Standard Operating Procedure for Determination of Mitigation Ratios.	City Planning Division and Land Development Division Manager	Once prior to issuance of grading permits	Prior to the issuance of grading permits	Written verification of USACE approval of jurisdictional determination and Clean Water Act Section 404 permit.		Withhold Grading Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>The applicant shall consult with United States Army Corps of Engineers, California Department of Fish and Wildlife, and Regional Water Quality Control Board to establish the need for permits based on the results of a recent jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained for project-level development. Compensation for losses associated with the altering of drainages on site shall be in agreement with the permit conditions and in coordination with compensation outlined below.</p> <p>Mitigation will consist of onsite creation, offsite creation, or purchase of mitigation credits from an approved mitigation bank. As outlined in the WLC programmatic DBESP report, onsite riparian habitat will be created at a minimum 1:1 ratio due to the poor quality of onsite habitat. New habitat will be created within the onsite detention/infiltration basins to the extent allowed by the resource agencies to reduce storm flows, improve water quality, and reduce sediment transport. Habitat creation will include the installation of mule fat scrub or similar riparian scrub habitat to promote higher quality riparian habitat, but still maintain the basins for their primary role as detention facilities. The use of these areas as conservation areas would require consent from CDFW and the City of Moreno Valley (MM BIO-2b and MM DBESP 1 through 3).</p>						
4.4.6.3B As required by the Resource Conservation Agency (RCA), a program-level Determination of a Biological Equivalent or	City Planning Division	Once upon submittal of plot plan	Prior to the approval of any Plot Plans	Review and Approval of site specific DBESP and		Withhold Approval Plot Plans

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

permits for development in Planning Areas 9-12 adjacent to the natural gas compressor plant, the applicant shall prepare a risk assessment report analyzing safety conditions relative to the existing compressor plant and planned development. The report must be based on appropriate industry standards and identify the potential hazards from the compressor plant (e.g., fire, explosion) and determine that the distance from the plant to the closest planned buildings in Planning Areas 9-12 is sufficient to protect the safety of workers from accidents that could occur (see Final EIR Volume 2 Figure 4.1.6B) at the compressor plant. This measure shall be implemented to the satisfaction of the City Building and Safety Division and the Fire Prevention Bureau.	Fire Marshal	issuance of discretionary permits for development within Planning Areas 9-12	issuance of discretionary permits for development within Planning Areas 9-12	approval of a risk assessment		Discretionary Permit
4.8.6.1D Prior to the issuance of any grading permit, the developer shall inform the City of any existing solid waste materials within the development area. In conjunction with grading activities, all solid waste matter within the development area shall be removed by a licensed contractor and disposed of in an approved landfill. A record of the removal and disposal of any waste materials, in compliance with applicable laws and regulations, shall be submitted to the City prior to the issuance of any building permits.	Recycling Coordinator/Public Works	Once before issuance of grading permits	Prior to issuance of grading permits	Applicant will inform the City in writing of any existing solid waste materials within the development area		Withhold Grading Permit
4.9 Hydrology and Water Quality						
4.9.6.1A Prior to issuance of any building permit within the Specific Plan area, the developer shall construct storm drain pipes and conveyances, as well as, combined detention and infiltration basin(s), bioretention areas, and spreading area(s) within each proposed watershed, as outlined in the project hydrology plan, to mitigate	Land Development/Public Works	Prior to Occupancy	Prior to issuance of any development permit	Review and approval of construction documents Field Inspection		Withhold Building Permit

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: World Logistics Center Specific Plan

Applicant: Highland Fairview

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
the impacts of increased peak flow rate, velocity, flow volume and reduce the time of concentration by storing and infiltrating increased runoff for a limited period of time and release the outflow at a rate that does not exceed the pre-development peak flows and velocities for the 2, 5, 10, 25, and 100-year storms and volumes as assessed in the water balance model for historical conditions. For the purpose of this mitigation measure, the term "construct" shall mean to substantially complete construction so as to function for its intended purpose during construction with complete construction prior to occupancy. Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. The infiltration rate of the underlying soils will be used to properly size the bioretention areas and detention basins/infiltration basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins are captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance. This measure shall be implemented to the satisfaction of the City Engineer. Energy dissipaters shall be used as the spillways of basins to reduce the runoff velocity and dissipate the flow energy. Drainage weir structures shall be constructed at the downstream end of the watersheds flowing to the San Jacinto Wildlife Area to control the runoff and spread the flow such that the flows exiting the project boundary will return to the sheet flow pattern similar to the existing condition. Detention basins and spreading areas shall be designed to account for the amount of the sediment

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
development.						
4.15.7.4D As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Sections 3.55.050 and 3.55.060. Required TUMF payments shall be made prior to the issuance of occupancy permits for the requested development.	City Engineer	Once before to issuance of occupancy permits	Prior to issuance of occupancy permits	Written verification of payment of TUMF		Withhold Occupancy Permits
4.15.7.4E In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the World Logistic Center Specific Plan Traffic Impact Analysis (i.e., under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to Mitigation Measure 4.15.7.4F). As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 et seq., and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies. For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the World Logistic Center contributes to cumulatively significant impacts, and where the fair share contribution of the World Logistic Center project as a whole was	City Engineer	Once before to issuance of occupancy permits	Prior to issuance of occupancy permits	Written verification of payment of DIF or TUMF		Withhold Occupancy Permits

Date: May 2015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire World Logistic Center to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with Mitigation Measure 4.15.7.4F.						
4.15.7.4F The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the project does not have a significant impact. Fair-share	City Engineer	Once prior to issuance of building permits for individual buildings.	Prior to issuance of occupancy permits	Written verification of payment of fair-share fees		Withhold Occupancy Permits

3.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
contributions will be determined on a building-by-building basis as a share of the impact of the Project as a whole (for each segment or intersection where the World Logistics Center project as a whole has a significant impact identified in the Programmatic Environmental Impact Report) as determined by the Traffic Impact Analysis and will be due as each certificate of occupancy is issued. The fair share payments for the significantly impacted road segments and intersections identified in the Programmatic Environmental Impact Report will be required even though the impact resulting from a specific building does not, by itself, cause a significant impact.						
4.15.7.4G City shall work directly with Western Riverside Council of Governments to request that Transportation Uniform Mitigation Fee funding priorities be shifted to align with the needs of the City, including improvements identified in the World Logistics Center Specific Plan traffic impact analysis. Toward this end, City shall meet regularly with Western Riverside Council of Governments.	City Engineer	On-going	Yearly starting with project up and ending with project buildout.
